- The following commands configure a route map called ***rm*** to set the IS-IS level to Level-1, then use it to redistribute connected routes.

```
switch(config)# route-map rm
switch(config-route-map-rm)# set isis level level-1
switch(config-route-map-rm)# router isis osiris
switch(config-router-isis)# redistribute connected route-map rm
switch(config-router-isis)#
```

- The following command displays IS-IS database information and confirms that the level has been set to Level-1.

```
switch# show isis database detail
ISIS Instance: inst1 VRF: default
 ISIS Level 1 Link State Database
 LSPID Seq Num Cksum Life IS Flags
 1111.1111.1001.00-00 10 63306 751 L2 <>
 NLPID: 0xCC(IPv4) 0x8E(IPv6)
 Area address: 49.0001
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

15.4.5.2.4 Configuring Redistribution of BGP Routes into ISIS

The **redistribute bgp route-map** command redistributes the BGP routes from the specified route map into IS-IS. Only one route map can be specified; reissuing the command overrides any previous configuration.

The **no redistribute bgp** and **default redistribute bgp** commands disable BGP route redistribution from the specified domain by removing the **redistribute bgp** statement from ***running-config***.

The command is available in both ***router IS-IS*** configuration mode and the ***address-family*** submode. The command is rejected if configured in both modes at the same time. Issuing the **no** or **default** command in ***router IS-IS*** configuration mode has no effect on redistribution configured in the ***address-family*** submode.

Note: If the command is configured in an ***address-family*** submode, it only redistributes routes from that address family. If it is configured in router-ISIS mode, it applies to all enabled address families.

Examples

- These commands redistribute IPv4 BGP routes from the route map called ***bgp-to-isis-v4*** into the ISIS domain.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-isis-af)# redistribute bgp route-map bgp-to-isis-v
4
switch(config-router-isis-af)#
```

- These commands redistribute all BGP routes from the route map ***bgp-to-isis*** into ISIS.

```
switch(config)# router isis 1
switch(config-router-isis)# redistribute bgp route-map bgp-to-isis
```

15.4.5.2.5 Setting the Overload Bit

The overload bit is set in link state packets (LSPs) to signal that the switch is not available for forwarding transit traffic (for instance, during startup or when the switch is being taken down for

maintenance). To set the overload bit manually, use the **set-overload-bit** command without the **on-startup** option. To configure the switch to set the overload bit after a reboot, allowing routing protocols to converge before the switch is used for forwarding traffic, use the **set-overload-bit** command with the **on-startup** option. The overload bit will remain set set for the interval specified after startup.

Note: When using the **on-startup** option, the overload bit will remain set in LSPs until the IS-IS agent has been up for the configured interval. If the configured **on-startup** time is less than the actual IS-IS agent uptime, the command will be applied immediately.

In scenarios when Border Gateway Protocol (BGP) routes are resolved using an Interior Gateway Protocol (IGP), if the transit router reboots and becomes available again, the IGP will consider the transit router as an optimal path again. After rebooting, the transit router will blackhole traffic until the transit router learns the external destination reachability information via BGP.

Examples

- These commands configure the switch to set the overload bit in LSPs sent for ***120*** seconds after startup.

```
switch(config)# router isis Osiris
switch(config-router-isis)# set-overload-bit on-startup 120
switch(config-router-isis)#
```

- These commands configure the overload bit until BGP converges. If BGP fails to converge within the set timeout default period, then the overload bit gets cleared.

```
switch(config)# router isis Osiris
switch(config-router-isis)# set-overload-bit on-startup wait-for-bgp
switch(config-router-isis)# set-overload-bit on-startup wait-for-bgp
 timeout 750
switch(config-router-isis)#
```

15.4.5.2.6 Configuring IS-IS MD5 Authentication

To configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated, use the **authentication mode** and **authentication key** commands. To configure authentication on the interface, causing IS-IS Hellos to be authenticated, use the **isis authentication mode** and **isis authentication key** commands on the interface.

Two forms of authentication are supported by the IS-IS routing protocol: Clear-text authentication and MD5 authentication. The difference between the two forms of authentication is in the level of security provided. In the case of clear-text authentication, the password is specified as text in the authentication TLV, making it possible for an attacker to break authentication by sniffing and capturing IS-IS PDUs on the network. Arista recommends using the MD5 authentication.

HMAC MD5 authentication provides much stronger authentication by computing the message digest (on the IS-IS PDU contents) using the secret key to produce a hashed message authentication code (HMAC). Different modes of authentication can be specified on the interface, which authenticates IIH PDUs (IS-IS hello PDUs), and globally in the router IS-IS mode, in which the LSPs, CSNPs and PSNPs are authenticated. Area-wide and domain-wide authentication can be specified for L1 and L2 routers respectively.

Example

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)# router isis 1
switch(config-router-isis)# authentication mode md5
switch(config-router-isis)# authentication key secret
```

```
switch(config-router-isis)#
```

- These commands configure authentication on the interface causing IS-IS hellos to be authenticated.

```
switch(config)# interface Ethernet 3/6
switch(config-if-Et3/6)# isis authentication mode text
switch(config-if-Et3/6)# isis authentication key 7 cAm28+9a/xPi0
4o7hjd8Jw==
switch(config-if-Et3/6)#
```

To maximize interoperability, Arista recommends using the same key in both interface mode and in the ***router isis*** mode.

15.4.5.2.7 Setting the SPF Interval

The SPF timer interval defines the maximum interval between two successive SPF calculations. IS-IS runs SPF calculations following a change in the network topology or the link-state database. The **spf-interval** command defines the following intervals:

- **Maximum wait interval:** The maximum time a switch will wait before running an SPF after a topology change.
- **Initial wait interval:** In a network that has been stable throughout the hold interval, this interval defines the initial wait time of a switch for performing an SPF calculation after a topology change. As several link-state updates must be sent after a topology change, the initial wait interval allows the network to settle before a switch computes an SPF. If the topology changes during an initial wait interval, an SPF is calculated after the initial wait interval expires and no further changes are made to throttle timers.
- **Hold time:** This interval delays SPF calculations during network instability. If the topology changes during a hold time, an SPF is computed when the hold time expires. Subsequent hold intervals are doubled up to the configured maximum wait interval for continuous topology changes. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF is computed after the initial wait interval.

Note: EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

Example

This command configures maximum wait interval, initial wait interval, and hold time to ***10*** seconds, ***2000*** ms, and ***1000*** ms respectively.

```
switch(config)# router isis inst1
switch(config-router-isis)# spf-interval 10 2000 1000
```

15.4.5.2.8 Configuring IS-IS Segment Routing Global Adjacency-SID

IS-IS Segment Routing (SR) supports global adjacency SIDs for point-to-point interfaces. The adjacency SID is configured as an index using the adjacency-segment command.

Global adjacency segments are represented using an index instead of actual MPLS labels. The index is an offset into the Segment Routing Global Block (SRGB) advertised by a router, resulting in an MPLS label. The default value of SRGB in EOS is Base: ***900000*** and Size: ***65536***.

The same index may be used to configure multiple interfaces so that MPLS forms an ECMP group, and the same index may be applied to IPv4 and IPv6 adjacencies.

Example

In this example, the global adjacency is configured on a point-to-point interface ethernet ***Et1***, with an index value ***10***.

```
switch(config-if-Et1)# adjacency-segment ipv4 p2p index 10 global
```

Displaying Adjacency SID Information

The command **`show isis segment-routing adjacency-segments`** displays the global adjacency SID value and other related information.

Examples

- In this example an interface is configured as follows:

```
interface ethernet1
 ip address 1.1.1.1/24
 ipv6 address 1000::1/64
 isis enable isis1
 isis network point-to-point
 adjacency-segment ipv4 p2p index 1 global
 adjacency-segment ipv6 p2p index 2 global
```

- The show output for the above interface configuration:

```
switch# show isis segment-routing adjacency-segments

System ID: 1000.0000.0002                       Instance: isis1
SR supported Data-plane: MPLS                   SR Router ID: 1.1.1.4
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000     Size: 16384
Adjacency Segment Count: 2
Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
                   L: Local, S: Set

Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P -
Point-to-Point adjacency, LAN - Broadcast adjacency

Locally Originated Adjacency Segments
Adj IP Address     Local Intf  SID     SID Source   Flags                Type
-----------------  ----------  ------  -----------  ---------------      -------
1.1.1.2            Et1         1       Configured    F:0 B:0 V:0 L:0 S:0  P2P L1
fe80::1:ff:fe65:0  Et1         2       Configured    F:1 B:0 V:0 L:0 S:0  P2P L1

Received Global  Adjacency Segments
SID              Originator             Neighbor          Flags
---------        --------------------   ----------------  ---------
    0                 rtrmpls1          1000.0000.0002     F:0 B:0 V:0 L:0 S:0
```

15.4.5.2.9 Enabling Logging for Peer Changes

The **`log-adjacency-changes (IS-IS)`** command configures the switch to send syslog messages when it detects IS-IS neighbor adjacency state changes.

Example

These commands configure the switch to send a Syslog message when a neighbor goes up or down.

```
switch(config)# router isis Osiris
switch(config-router-isis)# log-adjacency-changes
switch(config-router-isis)#
```

15.4.5.2.10 Setting the IS-IS hostname

The **`is-hostname`** command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS

hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default if theres a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to deconfigure an assigned hostname for IS-IS using the **no is-hostname** command. When the IS-IS hostname is removed, the switch goes back to using the switchs hostname as the IS-IS hostname.

Examples

- These commands configure the IS-IS hostname to the symbolic name ***ishost1*** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# is-hostname ishost1
switch(config-router-isis)#
```

- These commands unconfigure the IS-IS hostname of the symbolic name ***ishost1*** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# no is-hostname ishost1
switch(config-router-isis)#
```

15.4.5.2.11 Configuring IS-IS Multi-Topology

The **multi-topology** command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly, the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families.

When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The **isis ipv6 metric** command configures the IPv6 metric.

The **isis multi-topology** command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The address families that are enabled on an interface are based on the global address families enabled in router IS-IS configuration mode, and the addresses configured on the interface. To enable a particular address family on an interface, it needs to have an address configured in that address family. In the case where both IPv4 and IPv6 address families are enabled in router IS-IS configuration mode, then if an interface has IPv4 and IPv6 addresses, both IPv4 and IPv6 address families are enabled on that interface. In the case of an interface with only an IPv4 address family, the IPv4 address family is enabled on that interface. Where an interface only has an IPv6 address family, the IPv6 address family is enabled on that interface. Finally, where only the IPv6 address family is enabled in router IS-IS config mode and MT is enabled, then the IPv6 address family is enabled on all interfaces which have an IPv6 address configured.

Examples

- These commands configure MT for the IS-IS router.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# multi-topology
switch(config-router-isis-af)#
```

- These commands unconfigure MT for the IS-IS router.

```
switch(config)# router isis 1
```

```
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# no multi-topology
switch(config-router-isis-af)#
```

- These commands configure the IPv6 metric.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis ipv6 metric 30
switch(config-if-Et5/6)#
```

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# isis multi-topology address-family ipv4 unicast
switch(config-if-Et1)#
```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# isis multi-topology address-family ipv6 unicast
switch(config-if-Et1)#
```

- These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# no isis multi-topology address-family unicast
switch(config-if-Et1)#
```

15.4.5.3 Configuring Optional IS-IS Interface Parameters

After globally enabling IS-IS, the following parameters may be configured on individual interfaces.

- Setting the Hello Packet Interval
- Configuring the Hello Multiplier for the Interface
- Configuring the IS-IS Metric
- Setting the LSP Transmission Interval
- Setting the IS-IS Priority
- Configuring an Interface as Passive
- Configuring BFD support for IS-IS for IPv4

15.4.5.3.1 Setting the Hello Packet Interval

The **`isis hello-interval`** command sets the time interval between the hello packets that maintain an IS-IS adjacency.

Example

These commands configure a hello interval of ***60*** seconds for ***interface ethernet 4***.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# isis hello-interval 60
switch(config-if-Et4)#
```

15.4.5.3.2 Configuring the Hello Multiplier for the Interface

The switch maintains the adjacency by sending/receiving hello packets. When receiving no hello packets from the peer within a time interval, the local switch considers the neighbors invalid.

The **isis hello-multiplier** command calculates the hold time announced in hello packets by multiplying this number with the configured **isis hello-interval**.

Example

- These commands configure a hello multiplier of ***5*** for ***interface ethernet 4***.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# isis hello-interval 60
switch(config-if-Et4)# isis hello-multiplier 5
switch(config-if-Et4)#
```

15.4.5.3.3 Configuring the IS-IS Metric

The **isis metric** command sets the cost for sending information over a specific interface. At present only wide metrics are supported.

Example

These commands configure a metric cost of ***30*** for sending information over ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis metric 30
switch(config-if-Et5)#
```

15.4.5.3.4 Setting the LSP Transmission Interval

The **isis lsp tx interval** command configures the minimum interval between successive LSP transmissions on an interface.

Example

This command sets the LSP transmission interval on interface ***interface ethernet 5*** to ***50*** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis lsp tx interval 50
switch(config-if-Et5)#
```

15.4.5.3.5 Setting the IS-IS Priority

The **isis priority** command determines which device will be the Designated Intermediate System (DIS). The device with the highest priority on the LAN will become the DIS.

Example

These commands configure a device priority of ***60*** on interface ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis priority 60
switch(config-if-Et5)#
```

15.4.5.3.6 Configuring an Interface as Passive

A passive IS-IS interface does not send or receive IS-IS packets and will not form adjacencies, but is still included in LSP advertisements, making its IP address visible to the IS-IS domain. To configure an IS-IS interface as passive, use the **isis passive** command in interface configuration mode or the **passive (IS-IS)** command in router IS-IS configuration mode.

Examples

- These commands configure ***interface ethernet 10*** as a passive interface.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# isis passive
switch(config-if-Et10)#
```

- These commands also configure ***interface ethernet 10*** as a passive interface.

```
switch(config)# router isis Osiris
switch(config-router-isis)# passive ethernet 10
switch(config-router-isis)#
```

15.4.5.3.7 Configuring BFD support for IS-IS for IPv4

The **isis bfd** and **bfd all-interfaces** commands configure Bidirectional Forwarding Detection (BFD). BFD is supported for both IS-IS IPv4 and IPv6 routes.

Examples

- These commands enable BFD (for the IPv4 address family) for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all interfaces.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-af)# bfd all-interfaces
switch(config-router-af)#
```

- These commands enable BFD on an IS-IS interface.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6)#
```

15.4.5.4 Configuring IS-IS Segment Routing

Global IS-IS Segment Routing (IS-IS SR) commands are accessed in Segment-Routing MPLS mode, under the router IS-IS configuration mode. Interface-specific IS-IS SR commands are accessed in interface configuration mode.

15.4.5.4.1 Starting the MPLS Agent

The Routing Information Base (RIB) or IS-IS agent provides IS-IS segment routing, but the actual installation of LFIB entries pertaining to SR information provided by IS-IS is handled by the MPLS agent in EOS, which is disabled by default. To enable the MPLS agent, use the following commands.

Note: IP(v6) routing must be enabled as a prerequisite.

Example

The following commands enable IP routing and the MPLS agent on the switch.

```
switch(config)# ip routing
switch(config)# mpls ip
switch(config)#
```

15.4.5.4.2 Enabling IS-IS SR

By default, IS-IS SR is disabled. You must enable it explicitly by issuing the **no** form of the **shutdown (IS-IS SR)** command in Segment-Routing MPLS configuration mode.

Example

The following commands enable IS-IS SR.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#no shutdown
switch(config-router-isis-sr-mpls)#
```

15.4.5.4.3 Disabling IS-IS Segment Routing

To administratively disable IS-IS SR, issue the **shutdown (IS-IS SR)** command in Segment-Routing MPLS configuration mode. To disable ***isis sr*** and delete all ***isis sr*** configuration, issue the **no segment-routing mpls** command in ***router isis*** configuration mode.

Example

- The following commands administratively disable ***router isis***.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# shutdown
switch(config-router-isis-sr-mpls)#
```

- The following commands disable ***router isis*** and delete all ***router isis*** configuration.

```
switch(config)# router isis instance1
switch(config-router-isis)# no segment-routing mpls
switch(config-router-isis)#
```

15.4.5.4.4 SRGB (Segment Routing Global Range)

The global segments such as Prefix-SID, Node-SID, Proxy-node-SID are represented using indices of actual MPLS labels. These indices are offset on the SRGB advertised by a router to derive the respective MPLS label. The default value of SRGB in EOS is Base: ***900000***, Size: ***65536***. In other words, the labels that any global segment could represent is between ***900000***-***965535***. The MPLS label range is categorized and reserved into pools based on the applications using these labels. The default values of label ranges in these pools are:

- Dynamic Global Range--(***100000***) (***262144***)
- IS-IS SR Global Range -- (***900000***) (***65536***)
- Static Global Range -- (***16***) (***99984***)

Note: SRGB can be configured to fit in different MPLS ranges as long as it does not fall under an MPLS range already assigned for usage by other applications.

Example

```
switch(config)# mpls label range isis-sr 900000 65536
```

15.4.5.4.5 IS-IS Maximum LSP Size

The IS-IS maximum LSP size provides the ability to configure the maximum LSP size that the IS-IS protocol accepts and sends.The default value of LSP size is ***9000***. The **lsp size maximum** command configures maximum size of an LSP that is sent or received. The default LSP maximum size is ***9000***. The minimum value is ***512***.

Example

```
switch(config)# lsp size maximum 400
```

The **no lsp size maximum** and **default lsp size maximum** commands remove the specified **lsp size maximum** command from ***running-config***.

```
switch(config)# no lsp size maximum
```

```
switch(config)# default lsp size maximum
```

15.4.5.4.6 Configuring Node-SID

Node segments are indices associated with routers within an IS-IS SR domain. This is done by associating node-segments with prefix mask length ***/32*** (IPV4) or ***/128*** (IPV6) addresses. Node segments are carried as sub-TLVs (type-length-value) in IP reachability TLVs for the prefixes with which these segments are associated. Node segments are configured on IS-IS enabled Loop-back interface(s) as shown in the example below.

Examples

- The following commands are used to associate a node-segment with an IPv4 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/32
switch(config-if-Lo1)# node-segment ipv4 index 5
```

- The following commands are used to associate a node-segment with an IPv6 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ipv6 add 2000::24/128
switch(config-if-Lo1)# node-segment ipv6 index 5
```

- The following example shows a warning thrown at the CLI when a ***/32*** or ***/128*** address is not configured on the interface.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/24
switch(config-if-Lo1)# node-segment ipv4 index 1
! /32 IPv4 address is not configured on the interface
```

- The following command removes the node-segment from IS-IS SR from an interface.

```
switch(config-if-Lo1)# no node-segment ipv4 index 1
```

15.4.5.4.7 Configuring Prefix-SIDs

Prefix segments are associated with any IS-IS prefix a router is originating an IP Reachability TLV for. These segments are carried as sub-TLVs in IP Reachability TLVs of the prefixes with which these segments are associated. Prefix segments are configured under segment-routing MPLS configuration mode in IS-IS.

Note: The configured prefix segment is effective, only if, the prefix for which a prefix-SID configured becomes a part of IS-IS by enabling IS-IS on interfaces, or by redistribution from other protocols etc.

Example

The following commands are used to associate a prefix segment with an IPv4 address with index value of ***50***.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# prefix-segment 1.1.1.0/24 index 50
```

15.4.5.4.8 Configuring Proxy-Node SIDs

Node segments represent a device (node) by attaching a segment (index) with a /32, /128 prefix which generally is configured on a loopback interface. There are routers which do not support segment routing, and there might be a situation where it is required to assign node identifiers on such routers. To overcome this shortfall, a router that supports IS-IS SR is made to proxy by configuring a proxy-node-SID for a IS-IS prefix originating from the router that does not support IS-IS SR.

Example

A proxy-node SID associates a ***/32*** or a ***/128*** route with an SID as shown below.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# proxy-node-segment 1.1.1.0/32 index
 50
```

Although the general use case is to configure a proxy node segment on a router that is not originating the prefix with which we want to associate the proxy-node SID, it is not prohibited to configure one for self-originated prefixes.

Configuring proxy-node-SIDs enables a router to send out a Binding-SID TLV with details pertaining to the prefix and SID.

Note: A Binding-SID can carry a range of prefixes and an associated range of SIDs, but at present the EOS does not support to configure such ranges with one binding segment TLV in IS-IS SR. However, we do process ranges of prefixes and SIDs if received from devices that support such configurations.

15.4.5.4.9 Configuring Anycast-SID

An Anycast-SID is a prefix segment that identifies a set of routers and not a specific router. It enforces the ECMP-aware shortest-path forwarding towards the closest node of the anycast set.

An example of such an anycast group could be a set of routers A1, A2, A3, and A4 where at least one router of A1, A2, A3, and A4 advertises the prefix SID corresponding to the anycast address (which can be a prefix originating on all of A1, A2, A3 and A4 a loop-back address, maybe).

In general use case, all the routers of the anycast group would have the same prefix-SID configured for the anycast IP address present on them.

Note: That for Anycast-SID to work as expected, the SRGB on the members of the anycast group should be same.

15.4.5.4.10 Configuring router-ID

A router that support IS-IS SR need to advertise its SR data-plane capability and the range of MPLS label values it uses for segment routing, this is advertised by inserting SR-Capability sub-TLV in the Router Capabilities TLV.

A Router Capability TLV is now sent in IS-IS LSPs when Segment routing is enabled and it is necessary for a Router Capability TLV to carry a router-ID. This router-ID could be configured in

EOS under the segment routing MPLS configuration mode. If no router-ID is configured, the router automatically picks up the highest IPv4 address configured on the router for an router-ID.

15.4.5.4.11 Configuring IS-IS Static Adjacency SID

Adjacency segments for IS-IS adjacencies are statically configured on the switch, so that these values are preserved even when the switch restarts. Static adjacency segments are configured per address family on any interface (including Port-Channel, VLANs and SVIs). They are configured and advertised as labels.

These are the few points to be considered while configuring the static adjacency SIDs:

- The same label can be configured on multiple interfaces so that MPLS can form ECMP, the same value can be applied to IPv4 and IPv6 adjacency.
- Static adjacency SID is applied only to p2p interface, and has local scope. When interface type changes to LAN, then dynamic adjacency SID is assigned.
- When Static adjacency SIDs are configured, then simply replace dynamic adjacency SIDs which are advertised to other routers and installed in the local LFIB.
- Static adjacency SID is applied regardless of Adjacency Segment Allocation Mode.
- When Static adjacency SID is disabled, then normal rules for dynamic adjacency SID is applied (it automatically applies a value based on Adjacency Segment Allocation Mode as described in IS-IS Segment Routing TOI document).

Example

```
switch(config-if-Et1)# adjacency-segment ipv4 p2p index 50 global
```

They can be a label (local) or index (global) and we can assign multiple adjacency segments per link.

Where label-value must be within the SR Local Block (SRLB) that can be found in the output of **`show mpls label range`** command as shown.

```
switch# show mpls label range
Start     End       Size      Usage
------------------------------------------------
0         15        16        reserved
16        99999     99984     static mpls
100000    362143    262144    free (dynamic)
362144    899999    537856    unassigned
900000    965535    65536     isis-sr
900000    965535    65536     bgp-sr
965536    1031071   65536     srlb
1031072   1036287   5216      unassigned
1036288   1048575   12288     l2evpn
```

15.4.5.4.12 Configuring Adjacency Segment Label Range

Adjacency Segments are MPLS labels assigned to IS-IS adjacencies.These labels are shared with other routers in the domain by adding them in adjacency-SID sub-TLVs which are inserted in neighbor Reachability TLVs in IS-IS.

The MPLS labels (adjacency segments) are incrementally allocated to adjacencies, as the transition to Up state, from a adjacent set of MPLS labels pre-allocated by MPLS agent. This label range extends from ***100000*** to ***116383*** (base: ***100000***, size: ***16384***) by default. This could be changed by the following configuration:

Example

```
switch(config)# mpls label range dynamic 200000 131072
```

The dynamic label pool is shared between LDP and IS-IS SR Adjacency Segments.

15.4.5.4.13 Configuring Adjacency Segment Allocation Mode

Adjacency Segments are allocated to all IS-IS adjacencies based on the IS-IS routers that have advertised IS-IS SR capability or to none of the adjacencies. The command adjacency-segment allocation is used to configure this under the ***segment-routing mpls*** configuration mode.

The default behavior is to allocate adjacency segments to adjacencies of SR supporting devices.

Example

```
switch(config-router-isis-sr-mpls)# adjacency-segment allocation sr-peer
```

15.4.5.4.14 Adjacency Segment Persistence across Link Flaps

Adjacency segments are allocated to IS-IS adjacencies based on configured adjacency segment allocation mode mentioned above.

If an adjacency that has been allocated label L goes down, L is reserved for this adjacency for a duration of ***3600*** seconds from the time of the adjacency down event. Only the adjacency that owned this label before going down could reclaim label L in this duration.

15.4.5.4.15 Troubleshooting IS-IS Segment Routing

- The **`show tech-support ribd`** command has a section starting with the string SR Book Keeper which has extensive information on state of IS-IS SR on the router.
- In-case, if IS-IS SR is configured but SR related TLVs/sub, but, TLVs are not being sent in IS-IS LSPs.
  - Ensure that MPLS has been enabled (MPLD IP) enabled.
  - Check if segment routing is administratively shut down.
  - A segment might have been configured for a prefix not yet being advertised in IS-IS.
- In case, if Adjacency Segments are not being advertised.
  - Check if the adjacency segment mode is correctly set.
  - Adjacency Mode is set to all SR supported interfaces (default setting) and the peer does not support SR.
- Generally, it is good to not have same prefix with different indices or same index with different prefixes. There are CLI prohibitions that ensure that a router is not sending out conflicting sets of prefixes and associated SIDs. As there is possibility of receiving conflicting prefix-segments from other devices, there are ways to resolve the following three types of conflicts: prefix+SID conflict, SID conflict and prefix conflict.
  - Prefix+SID Conflict: When there are two prefix segments which have both the prefix and SID have same values, the one from the higher system ID is chosen for LFIB processing.
  - Prefix Conflict: If the two prefix segments which have same Prefix are from two different system than the one from higher system ID is chosen. If they are originated from same system ID than we choose the prefix segment of smaller SID.
  - SID Conflict: If the two prefix segments which have same SID are from two different system than the one from higher system ID is chosen. If they are originated from same system than the one which is of smaller prefix length is chosen. If prefix length is also same than the one with smaller address is chosen.

For a given prefix, if both a proxy-node segment and prefix-SID are received, the prefix-SID advertised is preferred while the proxy-node segment is ignored.

The **show tech-support ribd** displays detail information about IS-IS SRs internal state, and more information on conflicts and chosen active segments could be found under the SR Book Keeper section of **show tech-support ribd** command as shown.

```
Received Prefix Segments:
-------------------------------------------------------------------
 Prefix     | Value | Index/Label | Type    | SystemID       | spfgen
 * - Active, # - Duplicate pfx, + - duplicate SID
-------------------------------------------------------------------
*1.0.3.0/24    3      Index        Prefix   1111.1111.1002   0
*1.0.5.1/32    0      Index        Node     1111.1111.1002   0
*1.0.6.1/32    2      Index        Node     1111.1111.1003   39
*1.0.7.1/32    14     Index        Node     1111.1111.1001   39
#1.0.7.1/32
```

10 Index Proxy ***1111.1111.1003 39***

15.4.5.5 Configuring Redistribution of DHCP for IS-IS Agent (IPv6)

The **redistribute dhcp** command redistributes DHCPv6 routes in IS-IS when using multi-agent routing protocol mode.

The **redistribute dhcp** command enables DHCP route redistribution in IS-IS when using the multi-agent routing protocol mode.

- These commands redistribute IPv6 DHCP routes into the ISIS domain.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6
switch(config-router-isis-af)# redistribute dhcp
switch(config-router-isis-af)#
```

- The following command shows the DHCPv6 routes distributed into IS-IS.

```
switch(config)# show isis database detail
IS-IS Instance: inst1 VRF: default
  IS-IS Level 1 Link State Database
    LSPID                 Seq Num   Cksum  Life  IS Flags
    1111.1111.1001.00-00  10        19778  1101  L1 <>
      ...
      Reachability (MT-IPv6): 3ffe:701:ffff:101::10/128 Metric: 0 Type:
 1 Up
      ...
```

15.4.5.6 Disabling IS-IS

An IS-IS instance can be shut down globally or can be disabled on individual interfaces.

The **shutdown (IS-IS)** command shuts down an IS-IS instance globally.

Example

These commands disable IS-IS globally without modifying the IS-IS configuration.

```
switch(config)# router isis Osiris
switch(config-router-isis)# shutdown
switch(config-router-isis)#
```

The **no isis enable** command disables IS-IS on an interface.

Example

These commands disable IS-IS on interface ***interface ethernet 4***.

```
switch(config-router-isis)# interface ethernet 4
switch(config-if-Eth4)# no isis enable
```

15.4.5.7 Configuring IS-IS Graceful Restart (GR)

By default, IS-IS graceful restart is disabled. Use the graceful-restart command to configure graceful restart on an IS-IS router. By default IS-IS graceful-restart-helper functionality is enabled, and to disable it use no graceful-restart-helper command.

Examples

In this example IS-IS graceful restart is configured with t2 wait time of ***30*** seconds for ***level-1*** routes.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart t2 level-1 30
```

t2 is the maximum wait time for the LSP database to synchronize (SPF computation is not done while t2 is running). t2 can be configured for either Level-1 or Level-2 through the CLI. The default value is ***30*** seconds, and the allowed configuration range is ***5*** to ***300*** seconds.

Example

In this example an ISIS graceful restart is configured with restart-hold-time of ***50*** seconds.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart restart-hold-time 50
```

In case of a planned restart, the hold time advertised by the IS-IS router prior to restart should be greater than the time for which the router is expected to be offline. Otherwise, neighboring routers will bring down the adjacency before the restarting router has a chance to send a restart request in its hello packet, which may result in traffic loss.

In case of ASU2, the IS-IS router instance will advertise a hello hold time of ***restart-hold-time*** on those interfaces for which the configured hold time is less than ***restart-hold-time***. This is done just before the router restarts.

Note: Once the router has restarted, the routers advertised hello hold time will depend on the hello-interval and hello-multiplier configuration on each interface as before. By default, the ***restart-hold-time*** is disabled.

For Graceful Restart to be successful, the hold time advertised by the router should be greater than the time it takes for Graceful Restart to complete. If the restarting router is DIS, hold time advertised is 1/3rd of the configured value (default is 9s). We recommend increasing the hold time for the DIS to a higher value before a planned restart; otherwise, it may result in traffic loss.

15.4.5.8 TI-LFA FRR using IS-IS Segment-Routing Configuration

The following configuration tasks can be performed by Topology Independent Fast Reroute (TI-LFA FRR) using IS-IS Segment-Routing.

- Configuring Link or Node Protection on a Specific Interface
- Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments
- Making Locally-originated Adjacency Segments Backup Eligible
- Enabling SRLG Protection
- show ip route

15.4.5.8.1 Configuring Link or Node Protection on a Specific Interface

To enable link or node protection for node segments and Adjacency segments learned on a specific IS-IS interface, use the following command in the interface configuration mode.

```
switch(config-if-Et1)# [no|default] isis fast-reroute ti-lfa mode
 {link-protection|node-protection|disabled} [level-1|level-2]
```

The interface TI-LFA configuration inherits the address-family sub-mode configuration by default.

On an L1-L2 router, the [**level-1**|**level-2**] optional keyword in both the router IS-IS address-family sub-mode and interface configuration mode CLIs is used to restrict protection to node segments and Adjacency segments learned through either Level-1 or Level-2 topologies only.

15.4.5.8.2 Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments

The Point of Local Repair (PLR) switches to the TI-LFA backup path on link failure or BFD neighbor failure but switches back to the post-convergence path once the PLR computes SPF and updates its LFIB. This sequence of events can lead to micro-loops in the topology if the PLR converges faster than other routers along the post-convergence path. So a configuration option is provided to apply a delay, after which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

To configure a convergence delay only to LFIB routes that are being protected, the following command is used either in the router IS-IS mode or the ***router isis address-family*** sub-mode. A default of ***10*** seconds is used when using the command without an explicitly specified delay.

```
switch (config-router-isis-af)# timers local-convergence-delay
[delay_in_milliseconds] protected-prefixes
```

15.4.5.8.3 Making Locally-originated Adjacency Segments Backup Eligible

The PLR computes backup paths for an adjacency segment only if the Adjacency SID sub-TLV has the B-flag (backup flag) set.

To set the B-flag in originated Adjacency SID sub-TLVs corresponding to adjacency segments dynamically allocated on the router, the following command is used in the ***segment-routing mpls*** sub-mode in the ***router isis*** mode.

```
switch(config-router-isis-sr-mpls)# adjacency-segment allocation [all-interfaces |
sr-peers]
```

To set the B-flag in originated Adjacency SID sub-TLVs corresponding to adjacency segments statically configured on the router, the following command is used in the interface configuration mode.

```
switch(config-if-Et1)# adjacency-segment [ipv4 | ipv6] p2p [multiple][label label |
index index] backup-eligible
```

backup-eligible is the newly introduced optional keyword in both the CLIs mentioned above that controls the setting of the B-flag in the Adjacency SID sub-TLV.

15.4.5.8.4 Enabling SRLG Protection

To enable SRLG protection on all interfaces, use the **`fast-reroute ti-lfa srlg`** command. This command is used in addition to configuring link-protection or node-protection. If SRLG protection is enabled, the backup paths are computed after excluding all the links that share the same SRLG with the active link that is being used by all prefix segments and adjacency segments.

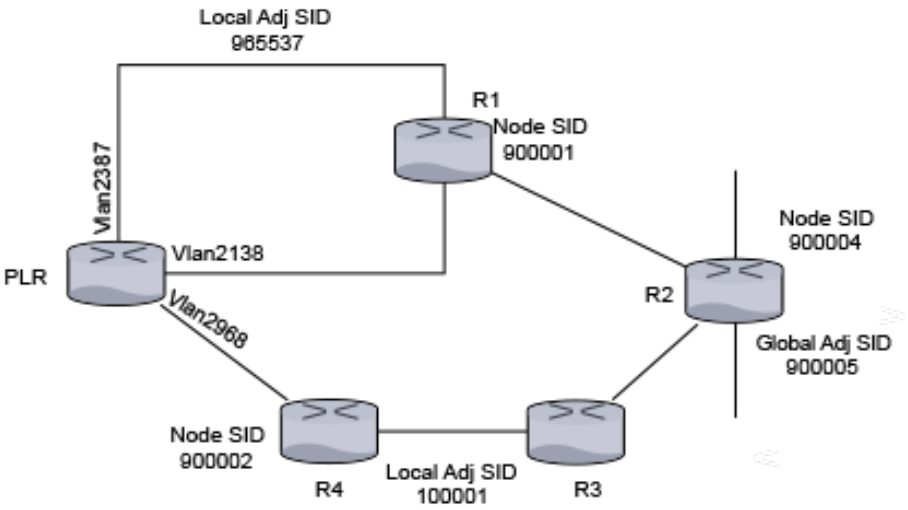
```
switch(config-router-isis-af)# fast-reroute ti-lfa srlg [strict]
```

If the optional argument **strict** is configured, the backup path is only programmed if a backup path that excludes all the SRLGs configured on the primary interface. If the keyword is not provided and an SRLG excluding path is not available, TI-LFA programs the backup path that excluded the maximum number of SRLGs possible.

To selectively disable SRLG protection on an interface, use the **`isis [ipv4|ipv6] fast-reroute ti-lfa srlg disabled`** command. This is useful if SRLG protection is enabled globally for all interfaces but needs to be selectively disabled for a specific interface.

```
switch(config-intf-et1)# isis [ipv4 | ipv6] fast-reroute ti-lfa srlg disabled
```

Sample Configuration



The above topology will be used to demonstrate the configuration and show command output.

Figure 56: Sample Configuration

The above topology is used to demonstrate the configuration and show command output. You will see the backup paths that the PLR computes to protect the node segments of R1 and R2, the global adjacency segment on R2, and the local adjacency segment on the ***vlan 2387*** on the PLR.

Here is a snippet of the configuration on the PLR.

```
switch(config)# interface vlan 2138
switch(config-if-Vl2138)# ip address 10.1.1.1/24
```

```
switch(config-if-Vl2138)# isis enable inst1
switch(config-if-Vl2138)# isis metric 11
switch(config-if-Vl2138)# isis network point-to-point

switch(config)# interface vlan2387
switch(config-if-Vl2138)# ip address 10.1.2.1/24
switch(config-if-Vl2138)# isis enable inst1
switch(config-if-Vl2138)# isis network point-to-point
switch(config-if-Vl2138)# adjacency-segment ipv4 p2p label 965537
 backup-eligible

switch(config)# interface vlan2968
switch(config-if-Vl2968)# ip address 10.1.3.1/24
switch(config-if-Vl2968)# isis enable inst1
switch(config-if-Vl2968)# isis network point-to-point
switch(config-if-Vl2968)# isis fast-reroute ti-lfa mode disabled

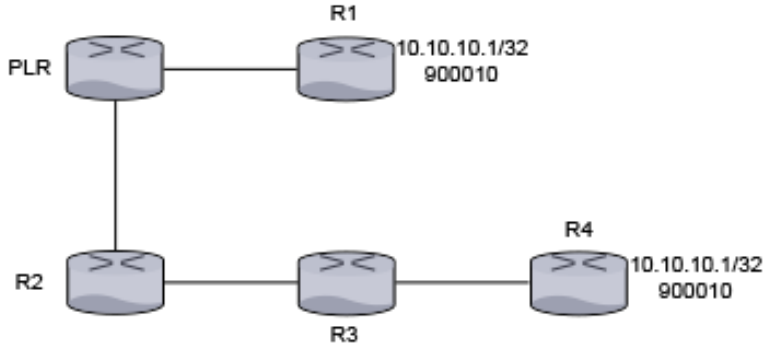
…

switch(config)# router isis inst1
switch(config-isis)# net 49.0001.1111.1111.1001.00
switch(config-isis)# router-id ipv4 252.252.1.252
switch(config-isis)# is-type level-2
switch(config-isis)# timers local-convergence-delay 5000
 protected-prefixes
   !
switch(config-isis)# address-family ipv4 unicast
switch(config-isis-af)# fast-reroute ti-lfa mode node-protection
   !

switch(config-isis)# segment-routing mpls
switch(config-isis-sr-mpls)# no shutdown
switch(config-isis-sr-mpls)# adjacency-segment allocation sr-
peers backup-eligible
!
end
```

The protection of anycast segments does not need any new configuration. The above configuration enables protection of anycast segments.

To demonstrate the protection of anycast segments consider the following topology.



R1 and R4 are originators of the host prefix 10.10.10.1/32 and advertise prefix segment 900010. Note that this should be configured as a prefix segment and not a node segment.

Figure 57: Topology Number 2

R1 and R4 are originators of the host prefix ***10.10.10.1/32*** and advertise prefix segment ***900010***. This must be configured as a prefix segment and not a node segment.

R1 and R4's configuration should look similar to the following:

```
switch(confg)# router isis inst1
switch(config-router-isis)# interface Loopback0
switch(config-if-Lo0)# ip address 10.10.10.1/32
switch(config-if-Lo0)# isis enable inst1

!
...
switch(confg)# router isis inst1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# prefix-segment 10.10.10.1/32
 index 10
!
```

The prefix in the prefix-segment command must belong to an interface enabled with IS-IS or must be an active route in the RIB of another protocol redistributed into IS-IS.

When the link or node protection is configured on the PLR, then the primary path to the segment ***900010*** is PLR - R1 and the backup path is PLR - R2 - R3 - R4. In other words, the destination in the backup path is the segment originated by R4 as the segment originated by R1 and is not reachable when link PLR-R1 or the node R1 goes down.

15.4.5.8.5 show ip route

When services like LDP pseudowires, BGP LU, L2 EVPN, or L3 MPLS VPN use IS-IS SR tunnels as an underlay, these services are automatically protected by TI-LFA tunnels that protect the IS-IS SR tunnels. The **`show ip route`** command displays the hierarchy of the overlay-underlay-TI-LFA tunnels.

```
switch# show ip route
 B        2001:db8:3::/48 [200/0]
           via 2002::b00:301/128, IS-IS SR tunnel index 3, label
 122697
  via TI-LFA tunnel index 5, label imp-null(3)
  via fe80::200:76ff:fe03:0, Ethernet26/1, label imp-null(3)
  backup via fe80::200:76ff:fe01:0, Ethernet30/1, label 900002
 900003
```

15.4.5.9 IS-IS Dynamic Flooding Configuration

Configure Dynamic flooding using the **`lsp flooding dynamic`** command under the ***router config*** mode. For example:

```
switch(config)# router isis Amun
switch(config-router-isis)# net 49.0000.0000.3333.00
switch(config-router-isis)# is-hostname ip3
switch(config-router-isis)# lsp flooding dynamic
```

Dynamic flooding should be enabled on all routers in the area. To enable Dynamic Flooding on all routers, use the following command:

`lsp flooding dynamic` [level-1 | level-2]

`nolsp flooding dynamic` [level-1 | level-2]

`default lsp flooding dynamic` [level-1 | level-2]

If necessary, the area leader election process can be tuned or disabled with the commands:

`area leader` [level-1 | level-2] priority ***0-255*** area leader [level-1 | level-2] disabled

`no area leader` [level-1 | level-2] priority ***0-255*** area leader [level-1 | level-2] disabled

`default area leader` [level-1 | level-2] priority ***0-255*** area leader [level-1 | level-2] disabled

15.4.5.9.1 Limitations

On a sparse topology, Dynamic Flooding is not effective and only adds overhead. Leaf-spine and Clos networks are appropriate dense topologies.

15.4.5.10 Relax Address-Family Check for IS-IS Adjacency

Address-Family Check for IS-IS creates the adjacency between devices with different address famiies. For example, a router supporting IPv4 and IPv6 is connected to a IPv4 only router, **Address-Family Check** is verified by comparing the NLPID TLV (Type #129) advertised in IIH hellos exchanged between peers. It is useful in following scenarios.

Incrementally Enable IPv6 in an Existing IPv4 Network

Relaxing the **Address-Family Check** is useful to gradually add IPv6 support in an IPv4 network, without disturbing the IPv4 connectivity.

IPv4 Controller Peering IPv4/v6 Dual Stack Router

A controller forms an IS-IS adjacency with a router and uses the IS-IS database for topology discovery. If the controller only supports IPv4 IS-IS or only IPv4 tunnels, to relax the **Address-Family Check** on the dual stack IPv4/v6 router for adjacency is useful in establishment.

Disabling the Address-family Check

Under IS-IS instance, configure the following to disable the **Address-Family Check** during IIH processing.

```
switch(config-router-isis)#?
   adjacency Configure parameters for adjacency formation
switch(config-router-isis)# adjacency?
   address-family Configure address-family related parameters for
 adjacency formation
switch(config-router-isis)# adjacency address-family?
   match Configure address-family match check related parameters for
 adjacency formation
switch(config-router-isis)# adjacency address-family match?
   disabled Relax address-family match check for bringing up adjacency
switch(config-router-isis)# adjacency address-family match disabled?
```

Show Command

The **show isis neighbor detail** command displays address family details at each end of the adjacency.

```
switch# show isis neighbor detail
Instance  VRF      System Id   Type Interface       SNPA        State
 Hold time   Circuit Id
inst1     default  1111.1111.1002   L2   Vlan2116           P2P
  UP    24          06
  Area Address(es): 49.0001
  SNPA: P2P
  Router ID: 1.0.0.2
  Advertised Hold Time: 30
  State Changed: 00:04:18 ago at 2020-11-01 22:28:35
  IPv4 Interface Address: 1.0.0.2
  IPv6 Interface Address: none
  Interface name: Vlan2116
  Graceful Restart: Supported
  Segment Routing Enabled
    SRGB Base: 900000 Range: 65536
    Adjacency Label IPv4: 149152
  Supported Address Families: IPv4, IPv6
  Neighbor Supported Address Families: IPv4
```

The **show isis interface detail** command shows the details of supported protocols on the interface and the neighbors connected to it. The state of **Address-Family match check** is also displayed.

```
switch(config-router-isis)# show isis interface detail
IS-IS Instance: inst1 VRF: default
  Interface Vlan2116:
    Index: 35 SNPA: P2P
    MTU: 1497 Type: point-to-point

     Address Family Match: Disabled
      IPv4 Interface Address: 1.0.0.2
      Areas:
        49.0001
```

Usage Guidelines

For IPv6 network upgrade, ensure the knob is incrementally configured on a contiguous section of the network, at any point the choice of routers for upgrade should not bisect the upgraded (supporting IPv4/v6) part of the network. All the routers bordering the upgraded network should always have the knob enabled.

When a proper set of router is established, the following steps are carried on each router.

1. Enable the CLI knob.
2. Enable IPv6 address family in the IS-IS instance.
3. Configure IPv6 on all the IS-IS interfaces.

15.4.5.11 Displaying IS-IS Information

The following sections describe display and verification of IS-IS settings and of peer and connection configuration:

- Displaying the Link State Database
- Displaying the Interface Information for the IS-IS Instance
- Displaying IS-IS Neighbor Information
- Displaying IS-IS Instance Information
- Displaying IS-IS Segment Routing Information
- Displaying show isis local-convergence-delay
- Verifying IS-IS Graceful Restart (GR) Information
- IS-IS Dynamic Flooding Show Commands

15.4.5.11.1 Displaying the Link State Database

To display the link state database of IS-IS, use the **`show isis database`** command.

Example

This command displays the IS-IS link state database.

```
switch# show isis database
ISIS Instance: Osiris
  ISIS Level 2 Link State Database
    LSPID                 Seq Num   Cksum  Life   IS Flags
    1212.1212.1212.00-00  4         714    1064   L2 <>
    1212.1212.1212.0a-00  1         57417  1064   L2 <>
    2222.2222.2222.00-00  6         15323  1116   L2 <>
    2727.2727.2727.00-00  10        15596  1050   L2 <>
    3030.3030.3030.00-00  12        62023  1104   L2 <>
    3030.3030.3030.c7-00  4         53510  1104   L2 <>
switch>
```

15.4.5.11.2 Displaying the Interface Information for the IS-IS Instance

To display interface information related to the IS-IS instance, use the **`show isis interface`** command.

Example

This command displays IS-IS interface information.

```
switch# show isis interface

ISIS Instance: Osiris
  Interface Vlan20:
    Index: 59 SNPA: 0:1c:73:c:5:7f
    MTU: 1497 Type: broadcast
    Level 2:

15.4.5.11.3 Displaying IS-IS Neighbor Information

To display general information for IS-IS neighbors that the device sees, use **show isis neighbors**.

Example

This command displays information for IS-IS neighbors that the device sees.

```
switch# show isis neighbor
Inst Id   System Id       Type  Interface   SNPA          State  Hold
 time
10        2222.2222.2222  L2    Vlan20       2:1:0:c:0:0   UP    30
10        1212.1212.1212  L2    Vlan20       2:1:0:d:0:0   UP     9
10        3030.3030.3030  L2    Ethernet30   2:1:0:b:0:0   UP     9
switch>
```

15.4.5.11.4 Displaying IS-IS Instance Information

To display the system ID, Type, Interface, IP address, State and Hold information for IS-IS instances, use the **show isis summary** command. The command is also used to verify the configured maximum wait interval, initial wait interval, and hold time of SPF timers in IS-IS instances. This command also displays values of the current SPF interval, last Level-1 SPF run, and last Level-2 SPF run.

Example

- This command displays general information about IS-IS instances.

```
switch# show isis summary
ISIS Instance: Osiris
  System ID: 1010.1040.1030, administratively enabled, attached
  Internal Preference: Level 1: 115, Level 2: 115
  External Preference: Level 1: 115, Level 2: 115
  IS-Type: Level 2, Number active interfaces: 1
  Routes IPv4 only
  Last Level 2 SPF run 2:32 minutes ago
  Area Addresses:
    10.0001
  level 2: number dis interfaces: 1, LSDB size: 1
switch>
```

- This command displays the SPF interval information about IS-IS instances.

```
switch(config-router-isis-af)# show isis summary

IS-IS Instance: 1 VRF: default
 System ID: 0000.0000.0001, administratively enabled
 Multi Topology disabled, not attached
 IPv4 Preference: Level 1: 115, Level 2: 115
 IPv6 Preference: Level 1: 115, Level 2: 115
 IS-Type: Level 1 and 2, Number active interfaces: 0
 Routes both IPv4 and IPv6
                            Max wait(s) Initial wait(ms) Hold
 interval(ms)
```

```
  LSP Generation Interval:     5              50               50
  SPF Interval:                2            1000             1000
  Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
  Last Level 1 SPF run 1 seconds ago
  Last Level 2 SPF run 1 seconds ago
  Authentication mode: Level 1: None, Level 2: None
  Graceful Restart: Disabled, Graceful Restart Helper: Enabled
  Area Addresses:
    49.0001
  level 1: number dis interfaces: 0, LSDB size: 1
  level 2: number dis interfaces: 0, LSDB size: 1
```

15.4.5.11.5 Displaying IS-IS Segment Routing Information

IS-IS Segment Routing information is displayed using the following commands:

- **show isis database detail**
- **show isis segment-routing**
- **show isis segment-routing global-blocks**
- **show isis segment-routing prefix-segments**
- **show isis segment-routing adjacency-segments**
- **show mpls label ranges**
- **show mpls segment-routing bindings**
- **show mpls lfib route**
- **show mpls lfib route <label value>**

show isis database detail

The **show isis database detail** command provides a view of LSPDB of different devices in the IS-IS domain. The output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.

Example

```
switch# show isis database detail
ISIS Instance: inst1 VRF: default
 ISIS Level 2 Link State Database
 LSPID Seq Num Cksum Life IS Flags
 1111.1111.1001.00-00 10 63306 751 L2 <>
 NLPID: 0xCC(IPv4) 0x8E(IPv6)
 Area address: 49.0001
 Interface address: 1.0.7.1
 Interface address: 1.0.0.1
 Interface address: 2000:0:0:47::1

```

show isis segment-routing

The **`show isis segment-routing`** command displays the summary information on IS-IS SR status.

Example

```
switch(config)# show isis segment-routing
System ID: 1111.1111.1002               Instance: inst1
SR supported Data-plane: MPLS           SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000   Size: 65536
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000     Size: 16384
All Prefix Segments have    : P:0 E:0 V:0 L:0
All Adjacency Segments have : F:0 B:0 V:1 L:1 S:0
ISIS Reachability Algorithm : SPF (0)
Number of ISIS segment routing capable peers: 3
Self-Originated Segment Statistics:
Node-Segments       : 2
Prefix-Segments     : 2
Proxy-Node-Segments : 0
Adjacency Segments  :
```

About the Output

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported data plane is shown against the SR supported Data-plane field whereas the Router ID being advertised in the Router Capability is mentioned in the SR Router ID Field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The **`show isis segment-routing`** command also provides information if segment routing has been administratively disabled as shown.

```
switch(config-router-isis-sr-mpls)# show isis segment-routing
! IS-IS (Instance: inst1) Segment Routing has been administratively
 shutdown
```

show isis segment-routing global-blocks

The **show isis segment-routing global-blocks** command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

Example

```
switch# show isis segment-routing global-blocks
System ID: 1111.1111.1002              Instance: inst1
SR supported Data-plane: MPLS          SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000  Size: 65536
Number of ISIS segment routing capable peers: 3
SystemId             Base         Size
-------------------- ------------ -----
1111.1111.1002        900000      65536
1111.1111.1001        900000      65536
```

show isis segment-routing prefix-segments

The **show isis segment-routing prefix-segments** command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.

Example

```
switch# show isis segment-routing prefix-segments
System ID: 1111.1111.1002         Instance: inst1
SR supported Data-plane: MPLS     SR Router ID: 252.252.2.252
Node: 2 Proxy-Node: 2 Prefix: 2 Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
                   E: Explicit-NULL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2
Prefix        SID     Type        Flags                SystemID        Type
--------------------- ---------   ----------------     --------------------
 1.0.7.1/32    2      Node        R:0 N:1 P:0 E:0 V:0 L:0   1111.1111.1001  L1
* 1.0.8.1/32   4      Node        R:0 N:1 P:0 E:0 V:0 L:0   1111.1111.1002  L2
 1.0.11.0/24   10     Prefix      R:1 N:0 P:0 E:0 V:0 L:0   1111.1111.1001  L2
* 1.0.12.0/24  12     Prefix      R:1 N:0 P:0 E:0 V:0 L:0   1111.1111.1002  L2
 1.0.15.1/32   18     Proxy-Node  R:0 N:0 P:0 E:0 V:0 L:0   1111.1111.1001  L2
 1.0.16.1/32   20     Proxy-Node  R:0 N:0 P:0 E:0 V:0 L:0   1111.1111.1003  L2
```

About the Output

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this routers IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show commands output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.

show isis segment-routing prefix-segments self-originated

The **show isis segment-routing prefix-segments self-originated** command output is identical to show isis segment-routing prefix-segments except, the fact that the former lists only self-originated prefix segments.

show isis segment-routing adjacency-segments

The **show isis segment-routing adjacency-segments** displays list of all the adjacency segments that are being originated by IS-IS SR on a router.

Example

```
switch# show isis segment-routing adjacency-segments
System ID: 1111.1111.1002           Instance: inst1
SR supported Data-plane: MPLS       SR Router ID: 252.252.2.252
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000     Size: 16384
Adjacency Segment Count: 4
Adj IP-address     Local     Intf    Label    SID  Source     Flags      Type
-----------------  --------  ------  ------   ---  ---------  ---------  --------
1.0.0.1            Vlan2472  100000  Dynamic  F:0   B:0 V:1    L:1 S:0   LAN L2
1.0.1.2            Vlan2579  100001  Dynamic  F:0   B:0 V:1    L:1 S:0   P2P L2
fe80::1:ff:fe01:0  Vlan2472  100002  Dynamic  F:0   B:0 V:1    L:1 S:0   LAN L2
fe80::1:ff:fe02:0  Vlan2579  100003  Dynamic  F:0   B:0 V:1    L:1 S:0   P2P L2
```

About the Output

It consists allocation mode, MPLS label pool from which labels would be allocated to adjacencies, total count of adjacency segments allocated so far and the default flag values carried in all adj-SID sub-TLVs originating from this device.

The main section of the output lists all the adjacency segments allocated so far in six columns each pertaining to Adjacency IP address, local interface name, MPLS label value, SID source, flags in the sub-TLV and the type of adj-SID respectively. The type of the adjacency segments depends on the IS-IS type of adjacency and the IS level.

show mpls label ranges

The **`show mpls label ranges`** command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

The isis-sr refers to the SRGB use-case in IS-IS, and isis (dynamic) refers to the label pool that is used for dynamic allocation of adjacency segments in IS-IS.

Example

```
switch# show mpls label ranges
Start    End      Size     Usage
-----------------------------------------
0        15       16       reserved
16       99999    99984    static mpls
100000   116383   16384    isis (dynamic)
116384   362143   245760   free (dynamic)
362144   899999   537856   unassigned
900000   965535   65536    isis-sr
```

show mpls segment-routing bindings

The **`show mpls segment-routing bindings`** command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

Example

```
switch# show mpls segment-routing bindings
1.0.7.1/32
 Local binding: Label: 900002
 Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
 Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
 Local binding: Label: imp-null
 Remote binding: Peer ID: 1111.1111.1001, Label: 900004
 Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
```

```
 Local binding: Label: 900006
 Remote binding: Peer ID: 1111.1111.1001, Label: 900006
 Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```

show mpls lfib route

The **show mpls lfib route** command displays the LFIB. Each LFIB entry has In-Label, Out-Label, metric, payload type, nexthop information, etc. fields. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.

Example

```
switch# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
        M - Mpls Via, P - Pseudowire Via,
        I - IP Lookup Via, V - Vlan Via,
        VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
        VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
        NG - Nexthop Group Via
Source Codes:
        S - Static MPLS Route, B2 - BGP L2 EVPN,
        B3 - BGP L3 VPN, R - RSVP,
        P - Pseudowire, L - LDP,
        IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
        IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
        BL - BGP LU, ST - SR TE Policy,
        DE - Debug LFIB

 IA 100000 [1]
           via M, 1.0.1.2, pop
           payload autoDecide, ttlMode uniform, apply egress-acl
           interface Vlan2930
 IA 100001 [1]
           via M, fe80::200:eff:fe02:0, pop
           payload autoDecide, ttlMode uniform, apply egress-acl
           interface Vlan2930
 IP 900008 [1]
           via M, 1.0.1.2, swap 900008
           payload autoDecide, ttlMode uniform, apply egress-acl
           interface Vlan2930
 IP 900009 [1]
           via M, fe80::200:eff:fe02:0, swap 900009
           payload autoDecide, ttlMode uniform, apply egress-acl
           interface Vlan2930
```

show mpls lfib route <label value>

The **show mpls lfib route <label value>** command provides information relevant to just the label value passed as an extension to the show command.

Example

```
switch# show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
        M - Mpls Via, P - Pseudowire Via,
        I - IP Lookup Via, V - Vlan Via,
        VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
        VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
```

```
        NG - Nexthop Group Via
Source Codes:
        S - Static MPLS Route, B2 - BGP L2 EVPN,
        B3 - BGP L3 VPN, R - RSVP,
        P - Pseudowire, L - LDP,
        IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
        IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
        BL - BGP LU, ST - SR TE Policy,
        DE - Debug LFIB
 IP 900008 [1]
            via M, 1.0.1.2, swap 900008
            payload autoDecide, ttlMode uniform, apply egress-acl
            interface Vlan2930
```

15.4.5.11.6 Displaying show isis local-convergence-delay

The **`show isis local-convergence-delay`** command shows the current or last attempt at delaying the convergence of protected routes on a link down/BFD neighbor down event. If the timer aborts for some reason (such as a topology change causing a new SPF), the attempt fails.

```
switch# show isis local-convergence-delay

IS-IS Instance: inst1 VRF: default
  System ID: 1111.1111.1001
  IPv4 local convergence delay configured, 5000 msecs
  IPv6 local convergence delay configured, 5000 msecs
  Level 1 attempts 0, failures 0
  Level 2 attempts 3, failures 1

  Level 2 in progress due to LINK DOWN on Vlan2138
    TI-LFA node protection is enabled for IPv4
    IPv4 Routes delayed: 0
      Delay timer started at: 2019-07-25 23:16:33
      Delay timer expires in 2 secs
    TI-LFA protection is disabled for IPv6

  Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
    TI-LFA node protection is enabled for IPv4
    IPv4 Routes delayed: 3
      Delay timer started at: 2019-07-25 23:14:51
      Delay timer stopped at: 2019-07-25 23:14:56
    TI-LFA protection is disabled for IPv6
```

The **detail** keyword also lists all the routes that have been delayed.

```
switch# show isis local-convergence-delay detail
  ...
  Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
    TI-LFA node protection is enabled for IPv4
    IPv4 Routes delayed: 3
      Delay timer started at: 2019-07-25 23:14:51
      Delay timer stopped at: 2019-07-25 23:14:56
      Delayed routes:
        10.0.7.1/32
        10.0.9.1/32
        10.0.10.1/32
```

```
    TI-LFA protection is disabled for IPv6
```

15.4.5.11.7 Verifying IS-IS Graceful Restart (GR) Information

GR State can be one of the following:

- Last Start/Restart was completed successfully.
- Last Start/Restart exited after t2 (level-1/level-2) expiry.
- Last Restart exited after t3 expiry.
- Start/Restart in progress.
- Graceful Restart was disabled during startup.

The following show commands are used to display the IS-IS graceful restart information.

- The **`show isis graceful-restart vrf [vrf-name]`** command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

  Example

```
switch# show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
 System ID: 0000.0000.0001
 Graceful Restart: Enabled, Graceful Restart Helper: Enabled
 State: Last Start exited after T2 (level-1) expiry
 T1 : 3s
 T2 (level-1) : 30s/20s remaining
 T2 (level-2) : 30s/not running
 T3 : not running

System ID       Type   Interface     Restart Capable  Status
is-hostname-1   L1L2   Ethernet1     Yes              Running
is-hostname-2   L1     Ethernet2     Yes              Restarting
```

- The **`show isis summary vrf [vrf-name]`** command displays the graceful restart state and helper configuration.

  Example

```
switch# show isis summary vrf default
IS-IS Instance: 1 VRF: default
 System ID: 0000.0000.0001, administratively enabled
 ....
 Graceful Restart: Enabled, Graceful Restart Helper: Enabled
```

- The **`show isis neighbors detail vrf [vrf-name]`** command displays the helpers view of a restarting router.

  Example

```
switch# show isis neighbors detail vrf default
Instance  VRF      System Id  Type Interface  SNPA     State  Hold time   Circuit Id
1         default  OT1        L1   Ethernet1  2:1:0:b  4:0:0  UP          29839   OT3.05
  Area Address(es): 49.0001
  SNPA: 2:1:0:b4:0:0
 ....
 Graceful Restart: Supported, Status: Restarting (RR rcvd, RA sent, CSNP sent)
```

- The **`show isis interface detail vrf [vrf-name]`** command displays the graceful restart related stats for that interface.

  Example

```
switch# show isis interface detail vrf default
```

```
ISIS Instance: ISISQ VRF: default
  Interface Ethernet1:
    Index: 2 SNPA: P2P
    ...
    Level 1:
      Graceful Restart Status: RR sent, SA sent, RA rcvd, CSNP rcvd
```

15.4.5.11.8 IS-IS Dynamic Flooding Show Commands

Several show commands are available to monitor Dynamic Flooding. To see the flooding topology, use the **`show isis dynamic flooding topology`** command:

```
switch# show isis dynamic flooding topology

IS-IS Instance: Amun VRF: default
  Level 1:
    Path: ip6.00 ip4.00 ip2.00 ip1.00 ip3.00 ip5.00 ip6.00
```

This command displays a list of paths that describe the flooding topology. Each path is a list of nodes in the network.

To see which interfaces dynamic flooding will use, use the **`show isis dynamic flooding interfaces`** command:

```
switch# show isis dynamic flooding interfaces

IS-IS Instance: Amun VRF: default
  Level 1:
    Ethernet5
    Ethernet4
```

This shows that the system is currently flooding only on ***ethernet4*** and ***ethernet5***. Normally at least two interfaces are selected.

15.4.6 IS-IS Commands

Global Configuration Commands

- router isis

Clear Commands

- clear isis database
- clear isis neighbor

Interface Configuration Commands

- adjacency-segment
- adjacency-segment (allocation)
- adjacency-segment (static)
- area leader
- authentication key
- authentication mode
- bfd all-interfaces
- isis [ipv4|ipv6] fast-reroute ti-lfa srlg
- isis authentication key
- isis authentication mode
- isis bfd
- isis enable
- isis fast-reroute ti-lfa mode
- isis hello-interval
- isis hello-multiplier
- isis ipv6 metric
- isis lsp tx interval
- isis metric
- isis multi-topology
- isis network
- isis passive
- isis priority

Router IS-IS Configuration Mode (Includes Address-Family Mode)

- address-family
- fast-reroute ti-lfa mode
- fast-reroute ti-lfa srlg
- graceful-restart (IS-IS)
- is-hostname
- is-type
- log-adjacency-changes (IS-IS)
- lsp dynamic flooding
- match isis level
- multi-topology
- net
- passive (IS-IS)
- redistribute (IS-IS)

- redistribute bgp route-map
- set isis level
- set-overload-bit
- shutdown (IS-IS)
- spf-interval

IS-IS Segment Routing Commands

- adjacency-segment (static)
- mpls label range
- node-segment
- prefix-segment
- proxy-node-segment
- segment-routing mpls
- shutdown (IS-IS SR)

Display Commands EXEC Mode

- show ip route
- show isis database
- show isis database detail
- show isis dynamic flooding
- show isis graceful-restart vrf
- show isis hostname
- show isis interface
- show isis local-convergence-delay
- show isis neighbors
- show isis network topology
- show isis segment-routing
- show isis segment-routing prefix-segments
- show isis segment-routing adjacency-segments
- show isis segment-routing global-blocks
- show isis segment-routing tunnel
- show isis summary
- show isis ti-lfa path
- show isis ti-lfa tunnel
- show mpls label ranges
- show mpls segment-routing bindings
- show mpls lfib route
- show tunnel fib

15.4.6.1 address-family

The **address-family** command places the switch in address-family configuration mode.

Address-family configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The **no address-family** and **default address-family** commands delete the specified address-family from ***running-config*** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to the ***isis*** configuration mode.

Command Mode

Router-IS-IS Configuration

Command Syntax

address-family [ipv4 | ipv6][MODE]

no address-family [ipv4 | ipv6][**MODE]**

default address-family [ipv4 | ipv6][**MODE**]

Parameters

- **address_family** Options include:
  - **ipv4** IPv4 unicast
  - **ipv6** IPv6 unicast
- **MODE** Options include:
  - ***no parameter*** Defaults to unicast.
  - **unicast** All IPv4 or IPv6 addresses are active.

Example

- These commands enter the ***address family*** mode for IPv4 unicast.

```
switch(config)# router isis Osiris
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af)#
```

- To exit from the IPv4 IS-IS unicast ***address family*** configuration mode, enter the following command.

```
switch(config)# router isis Osiris
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af)# exit
switch(config-router-isis)#
```

15.4.6.2 adjacency-segment

Use the **`adjacency-segment`** command in the interface configuration mode to have the PLR computes backup paths for an adjacency segment only if the Adjacency SID sub-TLV has the B-flag (backup flag) set.

Command Mode

Interface configuration mode

Command Syntax

`adjacency-segment` [ipv4|ipv6] p2p [multiple][label ***label*** | index***index***] backup-eligible

`no adjacency-segment` [ipv4 | ipv6]p2p [multiple][label ***label***|index ***index***] backup-eligible

`default adjacency-segment` [ipv4 | ipv6]p2p multiple][label ***label***|index ***index***] backup-eligible

Parameters

- **ipv4** IPv4 related.
- **ipv6** IPv6 related.
- **p2p** P2P interface type.
- **multiple** Configure multiple Adj-SIDs.
- **label *label*** Label value to be assigned as Adj-SID for adjacency on this interface. ***label*** range ***16 -1048575***.
- **index *index*** Prefix segment identifier. ***index*** range ***0-65535***.
- **backup-eligible** Eligible for protection.

15.4.6.3 adjacency-segment (allocation)

The **adjacency-segment** command allocates adjacency segments to all IS-IS adjacencies, or only those adjacencies which are to IS-IS routers that have advertised IS-IS SR capability, or to none of the adjacencies.

Command Mode

Segment-Routing MPLS Configuration

Command Syntax

adjacency-segment allocation [all-interface |none | sr-peers]

Parameters

- **allocation** Allocation of Adjacency Segments.
- **all-interface** Allocates adjacency segments to all IS-IS adjacencies.
- **none** Disable automatic adjacency segment allocation.
- **sr-peers** Allocate adjacency segments to IS-IS adjacencies with SR peers.

Example

This command allocates the adjacency segment to an sr-peer.

```
switch(config-router-isis-sr-mpls)# adjacency-segment allocation sr-peer
```

15.4.6.4 adjacency-segment (static)

The **`adjacency-segment`** command configures IS-IS adjacencies statically on the switch, so that these values are preserved even when the switch restarts. The no and the default form of the command places the switch back to the global configuration mode.

Command Mode

Interface Ethernet Configuration

Command Syntax

`adjacency-segment` ipv4 | ipv6 p2p [[label ***label-value***]|[index ***index-value*** global]]

Parameters

- **ipv4** IS-IS SR adjacency segment IPv4 interface configuration.
- **ipv6** IS-IS SR adjacency segment IPv6 interface configuration.
- ***label*** Label value to be assigned as Adj-SID for adjacency on this interface. Value ranges from ***16*** to ***1048575***.
- ***index*** Index to be assigned as Adj-SID for adjacency on this interface. Value ranges from ***0*** to ***65535***.
- **global** global adjacency SID.

Example

This command allocates the adjacency segment to an IPv4 p2p interface with a index value ***50***.

```
switch(config-if-Et1)# adjacency-segment ipv4 p2p index 50 global
```

15.4.6.5 area leader

Use the **area leader** command to tune or disable the area leader election process.

Command Mode

Router configuration mode

Command Syntax

area leader [disabled | level-1 [disabled] | level-2 [disabled] | priority [***num*** [level-1 | level-2]]]

no area leader

default area leader

Parameters

- **disabled** Disables becoming the are leader.
- **level-1** Configure at Level 1.
  - **disabled** Disables becoming the are leader.
- **level-2** Configure at Level 2.
  - **disabled** Disables becoming the are leader.
- **priority** Sets the area leader priority.
  - **level-1** Configure at Level 1.
  - **level-2** Configure at Level 2.

15.4.6.6 authentication key

The**authentication key** command configures the authentication key for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The **no authentication key** and **default authentication key** commands disables the authentication key for the IS-IS instance.

Command Mode

ISIS-Router Configuration

Command Syntax

authentication key [*0* | *7*] **[LAYER_VALUE]**

no authentication key [*0* | *7*] **[LAYER_VALUE]**

default authentication key [*0* | *7*] **[LAYER_VALUE]**

Parameters

LAYER_VALUE layer value. Options include:

- **level-1**
- **level-2**

Example

These commands configure authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated.

```
switch(config)# router isis 1
switch(config-router-isis)# authentication key secret
switch(config-router-isis)#
```

15.4.6.7 authentication mode

The **`authentication mode`** command configures authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated.

The **`no authentication mode`** and **`default authentication mode`** commands disables authentication for the IS-IS instance.

Command Mode

ISIS-Router Configuration

Command Syntax

`authentication mode` **[md5 | *text*] [LAYER_VALUE]**

`no authentication mode` **[md5 | *text*] [LAYER_VALUE]**

`default authentication mode` **[md5 | *text*] [LAYER_VALUE]**

Parameters

- **LAYER_VALUE** Layer value. Options include:
  - **level-1**
  - **level-2**

Example

These commands configure authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated.

```
switch(config)# router isis 1
switch(config-router-isis)# authentication mode md5
switch(config-router-isis)#
```

15.4.6.8 bfd all-interfaces

The **bfd all-interfaces** command enables Bidirectional Forwarding Detection (BFD) for all IS-IS-enabled interfaces in the IPv4 or IPv6 address family.

Use the **isis bfd** command to configure BFD on a specific interface.

Command Mode

Router-IS-IS Address-Family Configuration

Command Syntax

bfd all-interfaces

Example

These commands enable BFD for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all the interfaces.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-af)# bfd all-interfaces
switch(config-router-af)#
```

15.4.6.9 clear isis database

The **`clear isis database`** command clears a specific LSP with a predefined LSP ID, or LSPs at a given level, or all LSPs in the database. Additionally, the command sends purge LSPs throughout the network to clear LSPs from all devices.

Note: Exercise caution while using this command since it can be disruptive to the network.

Command Mode

Privileged Exec

Command Syntax

`clear isis [INSTANCE] database {`*`LSPID`*` | all | level-1 | level-2}`

Parameters

- ***INSTANCE*** Clears all LSPs from a specific LSP instance.
- ***LSPID*** Clears an LSP based on the specific LSP ID.
- **all** Clears all LSPs from the LSP database.
- **level-1** Clears LSPs at level 1 only.
- **level-2** Clears LSPs at level 2 only.

Examples

- This command clears all LSPs for the specific LSP ID of ***1111.1111.1002.00-00***.

```
switch(config)# clear isis database 1111.1111.1002.00-00
1 LSPs cleared on instance 1.
switch(config)#
```

- This command clears all LSPs from the LSP database.

```
switch(config)# clear isis database all
3 LSPs cleared on instance 1.
switch(config)#
```

- This command clears all LSPs from the level 1 LSP database.

```
switch(config)# clear isis database level-1
3 LSPs cleared on instance 1.
switch(config)#
```

- This command clears all LSPs from a specific LSP instance *instance2*.

```
switch(config)# clear isis instance2 database all
3 LSPs cleared on instance instance 2.
switch(config)#
```

15.4.6.10 clear isis neighbor

The **clear isis neighbor** command clears IS-IS adjacencies that exist on an interface, or at a specific level, or the adjacencies formed with a given neighbor (either with a system ID or a hostname).

Command Mode

Privileged EXEC

Command Syntax

clear isis neighbor {*Neighbor-ID* | all | *interface*} [level-1 | level-2 | level-1-2]

Parameters

- ***Neighbor-ID*** Clears adjacencies based on the system ID or the hostname of a neighbor.
- **all** Clears all adjacencies.
- ***interface*** Clears adjacencies for a specific interface.
- **level-1** level 1 only.
- **level-1-2** level 1-2 point-to-point only.
- **level-2** level 2 only.

Examples

- This command clears IS-IS adjacencies with a neighbor ***af86.3032.1a0f***.

```
switch# clear isis neighbor af86.3032.1a0f
2 neighbors cleared on instance 1
switch#
```

- This command clears all IS-IS adjacencies on an interface ***et1***.

```
switch# clear isis neighbor interface et1
4 neighbors cleared on instance 1
switch#
```

- This command clears IS-IS adjacencies with a neighbor ***af86.3032.1a0f*** and on interface ***et1***.

```
switch# clear isis neighbor af86.3032.1a0f interface et1
2 neighbors cleared on instance 1
switch#
```

- This command clears all IS-IS adjacencies at Level 1 and on interface ***et1***.

```
switch# clear isis neighbor interface et1 level-1
2 neighbors cleared on instance 1
switch#
```

- This command clears Level 1-2 point-to-point adjacencies only.

```
switch# clear isis neighbor all level-1-2
0 neighbors cleared on instance 1
switch#
```

15.4.6.11 fast-reroute ti-lfa mode

Use the **fast-reroute ti-lfa mode** to enable link or node protection for node segments and adjacency segments of a specific address-family learned on all IS-IS interfaces.

Command Mode

address-family sub-mode of the router isis mode (config-router-isis-af)

Command Syntax

fast-reroute ti-lfa mode [[[link-protection | node-protection][level-1 | level-2]] | disabled]

Parameters

- **link-protection** Protects against the failure of the link.
- **node-protection** Protects against the failure of the neighbor mode.
- **level-1** Protects prefixes only in level-1.
- **level-2** Protects prefixes on in level-2. Disables the fast-reroute TI-LFA mode.

Guidelines

FRR using TI-LFA is disabled globally by default in the router IS-IS address-family sub-modes.

The interface TI-LFA configuration inherits the address-family sub-mode configuration by default.

15.4.6.12 fast-reroute ti-lfa srlg

Use the **`fast reroute ti-lfa srlg`** command to enable SRLG protection on all interfaces. This command is used in addition to configuring link-protection or node-protection. When SRLG protection is enabled, the backup paths are computed after excluding all the links that share the same SRLG with the active link that is being used by all prefix segments and adjacency segments.

Command Mode

IS-IS router address-family configuration mode

Command Syntax

`fast-reroute ti-lfa srlg` [strict]

Parameters

strict The backup path is only programmed if a backup path that excludes all the SRLGs configured on the primary interface.

15.4.6.13 graceful-restart (IS-IS)

The **graceful-restart** command configures IS-IS graceful-restart. The command provides options to configure the t2 time or the restart-hold-time.

t2 is the maximum wait time for the LSP database to synchronize (SPF computation is not done while t2 is running). t2 can be configured for either Level-1 or Level-2 routes.

restart-hold-time is the hold time advertised by the router to its neighbors before undergoing ASU2 fast reboot.

The **no graceful-restart** and **default graceful-restart** commands disables the IS-IS graceful-restart configuration from ***running-config***.

Command Mode

Router-IS-IS Configuration

Command Syntax

graceful-restart ***t2 | restart-hold-time value***

no graceful-restart ***t2 | restart-hold-time value***

default graceful-restart ***t2 | restart-hold-time value***

Parameters

- ***value*** The time in seconds. Value ranges from ***5*** to ***300*** seconds.
- ***restart-hold-time*** Sets the hold time when restarting.
- ***t2*** Sets the LSP database sync wait time.

Examples

- In this example an ISIS graceful restart is configured with t2 wait time of ***30*** seconds for Level-1 routes.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart t2 level-1 30
```

- In this example an ISIS graceful restart is configured with restart-hold-time of ***50*** seconds.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart restart-hold-time 50
```

15.4.6.14 is-hostname

The **is-hostname** command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default, if a hostname is configured on the switch, it is used as the IS-IS hostname. It is also possible to unconfigure an assigned hostname for IS-IS using the **no is-hostname** command. When the IS-IS hostname is removed, the switch goes back to using the switchs hostname as the IS-IS hostname.

Command Mode

Router-IS-IS Configuration

Command Syntax

is-hostname ***string***

no is-hostname

Examples

- These commands configure the IS-IS hostname to the symbolic name ***ishost1*** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# is-hostname ishost1
switch(config-router-isis)#
```

- These commands unconfigure the IS-IS hostname of the symbolic name ***ishost1*** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# no is-hostname ishost1
switch(config-router-isis)#
```

15.4.6.15 isis authentication key

The **isis authentication key** command configures the authentication key on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables the authentication key for the IS-IS instance.

Command Mode

Interface-Ethernet Configuration

Command Syntax

isis authentication key [*0* | *7*] **[LAYER_VALUE]**

no isis authentication key [*0* | *7*] **[LAYER_VALUE]**

default isis authentication key [*0* | *7*] **[LAYER_VALUE]**

Parameters

LAYER_VALUE Layer value. Options include:

- **level-1**
- **level-2**

Example

These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)# interface Ethernet 3/6
switch(config-if-Et3/6)# isis authentication mode text
switch(config-if-Et3/6)# isis authentication key 7 cAm28+9a/xPi0
4o7hjd8Jw==
switch(config-if-Et3/6)#
```

15.4.6.16 isis authentication mode

The **isis authentication mode** command configures authentication on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables authentication for the IS-IS instance.

Command Mode

Interface-Ethernet Configuration

Command Syntax

isis authentication mode [md5 | ***text***][**LAYER_VALUE**]

no isis authentication mode [md5 | ***text***][**LAYER_VALUE**]

default isis authentication mode [md5 | ***text***][**LAYER_VALUE**]

Parameters

LAYER_VALUE Layer value. Options include:

- **level-1**
- **level-2**

Example

These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)# interface Ethernet 3/6
switch(config-if-Et3/6)# isis authentication mode text
switch(config-if-Et3/6)# isis authentication key 7 cAm28+9a/xPi0
4o7hjd8Jw==
switch(config-if-Et3/6)#
```

15.4.6.17 isis bfd

The **isis bfd** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

isis bfd

no isis bfd

default isis bfd

Example

These commands enable BFD on IS-IS interfaces.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6)#
```

15.4.6.18 isis enable

The **isis enable** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

isis enable ***instance_id***

no isis enable

default isis enable

Parameters

instance_id IS-IS instance name.

Examples

- These commands enable the IS-IS protocol on the ***interface ethernet 4***.

```
switch(config)# router isis Osiris
switch(config-router-isis)# net 49.0001.1010.1040.1030.00
switch(config-router-isis)# interface ethernet 4
switch(config-if-Eth4)# isis enable Osiris
```

- These commands disable the IS-IS protocol on the ***interface ethernet 4***.

```
switch(config)# interface ethernet 4
switch(config-if-Eth4)# no isis enable
```

15.4.6.19 isis fast-reroute ti-lfa mode

Use the **isis fast-reroute ti-lfa mode** command to enable link or node protection for node segments and adjacency segments learned on a specific IS-IS interface. By default, the interface TI-LFA configuration inherits the address-family sub-mode configuration.

The **no isis fast-reroute ti-lfa mode** and **default isis fast-reroute ti-lfa mode** commands disable link or node protection for node segments and adjacency segments learned on a specific IS-IS interface.

Command Mode

Interface configuration mode.

Command Syntax

isis fast-reroute ti-lfa mode [link-protection | node-protection | disabled][level-1 | level-2]

no isis fast-reroute ti-lfa mode [link-protection | node-protection | disabled][level-1 | level-2]

default isis fast-reroute ti-lfa mode [link-protection | node-protection | disabled][level-1 | level-2]

Parameters

- **link-protection** Configures link-protection.
- **node-protection** Configures node-protection.
- **disabled** Disables protection over the link.
- **level-1** Optional keyword in both the ***router isis address-family*** sub-mode and interface configuration mode CLIs is used to restrict protection to node segments and adjacency segments learned through either Level-1 topologies only.
- **level-2** Optional keyword in both the ***router isis address-family*** sub-mode and interface configuration mode CLIs is used to restrict protection to node segments and adjacency segments learned through Level-2 topologies only.

15.4.6.20 isis hello-interval

The **isis hello-interval** command sends Hello packets from applicable interfaces to maintain the adjacency through the transmitting and receiving of Hello packets. The Hello packet interval can be modified.

The **no isis hello-interval** and **default isis hello-interval** commands restore the default hello interval of ***10*** seconds on the configuration mode interface by removing the **isis hello-interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

isis hello-interval ***time***

no isis hello-interval

default isis hello-interval

Parameters

time Values range from ***1*** to ***300***; default is ***10***.

Examples

- These commands configure a hello interval of ***45*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# isis hello-interval 45
switch(config-if-Vl200)#
```

- These commands remove the configured hello interval of ***45*** seconds from ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# no isis hello-interval
switch(config-if-Vl200)#
```

- These commands configure a hello interval of ***60*** seconds for ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis hello-interval 60
switch(config-if-Et5)#
```

- These commands remove the configured hello interval of ***60*** seconds from ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no isis hello-interval
switch(config-if-Et5)#
```

15.4.6.21 isis hello-multiplier

The **isis hello-multiplier** command specifies the number of IS-IS hello packets missed by a neighbor before the adjacency is considered down.

The **no isis hello-multiplier** and **default isis hello-multiplier** commands restore the default hello interval of ***3*** on the configuration mode interface by removing the **isis hello-multiplier** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

isis hello-multiplier ***factor***

no isis hello-multiplier

default isis hello-multiplier

Parameters

factor Values range from ***3*** to ***100***; default is ***3***.

Examples

- These commands configure a hello multiplier of ***4*** for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# isis hello-multiplier 4
switch(config-if-Vl200)#
```

- These commands remove the configured hello multiplier of ***4*** from ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# no isis hello-multiplier
switch(config-if-Vl200)#
```

- These commands configure a hello multiplier of ***45*** for ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis hello-multiplier 45
switch(config-if-Et5)#
```

- These commands remove the configured hello multiplier of ***45*** from ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no isis hello-multiplier
switch(config-if-Et5)#
```

15.4.6.22 isis [ipv4|ipv6] fast-reroute ti-lfa srlg

Use the **`isis [ipv4|ipv6] fast-reroute ti-lfa srlg`** command to enable protection selectively on a specific interface. This command only enables SRLG protection for prefix segments and adjacency segments enabled on the interface.

Command Mode

Interface configuration mode

Command Syntax

`isis` [ipv4 | ipv6][fast-reroute ti-lfa srlg][strict | disabled]

`no isis` [ipv4 | ipv6][fast-reroute ti-lfa srlg][strict | disabled

`default isis` [ipv4 | ipv6][fast-reroute ti-lfa srlg][strict | disabled]

Parameters

- **ipv4** IS-IS IPv4 interface configuration.
- **ipv6** IS-IS IPv6 interface configuration.
- **fast-reroute** Configures fast reroute.
- **ti-lfa** Configures TI-LFA FRR.
- **srlg** Excludes same SRLG links from backup path.
- **strict** The backup path is only programmed only if a backup path that excludes all the SRLGs configured on the primary interface. If **strict** is not provided and an SRLG excluding path is not available, TI-LFA programs the backup path that excluded the maximum number of SRLGs possible.
- **disabled** Use to selectively disable SRLG protection on an interface. This is useful when SRLG protection is enabled globally for all interfaces but needs to be selectively disabled for a specific interface.

15.4.6.23 isis ipv6 metric

The **isis ipv6 metric** command configures the IPv6 metric.

The **no isis ipv6 metric** and **default isis ipv6 metric** commands restore the default metric of 10 on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

isis ipv6 metric ***metric_value***

no isis ipv6 metric

default isis ipv6 metric

Parameters

metric_value Values range from ***1*** to ***16777214***; default is ***10***.

Example

These commands configure the IPv6 metric.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis ipv6 metric 30
switch(config-if-Et5/6)#
```

15.4.6.24 isis lsp tx interval

The **`isis lsp tx interval`** command sets the interval at which IS-IS sends link-state information on the interface.

The **`no isis lsp tx interval`** and **`default isis lsp tx interval`** commands restores the default setting of ***33*** ms. by removing the **`isis lsp tx interval`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

`isis lsp tx interval` ***period***

`no isis lsp tx interval`

`default isis lsp tx interval`

Parameters

period Value ranges from ***1*** through ***3000***. Default interval is ***33*** ms.

Examples

- This command sets the LSP interval on interface ***interface ethernet 5*** to ***600*** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis lsp tx interval 600
switch(config-if-Et5)#
```

- This command removes the LSP interval on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no isis lsp tx interval
switch(config-if-Et5)#
```

15.4.6.25 isis metric

The **isis metric** command sets cost for sending information over an interface.

The **no isis metric** and **default isis metric** commands restore the metric to its default value of ***10*** by removing the **isis metric** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

isis metric ***metric_cost***

no isis metric

default isis metric

Parameters

metric_cost Values range from ***1*** to ***1677214***. Default value is ***10***.

Examples

- These commands configure a metric cost of ***30*** for sending information over ***interface ethernet 5***.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# isis metric 30
switch(config-if-Et5)#
```

- These commands remove the configured metric cost of ***30*** from ***interface ethernet 5***.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# no isis metric
switch(config-if-Et5)#
```

15.4.6.26 isis multi-topology

The **isis multi-topology** command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The **no isis multi-topology** and **default isis multi-topology** commands restores the default interface to both IPv4 and IPv6 address families.

Command Mode

Interface-Ethernet Configuration

Command Syntax

isis multi-topology address-family ipv4 unicast

no isis multi-topology address-family ipv4 unicast

default isis multi-topology address-family ipv4 unicast

Examples

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis multi-topology address-family ipv4
 unicast
switch(config-if-Et5/6)#
```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis multi-topology address-family ipv6
 unicast
switch(config-if-Et5/6)#
```

- These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# no isis multi-topology address-family unicast
switch(config-if-Et5/6)#
```

15.4.6.27 isis network

The **`isis network`** command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The **`no isis network`** and **`default isis network`** commands set the configuration mode interface as a broadcast link by removing the corresponding **`isis network`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`isis network` point-to-point

`no isis network`

`default isis network`

Examples

- These commands configure ***interface ethernet 10*** as a point-to-point link.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# isis network point-to-point
switch(config-if-Et10)#
```

- This command restores ***interface ethernet 10*** as a broadcast link.

```
switch(config-if-Et10)# no isis network
switch(config-if-Et10)#
```

15.4.6.28 isis passive

The **isis passive** command configures the configuration-mode interface as passive. The switch will continue to advertise the IP address in the LSP, but the interface will not send or receive IS-IS control packets.

The **no isis passive** command removes the passive configuration, allowing the interface to send and receive IS-IS control packets. The **default isis passive** command sets the interface to the default interface activity setting by removing the corresponding **isis passive** or **no isis passive** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

isis passive

no isis passive

default isis passive

Examples

- These commands configure ***interface ethernet 10*** as a passive interface.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# isis passive
switch(config-if-Et10)#
```

- These commands restore ***interface ethernet 10*** as an active interface.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# no isis passive
switch(config-if-Et10)#
```

15.4.6.29 isis priority

The **`isis priority`** command sets the IS-IS priority for the interface.

The default priority is ***64***. The network device with the highest priority will be elected as the designated intermediate router to send link-state advertisements for that network.

The **`no isis priority`** and **`default isis priority`** commands restore the default priority (***64***) on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

`isis priority` ***priority_level***

`no isis priority`

`default isis priority`

Parameters

priority_level Value ranges from ***0*** to ***127***. Default value is ***64***.

Examples

- These commands configure a IS-IS priority of ***60*** on **`interface ethernet 5`**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# isis priority 60
switch(config-if-Et5)#
```

- These commands restores the default IS-IS priority of ***64*** from ***interface ethernet 5***.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# no isis priority
switch(config-if-Et5)#
```

- These commands configure the switch with a priority of ***64*** for ***interface vlan 7***.

```
switch(config)# interface vlan 7
switch(config-if-Vl7)# isis priority 64
switch(config-if-Vl7)#
```

- These command restores the default IS-IS priority of ***64*** for ***64***.

```
switch(config)# interface vlan 7
switch(config-if-Vl7)# no isis priority
switch(config-if-Vl7)#
```

15.4.6.30 is-type

The **is-type** command configures the routing level for an IS-IS instance.

An IS-IS router can be configured as Level-1-2 which can form adjacencies and exchange routing information with both Level-1 and Level-2 routers. A Level-1-2 router can be configured to transfer routing information from Level-1 to Level-2 areas and vice versa (via route leaking). By default, all routes from Level-1 area are always leaked into Level-2 network.

Command Mode

Router-IS-IS Configuration

Command Syntax

is-type LAYER_VALUE

Parameters

- **LAYER_VALUE** Layer value options include:
  - **level-1**
  - **level-1-2**
  - **level-2**

Examples

- These commands configure Level 1-2 routing.

```
switch(config)# router isis Osiris
switch(config-router-isis)# is-type level-1-2
switch(config-router-isis)#
```

- These commands configure Level 2 routing.

```
switch(config)# router isis Osiris
switch(config-router-isis)# is-type level-2
switch(config-router-isis)#
```

15.4.6.31 log-adjacency-changes (IS-IS)

The **log-adjacency-changes** command sets the switch to send Syslog messages when it detects link state changes or when it detects that a neighbor state has changed.

The default option is active when ***running-config*** does not contain any form of the command. Entering the command in any form replaces the previous command state in ***running-config***.

Command Mode

Router-IS-IS Configuration

Command Syntax

log-adjacency-changes

no log-adjacency-changes

default log-adjacency-changes

Examples

- These commands configure the switch to send a Syslog message when a neighbor state changes.

```
switch(config)# router isis Osiris
switch(config-router-isis)# log-adjacency-changes
switch(config-router-isis)#
```

- These commands configure not to log the peer changes.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no log-adjacency-changes
switch(config-router-isis)#
```

15.4.6.32 lsp dynamic flooding

Use the **lsp flooding dynamic** command to configure dynamic flooding. Dynamic flooding must be enabled on all roters in the area. The **no** form of the command removes LSP dynamic flooding. LSP flooding dynamic is disabled by default.

Command Mode

Router configuration mode

Command Syntax

lsp flood dynamic [level-1 | level-2]

no lsp flood dynamic [level-1 | level-2]

default lsp flood dynamic [level-1 | level-2]

Parameters

- **level-1** Level 1 adjeacencies.
- **level-2** Level 2 adjencencies.

Example

```
switch(config)# router isis Amun
switch(config-router-isis)# net 49.0000.0000.3333.00
switch(config-router-isis)# is-hostname ip3
switch(config-router-isis)# lsp flooding dynamic
```

15.4.6.33 match isis level

The **match isis level** command configures a route map to match on ISIS level. It filters the Level-1 or Level-2 routes by using route maps match statement.

The **no match isis level** and **default match isis level** commands disables the match ISIS level configuration from ***running-config***.

Command Mode

Route-map Configuration

Command Syntax

match isis level [level-1 | level-2]

no match isis level [level-1 | level-2]

default match isis level [level-1 | level-2]

Parameters

- **level-1** IS-IS level 1.
- **level-2** IS-IS level 2.

Example

These commands place the switch in ***route-map*** mode, and configures a route map to match isis level to Level-1.

```
switch(config)# route-map Test
switch(config-route-map-test)# match isis level level-1
```

15.4.6.34 mpls label range

The **mpls label range** command derives the indices of the actual MPLS label on the SRGB advertised by the router. The default value of SRGB in EOS is Base: ***900000***, Size: ***65536***. In other words, the labels that any global segment could represent is between ***900000***-***965535***.

Command Mode

Global Configuration

Command Syntax

mpls label range ***value***

Parameters

value Specifies the Segment Routing global range.

- **dynamic** Specifies labels reserved for dynamic assignment. Default value is (***100000***) (***262144***).
  - **IS-IS-sr** Specifies labels reserved for IS-IS SR global segment identifiers (SIDs). Default value is (***900000***) (***65536***).
  - **static** Specifies labels reserved for static MPLS routes. Default value is (***16***) (***99984***).

Example

The following command configures an IS-IS SR global range with a value of (***900000***)-- starting label range, (***65536***)--Numbers of labels to reserve.

```
switch(config)# mpls label range isis-sr 900000 65536
```

15.4.6.35 multi-topology

The **multi-topology** command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families. When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The **no multi-topology** and **default multi-topology** commands restores the default interface to both IPv4 and IPv6 address families.

Command Mode

Router IS-IS Address-Family Configuration

Command Syntax

multi-topology

no multi-topology

default multi-topology

Examples

- These commands configure MT for the IS-IS router.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# multi-topology
switch(config-router-isis-af)#
```

- These commands unconfigure MT for the IS-IS router.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# no multi-topology
switch(config-router-isis-af)#
```

15.4.6.36 net

The **net** command configures the Network Entity Title of the IS-IS instance. By default, no NET is defined.

The **no net** and **default net** commands removes the NET from ***running-config***.

Command Mode

Router-IS-IS Configuration

Command Syntax

net ***mask_hex***

no net

default net

Parameters

- ***maxk_hex*** Mask value. Format is hh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.00.

Examples

- These commands specify the NET as ***49.0001.1010.1040.1030.00***, in which the system ID is ***1010.1040.1030***, area ID is ***49.0001***.

```
switch(config)# router isis Osiris
switch(config-router-isis)# net 49.0001.1010.1040.1030.00
switch(config-router-isis)#
```

- These commands remove NET ***49.0001.1010.1040.1030.00*** from **running-config**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no net 49.0001.1010.1040.1030.00
switch(config-router-isis)#
```

15.4.6.37 node-segment

The **node-segment** command associates the node segments with prefix mask length ***/32*** (IPV4) or ***/128*** (IPV6) addresses. The **node-segment** command must be issued on an IS-IS-enabled loop back interface.

Command Mode

Loop-back Interface Configuration

Command Syntax

node-segment [ipv4 | ipv6] ***index value***

Parameters

- **ipv4** Specifies the IPv4 node configuration.
- **ipv6** Specifies the IPv6 node configuration.
- ***index*** Node segment identifier.
- ***value*** Index to be mapped with IP prefix. Value ranges from ***0***-***65535***.

Examples

- The following commands are used to associate a node-segment with an IPv4 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/32
switch(config-if-Lo1)# node-segment ipv4 index 5
```

- The following commands are used to associate a node-segment with an IPv6 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ipv6 add 2000::24/128
switch(config-if-Lo1)# node-segment ipv6 index 5
```

- The following example shows a warning thrown at the CLI when a ***/32*** or ***/128*** address is not configured on the interface.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/24
switch(config-if-Lo1)# node-segment ipv4 index 1
! /32 IPv4 address is not configured on the interface
```

- The following command removes the node-segment from IS-IS SR from an interface.

```
switch(config-if-Lo1)# no node-segment ipv4 index 1
```

15.4.6.38 passive (IS-IS)

The **passive** command configures the specified IS-IS interface as passive. The switch will continue to advertise the IP address in the LSP, but the interface will not send or receive IS-IS control packets.s

The **no passive** command removes the passive configuration, allowing the interface to send and receive IS-IS control packets. The **default passive** command sets the interface to the default interface activity setting by removing the corresponding **passive** or **no passive** statement from ***running-config***.

Command Mode

Router-IS-IS Configuration

Command Syntax

passive INTERFACE_NAME

no passive INTERFACE_NAME

default passive INTERFACE_NAME

Parameters

INTERFACE_NAME Options include:

- **ethernet *e_range*** Ethernet interface list.
- **loopback *l_range*** loopback interface list.
- **port-channel *p_range*** channel group interface list.
- **vlan *v_range*** VLAN interface list.

Valid ***e_range***, ***l_range***, ***p_range***, and ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Examples

- These commands configure ***interface ethernet 10*** as a passive interface.

```
switch(config)# router isis Osiris
switch(config-router-isis)# passive ethernet 10
switch(config-router-isis)#
```

- These commands restore ***interface ethernet 10*** as an active IS-IS interface.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no passive ethernet 10
switch(config-router-isis)#
```

15.4.6.39 prefix-segment

The **`prefix-segment`** command associates prefix segments with any IS-IS prefix a router is originating an IP Reachability TLV for.

Command Mode

Segment-Routing MPLS Configuration

Command Syntax

`prefix-segment` ***ip-address index value***

Parameters

- ***ip-address*** It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- ***index*** Node segment identifier.
- ***value*** Index to be mapped with IP prefix. Value ranges from ***0***-***65535***.

Example

The following commands are used to associate a prefix segment with an IPv4 address with index value of ***50***.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# prefix-segment 1.1.1.0/24 index 50
```

15.4.6.40 proxy-node-segment

The **`proxy-node-segment`** command configures a proxy-node-SID for a IS-IS prefix originating from the router that does not support IS-IS SR.

Command Mode

Segment-Routing MPLS Configuration

Command Syntax

`proxy-node-segment` ***ip-address index value***

Parameters

- ***ip-address*** It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- ***index*** Node segment identifier.
- ***value*** Index to be mapped with IP prefix. Value ranges from ***0***-***65535***.

Example

A proxy-node-segment associates a ***/32*** or a ***/128*** route with an SID as shown below.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# proxy-node-segment 1.1.1.0/32 index
 50
```

15.4.6.41 redistribute (IS-IS)

The **redistribute** command redistributes the specified types of routes into IS-IS.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** statement from ***running-config***.

Command Mode

Router-IS-IS Configuration

Command Syntax

redistribute ROUTE_TYPE

no redistribute ROUTE_TYPE

default redistribute ROUTE_TYPE

Parameters

ROUTE_TYPE The route type for which routes are redistributed. These are the option to include.

- bgpredistribute BGP routes
- connectedredistribute connected routes
- ospfredistribute OSPF routes
- ospfv3redistribute OSPFv3 routes
- staticredistribute static routes

Examples

- These commands redistribute connected routes into the IS-IS domain.

```
switch(config)# router isis Test
switch(config-router-isis)# redistribute connected
```

- These commands redistribute static routes into the IS-IS domain.

```
switch(config)# router isis Test
switch(config-router-isis)# redistribute static
```

- These commands redistribute the BGP routes into ISIS domain in the ***address-family*** mode.

```
Switch(config)# router isis 1
Switch(config-router-isis)# address-family ipv4
Switch(config-router-isis-af)# redistribute bgp route-map bgp-to-isis-v
4
```

- These commands redistribute the BGP routes into ISIS domain in the ***router-isis*** mode.

```
Switch(config)# router isis 1
Switch(config-router-isis)# redistribute bgp route-map bgp-to-isis
```

15.4.6.42 redistribute bgp route-map

The **redistribute bgp route-map** command redistributes the BGP routes from the specified route map into IS-IS. Only one route map can be specified; reissuing the command overrides any previous configuration.

The **no redistribute bgp** and **default redistribute bgp**commands disable BGP route redistribution from the specified domain by removing the **redistribute bgp** statement from ***running-config***.

The command is available in both ***router isis*** configuration mode and the ***address-family*** submode. The command is rejected if configured in both modes at the same time. Issuing the **no** or **default** command in ***router isis*** configuration mode has no effect on redistribution configured in the ***address-family*** submode.

Note: If the command is configured in an ***address-family*** submode, it only redistributes routes from that address family. If it is configured in ***router-isis*** mode, it applies to all enabled address families.

Command Mode

Router-IS-IS Configuration

Router-IS-IS Address-Family Configuration

Command Syntax

redistribute bgp route-map ***map_name***

no redistribute bgp

default redistribute **ROUTE_TYPE**

Parameter

map_name Route map to be used for redistribution of BGP routes.

Examples

- These commands redistribute IPv4 BGP routes from the route map called ***bgp-to-isis-v4*** into the ISIS domain.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-isis-af)# redistribute bgp route-map bgp-to-isis-v
4
switch(config-router-isis-af)#
```

- These commands redistribute all BGP routes from the route map ***bgp-to-isis*** into ISIS.

```
switch(config)# router isis 1
switch(config-router-isis)# redistribute bgp route-map bgp-to-isis
```

15.4.6.43 router isis

The **`router isis`** command places the switch in router ISIS configuration mode.

Router ISIS configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **`exit`** command does not affect the configuration.

The **`no router isis`** command deletes the IS-IS instance.

The **`exit`** command returns the switch to ***global*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`router isis` ***instance_name*** [**VRF_INSTANCE**]

`no router isis` ***instance_name***

`default router isis` ***instance_name***

Parameters

- ***instance_name*** routing instance.
- **VRF_INSTANCE**
  - ***no parameter***
  - **vrf** ***vrf_name***

Examples

- These commands places the switch in the ***router isis*** mode and creates an IS-IS routing instance named ***Osiris***.

```
switch(config)# router isis Osiris
switch(config-router-isis)#
```

- This command attempts to open an instance with a different routing instance name from that of the existing instance. The switch displays an error and stays in ***global*** configuration mode.

```
switch(config)# router isis Osiris
% More than 1 ISIS instance is not supported
switch(config)#
```

- This command deletes the IS-IS instance.

```
switch(config)# no router isis Osiris
switch(config)#
```

15.4.6.44 segment-routing mpls

The **segment-routing mpls** command places the switch in the ***segment-routing mpls*** configuration mode.

The **no segment-routing mpls** and **default segment-routing mpls** commands disable IS-IS SR and delete all IS-IS SR configurations.

Command Mode

Router IS-IS Configuration

Command Syntax

segment-routing mpls

no segment-routing mpls

default segment-routing mpls

Example

The following commands place the switch in ***segment-routing mpls*** configuration mode.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)#
```

15.4.6.45 show ip route

When services like LDP pseudowires, BGP LU, L2 EVPN, or L3 MPLS VPN use IS-IS SR tunnels as an underlay, these services are automatically protected by TI-LFA tunnels that protect the IS-IS SR tunnels. The **show ip route** command displays the hierarchy of the overlay-underlay-TI-LFA tunnels.

```
switch# show ip route
 B        2001:db8:3::/48 [200/0]
           via 2002::b00:301/128, IS-IS SR tunnel index 3, label
 122697
  via TI-LFA tunnel index 5, label imp-null(3)
  via fe80::200:76ff:fe03:0, Ethernet26/1, label imp-null(3)
  backup via fe80::200:76ff:fe01:0, Ethernet30/1, label 900002
 900003
```

15.4.6.46 set isis level

The **`set isis level`** command configures a route map to set ISIS level.

The **`no set isis level`** and **`default set isis level`** commands disables the set ISIS level configuration from ***running-config***.

Command Mode

Route-map Configuration

Command Syntax

`set isis level` [level-1 | level-2 | level-1-2]

`no set isis level` [level-1 | level-2 | level-1-2]

`default set isis level` [level-1 | level-2 | level-1-2]

Parameters

- **level-1** IS-IS level 1.
- **level-2** IS-IS level 2.
- **level-1-2** IS-IS level 1 and level 2.

Example

These commands place the switch in the ***route-map*** mode, and configures a route map to set isis level to **level-1**.

```
switch(config)# route-map Test
switch(config-route-map-test)# set isis level level-1
```

15.4.6.47 set-overload-bit

The **set-overload-bit** command sets the overload bit in link state packets (LSPs) to signal that the switch is not available for forwarding transit traffic (for instance, during startup or when the switch is being taken down for maintenance). To configure the switch to set the overload bit for a specified period after a reboot, use the **on-startup** option.

The **no set-overload-bit** and **default set-overload-bit** commands remove the corresponding **set-overload-bit** command from ***running-config***.

Note: When using the **on-startup** option, the overload bit will remain set in LSPs until the IS-IS agent has been up for the configured interval.

Command Mode

Router-IS-IS Configuration

Command Syntax

set-overload-bit [**on-startup** *interval*]

no set-overload-bit

default set-overload-bit

Parameters

- **on-startup** Configures the switch to set the overload bit in LSPs for a period of *interval* seconds after startup.
- *interval* The period in seconds for which the overload bit remains set after startup.

Examples

- These commands configure the switch to sets the overload bit for ***120*** seconds after startup.

```
switch(config)# router isis Osiris
switch(config-router-isis)# set-overload-bit on-startup 120
switch(config-router-isis)#
```

- These commands remove the configured overload bit of ***120*** seconds from the ***running-config***.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no set-overload-bit on-startup
switch(config-router-isis)#
```

15.4.6.48 show isis database

The **show isis database** command displays the link state database of IS-IS. The default command displays active routes and learned routes.

Command Mode

EXEC

Command Syntax

show isis database [**INSTANCES**][**INFO_LEVEL**]

show isis database [**INFO_LEVEL**] [**VRF_INSTANCE**]

Parameters

- **INSTANCES** Options include:
  - ***no parameter***
  - ***instance_name***
- **INFO_LEVEL** Options include:
  - ***no parameter***
  - **detail**
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter***
  - **vrf *vrf_name***

Display Values

- **ISIS Instance**
- **LSPID**
- **Seq Num**
- **Cksum**
- **Life**
- **IS**

Examples

- This command displays general information about the link state database of IS-IS.

```
switch# show isis database

ISIS Instance: Osiris
  ISIS Level 2 Link State Database
    LSPID                 Seq Num   Cksum  Life  IS Flags

switch>
```

15.4.6.49 show isis database detail

The **show isis database detail** command displays a view of LSPDB of different devices in the IS-IS domain.

Command Mode

EXEC

Command Syntax

show isis database detail

Example

The command output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.

```
switch# show isis database detail

ISIS Instance: inst1 VRF: default

```

15.4.6.50 show isis dynamic flooding

Use the **show isis dynamic flooding** command to monitor Dynamic Flooding.

Command Mode

EXEC

Command Syntax

show isis dynamic flooding [interfaces | level-1 | level-2 | nodes | paths | topology | interface]

Parameters

- **interfaces** Flooding interfaces
- **level-1** Level 1 adjencencies only.
- **level-2** Level 2 adjencencies only.
- **nodes** Nodes in the flooding topology.
- **paths** Paths in the flooding topology.
- **topology** Flooding topology.

Examples

- The command **show isis dynamic flooding nodes** shows the list of nodes in the area and the indices for the nodes.

```
switch# show isis dynamic flooding nodes
IS-IS Instance: Amun VRF: default
   Level 1 Nodes:
     Index           Node ID
     0               ip6.00
     1               ip4.00
     2               ip2.00
     3               ip1.00
     4               ip3.00
     5               ip5.00
```

- The command **show isis dynamic flooding paths** shows the list of paths in the flooding topology using node indices.

```
switch# show isis dynamic flooding paths
IS-IS Instance: Amun VRF: default
  Level 1:
    Path: 0 1 2 3 4 5 0
```

- To view the flooding topology, use the **show isis dynamic flooding topology** command:

```
switch# show isis dynamic flooding topology
IS-IS Instance: Amun VRF: default
  Level 1:
    Path: ip6.00 ip4.00 ip2.00 ip1.00 ip3.00 ip5.00 ip6.00
```

- To view which interfaces dynamic flooding will use, use the **show isis dynamic flooding interfaces** command:

```
switch# show isis dynamic flooding interfaces
IS-IS Instance: Amun VRF: default
  Level 1:
    Ethernet5
    Ethernet4
```

15.4.6.51 show isis graceful-restart vrf

The **show isis graceful-restart vrf** command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

Command Mode

EXEC

Command Syntax

show isis graceful-restart vrf ***vrf-name***

Example

In this example the show isis graceful-restart command displays the output for the default vrf instance.

```
switch# show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
 System ID: 0000.0000.0001
 Graceful Restart: Enabled, Graceful Restart Helper: Enabled
 State: Last Start exited after T2 (level-1) expiry
 T1 : 3s
 T2 (level-1) : 30s/20s remaining
 T2 (level-2) : 30s/not running
 T3 : not running

System ID       Type   Interface     Restart Capable  Status
is-hostname-1   L1L2   Ethernet1     Yes              Running
is-hostname-2   L1     Ethernet2     Yes              Restarting
```

15.4.6.52 show isis hostname

The **`show isis hostname`** command displays mapping between the System ID and IS-IS hostname.

Command Mode

EXEC

Command Syntax

`show isis hostname`

Example

This command mapping between the System ID and IS-IS hostnames ***host1*** and ***host2***.

```
switch# show isis hostname
ISIS Instance: 1 VRF: default
Level System ID Hostname
L1 1111.1111.1001 host1
L1 1111.1111.1002 host2
```

15.4.6.53 show isis interface

The **show isis interface** command displays interface information for the IS-IS instance.

Command Mode

EXEC

Command Syntax

show isis interface [**INSTANCES**][**INTERFACE_NAME**][**INFO_LEVEL**]

show isis interface [**INTERFACE_NAME**] [**INFO_LEVEL**][**VRF_INSTANCE**]

Parameters

- **INSTANCES** Options include:
  - ***no parameter***
  - ***instance_name***
- **INTERFACE_NAME** Values include:
  - ***no parameter*** all interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **INFO_LEVEL** Options include:
  - ***no parameter***
  - **detail**
- **VRF_INSTANCE** specifies the VRF instance.
  - ***no parameter***
  - **vrf *vrf_name***

Display Values

- **ISIS Instance**
- **System ID**
- **Index**
- **MTU**
- **Metric**
- **LAN-ID**
- **DIS**
- **Type**
- **Interface**
- **SNPA**
- **State**
- **Hold time**

Examples

- This command displays general IS-IS information for instance ***Osiris***.

```
switch# show isis interface

ISIS Instance: Osiris
  Interface Vlan20:
```

```
    Index: 59 SNPA: 0:1c:73:c:5:7f
    MTU: 1497 Type: broadcast
    Level 2:
      Metric: 10, Number of adjacencies: 2
      LAN-ID: 1212.1212.1212, Priority: 64
      DIS: 1212.1212.1212, DIS Priority: 64
  Interface Ethernet30:
    Index: 36 SNPA: 0:1c:73:c:5:7f
    MTU: 1497 Type: broadcast
    Level 2:
      Metric: 10, Number of adjacencies: 1
      LAN-ID: 3030.3030.3030, Priority: 64
      DIS: 3030.3030.3030, DIS Priority: 64
```

- This command displays detailed IS-IS information for instance ***Osiris***.

```
switch# show isis interface detail

ISIS Instance: Osiris
  Interface Vlan20:
    Index: 59 SNPA: 0:1c:73:c:5:7f
    MTU: 1497 Type: broadcast
    Level 2:
      Metric: 10, Number of adjacencies: 2
      LAN-ID: 1212.1212.1212, Priority: 64
      DIS: 1212.1212.1212, DIS Priority: 64
    Adjacency 2222.2222.2222:
      State: UP, Level: 2 Type: Level 2 IS
      Hold Time: 30, Supported Protocols: ipv4, ipv6

      IPv4 Interface Address: 10.1.1.3
      IPv6 Interface Address: fe80::1:ff:fe0c:0
      Areas:
        49.0001
    Adjacency 1212.1212.1212:
      State: UP, Level: 2 Type: Level 2 IS
      Hold Time: 9, Supported Protocols: ipv4, ipv6
      SNPA: 2:1:0:d:0:0, Priority: 64
      IPv4 Interface Address: 10.1.1.2
      IPv6 Interface Address: fe80::1:ff:fe0d:0
      Areas:
        49.0001
  Interface Ethernet30:
    Index: 36 SNPA: 0:1c:73:c:5:7f
    MTU: 1497 Type: broadcast
    Level 2:
      Metric: 10, Number of adjacencies: 1
      LAN-ID: 3030.3030.3030, Priority: 64
      DIS: 3030.3030.3030, DIS Priority: 64
    Adjacency 3030.3030.3030:
      State: UP, Level: 2 Type: Level 2 IS
      Hold Time: 9, Supported Protocols: ipv4, ipv6
      SNPA: 2:1:0:b:0:0, Priority: 64
      IPv4 Interface Address: 30.1.1.2
      IPv6 Interface Address: fe80::1:ff:fe0b:0
      Areas:
        49.0001
```

- This example displays the state of TI-LFA protection for IPv4/IPV6 prefixes learned on that IS-IS interface.

```
switch# show isis interface Vlan2387
```

```
IS-IS Instance: inst1 VRF: default

  Interface Vlan2387:
    Index: 36 SNPA: P2P
    MTU: 1497 Type: point-to-point
    BFD IPv4 is Disabled
    BFD IPv6 is Disabled
    Hello Padding is Enabled
    Level 2:
      Metric: 10, Number of adjacencies: 1
      Link-ID: 24
      Authentication mode: None
      TI-LFA node protection with SRLG loose protection is enabled for
 the following IPv4 segments: node segments, adjacency segments
      TI-LFA protection is disabled for IPv6
```

15.4.6.54 show isis local-convergence-delay

The **show isis local-convergence-delay** command shows the current or last attempt at delaying the convergence of protected routes on a link down/BFD neighbor down event. If the timer aborts for some reason (such as a topology change causing a new SPF), the attempt fails.

```
switch# show isis local-convergence-delay

IS-IS Instance: inst1 VRF: default
  System ID: 1111.1111.1001
  IPv4 local convergence delay configured, 5000 msecs
  IPv6 local convergence delay configured, 5000 msecs
  Level 1 attempts 0, failures 0
  Level 2 attempts 3, failures 1

  Level 2 in progress due to LINK DOWN on Vlan2138
    TI-LFA node protection is enabled for IPv4
    IPv4 Routes delayed: 0
      Delay timer started at: 2019-07-25 23:16:33
      Delay timer expires in 2 secs
    TI-LFA protection is disabled for IPv6

  Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
    TI-LFA node protection is enabled for IPv4
    IPv4 Routes delayed: 3
      Delay timer started at: 2019-07-25 23:14:51
      Delay timer stopped at: 2019-07-25 23:14:56
    TI-LFA protection is disabled for IPv6
```

The **detail** keyword also lists all the routes that have been delayed.

```
switch# show isis local-convergence-delay detail
  ...
  Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
    TI-LFA node protection is enabled for IPv4
    IPv4 Routes delayed: 3
      Delay timer started at: 2019-07-25 23:14:51
      Delay timer stopped at: 2019-07-25 23:14:56
      Delayed routes:
        10.0.7.1/32
        10.0.9.1/32
        10.0.10.1/32
    TI-LFA protection is disabled for IPv6
```

15.4.6.55 show isis neighbors

The **show isis neighbors** command displays IS-IS neighbor information.

Command Mode

EXEC

Command Syntax

show isis neighbors [**INSTANCES**] [**INFO_LEVEL**]

show isis neighbor [**INFO_LEVEL**] [**VRF_INSTANCE**]

Parameters

- **INSTANCES** Options include:
  - ***no parameter***
  - ***instance_name***
- **INFO_LEVEL** Options include:
  - ***no parameter***
  - **detail**
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter***
  - **vrf *vrf_name***

Display Values

- **Inst. ID**
- **System ID**
- **Type**
- **Interface**
- **SNPA**
- **State**
- **Hold time**
- **Area Address**

Example

This command displays general information about the IS-IS neighbors.

```
switch(config)# show isis neighbors

Inst Id   System Id           Type Interface       SNPA              State Hold time
10        2222.2222.2222      L2   Vlan20          2:1:0:c:0:0       UP    30
10        1212.1212.1212      L2   Vlan20          2:1:0:d:0:0       UP    9
10        3030.3030.3030      L2   Ethernet30      2:1:0:b:0:0       UP    9
switch(config)#
```

15.4.6.56 show isis network topology

The **show isis network topology** command displays a list of all IS-IS devices that are reachable in the network.

Command Mode

EXEC

Command Syntax

show isis network topology

show isis **INSTANCES** **network topology**

show isis network topology **VRF_INSTANCE**

Parameters

- **INSTANCES** Options include:
  - ***no parameter***
  - ***instance_name***
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter***
  - **vrf** ***vrf_name***

Display Values

- **System Id**
- **Metric**
- **Next-Hop**
- **Interface**
- **SNPA**

Example

This command displays the list of all devices reachable in the network.

```
switch# show isis network topology

IS-IS Instance: Osiris VRF: default
  IS-IS paths to level-2 routers
    System Id        Metric   IA Metric Next-Hop         Interface     SNPA
    2222.2222.2222   10       0         2222.2222.2222   Ethernet1     P2P

switch>
```

15.4.6.57 show isis segment-routing adjacency-segments

The **show isis segment-routing adjacency-segments** command displays the global adjacency SID value and other related information.

Command Mode

EXEC

Command Syntax

show isis segment-routing adjacency-segments

Examples

- In this example the **show isis segment-routing adjacency-segments** command displays the output for the interface configured like this:

```
interface Ethernet1
 ip address 1.1.1.1/24
 ipv6 address 1000::1/64
 isis enable isis1
 isis network point-to-point
 adjacency-segment ipv4 p2p index 1 global
 adjacency-segment ipv6 p2p index 2 global
```

- The show output for the above interface configuration:

```
switch# show isis segment-routing adjacency-segments

System ID: 1000.0000.0002                       Instance: isis1

15.4.6.58 show isis segment-routing global-blocks

The **show isis segment-routing global-blocks** command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

Command Mode

EXEC

Command Syntax

show isis segment-routing global-blocks

Example

```
switch# show isis segment-routing global-blocks
System ID: 1111.1111.1002              Instance: inst1
SR supported Data-plane: MPLS          SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000  Size: 65536
Number of ISIS segment routing capable peers: 3
SystemId             Base         Size
-------------------- ------------ -----
1111.1111.1002       900000       65536
1111.1111.1001       900000       65536
```

15.4.6.59 show isis segment-routing prefix-segments

The **show isis segment-routing prefix-segments** command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.

Command Mode

EXEC

Command Syntax

show isis segment-routing prefix-segments

Example

```
switch# show isis segment-routing prefix-segments
System ID: 1111.1111.1002         Instance: inst1
SR supported Data-plane: MPLS     SR Router ID: 252.252.2.252
Node: 2 Proxy-Node: 2 Prefix: 2 Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
                   E: Explicit-NULL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2
    Prefix     SID     Type        Flags                    SystemID         Type
--------------------- ---------    ----------------------  ---------------  -----
 1.0.7.1/32      2     Node        R:0 N:1 P:0 E:0 V:0 L:0   1111.1111.1001   L1
* 1.0.8.1/32      4     Node        R:0 N:1 P:0 E:0 V:0 L:0   1111.1111.1002   L2
 1.0.11.0/24    10     Prefix      R:1 N:0 P:0 E:0 V:0 L:0   1111.1111.1001   L2

  10.1.1.3/32        4    Node   ...    1111.1111.1005   L2    node with SRLG strict
  10.1.1.4/32        10   Prefix ...    1111.1111.1004   L1    node
```

About the Output

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this routers IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show commands output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.

15.4.6.60 show isis segment-routing

The **show isis segment-routing** command displays the summary information on IS-IS SR status.

Command Mode

EXEC

Command Syntax

show isis segment-routing

Example

The command output displays the summary information on IS-IS SR status.

```
switch(config)# show isis segment-routing
System ID: 1111.1111.1002               Instance: inst1
SR supported Data-plane: MPLS           SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000   Size: 65536
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000     Size: 16384
All Prefix Segments have    : P:0 E:0 V:0 L:0
All Adjacency Segments have : F:0 B:0 V:1 L:1 S:0
ISIS Reachability Algorithm : SPF (0)
Number of ISIS segment routing capable peers: 3
Self-Originated Segment Statistics:
Node-Segments       : 2
Prefix-Segments     : 2
Proxy-Node-Segments : 0
Adjacency Segments :
```

About the Output

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported data plane is shown against the SR supported Data-plane field, while the router ID being advertised in the Router Capability is mentioned in the SR Router ID field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The **show isis segment-routing** command also provides information if segment routing has been administratively disabled as shown.

```
switch(config-router-isis-sr-mpls)# show isis segment-routing
! IS-IS (Instance: inst1) Segment Routing has been administratively
 shutdown.
```

15.4.6.61 show isis segment-routing tunnel

The **show isis segment-routing tunnel** command displays all the IS-IS SR tunnels. The field **TI-LFA tunnel index** displays the index of the TI-LFA tunnel protecting the SR tunnel. The same TI-LFA tunnel that protects the LFIB route also protects the corresponding IS-IS SR tunnel.

```
switch#show isis segment-routing tunnel 10.0.10.1/32
Index   Endpoint        Nexthop    Interface   Labels     TI-LFA
                                                          tunnel index
------ --------------- ---------- ---------- ---------- -------------
4       10.0.10.1/32    10.0.0.2   Vlan2387    [900004]   0
```

15.4.6.62 show isis summary

The **show isis summary** command displays information about the configured IS-IS instances.

Command Mode

EXEC

Command Syntax

show isis summary

show isis [**INSTANCES**] summary

show isis summary VRF_INSTANCE

Parameters

- **INSTANCES** Options include:
  - ***no parameter***
  - ***instance_name***
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter***
  - **vrf *vrf_name***

Display Values

- **System ID**
- **IPv4 Preference**
- **IPv6 Preference**
- **IS-Types**
- **LSP Generation interval**
- **SPF Interval**
- **Current SPF Hold Interval**
- **IS-Types Run Time**
- **Area Addresses**
- **Designated Intermediate Systems (DIS) Interfaces**
- **Link State DataBase (LSDB) size**

Display Status

- **Multi Topology**
- **Authentication Mode**
- **Graceful Restart**
- **Graceful Restart Helper**

Example

This command displays general information about the configured IS-IS instances.

```
switch(config-router-isis-af)# show isis summary

IS-IS Instance: 1 VRF: default
 System ID: 0000.0000.0001, administratively enabled
 Multi Topology disabled, not attached
 IPv4 Preference: Level 1: 115, Level 2: 115
 IPv6 Preference: Level 1: 115, Level 2: 115
 IS-Type: Level 1 and 2, Number active interfaces: 0
 Routes both IPv4 and IPv6
 LSP size maximum: Level 1: 9000, Level 2: 9000
                           Max wait(s) Initial wait(ms) Hold interval(ms)
 LSP Generation Interval:     5             50               50
```

```
SPF Interval:                 2            1000             1000
Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
Last Level 1 SPF run 1 seconds ago
Last Level 2 SPF run 1 seconds ago
Authentication mode: Level 1: None, Level 2: None
Graceful Restart: Disabled, Graceful Restart Helper: Enabled
Area Addresses:
  49.0001
level 1: number dis interfaces: 0, LSDB size: 1
level 2: number dis interfaces: 0, LSDB size: 1
```

15.4.6.63 show isis ti-lfa path

The **`show isis ti-lfa path`** command displays the repair path with the list of all the system IDs from the P-node to the Q-node for every destination/constraint tuple. You will see that even though node protection is configured, a link protecting LFA is computed too. This is to fallback to link protecting LFAs if the node protecting LFA becomes unavailable.

```
switch#show isis ti-lfa path 1111.1111.1005
TI-LFA paths for IPv4 address family
Topo-id: Level-2
Destination     Constraint                      Path
1111.1111.1005  exclude node 1111.1111.1002     1111.1111.1003
                                                1111.1111.1004
                exclude Vlan2387                1111.1111.1002
                SRLG strict
```

```
switch#show isis ti-lfa path 10.10.10.1/32
TI-LFA paths for IPv4 address family
Topo-id: Level-1
Destination     Constraint                      Path
--------------- ------------------------------ --------------
10.10.10.1/32   exclude Vlan2387                1111.1111.1002
                                                1111.1111.1003
                exclude node 1111.1111.1004     1111.1111.1002
    SRLG strict       1111.1111.1003
```

15.4.6.64 show isis ti-lfa tunnel

The TI-LFA repair tunnels are just internal constructs that are shared by multiple LFIB routes that compute similar repair paths. The **`show isis ti-lfa tunnel`** command displays TI-LFA repair tunnels with the primary and backup via information.

```
switch#show isis ti-lfa tunnel 1
Tunnel Index 1
   via 10.0.1.2, 'Vlan2968'
      label stack 3
   backup via 10.0.0.2, 'Vlan2387'
```

```
      label stack 900004 900002
```

15.4.6.65 show tunnel fib

The **`show tunnel fib`** command that displays tunnels programmed in the tunnel FIB also includes the TI-LFA tunnels along with protected IS-IS SR tunnels.

```
switch#show tunnel fib ti-lfa 1

Type 'TI-LFA', index 1, forwarding None
   via 10.0.1.2, 'Vlan2968'
      label stack 3
   backup via 10.0.0.2, 'Vlan2387'
      label stack 900004 900002
```

```
switch#show tunnel fib isis segment-routing

Type 'IS-IS SR', index 1, endpoint 2002::b00:201/128, forwarding
 Primary
   via TI-LFA tunnel index 3 label 3
      via fe80::200:76ff:fe01:0, 'Ethernet30/1' label 900002
      backup via fe80::200:76ff:fe03:0, 'Ethernet26/1' label
 132769

Type 'IS-IS SR', index 2, endpoint 2002::b00:101/128, forwarding
 Primary
   via TI-LFA tunnel index 4 label 3
      via fe80::200:76ff:fe01:0, 'Ethernet30/1' label 3
      backup via fe80::200:76ff:fe03:0, 'Ethernet26/1' label
 132769 900001
```

15.4.6.66 show mpls label ranges

The **show mpls label ranges** command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

Command Mode

EXEC

Command Syntax

show mpls label ranges

Example

```
switch# show mpls label ranges
Start    End      Size     Usage
-----------------------------------------
0        15       16       reserved

15.4.6.67 show mpls lfib route

The **show mpls lfib route** command displays the LFIB information for a specified route or for all routes. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.

Command Mode

EXEC

Command Syntax

show mpls lfib route [*label_num*]

Syntax

- ***label_num*** Displays only the LFIB information for the specified route. If no label number is specified, the command displays information for all LFIB routes.

Example

- This command displays LFIB information for all routes.

```
switch# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
        M - Mpls Via, P - Pseudowire Via,
        I - IP Lookup Via, V - Vlan Via,
        VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
        VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
        NG - Nexthop Group Via
Source Codes:
        S - Static MPLS Route, B2 - BGP L2 EVPN,
        B3 - BGP L3 VPN, R - RSVP,
        P - Pseudowire, L - LDP,
        IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
        IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
        BL - BGP LU, ST - SR TE Policy,
        DE - Debug LFIB
 IA 100000 [1]
            via M, 1.0.1.2, pop
            payload autoDecide, ttlMode uniform, apply egress-acl
            interface Vlan2930
 IA 100001 [1]
            via M, fe80::200:eff:fe02:0, pop
            payload autoDecide, ttlMode uniform, apply egress-acl
            interface Vlan2930
 IP 900008 [1]
            via M, 1.0.1.2, swap 900008
            payload autoDecide, ttlMode uniform, apply egress-acl
            interface Vlan2930
 IP 900009 [1]
            via M, fe80::200:eff:fe02:0, swap 900009
            payload autoDecide, ttlMode uniform, apply egress-acl
            interface Vlan2930
switch#
```

- This command displays LFIB information only for the route labeled ***900008***.

```
switch# show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
        M - Mpls Via, P - Pseudowire Via,
```

```
        I - IP Lookup Via, V - Vlan Via,
        VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
        VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
        NG - Nexthop Group Via
Source Codes:
        S - Static MPLS Route, B2 - BGP L2 EVPN,
        B3 - BGP L3 VPN, R - RSVP,
        P - Pseudowire, L - LDP,
        IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
        IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
        BL - BGP LU, ST - SR TE Policy,
        DE - Debug LFIB
 IP 900008 [1]
            via M, 1.0.1.2, swap 900008
            payload autoDecide, ttlMode uniform, apply egress-acl
            interface Vlan2930
switch#
```

15.4.6.68 show mpls segment-routing bindings

The **show mpls segment-routing bindings** command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

Command Mode

EXEC

Command Syntax

show mpls segment-routing bindings

Example

```
switch# show mpls segment-routing bindings
1.0.7.1/32
 Local binding: Label: 900002
 Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
 Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
 Local binding: Label: imp-null
 Remote binding: Peer ID: 1111.1111.1001, Label: 900004
 Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
 Local binding: Label: 900006
 Remote binding: Peer ID: 1111.1111.1001, Label: 900006
 Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```

15.4.6.69 shutdown (IS-IS)

The **shutdown** command disables IS-IS on the switch without modifying the IS-IS configuration.

The **no shutdown** and **default shutdown** commands enable the IS-IS instance by removing the **shutdown** command from ***running-config***.

Command Mode

Router-IS-IS Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands disable IS-IS on the switch.

```
switch(config)# router isis Osiris
switch(config-router-isis)# shutdown
switch(config-router-isis)#
```

- This command enables IS-IS on the switch.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no shutdown
switch(config-router-isis)#
```

15.4.6.70 shutdown (IS-IS SR)

The **shutdown** and **default shutdown** commands administratively disable IS-IS SR on the switch without modifying the IS-IS SR configuration.

The **no shutdown** command enables IS-IS SR.

Command Mode

Segment-Routing MPLS Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands administratively disable IS-IS SR on the switch but preserve the IS-IS SR configuration.

```
switch(config)# router isis Osiris
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# shutdown
switch(config-router-isis-sr-mpls)#
```

- This command enables IS-IS SR on the switch.

```
switch(config)# router isis Osiris
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# no shutdown
switch(config-router-isis-sr-mpls)#
```

15.4.6.71 spf-interval

The **spf-interval** command sets the Shortest Path First (SPF) timer that defines the interval between IS-IS path calculations. The default value is two seconds.

This command also configures the maximum wait interval between any two SPF runs, initial wait interval before executing the first SPF computation, and the hold time between the first and second SPF runs.

The **no spf-interval** and **default spf-interval** commands restore the default maximum IS-IS path calculation interval to two seconds by removing the **spf-interval** command from ***running-config***.

For information about viewing SPF interval values, see **Displaying IS-IS Instance Information**.

Command Mode

Router-IS-IS Configuration

Command Syntax

spf-interval ***max-wait*** [***initial-wait*** | ***hold-time***]

no spf-interval

default spf-interval

Parameters

- ***max-wait*** Value ranges from ***1*** through ***300*** seconds. Default maximum wait interval is ***2*** seconds.
- ***initial-wait*** Value ranges from ***1*** through ***300000*** ms. Default initial wait interval is ***1000*** ms.
- ***hold-time*** Value ranges from ***1*** through ***300000*** ms. Default hold interval is ***1000*** ms.

Guidelines

EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

Examples

- This command configures the SPF maximum wait interval to ***50*** seconds.

```
switch(config)# router isis Osiris
switch(config-router-isis)# spf-interval 50
```

- This command configures maximum wait interval, initial wait interval, and hold time to ***20*** seconds, ***10000*** ms, and ***5000*** ms respectively.

```
switch(config)# router isis inst1
switch(config-router-isis)# spf-interval 20 10000 5000
```

- This command reverts the SPF interval configuration to its default value.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no spf-interval
```

15.4.6.72 timers local-convergence-delay

The Point of Local Repair (PLR) switches to the TI-LFA backup path on link failure or BFD neighbor failure but switches back to the post-convergence path once the PLR computes SPF and updates its LFIB. This sequence of events can lead to micro-loops in the topology if the PLR converges faster than other routers along the post-convergence path. So a configuration option is provided to apply a delay, after which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

Command Mode

IS-IS address-family sub-mode

Command Syntax

`timers local-convergence-delay` [***delay_in_seconds***] protected-prefixes

Parameters

- ***delay_in_seconds*** The convergence delay, in seconds. A default of 10 seconds is used when the command is used without an explicitly specified delay.
- **protected-prefixes** The prefix which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

15.5 Border Gateway Protocol (BGP)

Border Gateway Protocol (BGP) exchanges routing information among neighboring routers in different Autonomous Systems (AS). Arista switches use BGP version 4+, incorporating the multiprotocol extensions defined by ***RFC 4760*** so that BGP can carry both IPv4 and IPv6 routes simultaneously over a single BGP peering.

This section contains the following topics:

Arista switches support these BGP functions:

- A single BGP instance.
- Simultaneous internal (iBGP) and external (eBGP) peering.
- Multiprotocol BGP, including IPv4-mapped IPv6 address next hops for IPv6 labeled-unicast routes.
- BGP Confederations.
- BGP Selective Route Download.
- BGP Route Reflection.

15.5.1 BGP Conceptual Overview

BGP is a protocol that exchanges routing information among neighboring routers in different autonomous systems through TCP sessions.

BGP neighbors (peers) communicate through a TCP session on port ***179***. They are established by manual configuration commands (static peers) or by creating a peer group listen range and accepting incoming peering requests in that range (dynamic peers). Internal BGP (iBGP) peers operate within a single Autonomous System (AS). External BGP (eBGP) peers operate between autonomous systems. Border routers are on AS boundaries and exchange information with other autonomous systems; the primary function of border routers is distributing routes. Internal routers do not distribute route updates that they receive.

BGP defines a state machine for establishing connections. BGP routers maintain a state variable for each peer-to-peer session to track connection status. The state machine consists of these states:

- **Idle**: the router initializes BGP resources, refuses inbound BGP connection attempts, initiates a TCP connection to the peer, then transitions to the **Connect** state.
- **Connect**: the router waits for the TCP connection to complete, then sends an OPEN message to the peer and transitions to the **OpenSent** state if successful. If unsuccessful, it sets the **ConnectRetry** timer and transitions to the **Active** state upon expiry.
- **Active**: the router sets the **ConnectRetry** timer to zero and returns to the **Connect** state.
- **OpenSent:** the router waits for an OPEN message from the peer. After receiving a valid message, it transitions to the **OpenConfirm** state.
- **OpenConfirm**: the router waits for a keepalive message from its peer. If the message is received prior to a timeout expiry, the router transitions to the **Established** state. If the timeout expires or an error condition exists, the router transitions to the **Idle** state.
- **Established**: peers exchange UPDATE messages about routes they advertise. If an UPDATE message contains an error, the router sends a NOTIFICATION message and transitions to the **Idle** state.

During established BGP sessions, routers exchange UPDATE messages about the destinations to which they offer connectivity. The route description includes the destination prefix, prefix length,

autonomous systems in the path, the next hop, and information that affects the acceptance policy of the receiving router. UPDATE messages also list destinations to which the router no longer offers connectivity.

BGP detects and eliminates routing loops while making routing policy decisions by using the network topology as defined by AS paths and path attributes.

15.5.1.1 Multiprotocol BGP

Multiprotocol BGP facilitates the advertisement of network routes and switch capabilities to neighbors from multiple address families over a single BGP peering. The switch supports IPv4 unicast and IPv6 unicast address families.

Neighbors negotiate to select an address family when establishing a connection. The peer session is based on this address family, which identifies the following:

- the set of network layer protocols to which the address carried in the Next Hop field must belong.
- the encoding format of the next-hop address.
- the semantics of Network Layer Reachability Information (NLRI).

15.5.1.2 BGP Confederations

BGP confederations divide an Autonomous System (AS) into subsystems (sub-ASs), each identified by a unique sub-AS number, while still appearing externally as a single AS.

15.5.1.3 QoS Control of Neighbor Discovery and ARP Packets

To help prevent BGP sessions from being affected by dropped neighbor discovery and ARP packets, some Arista switches assign those packets to a higher priority output queue when they are being software forwarded. This helps minimize hardware drops from competition with data plane packets traffic congestion.

15.5.1.4 Best-path Selection

Routing information received via the BGP protocol often contains more than one route to the same destination: the BGP best-path selection algorithm determines which of these routes will be installed in the routing table. Criteria are evaluated in order; at each step, if there is a tie for best path the next criterion is applied. If there is still a tie at the end of the process, BGP installs the route received from the peer with the lowest address. When Equal Cost Multi Path (ECMP) routing is enabled, multiple paths to a single destination may be installed in the IP routing table.

Route preferences can be shaped through configuration choices as described in Configuring Best-path Selection.

15.5.1.5 BGP Convergence

BGP supports convergence where it waits for all peers to join and receive all the routes from other peers.

Before declaring convergence, BGP also waits for IGP protocols to converge so that all IBGP sessions are established, and routes that were learned over IBGP sessions, are resolved via the IGP routes. BGP declares convergence when it has received route updates from all its peers and End-Of-RIB (EOR) markers from all the expected peers and IGP protocols have converged. Using BGP convergence, you can avoid hardware updates or route advertisement churn during a switch reload or a BGP instance start.

15.5.1.6 BGP Communities

A BGP community is a group of subnet address prefixes that share a common identifying attribute. Communities simplify routing policies by consolidating IP network spaces into logical entities that BGP

speakers can address to accept, prefer, and distribute routing information. BGP communities are defined by setting the community value within route maps. Community lists then reference one or more communities as follows:

- **Standard** community lists refer to communities by name or number.
- **Expanded** community lists reference communities using regular expressions.

15.5.1.7 BGP Graceful Shutdown Community

Autonomous System Boundary Routers (ASBRs) do not update all paths received from external BGP sessions and routers. They hide inefficient alternate paths and update only best paths in the routing table. BGP route policies are applied to all internal BGP sessions of ASBRs that support the graceful shutdown procedure.

As a part of maintenance mode, these route policies perform the following functionalities on routing advertisements:

- Match the graceful shutdown community with route map rules.
- Set the local preference attribute value of the paths that are tagged with the graceful shutdown community as ***0***.

Refer to Maintenance Mode for detailed information on maintenance mode.

15.5.1.8 BGP Labeled-Unicast (LU) path Nexthop resolution over Tunnel RIB Entries

BGP Labeled-Unicast Protocol (BGP LU) path next-hop is enhanced to allow BGP in ***ribd*** mode to support resolution of BGP LU path next-hop over entries in the Tunnel RIB and fall-back to resolving over connected route when there is no entry in Tunnel RIB that provides a direct match for the BGP LU path next-hop. Previously, BGP in “ribd” mode allowed resolution of BGP Labeled-Unicast Protocol (BGP LU) path next-hop over only connected routes, resolution of the next-hop over IGP or static routes was not allowed since the next-hop router may not be in the MPLS forwarding path in which case the traffic will get dropped by the next-hop router (per IGP).

The following two use cases explain how BGP LU path next-hop resolution over tunnels would help in achieving desired or efficient traffic forwarding.

- Egress Peer Engineering (EPE)
- Inter-AS Option C

Egress Peer Engineering (EPE)

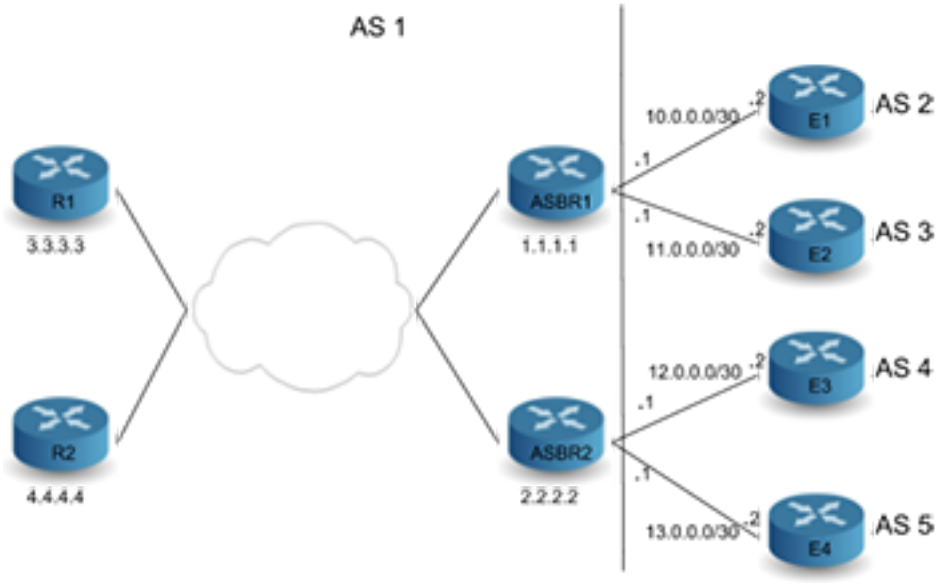
Egress Peer Engineering is a source-routing paradigm that provides ability to select an egress node/ interface through which traffic goes out of an Autonomous System (AS). As shown in Figure 1 below R1, R2, ASBR1 & ASBR2 are in AS 1 and E1, E2, E3 & E4 are in different Ases. R1, R2, ASBR1 & ASBR2 could be connected each other directly or reachable to each other over an IGP (OSPF/ISIS) or MPLS tunnel. Let’s assume reachability of loop-back addresses 1.1.1.1, 2.2.2.2, 3.3.3.3 & 4.4.4.4 through LDP or Segment Routing (SR). There exists an iBGP Full Mesh between R1, R2, ASBR1 & ASBR2. eBGP session is present between ASBR1 & E1, ASBR1 & E2, ASBR2 & E3 and ASBR2 & E4. Consider following BGP updates are received on ASBR1:

Prefix ***50.0.0.0/8*** next-hop ***10.0.0.2*** as-path ***2 100*** from ***E1***.

Prefix ***50.0.0.0/8*** next-hop ***11.0.0.2*** as-path ***3 200 300*** from ***E2***.

BGP path from ***E1*** will be selected as best path due to shorter AS path length. ***ASBR1*** advertises this prefix to both ***R1*** & ***R2***. Any traffic destined to prefix ***50.0.0.0/8*** from ***R1*** will always be tunneled to ***ASBR1*** and then it will always be sent on an interface connected to ***E1***. Traditional Destination based routing enforced by BGP policy and best path selection on the ASBRs may route traffic to a single AS as exit when a case can be made that for some prefixes an exit via some other AS may be preferable.

BGP LU can be used here to perform traffic engineering or selecting Egress peer through which traffic should be forwarded.



A Centralized EPE Controller can be used to establish iBGP session with ***R1*** and *R2*. Let's assume Controller advertises BGP LU routes for ***E2***, i.e., ***11.0.0.2/32***, with next-hop set to loop-back IP address of ***ASBR1***, that is, ***1.1.1.1*** and a label ***111*** to ***R1*** & ***R2***.

```
switch# show ip bgp 11.0.0.2/32
BGP routing table information for VRF default
Router identifier 3.3.3.3, local AS number 1
BGP routing table entry for 11.0.0.2/32
Paths: 1 available
 Local
   1.1.1.1 labels [111] from 100.100.100.1 (100.100.100.1)
     Origin IGP, metric 0, localpref 100, IGP metric 40, weight 0,
 received
21:07:07 ago, valid, external, not installed
     Rx SAFI: Labels
     Tunnel RIB eligible
```

BGP LU path next-hop will get resolved over an ISIS SR tunnel present on ***R1*** and ***R2*** to reach ***1.1.1.1***, loop-back IP address of ***ASBR1***.

```
switch# show tunnel rib brief
 Endpoint   Tunnel Type  Index(es)   Metric  Metric2 Preference   Preference2
---------- ------------ ---------   ------- ------- ----------  -----------
1.1.1.1/32  IS-IS SR IPv4     5         40       0       115           0

switch#show bgp labeled-unicast tunnel

-------- ---- ------
 100     200    0

switch#show isis segment-routing tunnel
  Index       Endpoint          Nexthop            Interface        Labels
--------      ----------        -------            ---------        ----------
    5         1.1.1.1/32        6.6.6.6            Ethernet 5       [ 900001 ]
```

Controller or CLI can be used to install a static label route on ***ASBR1*** such that ingress label ***111*** have a forwarding action of “POP and forward” to next-hop (***11.0.0.2***) in MPLS forwarding table.

```
switch# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 20 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
         M - Mpls Via, P - Pseudowire Via,
         I - IP Lookup Via, V - Vlan Via,
         VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
         VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
         NG - Nexthop Group Via
Source Codes:
         S - Static MPLS Route, B2 - BGP L2 EVPN,
         B3 - BGP L3 VPN, R - RSVP,
         P - Pseudowire, L - LDP,
         IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
         IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
         BL - BGP LU, ST - SR TE Policy,
         DE - Debug LFIB

S   111      [100]
               via M, 11.0.0.2, pop
                payload ipv4, apply egress-acl
                interface Ethernet 4
```

For prefixes to which traffic should be sent over interface connected ***E2*** controller will advertise a BGP route with next-hop being BGP LU prefix and higher local-preference compared to paths advertised by ***ASBR1*** and ***ASBR2***, so that path received from controller will be preferred over paths coming from ***ASBR1*** and ***ASBR2***.

```
switch# show ip bgp 50.0.0.0/8
BGP routing table information for VRF default
Router identifier 3.3.3.3, local AS number 1
BGP routing table entry for 50.0.0.0/8
Paths: 3 available
 Local

     Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0,
 received 00:30:38
ago, valid, internal
     Rx SAFI: Unicast
```

This results in pushing two labels on ***R1***, top label is the label corresponding to ISIS SR tunnel to reach ***ASBR1*** and bottom label is the label that corresponds to egress interface. Similarly LU route for ***12.0.0.0.2*** or ***13.0.0.2*** can be advertised from controller to select egress peer between ***E3*** and ***E4***. This approach provides Egress peer selection on an ingress router ***R1***/***R2***.

```
switch# show ip route 50.0.0.0/8
```

```

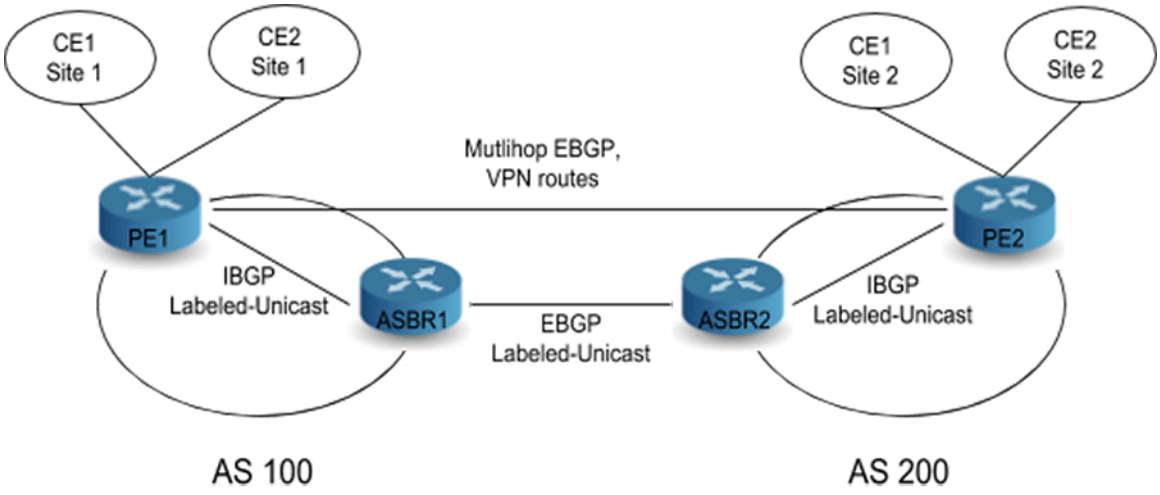
```

Inter-AS Option C

Inter-AS Option C is an efficient and scalable MPLS IP VPN solution to provide connectivity between two sites of a customer connected to Provider Edge (PE) routers in different ASes. Following diagram shows a typical topology.



PE1 and ***ASBR1*** and ***PE2*** and ***ASBR2*** distribute loop-back addresses using an IBGP Labeled Unicast (LU) session. ***ASBR2*** advertises system addresses in ***AS200*** to ***ASBR1*** with next-hop as itself over EBGP LU session between them and installing Label swap entry of label sent to ***ASBR1*** (L2) to label received from ***PE2*** (L1) in MPLS forwarding table. ***ASBR1*** further propagates system addresses in ***AS200*** learned from ***ASBR2*** into ***AS100*** or to ***PE1*** using IBGP LU session with next-hop as itself and installing Label swap entry with label advertised to ***PE1*** (L3) to Label received from ***ASBR2*** (L2) in MPLS forwarding table. Similarly ***ASBR1*** sends system addresses in ***AS100*** to ***ASBR2*** over EBGP LU session, ***ASBR2*** forwards them into ***AS200*** or to ***PE2*** using IBGP LU session with itself as next-hop and this would trigger installing appropriate label swap actions into MPLS forwarding table. These advertisements results in the creation of a label switched path from ***PE1*** to ***PE2***.

PE1 and ***PE2*** exchange VPN routes between each other using a Multi hop EBGP session with next-hop being their own loop-back/system addresses. This method eliminates the requirement of storing or sending/receiving VPN routes at ASBR routers. When PE and ASBR routers are non-adjacent, but in the same AS, then LDP or ISIS-SR can be used as a transport label signaling protocol and this would need resolving BGP LU path next-hop over LDP or ISIS-SR tunnel. An IP packet destined to an address in ***CE1*** site ***2*** is received on ***PE1*** from ***CE1*** site ***1*** ***PE1*** would need to push ***3*** labels onto it. Bottom label corresponds to packet destination address in a particular VRF of ***CE1*** site ***2*** advertised by ***PE2*** to ***PE1*** over Multi hop EBGP session, Middle label belongs to ***PE2*** system address sent by ***ASBR1*** and top label corresponding to ***ASBR1*** system address assigned by transport label signaling protocol.

15.5.1.9 BGP Selective Route Download

BGP Selective Route Download allows the learning and advertising of BGP routes without installing them in hardware. The BGP routes are filtered before installation in hardware through the route map definition and routes that are filtered out are flagged as inactive in the Routing Information Base (RIB).

The route map used for filtering is applied only to BGP learned paths and not on locally originated routes, for example, BGP aggregate or redistributed routes. Also, because the BGP routes filtered by Selective Route Download are not active in the RIB, they are not used for recursive resolution, they are not redistributed into other protocols, and they do not contribute to BGP aggregates.

When BGP Selective Route Download is configured, the best path for peer advertisement is chosen based on the following aspects. If received BGP paths exist, then the best of them is advertised to BGP peers, else, the aggregate is preferred if configured and active. If neither BGP paths nor a BGP aggregate is available, then the RIB winner is advertised.

Note: The number of routes is limited based on the compute and memory resources available at runtime.

15.5.1.10 BGP Route Reflector

A BGP route reflector is a switch within an autonomous system that forwards route information learned from iBGP peers to other iBGP peers as an alternative to a full-mesh topology. When the switch is configured as a route reflector it can also be configured to preserve the BGP attributes of the reflected routes (next-hop, local preference, and metric) in its route advertisements regardless of outbound BGP policies.

15.5.1.11 BGP Nexthop Resolution RIBs: EVPN and IPV4/6 Labeled-Unicast Support

Adds the BGP Nexthop Resolution RIBs feature for EVPN and labeled-unicast address families.

BGP Nexthop Resolution RIBs: EVPN and IPV4/6 Labeled-Unicast Support adds support for user-configured BGP Nexthop Resolution RIB profiles for various BGP-based services such as IP unicast, L3 VPN, EVPN, etcetra. This feature allows an administrator to customize the next hop resolution semantics of BGP routes with an ordered list, or profile, of resolution RIB domains (for example, either tunnel or IP domain). This allows EOS to direct specific services over the specified RIB domains, overriding the default behavior. Further, this feature, through the use of user-defined tunnel RIBs, empowers an administrator to further select a subset of tunneling protocols for specific services.

Note: This feature is only available when running the multi-agent routing protocol model.

15.5.1.11.1 Support for Set Large Community List Limitations

Resolution of NLRI from (directly connected) eBGP Speakers

For IPv4 or IPv6 unicast NLRI received from eBGP, directly connected BGP sessions are resolved by only using connected routes, or **system-connected**, in the parlance of this feature. This feature does not change this behavior, nor will configuration of a non-default resolution profile affect this behavior.

Address Family Profile Restrictions

Certain BGP address families only support a subset of possible next-hop resolution profiles. This section documents such limitations.

Address family	Restriction
IPv4/IPv6 unicast (non 6PE)	None.
IPv6 unicast 6PE	Only supports tunnel domains*.

IPv4/IPv6 unicast (eBGP directly connected)	Only supports system-connected; Not configurable.
IPv4/IPv6 VPN	Only supports tunnel domains* and system-connected.
IPv4/IPv6 LU	Only supports tunnel domains* and system-connected.
EVPN (MPLS)	Only supports tunnel domains* and system-connected.
EVPN (VXLAN)	Only supports IP domains+.

* Tunnel domains refer to tunnel RIBs, e.g. system-colored-tunnel-rib, system-tunnel-rib, or user-defined tunnel RIBs.

+ IP domains are either of system-unicast-rib or system-connected.

15.5.1.12 BGP Logical OR of Multiple Community Lists in the Same Match Command

In the multi-agent routing protocol model, the BGP agent now supports matching community lists with a logical OR via the route map **`match community or-results`** command (same applies for extended and large communities with **`match extcommunity`** and **`match large-community`**).

Without the **`or-results`** portion of the command, the default is to compute the logical AND of all provided community lists. Before, one would need to merge existing community lists into one to do a logical OR:

Issue:

```
ip community-list COMMLIST1 permit 1:1
ip community-list COMMLIST2 permit 2:2

! No way to match "COMMLIST1" or "COMMLIST2" in a singe
! route-map sequence
match community COMMLIST1 COMMLIST2
```

Workaround:

```
ip community-list standard mergedCommunityList permit 1:1
ip community-list standard mergedCommunityList permit 2:2

match community mergedCommunityList
```

15.5.1.12.1 Limitations

This feature is available only when configuring BGP in the multi-agent routing protocol model.

15.5.1.13 BGP Flowspec

The ***EOS Release 4.21.3F*** introduces support for BGP Flowspec, as defined in ***RFC5575*** and ***RFC7674***. The typical use case is to filter or redirect DDoS traffic on edge routers.

BGP Flowspec rules are disseminated using a new BGP address family. The rules include both matching criteria used to match traffic, and actions to perform on the matching traffic. The rules are programmed into TCAM resources and applied on the ingress ports for which flowspec is enabled.

15.5.1.13.1 Release Updates

***EOS Release 4.x* enhancements:**

- Added support for BGP Flowspec applied to SVI.
- BGP Flowspec releases TCAM banks as they are no longer needed to store matches. Previously, once TCAM banks allocated to BGP Flowspec, they never released.

EOS Release 4.22.0 **Enhancements:**

- Added support for redirect over MPLS or GRE Tunnels.
- Added support for traffic-rate action.

EOS Release 4.22.1 **Enhancements:**

Added support for hitless rule updates. This enhancement ensures that persistent filtering rules are always active while other filtering rules are updated (example: rules are published or withdrawn by a BGP peer).

EOS Release 4.23.1 **Enhancements:**

- Added support for best-effort rule programming. When a switch receives more filtering rules from its BGP neighbors than can fit within TCAM hardware, it programs the highest priority Flowspec rules up to the maximum TCAM available on a per-ASIC basis. The maximum TCAM available could either be the per-ASIC maximum free TCAM banks or the limit set by **`feature flow-spec bank maximum tcam`** in the hardware sub-configuration. (**LIMITATION** - the best-effort rule programming does not apply when Flowspec rules, after expansion into HW TCAM entries, occupy more than 24k 160b IPv4 or 320b IPv6 HW TCAM entries. In this case, programming fails, and no flowspec rules are programmed in hardware. This limitation is resolved in ***EOS Release 4.24.2***).
- Added support for traffic-marking action. To enable traffic-marking action, the **`feature flow-spec port (ipv4|ipv6)`** command of the active TCAM profile must include action **set-dscp**.
- Added support for packet length (Type 10) component match on IPv4 packets. To enable matching on IPv4 packet length, the **`feature flow-spec port ipv4`** command of the active TCAM profile must include keyword **field ip-length**.

EOS Release 4.23.2 **Enhancements:**

- Added support for configuring BGP Flowspec in a non-default VRF. Only a single VRF is supported.
- Added support for packet length (Type 10) component match on IPv6 packets. To enable matching on IPv6 packet length, the **`feature flow-spec port ipv6`** command of the active TCAM profilemust include the keword **field ipv6-length**.

EOS Release 4.24.0 **Enhancements:**

Added support for configuring BGP Flowspec on subinterfaces. To enable subinterface support, the TCAM profile of the flow-spec feature must include **`port qualifier size 3 bits`** (see Flowspec TCAM Profile and Flowspec Policer TCAM Profile below).

EOS Release 4.24.1 **Enhancements:**

- Added support for BGP Flowspec in the DCS-7500R3 and DCS-7280R3 series.
- Added support for configuring BGP Flowspec in multiple VRFs.

EOS Release 4.24.2 **Enhancements:**

Removed ***EOS Release 4.23.1*** limitation to best effort programming.

EOS Release 4.25.2 **Enhancements:**

- Added support for BGP Flowspec applied to SVI.

- BGP Flowspec will release TCAM banks they are no longer needed to store matches. Previously, once TCAM banks were allocated to BGP Flowspec, they would never be released.

15.5.1.13.2 Limitations

Flowspec functionality:

- The following actions are supported:
  - Drop
  - Redirect to a VRF
  - Redirect to a nexthop (https://tools.ietf.org/html/draft-simpson-idr-flowspec-redirect-02 and https://tools.ietf.org/html/draft-ietf-idr-flowspec-redirect-ip-02 are supported).
  - Redirect to an IPv6 nexthop (https://tools.ietf.org/html/draft-ietf-idr-flowspec-redirect-ip-02) is supported only in EOS-4.22.0 or later.
  - Policer (***EOS Release 4.22.0*** or later)
  - Traffic-marking (***EOS Release 4.23.1*** or later)

  To redirect to a nexthop, IP RIB must have a route to resolve the specified nexthop. When redirecting to a VRF, a default route for the VRF must be configured and traffic is sent to the nexthop for the default route in this VRF.
- Prior to version ***EOS Release 4.22.0***, to redirect to a nexthop or VRF, the resolving route cannot be via MPLS VPN or GRE tunnel, so the resolving route must have regular IP nexthop(s) for the redirect action. This limitation was removed in ***EOS Release 4.22.0***, except for the IPv6 GRE tunnels support for redirect action.
- All matching components described in ***RFC 5575*** are supported, except for the following known caveats:
  - For TCP flags, the ECE, CWR, and NS flags are not supported.
  - For fragment flags, only the ***Is a fragment (IsF)*** bit is supported only for IPv4 packets. Combining source and destination ports and the Fragment flags in the same rule is not supported.
- When flowspec policer is supported, the flowspec counter feature is disabled due to a hardware limitation.
- Beginning with ***EOS Release 4.23.2***, the flowspec address family can be configured in a non-default VRF. However, only a single VRF (default or non-default) may be used on ***EOS Release 4.24.0*** or earlier versions.
- The additional BGP NLRI type (AFI=1, SAFI=134) which can be used to propagate traffic filtering information in a BGP/MPLS VPN environment is not supported.
- The validation procedure described in ***RFC 5575*** is not supported. Any received flowspec rules are considered valid.

BGP limitations:

- ECMP of flowspec rules are not supported. If the same rule is received from two peers and ECMP is configured, only the actions received from the ECMP head are applied.
- BGP Graceful Restart is not supported.
- Policies applied on the flowspec NLRI are not supported. This means that prefix-list matching rules in a route-map will not match against flowspec rules.
- BGP Additional Paths Send functionality is not supported.

Platform limitations:

- Flowspec rules can only be applied to traffic received on ***routed Ethernet and Port-Channel*** interfaces in the initial release. L3 subinterfaces are supported starting from ***EOS Release 4.24.0***.SVIs are supported starting from ***EOS Release 4.25.2***. L2 interfaces are not supported.
- Counters can either be reported for Flowspec or ACLs, but not both.

- With ***EOS Release 4.24.1*** and earlier versions, if the number of flow-spec rules exceed the available hardware TCAM resources, all rules are removed and a message is logged.
- When reinstalling the entire set of Flowspec rules, all existing rules are removed from the hardware upon installation.

Scaling limits:

- Similar to other TCAM features, the number of rules (BGP NLRI) that are supported in flowspec depend on the match criteria of each rule. Assuming that Flowspec is the only TCAM feature enabled on the switch, it attempts to use all of the TCAM space available (24K entries per chip) in the forwarding chip. Simple flowspec IPv4 rules will map to one entry, allowing a max of 24K rules. Simple IPv6 rules each take two entries, resulting in a max of 12K rules.
- Some types of rules expand into multiple entries in the TCAM. Port ranges are a common example. Combining source and destination port ranges in a single rule multiplies the number of entries needed to cover all combinations, which can quickly consume all of the TCAM space.
- The Flowspec and Flowspec Policer TCAM profiles support configuring the feature on up to seven VRFs starting with ***EOS Release 4.24.1***. This scale can be adjusted with the number of bits in the feature's port qualifier size at the expense of removing other TCAM key fields.
- Make-before-break policer allocation affects scaling limits.

15.5.1.14 Support for Set Large Community List

EOS adds support to use large community lists in the set large community route map set clause.

The Support for Set Large Community List feature allows a large community list to be shared between a number of route maps. Changes to the large community list then affect all route-maps which use this list. This makes applying the same policy change to different inbound and outbound communication easier.

Properties of large communities and how to create large community lists are not be covered as those are described here.

15.5.1.14.1 Configuring Support for Set Large Community List

The following commands have been added to route map configuration

`set large-community large-community-list` **LIST1** [**LIST2**][additive | delete]

`no set large-community large-community-list` **LIST1** [**LIST2**][additive | delete]

`default set large-community large-community-list` **LIST1** [**LIST2**][additive | delete]

The following command replaces the large community value of the contents of the permit sequences of the specified large community list. It is possible to specify more than one large community list to the set clause. In this example, the community values in permit sequences in the lists are concatenated and applies in the set clause.

`set large-community large-community-list` **LIST1** [**LIST2**]

`no set large-community large-community-list` **LIST1** [**LIST2**]

`default set large-community large-community-list` **LIST1** [**LIST2**]

The following command works similarly to the prior command, however, it does not replace communities already set on a route; it concatenates the community values with the values specified in the list. Duplicate communities are only shown once.

`default set large-community large-community-list` **LIST1** [**LIST2**][additive]

`set large-community large-community-list` **LIST1** [**LIST2**][additive]

`no set large-community large-community-list` **LIST1** [**LIST2**][additive]

In the following command, the **delete** keyword is used. The **delete** keyword specifies that any large community values in the input matching any of the large community values (or large community value regular expressions) in the specified large community lists are removed.

default set large-community large-community-list LIST1 [**LIST2**][delete]

set large-community large-community-list LIST1 [**LIST2**][delete]

no set large-community large-community-list LIST1 [**LIST2**][delete]

Apply the following command to the concerned neighbour which large communities are to be sent, otherwise they are not sent.

neighbour *X.X.X.X* send-community large

15.5.1.14.2 Support for Set Large Community List Show Commands

Use the following command to show information about all of the configured route maps.

show route-map

This is an example output of the **show route-map** command.

```
switch# show route-map
route-map rm1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set large-community large-community-list lgl1 lgl2
```

15.5.1.14.3 Support for Set Large Community List Limitations

Resolution of NLRI from (directly connected) eBGP Speakers

For IPv4 or IPv6 unicast NLRI received from eBGP, directly connected BGP sessions are resolved by only using connected routes, or **system-connected**, in the parlance of this feature. This feature does not change this behavior, nor will configuration of a non-default resolution profile affect this behavior.

Address Family Profile Restrictions

Certain BGP address families only support a subset of possible next-hop resolution profiles. This section documents such limitations.

Address family	Restriction
IPv4/IPv6 unicast (non 6PE)	None.
IPv6 unicast 6PE	Only supports tunnel domains*.
IPv4/IPv6 unicast (eBGP directly connected)	Only supports system-connected; Not configurable.
IPv4/IPv6 VPN	Only supports tunnel domains* and system-connected.
IPv4/IPv6 LU	Only supports tunnel domains* and system-connected.
EVPN (MPLS)	Only supports tunnel domains* and system-connected.
EVPN (VXLAN)	Only supports IP domains+.

* Tunnel domains refer to tunnel RIBs, e.g. system-colored-tunnel-rib, system-tunnel-rib, or user-defined tunnel RIBs.

+ IP domains are either of system-unicast-rib or system-connected.

15.5.1.15 BGP Additional Paths Send Optimization

BGP Add-Path TX, or send, allows for a BGP speaker to advertise multiple paths (instead of a single best-path) for a prefix towards a peering BGP speaker. BGP Add-Path increases path diversity in a network. It restores fast traffic and has efficient link usage through multipathing. This can also be used as a monitoring solution for eligible paths to a monitoring or receiving Add-Path speaker.

Without Add-Path, a sending speaker only sends the best-path for a prefix and a receiving speaker collects all best-path announcements from its peers. The receiving speaker uses only the peer's address to identify the path.

With Add-Path, the sending speaker can potentially send multiple paths using distinct path-id's to a peer and the receiver can use to distinguish the multiple paths coming from the same sender.

15.5.1.16 Ordered Next Hops in FEC

In symmetric network topology, for the same Equal Cost Multi-Path (ECMP) route programmed at different devices in a switch layer, the various devices can program ECMP next-hops in the Forwarding Equivalence Class (FEC) for that route in varying orders. This could result in inconsistent hashing of traffic for those destination routes at the same layer of switches in the network and could be undesired behavior for certain classes of applications. Ordered FEC is an approach to order the next hops in the FEC of a route based on a network-wide device identifier for each next-hop resulting inconsistent ordering of next hops in the FEC for a route across all switches in a layer.

A BGP router-id can be used as a unique network-wide device identifier and BGP paths received from various peers for a BGP ECMP route can have their paths and subsequently, next-hops sorted based on the corresponding peer's router-id. Ordered Next Hops in the FEC feature would use the BGP router-id to achieve a consistent ordering of next hops in the FEC for a route. This feature is available with multi-agent routing protocol models.

15.5.1.16.1 Configuring Ordered Next Hops in FEC

Use the following configuration commands to implement Ordered FEC solution for BGP routes.

- The BGP instance must be configured to order ECMP paths received for a BGP route deterministically using **`bgp bestpath tie-break router-id`** under ***router bgp*** configuration mode.

```
switch(config)# router bgp 100
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp)# bgp bestpath tie-break router-id
switch(config-router-bgp)#
```

Note: Other tie-break options available under ***router bgp*** configuration mode is not supported for Ordered Next Hops in FEC solution.

- The device must be configured to enforce ordering of next hops as determined by the protocol agents in the FEC programmed for the route using the **`rib fib fec ecmp ordered`** command under ***router general*** configuration mode.

```
switch(config)# router general
switch(config-router-general)# rib fib fec ecmp ordered
switch(config-router-general)#
```

15.5.1.16.2 Ordered FEC Show Commands

The **show ip route fec** command displays if the next-hops in the FEC of a route have been ordered. The output below indicate the show command output before enabling the Ordered FEC solution on the device, and after enabling it. The **show ip bgp** command output is also included to correlate next hop with corresponding router-id of the peer that the path was received from.

Example

```
switch# show ip bgp 1.0.16.0
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 1
BGP routing table entry for 1.0.16.0/24

    via 1.0.15.2, Vlan2191
    via 1.0.11.2, Vlan2836
```

15.5.1.16.3 Limitations

Ordered FEC is supported only for IPv4 and IPv6 BGP ECMP routes received with directly connected next hops.

15.5.1.17 BGP IPv4-mapped IPv6 Address Next Hops for IPv6 Labeled-Unicast Routes

A BGP router in an IPv4 network may need to receive or send labeled-unicast routes to and from IPv6 networks. A receiving BGP router can be configured so that when it receives a next hop with an IPv4-mapped IPv6 address, the IPv4 address is used for resolving the next hop. Similarly, a sending BGP router can use the IPv4-mapped IPv6 address of its interface as the next hop. For example, this allows IPv6 labeled-unicast EPE bindings to be carried across an IPv4 MPLS network with a next hop corresponding to the border node's loopback IPv4-mapped IPv6 address. The iBGP peer receiving the IPv6 labeled-unicast EPE bindings resolves the IPv4-mapped IPv6 next hop over a IPv4 MPLS transport tunnel.

Example

In this example, a labeled-unicast path from a BGP router in one IPv6 network needs to cross an IPv4 MPLS network to a BGP router in another IPv6 network, as shown in the figure.

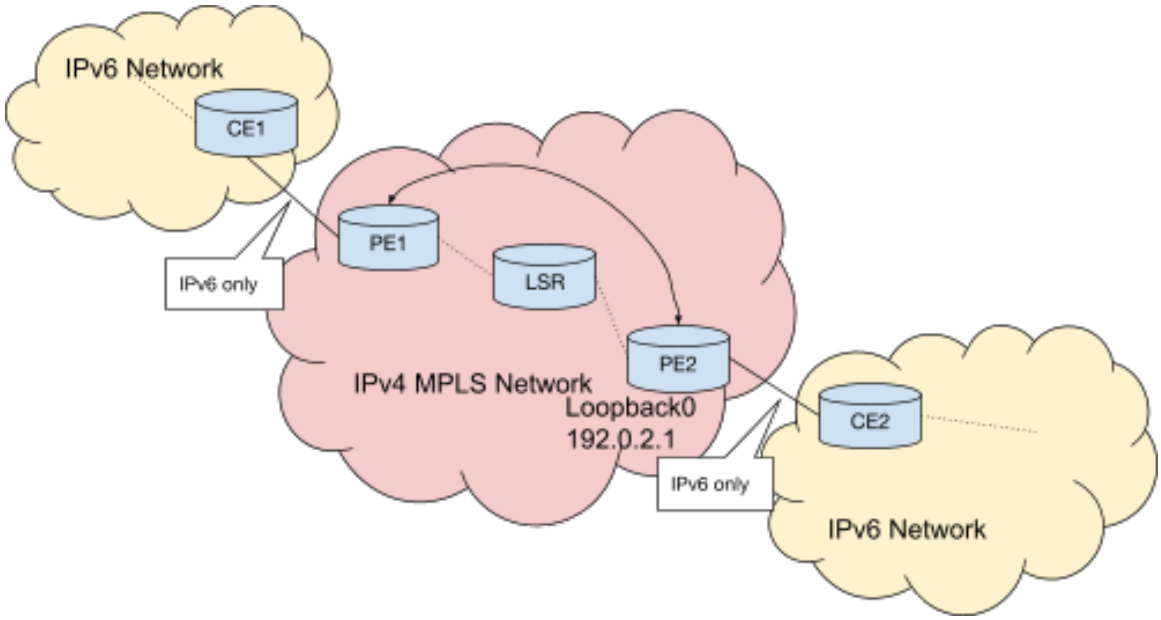

Figure 58: IPv4-mapped IPv6 address example

- Customer edge router CE2 advertises an IPv6 labeled-unicast route to provider edge router PE2.
- PE2 advertises to PE1 the IPv6 labeled-unicast route using the IPv4-mapped address of its loopback interface.
- PE1 receives the IPv6 labeled-unicast route, and uses the IPv4 address of the IPv4-mapped IPv6 address in order to resolve the next hop. It resolves to PE2 with an IPv4 multiprotocol label switching (MPLS) tunnel.
- PE1 advertises the IPv6 labeled-unicast route to CE1.

This allows a BGP speaker to send and receive IPv6 labeled-unicast paths with IPv4-mapped IPv6 next hops through the use of appropriate send-side policy and receive-side policy.

15.5.2 Configuring BGP

These sections describe basic BGP configuration steps:

15.5.2.1 Configuring BGP Instances

15.5.2.1.1 Creating an Instance and Entering BGP Configuration Mode

The switch supports one BGP instance, which is associated with a specified Autonomous System (AS). To other BGP peers, the AS number uniquely identifies the network to which the switch belongs. Arista switches support four-byte AS numbers as described in ***RFC 4893***. Four-byte AS number capability is communicated to BGP peers in OPEN messages. When communicating with a BGP peer which does not support four-byte AS numbers, the switch will replace AS numbers greater than ***65535*** with the well-known two-byte AS number ***23456*** (also called AS_TRANS), and encode the actual four-byte AS numbers using the ***AS4_PATH*** attribute.

The switch must be in router-BGP configuration mode to run BGP configuration commands. The **router bgp** command places the switch in the ***router-BGP*** configuration mode for creating a BGP instance if one was not previously created. BGP configuration commands apply globally to the BGP instance.

Example

This command places the switch in router-BGP configuration mode. It also creates a BGP instance in AS ***50*** if an instance was not previously created.

```
switch(config)# router bgp 50
switch(config-router-bgp)#
```

When a BGP instance exists, the **router bgp** command must include its autonomous system. Any attempt to create a second instance results in an error message.

Example

This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

```
switch(config)# router bgp 100
% BGP is already running with AS number 50
switch(config)#
```

15.5.2.1.2 Configuring BGP in a VRF

IPv6 VRF support in EOS allows application of a BGP configuration to a single VRF instance, overriding global commands. To apply VRF-specific BGP configuration, use the **vrf** command within router-BGP configuration mode to enter BGP VRF configuration mode. IPv6 BGP VRF configuration is performed in the VRF submode of the router-BGP configuration mode. This submode is also where a Route Distinguisher (RD) is configured for a VRF on switches running Ethernet VPN (EVPN): use the **rd (Router-BGP VRF and VNI Configuration Modes)** command to configure an RD for a VRF.

Examples

- These commands place the switch in BGP VRF configuration mode for VRF ***purple***. Commands issued in this mode override the global BGP configuration for the specified VRF instance.

```
switch(config)# router bgp 1
switch(config-router-bgp)# vrf purple
switch(config-router-bgp)#
```

- These commands activate IPv6 address-family support for the IPv6 neighbor ***2001:0DB8:8c01::1*** in VRF ***purple***.

```
switch(config-router-bgp-vrf-purple)# router-id 1.1.1.1
switch(config-router-bgp-vrf-purple)# neighbor 2001:0DB8:8c01::1
 remote-as 16
switch(config-router-bgp-vrf-purple)# address-family ipv6
switch(config-router-bgp-vrf-purple-af)# neighbor 2001:0DB8:8c01::1
 activate
switch(config-router-bgp-vrf-purple-af)#
```

- This command configures a route distinguisher for VRF ***purple***.

```
switch(config-router-bgp-vrf-purple)# rd 530:12
switch(config-router-bgp-vrf-purple)#
```

15.5.2.1.3 Using RCF in BGP configuration

RCF functions support in EOS allows application of a BGP configuration to filter routes and update route attributes. RCF functions can be configured for inbound and outbound updates on BGP neighbors under the IPv4 unicast, IPv6 unicast, IPv4 labeled unicast, and IPv6 labeled unicast address families.

Examples

- These commands configure the switch in RCF functions for IPv4 application.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# neighbor 192.168.0.1 rcf in INBOUND_POLIC
Y()
```

```
switch(config-router-bgp-af)# neighbor 192.168.0.1 rcf out
 OUTBOUND_POLICY()
```

- These commands configure the switch in RCF functions for IPv6 unicast application.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# address-family ipv6 labeled-unicast
switch(config-router-bgp-af-label)# neighbor 192.168.0.1 rcf in
 LU_INBOUND_POLICY()
switch(config-router-bgp-af-label)# neighbor 192.168.0.1 rcf out
 LU_OUTBOUND_POLICY()
```

- These commands configure RCF function with the redistribute configuration statement for connected and static routes.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# redistribute connected rcf CONNECTED_POL
ICY()
switch(config-router-bgp)# redistribute static rcf STATIC_POLICY()
```

- These commands configure RCF function on routes redistributed into BGP from IS-IS. Level 1, level 2, or both IS-IS level routes can be specified for RCF application.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# redistribute isis level-1 rcf ISIS_LEVEL_1_
POLICY()
switch(config-router-bgp)# redistribute isis level-2 rcf ISIS_LEVEL_2_
POLICY()
switch(config-router-bgp)# redistribute isis level-1-2 rcf
 ISIS_LEVEL_1_2_POLICY()
```

15.5.2.2 Configuring BGP Neighbors

15.5.2.2.1 Establishing BGP Neighbors

BGP neighbors, or peers, are established by configuration commands that initiate a TCP connection. BGP supports two types of neighbors:

- **Internal neighbors** are in the same autonomous system.
- **External neighbors** are in different autonomous systems.

BGP neighbors can be either static or dynamic:

- **Static neighbors** are established by manually configuring the connection.
- **Dynamic neighbors** are established by creating a listen range and accepting incoming connections from neighbors in that address range.

Static neighbors may belong to a static peer group, allowing them to be configured as a group. Configuration applied to an individual member of a static peer group overrides the group configuration for that peer. Dynamic neighbors must belong to a dynamic peer group, and can only be configured as a group.

Static BGP Neighbors

The **`neighbor remote-as`** command connects the switch with a peer, establishing a static neighbor.

Once established, a static neighbor may be added to an existing peer group. Any configuration applied to the peer group then is inherited by the neighbor, unless a conflicting configuration has been entered for that peer. Settings applied to a member of the peer group override group settings.

Note: To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (for example, in an IPv6-only environment), configure an appropriate router ID using the **router-id (BGP)** command.

Examples

- These commands establish an internal BGP connection with the peer at ***10.1.1.14***.

```
switch(config)# router bgp 50
switch(config-router-bgp)# neighbor 10.1.1.14 remote-as 50
switch(config-router-bgp)#
```

- These commands establish an external BGP connection with the peer at ***192.168.2.5***.

```
switch(config)# router bgp 50
switch(config-router-bgp)# neighbor 192.168.2.5 remote-as 100
switch(config-router-bgp)#
```

Dynamic BGP Neighbors

The **bgp listen range** command specifies a range of IPv4 addresses from which the switch will accept incoming dynamic BGP peering requests, and creates the named dynamic peer group to which those peers belong. Dynamic BGP neighbors are peers which have not been manually established, but are accepted into a dynamic peer group when the switch receives a peering request from them.

Dynamic peers cannot be configured individually, but inherit any configuration that is applied to the peer group to which they belong. Peering relationships with dynamic peers are terminated if the peer group is deleted.

Example

These commands create a peer group called “brazil” which accepts dynamic peering requests from the ***192.168.2.0/24*** subnet.

```
switch(config)# router bgp 50
switch(config-router-bgp)# bgp listen range 192.168.2.0/24 peer-group
 brazil remote-as 50
switch(config-router-bgp)#
```

Displaying Neighbor Connections

The **show ip bgp summary** and **show ip bgp neighbors** commands display neighbor connection status.

Example

This command indicates the connection state with the peer at ***192.168.2.5*** is **Estab** (established). The peer is an external neighbor because it is in AS ***100*** and the local server is in AS ***50***.

```
switch# show ip bgp summary
BGP summary information for VRF default
BGP router identifier 192.168.104.2, local AS number 50
Neighbor Status Codes: m - Under maintenance
  Neighbor     V  AS  MsgRcvd  MsgSent  InQ OutQ  Up/Down State  PfxRcd
 PfxAcc
  192.168.2.5  4  100     198      281    0    0 03:11:31 Estab  12
 12
switch#
```

Static BGP Peer Groups

A static BGP peer group is a collection of BGP neighbors which can be configured as a group. Once a static peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Neighbors added to the group will inherit any settings already created for the group. Static peer group members may also be configured individually, and the settings of an individual neighbor in the peer group override group settings for that neighbor.

When the **default** form of a BGP configuration command is entered for a member of a static peer group, the peer inherits that configuration from the peer group.

A static peer group is created with the **neighbor peer group (create)** command, or by using the **bgp listen range** command to accept dynamic peering requests. Once a static peer group has been created, static neighbors can be manually added to the group by using the **neighbor peer group (neighbor assignment)** command. The **no neighbor peer group (neighbor assignment)** command removes a neighbor from a static peer group.

The **no neighbor peer group (create)** command will delete a static peer group. When a peer group is deleted, the members of that group revert to their individual configurations, or to the system default for any attributes that have not been specifically configured for that peer.

Examples

- These commands create a peer group named ***akron***.

```
switch(config)# router bgp 50
switch(config-router-bgp)# neighbor akron peer group
switch(config-router-bgp)#
```

- This command adds the neighbors at ***1.1.1.1*** and ***2.2.2.2*** to peer group ***akron***.

```
switch(config-router-bgp)# neighbor 1.1.1.1 peer group akron
switch(config-router-bgp)# neighbor 2.2.2.2 peer group akron
switch(config-router-bgp)#
```

- These commands configure the members of peer group ***akron***, but cause the neighbor at ***1.1.1.1*** to use the system default value for out-delay.

```
switch(config-router-bgp)# neighbor akron remote-as 109
switch(config-router-bgp)# neighbor akron out-delay 101
switch(config-router-bgp)# neighbor akron maximum-routes 12000
switch(config-router-bgp)# no neighbor 1.1.1.1 out-delay
switch(config-router-bgp)#
```

Dynamic BGP Peer Groups

A dynamic BGP peer group is a collection of BGP neighbors in a specified address range which makes a peer request to the switch. Members of dynamic peer group are configured in groups and not as individuals. A dynamic peer group name is used as a parameter to apply the configuration across all the members in the group. Neighbors joining the group inherit any settings already created for the group.

The **bgp listen range** command is used to create a dynamic peer group. This command identifies the BGP peering request from a range of IP address, and names the dynamic peer group to which those peers belong to. The **bgp listen range** command can be configured to accept a peering request from a single AS number or to accept peer request from the range of AS numbers. To accept the request from the range of AS numbers use the **peer filter** option in the command as shown. If the peer filter referred by the **bgp listen range** command does not exist, or if the filter exists but has no match commands, it will accept any AS number.

Note: When a listen range command is modified, any existing dynamic neighbor that is already established will get reset.

To delete a dynamic peer group, use the **no** or **default** form of the **`bgp listen range`** command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Examples

- These commands create a dynamic peer group called ***brazil*** in a single AS, which accepts peering requests from the ***192.0.2.0/24*** subnet the single AS is ***5***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-group
 brazil remote-as 5
switch(config-router-bgp)#
```

- These commands create a dynamic peer group called ***brazil*** in a range of ASNs, which accepts peering requests from the ***192.0.2.0/24*** subnet. The range of AS numbers is defined by peer filter option.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-group
 brazil peer-filter group-1
switch(config-router-bgp)#
```

- The **`show ip bgp peer group`** command displays the source of a listen range's remote AS number definition as shown.

```
switch(config-router-bgp)# show ip bgp peer-group
BGP peer-group is brazil
 BGP version 4
 Listen-range subnets:
VRF default:
192.0.2.0/24, remote AS 5
192.0.2.0/24, peer filter group1
switch(config-router-bgp)#
```

15.5.2.2.2 Peer Filter

A peer filter defines a set of rules to decide whether to accept or reject the incoming peer request based on the peer's attributes. The peer filter is defined using a sequence number and a match statement, and supports one new match statement for matching against a range of BGP AS numbers. A peer filter is defined in peer filter configuration mode as shown. The peer filter command supports only matching AS ranges. Unlike route maps, peer filters do not support sets, continues or subroutines.

To delete a peer filter, use the **`no peer filter`** or **`default peer filter`** commands.

Examples

- These commands define a peer filter that accepts any AS number.

```
switch(config)# peer-filter group1
switch(config-peer-filter-group1)# 10 match as-range 1-4294967295
 result accept
switch(config-peer-filter-group1)#
```

- These commands define a peer filter that accepts any AS number between ***65000*** and ***65100*** (inclusive) except ***65008*** and ***65009***.

```
switch(config)# peer-filter group2
```

```
switch(config-peer-filter-group2)# 10 match as-range 65008-65009 result
 reject
switch(config-peer-filter-group2)# 20 match as-range 65000-651000
 result accept
switch(config-peer-filter-group2)#
```

- These commands define a peer filter that accepts ***3*** specific remote AS numbers.

```
switch(config)# peer-filter group3
switch(config-peer-filter-group3)# 10 match as-range 65003 result
 accept
switch(config-peer-filter-group3)# 20 match as-range 65007 result
 accept
switch(config-peer-filter-group3)# 30 match as-range 65009 result
 accept
switch(config-peer-filter-group3)#
```

- The **show peer-filter** command displays the peer filter definition.

```
switch(config)# show ip bgp peer-group3
peer-filter group3
   10 match as-range 65003 result accept
   20 match as-range 65007 result accept
30 match as-range 65009 result accept
switch(config)#
```

15.5.2.2.3 Special Considerations for IPv6

BGP predates the use of IPv6, and BGP configuration assumes IPv4 connections by default. The following additional steps are used to configure IPv6 BGP neighbors.

Note: To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the **router-id (BGP)** command.

Activating IPv6 Neighbors

By default, the switch does not negotiate or advertise IPv6 BGP routes. In order to establish a session with an IPv6 neighbor, it must be made active in the IPv6 address family. The **ipv6-unicast** option of the **bgp default** command causes the switch to send IPv6 capability messages and all network advertisements with IPv6 prefixes to all BGP neighbors. The **neighbor activate** command issued in IPv6 address family configuration mode does the same for a single BGP neighbor.

Examples

- These commands make all BGP neighbors active in the IPv6 address family.

```
switch(config)# router bgp 11
switch(config)# address-family ipv6
switch(config-router-bgp-af)# bgp default ipv6-unicast
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#
```

- These commands make the BGP neighbor at ***2001:0DB8:8c01::1*** active in the IPv6 address family.

```
switch(config)# router bgp 11
switch(config)# address-family ipv6
switch(config-router-bgp-af)# neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)# exit
```

```
switch(config-router-bgp)#
```

Sending IPv4 NLRIs over IPv6 Connections

The switch supports the exchange of IPv4 NLRIs with IPv6 neighbors. To enable this feature for all IPv6 neighbors, use the **ipv4-unicast transport ipv6** option of the **bgp default** command in the ***IPv4 address family*** configuration mode. To enable it for a single IPv6 neighbor, use the **neighbor activate** command for that neighbor in the ***IPv4 address family*** configuration mode.

To send IPv4 NLRIs to IPv6 neighbors, the IPv4 next-hop address must also be communicated. To explicitly configure an IPv4 next hop to send to a specific IPv6 neighbor, use the **neighbor local-v4-addr** command. In some network configurations, the switch can also be configured to automatically determine the best IPv4 next-hop address for an individual IPv6 neighbor or for all neighbors in the VRF using the **neighbor auto-local-addr** command.

Examples

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors, then configure the switch to automatically select a local IPv4 address to be sent in NLRIs to the IPv6 neighbors in a peer group called ***indianapolis***.

```
switch(config)# router bgp 11
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# neighbor indianapolis auto-local-addr
switch(config-router-bgp)#
```

- These commands permit IPv4 NLRI transport with the IPv6 neighbor at ***2001:0DB8:8c01::1*** using a local IPv4 address of ***10.7.5.11***.

```
switch(config)# router bgp 11
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# neighbor 2001:0DB8:8c01::1 local-v4-addr
 10.7.5.11
switch(config-router-bgp)#
```

15.5.2.2.4 Maintaining Neighbor Connections

BGP neighbors maintain connections by exchanging KEEPALIVE, UPDATE, and NOTIFICATION messages. Neighbors that do not receive a message from a peer within a specified period (**hold time**) close the BGP session with that peer. Hold time is typically three times the period between scheduled KEEPALIVE messages. The default keepalive period is ***60*** seconds; default hold time is ***180*** seconds.

The **timers bgp** command configures the hold time and keepalive period. A peer retains its BGP connections indefinitely when its hold time is zero.

Example

This command sets the keepalive period to ***15*** seconds and the hold time to ***45*** seconds.

```
switch(config-router-bgp)# timers bgp 15 45
switch(config-router-bgp)#
```

The **show ip bgp neighbors** command displays the hold time.

Example

This command indicates the BGP hold time is ***45*** seconds.

```
switch# show ip bgp neighbors 10.100.100.2
BGP neighbor is 10.100.100.2, remote AS 100
BGP version 4, remote router ID 192.168.100.13, VRF default
  Negotiated BGP version 4
  Last read 00:00:05, last write 00:00:05
  Hold time is 45, keepalive interval is 15 seconds          <= hold time
  Configured hold time is 45, keepalive interval is 15 seconds
  Connect timer is inactive
  Idle-restart timer is inactive
  BGP state is Established, up for 04:44:05
  Number of transitions to established: 11
  Last state was OpenConfirm
  Last event was RecvKeepAlive
  Last sent notification:Cease/administrative reset, Last time 04:44:09
  Last rcvd notification:Cease/peer de-configured, Last time    2d02h,
 First time 7d08h, Repeats 1
  Neighbor Capabilities:
  Multiprotocol IPv4 Unicast: advertised and received and negotiated
  Four Octet ASN: advertised and received
              <-------OUTPUT OMITTED FROM EXAMPLE------->
switch#
```

15.5.2.2.5 Neighbor Route Configuration

Maximum Routes

The **`neighbor maximum-routes`** command determines the number of BGP routes the switch accepts from a specified neighbor. The switch disables peering with the neighbor when this number is exceeded.

Example

This command configures the switch to accept ***15,000*** routes from the peer at ***192.168.18.24***.

```
switch(config-router-bgp)# neighbor 192.168.18.24 maximum-routes 15000
switch(config-router-bgp)#
```

Route Reflection

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers; they do not re-advertise iBGP-learned routes within the AS to prevent routing loops. Although a fully meshed network topology ensures that all AS members share routing information, this topology can result in high volumes of iBGP messages when scaled. Alternatively, one or more routers can be configured as route reflectors in larger networks.

A route reflector re-advertises routes learned through iBGP to a group of BGP neighbors within the AS, replacing the function of a fully meshed topology. The **`neighbor route-reflector-client`** command configures the switch to act as a route reflector and configures the specified neighbor as a client. The **`bgp client-to-client reflection`** command enables client-to-client reflection.

Cluster IDs When using route reflectors, an AS is divided into clusters. A cluster contains at least one route reflector and a group of clients to which they re-advertise route information. A cluster may contain multiple route reflectors to provide redundancy protection. Each reflector has a cluster ID. When the cluster has a single route reflector, the cluster ID is its router ID. When a cluster has multiple route reflectors, a 4-byte cluster ID is assigned to all route reflectors in the cluster, allowing them to

recognize updates from other cluster reflectors. The **bgp cluster-id** command configures the cluster ID in a cluster with multiple route reflectors.

Attribute Preservation Outbound BGP policies can rewrite the BGP attributes (next-hop, local preference and metric) of routes advertised by a route reflector. To configure the route reflector to preserve these attributes regardless of policy (unless those policies are included in a route map), use the **bgp route-reflector preserve-attributes** command. To include route attributes at all times (even contrary to policies included in route maps), use the always option of the command.

Client-to-client Reflection Usually the clients of a route reflector are not interconnected, and any routes learned by a client are mirrored to other clients and re-advertised within the AS by the route reflector. If the clients of a route reflector are fully meshed, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled using the **no bgp client-to-client reflection** command.

Examples

- These commands configure the switch as a route reflector and the neighbor at ***172.72.14.5*** as one of its clients, set the cluster ID to ***172.22.30.101***, and configure the reflector to preserve all BGP attributes of re-advertised routes.

```
switch(config-router-bgp)# neighbor 172.72.14.5 route-reflector-client
switch(config-router-bgp)# bgp cluster-id 172.22.30.101
switch(config-router-bgp)# bgp route-reflector preserve-attributes
switch(config-router-bgp)#
```

- This command displays the global BGP status for the default VRF, including route reflector configuration.

Note: The value of the “Attributes of reflected routes” can be **preserved** (reflected routes maintain attributes unless they are removed by an outbound BGP policy map), **always preserved** (reflected routes maintain BGP attributes regardless of all policies), or **not preserved** (reflected routes do not maintain their BGP attrributes).

```
switch# show bgp instance
BGP instance information for VRF default
BGP Local AS: 64512, Router ID: 1.1.4.1
Total peers:              14
  Configured peers:       14
  UnConfigured peers:     0
  Disabled peers:         4
  Established peers:      9
Graceful restart helper mode enabled
Attributes of reflected routes are preserved
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
    BGP has converged:   yes,   Time taken to converge: 00:05:44
    Outstanding EORs:    0,     Outstanding Keepalives: 0
Convergence timeout: 00:10:00
switch#
```

Route Preference

The primary function of external peers is to distribute routes they learn from their peers. Internal peers receive route updates without distributing them. External peers receive route updates, then distribute them to internal and external peers.

Local preference is a metric that iBGP sessions use to select an external route. Preferred routes have the highest local preference value. UPDATE packets include this metric in the **LOCAL_PREF** field.

The **neighbor export-localpref** command specifies the **LOCAL_PREF** that the switch sends to an internal peer. The command overrides previously assigned preferences and has no effect on external peers.

Example

This command configures the switch to enter ***200*** in the **LOCAL_PREF** field of UPDATE packets it sends to the peer at ***10.1.1.45***.

```
switch(config-router-bgp)# neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp)#
```

The **neighbor import-localpref** command assigns a local preference to routes received through UPDATE packets from an external peer. This command has no effect when the neighbor is an internal peer.

Examples

- This command configures the switch to assign the local preference of ***50*** for routes advertised from the peer at ***172.16.5.2***.

  ```
  switch(config-router-bgp)# neighbor 172.16.5.2 import-localpref 50
  switch(config-router-bgp)#
  ```

  The **show ip bgp** command displays the **LOCAL_PREF** value for all listed routes.
- This command indicates the route to network 10.10.20.0/24 has a local preference of 400.

  ```
  switch# show ip bgp
  BGP routing table information for VRF default
  Router identifier 192.168.100.23, local AS number 64512
  Route status codes: s - suppressed, * - valid, > - active, # - not
   installed, E - ECMP head, e - ECMP S - Stale, c - Contributing to
   ECMP, b - backup, L - labeled-unicast
  Origin codes: i - IGP, e - EGP, ? - incomplete
  AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
   Nexthop - Link Local Nexthop

          Network          Next Hop         Metric  LocPref Weight  Path
   * >Ec 10.10.20.0/24     192.168.31.3     0       400     0
   64521 i
  switch#
  ```

Graceful Restart

Graceful BGP restart allows a BGP speaker with separate control plane and data plane processing to continue forwarding traffic during a BGP restart. Its neighbors (receiving speakers) may retain routing information from the restarting speaker while a BGP session with it is being re-established, reducing route flapping.

Arista switches can act as helpers (receiving speakers) for graceful BGP restart with neighbors that advertise graceful restart capability.

Graceful restart helper mode is enabled by default, but can be turned off globally with the **no graceful-restart-helper** command. Per-peer configuration takes precedence over the ***global*** configuration.

Examples

- This command disables graceful restart helper mode for all BGP peers.

  ```
  switch(config-router-bgp)# no graceful-restart-helper
  ```

```
switch(config-router-bgp)#
```

- This command disables graceful restart helper mode for the neighbor at ***192.168.32.5*** regardless of global configuration.

```
switch(config-router-bgp)# no neighbor 192.168.32.5 graceful-restart-
helper
switch(config-router-bgp)#
```

Peers with graceful restart capability advertise a restart time value as an estimate of the time it will take them to restart a BGP session. When a BGP session with a restarting speaker goes down, the switch (receiving speaker) marks routes from that peer as stale and starts the restart timer. If the session with the peer is not re-established before the restart time runs out, the switch deletes the stale routes from that peer. If the session is re-established within that time, the stale path timer is started. If the stale paths are not updated by the restarting speaker before the stale path time runs out, they are deleted. The maximum time these stale paths are retained after the BGP session is re-established is ***300*** seconds by default, but can be configured using the **graceful-restart stalepath-time** command.

Example

This command configures BGP to discard stale paths from a restarting peer ***500*** seconds after the BGP session with that peer is re-established.

```
switch(config-router-bgp)# graceful-restart stalepath-time 500
switch(config-router-bgp)#
```

15.5.2.2.6 Filtering Routes

Filtering with Route Maps

Route maps are used in BGP to directly filter IPv4 unicast routes. The **neighbor route-map (BGP)** command applies a route map to inbound or outbound BGP routes. To display the route maps associated with a specific BGP neighbor, use the **show ip bgp neighbors** command.

The redistribution of BGP unicast routes into multicast address families allows the network to take a different path for the multicast traffic. It allows redistribution of IPv4 unicast routes into the IPv4 multicast address family and IPv6 unicast routes into the IPv6 multicast address family.

The following command configures the redistribution of IPv4 unicast routes into IPv4 multicast address family in both default and non-default VRF.

```
switch(config-router-bgp)# address-family ipv4 multicast
switch(config-router-bgp-af)# route input address-family ipv4 unicast rcf
 onePfx()
```

The following commands shows the two BGP unicast routes that are received by ***bgprtr1***.

```
bgprtr1(config-router-multicast)# show bgp ipv4 unicast
BGP routing table information for VRF default
Router identifier 1.1.1.1, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup, L -

```

Filtering with BGP Communities

Community values are assigned to a set of subnet prefixes through route map **`set`** commands. Route map **`match`** commands subsequently use community values to filter routes. The switch uses the following **`ip community-list`** commands to filter community routes into a BGP domain:

- **`ip community-list`** creates a community list by explicitly referencing one or more communities by name or number.
- **`ip community-list regexp`** creates a community list by referencing one or more communities by regular expression.
- **`ip extcommunity-list`** creates an extended community list to identify routes for VRFs or for Link BandWidth (LBW) by explicitly referencing extended communities by prefix and number.
- **`ip extcommunity-list regexp`** creates an extended community list to identify routes for VRFs or for Link BandWidth (LBW) by regular expression.

The BGP community attribute is a ***32*** bit value formatted as follows:

- an integer between ***0*** and ***4294967040***.
- AA:NN, where AA is ***65535*** and NN specifies the community number (***0***-***65535***) within the AS.

These four community attribute values, and the associated BGP speaker actions, are predefined:

- **no-export**: speaker does not advertise the routes beyond the BGP domain.
- **no-advertise**: speaker does not advertise the routes to any BGP peers.
- **local-as**: speaker does not advertise route to any external peers.
- **internet**: speaker advertises the route to the Internet community. By default, this includes all prefixes.

Example

- These commands assign two network subnets to a prefix list, assign a community number to the prefix list members, then utilize that community in an **`ip community-list`** command to permit the routes into the BGP domain.

1. Compose the IP prefix list.

```
switch(config)# ip prefix-list PL_1 permit 10.1.2.5/24
switch(config)# ip prefix-list PL_1 permit 10.2.5.1/28
switch(config)#
```

2. Create a route map that matches the IP prefix list and sets the community value.

```
switch(config)# route-map MAP_1 permit
switch(config-route-map-MAP_1)# match ip address prefix-list PL_1
switch(config-route-map-MAP_1)# set community 500
switch(config-route-map-MAP_1)# exit
switch(config)#
```

3. Create a community list that references the community.

```
switch(config)# ip community-list CL_1 permit 500
switch(config)#
```

BGP extended communities identify routes for VRFs or for Link BandWidth (LBW). Extended community clauses utilize Route Target (RTt) and Site of Origin Options (SOO):

- **route targets** identify sites that may receive appropriately tagged routes.
- **site of origin** identifies the site where the router learned the route.

Filtering with AS Path Access Lists

An AS path access list is a named list of permit and deny statements which use regular expressions to filter BGP routes based on their AS path attribute. AS path access lists are created using the **ip as-path access-list** command, and are applied using a route map **match** clause with the name of the access list as a parameter.

Example

These commands create an AS path access list identifying routes which pass through AS ***3***, create a route map which references the access list, assign the routes it filters to community ***300***, and apply the route map to the neighbor at ***192.68.14.5*** to assign a community value of ***300*** to inbound routes received from that neighbor.

1. Create the AS path access list.

```
switch(config)# ip as-path access-list as_list3 permit _3
```

2. Create a route map that matches the AS path access list and sets the community value.

```
switch(config)# route-map MAP_3 permit
switch(config-route-map-MAP_3)# match as-path as_list3
switch(config-route-map-MAP_3)# set community 300
switch(config-route-map-MAP_3)# exit
```

3. Apply the route map to the neighbor.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.68.14.5 route-map MAP_3 in
switch(config-router-bgp)#
```

15.5.2.3 Configuring GTSM for BGP

The Generalized TTL Security Mechanism (GTSM) uses a packet's Time to Live (TTL) (IPv4) or Hop Limit (IPv6) to protect BGP peering sessions from Denial-of-Service (DoS) attacks based on forged protocol packets.

An IP packet received from a BGP peer is discarded when its current TTL value is less than (***255***-***n***) where ***n*** is the configured maximum number of hops to the peer. Use the **neighbor ttl maximum-hops** command to configure the maximum hop count.

Note: IP packets to GTSM enabled BGP peers are sent with the configured TTL value of ***255***.

15.5.2.4 Configuring Routes

15.5.2.4.1 Advertising Routes

A BGP neighbor advertises routes it can reach through UPDATE packets. The **network (BGP)** command specifies a prefix that the switch advertises as a route originating from its AS.

The configuration clears the host portion of addresses entered in **network** commands. For example, ***192.0.2.4/24*** is stored as ***192.0.2.0/24***.

Example

This command configures the switch to advertise the ***10.5.8.0/24*** network.

```
switch(config-router-bgp)# network 10.5.8.0/24
switch(config-router-bgp)#
```

By default, BGP will advertise only those routes that are active in the switch's RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The **bgp advertise-inactive** command causes BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

Examples

- This command configures the switch to advertise routes learned through BGP even if they are not active on the switch.

  ```
  switch(config-router-bgp)# bgp advertise-inactive
  switch(config-router-bgp)#
  ```

- This command overrides inactive route advertisement for VRF ***purple***.

  ```
  switch(config-router-bgp)# vrf purple
  switch(config-router-bgp-vrf-purple)# no bgp advertise-inactive
  switch(config-router-bgp-vrf-purple)#
  ```

15.5.2.4.1.1Advertising ISIS Routes into BGP Network

The **redistribute isis route-map isis-to-bgp** command advertises the routes learned through IS-IS routes into the BGP network. It also allows the user to selectively advertise some routes and modify route attributes before advertising using route maps.

The command is available in both address-family mode and router BGP mode, but the command is rejected if configured in both address-family mode and router mode at the same time.

While redistributing IS-IS routes into BGP, the **Level-1** or **Level-2** keyword can be used to selectively redistribute Level-1 routes or Level-2 routes into BGP. The keyword is optional, and defaults to Level-2 when not configured.

Use the **show ipv6 bgp detail** command to verify that routes are advertised with correct attributes.

Note: If the command is configured in router-af mode, it only redistributes routes with matching address family. If it is configured in router mode, it applies to all enabled address-families.

Examples

- These commands redistribute IS-IS routes into BGP in the ***address-family*** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# redistribute isis level-1 route-map isis-
to-bgp-v4
switch(config-router-bgp-af)#
```

- These commands redistribute IS-IS routes into BGP in the ***router BGP*** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute isis level-1 route-map isis-to-
bgp
switch(config-router-bgp)#
```

15.5.2.4.1.2Advertising OSPF Routes into BGP Network

Routes learned through the OSPF protocol can be redistributed into the BGP domain and advertised by BGP. To redistribute OSPF routes into BGP, use the **redistribute (BGP)** command. By default, **redistribute ospf** will redistribute only internal OSPF routes into BGP; the command must be issued separately with additional parameters for each type of OSPF route that is to be redistributed.

Examples

- These commands redistribute internal OSPF routes into BGP.

```
switch(config)# router bgp 1
switch(config-router-bgp) #redistribute ospf
switch(config-router-bgp)#
```

- These commands redistribute internal, external, and NSSA external OSPF routes into BGP.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute ospf internal
switch(config-router-bgp)# redistribute ospf external
switch(config-router-bgp)# redistribute ospf nssa-external
switch(config-router-bgp)#
```

15.5.2.4.2 BGP Route Aggregation

Aggregation combines the characteristics of multiple routes into a single route for advertisement by the BGP speaker. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregation options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Aggregate routes are created with the **aggregate-address** command, which takes an IP subnet as an argument; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

Note: This behaviour is observed only when the Single agent routing model (ribd) is run on the switch.

BGP speakers display aggregate routes that they create as null routes (with one exception: if all the contributors to the aggregate have the same BGP path attributes, then the BGP aggregate copies those attributes and is no longer a null route). Aggregate routes are advertised into the BGP autonomous system and redistributed automatically, and their redistribution cannot be disabled. BGP neighbors display inbound aggregate routes as normal BGP routes. Null routes are displayed with the **show ip route** command; normal BGP routes (and null aggregate routes) are displayed with the **show ip bgp** and **show ip route** commands.

Aggregation Options

The **aggregate-address** command provides the following aggregate route options:

- **AS_PATH attribute inclusion**: the **as-set** option controls the aggregate route's AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

  When the command includes **as-set**, the aggregate route's AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

  When the command does not include **as-set**, the aggregate route's ATOMIC_AGGREGATE attribute is set and the AS_PATH attribute does not include AS numbers of contributing routes.
- **Attribute assignment**: the **attribute-map** option assigns attributes contained in set commands in a specified route map's lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route's attributes by the switch.
- **Route suppression**: the **summary-only** option suppresses the advertisement of the contributor routes that comprise the aggregate.
- **Contributor filtering**: the **match-map** option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

Example

- These commands create an aggregate route (***10.16.48.0/20***) from four contributor routes (***10.16.48.0/23***, ***10.16.50.0/23***, ***10.16.52.0/23***, and ***10.16.54.0/23***). The aggregate route includes the **AS_PATH** information from the contributor routes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)# exit
switch(config)#
```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config)# route-map map1 permit 10
switch(config-route-map-map1)# set local-preference 40
switch(config-route-map-map1)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 attribute-
map map1
switch(config-router-bgp)# exit
```

```
switch(config)#
```

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```
switch(config)# route-map matchmap permit 10
switch(config-route-map-matchmap)# match ip address prefix-list agglist
switch(config-route-map-matchmap)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 1.1.0.0/16 match-map
 matchmap
switch(config-router-bgp)#
```

Identifying BGP Aggregate Contributors Match in Outbound Policy

When configured, this feature introduces the ability to match on:

1. Any BGP aggregate contributor, in the outbound route maps.
2. A specific BGP aggregate's contributor, in the outbound route maps.

The attributes that are currently supported for matching on BGP aggregate contributors are community, local-preference, prefix, next-hop,route-type.

Match Contributors to Any Aggregate

To match contributors to any BGP aggregate and set attributes (say communities) on said contributor, add an outbound policy with the clause:

```
switch(config-route-map-test)# match aggregate-role contributor
```

The **match aggregate-role contributor** clause only works with outbound policies.

Example

In this example, all the BGP contributor routes (to all aggregates) is assigned to the community ***65536:100*** as they are advertised to the neighbor ***192.0.2.1***.

```
ip community-list BLUE permit 65536:100
!
route-map OUTBOUND_POLICY permit 10
 match aggregate-role contributor
 set community community-list BLUE
!
route-map OUTBOUND_POLICY permit 20
 description "Permit the routes rejected by seq10"
!
router bgp 65536
 aggregate-address 203.0.113.0/24
 neighbor 192.0.2.1 route-map OUTBOUND_POLICY out
!
```

Match Contributors to Specific Aggregates

To match contributors which contribute only to a BGP aggregate with specific attributes (say communities) and set attributes (say communities again) on said contributor, add an outbound policy with the clause:

```
switch(config-route-map-test)# match aggregate-role contributor
 aggregate-attributes MATCH_AGG_COLOR
```

Define the **MATCH_AGG_COLOR** as below:

```
route-map MATCH_AGG_COLOR
     match community RED
```

Add an aggregate definition to explicitly set the desired attributes on the aggregate of interest:

```
route-map AGG_SET_COLOR
 set community community-list RED
!
router bgp 65536
 aggregate-address 203.0.113.0/24 attribute-map AGG_SET_COLOR
```

The route map referenced by the match **aggregate-role contributor aggregate-attributes** clause discards all set operations.

Example

- In this example the BGP contributor routes to the aggregate ***203.0.113.0/24*** (that has community ***65536:200***), to be assigned the community ***65536:100*** when they are advertised outbound to the neighbor ***192.0.2.1***.

```
ip community-list BLUE permit 65536:100
ip community-list RED permit 65536:200
!
route-map AGG_SET_COLOR
 set community community-list RED
!
route-map MATCH_AGG_COLOR
 match community RED
!
route-map OUTBOUND_POLICY permit 10
 match aggregate-role contributor aggregate-attributes MATCH_AGG_COLOR
 set community community-list BLUE
!
route-map OUTBOUND_POLICY permit 20
 description “Permit the routes rejected by seq10”
!
router bgp 65536
 aggregate-address 203.0.113.0/24 attribute-map AGG_SET_COLOR
 neighbor 192.0.2.1 route-map OUTBOUND_POLICY out
!
```

Invert-result Support

This match clause supports the invert-result modifier. When applied, invert-result inverts the result of the match clause to which it is applied.

The results for the following command would be:

```
switch(config-route-map-test)# match invert-result aggregate-role
 contributor aggregate-attributes MATCH_AGG_COLOR
```

1. match all routes that are not contributors to any aggregate.
2. match all routes that are contributors to aggregates where the aggregate doesn’t match **MATCH_AGG_COLOR** (provided **MATCH_AGG_COLOR** is configured).
3. not match all routes that are contributors to aggregates where the aggregate matches **MATCH_AGG_COLOR** (provided **MATCH_AGG_COLOR** is configured).
4. not match all routes that are contributors to aggregates if **MATCH_AGG_COLOR** is not configured.

Related Command

15.5.2.4.3 Customizing the BGP AS-Path Attribute

The BGP Replace AS-Path feature allows the user to customize the **AS_PATH** attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor. To configure the BGP Replace AS-Path feature, use the **set as-path match** and **set as-path prepend** commands.

To replace the **AS_PATH** attribute of routes received from a BGP neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the inbound direction.

To replace the **AS_PATH** attribute of routes that are advertised to a neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the outbound direction.

The Replace AS-Path feature works in conjunction with the AS-Path Prepend feature which is also used to modify the **AS_PATH** attribute. However, if both features are configured within the same route map, then the replace AS-Path feature takes precedence over the AS-Path Prepend.

Note: The BGP Replace AS-Path feature supports both eBGP and iBGP neighbors. The locally configured AS number is always prefixed to the AS-Path of routes advertised to the eBGP neighbors. This RFC behavior is retained in Arista's implementation of the Replace AS-Path feature as well.

BGP Replace AS-Path has the following limitations:

- Replacing the AS-Path should be used cautiously since it may impact BGP loop prevention.
- A few duplicated routes may be advertised and installed on a router after the original AS-Path of those routes are replaced.To fix this issue, it is always suggested to filter out such routes by prefix with BGP Community.

Example

This command replaces the AS-Path with the **none** option.

```
switch# show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default

switch#
```

The AS-path of matching prefixes are replaced with the locally configured AS 200.

15.5.2.4.4 Modifying the Local AS Value

The switch can replace its local AS number with a configured value when sending OPEN messages to a specified neighbor, allowing the switch to appear as a member of a different AS to that peer. In the case of a static peer, the neighbor must also be configured to recognize the modified AS in order for peering to occur. The additional configuration is unnecessary in the case of dynamic peers.

To configure a different local AS value for the switch, use the **neighbor local-as** command. To configure the peer to expect the altered ASN from the switch, use the **neighbor remote-as** command on the peer.

Example

These commands configure the switch to replace its local ASN in OPEN messages sent to the peer at ***10.13.64.1*** with ***ASN 64500***, and configure the peer to expect that ASN in messages received from the switch.

Switch Configuration

```
switch(config)# router bgp 64497
switch(config-router-bgp)# neighbor 10.13.64.1 local-as 64500 no-prepend
switch(config-router-bgp)#
```

Peer Configuration

```
peer(config)# router bgp 64502
peer(config-router-bgp)# neighbor 10.4.3.10 remote-as 64500
peer(config-router-bgp)#
```

15.5.2.4.5 AS-path Modifications for Split ASes

By default, BGP rejects routes that contain the local Autonomous System Number (ASN). Sometimes a single autonomous system is divided geographically or otherwise with one or more provider ASs in between. In these cases, a valid route can sometimes be dropped by a customer edge router because the local ASN appears in the AS-path of route advertisements that have traveled through one or more provider networks. To ensure that these routes are not dropped, the provider edge router can be configured to replace the customer AS with its own, or the customer edge router can be configured to ignore its local AS number in received routes.

Replacing Remote ASN in Outbound Route Announcements

To replace a remote ASN with the local ASN in BGP route announcements sent to a specified router, use the **`neighbor as-path remote-as replace out`** command.

Example

These commands configure the switch to substitute its local ASN for the ASN of the BGP neighbor at ***192.168.2.15*** in BGP routes advertised to that neighbor.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.2.15 as-path remote-as
 replace out
switch(config-router-bgp)#
```

Ignoring Local ASN in Incoming Route Announcements

To accept BGP routes that include the local ASN in their AS-path attribute, use the **`neighbor allowas-in`** command.

Example

These commands configure the switch to accept routes from the BGP neighbor at ***192.168.1.30*** which contain the switch's ASN in their AS paths as many as ***3*** times.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 allowas-in
switch(config-router-bgp)#
```

15.5.2.5 Configuring Address Families

The switch determines the network prefixes that peering sessions advertise and the BGP neighbor addresses that receive advertisements through address family activity configuration.

An address family is a data structure that defines route advertising status to BGP neighbor addresses. Each BGP neighbor address is assigned an activity level for each address family on the switch. The switch sends capability and network prefix advertisements to neighbor addresses that are active within specified address families:

- **IPv4 address family:** switch advertises IPv4 capability and network commands with IPv4 prefixes to neighbor addresses configured as **IPv4 address family active**.
- **IPv6 address family:** switch advertises IPv6 capability and network commands with IPv6 prefixes to neighbor addresses configured as **IPv6 address family active**.

15.5.2.5.1 Neighbor Address Family Configuration

Address family activity levels for neighbor addresses are configured through **`bgp default`** and **`neighbor activate`** commands.

- The **bgp default** command specifies the default activity level of BGP neighbor addresses for a specified address family.
- The **neighbor activate** command specifies deviations from default address family activity level for a specified BGP neighbor address.

Default Neighbor Activation

The **bgp default** command configures the default address family activity level of all configured BGP neighbor addresses. The switch advertises the following to **address family active** addresses:

- IPv4 address family active: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family active: IPv6 capability and all network advertisements with IPv6 prefixes.

These commands configure default address family activity levels for configured BGP neighbor addresses:

- **bgp default ipv4-unicast**: all BGP neighbor addresses are IPv4 address family active (this is the switch default).
- **no bgp default ipv4-unicast**: no BGP neighbor addresses are IPv4 address family active.
- **bgp default ipv6-unicast**: all BGP neighbor addresses are IPv6 address family active.
- **no bgp default ipv6-unicast**: no BGP neighbor addresses are IPv6 address family active (this is the switch default).
- **bgp default ipv4-unicast transport ipv6**: all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIs.

Note: If it is necessary to exchange IPv4 NLRIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command **bgp default ipv4-unicast transport ipv6**. For an individual neighbor, use the **neighbor activate** command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

Activating Individual Neighbor Addresses

The **address-family** command places the switch in address family mode to configure the address family activity level of individual BGP neighbor addresses. The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The ***running-config*** displays **address family** commands in sub-blocks of the BGP configuration. The **neighbor activate** command is available in each address family configuration mode and defines the configuration mode ***address family*** activity level of a specified configured BGP neighbor address. Addresses are assigned one of the following states by the activate command:

- **neighbor activate** configures the address as active in the configuration mode ***address family***.
- **no neighbor activate** configures the address as not active in the configuration mode ***address family***.

The switch sends the following announcements to addresses that are active in an address family:

- **IPv4 address family**: IPv4 capability and all network routes with IPv4 prefixes.
- **IPv6 address family**: IPv6 capability and all network routes with IPv6 prefixes.

The **neighbor route-map (BGP)** command applies a route map to inbound or outbound BGP routes. In address-family mode, the route map is applied to routes corresponding to the configuration-mode address family. When a route map is applied to outbound routes, the switch advertises only routes matching at least one section of the route map. One outbound and one inbound route map can be applied to a neighbor for each address family. Applying a route map to a route replaces the previous corresponding route map assignment.

Network Route Advertising in Address Families

The **network (BGP)** command specifies a network for advertisement through UPDATE packets to BGP peers. The command is available in Router-BGP and Router-BGP-Address-Family configuration modes; the mode in which the command is issued does not affect the command's execution.

- Commands with an IPv4 address are advertised to peers that are IPv4 address family-active.
- Commands with an IPv6 address are advertised to peers that are IPv6 address family-active.

Examples

- These commands instantiate BGP, configure three neighbors, and configure two network routes.

  The default activity level for IPv4 and IPv6 address families is set to the default; all neighbor addresses are IPv4 address family active and IPv6 address family not active. IPv4 capability and network routes with IPv4 prefixes are advertised to all neighbor IPv4 addresses.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)# neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)# neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)# network 172.18.23.9/24
switch(config-router-bgp)# network 2001:0DB8:de29::/64
switch(config-router-bgp)#
```

- These commands instantiate BGP on the switch, set IPv4 default activity level (**not active**), set IPv6 default activity level (**active**), and configure three neighbor addresses and two network route prefixes.

  IPv6 capability and network routes with IPv6 prefixes are advertised to all neighbor addresses.

```
switch(config)# router bgp 10
switch(config-router-bgp)# bgp default ipv6-unicast
switch(config-router-bgp)# no bgp default ipv4-unicast
switch(config-router-bgp)# neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)# neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)# neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)# network 172.18.23.9/24
switch(config-router-bgp)# network 2001:0DB8:de29::/64
switch(config-router-bgp)#
```

- These commands configure three neighbors, two network routes, and the default activity level for each address family (**not active**), and specify neighbor addresses for each address family that is active.

```
switch(config)# router bgp 11
switch(config-router-bgp)# neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)# neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)# neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)# network 172.18.23.9/24
switch(config-router-bgp)# network 2001:0DB8:de29::/64
switch(config-router-bgp)# no bgp default ipv4-unicast
switch(config-router-bgp)# no bgp default ipv6-unicast
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# neighbor 172.21.14.8 activate
switch(config-router-bgp-af)# neighbor 172.23.18.6 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#
```

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors.

```
switch(config)# router bgp 11
switch(config)# address-family ipv4
switch(config-router-bgp-af)# bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#
```

15.5.2.6 Configuring Best-path Selection

The best-path selection algorithm (described under **Best-Path Selection**) determines which of multiple paths to the same destination received by BGP will be added to the IP routing table. To shape route preferences and influence best-path selection, use the following commands in router-BGP configuration mode.

- **`bgp always-compare-med`** configures the switch to always consider the Multi-Exit Discriminator (MED) value when comparing paths (disabled by default).
- **`bgp bestpath as-path ignore`** configures the switch to ignore the length of the Autonomous System (AS) path when comparing routes (disabled by default).
- **`bgp bestpath as-path multipath-relax`** used in Equal-Post Multi Path (ECMP configuration) and enabled by default; the **no** form of the command configures the switch to consider paths unequal if their AS paths have different contents.
- **`bgp bestpath ecmp-fast`** the no form of this command causes the switch to ignore order of arrival in evaluating paths within an ECMP group.
- **`bgp bestpath med confed`** causes comparison of Multi-Exit Discriminator (MED) values in routes originating within the same confederation as the switch and received from confederation peers (disabled by default).
- **`bgp bestpath med missing-as-worst`** configures the switch to treat a missing MED as having the highest (least preferred) value (disabled by default). This command overrides the **missing-as-worst** setting of the **`bgp bestpath med confed`** command.
- **`bgp bestpath tie-break cluster-list-length`** configures the switch to prefer the multipath route with the shortest **CLUSTER_LIST** length in case of a tie in step 10 of the selection process (disabled by default).
- **`bgp bestpath tie-break router-id`** configures the switch to prefer the multipath route with the lowest **ROUTER_ID** in case of a tie in step 10 (disabled by default).

15.5.2.6.1 Displaying Reasons for Best-path Selection

To see the reasons why certain routes were excluded by the best-path selection process, use the **detail** option of the **`show ip bgp`** command. Enter the prefix to which BGP has selected a best path, and the output will display all learned paths. Paths which were not selected as best will display the reason they were not selected after the label **not best**.

The reason will be listed as one of the following:

- **path weight**
- **local preference**
- **AS path length**
- **origin**
- **path MED**
- **eBGP path preferred**
- **IGP cost**
- **AS path details**
- **ECMP-Fast configured**
- **router ID**

- **originator ID**
- **router ID tie-break configured**
- **cluster list length**
- **cluster list length tie-break configured**
- **peer IP address**
- **path ID**
- **redistributed route exists**
- **unknown**
- **another route from the same AS is a better BGP route**
- **peer not ready**
- **unusable**

Example

This command displays the reasons why three routes to ***172.16.0.0/24*** were rejected by the best-path algorithm. The reason for rejection is preceded by the label **Not best:**

```
switch# show ip bgp 172.16.0.0/24 detail
BGP routing table information for VRF default
Router identifier 192.168.100.18, local AS number 64524
Route status: [a.b.c.d] - Route is  queued for advertisement to peer.
BGP routing table entry for 204.1.47.220/30
 Paths: 4 available
  64512 64550 65100
    192.168.14.2 from 192.168.14.2 (192.168.100.21)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
 ago, valid,
external, ECMP head, ECMP, best, ECMP contributor
      Rx SAFI: Unicast
  64512 64550 65100
    192.168.24.2 from 192.168.24.2 (192.168.100.22)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
 ago, valid,
external, ECMP, ECMP contributor
      Rx SAFI: Unicast
      Not best: ECMP-Fast configured
  64512 64550 65100
    192.168.34.2 from 192.168.34.2 (192.168.100.23)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
 ago, valid,
external, ECMP, ECMP contributor
      Rx SAFI: Unicast
      Not best: Redistributed route exists
  64512 64550 65100
    192.168.44.2 from 192.168.44.2 (192.168.100.24)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
 ago, valid,
external, ECMP, ECMP contributor
      Rx SAFI: Unicast
      Not best: eBGP path preferred
Not advertised to any peer
switch#
```

15.5.2.7 Configuring BGP Convergence

To avoid hardware updates and route advertisement churn during switch reload or BGP instance start, BGP enters into the convergence state where it waits for all peers to join and receive all routes from all the peers.

BGP Convergence is bound by an upper value of convergence time (default value is ***5*** minutes) and BGP declares convergence on expiry of convergence timer. At the end of convergence, BGP updates the routes in FIB and advertises to all the peers.

To configure BGP convergence and the different timeout features, use the following commands in router-BGP configuration mode.

- **`update wait-for-convergence`** enables the BGP convergence feature.
- **`bgp convergence slow-peer time`** configures the BGP convergence idle peer timeout value. The default timeout value is 90 seconds.
- **`bgp convergence time`** configures the BGP convergence timeout value. The default timeout value is 300 seconds.

Different Cases for Convergence with Default Timeout Configuration

- **Convergence Time < 90 seconds after the first peer has joined**: this is the best case when all the configured peers have joined and EORs have been received from all peers in less than ***90*** seconds after the first peer has joined.
- **Convergence Time = 90 seconds after the first peer has joined**: this is the case when one or more BGP peers have joined within ***90*** seconds and EORs have been received from all peers within ***90*** seconds, but there are still some configured peers which have not joined yet. In this case, the convergence is declared after slow-peer timeout is reached.
- **Convergence Time > 90 seconds after the first peer has joined**: this is the case when one or more BGP peers have joined after ***90*** seconds, but EORs have not been received from all peers. As soon as EORs are received from all peers which have joined during the first ***90*** seconds, the convergence is declared.
- **Convergence Time = 300 seconds after the first peer has joined**: this is the case when EOR is not received till ***300*** seconds from some of the peers that have joined during 90 seconds after the first peer has joined.

15.5.2.7.1 Displaying BGP Convergence Status

Use the **`show bgp convergence`** command to view information about the BGP convergence status, and to know if the convergence timer has started or not. The examples below show the command output at different points in the convergence process.

No Peers Have Joined

This is the output when no peers have joined before convergence.

```
switch(config-router-bgp)# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to
 join)
 Convergence timer is not running
 Convergence timeout in use: 00:02:30
 Convergence slow peer timeout in use: 00:00:55
 First peer is not up yet
 All the expected peers are up: no
 All IGP protocols have converged: yes
 Outstanding EORs: 0, Outstanding Keepalives: 0
 Pending Peers: 2
 Total Peers: 2
 Established Peers: 0
 Disabled Peers: 0
```

```
 Peers that have not converged yet:
 IPv4 peers:
 201.1.1.1 (Session : Connect)
 202.1.1.1 (Session : Connect)
 IPv6 peers:
 None
switch(config-router-bgp)#
```

First Peer Has Joined

This is the output when the first peer has joined before convergence.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from peer(s)
 and IGP
convergence)
 Convergence timer running, will expire in 00:01:50
 Convergence timeout in use: 00:02:30
 Convergence slow peer timeout in use: 00:00:55
 First peer came up 00:00:13 ago
 All the expected peers are up: no
 All IGP protocols have converged: yes
 Outstanding EORs: 0, Outstanding Keepalives: 0
 Pending Peers: 1
 Total Peers: 2
 Established Peers: 1
 Disabled Peers: 0
 Peers that have not converged yet:
 IPv4 peers:
 201.1.1.1 (Session : Active)
 IPv6 peers:
 None
switch#
```

Convergence Timeout Reached

This is the output when the convergence timeout value is reached.

```
switch(config-router-bgp)# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
 Time taken to converge 00:02:30
 Pending Peers: 1
 Total Peers: 2
 Established Peers: 1
 Disabled Peers: 0
 Peers that did not converge before local bgp convergence:
 IPv4 peers:
 201.1.1.1 (Session : Active)
 202.1.1.1 (Session : Established)
 IPv6 peers:
 None
```

```
switch(config-router-bgp)#
```

Converged State

This is the output during the converged state.

```
switch(config-router-bgp)# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
 Time taken to converge 00:00:02
 First peer came up 00:00:05 ago
 Pending Peers: 0
 Total Peers: 3
 Established Peers: 3
 Disabled Peers: 0
 Peers that did not converge before local bgp convergence:
 IPv4 peers:
 None
 IPv6 peers:
 None
switch(config-router-bgp)#
```

15.5.2.8 Configuring BGP Graceful Shutdown Community

15.5.2.8.1 Creating a Route-Map Entry That Sets the Community for Graceful Shutdown

The **set community (route-map)** command specifies community attribute modifications to BGP routes.

Example

```
switch(config)# route-map map1
switch(config-route-map-map1)# set community GSHUT
switch(config)# exit
switch(config)#
```

15.5.2.8.2 Creating a Route-Map Entry with Matching Preferences on Graceful Shutdown Community

The **ip community-list** command creates and configures a BGP access list that is based on BGP communities.

The **match (route-map)** command creates a route map clause entry that specifies one route filtering condition.

Example

```
switch(config)# ip community-list gshut_list permit GSHUT
switch(config)# route-map map1
switch(config-route-map-map1)# match community gshut_list
switch(config-route-map-map1)# exit
switch(config)#
```

15.5.2.8.3 Validating the Route-Map

The **show route-map** command displays the contents of the specified route maps.

Example

```
switch# show route-map map1
route-map map1 permit 10
Description:
Match clauses:
Set clauses:
set community GSHUT
switch#
```

15.5.2.9 Configuring BGP Additional Paths Send

The **bgp additional-paths send mode/application** command is used in the BGP configuration mode to enable BGP additional paths.

The following examples show how to configure Add-Path TX at global, address family (AF) and neighbor for both default VRF and non-default VRF.

Add-Path TX at Global Level (AF and NeighborIndependent) for Default VRF

These commands configure all peers under the default VRF to be Add-Path capable at global level with different options for BGP router ***65003***.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send limit 2

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send ecmp limit 2

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send backup
```

Add-Path TX at Address-Family Level (neighbor independent) for Default VRF

These configure all peers under the default VRF to be Add-Path capable when exchanging IPv4 NLRI, under **address-family ipv4** for BGP router ***65003***.

```
switch(config)#router bgp 65003
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp additional-paths send any

switch(config)#router bgp 65003
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp additional-paths send limit 3

switch(config)#router bgp 65003
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp additional-paths send ecmp

switch(config)#router bgp 65003
```

```
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp additional-paths send ecmp limit 3

switch(config)#router bgp 65003
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp additional-paths send backup
```

Add-Path TX at Neighbor Level for Default VRF

These configure a specific peer under the default VRF to be Add-Path capable for BGP router ***65003*** and neighbor ***90.0.0.1***.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send limit

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send ecmp
 limit 4

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send backup
```

Add-Path TX at Global Level (AF and Neighbor Independent) for Non-default VRF

These commands configure Add-Path TX at global level (AF and neighbor independent) for non-default VRF for BGP router ***65003*** and **Acme** VRF.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send limit 5

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send ecmp limit
 5

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send backup
```

Add-Path TX at Address-Family Level (neighbor Independent) for Non-default VRF

These configure all peers under the non-default VRF to be Add-Path capable under **address-family ipv4** for BGP router ***65003*** and **Acme** VRF.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send limit 6

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send ecmp
 limit 6

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send backup
```

Add-Path TX at Neighbor Level (AF Independent) for Non-default VRF

These configure a specific peer under the non-default VRF to be Add-Path capable for BGP router ***65003***, neighbor ***90.0.0.1*** and **Acme** VRF.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths
 send any

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths
 send limit 7

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths
 send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths
 send ecmp limit 7

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths
 send backup
```

15.5.2.10 Configuring BGP Selective Route Download

The **bgp route install-map** command is used in the BGP configuration mode to enable BGP Selective Route Download. BGP Selective Route Download can also be configured in an address family or VRF instance as shown in the following examples.

The following examples show how to configure a prefix list and route map, then apply BGP Selective Route Download to the map.

Examples

- These commands install BGP routes in the ***10.0.0.0/24*** and ***20.0.0.0/24*** ranges in the RIB (and thus in the hardware), but no other BGP routes.

```
switch(config)# ip prefix-list PFXL_ALLOW
switch(config-ip-pfx)# seq 1 permit 10.0.0.0/24 ge 24 le 32
switch(config-ip-pfx)# seq 2 permit 20.0.0.0/24 ge 24 le 32
switch(config-ip-pfx)# exit
switch(config-ip-pfx)#
```

- These commands configure the permit and deny rules for BGP routes.

```
switch(config)# route-map BGP_INSTALL_MAP permit 10
switch(config-route-map-BGP_INSTALL_MAP)# match ip address prefix-list
 PFXL_ALLOW
switch(config-route-map-BGP_INSTALL_MAP)# exit
switch(config)# route-map BGP_INSTALL_MAP deny 20
switch(config)#
```

- These commands configure Selective Route Download for the map **BGP_INSTALL_MAP**.

```
switch(config)# router bgp 100
switch(config-router-bgp)# bgp route install-map BGP_INSTALL_MAP
switch(config-router-bgp)#
```

The following examples show how to configure prefix lists individually for the IPv4 and IPv6 address families, then apply BGP Selective Route Download for these address families.

Examples

- These commands configure the IPv4 address family prefix list.

```
switch(config)# ip prefix-list V4_ALLOW
switch(config-ip-pfx)# route-map BGP_V4_MAP permit 10
switch(config-route-map-BGP_V4_MAP)# match ip address prefix-list
 V4_ALLOW
switch(config-route-map-BGP_V4_MAP)# route-map BGP_V4_MAP deny 20
switch(config-route-map-BGP_V4_MAP)# exit
switch(config-route-map-BGP_V4_MAP)#
```

- These commands configure the IPv6 address family prefix list.

```
switch(config)# ipv6 prefix-list V6_ALLOW
switch(config-ipv6-pfx)# route-map BGP_V6_MAP permit 10
switch(config-route-map-BGP_V6_MAP)# match ipv6 address prefix-list
 V6_ALLOW
switch(config-route-map-BGP_V6_MAP)# route-map BGP_V6_MAP deny 20
switch(config-route-map-BGP_V6_MAP)# exit
switch(config-route-map-BGP_V6_MAP)#
```

- These commands configure Selective Route Download individually for the two address families.

```
switch(config)# router bgp 200
```

```
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp route install-map BGP_V4_MAP
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# bgp route install-map BGP_V6_MAP
switch(config-router-bgp-af)#
```

15.5.2.10.1 Displaying BGP Selective Route Download Information

The **show ip bgp** command displays BGP RIB winning paths that are not installed in the RIB.

Example

The following command displays BGP routing table information for VRF default, showing winning paths that are not installed in the RIB.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
 installed, E
- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
 Nexthop -
Link Local Nexthop

       Network             Next Hop         Metric  LocPref Weight Path
 * >   6.0.0.0/24          1.0.0.1          0       100     0       ?
 * #   7.0.0.0/24          1.0.0.1          0       100     0       ?
switch#
```

The **show ip bgp** command with a specified prefix displays detailed information and the reason for the BGP RIB winning paths to that prefix not being installed in the RIB.

Example

The following command displays detailed information for the BGP routing table for VRF default.

```
switch# show ip bgp 7.0.0.0/24
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
BGP routing table entry for 7.0.0.0/24
 Paths: 1 available
  Local
    1.0.0.1 from 1.0.0.1 (1.0.0.1)
      Origin INCOMPLETE, metric 0, localpref 100, weight 0, valid,
 internal, not
installed (denied by install-map)
switch#
```

The **show ip bgp installed** command displays the list of installed routes in the BGP RIB.

Example

The following command displays the list of installed routes in BGP routing table for VRF defaults.

```
switch# show ip bgp installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
 installed, E
```

```
- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
 Nexthop -
Link Local Nexthop

        Network             Next Hop         Metric  LocPref Weight Path

 * >    6.0.0.0/24          1.0.0.1          0       100     0      ?
switch#
```

The **show ip bgp not-installed** displays the list of non-installed routes in the RIB.

Example

The following command displays the list of non-installed routes in the BGP routing table for VRF default.

```
switch# show ip bgp not-installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
 installed, E
- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
 Nexthop -
Link Local Nexthop

        Network             Next Hop         Metric  LocPref Weight Path

 * #    7.0.0.0/24          1.0.0.1          0       100     0      ?
switch#
```

15.5.2.11 Configuring Nexthop Resolution

The configuration model for this feature involves configuring and applying **Nexthop Resolution RIB Profiles** on a per-address family basis. There are two ways a profile can be applied: (1) across an entire address-family, or (2) a granular, route-map based mechanism for specific routes within an address family. The per-address-family configuration is the simplest. It enables specification of a unique profile for all the routes in a given address family, such as IPV4 unicast, or EVPN. In contrast, the route-map approach leverages the matching criteria of route-map statements to apply profiles to individual routes within an address family.

Note: Note the support for each configuration and submode were released in a phased manner.

The general configuration model for the CLI is a new command under the BGP address-family submode:

```
switch(config-router-bgp-af)# next-hop resolution ribs(PROFILE|[route-map
 NAME])
```

The PROFILE option is a list of up to three (3) resolution domains. The NAME option is the name of a route-map. Notice the PROFILE and route-map NAME options are mutually exclusive. That is, a resolution profile can be specified either explicitly at the address family level, or on a per-route basis via a route-map.

To enable setting a profile using a route-map, this feature adds support for a new set statement in the route-map submode:

```
switch(config-route-map-NAME)# set next-hop resolution ribs PROFILE
```

You ban combine this statement with existing match statements to select profiles based on the BGP path attributes of a route, or other properties.

As mentioned, the profile itself is a list of resolution domains:

```
PROFILE:=DOMAIN[DOMAIN[DOMAIN]]
```

Example configuration for EVPN MPLS, EVPN VXLAN and BGP Labeled-unicast:

```
switch(config)# router bgp id
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# next-hop mpls resolution ribs PRIMARY-RIB
 [FALLBACK-RIB]
switch(config-router-bgp-af)# next-hop vxlan resolution ribs IP-RIB
        ...
    address-family ipv4 labeled-unicast
      next-hop mpls resolution ribs PRIMARY-RIB [FALLBACK-RIB]
    address-family ipv6 labeled-unicast
      next-hop mpls resolution ribs PRIMARY-RIB [FALLBACK-RIB]
```

The **PRIMARY-RIB** and **FALLBACK-RIB** refers to either tunnel domain or IP RIB domain. EVPN VXLAN only supports IP-RIB domain.

Configure the tunnel domain as:

- **tunnel-rib <tunnel-rib-name>** where the ***<tunnel-rib-name>*** refers to either the system-tunnel-rib or the user defined tunnel rib.

The IP domain can be either:

- **system-unicast-rib**
- **system-connected**

The **system-unicast-rib** refers to complete IP RIB and the **system-connected** refers to just the connected routes.

Primary and secondary RIBs cannot come from the same domain (for example, both cannot be from the tunnel domain and both cannot be from the IP RIB domain). The **FALLBACK-RIB** is optional.

Nexthops will first attempt to resolve, using the primary rib. If the resolution fails, it attempts to resolve using the fallback rib (if that exists).

Example

```
router bgp <id>
   address-family ipv4 labeled-unicast
      next-hop resolution ribs tunnel-rib USER_TR system-unicast-rib
```

All the nexthops of the IPV4 labeled-unicast routes will first attempt to resolve, using the **tunnel rib USER_TR**. If the resolution fails, the nexhops attempt to resolve using the **complete unicast IP RIB**.

Each DOMAIN can be either a system or user-defined tunnel RIB or a unicast RIB. The available resolution domains, and their corresponding tokens, are tabulated below:

Table 71: Domains

Domain	Token	Description
IP RIB	`system-unicast-rib`	The complete IP unicast RIB is available for next-hop resolution.
Connected routes (IP)	`system-connected`	Only connected routes are available for next-hop resolution.
System tunnel RIB	`tunnel-rib system-tunnel-rib`	All winning tunnels from all protocols are available for next-hop resolution.
System colored tunnel RIB	`tunnel-rib colored system-colored-tunnel-rib`	All winning, colored tunnels from all protocols are available for next-hop resolution. Only routes with an associated color can be resolved by the system colored tunnel RIB.
User-defined tunnel RIB	`tunnel-rib NAME`	All contributing tunnels to the tunnel RIB called NAME are available for next-hop resolution.
IP RIB of VPN Import VRF	`vrf-unicast-rib`	This token is limited to BGP L3VPNs.

Now the profile configuration is available under select BGP address family submodes. For example:

```
switch(config)# router bgp num
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# next-hop mpls resolution ribs PROFILE
      next-hop vxlan resolution ribs PROFILE
   address-family ipv4
      next-hop resolution ribs ( PROFILE | route-map NAME )
   address-family ipv4 labeled-unicast
      next-hop resolution ribs PROFILE
   address-family ipv6
      next-hop resolution ribs ( PROFILE | route-map NAME )
      next-hop 6pe resolution ribs PROFILE
   address-family ipv6 labeled-unicast
      next-hop resolution ribs PROFILE
   address-family vpn-ipv4
      next-hop resolution ribs PROFILE
   address-family vpn-ipv6
      next-hop resolution ribs PROFILE
```

Note that a given address-family may restrict the possible profiles which can be configured, and may not support specifying a route-map. For example, the resolution profile for 6PE routes, configured via *next-hop 6pe resolution ribs PROFILE*, is constrained to only the tunnel domain. That is, the profile cannot specify either *system-unicast-rib or system-connected*. This is, of course, because it is meaningless to resolve a 6PE next-hop using either of those resolution domains.

15.5.2.11.1 Release Matrices

The following tables detail the release in which the possible configurations for this feature are available.

Configuration	Release

	next-hop resolution ribs PROFILE command					
	4.22.0F	4.22.1F	4.23.1F	4.24.1F	4.25.1F	Unsupported / Not Applicable
IPv4/IPv6 unicast (non 6PE)	X					
IPv6 unicast 6PE	X					
IPv4/IPv6 VPN (vrf-unicast-rib)	X					
IPv4/IPv6 VPN (full profile)		X				
EVPN (MPLS)			X			
EVPN (VXLAN)			X			
IPv4/IPv6 LU			X			
IPv4/IPv6 Multicast						X
IPv4/IPv6 SR TE						X

match extcommunity						X
match large-community						X
All other match statements						X
All other set statements						X
sub-route-map						X

15.5.2.11.2 Default Resolution Profiles

Given the aforementioned configuration model, the default resolution profiles in EOS for each address-family can be expressed by the following:

Address-family	Default profile
IPv4/IPv6 unicast (non 6PE)	tunnel-rib colored system-colored-tunnel-rib tunnel-ribsystem-tunnel-rib system-unicast-rib
IPv6 unicast 6PE	tunnel-rib colored system-colored-tunnel-rib tunnel-ribsystem-tunnel-rib
IPv4/IPv6 unicast (eBGP directly connected)	system-connected
IPv4/IPv6 VPN	tunnel-rib colored system-colored-tunnel-rib tunnel-ribsystem-tunnel-rib system-connected
IPv4/IPv6 LU	tunnel-rib colored system-colored-tunnel-rib tunnel-ribsystem-tunnel-rib system-connected
EVPN (MPLS)	tunnel-rib colored system-colored-tunnel-rib tunnel-ribsystem-tunnel-rib system-connected
EVPN (VXLAN)	system-unicast-rib
IPv4/IPv6 Multicast	*This is not supported. Multicast next-hops are first resolved in the MRIB. Failure to resolve in the MRIB results in a lookup in the unicast RIB.*
Flowspec	*These next hops are not resolved.*

Note: Support for the **system-colored-tunnel-rib** was released in ***EOS Release 4.24.1F***. For earlier releases, the defaults can be determined by omitting this resolution domain.

15.5.2.11.3 Semantics

When processing the next-hop of a route, the next-hop resolver attempts resolution by using the first domain in the route's resolution profile. If the resolution domain successfully resolves the next-hop, the resolver stops. If resolution fails, however, the resolver moves onto the next domain, if it exists, and tries again. This iterative process continues until the next-hop is either resolved, or the profile is exhausted. In the latter case, the next-hop is left unresolved.

To illustrate this, consider the following example. This resolution profile constrains the resolution of a BGP route to only the IP unicast RIB:

```
switch(config-router-bgp-af)# next-hop resolution ribs system-unicast-rib
```

When a next-hop is unresolvable in the IP unicast RIB, and there are no further resolution domains to try, then the next-hop is ultimately unresolved. In contrast, the following profile first attempts resolution in the system colored tunnel RIB, then the system tunnel RIB, and finally attempts resolution using connected routes:

```
switch(config-router-bgp-af)# next-hop resolution ribs tunnel-rib colored
 system-colored-tunnel-rib tunnel-rib system-tunnel-rib system-connected
```

Therefore, only when a next-hop cannot be resolved by any of those domains will it be ultimately unresolved.

15.5.2.11.3.Route Map Semantics

This section describes semantics and limitations specific to the **next-hop resolution ribs route-map NAME** command.

The use of a route-map to select a custom resolution profile allows for per-route granularity rather than an entire BGP address-family. The next-hop resolution semantics of a next-hop whose profile is set using a route-map are the same as the per-address family configuration. However, unlike in the per-address family configuration model, a route-map makes it possible to leave the resolution profile for a next-hop unspecified. **A next-hop for which the resolution profile is unspecified is left unresolved**. The following example illustrates this as well as the recommended configuration.

The profile below constrains the resolution of a subset of IPV4 unicast routes to only the system tunnel RIB:

```
ip prefix-list SUBSET 192.0.2.1/32 192.0.2.2/32 192.0.2.3/32
route-map TUNNEL_ONLY permit 10
   match ip next-hop prefix-list SUBSET
   set next-hop resolution ribs tunnel-rib system-tunnel-rib

router bgp 64512
   address-family ipv4
      next-hop resolution ribs route-map TUNNEL_ONLY
```

Note, however, that the **TUNNEL_ONLY** route-map applies to *all IPV4 unicast routes*. Further, note that only routes whose next-hop value matches SUBSET will have a resolution profile set. **All other IPV4 unicast routes will have no resolution profile.** Any route without a resolution profile is left **unresolved**. This is often not intentional.

A more common use case is to allow the route's which do not match a given sequence to fallback to the system default resolution behavior. This can be achieved by adding a second sequence to the route-map with no match statements (matches all routes), and a single set statement which sets the default profile (see the **Default Resolution Profiles** section) for the given address family.

Example

```
ip prefix-list SUBSET 192.0.2.1/32 192.0.2.2/32 192.0.2.3/32
route-map TUNNEL_ONLY permit 10
   match ip next-hop prefix-list SUBSET
   set next-hop resolution ribs tunnel-rib system-tunnel-rib
route-map TUNNEL_ONLY permit 20
   set next-hop resolution ribs tunnel-rib colored system-colored-tunnel-
rib tunnel-rib system-tunnel-rib system-unicast-rib

router bgp 64512
   address-family ipv4
      next-hop resolution ribs route-map TUNNEL_ONLY
```

This feature provides an explicit token to automatically fallback to the default resolution profile of whichever address family the route-map is applied:

```
ip prefix-list SUBSET 192.0.2.1/32 192.0.2.2/32 192.0.2.3/32
route-map TUNNEL_ONLY permit 10
   match ip next-hop prefix-list SUBSET
   set next-hop resolution ribs tunnel-rib system-tunnel-rib
route-map TUNNEL_ONLY permit 20
   set next-hop resolution ribs system-default

router bgp 64512
   address-family ipv4
      next-hop resolution ribs route-map TUNNEL_ONLY
```

15.5.2.11.4 BGP L3VPNs: Next-hop Resolution ribs vrf-unicast-rib

This subfeature affects both the profile used to resolve BGP VPN routes as well as the VRF in which the route resolution takes place. With this feature disabled, or prior to ***EOS Release 4.22.0F***, imported VPN routes and is subject to the following restriction:

For each VPN route received from a neighbor, the route is imported (based on route-targets) and installed into the target VRF (import-vrf), **only if the nexthop of the route is resolvable via an MPLS tunnel in the default VRF.**

With this feature enabled, the above restriction is lifted, enabling a VPN route to be imported into the target VRF unconditionally. The plain IP unicast route is subsequently resolved using the unicast RIB of the target VRF.

Note: With this feature enabled, no attempt is made to resolve the VPN route over an MPLS tunnel (even if one exists) in the default VRF. Therefore, the VPN routes received from a neighbor remains inactive in the default VRF.

To enable this feature, use the domain token **vrf-unicast-rib** under the IPV4 / IPV6 address family submodes:

```
switch(config-router-bgp-af)# next-hop resolution ribs vrf-unicast-rib
```

15.5.2.11.4.1 Examples

To enable the **vrf-unicast-rib** feature:

```
router bgp 64512
   address-family vpn-ipv4
      next-hop resolution ribs vrf-unicast-rib
```

The following IPV4 VPN route has been received from a neighbor:

```
switch(config)# show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop
         Network             Next Hop         Metric  LocPref Weight Path
         RD: 11.0.1.1:0 IPv4 prefix 50.1.1.0/24
                             42.42.42.42      -       1       0      100 200 i
```

The route is **inactive** in the default VRF.

Also, there is a VRF, ***CUST-1***, where the VPN route (based on the route-targets) is imported. In the ***CUST-1*** VRF, the nexthop of the route is resolved via a static route to ***42.42.42.42***. With this feature enabled, the VPN route is imported and installed in the VRF ***CUST-1***:

```
switch(config)# show ip bgp vrf CUST-1
BGP routing table information for VRF CUST-1
Router identifier 11.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop
        Network            Next Hop         Metric  LocPref Weight Path
     * >      50.1.1.0/24         42.42.42.42      -       1       0      100 200 i
```

To confirm the route is installed in the ***VRF CUST-1***, use the **show ip route** command:

```
switch(config)# show ip route vrf CUST-1
VRF: CUST-1
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route
 S      42.42.42.42/32 is directly connected, Null0
 B I    50.1.1.0/24 is directly connected, Null0
```

The resolution profile used to resolve the next-hop can be seen using the **show rib next-hop** command. Note how the profile includes (only) the system-unicast-rib for ***CUST-1***.

```
switch(config)# show rib next-hop ip vrf CUST-1 bgp detail
VRF: CUST-1, Protocol: bgp
Codes: * - Unresolved Next hop
       L - Part of a recursive route resolution loop
       A - Next hop not resolved in ARP/ND
11.0.1.1 [1 pref/0 metric] [ID: 18] type ipv4
   Resolution RIBs: system-unicast-rib
   via Null0, directly connected [ID 3]
```

15.5.2.11.5 Viewing the BGP Nexthop Resolution Status

The following existing show commands which have been enhanced for this feature:

- **show route-msp NAME**
- **show bgp instance** [vrf **NAME**]
- **show rib next-hop {ip | ipv6}[PROTCOL] detail**

show route-map NAME

Use the **show route-map NAME** command to display the new set statement:

```
switch(config)# show route-map
route-map foo permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
```

```
    set next-hop resolution ribs tunnel-rib system-tunnel-rib
route-map foo permit 20
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set next-hop resolution ribs tunnel-rib colored system-colored-
tunnel-rib tunnel-rib system-tunnel-rib system-unicast-rib

switch(config)#show route-map | json
{
   "routeMaps": {
      "foo": {
         "entries": {
            "20": {
               "setRules": {
                  "resolutionRibProfileConfig": {
                     "resolutionMethods": [
                        {
                           "ribType": "tunnel",
                           "colored": true,
                           "name": "system-colored-tunnel-rib"
                        },
                        {
                           "ribType": "tunnel",
                           "name": "system-tunnel-rib"
                        },
                        {
                           "ribType": "ip",
                           "name": "system-unicast-rib"
                        }
                     ]
                  }
               },
               "subRouteMap": {
                  "name": "",
                  "invert": false
               },
               "filterType": "permit",
               "matchRules": {},
               "description": []
            },
            "10": {
               "setRules": {
                  "resolutionRibProfileConfig": {
                     "resolutionMethods": [
                        {
                           "ribType": "tunnel",
                           "name": "system-tunnel-rib"
                        }
                     ]
                  }
               },
               "subRouteMap": {
                  "name": "",
                  "invert": false
               },
               "filterType": "permit",
               "matchRules": {
               },
               "description": []
            }
         }
```

```
        }
    }
},
```

show bgp instance [vrf NAME]

Use the **`show bgp instance`** command to inspect the configured profiles and route-maps for each address family. The diplay output has been extended to show the resolution ribs as seen below, done so in order to display the resolution ribs used for EVPN and BGP Labeled-unicast address families. The output displays the resolution rib profile configuration for the respective address families.

Example

```
switch(config-router-bgp)# show bgp instance
BGP instance information for VRF default
...
Address family IPv4 MplsLabel:
  Additional-paths installation is disabled
  Convergence based update synchronization is disabled
  Target RIBs: Tunnel RIB
    Resolution RIBs: tunnel-rib system-tunnel-rib, system-connected
...
Address family IPv6 MplsLabel:
  Additional-paths installation is disabled
  Convergence based update synchronization is disabled
  Target RIBs: Tunnel RIB
    Resolution RIBs: tunnel-rib system-tunnel-rib, system-connected
...
Address family L2VPN EVPN:
  Additional-paths installation is disabled
  Convergence based update synchronization is disabled
    Vxlan Resolution RIBs: system-unicast-rib
    Mpls Resolution RIBs: tunnel-rib system-tunnel-rib, system-connected
```

Use the **show rib next-hop ip bgp** command to display the per-via resolution profile.

show rib-next-hop {ip,ipv6} [proto] detail

Use the **`show rib next-hop`** **{ip | ipv6}[proto] detail** command to display which resolution profile is used to resolve each next-hop.

Example

```
switch#(config-router-bgp)# show rib next-hop ip bgp detail
VRF: default, Protocol: bgp
Codes: * - Unresolved Next hop
       L - Part of a recursive route resolution loop
       A - Next hop not resolved in ARP/ND
192.0.2.1 [110 pref/20 metric] [ID: 1] type ipv4
   Resolution RIBs: tunnel-rib colored system-colored-tunnel-rib, tunnel-
rib system-tunnel-rib, system-unicast-rib
   via 198.51.100.1, Ethernet3 [ID: 10]
192.0.2.2 * [ID: 86]
   Resolution RIBs: No profile set for this next-hop
192.0.2.3 * [ID: 78]
   Resolution RIBs: tunnel-rib colored system-colored-tunnel-rib, tunnel-
rib system-tunnel-rib, system-connected
```

Note how ***192.0.2.2*** has no profile set, and is therefore unresolved. This show command illustrates this clearly with the **`No profile set for this next-hop`** message.

15.5.2.11.6 User-defined Tunnel RIBs for NextHop Resolution

Currently, EOS generates a single system-defined tunnel RIB for the next-hop resolution.

When tunnels to the same destination address are learned from multiple protocols, a fixed preference that is associated with each protocol is used to determine the winning tunnel.

However, with the User-defined tunnel RIBs feature the user is allowed to create user-defined tunnel RIBs with:

- Control over which protocols may contribute to the tunnel RIB.
- The ability to override the preference for all tunnels from a protocol to achieve non-default ordering of tunnels.
- The option to use it in a context where the system-defined tunnel RIB does not suffice.

15.5.2.11.6.1 Configuring User-defined Tunnel RIBs

A new ***tunnel-ribs*** configuration mode allows the creation of user-defined tunnel RIBs. For example, the following configuration creates a tunnel RIB with tunnels learned from IS-IS SR and LDP only, with IS-IS SR tunnels being preferred over LDP:

```
switch(config)# tunnel-ribs
switch(config-tunnel-ribs)# tunnel-rib SR_OVER_LDP
switch(config-tunnel-rib-SR_OVER_LDP)# source-protocol isis segment-routi
ng preference 10
switch(config-tunnel-rib-SR_OVER_LDP)# source-protocol ldp preference 20
```

When adding a source protocol in a user-defined tunnel RIB, the preference is optional. A lower preference value indicates a more preferred protocol. If the preference is not specified, the following system-defined preference values are used:

Source Protocol	System-defined Preference
Static	15
Nexthop group tunnel	25
RSVP LER	45
LDP	55
IS-IS SR	65
BGP-LU	85

Modifying the system-tunnel-rib

The user can explicitly modify the default preferences for the **system-tunnel-rib** as well as user-defined RIBs:

```
switch#(config)# tunnel-ribs
switch#(config-tunnel-ribs)# tunnel-rib system-tunnel-rib
switch#(config-tunnel-rib-system-tunnel-rib)#?
  source-protocol  Configure the tunnel source
  ---------------------------------------
  comment          Up to 240 characters, comment for this mode
  default          Set a command to its defaults
  exit             Leave Configure mode
  no               Disable the command that follows
  show             Display details of switch operation
  !!               Append to comment

switch#(config-tunnel-rib-system-tunnel-rib)# source-protocol ?
```

```
  bgp            BGP tunnel
  isis           IS-IS tunnel
  ldp            LDP tunnel
  nexthop-group  Nexthop group tunnel
  rsvp-ler       RSVP LER tunnel
  static         Static tunnel

switch#(config-tunnel-rib-system-tunnel-rib)# source-protocol rsvp-ler
 preference 2
switch#(config-tunnel-rib-system-tunnel-rib)# exit
switch#(config-tunnel-ribs)# show active all
tunnel-ribs
   tunnel-rib system-tunnel-rib
      source-protocol static
      source-protocol isis segment-routing
      source-protocol bgp labeled-unicast
      source-protocol nexthop-group
      source-protocol rsvp-ler preference 2
      source-protocol ldp
```

15.5.2.11.6. Displaying Tunnel RIB Information

- Use the **show tunnel rib** to display the user defined RIB information:

```
switch# show tunnel rib SR_OVER_LDP brief
Tunnel RIB: SR_OVER_LDP
Endpoint        Tunnel Type   Index(es) Tunnel Preference  IGP Preference  IGP Metric
--------------- ------------- --------- ------------------ --------------- ----------
1.1.1.1/32      IS-IS SR IPv4 2         10                 115             20
```

- Use the **show tunnel rib brief** command to display the system-defined tunnel RIB information.

```
switch# show tunnel rib brief
Tunnel RIB: system-tunnel-rib
Endpoint        Tunnel Type   Index(es) Tunnel Preference  IGP Preference  IGP Metric
--------------- ------------- --------- ------------------ --------------- ----------
1.1.1.1/32      LDP           1         55                 1               0
```

- Use the **show active all** command to display the information about which source protocols contribute to the system-defined tunnel RIB.

```
switch(config)# tunnel-ribs
switch(config-tunnel-ribs)# tunnel-rib system-tunnel-rib
switch(config-tunnel-ribs)# show active all
tunnel-ribs
   tunnel-rib system-tunnel-rib
      source-protocol static
      source-protocol isis segment-routing
      source-protocol bgp labeled-unicast
      source-protocol nexthop-group
      source-protocol rsvp-ler
      source-protocol ldp
```

15.5.2.12 Configuring BGP Confederations

BGP confederations allow you to break an Autonomous System (AS) into multiple sub-ASs, and then to group the sub-ASs as a confederation. The sub-ASs exchange iBGP routing information (next-hop, local-preference and MED), but communicate via eBGP.

To configure a BGP confederation, complete the following tasks on each BGP device in the confederation.

- **Configure the local AS number**: the local AS number is the membership number in a sub-AS. BGP devices with the same local AS number are identified as members of the same sub-AS. BGP devices always use the local AS number when communicating with other BGP4 devices in the confederation.
- **Configure the confederation ID**: the confederation ID is the AS number for those BGP devices that are outside of the confederation. A BGP device outside the confederation is not aware that BGP devices are in multiple sub-ASs. The confederation ID must differ from the sub-AS numbers.
- **Configure the list of sub-AS numbers that are confederation members**: devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

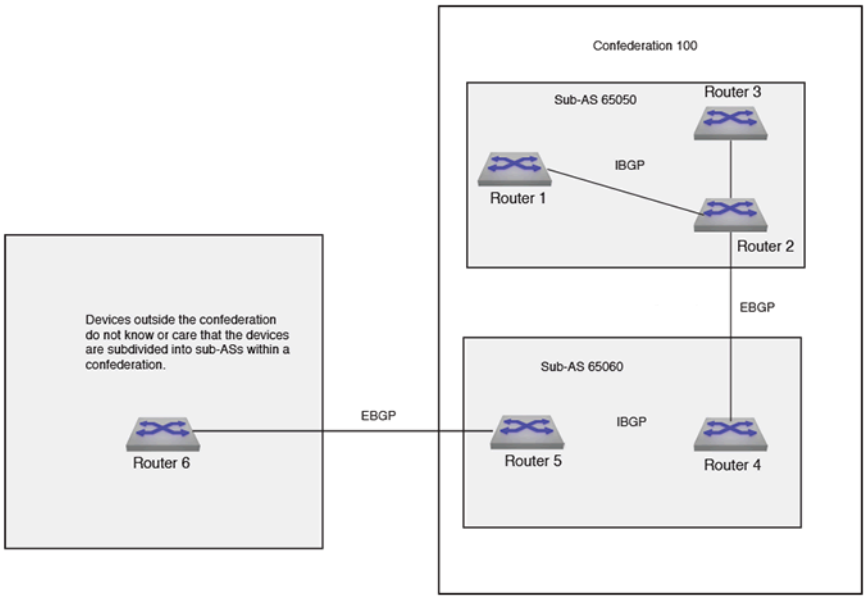

Figure 59: BGP Confederation Example

Example

- The **router bgp** command enables BGP and configures the router in sub-autonomous system ***65050***. The **bgp confederation identifier** command specifies that confederation ***65050*** belongs to autonomous system ***100***.

  The neighbors from other autonomous systems within the confederation are treated as special eBGP peers when using the **bgp confederation peers** command.

```
switch(config)# router bgp 65050
switch(config-router-bgp)# bgp confederation identifier 100
switch(config-router-bgp)# bgp confederation peers 65060
switch(config-router-bgp)#
```

- The Arista EOS will group the maximum ranges together. In this example, peers ***65032*** and ***65036*** are not included in BGP confederation ***100***.

```
switch(config)# router bgp 65050
switch(config-router-bgp)# bgp confederation identifier 100
switch(config-router-bgp)# bgp confederation peers 65060
switch(config-router-bgp)# no bgp confederation peers 65032, 65036
switch(config-router-bgp)#
```

15.5.2.13 Configuring BGP Flowspec

The BGP Flowspec address family is enabled on a per-peer basis with:

Example

```
switch(config)# router bgp id
switch(config-router-bgp)# address-family flow-spec [ipv4 | ipv6]
switch(config-router-bgp-af)# neighbor address activate
```

Flowspec has to be explicitly enabled on an interface, with:

Example

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# flow-spec ipv4 ipv6
```

Currently, both IPv4 and IPv6 must be enabled together on the interface. A user defined TCAM profile, a feature introduced in ***EOS Relaease 4.20.5F***, must be configured for TCAM support for flowspec.

Warning: Creating user-defined TCAM profile on the Arista switch could cause serious issues that impact traffic. You should test flowspec policer with the profile given in this document. If you need to add new features in the profile, work with Arista's TAC team to define and test the new profile before deploying it on your production switches.

The ACL counters and Flowspec counters cannot be enabled simultaneously. To enable reporting of counters for flow-spec rules, use the following configuration:

Example

```
switch(config)# no hardware counter feature acl in
switch(config)# hardware counter feature flow-spec in
```

15.5.2.13.1 Displaying Flowspec Information

The BGP show commands have been enhanced to display the **`flow-spec`** content for both IPv4 and IPv6 address families:

Example

The **`show bgp flow-spec ipv4 summary`** command displays the count of flowspec rules received from each peer:

```
switch(config)# show bgp flow-spec ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 10
Neighbor Status Codes: m - Under maintenance
  Neighbor     V  AS    MsgRcvd   MsgSent  InQ OutQ  Up/Down State  RulesRcd
 RulesAcc
  10.0.0.2     4  10         12         4    0    0 00:02:18 Estab  2        2
  10.0.1.2     4  10          6         4    0    0 00:02:18 Estab  0        0
```

The **`show bgp flow-spec ipv4`** displays a brief description of each flowspec rule, including the matching rule and actions. The matching rule uses a format:

dest prefix; **src prefix**; [**component:condition**] **+**

The component is abbreviated, for example, DP for destination port and IP for IP Protocol as shown in the following example. The detail of the show command will display the full component name.

The condition is expressed with logical operators. In the following example, **`IP:=6|=17`** matches any packets whose IP Protocol is 6 (TCP) or 17 (UDP). **`DP:>1010&<1024`** matches any packets whose destination port is greater than ***1010*** and less than ***1024***.

Example

```
switch(config)# show bgp flow-spec ipv4
BGP Flow Specification rules for VRF default
Router identifier 0.0.0.1, local AS number 10
Rule status codes: # - not installed, M - received from multiple
 peers

   Matching Rule
 Actions
   10.2.3.0/24;*;
 Drop
   10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
 Drop
```

The **`show bgp flow-spec detail`** displays the full details of each flowspec rule including the peer(s) it was received from, BGP properties, and an expanded description of the matching rule:

Example

```
switch(config)# show bgp flow-spec ipv4 detail
BGP Flow Specification rules for VRF default
Router identifier 0.0.0.1, local AS number 10
BGP Flow Specification Matching Rule for 10.2.3.0/24;*;
 Rule identifier: 3882065752
 Matching Rule:
   Destination Prefix: 10.2.3.0/24
   Source Prefix: *
 Paths: 1 available
  Local
    from 10.0.0.2 (10.1.1.2)
      Origin IGP, metric -, localpref 100, weight 0, valid,
 internal, best
      Actions: Drop
BGP Flow Specification Matching Rule for 10.2.4.0/24;1
0.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
 Rule identifier: 3882090640
 Matching Rule:
   Destination Prefix: 10.2.4.0/24
   Source Prefix: 10.2.0.0/16
   IP Protocol: =6 | =17
   Destination Port: >1010 & <1024
 Paths: 1 available
  Local
    from 10.0.0.2 (10.1.1.2)
      Origin IGP, metric -, localpref 100, weight 0, valid,
 internal, best
      Actions: Drop
```

The **show flow-spec ipv4 summary** command displays an overall status of how many flowspec rules were received and how many were installed:

Example

```
switch(config)# show flow-spec ipv4 summary
Flow specification rules summary for VRF default
  Total number of rules: 2
  Number of installed rules: 2
```

The **show flow-spec ipv4** displays the installation status of the rule, and a counter of how many hits it has accumulated. This command also compiles the received flowspec rules into rules that can be programmed into the TCAM. For example, logical expressions on values such as the destination port are converted to ranges, as shown below:

Example

```
switch(config)# show flow-spec ipv4
Flow specification rules for VRF default
Applied on: Ethernet47/1
  Flow-spec rule: 10.2.3.0/24;*;
    Rule identifier: 3882065752
    Matches:
      Destination prefix: 10.2.3.0/24
    Actions:
      Police: 80 Mbps (10 MBps)
      Redirect: VRF customer1
                Route via LDP tunnel index 4, MPLS label 100123
                Route via LDP tunnel index 1, MPLS label 116507
    Status:
      Installed: yes
      Counter: 312 packets
  Flow-spec rule: 10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1
010&<1024;
    Rule identifier: 3882090640
    Matches:
      Destination prefix: 10.2.4.0/24
      Source prefix: 10.2.0.0/16
      Next protocol: 17
                     6
      Destination port: 1011-1023
    Actions:
      Police: 80 Mbps (10 MBps)
      Redirect: VRF customer1
                Route via LDP tunnel index 4, MPLS label 100123
                Route via LDP tunnel index 1, MPLS label 116507
    Status:
      Installed: yes
      Counter: 0 packets
```

Infeasible rules are detected and not programmed, and this status is reported using the **show flow-spec ipv4** command. Examples of the infeasible rules are:

- The **lt/gt/eq** operator is missing in the numerical opVal component.
- Co-existence of TCP flag component with ICMP type or code component in the same rule.

- Co-existence of port based component with ICMP type or code component in the same rule.For example, the default route in the specified VRF can be resolved over a GRE or MPLS tunnel. The following **show** command output verifies the resolution over the tunnel:

For redirect actions, additional information is displayed to show how it was resolved.

Example

```
Actions:
      Redirect: VRF customer1
                Route via LDP tunnel index 4, MPLS label 100123
                Route via LDP tunnel index 1, MPLS label 116507
```

The specified **nexthop** in the flow-spec **redirect** action can be resolved by the respective VRFs IP RIB over MPLS or GRE tunnel, as shown in the following example:

Example

```
Actions:
      Redirect: VRF default, fc00:91:91:91::91
                Route via Static Interface tunnel index 1
```

15.5.2.14 Configuring BGP Logical OR of Multiple Community Lists

Adding the **or-results** token to the **match community** command allows you to do a logical OR between all provided community lists:

```
match community or-results COMMLIST1 COMMLIST2
match extcommunity or-results EXTCOMMLIST1 EXTCOMMLIST2
match large-community or-results LARGECOMMLIST1 LARGECOMMLIST2
```

Full configuration example:

- Enable the Multi-agent mode.

```
switch(config)#service routing protocols model multi-agent
```

- Create community lists (extended and large communities are also compatible with **or-results**).

```
switch(config)#ip community-list COMMLIST1 permit 1:1
switch(config)#ip community-list COMMLIST2 permit 2:2
```

- Configure Route-map with **or-results**.

```
switch(config)#route-map IN-POLICY
switch(config-route-map-IN-POLICY)#match community or-results
                                   COMMLIST1 COMMLIST2
```

15.5.2.14.1 Displaying BGP Logical OR Information

The **or-results** match clauses can be seen with the standard **show route-map** command, as shown in the following command display outputs.

```
switch# show route-map IN-POLICY
route-map IN-POLICY permit 10
```

```
  Description:
  Match clauses:
    match community or-results COMMLIST1 COMMLIST2
  SubRouteMap:
  Set clauses:
    set local-preference 500
route-map IN-POLICY permit 20
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
```

```
switch# show run | in 200.200.200.57
   neighbor 200.200.200.57 remote-as 300
   neighbor 200.200.200.57 update-source Loopback200
   neighbor 200.200.200.57 ebgp-multihop
   neighbor 200.200.200.57 route-map IN-POLICY in
   neighbor 200.200.200.57 maximum-routes 0
```

```
switch# show ip bgp community 1:1
BGP routing table information for VRF default
Router identifier 220.220.220.51, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop

         Network                Next Hop              Metric  LocPref Weight  Path
 * >     66.170.224.0/20        200.200.200.57        0       500     0       300 ?
 * >     66.170.232.0/21        200.200.200.57        0       500     0       300 ?

 * >     192.47.242.0/24        200.200.200.57        0       500     0       300 ?
```

15.5.2.15 Setting the BGP Missing Policy Action

To set the default policy behavior for BGP so that all routes can be denied or rejected, use the **bgp missing policy** command. Options control inbound and outbound directions independently. When the inbound direction is affected, currently installed routes from the peer are removed (and withdrawn from other attached peers). When the outbound direction is affected, currently exported routes to the peer are withdrawn. Setting the Missing Policy Action options back to its default/permit value re-applies the current inbound route-map policy processing to the set of routes received from the peer and export routes according to the configured outbound route-map. If soft-reconfiguration is disabled and the inbound direction is affected then the peer must re-send its routes (e.g. a manual “clear ip bgp” command is required).

Configuring the BGP Missing Policy Action

Permit is the default missing policy action when no/default are applied. Entering the ‘default’ form of the command in a non-default VRF will cause the non-default VRF to inherit the setting from the default VRF. Entering the **no** form of the command in a non-default VRF will cause the non-default VRF to be configured with the **permit** setting regardless of the default VRF setting.

The include keyword is optional, and only takes effect in the multi-agent protocol model.

The following configures the BGP missing policy action.

```
switch(config-router-bgp)# bgp missing-policy [include {prefix-list|sub-
route-map}]
direction [in|out] action [permit|deny|deny-in-out]
switch(config-router-bgp)# [no|default] bgp missing-policy [include
 {prefix-list|sub-route-map}]
direction [in|out] action
```

Actions

For the actions, the **permit** and **deny** options inherit the direction of route denial from the direction, while the **deny-in-out** option specifically calls out denying routes in both directions.

- direction **in** action **permit**: allow all routes in the inbound direction when the inbound route-map is misconfigured (default).
- direction **out** action **permit**: allow all routes in the outbound direction when the outbound route-map is misconfigured (default).
- direction **in** action **deny**: deny all routes in the inbound direction when the inbound route-map is misconfigured
- direction **out** action **deny**: deny all routes in the outbound direction when the outbound route-map is misconfigured
- direction **in** action **deny-in-out**: deny all routes in both inbound/outbound directions when the inbound route-map is misconfigured
- direction **out** action **deny-in-out**: deny all routes in both inbound/outbound directions when the outbound route-map is misconfigured

The include keyword specifies that the policy constructs in the route map should also be examined. The options to the include keyword are.

- **sub-route-map**: examine the sub route map references if any are defined in a route map covered by a missing policy statement. If the sub route map statement – or any in a route map chain – makes a reference to a route map which does not exist, then the missing policy action will be applied.
- **prefix-list**: examine the prefix list references if any are defined in a route map covered by a missing policy statement. If the prefix-list statement – or any in the applied route map chain – makes a reference to a prefix list which does not exist, then the missing policy action will be applied.

Displaying BGP Missing Policy Action Configurations

The **`show ip bgp neighbors`** command displays the status of a peer which is currently in the missing policy/default deny state.The **`Missing policy/default deny`** lines would be omitted if the configuration option is disabled or the route-maps are configured correctly.

```
switch(config-router-bgp)# show ip bgp neighbors
BGP neighbor is 1.0.0.2, remote AS 200, external link
BGP version 4, remote router ID 0.0.1.1, VRF default
Negotiated BGP version 4
…
Missing policy/default deny import action is active
Missing policy/default deny export action is active
```

```
Inbound route map is rm1
Outbound route map is rm2
…
```

15.5.2.16 Configuring BGP IPv4-mapped IPv6 Address Next Hops for IPv6 Labeled-Unicast Routes

Receive-side Configuration

To configure BGP to translate IPv4-mapped IPv6 addresses to IPv4 addresses when receiving next hops in labeled-unicast routes, use the neighbor next-hop resolution v4-mapped-v6 translation command. With this configuration, when the switch receives an IPv4-mapped IPv6 address for the next hop of an IPv6 labeled-unicast route, it will translate it to an IPv4 address, which allows the next hop to be resolved in an IPv4 network. This command takes effect only if the multi-agent routing protocol model is running. It applies only to the default VRF.

Example

These commands enter BGP IPv6 Labeled-Unicast Address Family Configuration Mode for AS ***64510*** (creating the BGP instance if it does not exist) and enable the translation of IPv4-mapped IPv6 addresses to IPv4 addresses for neighbors in the ***v6_pg*** peer group.

```
switch(config)# router bgp 64510
switch(config-router-bgp)# address-family ipv6 labeled-unicast
switch(config-router-bgp-af-label)# neighbor v6_pg next-hop resolution
 v4-mapped-v6 translation
switch(config-router-bgp-af-label)#
```

Send-side Configuration

A BGP router advertising a route can provide the IPv4-mapped IPv6 address of one of its local interfaces, such as a loopback interface, as the next hop. This source interface is specified with the **neighbor next-hop-self** command. The interface must be configured with an IPv4 address for this to be effective.

This configuration does not enable next-hop-self. It simply specifies the interface to be provided if the router advertises itself as the next hop. The next-hop-self action can be enabled with the **neighbor next-hop-self** command, or by configuring Egress Peer Engineering (EPE) using the **neighbor default-originate** command, or by other methods.

Example

These commands enable the switch to advertise itself as a next hop for the peer at ***2001:0db8::1***, and then configure the switch to use the IPv4 address of the ***Loopback 0*** interface for the next hop for the peer at ***2001:0db8::1*** if the route is IPv4-mapped IPv6.

```
switch(config)# router bgp 64510
switch(config-router-bgp)# neighbor 2001:0db8::1 next-hop-self
switch(config-router-bgp)# neighbor 2001:0db8::1 next-hop-self v4-mapped-
v6 source-interface Loopback 0
switch(config-router-bgp)#
```

15.5.2.17 BGP Operational Commands

15.5.2.17.1 Shutdown

The **shutdown (BGP)** command disables BGP operations without disrupting the BGP configuration. The **no router bgp** command disables BGP and removes the BGP configuration.

The **no shutdown (BGP)** command resumes BGP activity.

Examples

- This command disables BGP activity on the switch.

```
switch(config-router-bgp)# shutdown
switch(config-router-bgp)#
```

- This command resumes BGP activity on the switch.

```
switch(config-router-bgp)# no shutdown
switch(config-router-bgp)#
```

15.5.2.17.2 Clearing the Routing Table and Resetting BGP Sessions

When entered without parameters, the **clear ip bgp** command clears all BGP learned routes from the routing table, reads routes from designated peers, and sends routes required by those peers. Routes that are read or sent are processed through any modified route map or AS-path access list.

Followed by an asterisk (*****), it clears the BGP sessions with all BGP peers. To reset the session with a specific peer, enter the peer's IP address at the end of the command.

Example

This command removes all BGP learned routes from the routing table.

```
switch# clear ip bgp
! Peerings for all neighbors were hard reset
switch#
```

15.5.3 BGP IPv6 Link Local Peers Discovery

BGP IPv6 Link Local Peers Discovery supports a dynamic configuration model to eliminate the need for the network administrator to assign and configure IPv6 addresses for BGP peering.

Leverage the following details to automatically establish BGP adjacency:

- IPv6 link local addresses are automatically generated by the system based on MAC addresses.
- IPv6 router advertisements are used to communicate these addresses among potential BGP peers.

BGP IPv6 Link Local Peers Discovery uses IPv6 router advertisement to discover the peers IPv6 link local address. Devices are required to have IPv6 routing enabled, and the interface used for peering must have an IPv6 link local address. The time taken to discover the peers IPv6 link local address is proportional to the time taken by the peer to send a router advertisement message. When bringing up BGP sessions based on router advertisements received, a flurry of router advertisements on the interfaces causes the Rib agent to do more work and potentially delays the discovery of BGP neighbors over those interfaces and the establishment of BGP sessions. Since these are link local addresses, the peers must be directly connected at Layer 3.

15.5.4 BGP Examples

This section shows example configurations and topologies for iBGP (BGP Example 1) and eBGP (BGP Example 2).

15.5.4.1 BGP Example 1

Example 1 features an internal BGP (iBGP) link that connects peers in AS ***100***.

15.5.4.1.1 BGP Example 1 Diagram

Figure 60: BGP Example 1 displays an iBGP connection, linking neighbors within AS ***100***. Each switch advertises two subnets. In UPDATE packets sent by Switch A, the **LOCAL_PREF** field is ***150***. In UPDATE packets sent by Switch B, the **LOCAL_PREF** field is ***75***.

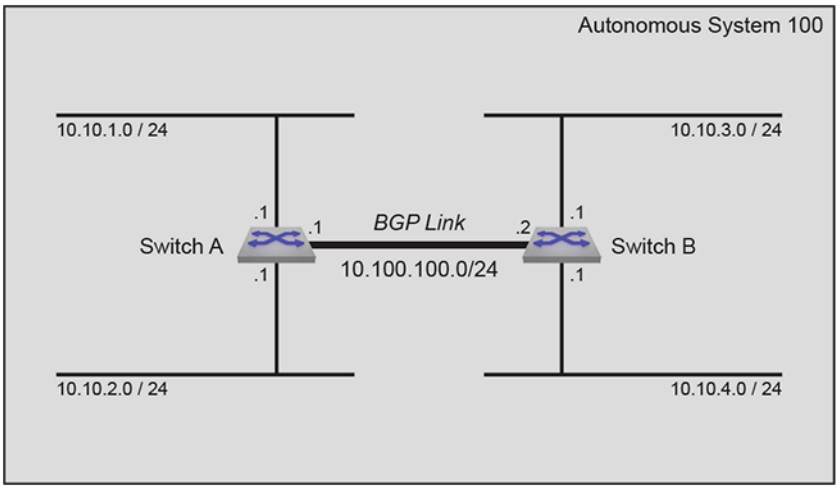

Figure 60: BGP Example 1

15.5.4.1.2 BGP Example 1 Code

This code configures the Example 1 BGP instance on both switches.

1. Configure the neighbor addresses.
   a. Specify the neighbor to ***Switch A***.

```
switchA(config)# router bgp 100
switchA(config-router-bgp)# neighbor 10.100.100.2 remote-as 100
```

   b. Specify the neighbor to ***Switch B***.

```
switchB(config)# router bgp 100
switchB(config-router-bgp)# neighbor 10.100.100.1 remote-as 100
```

2. Configure the routes to be advertised.
   a. Advertise ***Switch A***'s routes.

```
switchA(config-router-bgp)# network 10.10.1.0/24
switchA(config-router-bgp)# network 10.10.2.0/24
```

   b. Advertise ***Switch B***'s routes.

```
switchB(config-router-bgp)# network 10.10.3.0/24
switchB(config-router-bgp)# network 10.10.4.0/24
```

3. Configure the **LOCAL_PREF**.
   a. Configure **LOCAL_PREF** on ***Switch A***.

```
switchA(config-router-bgp)# neighbor 10.100.100.2 export-localpref
 150
```

b. Configure **LOCAL_PREF** on ***Switch B***.

```
switchB(config-router-bgp)# neighbor 10.100.100.2 export-localpref 75
```

4. Modify the hold time and keepalive interval.

a. Configure timers on ***Switch A***.

```
switchA(config-router-bgp)# timer bgp 30 90
```

b. Configure timers on ***Switch B***.

```
switchB(config-router-bgp)# timer bgp 30 90
```

15.5.4.2 BGP Example 2

Example 2 creates an external BGP (eBGP) link that connects routers in AS ***100*** and AS ***200***.

15.5.4.2.1 BGP Example 2 Diagram

Figure 61: BGP Example 2 displays an eBGP connection, linking ***Switch A*** in AS ***100*** to ***Switch B*** in AS ***200***. Each switch advertises two subnets.

Switch A assigns a local preference of ***150*** to networks advertised by ***Switch B***. ***Switch B*** assigns a local preference of ***75*** to networks advertised by ***Switch A***.

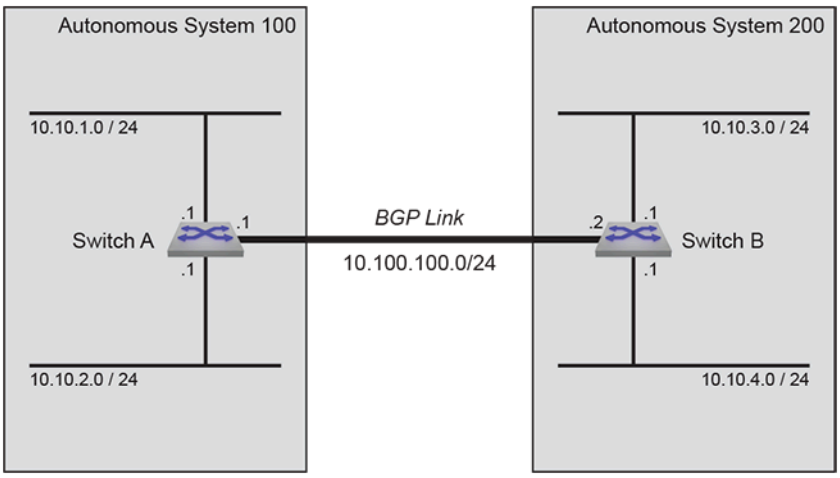

Figure 61: BGP Example 2

15.5.4.2.2 BGP Example 2 Code

This code configures the Example 2 BGP instance on both switches.

1. Configure the neighbor addresses.

a. Specify the neighbor to ***Switch A***.

```
switchA(config)# router bgp 100
switchA(config-router-bgp)# neighbor 10.100.100.2 remote-as 200
```

b. Specify the neighbor to ***Switch B***.

```
switchB(config)# router bgp 200
switchB(config-router-bgp)# neighbor 10.100.100.1 remote-as 100
```

2. Configure the routes to be advertised.

a. Advertise ***Switch A***'s routes.

```
switchA(config-router-bgp)# network 10.10.1.0/24
switchA(config-router-bgp)# network 10.10.2.0/24
```

b. Advertise ***Switch B***'s routes.

```
switchB(config-router-bgp)#network 10.10.3.0/24
switchB(config-router-bgp)#network 10.10.4.0/24
```

3. Configure the ***LOCAL_PREF***.

a. Configure ***LOCAL_PREF*** on ***Switch A***.

```
switchA(config-router-bgp)# neighbor 10.100.100.2 import-localpref
 150
```

b. Configure ***LOCAL_PREF*** on ***Switch B***.

```
switchB(config-router-bgp)# neighbor 10.100.100.2 import-localpref 75
```

4. Modify the hold time and keepalive interval.

a. Configure timers on ***Switch A***.

```
switchA(config-router-bgp)# timer bgp 30 90
```

b. Configure timers on ***Switch B***.

```
switchB(config-router-bgp)# timer bgp 30 90
```

15.5.5 BGP Commands

Global Configuration Commands

- ip as-path access-list
- ip as-path regex-mode
- ip community-list
- ip community-list regexp
- ip extcommunity-list
- ip extcommunity-list regexp
- ip large-community-list regexp
- router bgp

Router General Command

- rib fib fec ecmp ordered

Router-BGP Configuration Mode (Includes Address-Family Mode)

- address-family
- address-family flow-spec
- aggregate-address
- bgp advertise-inactive
- bgp always-compare-med
- bgp bestpath as-path ignore
- bgp bestpath as-path multipath-relax
- bgp bestpath ecmp-fast
- bgp bestpath med confed
- bgp bestpath med missing-as-worst
- bgp bestpath tie-break cluster-list-length
- bgp bestpath tie-break router-id
- bgp client-to-client reflection
- bgp cluster-id
- bgp confederation identifier
- bgp confederation peers
- bgp convergence slow-peer time
- bgp convergence time
- bgp default

15.5.5.1 address-family

The **address-family** command places the switch in address-family configuration mode to configure the address family setting of addresses configured as BGP neighbors. The address-family configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The ***running-config*** displays the **address-family** commands in sub-blocks of the BGP configuration. The following commands are available in address family configuration mode:

- **neighbor activate** configures the address as active in the configuration mode address family.
- **no neighbor activate** configures the address as not active in the configuration mode address family.
- **neighbor default-originate** advertises a default route to the specified BGP neighbor.
- **neighbor route-map (BGP)** applies a route map to the specified BGP route.
- **network (BGP)** specifies a network for advertisement through UPDATE packets to BGP peers.

The **no address-family** and **default address-family** commands delete the specified address family from ***running-config*** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to router-BGP configuration mode.

Command Mode

Router-BGP Configuration

Command Syntax

bgp [ipv4 | ipv6]

no bgp [ipv4 | ipv6]

default bgp [ipv4 | ipv6]

Parameters

- **ipv4** subsequent commands are applied to the IPv4 unicast address family.
- **ipv6** subsequent commands are applied to the IPv6 unicast address family.

Example

These commands enter address family mode for IPv6-unicast, insert a command, then exit the mode:

```
switch(config)# router bgp 1
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# neighbor 172.10.1.1 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#
```

15.5.5.2 address-family flow-spec

Use the **address-family flow-spec** command to filter or redirect DDoS traffic on edge routers. The **no** and **default** versions of the command removes the filter to redirect the DDoS traffic.

Command Mode

BGP router configuration mode (config-router-bgp)

Command Syntax

address-family flow-spec [ipv4 | ipv6]

no address-family flow-spec [ipv4 | ipv6]

default address-family flow-spec [ipv4 | ipv6]

Parameters

- **ipv4** IPv4 flow specifications.
- **ipv6** IPv6 flow specifications.

Example

The BGP Flowspec address family is enabled on a per-peer basis with:

```
switch(config)# router bgp id
switch(config-router-bgp)# address-family flow-spec [ipv4|ipv6]
switch(config-router-bgp-af)# neighbor address activate
```

15.5.5.3 aggregate-address

The **`aggregate-address`** command creates an aggregate route in the Border Gateway Protocol (BGP) database. Aggregate routes combine the characteristics of multiple routes into a single route that the switch advertises. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregate routes are advertised only after they are redistributed.

The advertised address of the aggregate is entered as an IP subnet; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

Note: Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Command options affect the following aggregate routing attributes:

- **AS_PATH attribute inclusion**: the **as-set** option controls the aggregate route's **AS_PATH** and **ATOMIC_AGGREGATE** attribute contents. **AS_PATH** identifies the autonomous systems through which UPDATE message routing information passes. **ATOMIC_AGGREGATE** indicates that the route is an aggregate or summary of more specific routes.

  When the command includes **as-set**, the aggregate route's **AS_SET** attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the **AS_SET**.

  When the command does not include **as-set**, the aggregate route's **ATOMIC_AGGREGATE** attribute is set and the aggregate route **AS_PATH** will include the longest leading **PATH_SEQ** of the **AS_PATH** which is common to all contributor routes. For example, for the aggregate ***1.0.0.0/16*** with two contributors present, the **AS_PATH** for the aggregate is ***100 200*** as shown.

  Aggregate

  1.0.0.0/16 as-path ??

  Contributors

  1.0.1.0/24 **as-path** ***100 200 400 500***

  1.0.2.0/24 as-path 100 200 300
- **Attribute assignment**: the **attribute-map** option assigns attributes contained in set commands in a specified route map's lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route's attributes by the switch.
- **Route suppression**: the ***summary-only*** option suppresses the advertisement of the contributor routes that comprise the aggregate.
- **Contributor filtering**: the ***match-map*** option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

The **`no aggregate-address`** and **`default aggregate-address`** commands remove the corresponding **`aggregate-address`** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

`aggregate-address` **AGGREGATE_NET** [**AS_SET**][**SUMMARY**][**ATTRIBUTE_MAP**] [**MATCH_MAP**]

`no aggregate-address` **AGGREGATE_NET**

`default aggregate-address` AGGREGATE_NET

Parameters

- **AGGREGATE_NET** aggregate route IP address. Options include:
  - ***netv4_addr*** IPv4 subnet address (CIDR or address-mask notation).
  - ***netv6_addr*** IPv6 subnet address (CIDR notation).
- **AS_SET** controls **AS_PATH** attribute values associated with aggregate route. Options include:
  - ***no parameter*** **ATOMIC_AGGREGATE** attribute is set. Route contains no **AS_PATH** data.
  - **as-set** route includes **AS_PATH** information from contributor routes as **AS_SET** attributes.
- **SUMMARY** controls advertisement of contributor routes. Options include:
  - ***no parameter*** contributor and aggregate routes are advertised.
  - **summary-only** contributor routes are not advertised.
- **ATTRIBUTE_MAP** controls attribute assignments to the aggregate route. Options include:
  - ***no parameter*** attribute values are not assigned to route.
  - **attribute-map *map_name*** assigns attribute values in set commands of the map's permit clauses. Deny clauses and match commands in permit clauses are ignored.
- **MATCH_MAP** filters contributors to the aggregate route. Options include:
  - ***no parameter*** no contributors are filtered.
  - **match-map *map_name*** filters contributor routes using the named match-map.

Examples

- These commands create an aggregate route (***10.16.48.0/20***) from the contributor routes ***10.16.48.0/23***, ***10.16.50.0/23***, ***10.16.52.0/23***, and ***10.16.54.0/23***. The aggregate route includes the **AS_PATH** information from the contributor routes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)# exit
switch(config)#
```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config)# route-map map1 permit 10
switch(config-route-map-map1)# set community 45
switch(config-route-map-map1)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 attribute-
map map1
switch(config-router-bgp)# exit
switch(config)#
```

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```
switch(config)# route-map matchmap permit 10
switch(config-route-map-matchmap)# match ip address prefix-list agglist
switch(config-route-map-matchmap)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 1.1.0.0/16 match-map
 matchmap
switch(config-router-bgp)#
```

15.5.5.4 bgp advertise-inactive

By default, BGP will advertise only those routes that are active in the switch's RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The **bgp advertise-inactive** command configures BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

The **no bgp advertise-inactive** and **default bgp advertise-inactive** commands restore the default BGP behavior (advertising only active routes) by removing the corresponding bgp advertise-inactive command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp advertise-inactive

no bgp advertise-inactive

default bgp advertise-inactive

Example

These commands configure BGP to advertise inactive routes.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp advertise-inactive
switch(config-router-bgp)#
```

15.5.5.5 bgp always-compare-med

The **bgp always-compare-med** command configures the switch to always consider Multi-Exit Discriminator (MED) values (also known as “metric”) in best-path selection. By default, this function is disabled, and MED values are compared only if two paths have the same neighbor AS.

When there are two or more links between autonomous systems, MED values may be set by a router in the originating AS to give preferences to certain routes. In comparing MED values, the lower value is preferred.

The **no bgp always-compare-med** and **default bgp always-compare-med** commands restore the default behavior of comparing MED values only on paths with the same neighbor AS.

Command Mode

Router-BGP Configuration

Command Syntax

bgp always-compare-med

no bgp always-compare-med

default bgp always-compare-med

Related Commands

- **bgp bestpath as-path ignore**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med confed**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

Example

These commands configure BGP to always consider MED values in best-path comparisons.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp always-compare-med
switch(config-router-bgp)#
```

15.5.5.6 bgp bestpath as-path ignore

The **bgp bestpath as-path ignore** command configures BGP to ignore the length of the Autonomous System (AS) path when comparing routes. This behavior is disabled by default. Normally, the switch compares AS paths as the third step in the best-path selection process (see **Best-Path Selection**), preferring the route with the shorter AS path.

The **no bgp bestpath as-path ignore** and **default bgp bestpath as-path ignore** commands restore the default behavior of considering AS path length in route comparisons.

Command Mode

Router-BGP Configuration

Command Syntax

bgp bestpath as-path ignore

no bgp bestpath as-path ignore

default bgp bestpath as-path ignore

Related Commands

- **bgp always-compare-med**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med confed**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

Example

These commands configure BGP to ignore AS path lengths when comparing routes.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp bestpath as-path ignore
switch(config-router-bgp)#
```

15.5.5.7 bgp bestpath as-path multipath-relax

The **bgp bestpath as-path multipath-relax** command allows multiple eBGP routes to a destination to be considered equal in ECMP if their AS paths are the same length despite having different autonomous systems in those paths. The **no bgp bestpath as-path multipath-relax** command configures best-path selection to consider two paths *unequal* if their AS path contents are different, and prefers the first path received.

Multipath-relax is enabled by default. The **bgp bestpath as-path multipath-relax** and **default bgp bestpath as-path multipath-relax** commands restore the default behavior by removing the corresponding **no bgp bestpath as-path multipath-relax** command from ***running-config***.

For BGP to support equal cost multipath (ECMP) routing, the **maximum paths (BGP)** command must be issued in router-BGP configuration mode.

Command Mode

Router-BGP Configuration

Command Syntax

bgp bestpath as-path multipath-relax

no bgp bestpath as-path multipath-relax

default bgp bestpath as-path multipath-relax

Related Commands

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med confed**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

Example

These commands configure BGP best-path selection to consider routes unequal if the contents of their AS paths differ.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# no bgp bestpath as-path multipath-relax
switch(config-router-bgp)#
```

15.5.5.8 bgp bestpath ecmp-fast

By default, within an ECMP group the BGP best-path selection process prefers the active path (the first path received by the switch) unless a relevant tie-breaker is enabled. The **no bgp bestpath ecmp-fast** command causes the best-path selection process to ignore order of arrival and continue evaluating paths on other criteria.

The **bgp bestpath ecmp-fast** and **default bgp bestpath ecmp-fast** commands restore the default behavior by removing the corresponding **no bgp bestpath ecmp-fast** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp bestpath ecmp-fast

no bgp bestpath ecmp-fast

default bgp bestpath ecmp-fast

Related Commands

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath med confed**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

Example

These commands configure BGP to ignore order of arrival in best-path comparisons of paths within an ECMP group.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# no bgp bestpath ecmp-fast
switch(config-router-bgp)#
```

15.5.5.9 bgp bestpath med confed

By default, paths originating within the same confederation as the switch and received from confederation peers do not have their Multi-Exit Discriminator (MED) values compared as part of the best-path selection process. The **bgp bestpath med confed** command causes comparison of MED values in such routes. To ensure that MED values are considered in the best-path selection process for all routes received, use the **bgp always-compare-med** command.

The **no bgp bestpath med confed** and **default bgp bestpath med confed** commands restore the default behavior by removing the corresponding **bgp bestpath ecmp-fast** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp bestpath med confed [missing-as-worst]

no bgp bestpath med confed [missing-as-worst]

default bgp bestpath med confed [missing-as-worst]

Related Commands

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

Parameters

- **missing as worst** By default, best-path selection considers a missing MED value to be ***0***, so paths with missing MED values is preferred. This option reverses the behavior in comparisons of routes originating within the same confederation as the switch, treating a missing MED as having the highest (least preferred) value.

Note: The **bgp bestpath med missing-as-worst** command controls how best-path selection treats missing MED values for all routes received, and, if configured, overrides the **missing-as-worst** option of this command.

Example

These commands configure the BGP best-path selection process to consider MED values in comparisons between routes originating within the same confederation as the switch.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp bestpath med confed
switch(config-router-bgp)#
```

15.5.5.10 bgp bestpath med missing-as-worst

By default, BGP best-path selection considers a missing MED value to be **0**, so paths with missing MED values will be preferred. The **bgp bestpath med missing-as-worst** command reverses the behavior, treating a missing MED as having the highest (least preferred) value.

The **no bgp bestpath med missing-as-worst** and **default bgp bestpath med missing-as-worst** commands restore the default behavior (giving preference to missing MED values) by removing the corresponding **bgp bestpath med missing-as-worst** command from ***running-config***.

Note: This command overrides the **missing-as-worst** setting of the **bgp bestpath med confed** command.

Command Mode

Router-BGP Configuration

Command Syntax

bgp bestpath med missing-as-worst

no bgp bestpath med missing-as-worst

default bgp bestpath med missing-as-worst

Related Commands

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med confed**
- **bgp bestpath tie-break cluster-list-length**
- **bgp bestpath tie-break router-id**

Example

These commands configure the BGP best-path selection process to consider a missing MED value to be considered highest (least preferred) in MED comparisons for all routes received.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp bestpath med missing-as-worst
switch(config-router-bgp)#
```

15.5.5.11 bgp bestpath tie-break cluster-list-length

The **bgp bestpath tie-break cluster-list-length** command causes the best-path selection process to prefer the multipath route with the shortest **CLUSTER_LIST** length in case of a tie in step ***10***. The cluster list length is assumed to be ***0*** if the route does not carry a **CLUSTER_LIST** attribute.

The **no bgp bestpath tie-break cluster-list-length** and **default bgp bestpath tie-break cluster-list-length** commands restore the default behavior by removing the associated **bgp bestpath tie-break cluster-list-length** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp bestpath tie-break cluster-list-length

no bgp bestpath tie-break cluster-list-length

default bgp bestpath tie-break cluster-list-length

Related Commands

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med confed**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break router-id**

Example

These commands configure the BGP selection process to prefer the multipath route with the shortest **CLUSTER_LIST** length in case of a tie.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp bestpath tie-break cluster-list-length
switch(config-router-bgp)#
```

15.5.5.12 bgp bestpath tie-break router-id

The **bgp bestpath tie-break router-id** command causes the best-path selection process to prefer the multipath route with the lowest **ROUTER_ID** in case of a tie in step 10. If the route is a reflected route (i.e., if it contains route reflector attributes), the process will use the **ORIGINATOR_ID** as the **ROUTER_ID** for comparison. This behavior is disabled by default.

The **no bgp bestpath tie-break router-id** and **default bgp bestpath tie-break router-id** commands restore the default behavior by removing the associated **bgp bestpath tie-break router-id** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp bestpath tie-break router-id

no bgp bestpath tie-break router-id

default bgp bestpath tie-break router-id

Related Commands

- **bgp always-compare-med**
- **bgp bestpath as-path ignore**
- **bgp bestpath as-path multipath-relax**
- **bgp bestpath ecmp-fast**
- **bgp bestpath med confed**
- **bgp bestpath med missing-as-worst**
- **bgp bestpath tie-break cluster-list-length**

Example

These commands configure the best-path selection process to prefer the multipath route with the lowest **ROUTER_ID** in case of a tie.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp bestpath tie-break router-id
switch(config-router-bgp)#
```

15.5.5.13 bgp client-to-client reflection

By default, routes received from a route reflector client and selected as best routes are propagated to all BGP peers, including other route reflector clients. If the clients are fully meshed, however, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled.

The **no bgp client-to-client reflection** command disables client-to-client reflection.

The **bgp client-to-client reflection** and **default bgp client-to-client reflection** commands restore the default behavior by removing the **no bgp client-to-client reflection** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp client-to-client reflection

no bgp client-to-client reflection

default bgp client-to-client reflection

Example

These commands disable client-to-client reflection on the switch.

```
switch(config)# router bgp 1
switch(config-router-bgp)# no bgp client-to-client reflection
switch(config-router-bgp)#
```

15.5.5.14 bgp cluster-id

When using route reflectors, an AS is divided into clusters. A cluster consists of one or more route reflectors and a group of clients to which they re-advertise route information, and for redundancy a single cluster may contain multiple route reflectors. Each route reflector has a cluster ID. If the cluster has only one route reflector the cluster ID is its router ID, but if a cluster has multiple route reflectors a 4-byte cluster ID must be assigned to all route reflectors in the cluster. All must be configured with the same cluster ID to allow them to identify updates from the cluster's other route reflectors.

The **`bgp cluster-id command`** configures the cluster ID in a cluster with multiple route reflectors.

The **`no bgp cluster-id`** and **`default bgp cluster-id`** commands remove the cluster ID by removing the corresponding **`bgp cluster-id`** command from ***running-config***. Do not remove the cluster ID if there are multiple route reflectors in the cluster.

Command Mode

Router-BGP Configuration

Command Syntax

`bgp cluster-id` **ID_NUM**

`no bgp cluster-id`

`default bgp cluster-id`

Parameters

ID_NUM cluster ID shared by all route reflectors in the cluster (32-bit dotted-decimal notation). Options include:

- ***0.0.0.1*** to ***255.255.255.255*** valid cluster ID number.
- ***0.0.0.0*** removes the cluster-ID from the switch. Equivalent to **`no bgp cluster-id`** command.

Example

This command sets the cluster ID for the switch to ***172.22.30.101***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp cluster-id 172.22.30.101
switch(config-router-bgp)#
```

15.5.5.15 bgp confederation identifier

The **bgp confederation identifier** command configures the confederation identifier. Confederation can reduce the number of iBGP connections in a large AS domain. The AS domain is divided into several smaller sub-ASs, and each sub-AS remains fully connected. Devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

The **no bgp confederation identifier** and **default bgp confederation identifier** commands remove the **bgp confederation identifier command** from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp confederation identifier ***as_number***

no bgp confederation identifier

default bgp confederation identifier

Parameters

as_number the ID of BGP AS confederation. Values range from ***1*** to ***4294967295***.

Example

This command sets the BGP confederation identifier to ***9***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp confederation identifier 9
switch(config-router-bgp)#
```

15.5.5.16 bgp confederation peers

The **bgp confederation peers** command configures a confederation consisting of sub-ASs.

Before this command is executed, the confederation ID should be configured using the **bgp confederation identifier** command. Otherwise this configuration is invalid. The configured ASs in this command are inside the confederation and each AS uses a fully meshed network. The confederation appears as a single AS to the devices outside it.

The **no bgp confederation peers** and **default bgp confederation peers** commands delete the specified sub-AS from the confederation by removing the corresponding **bgp confederation peers** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

bgp confederation peers ***as_range***

no bgp confederation peers ***as_range***

default bgp confederation peers ***as_range***

Parameters

as_range the sub-AS number. Formats include number (from ***1*** to ***4294967295***), number range, or comma-delimited list of numbers and ranges.

Example

This command configures the confederation that contains AS ***1000*** and AS ***1002***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp confederation peers 1000 1002
switch(config-router-bgp)#
```

15.5.5.17 bgp convergence slow-peer time

The **bgp convergence slow-peer time** command configures the idle peer time to wait for the slow peers to establish a session in a BGP convergence state.

The **no bgp convergence slow-peer** time command disables the inheritance of the configuration from the global BGP configuration mode. The **default bgp convergence slow-peer time** command sets the timeout value to the default value.

Command Mode

Router-BGP Configuration

Command Syntax

bgp convergence slow-peer time ***timeout***

no bgp convergence slow-peer time

default bgp convergence slow-peer time

Parameters

timeout the maximum time to wait for the slow peers to establish a session connection. Values range from ***1*** to ***3600*** seconds. The default value is ***90*** seconds.

Example

This command configures an idle peer timeout of ***40*** seconds to wait before establishing a session.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp convergence slow-peer time 40
switch(config-router-bgp)#
```

15.5.5.18 bgp convergence time

The **bgp convergence time** command configures the time to wait before the BGP convergence starts in a session.

The **no bgp convergence time** command removes the configured convergence time to wait. The **default bgp convergence time** command sets the timeout value to the default value.

Command Mode

Router-BGP Configuration

Command Syntax

bgp convergence time ***timeout_range***

no bgp convergence time

default bgp convergence time

Parameters

timeout_range the maximum time to wait for the BGP convergence. Values range from ***1*** to ***3600*** seconds. The default value is ***300*** seconds.

Example

This command configures a convergence time of ***200*** seconds to wait before establishing a session.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp convergence time 200
switch(config-router-bgp)#
```

15.5.5.19 bgp default

The **bgp default** command configures the default address family activation level of all addresses configured as BGP neighbors. The switch sends the following announcements to addresses active in an address family:

- **ipv4 address family**: IPv4 capability and all network advertisements with IPv4 prefixes.
- **ipv6 address family**: IPv6 capability and all network advertisements with IPv6 prefixes.

The following commands configure default address family activation levels for addresses configured as BGP neighbors:

- **bgp default ipv4-unicast**: all addresses are IPv4 address family active.
- **no bgp default ipv4-unicast**: all addresses are *not* IPv4 address family active.
- **bgp default ipv6-unicast**: all addresses are IPv6 address family active
- **no bgp default ipv6-unicast**: all addresses are *not* IPv6 address family active.
- **bgp default ipv4-unicast transport ipv6**: all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIs.

Note: If it is necessary to exchange IPv4 NLRIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command **bgp default ipv4-unicast transport ipv6**. For an individual neighbor, use the **neighbor activate** command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

The activation state of an individual BGP neighbor address is configured by the **neighbor activate** command. The **neighbor activate** command overrides the address's default activation state for the address family configuration mode in which the command is issued:

- **neighbor activate**: the specified address is active.
- **no neighbor activate**: the specified address is *not* active.

The **default-default address family activation state** defines the address family activation level of all addresses configured as BGP neighbors when ***running-config*** does not contain any **bgp default** commands. The default state of the BGP default activation level varies by address family.

- **ipv4 address family**: all BGP addresses are IPv4 address family active.
- **ipv6 address family**: all BGP addresses are *not* IPv6 address family active.

The **default bgp default** command restores the default-default activation setting for BGP neighbor addresses in the specified address family:

- **default bgp ipv4-unicast** is equivalent to **bgp ipv4-unicast**.
- **default bgp ipv6-unicast** is equivalent to **no bgp ipv6-unicast**.

Command Mode

Router-BGP Configuration

Command Syntax

bgp default **ADDRESS_FAMILY**

no bgp default **ADDRESS_FAMILY**

default bgp default **ADDRESS_FAMILY**

Parameters

ADDRESS_FAMILY BGP address family. Options include:

- **ipv4-unicast** IPv4-unicast peering sessions.
- **ipv6-unicast** IPv6-unicast peering sessions.

Example

These commands configure the switch to configure all BGP neighbor addresses as IPv4 address-family active and IPv6 address-family active.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp default ipv4-unicast
switch(config-router-bgp)# bgp default ipv6-unicast
switch(config-router-bgp)# show active
router bgp 65533
   bgp log-neighbor-changes
   distance bgp 20 200 200
   neighbor 172.23.254.2 remote-as 65533
   neighbor 172.41.254.78 remote-as 65534
   neighbor 2001:0DB8:52a4:fe01::2 remote-as 65533
   neighbor 2001:0DB8:52a4:fe4c::1 out-delay 10
switch(config-router-bgp)#
```

The **show active** command does not display the **bgp default ipv4-unicast** command because it is the default setting for IPv4 peering sessions.

15.5.5.20 bgp enforce-first-as

The **bgp enforce-first-as** command causes a forced comparison of the first Autonomous System (AS) in the AS path of eBGP routes received from BGP neighbors to the configured remote external peer Autonomous System Number (ASN). Updates from eBGP peers that do not include that ASN as the first item in the AS path (in the **AS_PATH** attribute) are discarded.

This behavior is enabled by default upon BGP configuration, and disabled globally by the **no** form of this command. To configure first-AS enforcement for an individual neighbor or peer group, use the **neighbor enforce-first-as** command.

Command Mode

Router-BGP Configuration

Command Syntax

bgp enforce-first-as

default bgp enforce-first-as

no bgp enforce-first-as

Example

This command configures BGP to enforce the first AS globally.

```
switch(config-router-bgp)# bgp enforce-first-as
switch(config-router-bgp)#
```

15.5.5.21 bgp listen range

The **bgp listen range** command identifies the BGP peering request from a range of IPv4 or IPv6 address, and names the dynamic peer group to which those peers belong to. To create a static peer group, use the neighbor peer group (create) command.

The request can be from a single AS number or from a range of AS numbers configured. To accept the peering request from single ASN use the **remote-as** option, and to accept request from multiple ASNs use the **peer-filter** option.

Members of a dynamic peer group are configured in groups and not as individuals. Once a new peer group is created with a group name, the group name is then used as an argument by the following **neighbor** commands:

- **neighbor ebgp-multihop**
- **neighbor import-localpref**
- **neighbor maximum-routes**
- **neighbor route-map (BGP)**
- **neighbor timers**
- **neighbor update-source**

The **no bgp listen range** and **default bgp listen range** commands remove the dynamic peer group by deleting the corresponding command from ***running-config***. To remove a static peer group, use the **no neighbor** command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Command Mode

Router-BGP Configuration

Command Syntax

bgp listen range **NET_ADDRESS** [**PEER-ID** include ***router-id***] peer-group ***group_name*** [remote-as ***as_number*** | peer-filter ***filter_name***]

no bgp listen range **NET_ADDRESS** peer-group ***group_name***

default bgp listen range **NET_ADDRESS** peer-group ***group_name***

Parameters

- **NET_ADDRESS** IP address range. Options include:
  - ***IPv4_subnet*** IPv4 subnet (CIDR notation).
  - ***IPv4_address*** **mask** ***subnet*** IPv4 subnet (dotted decimal notation).
  - ***IPv6_prefix*** IPv6 subnet (dotted decimal notation).
- **PEER-ID** Additional specification for identifying a peer.
  - **include** Include following fields as part of peer identifier.
  - **router-id** Include router ID as part of peer identifier.
- ***group_name*** name of the peer group.
- ***as_number*** the autonomous system number, ranges from *1* to ***4294967295***.
- ***filter_name*** name of the peer filter.

Examples

- These commands create a dynamic peer group called ***brazil*** in AS ***5*** which accepts peering requests from the ***192.168.6.0/24*** subnet.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.168.6.0/24 peer-group
 brazil remote-as 5
switch(config-router-bgp)#
```

- These commands create a dynamic peer group called ***brazil*** in a range of AS numbers, which accepts peering requests from the ***192.0.2.0/24*** subnet. The range of AS numbers is defined by peer filter option.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-group
 brazil peer-filter group-1
switch(config-router-bgp)#
```

- These commands enable the same address peering.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-id
 include router-id peer-group brazil peer-filter group-1
```

15.5.5.22 bgp log-neighbor-changes

The **bgp log-neighbor-changes** command configures the switch to generate a log message when a BGP peer enters or exits the **established** state. This is the default behavior.

The **no bgp log-neighbor-changes** command disables the generation of these log messages. The **default bgp log-neighbor-changes** command enables the generation of these log messages.

Command Mode

Router-BGP Configuration

Command Syntax

bgp log-neighbor-changes

no bgp log-neighbor-changes

default bgp log-neighbor-changes

Example

These commands configure the switch to generate a message when a BGP peer enters or exits the **established** state.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp log-neighbor-changes
switch(config-router-bgp)#
```

15.5.5.23 bgp redistribute-internal (BGP)

The **bgp redistribute-internal** command enables the redistribution of iBGP routes into an Interior Gateway Protocol (IGP).

The **no bgp redistribute-internal** command disable route redistribution from the specified domain by removing the corresponding **bgp redistribute-internal** command from ***running-config***. The **default bgp redistribute-internal** command enables the redistribution of iBGP routes into an IGP.

Command Mode

Router-BGP Configuration Router-BGP Address-Family Configuration

Command Syntax

bgp redistribute internal

no bgp redistribute internal

default bgp redistribute internal

Example

This command redistributes internal BGP routes.

```
switch(config)# router bgp 9
switch(config-router-bgp)# bgp redistribute-internal
switch(config-router-bgp)#
```

15.5.5.24 bgp route install-map

The **bgp route install-map** command enables BGP Selective Route Download on the switch and allows the learning and advertising of the BGP routes without installing them in hardware.

The **no bgp route install-map** and **default bgp route install-map** commands delete the BGP Selective Route Download instance.

The **exit** command returns the switch to global configuration mode.

Command Mode

BGP Configuration

Command Syntax

bgp route install-map ***map_name***

Parameter

map_name The name of the route map configured.

Example

These commands configure BGP Selective Route Download for ***test_BGP*** map.

```
switch(config)# router bgp 100
switch(config-router-bgp)# bgp route install-map test_BGP
switch(config-router-bgp)#
```

15.5.5.25 bgp route-reflector preserve-attributes

The **bgp route-reflector preserve-attributes** command configures the switch, when operating as a BGP route reflector, to preserve the BGP attributes of re-advertised routes. By default, BGP attribute preservation is disabled. When attribute preservation is enabled, the BGP attributes (next-hop,local preference, and metric) are preserved in the reflected routes regardless of outbound BGP policies, except when those policies are part of an outbound route map. To override outbound route maps, use the **always** keyword.

The **no bgp route-reflector preserve-attributes** and **default bgp route-reflector preserve-attributes** commands disable BGP attribute preservation.

Command Mode

Router-BGP Configuration

Command Syntax

bgp route-reflector preserve-attributes [**always**]

no bgp route-reflector preserve-attributes

default bgp route-reflector preserve-attributes

Parameter

always Always preserves route attributes, overwriting route map changes.

Related Command

neighbor route-reflector-client

Example

The following commands configure the switch as a route reflector and the neighbor at ***10.5.2.1*** as one of its clients, then configure the switch to preserve the BGP attributes of reflected routes unless overridden by an outbound route map policy.

```
switch(config)# router bgp 10
switch(config-router-bgp)# neighbor 10.5.2.11 route-reflector-client
switch(config-router-bgp)# bgp route-reflector preserve-attributes
switch(config-router-bgp)#
```

15.5.5.26 clear bgp history

To clear all messages for a peer or group of peers, use the **`clear bgp history`** command .

Command Mode

Privileged EXEC

Command Syntax

`clear bgp` [**PEER** | **PREFIX** | peer-group **PEER_GROUP**] **`history`** [connect-failures] [vrf **VRF**]

Parameters

- **PEER** An IPv4 or IPv6 valid address.
- **PREFIX** An IPv4 or IPv6 valid prefix.
- **peer-group PEER_GROUP** A peer group name.
- **connect-failures** Optional and will not affect the result.
- **vrf VRF** A VRF name. If it's not supplied, command will act upon VRF default.

If no peer, prefix, or peer-group is supplied, the **`clear bgp history`** command will clear the history for all peers in the specified VRF.

Related Command

show bgp neighbors history

Example

This example clears the BGP Peer group ***Purple*** history from ***VRF_1***.

```
switch# clear bgp Purple history vrf VRF_1
```

15.5.5.27 clear ip bgp

The **clear ip bgp** command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

Command Mode

Privileged EXEC

Command Syntax

clear ip bgp [**PEERS**] [**RESET_TYPE**] [**DATA_FLOW**] [**VRF_INSTANCE**]

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
  - ***no parameters*** all IPv4 and IPv6 peers.
  - ***** all IPv4 and IPv6 peers.
  - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
  - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
  - ***intrf_ipv6_addr*** the peer using the specified IPv6 link-local address.
  - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - ***no parameters*** performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - **soft** performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - ***no parameters*** resets inbound and outbound routes.
  - **in** resets inbound peer routes.
  - **out** resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - ***no parameters*** resets matching peers in the context-active VRF.
  - ***vrf_name*** resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - **default** resets matching peers in the default VRF.

Related Commands

- **clear ip bgp counters**
- **clear ip bgp errors**
- **clear ip bgp neighbor ***

Guidelines

Use the **clear ip bgp** command after changing any of the following BGP attributes:

- weights
- distribution lists
- timers
- administrative distance

Examples

- This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ip bgp
! Peerings for all neighbors were hard reset
switch#
```

- This command has the same behavior as the above **clear ip bgp** command.

```
switch# clear ip bgp *
! Peerings for all neighbors were hard reset
switch#
```

15.5.5.28 clear ip bgp counters

The **clear ip bgp counters** command resets general statistics of peers. These statistics primarily consist of message-related counts.

Command Mode

Privileged EXEC

Command Syntax

clear ip bgp [**PEERS**] counters [**VRF_INSTANCES**]

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
  - ***no parameters*** all IPv4 and IPv6 peers.
  - ***** all IPv4 and IPv6 peers.
  - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
  - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
  - ***intrf_ipv6_addr*** the peer using the specified IPv6 link-local address.
  - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - ***no parameters*** resets matching peers in the context-active VRF.
  - ***vrf_name*** resets matching peers in the specified VRF.
  - **all** resets matching peers in all VRFs.
  - **default** resets matching peers in the default VRF.

Related Commands

- **clear ip bgp**
- **clear ip bgp errors**
- **clear ip bgp neighbor**

Example

This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ip bgp counters
! Counters for all neighbors were reset
switch#
```

15.5.5.29 clear ip bgp errors

The **clear ip bgp errors** command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

Command Mode

Privileged EXEC

Command Syntax

clear ip bgp [**PEERS**] **errors** [**VRF_INSTANCES**]

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
  - ***no parameters*** all IPv4 and IPv6 peers.
  - ***** all IPv4 and IPv6 peers.
  - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
  - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
  - ***intrf_ipv6_addr*** the peer using the specified IPv6 link-local address.
  - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - ***no parameters*** resets matching peers in the context-active VRF.
  - ***vrf_name*** resets matching peers in the specified VRF.
  - **all** resets matching peers in all VRFs.
  - **default** resets matching peers in the default VRF.

Related Commands

- **clear ip bgp**
- **clear ip bgp counters**
- **clear ip bgp neighbor ***

Example

This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ip bgp errors
! Errors for all neighbors were reset
switch#
```

15.5.5.30 clear ip bgp neighbor

The **clear ip bgp neighbor** command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv6 transport address family, use the **clear ipv6 bgp neighbor** command.

Command Mode

Privileged EXEC

Command Syntax

clear ip bgp neighbor [*****] [**vrf** ***vrf_name***] [**reason**

Parameters

***** optional; all neighbors in the address family are cleared with or without this option

vrf ***vrf_name*** specifies a VRF instance for which IPv4 transport address family BGP neighbors will be cleared. If no VRF is specified, the command clears IPv4 BGP neighbors in the context-active VRF.

vrf all clears IPv4 BGP neighbors in all VRFs.

vrf default clears IPv4 BGP neighbors in the default VRF.

reason ***message*** includes the specified message string in the notification sent to neighbors. Maximum string length 250 characters.

Related Commands

- **clear ip bgp**
- **clear ip bgp counters**
- **clear ip bgp errors**

Examples

- This command clears all IPv4 BGP neighbors in the context-active VRF.

```
switch# clear ip bgp neighbor
! Peerings for all ipv4 neighbors were hard reset
switch#
```

- This command clears all IPv4 BGP neighbors in VRF ***purple***.

```
switch# clear ip bgp neighbor vrf purple
! Peerings for all ipv4 neighbors were hard reset
switch#
```

15.5.5.31 clear ipv6 bgp

The **clear ipv6 bgp** command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 bgp [**PEERS**] [**RESET_TYPE**] [**DATA_FLOW**] [**VRF_INSTANCE**]

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
  - ***no parameters*** all IPv4 and IPv6 peers.
  - ***** all IPv4 and IPv6 peers.
  - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
  - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
  - ***intrf_ipv6_addr*** the peer using the specified IPv6 link-local address.
  - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - ***no parameters*** performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - **soft** performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - ***no parameters*** resets inbound and outbound routes.
  - **in** resets inbound peer routes.
  - **out** resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - ***no parameters*** resets matching peers in the context-active VRF.
  - ***vrf_name*** resets matching peers in the specified VRF.
  - **all** resets matching peers in all VRFs.
  - **default** resets matching peers in the default VRF.

Related Commands

- **clear ipv6 bgp counters**
- **clear ipv6 bgp errors**
- **clear ipv6 bgp neighbor ***

Guidelines

Use the **clear ipv6 bgp** command after changing any of the following BGP attributes:

- weights
- distribution lists
- timers
- administrative distance

Examples

- This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ipv6 bgp
! Peerings for all neighbors were hard reset
switch#
```

- This command has the same behavior as the above **clear ip bgp** command.

```
switch# clear ipv6 bgp *
! Peerings for all neighbors were hard reset
switch#
```

15.5.5.32 clear ipv6 bgp counters

The **clear ipv6 bgp counters** command resets general statistics of peers. These statistics primarily consist of message-related counts.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 bgp [**PEERS**] **counters** [**VRF_INSTANCES**]

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
  - ***no parameters*** all IPv4 and IPv6 peers.
  - ***** all IPv4 and IPv6 peers.
  - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
  - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
  - ***intrf_ipv6_addr*** the peer using the specified IPv6 link-local address.
  - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - ***no parameters*** resets matching peers in the context-active VRF.
  - ***vrf_name*** resets matching peers in the specified VRF.
  - **all** resets matching peers in all VRFs.
  - **default** resets matching peers in the default VRF.

Related Commands

- **clear ipv6 bgp**
- **clear ipv6 bgp errors**
- **clear ipv6 bgp neighbor ***

Example

This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ipv6 bgp counters
! Counters for all neighbors were reset
switch#
```

15.5.5.33 clear ipv6 bgp errors

The **clear ipv6 bgp errors** command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6s bgp [**PEERS**] **errors** [**VRF_INSTANCES**]

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
  - ***no parameters*** all IPv4 and IPv6 peers.
  - ***** all IPv4 and IPv6 peers.
  - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
  - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
  - ***intrf_ipv6_addr*** the peer using the specified IPv6 link-local address.
  - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - ***no parameters*** resets matching peers in the context-active VRF.
  - ***vrf_name*** resets matching peers in the specified VRF.
  - **all** resets matching peers in all VRFs.
  - **default** resets matching peers in the default VRF.

Related Commands

- **clear ipv6 bgp**
- **clear ipv6 bgp counters**
- **clear ipv6 bgp neighbor ***

Example

This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ipv6 bgp errors
! Errors for all neighbors were reset
switch#
```

15.5.5.34 clear ipv6 bgp neighbor

The **clear ipv6 bgp neighbor** command clears BGP neighbors belonging to the IPv6 transport address family. To clear BGP neighbors in the IPv4 transport address family, use the **clear ip bgp neighbor** command.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 bgp neighbor [*****] [**vrf** ***vrf_name***] [**reason** ***message***]

Parameters

***** optional; all neighbors in the address family are cleared with or without this option

vrf ***vrf_name*** specifies a VRF instance for which IPv6 transport address family BGP neighbors will be cleared. If no VRF is specified, the command clears IPv6 BGP neighbors in the context-active VRF.

vrf all clears IPv6 BGP neighbors in all VRFs.

vrf default clears IPv6 BGP neighbors in the default VRF.

reason *message* includes the specified message string in the notification sent to neighbors. Maximum string length 250 characters.

Related Commands

- **clear ipv6 bgp**
- **clear ipv6 bgp counters**
- **clear ipv6 bgp errors**

Examples

- This command clears all IPv6 BGP neighbors in the context-active VRF.

```
switch# clear ipv6 bgp neighbor
! Peerings for all ipv6 neighbors were hard reset
switch#
```

- This command clears all IPv6 BGP neighbors in VRF ***purple*** and adds a message to the notification.

```
switch# clear ipv6 bgp neighbor vrf purple reason going down for
 maintenance
! Peerings for all ipv6 neighbors were hard reset
switch#
```

15.5.5.35 distance bgp

The **distance bgp** command assigns an administrative distance to routes that the switch learns through BGP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from ***1*** to ***255***; lower distance values correspond to higher reliability. BGP routing tables do not include routes with a distance of ***255***.

The distance command assigns distance values to external, internal, and local BGP routes:

- **external**: Best-path routes learned from a neighbor external to the autonomous system. Default distance is ***200***.
- **internal**: Internal routes are routes learned from a BGP entity within the same autonomous system. Default distance is ***200***.
- **local**: Local routes are networks listed with a network router configuration command for that router or for networks that are redistributed from another process. Default distance is ***200***.

The **no distance bgp** and **default distance bgp** commands restore the default administrative distances by removing the **distance bgp** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

distance bgp ***external_dist*** [**INTERNAL_LOCAL**]

no distance bgp

default distance bgp

Parameters

- ***external_dist*** distance assigned to external routes. Values range from ***1*** to ***255***.
- **INTERNAL_LOCAL** distance assigned to internal and local routes. Values for both routes range from ***1*** to ***255***. Options include:
  - ***no parameter*** the ***external_dist*** value is also assigned to internal and local routes.
  - ***internal_dist local_dist*** values assigned to internal and local routes.

Example

- This command assigns an administrative distance of ***150*** to external routes, ***200*** to internal, and ***150*** to local routes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# distance bgp 150 200 150
switch(config-router-bgp)#
```

15.5.5.36 dynamic peer max

The **dynamic peer max** command limits the number of dynamic BGP peers allowed on the switch.

The **no dynamic peer max** and **default dynamic peer max** commands restore the default limit of dynamic BGP peers by removing the **dynamic peer max** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

dynamic peer max ***maximum***

no dynamic peer max

default dynamic peer max

Parameters

maximum the maximum number of dynamic BGP peers to be allowed on the switch. Values range from ***1*** to ***1000***; default value is ***100***.

Example

This command sets the maximum number of dynamic BGP peers allowed on the switch to ***200***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# dynamic peer max 200
switch(config-router-bgp)#
```

15.5.5.37 graceful-restart stalepath-time

The **graceful-restart stalepath-time** command specifies the maximum time that stale routes from a restarting BGP neighbor will be retained after a BGP session is re-established with that peer.

The **no graceful-restart stalepath-time** and **default graceful-restart stalepath-time** commands restore the default value of ***300*** seconds by deleting the **graceful-restart stalepath-time** statement from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

graceful-restart stalepath-time ***interval***

no graceful-restart stalepath-time

default graceful-restart stalepath-time

Parameters

interval Maximum period (in seconds) that stale routes from a restarting BGP neighbor will be retained after the BGP session is re-established. Values range from ***1*** to ***3600*** (***60*** minutes). Default is ***300***.

Example

These commands configure the stale path retention interval to ***15*** minutes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# graceful-restart stalepath-time 900
switch(config-router-bgp)#
```

15.5.5.38 graceful-restart-helper

The **graceful-restart helper** command enables BGP graceful restart helper mode on the switch for all BGP neighbors. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart helper is enabled by default. To configure graceful restart helper mode for a specific neighbor or peer group, use the **neighbor graceful-restart-helper** command. Individual neighbor configuration takes precedence over the global configuration.

The **no graceful-restart helper** command disables graceful restart helper mode on the switch. The **default graceful-restart helper** command enables graceful restart helper mode by removing the corresponding **no graceful-restart helper** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

graceful-restart helper long-lived

no graceful-restart helper long-lived

default graceful-restart helper long-lived

Parameter

long-lived Enables long lived graceful restart helper mode.

Example

These commands disable graceful restart helper mode on the switch.

```
switch(config)# router bgp 1
switch(config-router-bgp)# no graceful-restart-helper
switch(config-router-bgp)#
```

15.5.5.39 ip as-path access-list

The **ip as-path access-list** command creates an access list to filter BGP route updates. If access list ***list_name*** does not exist, this command creates it. If it already exists, this command appends statements to the list.

The **no ip as-path access-list** and **default ip as-path access-list** commands delete the named access list.

Command Mode

Global Configuration

Command Syntax

ip as-path access-list ***list_name*** **FILTER_TYPE** *regex* **ORIGIN**

no ip as-path access-list ***list_name***

default ip as-path access-list ***list_name***

Parameters

- ***list_name*** the name of the AS path access list.
- **FILTER_TYPE** access resolution of the specified AS path. Options include:
  - **permit** access is permitted.
  - **deny** access is denied.
- **regex** a regular expression describing the AS path being filtered. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- **ORIGIN** the origin of the path information. Values include:
  - ***no parameter*** sets the origin to **any**.
  - **any** any BGP origin.
  - **egp** EGP origin.
  - **igp** IGP origin.
  - **incomplete** incomplete origin.

Example

These commands create an AS path access list named ***list1*** which allows all BGP routes except those originating in ***AS 3***.

```
switch(config)# ip as-path access-list list1 deny _3$
switch(config)# ip as-path access-list list1 permit .*
switch(config)#
```

15.5.5.40 ip as-path regex-mode

The **ip as-path regex-mode** command specifies how the switch will evaluate regular expressions describing AS paths in ACLs. When the regex mode is set to **asn**, AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match. When it is set to **string**, AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match. The default mode is **asn**.

For example, **asn** mode returns as **false** and the **string** mode returns as **true** when searching for "***10*** in an AS path of **100 200**.

The **no ip as-path regex-mode** and **default ip as-path regex-mode** commands restore the regex mode to **asn** by removing the **ip as-path regex-mode** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip as-path regex-mode MODE_SETTING

no ip as-path regex-mode

default ip as-path regex-mode

Parameters

MODE_SETTING Specifies how regular expressions describing AS paths in AS path ACLs will be evaluated. Options include:

- **asn** AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match.
- **string** AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match.

Example

This command sets the regex mode to **string**.

```
switch(config)# ip as-path regex-mode string
switch(config)#
```

15.5.5.41 ip community-list

The **ip community-list** command creates and configures a BGP access list based on BGP communities.

The **no ip community-list** and **default ip community-list** commands delete the specified community list by removing the corresponding **ip community-list** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip community-list ***list_name*** [permit | deny] [**GSHUT** | ***aa:nn*** | internet | local-as | no-advertise | no-export | *number*]

no ip community-list ***list_name***

default ip community-list ***list_name***

Parameters

- ***list_name*** name of the community list. Valid input is text.
- **permit** permits access to the specified community.
- **deny** denies access to the specified community.

  Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.
- **GSHUT** well-known graceful shutdown community.
- ***aa:nn*** AA is ***65535*** and NN specifies the community number (***0-65535***) within the AS.
- **internet** advertises route to the Internet community.
- **local-as** advertises route only to local peers.
- **no-advertise** does not advertise route to any peer.
- **no-export** advertises route only within BGP AS boundary.
- **number** community number. Values ranges from 0 to 4294967040.

Related Commands

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

Guideline

EOS does not support disabling the process of graceful shutdown community.

Note: The **ip community-list** command with the **permit internet** option permits access to all routes associated with any community.

Examples

- This command creates a BGP community list (named ***list_9***) that does not match members of route maps configured with AS-network number ***100:250***.

```
switch(config)# ip community-list list_9 deny 100:250
switch(config)#
```

- These commands create a BGP community list that permits the graceful shutdown community, then use that list it in a route map to permit routes with that community.

```
switch(config)# ip community-list gshut_list permit GSHUT
switch(config)# route-map map1
```

```
switch(config-route-map-map1)# match community gshut_list
switch(config-route-map-map1)# exit
switch(config)# show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
    match community gshut_list
  SubRouteMap:
  Set clauses:
switch(config)#
```

- This command permits access to all routes associated with the BGP community list (***CLIST1***).

```
switch(config)# ip community-list CLIST1 permit internet
switch(config)#
```

15.5.5.42 ip community-list regexp

The **ip community-list regexp** command creates and configures a BGP access list based on BGP communities. A BGP community access list filters prefixes based on their BGP communities. The command uses regular expressions to identify the communities specified by the list. To create a community list by explicitly specifying one or more communities, use the **ip community-list** command.

The **no ip community-list regexp** and **default ip community-list regexp** commands delete the specified community list. To delete a specific community-list entry, specify the entry in the **no ip community-list regexp** command.

Command Mode

Global Configuration

Command Syntax

ip community-list regexp ***list_name*** {deny | permit} ***reg_exp***

no ip community-list regexp ***list_name*** {deny | permit} ***reg_exp***

default ip community-list regexp ***list_name***

Parameters

- ***list_name*** name of the community list. Valid input is text.
- **permit** access is permitted for the specified community.
- **deny** access is denied for the specified community.

  Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.
- ***reg_exp*** list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

  Note: When using the **no** form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the **no** form of the command removes the entire list.

Related Commands

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

Guideline

The **ip community-list regexp** command with the **permit internet** option permits access to only those routes that carry the community value of ***0***.

Examples

- This command creates a BGP community list that permits routes from networks ***20-24*** and ***30-34*** in autonomous system ***10***.

```
switch(config)# ip community-list regexp list_2 permit 10:[2-3][0-4]_
switch(config)#
```

- This command removes the above statement from the community list named ***list_2***, leaving any other statements in the list intact.

```
switch(config)# no ip community-list regexp list_2 permit 10:[2-3][0-4]
_
```

```
switch(config)#
```

- This command deletes the community list named ***list_2*** entirely.

```
switch(config)# no ip community-list regexp list_2
switch(config)#
```

- This command permits access to all routes associated with the BGP community list (***CLIST1***) that carry the community value ***0***.

```
switch(config)# ip community-list regexp CLIST1 permit internet
switch(config)#
```

15.5.5.43 ip extcommunity-list

The **ip extcommunity-list** command creates an extended community list to filter VRF routes or for Link BandWidth (LBW) advertisement.

The following extcommunity-list types are supported:

- **Route Target (RT)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (SoO)** identifies sites where the switch learned the route.
- **Link Bandwidth (LBW)** advertises BGP link bandwidth.

The **no ip extcommunity-list** and **default ip extcommunity-list** commands delete the specified extended community list by removing the corresponding **ip extcommunity-list** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip extcommunity-list ***list_name*** {deny | permit} **COMM_1** [**COMM_2...COMM_n**]

no ip extcommunity-list ***list_name***

default ip extcommunity-list ***list_name***

Parameters

- ***list_name*** name of the extended community list.
- **deny** access is denied for the specified community.
- **permit** access is permitted for the specified community.
- **COMM_x** extended community attribute. Options include:
  - **rt** ***aa:nn*** route target, as specified by autonomous system:network number.
  - **rt** ***ip_addr:nn*** route target, as specified by ip address:network number.
  - **soo** ***aa:nn*** Site of Origin, as specified by autonomous system:network number.
  - **soo** ***ip_addr:nn*** site of origin, as specified by ip address:network number.
  - **lbw** link bandwidth in bits per second.

Related Commands

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

Example

This command creates a BGP extended community list that denies routes from route target ***100:250***.

```
switch(config)# ip extcommunity-list list_9 deny rt 100:250
switch(config)#
```

15.5.5.44 ip extcommunity-list regexp

The **ip extcommunity-list regexp** command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement. The command uses regular expressions to define the extended communities specified by the list. To specify particular values, use the **ip extcommunity-list** command.

The following extcommunity-list types are supported:

- **Route Target (RT)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (SoO)** identifies sites where the switch learned the route.
- **Link Bandwidth (LBW)** advertises BGP link bandwidth.

The **no ip extcommunity-list regexp** and **default ip extcommunity-list regexp** commands delete the specified extended community list by removing the corresponding **ip extcommunity-list regexp** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip extcommunity-list regexp ***list_name*** {deny | permit} ***reg_exp***

no ip extcommunity-list regexp ***list_name*** {deny | permit} ***reg_exp***

default ip extcommunity-list regexp ***list_name***

Parameters

- ***list_name*** name of the extended community list. Valid input is text.
- **deny** access is denied for the specified extended community list.

  Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.
- **permit** access is permitted for the specified extended community list.
- ***reg_exp*** list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
  - Expressions beginning with **RT:** match the **route target** extended community attribute option.
  - Expressions beginning with **SoO:** match the **site of origin** extended community attribute option.

Related Commands

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

Example

This command creates a BGP extended community list that denies routes from route target networks ***20-24*** and ***30-34*** in autonomous system ***10***.

```
switch(config)# ip extcommunity-list regexp list_1 deny RT:10:[2-3][0-4]_
switch(config)#
```

15.5.5.45 ip large-community-list regexp

The **ip large-community-list regexp** command creates and configures a BGP access list based on BGP large communities. A BGP large-community access list filters prefixes based on their BGP large community values. The command uses regular expressions to match large communities. Multiple large-community lists with the same name may be specified. To create a large-community list by explicitly specifying one or more communities, use the **ip large-community-list** command.

Large-communities are represented as follows: [ASN]:local-part1:local-part2.

The **no ip large-community-list regexp** and **default ip large-community-list regexp** commands delete the specified large community list. To delete a specific community-list entry, specify the entry in the **no ip large-community-list regexp** command.

Command Mode

Global Configuration

Command Syntax

ip large-community-list regexp ***list_name*** {deny | permit} ***reg_exp***

no ip large-community-list regexp ***list_name*** {deny | permit} ***reg_exp***

default ip large-community-list regexp ***list_name***

Parameters

- ***list_name*** name of the community list. Valid input is text.
- **deny** access is denied for the specified community.

  Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.
- **permit** access is permitted for the specified community.
- ***reg_exp*** list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

  Note: When using the **no** form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the **no** form of the command removes the entire list.

Related Commands

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

Examples

- This command creates a BGP large community list that permits routes from autonomous system ***10*** with local-part1 value of ***20-24*** or ***30-34***.

```
switch(config)# ip large-community-list regexp list_2 permit 10:[2-3]
[0-4]:_
switch(config)#
```

- This command removes the above statement from the large community list named ***list_2***, leaving any other statements in the list intact.

```
switch(config)# no ip large-community-list regexp list_2 permit 10:
[2-3]:[0-4]_
switch(config)#
```

- This command deletes the large community list named ***list_2*** entirely.

```
switch(config)# no ip large-community-list regexp list_2
switch(config)#
```

15.5.5.46 match as-range

The **match as-range** command defines the match statement for the peer-filter, based on the match statement the peer-filter accept or reject the incoming peer request. The match statement includes a sequence number, AS number range and a match condition to accept or reject a peer by comparing its remote AS number to the specified range. A peer filter can consist of a single match statement or multiple match statements. The match statement for the peer filter is configured under peer-filter configuration mode.

The **no match as-range** or **default match as-range** command deletes the peer-filter condition for the group from ***running-config***.

Command Mode

Peer-Filter Configuration

Command Syntax

[***sequence_number***] **match as-range** [***as_number1***] [***as_number2***] result {accept | reject} ***group_name***

no match as-range [***as_number1***] [***as_number2***] result {accept | reject} ***group_name***

default match as-range [***as_number1***] [***as_number2***] result {accept | reject} ***group_name***

Parameters

- ***sequence_number*** optional sequence number for the match statement; one is automatically created if not assigned. Values range from ***0*** to ***65535***.
- ***group_name*** name of the peer filter group.
- ***as_number*** the autonomous system number, values range from ***1*** to ***4294967295***.

Examples

- These commands define a peer filter that accepts any AS number.

```
switch(config)# peer-filter group1
switch(config-peer-filter-group1)# 10 match as-range 1-4294967295
 result accept
switch(config-peer-filter-group1)#
```

- These commands define a peer filter that accepts any AS number within ***65000*** and ***65100*** (inclusive) except ***65008*** and ***65009***.

```
switch(config)# peer-filter group2
switch(config-peer-filter-group2)# 10 match as-range 65008-65009 result
 reject
switch(config-peer-filter-group2)# 20 match as-range 65000-651000
 result accept
switch(config-peer-filter-group2)#
```

- These commands define a peer filter that accepts three specific remote AS numbers.

```
switch(config)# peer-filter group3
eswitch(config-peer-filter-group3)# 10 match as-range 65003 result
 accept
switch(config-peer-filter-group3)# 20 match as-range 65007 result
 accept
switch(config-peer-filter-group3)# 30 match as-range 65009 result
 accept
switch(config-peer-filter-group3)#
```

15.5.5.47 maximum-paths (BGP)

The **maximum-paths** command controls the maximum number of parallel BGP routes that the switch supports. The default maximum is one route. The command provides an Equal Cost Multiple Paths (ECMP) parameter that controls the number of equal-cost paths that the switch stores in the routing table for each route.

For paths to be consider equal, they must have the same weight, local preference, AS-path length, and origin. To require that they also have the same Mmulti-Exit Discriminator (MED) value, use the **bgp always-compare-med** command. To require that their AS paths have the same contents, use the **no bgp bestpath as-path multipath-relax** command.

The **no maximum-paths** and **default maximum-paths** commands restore the default values of the maximum number of parallel routes and the maximum number of ECMP paths by removing the corresponding **maximum paths** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

maximum-paths ***paths*** [ecmp ***ecmp_paths***]

no maximum-paths

default maximum-paths

Parameters

- ***paths*** maximum number of parallel routes. Default value is ***1***. Value must be less than or equal to the maximum number of ECMP paths.
- ***ecmp_paths*** maximum number of ECMP paths for each route. Default is maximum value as defined belows.

  Value for each parameter ranges from ***1*** to the number of interfaces available per ECMP group, which is platform dependent.

  - **Arad**: Values range from ***1*** to ***128***. Default value is ***128***.
  - **FM6000**: Values range from ***1*** to ***32***. Default value is ***32***.
  - **PetraA**: Values range from ***1*** to ***16***. Default value is ***16***.
  - **Trident**: Values range from ***1*** to ***32***. Default value is ***32***.
  - **Trident II**: Values range from ***1*** to ***128***. Default value is ***128***.

Examples

- These commands configure the maximum number of BGP parallel paths to ***12*** without changing the ECMP value.

```
switch(config)# router bgp 1
switch(config-router-bgp)# maximum-paths 12
switch(config-router-bgp)#
```

- These commands configure the maximum number of BGP parallel routes to ***2***, with a maximum of ***4*** ECMP paths for each route.

```
switch(config)# router bgp 1
switch(config-router-bgp)# maximum-paths 2 ecmp 4
switch(config-router-bgp)#
```

15.5.5.48 neighbor

Use the **neighbor** command to enable large communities on a ‘per-neighbor’ or ‘per-peer group’ basis. This behavior is consistent with all other forms of communities supported by EOS.

Receiving and processing of large communities is enabled by default.

Command Mode

BGP router mode

Command Syntax

neighbor [***A.B.C.D.*** [send-community [large]]| ***A:B:C:D:E:F:G:H*** | *NAME* | default | ***fe80::A:B:C:D% interface*** | interface]

Parameters

- ***A.B.C.D.*** Neighbor IPv4 address
  - **send-community** Enable sending communities.
    - **large** Send large community attribute to this neighbor.
- ***A:B:C:D:E:F:G:H*** Neighbor IPv6 address.
- ***NAME*** Name of the peer-group.
- **default** Apply to all neighbors.
- ***fe80::A:B:C:D% interface*** Neighbor IPv6 link-local address.
- **interface** Interface range to be used for BGP session establishment.

Example

You can enable large communities on a ‘per-neighbor’ or ‘per-peer group’ basis.

```
switch(config)# router bgp 1
switch(config-bgp-router)# neighbor 1.1.1.1 send-community large
```

15.5.5.49 neighbor activate

The **neighbor activate** command defines the configuration mode address family activation state of a specified address that is configured as a BGP neighbor. The switch sends the following announcements to addresses active in an address family:

- **IPv4 address family**: IPv4 capability and all network advertisements with IPv4 prefixes.
- **IPv6 address family**: IPv6 capability and all network advertisements with IPv6 prefixes.

The **bgp default** command configures the default address family activation state of addresses configured as BGP neighbors. The **neighbor activate** and **no neighbor activate** commands override the neighbor's default activation state within the ***address family*** configuration mode.

- **neighbor activate**: the specified address is active in the address family.

no neighbor activate: the specified address is not active in the address family.

The **default neighbor activate** command removes the corresponding **neighbor activate** or **no neighbor activate** command from ***running-config***, restoring the default address family activation state for the specified neighbor address.

Command Mode

Router-BGP Address-Family Configuration

Command Syntax

neighbor *neighbor_ID* activate

no neighbor *neighbor_ID* activate

default neighbor *neighbor_ID* activate

Parameters

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Limitations

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does *not* support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.

Example

These commands activate the advertising of specified neighbors during IPv4 peering sessions, then display the result.

```
switch(config)# router bgp 1
switch(config-router-bgp)# no address-family ipv4
switch(config-router-bgp-af)# neighbor 172.41.18.15 activate
switch(config-router-bgp-af)# neighbor 172.49.22.6 activate
switch(config-router-bgp-af)# no neighbor 172.15.21.18 activate
switch(config-router-bgp-af)# show active
   address-family ipv4
      no neighbor 172.15.21.18 activate
      neighbor 172.49.22.6 activate
      neighbor 172.41.18.15 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#
```

15.5.5.50 neighbor allowas-in

By default, BGP drops received routes if their Autonomous System (AS) paths contain the AS Number (ASN) of the switch. The **neighbor allowas-in** command configures the switch to accept routes from the specified BGP neighbor even if their AS paths contain the ASN of the switch itself. Optionally, the command can also configure the maximum number of times that the switch's ASN can appear in a route before it is dropped.

The **no neighbor allowas-in** command configures the default behavior (dropping BGP routes that contain the ASN of the switch).

The default **neighbor allowas-in** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the BGP neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **allowas-in** [***asn_quantity***]

no neighbor ***neighbor_ID*** **allowas-in**

default neighbor ***neighbor_ID*** **allowas-in**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***asn_quantity*** number of repetitions of the switch's ASN allowed in the AS path of routes received from the specified BGP neighbor. Values range from ***1*** to ***10***. Default is ***3***.

Related Commands

This command is used on a customer edge router that is part of a split AS; to address the problem at the provider end, use the **neighbor as-path remote-as replace out** command.

Example

These commands configure the switch to accept routes from the BGP neighbor at ***192.168.1.30*** which contain the switch's ASN in their AS paths as many as three times.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 allowas-in
switch(config-router-bgp)#
```

15.5.5.51 neighbor as-path remote-as replace out

By default, BGP drops received routes if their Autonomous System (AS) paths contain the AS Number (ASN) of the switch. In a split AS sharing route advertisements through a provider network, this can result in valid routes being dropped. The **neighbor as-path remote-as replace out** command configures a provider edge switch to replace the customer's AS with its own in route advertisements sent to neighbors in that AS.

The **no neighbor as-path remote-as replace out** command configures the default behavior (leaving the customer's AS in the AS path attribute of routes advertised to the specified neighbor).

The **default neighbor as-path remote-as replace out** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the BGP neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **as-path remote-as replace out**

no neighbor ***neighbor_ID*** **as-path remote-as replace out**

default neighbor ***neighbor_ID*** **as-path remote-as replace out**

Parameters

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Related Commands

This command is used on a provider edge router forwarding BGP routes to a customer in a split AS; to address the problem at the customer end, use the **neighbor allowas-in** command.

Example

These commands configure the switch to substitute its local ASN for the ASN of the BGP neighbor at ***192.168.2.15*** in BGP routes advertised to that neighbor.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.2.15 as-path remote-as
 replace out
switch(config-router-bgp)#
```

15.5.5.52 neighbor auto-local-addr

The **`neighbor auto-local-addr`** command configures the switch to automatically determine the local address to be used for the non-transport address family in NLRIs sent to the specified neighbor or peer group. This allows IPv4 NLRIs to be carried over IPv6 transport, or IPv6 NLRIs to be carried over IPv4 transport.

The **`no neighbor auto-local-addr`** command applies the system default configuration.

The **`default neighbor auto-local-addr`** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Note: While this feature works well in eBGP deployments in which the pairing routers are directly connected and have matching IP address configurations, multi-hop eBGP or iBGP deployments may require manual local address configuration.

To explicitly configure a local address for the non-transport address family for a specific neighbor or peer group, use the **`neighbor local-v4-addr`** command for IPv6 neighbors, or the **`neighbor local-v6-addr`** for IPv4 neighbors.

Command Mode

Router-BGP Configuration

Command Syntax

`neighbor` ***neighbor_ID*** **`auto-local-addr`**

`no neighbor` ***neighbor_ID*** **`auto-local-addr`**

`default neighbor` ***neighbor_ID*** **`auto-local-addr`**

Parameters

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

For the IPv6 neighbor at ***2001:0DB8:c2a4:1761::2***, these commands configure the switch to automatically determine the IPv4 NLRI value to be sent during peering sessions.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 2001:0DB8:c2a4:1761::2 auto-local-ad
dr
switch(config-router-bgp)#
```

15.5.5.53 neighbor default-originate

The **neighbor default-originate** command advertises a default route to a BGP neighbor or peer group. This default route overrides the default route advertised by any other means to the specified neighbor or peer group. However, the update generated by **neighbor default-originate** is not processed by neighbor route map out policies.

If a route map is specified in this command, its set clauses are used to modify attributes of the exported default route, but its match clauses are not used to conditionally advertise the route. The default route is always advertised to the specified neighbor.

The **no neighbor default-originate** command applies the system default configuration.

The **default neighbor default-originate** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration Router-BGP Address-Family Configuration

Command Syntax

neighbor ***neighbor_ID*** **default-originate** [**MAP**]

no neighbor ***neighbor_ID*** **default-originate**

default neighbor ***neighbor_ID*** **default-originate**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **MAP** specifies route map that modifies attributes of the exported default route. Options include:
  - ***no parameter*** attributes are not modified by a route map.
  - **route-map** ***map_name*** attributes set by specified route map are assigned to the exported default route.

Example

These commands advertise a default route to the BGP neighbor at ***192.168.14.5***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 192.168.14.5 default-originate
switch(config-router-bgp)#
```

15.5.5.54 neighbor description

The **neighbor description** command associates descriptive text with the specified peer or peer group.

The **no neighbor description** command removes the text association from the specified peer or peer group.

The **default neighbor description** command removes the text association from the specified peer for individual neighbors, and applies the peer group's description to neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **description** ***description_string***

no neighbor ***neighbor_ID*** **description**

default neighbor ***neighbor_ID*** **description**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***description_string*** text string to be associated with the neighbor or peer group.

Example

These commands associate the string ***PEER_1*** with the peer located at ***192.168.1.30***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 description PEER_1
switch(config-router-bgp)#
```

15.5.5.55 neighbor ebgp-multihop

The **neighbor ebgp-multihop** command programs the switch to accept and attempt BGP connections to the external peers residing on networks not directly connected to the switch. The command does not establish the multihop if the only route to the peer is the default route (***0.0.0.0***).

The **no neighbor ebgp-multihop** command applies the system default configuration.

The **default neighbor ebgp-multihop** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **ebgp-multihop** [***hop_number***]

no neighbor ***neighbor_ID*** **ebgp-multihop**

default neighbor ***neighbor_ID*** **ebgp-multihop**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***hop_number*** time-to-live (hops). Values range from ***1*** to ***255***. Default value is ***255***.

Example

These commands configure the switch to accept and attempt BGP connections to the external peer located at ***192.168.1.30***, setting the hop limit to ***32***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 ebgp-multihop 32
switch(config-router-bgp)#
```

15.5.5.56 neighbor enforce-first-as

The **neighbor enforce-first-as** command causes a forced comparison of the first Autonomous System (AS) in the AS path of eBGP routes received from a specified BGP peer or peer group to the configured remote external peer Autonomous System Number (ASN). Updates from the specified eBGP peers that do not include an ASN as first AS path (in the **AS_PATH** attribute) are discarded.

This behavior is enabled globally by default upon BGP configuration, and disabled for the specified neighbor or peer group by the **no** form of the command. To configure first AS enforcement globally, use the **bgp enforce-first-as** command.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **enforce-first-as**

no neighbor ***neighbor_ID*** **enforce-first-as**

default neighbor ***neighbor_ID*** **enforce-first-as**

Parameters

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

This command disables enforcement of the first BGP AS for the neighbors in peer group ***region-3***.

```
switch(config-router-bgp)# no neighbor region-3 enforce-first-as
switch(config-router-bgp)#
```

15.5.5.57 neighbor export-localpref

The **neighbor export-localpref** command determines the **LOCAL_PREF** value that is sent in BGP UPDATE packets to the specified peer or peer group. This command has no effect on external peers.

The **no neighbor export-localpref** command resets the **LOCAL_PREF** value to the system default of ***100*** in packets sent to the specified peer or peer group.

The **default neighbor export-localpref** command resets the **LOCAL_PREF** value to the system default of ***100*** for individual neighbors, and applies the peer groups's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **export-localpref** ***preference***

no neighbor ***neighbor_ID*** **export-localpref**

default neighbor ***neighbor_ID*** **export-localpref**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***preference*** preference value. Values range from ***0*** to ***4294967295***.

Example

This command configures the switch to fill the **LOCAL_PREF** field with ***200*** in UPDATE packets that it sends to the peer located at ***10.1.1.45***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp)#
```

15.5.5.58 neighbor graceful-restart

The **neighbor graceful-restart** command enables the BGP graceful restart mode for a specified BGP neighbor or peer group. When graceful restart mode is enabled, the switch retains routes from neighbors that are capable of graceful restart. By default, graceful restart is disabled for all BGP neighbors. Individual neighbor configuration takes precedence over the global configuration.

The **no neighbor graceful-restart** and **default neighbor graceful-restart** commands disable graceful restart mode for the specified BGP neighbor or peer group by removing the corresponding **no neighbor graceful-restart** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **graceful-restart**

no neighbor ***neighbor_ID*** **graceful-restart**

default neighbor ***neighbor_ID*** **graceful-restart**

Parameter

neighbor_ID neighbors's IPv4 or IPv6 address or peer group name.

Example

This command enables BGP graceful restart mode for the neighbor with the IP address ***192.168.12.1***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.12.1 graceful-restart
switch(config-router-bgp)#
```

15.5.5.59 neighbor graceful-restart-helper

The **neighbor graceful-restart helper** command enables BGP graceful restart helper mode for the specified BGP neighbor or peer group. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. The neighbor graceful-restart-helper is enabled by default for all BGP neighbors. To configure graceful restart helper mode for all BGP neighbors, use the **graceful-restart-helper** command. Individual neighbor configuration takes precedence over the global configuration.

The **no neighbor graceful-restart helper** command disables graceful restart helper mode for the specified BGP neighbor or peer group. The **default neighbor graceful-restart helper** command enables graceful restart helper mode for the specified BGP neighbor or peer group by removing the corresponding **no neighbor graceful-restart helper** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor *neighbor_ID* graceful-restart helper long-lived

no neighbor *neighbor_ID* graceful-restart helper long-lived

default neighbor *neighbor_ID* graceful-restart helper long-lived

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **long-lived** Enables long lived graceful restart helper mode.

Example

These commands disable graceful restart helper mode for the neighbor at ***192.168.12.1***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# no neighbor 192.168.12.1 graceful-restart-
helper
switch(config-router-bgp)#
```

15.5.5.60 neighbor import-localpref

The **neighbor import-localpref** command determines the local preference assigned to routes received from the specified external peer or peer group. This command has no effect on routes received from internal peers.**no neighbor import-localpref**

The command resets the local preference to the default of ***100*** for routes received from the specified peer or peer group.

The **default neighbor import-localpref** command resets the local preference to the default of ***100*** for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **import-localpref** ***preference***

no neighbor ***neighbor_ID*** **import-localpref**

default neighbor ***neighbor_ID*** **import-localpref**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***preference*** preference value. Values range from ***0*** to ***4294967295***.

Example

These commands configure the switch to assign a local preference of ***50*** to routes received from the peer located at ***192.168.1.30***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 import-localpref 50
switch(config-router-bgp)#
```

15.5.5.61 neighbor local-as

The **`neighbor local-as`** command changes the local AS value sent to the specified peer in OPEN messages, allowing the switch to appear as a member of a different AS to the selected peer. Arista switches replace the local AS number with the modified value rather than prepending it to routes, so we implement the command only as **`neighbor local-as no-prepend replace-as`**.

Note: To establish a BGP connection with a static peer, the peer must also be configured to expect the specified ASN. This is done by using the **neighbor remote-as** command on the peer switch.

The **`no neighbor local-as`** command disables this modification for the specified peer or peer group. The **`default neighbor local-as`** command disables this modification for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

`neighbor` ***neighbor_ID*** **`local-as`** ***as_id*** **`no-prepend replace-as`**

`no neighbor` ***neighbor_ID*** **`local-as`**

`default neighbor` ***neighbor_ID*** **`local-as`**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***as_id*** AS number that is sent in OPEN messages to the specified peer in place of the actual AS of the switch. Values range from ***1*** to ***4294967295***.

  This parameter cannot be set to the switch's AS number or to any AS number in the peer's network.

Examples

These commands configure the switch to replace its local ASN in OPEN messages sent to the peer at ***10.13.64.1*** with ASN ***64500***, and configure the peer to expect that ASN in messages received from the switch.

Switch Configuration

```
switch(config)# router bgp 64497
switch(config-router-bgp)# neighbor 10.13.64.1 local-as 64500 no-prepend
switch(config-router-bgp)#
```

Peer Configuration

```
peer(config)# router bgp 64502
peer(config-router-bgp)# neighbor 10.4.3.10 remote-as 64500
peer(config-router-bgp)#
```

15.5.5.62 neighbor local-v4-addr

The **neighbor local-v4-addr** command specifies the next-hop value that the switch sends as the IPv4 NLRI value to neighbors with whom IPv6 transport peering is established.

The **no neighbor local-v4-addr** command applies the system default configuration.

The **default neighbor local-v4-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

To configure the switch to automatically determine the IPv4 address to be sent as the next-hop in IPv4 NLRIs to an IPv6 neighbor, use the **neighbor auto-local-addr** command.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **local-v4-addr** ***ipv4_local***

no neighbor ***neighbor_ID*** **local-v4-addr**

default neighbor ***neighbor_ID*** **local-v4-addr**

Parameters

- ***neighbor_ID*** neighbor's IPv6 address or peer group name.
- ***ipv4_local*** next hop address.

Example

For the neighbor at ***2001:0DB8:c2a4:1761::2***, these commands specify an IPv4 NLRI value of ***10.7.5.11*** to be sent during IPv6 transport peering sessions.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 2001:0DB8:c2a4:1761::2 local-v4-addr
 10.7.5.11
switch(config-router-bgp)#
```

15.5.5.63 neighbor local-v6-addr

The **neighbor local-v6-addr** command specifies the next-hop value that the switch sends as the IPv6 NLRI value to neighbors with which IPv4 transport peering is established.

In IPv6 peering sessions, the switch sends the global IPv6 address of the interface that is used to transmit BGP updates.

The **no neighbor local-v6-addr** command applies the system default configuration.

The **default neighbor local-v6-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **local-v6-addr** ***ipv6_local***

no neighbor ***neighbor_ID*** **local-v6-addr**

default neighbor ***neighbor_ID*** **local-v6-addr**

Parameters

- ***neighbor_ID*** neighbor's IPv4 address or peer group name.
- ***ipv6_local*** next hop address (A:B:C:D:E:F:G:H).

Example

For the neighbor at ***10.7.5.11***, these commands specify an IPv6 NLRI value that is sent during IPv4 transport peering sessions.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a
4:1761::2
switch(config-router-bgp)# show active
router bgp 1
   bgp log-neighbor-changes
   bgp default ipv6-unicast
   neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
switch(config-router-bgp)#
```

15.5.5.64 neighbor maximum-routes

The **neighbor maximum-routes** command determines the number of BGP routes the switch accepts from a specified neighbor and defines an action when the limit is exceeded. The default value is ***12000***. To remove the maximum routes limit, select a limit of zero.

When the number of routes received from a peer exceeds the limit, the switch generates an error message. This command can also configure the switch to disable peering with the neighbor. In this case, the neighbor state is reset only through a **clear ip bgp** command.

The **no neighbor maximum-routes** command applies the system default maximum-routes value of ***12000*** for the specified peer.

The **default neighbor maximum-routes** command applies the system default value for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **maximum-routes** ***quantity*** [**ACTION**]

no neighbor ***neighbor_ID*** **maximum-routes**

default neighbor ***neighbor_ID*** **maximum-routes**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***quantity*** maximum number of routes. Values include:
  - ***0*** the switch does not define a route limit.
  - ***1 to 4294967294*** maximum number of routes.
- **ACTION** switch action when the route limit is exceeded. Values include:
  - ***no parameter*** peering is disabled and an error message is generated.
  - **warning-only** peering is not disabled, but an error message is generated.

Example

This command configures the switch to accept ***15000*** routes for the neighbor at ***10.3.16.210***. If the neighbor exceeds ***15000*** routes, the switch disables peering with the neighbor.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 110.3.16.210 maximum-routes 15000
switch(config-router-bgp)#
```

15.5.5.65 neighbor next-hop-peer

The **neighbor next-hop-peer** command configures the switch to list the peer address as the next hop in routes that it receives from the specified peer BGP-speaking neighbor or members of the specified peer group. This command overrides the next hop for all routes received from this neighbor or peer group.

The **no neighbor next-hop-peer** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-peer** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **next-hop-peer**

no neighbor ***neighbor_ID*** **next-hop-peer**

default neighbor ***neighbor_ID*** **next-hop-peer**

Parameters

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

This command configures the peer address of ***10.3.2.24*** as the next hop for routes advertised to the switch from the peer BGP neighbor.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.3.2.24 next-hop-peer
switch(config-router-bgp)#
```

15.5.5.66 neighbor next-hop-self

The **neighbor next-hop-self** command configures the switch to list its address as the next hop in routes that it advertises to the specified BGP-speaking neighbor or neighbors in the specified peer group. This is used in networks where BGP neighbors do not directly access all other neighbors on the same subnet.

The **no neighbor next-hop-self** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-self** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **next-hop-self**

no neighbor ***neighbor_ID*** **next-hop-self**

default neighbor ***neighbor_ID*** **next-hop-self**

Parameters

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

This command configures the switch as the next hop for the peer at ***10.4.1.30***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.4.1.30 next-hop-self
switch(config-router-bgp)#
```

15.5.5.67 neighbor next-hop resolution v4-mapped-v6 translation

The **neighbor next-hop resolution v4-mapped-v6 translation** command configures the switch to enable translation of IPv4-mapped IPv6 addresses to IPv4 addresses. With this setting enabled, when the switch receives an IPv4-mapped IPv6 address for a next hop, it will translate it to an IPv4 address. This allows the next hop to be resolved in an IPv4 network.

The **no neighbor next-hop resolution v4-mapped-v6 translation** and **default neighbor next-hop resolution v4-mapped-v6 translation** commands disable the translation from IPv4-mapped IPv6 addresses to IPv4 addresses.

Command Mode

BGP IPv6 Labeled-Unicast Address Family Configuration

Command Syntax

neighbor {***neighbor_ID***} **next-hop resolution v4-mapped-v6 translation**

no neighbor {***neighbor_ID***} **next-hop resolution v4-mapped-v6 translation**

default neighbor {***neighbor_ID***} **next-hop resolution v4-mapped-v6 translation**

Parameters

- ***neighbor_ID*** a neighboring peer or peer group that may send IPv4-mapped IPv6 addresses to this switch.

Guidelines

- This command is active only if the multi-agent routing protocol model is running.
- This command requires an IPv6 labeled-unicast address family.
- This command applies to the default VRF.

Example

These commands enter BGP IPv6 Labeled-Unicast Address Family Configuration mode for AS ***64510*** (creating the BGP instance if it does not exist) and enable the translation of IPv4-mapped IPv6 addresses to IPv4 addresses for neighbors in the ***v6_pg*** peer group.

```
switch(config)# router bgp 64510
switch(config-router-bgp)# address-family ipv6 labeled-unicast
switch(config-router-bgp-af-label)# neighbor v6_pg next-hop resolution
 v4-mapped-v6 translation
switch(config-router-bgp-af-label)#
```

15.5.5.68 neighbor out-delay

The **neighbor out-delay** command sets the period of time that a route update for the specified neighbor must be in the routing table before the switch exports it to BGP. The out delay interval is used for bundling routing updates.

The **no neighbor out-delay** command applies the system default (out-delay value of zero) for the specified peer.

The **default neighbor out-delay** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **out-delay** ***delay_time***

no neighbor ***neighbor_ID*** **out-delay** ***delay_time***

default neighbor ***neighbor_ID*** **out-delay** ***delay_time***

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***delay_time*** the out delay period (seconds). Values range from ***0*** to ***600***. Default value is ***0***.

Example

These commands set the out delay period to ***5*** seconds for the connection with the peer at ***10.24.15.9***.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.24.15.9 out-delay 5
switch(config-router-bgp)#
```

15.5.5.69 neighbor passive

The **neighbor passive** command sets the TCP connection for the specified BGP neighbor or peer group to passive mode. When the peer's transport connection mode is set to passive, it accepts TCP connections for BGP but does not initiate them.

The **no neighbor passive** command sets the specified BGP neighbor or peer group to active connection mode. BGP peers in active mode can both accept and initiate TCP connections for BGP. This is the default behavior.

The **default neighbor passive** command restores the default connection mode. The default mode is **active** for individual BGP peers, or the mode inherited from the peer group for peer group members.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor *neighbor_ID* passive

no neighbor *neighbor_ID* passive

default neighbor *neighbor_ID* passive

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

These commands configure the neighbor at IP address ***10.2.2.14*** to not initiate TCP connections for BGP peering.

```
switch(config)# router bgp 300
switch(config-router-bgp)# neighbor 10.2.2.14 passive
switch(config-router-bgp)#
```

15.5.5.70 neighbor password

The **neighbor password** command enables authentication on a TCP connection with a BGP peer. The plain-text version of the password is a string, up to ***8*** bytes in length. Peers must use the same password to ensure proper communication.

The ***running-config*** displays the encrypted version of the password. The encryption scheme is not strong by cryptographic standards; encrypted passwords should be treated in the same manner as plain-text passwords.

The **no neighbor password** command applies the system default for the specified peer, removing the neighbor password from the configuration and disabling authentication with the specified peer.

The **default neighbor password** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor password** and **default neighbor password** commands remove the neighbor password from the configuration, disabling authentication with the specified peer.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **password** [**ENCRYPT_LEVEL**] ***key_text***

no neighbor ***neighbor_ID*** **password**

default neighbor ***neighbor_ID*** **password**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **ENCRYPT_LEVEL** the encryption level of the ***key_text*** parameter. Values include:
  - ***no parameter*** the ***key_text*** is in clear text.
  - ***0*** the ***key_text*** is in clear text. Equivalent to the ***no parameter*** case.
  - ***7*** the ***key_text*** is MD5-encrypted.
- ***key_text*** the password.

Example

This command specifies a password in clear text.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.25.25.13 password 0 code123
switch(config-router-bgp)#
```

Running-config stores the password as an encrypted string.

15.5.5.71 neighbor peer group (create)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer group (create)** command is used to create static BGP peer groups. Static peer groups are peer groups whose members are added manually. To assign BGP neighbors to a static peer group, use the **neighbor peer group (neighbor assignment)** command. To create a dynamic peer group, use the **bgp listen range** command.

The **no neighbor peer group (create)** and **default neighbor peer group (create)** commands remove the specified static peer group from ***running-config***. When a static peer group is deleted, the neighbors that were members of that peer group lose any configuration that was inherited from the peer group. The **no** form of the **bgp listen range** command removes a dynamic peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***group_name*** **peer group**

no neighbor ***group_name*** **peer group**

default neighbor ***group_name*** **peer group**

Parameters

group_name peer group name.

Examples

- These commands create a BGP peer group called ***bgpgroup1***, assign several neighbors to the group, apply a route map, and adjust the configuration for one group member.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor bgpgroup1 peer group
switch(config-router-bgp)# neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)# neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)# neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)# show active
router bgp 9
bgp log-neighbor-changes
   neighbor bgpgroup1 peer group
   neighbor bgpgroup1 route-map corporate in
   neighbor bgpgroup1 maximum-routes 12000
   neighbor 10.1.1.1 peer group bgpgroup1
   neighbor 10.2.2.2 peer group bgpgroup1
   neighbor 10.3.3.3 peer group bgpgroup1
   neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```

- This command removes peer group ***bgpgroup1*** from ***running-config***. The group members remain, but all settings that group members inherited from the peer group are removed.

```
switch(config-router-bgp)# no neighbor bgpgroup1 peer group
switch(config-router-bgp)# show active
```

```
router bgp 9
bgp log-neighbor-changes
   neighbor 10.1.1.1 maximum-routes 12000
   neighbor 10.2.2.2 maximum-routes 12000
   neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```

15.5.5.72 neighbor peer group (neighbor assignment)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer group (neighbor assignment)** command is used to assign BGP neighbors to an existing static peer group. To create a static peer group, use the **neighbor peer group (create)** command. A neighbor can only belong to one peer group, so issuing this command for a neighbor that is already a member of another group will remove it from that group.

The **no neighbor peer group** and **default neighbor peer group** commands remove the specified neighbor from all peer groups. When a neighbor is removed from a peer group, the neighbor retains the configuration inherited from the peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor NEIGHBOR_ADDR **peer group** ***group_name***

no neighbor NEIGHBOR_ADDR **peer group**

default neighbor NEIGHBOR_ADDR **peer group**

Parameters

- **NEIGHBOR_ADDR** address of a neighbor being added to peer group. Values include:
  - ***ipv4_addr*** neighbor's IPv4 address.
  - ***ipv6_addr*** neighbor's IPv6 address.
- ***group_name*** peer group name.

Examples

- These commands create a BGP peer group called ***bgpgroup1***, assign several neighbors to the group, and apply a route map.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor bgpgroup1 peer group
switch(config-router-bgp)# neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)# neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)#
```

- This command removes the neighbor at ***1.1.1.1*** from the peer group. All settings that neighbor ***10.1.1.1*** inherited from the peer group are maintained.

```
switch(config-router-bgp)# no neighbor 10.1.1.1 peer group
switch(config-router-bgp)#
```

15.5.5.73 neighbor remote-as

The **neighbor remote-as** command configures the expected AS Number for a neighbor (peer). This configuration is required to establish a static peer connection. Internal neighbors have the same AS Number (ASN); external neighbors have different ASNs.

Note: To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the **router-id (BGP)** command.

When a static peer is using the **neighbor local-as** command to replace its local ASN with a configured ASN in OPEN messages, use the **neighbor remote-as** command to configure the switch to expect the configured ASN for that peer.

The **no neighbor remote-as** command applies the system default for the specified peer or peer group.

The **default neighbor remote-as** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **remote-as** ***as_id***

no neighbor ***neighbor_ID*** **remote-as**

default neighbor ***neighbor_ID*** **remote-as**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***as_id*** Autonomous System (AS) of the peer. Values range from ***1*** to ***4294967295***.

Example

These commands establish an eBGP connection with the router at ***10.4.3.10*** in ***AS 64500***.

```
switch(config)# router bgp 64497
switch(config-router-bgp)# neighbor 10.4.3.10 remote-as 64500
switch(config-router-bgp)#
```

15.5.5.74 neighbor remove-private-as

The **neighbor remove-private-as** command removes private autonomous system numbers from outbound routing updates for external BGP (eBGP) neighbors. When the Autonomous System (AS) path includes only private autonomous system numbers, the **REMOVAL** parameter specifies how the private autonomous system number is removed.

The **no neighbor remove-private-as** command applies the system default (preserves private AS numbers) for the specified peer.

The **default neighbor remove-private-as** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **remove-private-as** [**REMOVAL**]

no neighbor ***neighbor_ID*** **remove-private-as**

default neighbor ***neighbor_ID*** **remove-private-as**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **REMOVAL** specifies removal of all private AS numbers when the AS path contains only private AS numbers. Values include:
  - **all** removes all private AS numbers from AS path in outbound updates.
  - **all replace-as** all private AS numbers in AS path are replaced with router's local AS number.

  Note: This command does not support a mix of public and private AS numbers.

Examples

- These commands program the switch to remove all private AS numbers from outbound routing updates for the eBGP neighbor at ***10.5.2.11*** only if the AS path does not contain any public AS number.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.11 remove-private-as
switch(config-router-bgp)#
```

- This command replaces all private AS numbers in the AS path with the switch's local AS number.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.11 remove-private-as all
 replace-as
switch(config-router-bgp)#
```

15.5.5.75 neighbor rib-in pre-policy retain

By default, inbound BGP routes that are filtered out by the inbound policy are still stored on the switch. Because all routes are retained, this allows policies to be changed without the need to reset the BGP sessions. All routes received by the switch (including those that were filtered out by the inbound policy) can be seen by issuing the **show ip bgp neighbor received-routes** command.

The **no neighbor rib-in pre-policy retain** command configures the switch to discard those routes received from the specified neighbor (or peer group) that are filtered out by the inbound policy.

The **neighbor rib-in pre-policy retain** command restores the system default behavior (retaining routes from the specified neighbor or group regardless of inbound policy).

The **default neighbor rib-in pre-policy retain** command applies the system default (retaining policy-rejected routes) for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **rib-in pre-policy retain** [**all**]

no neighbor ***neighbor_ID*** **rib-in pre-policy retain**

default neighbor ***neighbor_ID*** **rib-in pre-policy retain**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **all** the command applies to all routes from the specified neighbor or peer group, including those that would otherwise be discarded as invalid (because their AS-Path contains the switch's own ASN, for example). Without this keyword, the command applies only to routes that were filtered out by the inbound policy.

Examples

These commands configure the switch to discard routes received from from the neighbor at ***10.5.2.23*** which are filtered out by the switch's inbound policies.

```
switch(config)# router bgp 9
switch(config-router-bgp)# no neighbor 10.5.2.23 rib-in pre-policy retain
switch(config-router-bgp)#
```

These commands configure the switch to retain all routes received from the neighbor at ***10.5.2.23*** (including invalid routes).

```
switch(config)# router bgp 9
switch(config-router-bgp)# no neighbor 10.5.2.23 rib-in pre-policy retain
 all
switch(config-router-bgp)#
```

15.5.5.76 neighbor route-map (BGP)

The **neighbor route-map** command applies a route map to inbound or outbound BGP routes. When a route map is applied to outbound routes, the switch will advertise only routes matching at least one section of the route map. Only one outbound route map and one inbound route map can be applied to a given neighbor. A new route map applied to a neighbor will replace the previous route map.

The command is available in the ***router-bgp*** and the ***router-bgp-address-family*** configuration modes. The mode in which the command is executed determines the scope of the command:

- In the ***router-bgp*** mode, the route map is applied to the specified neighbor in all peering sessions where it is advertised.
- In the ***router-bgp-address-family*** mode, the route map is applied to the neighbors only in peering sessions corresponding to the configuration-mode address family.

The **no neighbor route-map** command discontinues the application of the specified route map for the specified neighbor and direction. Removing a route map from one direction does not remove it from the other if it has been applied to both.

The **default neighbor route-map** command applies the system default (no route map) for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Router-BGP Address-Family Configuration

Command Syntax

neighbor ***neighbor_ID*** **route-map** ***map_name*** **DIRECTION**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***map_name*** name of a route map.
- **DIRECTION** routes to which the route map is applied. Options include:
  - **in** route map is applied to inbound routes.
  - **out** route map is applied to outbound routes.

Example

This command applies a route map named ***inner-map*** to a BGP inbound route from ***10.5.2.11***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.11 route-map inner-map in
switch(config-router-bgp)#
```

15.5.5.77 neighbor route-reflector-client

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers, but to prevent routing loops they must not re-advertise iBGP-learned routes within the AS. To ensure that all members of the AS share the same routing information, a fully meshed network topology (in which each member router of the AS is connected to every other member) can be used, but this topology can result in high volumes of iBGP messages when it is scaled. Instead, in larger networks one or more routers can be configured as route reflectors.

A route reflector is configured to re-advertise routes learned through iBGP to a group of BGP neighbors within the AS (its clients), eliminating the need for a fully meshed topology.

The **neighbor route-reflector-client** command configures the switch to act as a route reflector and configures the specified neighbor as one of its clients. Additional clients are specified by re-issuing the command.

The **no neighbor route-reflector-client** and **default neighbor route-reflector-client** commands disable route reflection by deleting the **neighbor route-reflector-client** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor *neighbor_ID* route-reflector-client

no neighbor *neighbor_ID* route-reflector-client

default neighbor *neighbor_ID* route-reflector-client

Parameters

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Related Commands

- **bgp client-to-client reflection**
- **bgp route-reflector preserve-attributes**

Example

This command configures the switch as a route reflector and the neighbor at ***10.5.2.1*** as one of its clients.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.11 route-reflector-client
switch(config-router-bgp)#
```

15.5.5.78 neighbor route-to-peer

The **neighbor route-to-peer** command allows BGP to establish a connection to reach the specified peer using kernel routing table information. By default, route-to-peer configuration is enabled for a peer or a peer group.

The **no neighbor route-to-peer** command prevents BGP from using kernel routing table information to establish a BGP connection to reach a peer and the **default neighbor route-to-peer** command enables route-to-peer configuration for a peer or a peer group by removing the corresponding **no neighbor route-to-peer** command from the ***running-config***.

If the peer is directly connected, BGP instead uses ARP table or neighbor table information to establish a BGP connection to reach the peer.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor *neighbor_ID* route-to-peer

no neighbor *neighbor_ID* route-to-peer

default neighbor *neighbor_ID* route-to-peer

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or the peer group name.

Example

These commands establish a connection between the switch and the BGP peer located at IP address ***172.16.1.1***, and prevent BGP from using kernel routing table information to establish a route to that peer.

```
switch(config)# router bgp 64496
switch(config-router-bgp)# no neighbor 172.16.1.1 route-to-peer
switch(config-router-bgp)# neighbor 172.16.1.1 remote-as 100
switch(config-router-bgp)#
```

15.5.5.79 neighbor send-community

The **neighbor send-community** command configures the switch to include community path attributes for routes in the UPDATE messages advertised to the specified BGP neighbor. By default, the command enables the switch to send all community attributes: standard, extended, and large. To advertise *only a subset* of community attributes, use the keyword(s) for the community attribute(s) to be included. To add additional community attributes in a separate command, or to remove specific community attributes from advertised routes, use the **neighbor send-community add / remove** command.

Note: The **neighbor send-community link-bandwidth** command will override this command and vice-versa.

The **no neighbor send-community** command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **send-community** [extended] [large][standard]

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **extended** includes extended community attributes.
- **large** includes large community attributes.
- **standard** includes standard community attributes.

Examples

- These commands configure the switch to send all community attributes to the neighbor at address ***10.5.2.23***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.23 send-community
switch(config-router-bgp)#
```

- These commands configure the switch to include only large community attributes in the routes sent to the neighbor at address ***10.5.2.24***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.24 send-community large
switch(config-router-bgp)#
```

- These commands configure the switch to send only standard and large community attributes to the neighbor at address ***10.5.2.25***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.25 send-community standard
 large
switch(config-router-bgp)#
```

15.5.5.80 neighbor send-community add / remove

The **neighbor send-community add / remove** command modifies the types of community path attributes included for routes in the UPDATE messages advertised to the specified BGP neighbor without having to issue the **no neighbor send-community** command.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **send-community** {add | remove}{extended | large | standard}

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **add** appends the specified community path attribute type to the list of community path attribute types sent to the specified neighbor.
- **remove** removes the specified community path attribute type from the list of community path attribute types sent to the specified neighbor.
- **extended** enables (or disables) sending of the extended community path attribute to the specified neighbor.
- **large** enables (or disables) sending of the large community path attribute to the specified neighbor.
- **standard** enables (or disables) sending of the standard community path attribute to the specified neighbor.
- **link-bandwidth** see **neighbor send-community link-bandwidth** for a description of this parameter.

Guidelines

- If the **neighbor send-community** command has been issued for the neighbor without specifying any community types, that neighbor will receive all community attributes in the routes advertised to it. Using the **neighbor send-community add** command then to add an attribute will cause the switch to send *only* the specified community types in advertised routes. This results in the other community path attributes no longer being advertised to that BGP peer.
- If all community types are removed using the **neighbor send-community remove** command, the switch will then send routes with all community types. (This behavior is maintained for backward compatibility.) To remove all community path attributes from routes sent to the specified neighbor, use the **no neighbor send-community** command.
- After using this command, issue the **show active** command in ***router-bgp*** configuration mode to ensure that the intended attributes are being sent to the specified neighbor.

Examples

- These commands configure the switch to send large community attributes in the routes sent to the neighbor at address ***10.5.2.24***, then add extended community attributes as well.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.24 send-community large
switch(config-router-bgp)# neighbor 10.5.2.24 send-community add
 extended
switch(config-router-bgp)# show active
switch(config-router-bgp)# neighbor 10.5.2.24 send-community add
 extended
switch(config-router-bgp)# show active
router bgp 9
   neighbor 10.5.2.24 send-community extended large
   neighbor 10.5.2.24 maximum-routes 12000
switch(config-router-bgp)#
```

- These commands configure the switch to include extended and large community attributes in the routes sent to the neighbor at address ***10.5.2.27***, then remove the large attribute from the list of community types to be included.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.27 send-community extended
 large
switch(config-router-bgp)# neighbor 10.5.2.27 send-community remove
 large
switch(config-router-bgp)# show active
router bgp 600
   neighbor 10.5.2.27 send-community extended
   neighbor 10.5.2.27 maximum-routes 12000
switch(config-router-bgp)#
```

- These commands attempt to configure the switch to remove large community attributes from routes sent to the neighbor at address ***10.5.2.28***, but send all others. However, because the original command did not specify a list of attributes, the **remove** command has no effect, and all community path attributes are still included.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.28 send-community
switch(config-router-bgp)# neighbor 10.5.2.28 send-community remove
 large
switch(config-router-bgp)# show active
router bgp 600
   neighbor 10.5.2.28 send-community
   neighbor 10.5.2.28 maximum-routes 12000
switch(config-router-bgp)#
```

- These commands configure the switch to send only large community attributes in routes sent to the neighbor at address ***10.5.2.29***, then attempt to remove the large attribute from sent routes. However, because this removes the last specified attribute, *all* community path attributes (including large) will now be included.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.29 send-community large
switch(config-router-bgp)# neighbor 10.5.2.28 send-community remove
 large
switch(config-router-bgp)# show active
router bgp 600
   neighbor 10.5.2.29 send-community
   neighbor 10.5.2.29 maximum-routes 12000
switch(config-router-bgp)#
```

15.5.5.81 neighbor send-community link-bandwidth

The **neighbor send-community link-bandwidth** command is used to locally regenerate the link-bandwidth value to be advertised to a specific BGP neighbor or peer group. When this command is configured the regenerated link-bandwidth value is included in the extended community path attribute in UPDATE messages.

This command is used specifically for local regeneration of the link-bandwidth value. To send an explictly-configured link-bandwidth value, add an extended community to a route map instead. (see **set extcommunity (route-map)**) and include extended community attributes in UPDATE messages sent to that neighbor.

Note: The **neighbor send-community** command will override this command and vice-versa.

The **no neighbor send-community** command applies the system default (not sending community attributes in **BGP UPDATE** messages) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **send-community link-bandwidth** {**aggregate** [***reference_speed***] | **divide** {**equal** | **ratio**}}

no neighbor ***neighbor_ID*** **send-community**

default neighbor ***neighbor_ID*** **send-community**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **aggregate** sends the sum of all link-bandwidth values for all paths toward a prefix to the specified neighbor or to each member of the specified peer group.
  - ***reference_speed*** optional value to specify a reference link speed in bits/second. Values range from ***0.0*** to ***4294967295.0***; larger values can also be expressed using the multiplier K (*10^3), M (*10^6), or G (*10^9). The link speed of the connection to the peer is divided by this value, and the resulting ratio is used to scale down the link-bandwidth advertised to the peer. If the result is >***1***, the multiplier is ignored and the full aggregate value is advertised.
- **divide** divides the cumulative link-bandwidth value described above among the peers in an Adj-RIB-Out either equally or proportionally.
  - **equal** divides the cumulative total link-bandwidth value equally among all peers in the same Adj-RIB-Out.
  - ***ratio*** divides the cumulative total link-bandwidth value among peers proportionally according to the speed of the connection to each peer in the Adj-RIB-Out.

Examples

- These commands configure the switch to locally regenerate the link-bandwidth value, dividing the bandwidth proportionally and including it in UPDATE messages to all peers in the peer group ***idaho***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor idaho send-community link-bandwidth
 divide ratio
switch(config-router-bgp)#
```

- These commands configure the switch to locally regenerate the link-bandwidth value, scale it down with a reference link speed of ***20*** gigabits/second, and include it in UPDATE messages to the neighbor at address ***10.5.2.24***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.24 send-community link-
bandwidth aggregate 20G
switch(config-router-bgp)#
```

15.5.5.82 neighbor shutdown

The **neighbor shutdown** command disables the specified neighbor. Disabling a neighbor also terminates all of its active sessions and removes associated routing information.

The **no neighbor shutdown** command enables the specified peer.

The default neighbor shutdown command enables individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **shutdown** reason ***REASON***

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Examples

- This command disables the neighbor at ***10.5.2.23***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.23 shutdown
switch(config-router-bgp)#
```

- This command disables the neighbor at ***10.5.2.23*** with a reason - planned upgrade. The reason parameter is optional.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.23 shutdown reason Planned
 upgrade
switch(config-router-bgp)#
```

15.5.5.83 neighbor timers

The **neighbor timers** command configures the BGP keepalive and hold times for a specified peer connection. The **timers bgp** command configures the times on all peer connections for which an individual command is not specified.

- **Keepalive time** is the period between the transmission of consecutive keepalive messages.
- **Hold time** is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering.

The hold time must be at least ***3*** seconds and should be three times longer than the keepalive setting.

The **no neighbor timers** command applies the system default for the specified peer or group (the timers specified by the **timers bgp** command).

The **default neighbor timers** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **timers** ***keep_alive hold_time***

no neighbor ***neighbor_ID*** **timers**

default neighbor ***neighbor_ID*** **timers**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***keep_alive*** keepalive period, in seconds. Values include:
  - ***0*** keepalive messages are not sent.
  - ***1 to 3600*** keepalive time (seconds).
- ***hold_time*** hold time. Values include:
  - ***0*** peering is not disabled by timeout expiry; keepalive packets are not sent.
  - ***3 to 7200*** hold time (seconds).

Example

This command sets the keepalive time to ***30*** seconds and the hold time to ***90*** seconds for the connection with the peer at ***10.24.15.9***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.24.15.9 timers 30 90
switch(config-router-bgp)#
```

15.5.5.84 neighbor ttl maximum-hops

The **neighbor ttl maximum-hops** command configures the Generalized TTL Security Mechanism (GTSM) for the specified neighbor(s).

The **no neighbor ttl maximum-hops** command disables the GTSM configuration in the specified neighbor.

The **default neighbor ttl maximum-hops** command applies the system default configuration for individual neighbors; and applies the peer group's setting for neighbors that are members of a peer group.

Command-Mode

Router-BGP Configuration

Command Syntax

`neighbor` ***neighbor_ID*** **`ttl maximum-hops`** ***hop_number***

`no sneighbor` ***neighbor_ID*** **`ttl maximum-hops`**

`default neighbor` ***neighbor_ID*** **`ttl maximum-hops`**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***hop_number*** maximum count of hops from a BGP peer. Values range from ***0*** to ***254***.

Example

This command configures the TTL security for ***10.20.20.30*** with a maximum of ***4*** hops.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.20.20.30 ttl maximum-hops 4
switch(config-router-bgp)#
```

15.5.5.85 neighbor update-source

The **neighbor update-source** command specifies the interface that BGP sessions use for TCP connections. By default, BGP sessions use the neighbor's closest interface (also known as the best local address).

The **no neighbor update-source** command applies the system default (using best local address for TCP connections) for the specified peer or group.

The default **neighbor update-source** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor *neighbor_ID* update-source INTERFACE

no neighbor *neighbor_ID* update-source

default neighbor *neighbor_ID* update-source

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **INTERFACE** interface type and number. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** loopback interface specified by ***l_num***.
  - **management *m_num*** management interface specified by ***m_num***.
  - **port-channel *p_num*** port-channel interface specified by ***p_num***.
  - **vlan** VLAN interface specified by ***v_num***.

Example

This command configures the switch to use ***ethernet 10*** for TCP connections for the neighbor at ***10.2.2.14***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.2.2.14 update-source ethernet 10
switch(config-router-bgp)#
```

15.5.5.86 neighbor weight

The **neighbor weight** command assigns a weight attribute value to paths from the specified neighbor. Weight is the first parameter that the BGP best-path selection algorithm considers. When multiple paths to a destination prefix exist, the best-path selection algorithm prefers the path with the highest weight. Other attributes are used only when all paths to the prefix have the same weight.

Weight values range from ***0*** to ***65535*** and are not propagated to other switches through route updates. The default weight for paths that the router originates is ***32768***; the default weight for routes received through BGP is ***0***.

A path's BGP weight is also configurable through route maps. Weight values set through route-map commands have precedence over neighbor weight command values.

The **no neighbor weight** command applies the system default (***32768*** for router-originated paths, ***0*** for routes received through BGP) for the specified peer or group.

The **default neighbor weight** command applies the system default for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***neighbor_ID*** **weight** ***weight_value***

no neighbor ***neighbor_ID*** **weight**

default neighbor ***neighbor_ID*** **weight**

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***weight_value*** weight value. Values range from ***1*** to ***65535***.

Example

This command specifies a weight of ***4000*** for all paths from the neighbor at ***10.1.2.5***.

```
switch(config)# router bgp 9
eswitch(config-router-bgp)#neighbor 10.1.2.5 weight 4000
switch(config-router-bgp)#
```

15.5.5.87 network (BGP)

The **network** command specifies a network for advertisement through UPDATE packets to BGP peers. The configuration zeros the host portion of the specified network address; for example, ***192.0.2.4/24*** is stored as ***192.0.2.0/24***. A route map option is available for assigning attributes to the network.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is issued does not affect the command. The scope of the command depends on the specified network address:

- commands with an IPv4 address are advertised to peers activated in the IPv4 address family.
- commands with an IPv6 address are advertised to peers activated in the IPv6 address family.

The **no network** and **default network** commands remove the network from the routing table, preventing its advertisement.

Command Mode

Router-BGP Configuration

Router-BGP Address-Family Configuration

Command Syntax

network NET_ADDRESS [**ROUTE_MAP**]

no network NET_ADDRESS

default network NET_ADDRESS

Parameters

- **NET_ADDRESS** IP address range. Entry options include:
  - ***ipv4_subnet*** IPv4 subnet (CIDR notation).
  - ***ipv4_addr*** **mask** ***subnet*** IPv4 subnet (address-mask notation).
  - ***ipv6_prefix*** neighbor's IPv6 prefix (CIDR notation).
- **ROUTE_MAP** specifies route map that assigns attribute values to the network. Options include:
  - ***no parameter*** attributes are not assigned through a route map.
  - **route-map** ***map_name*** attributes listed by specified route map are assigned to the network.

Example

This command enables BGP advertising for the network located at ***10.1.2.5***. The configuration stores the network as ***10.1.2.5***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# network 10.1.2.5/24
switch(config-router-bgp)#
```

15.5.5.88 no neighbor

The **no neighbor** command removes all neighbor configuration commands for the specified neighbor.

Neighbor settings can also be removed individually; refer to the command description page of the desired command for details. Neighbor settings for a peer group *must* be removed individually.

Command Mode

Router-BGP Configuration

Command Syntax

no neighbor ***neighbor_ID***

default neighbor ***neighbor_ID***

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address. This command does not accept a peer group name as an argument; peer group settings must be removed individually.

Example

This command removes all neighbor configuration commands for the neighbor at ***10.1.1.1***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# no neighbor 10.1.1.1
switch(config-router-bgp)#
```

15.5.5.89 peer-filter

The **peer-filter** command creates a peer filter group and places the switch in peer-filter configuration mode for that group. The peer-filter group parameters are defined using the **match as-range** command.

The **no peer-filter** and **default peer-filter** commands remove the peer-filter group from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

peer-filter ***filter_name***

no peer-filter ***filter_name***

default peer-filter ***filter_name***

Parameters

filter_name name of the peer filter.

Example

This command creates a peer filter called ***group1*** and places the switch in peer-filter configuration mode for that filter.

```
switch(config-router-bgp)# peer-filter group1
switch(config-peer-filter-group1)#
```

15.5.5.90 rd (Router-BGP VRF and VNI Configuration Modes)

The **rd** command adds a Route Distinguisher (RD) to VRF and VNI configuration modes. RDs internally identify routes belonging to a VRF or VNI to distinguish overlapping or duplicate IP address ranges. This allows the creation of distinct routes to the same IP address for different VPNs. The RD is a 64-bit number made up of an AS number or IPv4 address followed by a user-selected ID number.

If the switch is not running EVPN, an RD is not required for a VRF or VNI to function. Use **no** or **default** command forms to remove an RD from a VRF or VNI.

Note: Legacy RDs that were assigned in VRF Configuration Mode appear in **show vrf** outputs if an RD has not been configured using this command, but they no longer have an effect on the system. RDs assigned in the VNI Configuration Mode are displayed in the output of **show bgp evpn** command.

Command Modes

Router-BGP VRF Configuration

Router-BGP VNI Configuration

Command Syntax

rd ***admin_ID***:***local_assignment***

no rd

default rd

Parameters

- ***admin_ID*** an AS number or globally assigned IPv4 address identifying the entity assigning the RD. This should be an IANA-assigned identifying number.
- ***local_assignment*** a locally assigned number distinguishing the VRF. Values range from ***0***-***65535*** if the ***admin_ID*** is an IPv4 address, or from ***0***-***4294967295*** if the ***admin_ID*** is an AS number. If the ***admin_ID*** is an AS number, the ***local_assignment*** can also be entered in the form of an IPv4 address.

Examples

- These commands identify the administrator of the VRF named ***purple*** as AS ***530*** and assign ***12*** as its local number.

```
switch(config)# router bgp 50
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# rd 530:12
switch(config-router-bgp-vrf-purple)#
```

- These commands identify the administrator of the MAC-VRF named ***bundle1*** as AS ***530*** and assign ***12*** as its local number.

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# rd 530:12
cvx(config-macvrf-bundle1)#
```

15.5.5.91 redistribute (BGP)

The **redistribute** command enables the redistribution of specified routes to the BGP domain.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** command from ***running-config***.

Note: Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command Mode

Router-BGP Configuration

Command Syntax

redistribute ROUTE_TYPE [**ROUTE_MAP**]

no redistribute ROUTE_TYPE

default redistribute ROUTE_TYPE

Parameters

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - **connected** routes that are established when IP is enabled on an interface.
  - **match nssa-external** all OSPF NSSA external routes.
  - **match nssa-external 1** type 1 OSPF NSSA external routes.
  - **match nssa-external 2** type 2 OSPF NSSA external routes.
  - **ospf** internal routes from an OSPF domain.
  - **ospf match external** routes external to the AS, but imported from OSPF.
  - **ospf match internal** OSPF routes that are internal to the AS.
  - **ospf match nssa-external** all OSPF NSSA external routes.
  - **ospf match nssa-external 1** type 1 OSPF NSSA external routes.
  - **ospf match nssa-external 2** type 2 OSPF NSSA external routes.
  - **ospf3** routes from an OSPFv3 domain.
  - **ospf3 match external** routes external to the AS, but imported from OSPFv3.
  - **ospf3 match internal** OSPFv3 routes that are internal to the AS.
  - **rip** routes from a RIP domain.
  - **static** IP static routes.
  - **isis** IS-IS routes. Sub-options include:
    - **level-1** redistribute IS-IS level-1 routes.
    - **level-1-2** redistribute IS-IS level-1 and level-2 routes.
    - **level-2** redistribute IS-IS level-2 routes.
    - **route-map** route map reference.

      Note: While redistributing IS-IS routes into BGP, the **level-1** or **level-2** keyword can be used to selectively redistribute level-1 routes or level-2 routes into BGP. The **level-1** or **level-2** keyword is optional, and the command defaults to **level-2** when it is not configured.
- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - ***no parameter*** all routes are redistributed.
  - **route-map *map_name*** only routes in the specified route map are redistributed.

Examples

- These commands redistribute internal OSPF routes into the BGP domain.

```
switch(config)# router bgp 1
```

```
switch(config-router-bgp)# redistribute ospf
switch(config-router-bgp)#
```

- These commands redistribute ISIS routes into the BGP domain in the ***address-family*** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# redistribute isis level-1 route-map isis-
to-bgp-v4
switch(config-router-bgp-af)#
```

- These commands redistribute ISIS routes into the BGP domain in the ***router-bgp*** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute isis level-1 route-map isis-to-
bgp
switch(config-router-bgp)#
```

15.5.5.92 rib fib fec ecmp ordered

The **rib fib fec ecmp ordered** command is configured to enforce ordering of next hops as determined by the protocol agents in the FEC programmed for the route.

The **no rib fib fec ecmp ordered** command removes the Ordered FEC configuration from the **running-config**.

Command Mode

Router General Configuration Mode

Command Syntax

rib fib fec ecmp ordered

no rib fib fec ecmp ordered

Example

The **rib fib fec ecmp ordered** command configures the Ordered FEC feature on the switch.

```
switch(config)# router general
switch(config-router-general)# rib fib fec ecmp ordered
switch(config-router-general)#
```

15.5.5.93 router bgp

The **router bgp** command places the switch in router-BGP configuration mode. If BGP was not previously instantiated, this command creates a BGP instance with the specified AS number. Router-BGP configuration mode is not a group-change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

When a BGP instance exists, the command must include the AS number of the existing BGP instance. Running this command with a different AS number generates an error message.

The **no router bgp** and **default router bgp** commands delete the BGP instance.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

router bgp ***as_id***

no router bgp

default router bgp

Parameters

as_id Autonomous System (AS) number. Values range from ***1*** to ***4294967295***.

Examples

- This command creates a BGP instance with AS number ***64500***.

```
switch(config)# router bgp 64500
switch(config-router-bgp)#
```

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in the ***global*** configuration mode.

```
switch(config)# router bgp 64501
% BGP is already running with AS number 64500
switch(config)#
```

- This command exits the ***bgp*** configuration mode.

```
switch(config-router-bgp)# exit
switch(config)#
```

- This command deletes the BGP instance.

```
switch(config)# no router bgp
switch(config)#
```

15.5.5.94 router-id (BGP)

The **router-id** command sets the local router BGP router ID.

When no ID has been specified, the local router ID is set to the following:

- the loopback IP address when a single loopback interface is configured.
- the loopback with the highest IP address when multiple loopback interfaces are configured.
- the highest IP address on a physical interface when no loopback interfaces are configured.

Note: The router ID must be specified if the switch has no IPv4 addresses configured.

The **no router-id** and **default router-id** commands remove the **router-id** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

router-id ***id_num***

no router-id [***id_num***]

default router-id [***id_num***]

Parameter

id_num router ID number (32-bit dotted decimal notation).

Example

This command configures the fixed router ID address of ***10.10.4.11***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# router-id 10.10.4.11
switch(config-router-bgp)#
```

15.5.5.95 set large-community

Large communities are an optional transitive attribute of variable length. There are no predefined large-community types or values. Large communities may be configured alongside standard and extended communities within route-maps using additional configuration commands.

Large community values (***aa:nn:nn***) must consist of three decimal values each in the range (***0-4294967295***). All three sub-values of a large community value must be present. As-plain and As-dot notation are supported for the leading ASN value.

The **no** and **default** versions of the command return the command to the original configuration.

Command Mode

Route map configuration

Command Syntax

set large-community [large-community-list **LIST1** [[**LIST2**] [additive | delete]]]

no set large-community [large-community-list **LIST1** [[**LIST2**] [additive | delete]]]

default set large-community [large-community-list **LIST1** [[**LIST2**] [additive | delete]]]

Parameters

large-community-list Add a large community list entry.

- **LIST1** Name of large community list.
  - **additive** Adds to the existing community.
  - **delete** Deletes matching communities.

Examples

- The following route-map sets a number of large-community values using both as-plain and as-dot notation.

```
switch(config)# route-map LC permit 10
switch(config-route-map-LC)# set large-community 10.10:20:30
 40.40:50:60 1000:80:90
```

- The following route-map adds additional large-community values.

```
switch(config)# route-map LC permit 10
switch(config-route-map-LC)# set large-community 50:50:50 51:51:51
 additive
```

- The following route-map removes the specified large-community values if they are present.

```
switch(config)# route-map LC permit 10
switch(config-route-map-LC)# set large-community 60:60:60 61:61:61
 delete
```

- The following route-map matches multiple large-community values from large-community lists (***LC_a1*** **and** ***LC_a2***) and sets **local-pref** accordingly.

```
switch(config)# ip large-community-list LC_1 permit 10:20:30 40:50:60
switch(config)# ip large-community-list LC_2 permit 70:80:90
switch(config)# route-map LC permit 10
switch(config-map-LC)# match large-community LC_1 LC_2 exact_match
switch(config-map-LC)# set local-pref 111
```

15.5.5.96 show bgp labeled-unicast tunnel

The **`show bgp labeled-unicast tunnel`** command displays the contents of the BGP Labeled-Unicast (LU) tunnel table. The user can optionally specify a tunnel index parameter to view the specific single tunnel information.

Command Mode

EXEC

Command Syntax

`show bgp labeled-unicast tunnel` ***tunnel_index***

Parameters

tunnel_index index to view single tunnel information.

Examples

- This command displays the BGP LU tunnel table.

```
switch# show bgp labeled-unicast tunnel
Index Endpoint   Nexthop  Interface   Labels          Contributing Metric Metric 2 Pref Pref 2
----- ---------- -------- ----------- --------------- ------------ ------ -------- ---- ------
5     2.0.0.0/24 10.1.1.2 'Ethernet3' [ 123 899 900 ] Yes          0      100      200  0
6     2.0.1.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes          0      100      200  0
7     2.0.2.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes          0      100      200  0
switch#
```

- This command displays the BGP LU tunnel table for tunnel index ***4***.

```
switch# show bgp labeled-unicast tunnel 4
Index   Endpoint        Nexthop/Tunnel Index   Interface       Labels   Contributing Metric Metric 2  Pref  Pref 2
------  --------------- ---------------------- --------------- -------- ------------ ------ ---------- ------ ------
4       10.253.0.10/32  10.1.0.0               Port-Channel111 [ 3 ]     Yes          0      0        200    0

switch#
```

15.5.5.97 show bgp convergence

The **show bgp convergence** command displays information about the Border Gateway Protocol (BGP) convergence state and other statistics about the BGP instance in the specified VRF or in all VRFs.

Command Mode

EXEC

Command Syntax

show bgp convergence [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE specifies VRF instances. Options include:

- ***no parameter*** displays BGP information for the context-active VRF.
- **vrf *vrf_name*** displays BGP information for the specified VRF.
- **vrf all** displays BGP information for all VRFs.
- **vrf default** displays BGP information for the default VRF.

Examples

- This command displays the output when no peers have joined before convergence.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to
 join)
 Convergence timer is not running
 Convergence timeout in use: 00:02:30
 Convergence slow peer timeout in use: 00:00:55
 First peer is not up yet
 All the expected peers are up: no
 All IGP protocols have converged: yes
 Outstanding EORs: 0, Outstanding Keepalives: 0
 Pending Peers: 2
 Total Peers: 2
 Established Peers: 0
 Disabled Peers: 0
 Peers that have not converged yet:
 IPv4 peers:
 201.1.1.1 (Session : Connect)
 202.1.1.1 (Session : Connect)
 IPv6 peers:
 None
switch#
```

- This command displays the output when the first peer has joined before convergence.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from
 peer(s) and IGP
convergence)
```

```
 Convergence timer running, will expire in 00:01:50
 Convergence timeout in use: 00:02:30
 Convergence slow peer timeout in use: 00:00:55
 First peer came up 00:00:13 ago
 All the expected peers are up: no
 All IGP protocols have converged: yes
 Outstanding EORs: 0, Outstanding Keepalives: 0
 Pending Peers: 1
 Total Peers: 2
 Established Peers: 1
 Disabled Peers: 0
 Peers that have not converged yet:
 IPv4 peers:
 201.1.1.1 (Session : Active)
 IPv6 peers:
 None
switch#
```

- This command displays the output when the convergence timeout value is reached.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
 Time taken to converge 00:02:30
 Pending Peers: 1
 Total Peers: 2
 Established Peers: 1
 Disabled Peers: 0
 Peers that did not converge before local bgp convergence:
 IPv4 peers:
 201.1.1.1 (Session : Active)
 202.1.1.1 (Session : Established)
 IPv6 peers:
 None
switch#
```

- This command displays the output during the converged state.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
 Time taken to converge 00:00:02
 First peer came up 00:00:05 ago
 Pending Peers: 0
 Total Peers: 3
 Established Peers: 3
 Disabled Peers: 0
 Peers that did not converge before local bgp convergence:
 IPv4 peers:
 None
 IPv6 peers:
 None
switch#
```

15.5.5.98 show bgp flow-spec

The **show bgp flow-spec ipv4** displays a brief description of each flowspec rule, including the matching rule and actions.

Command Mode

EXEC

Command Syntax

show bgp flow-spec [ipv4 | ipv6] [summary | detail] [vrf ***VRFNAME***]

Parameters

- **ipv4** Displays information releated to IPv4.
- **ipv6** Displays information releated to IPv6.
- **summary** Displays summarized BGP information.
- **detail** Displays detailed information.
- **vrf *VRFNAME*** Displays flow-spec information in the named VRF.

Related Command

show flow-spec

Examples

- The **show bgp flow-spec ipv4 summary** command displays the count of flowspec rules received from each peer:

```
switch(config)# show bgp flow-spec ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 10
Neighbor Status Codes: m - Under maintenance
  Neighbor     V  AS    MsgRcvd   MsgSent  InQ OutQ  Up/Down State  RulesRcd RulesAcc
  10.0.0.2     4  10         12         4    0    0 00:02:18 Estab  2        2
  10.0.1.2     4  10          6         4    0    0 00:02:18 Estab  0        0
```

- The **show bgp flow-spec detail** displays the full details of each flowspec rule including the peer(s) it was received from, BGP properties, and an expanded description of the matching rule:

```
switch(config)# show bgp flow-spec ipv4 detail
BGP Flow Specification rules for VRF default
Router identifier 0.0.0.1, local AS number 10
BGP Flow Specification Matching Rule for 10.2.3.0/24;*;
 Rule identifier: 3882065752
 Matching Rule:
   Destination Prefix: 10.2.3.0/24
   Source Prefix: *
 Paths: 1 available
  Local
    from 10.0.0.2 (10.1.1.2)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal,
 best
      Actions: Drop
BGP Flow Specification Matching Rule for 10.2.4.0/24;10.2.0.0/16;IP:=6|
=17;DP:>1010&<1024;
 Rule identifier: 3882090640
 Matching Rule:
   Destination Prefix: 10.2.4.0/24
   Source Prefix: 10.2.0.0/16
   IP Protocol: =6 | =17
   Destination Port: >1010 & <1024
 Paths: 1 available
  Local
    from 10.0.0.2 (10.1.1.2)
```

```
      Origin IGP, metric -, localpref 100, weight 0, valid, internal,
best
      Actions: Drop
```

15.5.5.99 show bgp instance

The **show bgp instance** command displays summary Border Gateway Protocol (BGP) information about the BGP instance in the specified VRF or in all VRFs.

Command Mode

EXEC

Command Syntax

show bgp instance [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE specifies VRF instances. Options include:

- ***no parameter*** displays BGP information for the context-active VRF.
- **vrf *vrf_name*** displays BGP information for the specified VRF.
- **vrf all** displays BGP information for all VRFs.
- **vrf default** displays BGP information for the default VRF.

Examples

- This command displays information about the BGP instance in the context-active VRF.

```
switch# show bgp instance
BGP instance information for VRF purple
BGP Local AS:  64497, Router ID: 1.2.3.5
Total peers:              5
Configured peers:         3
  UnConfigured peers:     2
  Disabled peers:         0
  Established peers:      3
Graceful restart helper mode enabled
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
    BGP has converged:no
    Outstanding EORs:0,Outstanding Keepalives: 0
    Convergence timeout: 00:10:00
switch#
```

- This command displays information about the BGP instance in the default VRF.

```
switch# show bgp instance vrf default
BGP instance information for VRF default
BGP Local AS:  64503, Router ID: 1.2.3.5
Total peers:              1
Configured peers:         1
  UnConfigured peers:     0
  Disabled peers:         0
  Established peers:      0
Graceful restart helper mode enabled
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
    BGP has converged:no
    Outstanding EORs:0,Outstanding Keepalives: 0
    Convergence timeout: 00:10:00
switch#
```

15.5.5.100 show bgp neighbors history

The **show bgp neighbors history** command stores and displays a list of failed BGP connection attempts for each peer. This may be particularly useful while troubleshooting flappy connections. If dynamic peering is enabled, the failure history will be remembered even after the peers are no longer present.

Command Mode

EXEC

Command Syntax

show bgp neighbors [**PEER** | **PREFIX** | peer-group **PEER_GROUP**] **history** [connect-failures][vrf ***VRF***

Parameters

- **PEER** An IPv4 or IPv6 valid address.
- **PREFIX** An IPv4 or IPv6 valid prefix.
- **peer-group PEER_GROUP** A peer group name.
- **connect-failures** Optional and will not affect the result.
- **vrf *VRF*** A VRF name. If it is not supplied, the command will act upon the VRF default.

Guidelines

Relevant error messages are recorded by default, without any configuration. To clear all messages for a peer or group of peers, though, it is necessary to use the command **clear bgp history**. The syntax for this command is described as:

```
switch# clear bgp [PEER|PREFIX|peer-group PEER_GROUP] history [connect-
failures][vrf VRF]
```

If no peer, prefix, or peer-group is supplied, this command will clear the history for all peers in the specified VRF.

- The number of recorded messages is limited to eight per peer.
- Only errors that occur prior to session establishment will be recorded.
- The **show bgp neighbors history** is available only with the multi-agent protocol model.

Related Command

clear bgp history

Example

For each peer, its address will be printed at the first line, along with the VRF it is part of. Then, a table prints with the following columns:

- **Type**: the peer connection type. May be Static or Dynamic.
- **AS**: the remote Autonomous System number.
- **Time**: the time of the failure, using the local timezone.
- **Event**: a description related to the cause of the failed BGP connection.

```
switch> show bgp neighbors history
1.1.1.2 VRF default
Type      AS       Time                      Event
Static    65538    Mon 2019-05-13 04:16:24   Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:31   Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:39   Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:47   Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:55   Connect (No route to host)
Static    65538    Mon 2019-05-13 04:17:03   Connect (No route to host)
```

```
Static    65538    Mon 2019-05-13 04:18:17  bad AS number
Static    65538    Mon 2019-05-13 04:19:40  bad AS number
```

15.5.5.101 show bgp update-group

The **show bgp update-group** command displays how peers are grouped into update groups and can be used to verify that peers with different RCF functions with identical contents are grouped together.

Command Mode

EXEC

Command Syntax

show bgp update-group

Examples

This command displays information about how BGP peers are grouped into update groups.

```
switch# show bgp update-group
switch#
```

15.5.5.102 show flow-spec

The **show flow-spec** command displays an overall status of how many flowspec rules were received and how many were installed.

Command Mode

EXEC

Command Syntax

show flow-spec (ipv4 | ipv6) [summary][vrf ***VRFNAME***]

Parameters

- **ipv4** Displays information releated to IPv4.
- **ipv6** Displays information releated to IPv6.
- **summary** Displays summary of flow-spec rule.
- **vrf *VRFNAME*** Displays flow-spec information in the named VRF.

Related Command

show bgp flow-spec

Examples

- The **show flow-spec ipv4 summary** command displays an overall status of how many flowspec rules were received and how many were installed:

```
switch(config)# show flow-spec ipv4 summary
Flow specification rules summary for VRF default
  Total number of rules: 2
  Number of installed rules: 2
```

- The **show flow-spec ipv4** displays the installation status of the rule, and a counter of how many hits it has accumulated. This command also compiles the received flowspec rules into rules that can be programmed into the TCAM. For example, logical expressions on values such as the destination port are converted to ranges, as shown below:

```
switch(config)# show flow-spec ipv4
Flow specification rules for VRF default
Applied on: Ethernet47/1
  Flow-spec rule: 10.2.3.0/24;*;
    Rule identifier: 3882065752
    Matches:
      Destination prefix: 10.2.3.0/24
    Actions:
      Police: 80 Mbps (10 MBps)
      Redirect: VRF customer1
                Route via LDP tunnel index 4, MPLS label 100123
                Route via LDP tunnel index 1, MPLS label 116507
    Status:
      Installed: yes
      Counter: 312 packets
  Flow-spec rule: 10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
    Rule identifier: 3882090640
    Matches:
      Destination prefix: 10.2.4.0/24
      Source prefix: 10.2.0.0/16
      Next protocol: 17
                     6
      Destination port: 1011-1023
    Actions:
      Police: 80 Mbps (10 MBps)
      Redirect: VRF customer1
```

```
                Route via LDP tunnel index 4, MPLS label 100123
                Route via LDP tunnel index 1, MPLS label 116507
    Status:
      Installed: yes
      Counter: 0 packets
```

15.5.5.103 show ip as-path access-list

The **show ip as-path access-list** command displays BGP filters on the switch. Specifying an access list displays the statements from that access list. Entering the command without parameters displays the statements from all access lists on the switch.

Command Mode

EXEC

Command Syntax

show ip as-path access-list [***list_name***]

Parameters

list_name the name of an AS path access list.

Example

This command displays the contents of the AS path access list named ***list1***.

```
switch# show ip as-path access-list list1
ip as-path access-list list1 deny _3$
ip as-path access-list list1 permit .*
switch#
```

15.5.5.104 show ip bgp

The **show ip bgp** command displays Border Gateway Protocol (BGP) IPv4 routing table entries. The output format depends on the command parameters:

- **data-block format** displays comprehensive information for each specified BGP routing-table entry.
- **tabular format** displays routing-table entries for the specified IPv4 addresses.

Command Mode

EXEC

Command Syntax

show ip bgp [**FILTER**][**VRF_INSTANCE**]

Parameters

- **FILTER** routing-table entries to display. Options include:
  - ***no parameter*** displays all routing-table entries in tabular format.
  - **detail** displays all routing-table entries in data-block format.
  - ***ipv4_addr*** displays IPv4 host address in data-block format.
  - **PREFIX** displays the route information of the specified IPv4 prefix in data block format. Options include:
    - **detail *ipv4_prefix***displays the detailed route information of specified IPv4 prefix in data block format.
    - **longer-prefixes *ipv4_prefix*** displays the route information of IPv4 prefix in tabular block format.
    - **longer-prefixes detail *ipv4_prefix*** displays the detailed route information of specified IPv4 prefix in data block format.
  - **community-list *cmnty_list_name*** displays BGP routes filtered by the specified community list.
  - **installed** displays the information of installed BGP routes.
  - **labeled-unicast** displays the information of labeled-unicast BGP routes only.
  - **not-installed** displays the information of BGP routes that are not installed.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Guidelines

You must provide the IPv4 prefix in CIDR notation.

Examples

- This command displays the BGP routing table with prefix “L” flag for all BGP LU route entries.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

        Network         Next Hop     Metric     LocPref     Weight     Path
* > L   2.0.0.1/32      1.1.1.2      0          100         0          300 i
* #     2.0.0.1/32      1.0.0.2      0          100         0          200 ?
* > L   2.0.0.2/32      1.1.1.2      0          100         0          300 i
* #     2.0.0.2/32      1.0.0.2      0          100         0          200 ?
```

```
* > L   2.0.0.3/32     1.1.1.2      0          100        0          300 i
* #     2.0.0.3/32     1.0.0.2      0          100        0          200 ?
* > L   2.0.0.4/32     1.1.1.2      0          100        0          300 i
* #     2.0.0.4/32     1.0.0.2      0          100        0          200 ?
* > L   2.0.0.5/32     1.1.1.2      0          100        0          300 i

15.5.5.105 show ip bgp community

The **show ip bgp community** command displays Border Gateway Protocol (BGP) routing table entries, filtered by community.

Command Mode

EXEC

Command Syntax

show ip bgp community **COMM_1** [**COMM_2... COMM_n**][**MATCH_TYPE**][**DATA_OPTION**] [**VRF_INSTANCE**]

Parameters

- **COMM_x** community number or name, as specified in the route map that sets the community list number.
  - **GSHUT** well-known graceful shutdown community.
  - ***aa:nn*** AS and network number, separated by colon. Each value ranges from ***1*** **to** ***4294967295*****.**
  - ***comm_num*** community number. Values range from ***1*** to ***4294967040***.
  - **internet** advertises route to Internet community.
  - **local-as** advertises route only to local peers.
  - **no-advertise** does not advertise the route to any peer.
  - **no-export** advertises route only within BGP AS boundary.
- **MATCH_TYPE** routes are filtered based on their communities. Options include:
  - ***no parameter*** routes must match at least one community in the list.
  - **exact** route must match all communities and include no other communities.
  - **regex** display routes matching the regular expression of communities.
- **DATA_OPTION** type of information the command displays. Options include:
  - ***no parameter*** displays table of the routing entry line items.
  - **detail** displays data block for each routing table entry.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Guidelines

The interpretation of regular expressions is always based on string mode but not on the ACL configuration.

Example

This command displays the BGP routing table entries with the community ***64496:1000***.

```
switch# show ip bgp community 64496:1000 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 10.100.1.0/24
 Paths: 1 available
  64496 64497 65536
    10.1.0.100 from 10.1.0.100 (10.0.0.100)
      Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0,
 received 00:03:16 ago, valid, external, best
      Community: 655:23590 64496:1000
      Rx SAFI: Unicast
```

```
switch#
```

15.5.5.106 show ip bgp installed

The **show ip bgp installed** command displays the list of installed routes in the RIB.

Command Mode

EXEC

Command Syntax

show ip bgp installed

Example

This command displays the list of installed routes in the RIB.

```
switch# show ip bgp installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
 installed, E
- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
 Nexthop -
Link Local Nexthop

        Network             Next Hop         Metric  LocPref Weight Path

 * >    6.0.0.0/24          1.0.0.1          0       100     0      ?
switch#
```

15.5.5.107 show ip bgp neighbors (route type)

The **show ip bgp neighbors (route type)** command displays information for next-hop routes to a specified IPv4 neighbor. The **show ip bgp neighbors (route-type) community** command displays the same information for routes filtered by communities.

The output format depends on the selected **FILTER** parameter:

- data-block format displays comprehensive information for each specified route.
- tabular format displays routing table entries in tabular format for the specified IP addresses.

Commands that do not include a route type revert to the **show ip bgp neighbors** command.

Command Mode

EXEC

Command Syntax

show ip bgp neighbors ***neighbor_addr*** **HOPDIRECT** [**FILTER**] [**VRF_INSTANCE**]

show ip bgp neighbors ***neighbor_addr*** [**ROUTE_TYPE**] **HOPDIRECT** [**detail**]

Related Commands

- **show ip bgp neighbors**
- **show ip bgp neighbors (route-type) community**

Parameters

- ***neighbor_addr*** location of the neighbor.
- **ROUTE_TYPE** filters route on route type. Options include:
  - **ipv4 unicast** displays IPv4 unicast routes.
  - **ipv6 unicast** displays IPv6 unicast route
- **HOPDIRECT** filters route on the basis of direction from neighbor. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- **FILTER** routing table entries that the command displays. Values include:
  - ***no parameter*** displays all routing table entries in tabular format.
  - **detail** displays all routing table entries in data-block format.
  - ***ipv4_addr*** displays IPv4 host address in data-block format.
  - ***ipv4_prefix*** displays the route information of specified IPv4 prefix in data-block format. Option includes:
    - **longer-prefixes** displays the route information of IPv4 prefix in data-block format.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Example

This command displays information for routes advertised to the neighbor at ***10.3.0.103***.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
```

```
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop

switch#
```

15.5.5.108 show ip bgp neighbors (route-type) community

The **show ip bgp neighbors (route type) community** command displays information for next-hop routes to a specified neighbor. Routes are filtered by community.

The **show ip bgp neighbors (route type)** command displays the same information for routes filtered by IP addresses and subnets.

Command Mode

EXEC

Command Syntax

show ip bgp neighbors ***addr*** **RTE community CM_1** [**CM_2...CM_n**][**MATCH**][**INFO**] [**VRF_INST**]

Related Commands

- **show ip bgp neighbors**
- **show ip bgp neighbors (route type)**

Parameters

- ***addr*** location of the neighbor.
- **RTE** type of route that the command displays. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- **CM_x** community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - **GSHUT** well-known graceful shutdown community.
  - ***aa:nn*** AS and network number, separated by colon. Each value ranges from ***1*** to ***4294967295***.
  - ***comm_num*** community number. Values range from ***1*** to ***4294967040***.
  - **internet** advertises route to Internet community.
  - **local-as** advertises route only to local peers.
  - **no-advertise** does not advertise route to any peer.
  - **no-export** advertises route only within BGP AS boundary.
- **MATCH** routes are filtered based on their communities.
  - ***no parameter*** routes must match at least one community in the list.
  - **exact** route must match all communities and include no other communities.
- **INFO** type of information the command displays. Values include:
  - ***no parameter*** displays table of routing entry line items.
  - **detail** displays data block for each routing table entry.
- **VRF_INST** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Example

This command lists the routes advertised to the neighbor at ***10.3.0.103*** with community ***655:23590***.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes community 655:23590
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
```

```

switch#
```

15.5.5.109 show ip bgp neighbors regexp

The **show ip bgp neighbors regexp** command displays information for next-hop routes to a specified IPv4 neighbor that match the AS path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

show ip bgp neighbors ***addr*** **RTE regexp** ***as_paths*** [**VRF_INST**]

Related Commands

- **show ip bgp neighbors**
- **show ip bgp neighbors (route type)**

Parameters

- ***addr*** location of the neighbor.
- **RTE** type of route that the command displays. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- ***as_paths*** list of AS paths, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- **VRF_INST** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Example

This command lists the routes advertised to the neighbor at ***10.3.0.103*** where the AS path is ***64496***.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes regex ^64496$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500

 * >     10.100.2.0/24       10.1.0.100       42      100     -       64496 ?
switch#
```

15.5.5.110 show ip bgp neighbors

The **show ip bgp neighbors** command displays Border Gateway Protocol (BGP) and TCP-session data for a specified IPv4 BGP neighbor, or for all IPv4 BGP neighbors if an address is not specified.

Command Mode

EXEC

Command Syntax

show ip bgp neighbors [**NEIGHBOR_ADDR**] [**VRF_INSTANCE**]

Parameters

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
  - ***no parameter*** command displays information for all IPv4 BGP neighbors.
  - ***ipv4_addr*** command displays information for specified neighbor.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for the default VRF.

Related Commands

- **show ip bgp neighbors (route type)**
- **show ip bgp neighbors (route-type) community**

Examples

- This command displays information of the neighbor at ***10.1.0.100***.

```
switch# show ip bgp neighbors 10.1.0.100

switch#
```

15.5.5.111 show ip bgp not-installed

The **show ip bgp not-installed** command displays the list of non-installed routes in the RIB.

Command Mode

EXEC

Command Syntax

show ip bgp not-installed

Example

This command displays the list of non-installed routes in the RIB.

```
switch# show ip bgp not-installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
 installed, E
- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
 Nexthop -
Link Local Nexthop

        Network             Next Hop         Metric  LocPref Weight Path

 * #    7.0.0.0/24          1.0.0.1          0       100     0      ?
switch#
```

15.5.5.112 show ip bgp paths

The **show ip bgp paths** command displays all BGP AS paths in the database.

Command Mode

EXEC

Command Syntax

show ip bgp paths [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE specifies VRF instances.

- ***no parameter*** displays routing table for context-active VRF.
- **vrf *vrf_name*** displays routing table for the specified VRF.
- **vrf all** displays routing table for all VRFs.
- **vrf default** displays routing table for default VRF.

Display Values

- **Refcount**: number of routes using a listed path.
- **Metric**: the path's Multi Exit Discriminator (MED).
- **Path**: the route's AS path and its origin code.

Example

This command displays all BGP AS paths in the switch's database.

```
switch# show ip bgp paths
Refcount Metric     Path
6        0          64510 64505 64506 64507 i (HashID 9)
6        0          64510 ? (HashID 8)
12       0          65530 65531 65532 e (HashID 5)
12       0          i (HashID 6)
6        0          64100 64200 i (HashID 4)
28       0          i (HashID 1)
7        0          ? (HashID 2)
40       0          64510 i (HashID 10)
19       0          64510 i (HashID 7)
2        0          i (HashID 3)
switch#
```

15.5.5.113 show ip bgp peer-group

The **show ip bgp peer-group** command displays the BGP version, address family, and group members for all BGP peer groups defined on the switch.

Command Mode

EXEC

Command Syntax

show ip bgp peer-group [**GROUP**][**VRF_INSTANCE**]

Parameters

- **GROUP** peer group for which command displays information. Options include:
  - ***no parameter*** command displays information for all peer groups.
  - ***group_name*** name of peer group for which command displays information.
- **VRF_INSTANCE** specifies VRF instances.
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Example

This command displays BGP peer group information for all peer groups on the switch.

```
switch# show ip bgp peer-group
BGP peer-group is EXTERNAL
  BGP version 4
  Static peer-group members:
    VRF default:
      10.1.0.100, state: Connect
        Negotiated MP Capabilities:
            IPv4 Unicast: No
            IPv6 Unicast: No
            IPv4 SR-TE: No
            IPv6 SR-TE: No
      10.2.0.101, state: Connect
        Negotiated MP Capabilities:
            IPv4 Unicast: No
            IPv6 Unicast: No
            IPv4 SR-TE: No
            IPv6 SR-TE: No
BGP peer-group is INTERNAL
  BGP version 4
  Listen-range subnets:
    VRF default:
      10.3.0.0/24, remote AS 64500
  Dynamic peer-group members:
    VRF default:
switch#
```

15.5.5.114 show ip bgp regexp

The **show ip bgp regexp** command displays Border Gateway Protocol (BGP) IPv4 routing-table entries that match the AS path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

show ip bgp regexp ***as_paths*** [**VRF_INSTANCE**]

Parameters

- ***as_paths*** list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.

  Note: The AS delimiter (_) regular expression is not supported when BGP routes are filtered by community lists and the command output does not display BGP route information.
- **VRF_INSTANCE** specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Example

This command displays information about the BGP IPv4 routes in the context-active VRF where the AS path is ***64510***.

```
switch# show ip bgp regex ^64510$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP,  b - backup, L = labeled-unicast
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local
 Nexthop

        Network                Next Hop              Metric  LocPref Weight  Path
 *       10.2.0.0/24          10.2.0.101       0       100     0       64510 i
 * >     10.101.0.0/24        10.2.0.101       0       100     0       64510 i
 * >     10.101.1.0/24        10.2.0.101       0       100     0       64510 i
 * >     10.101.2.0/24        10.2.0.101       0       100     0       64510 i
switch#
```

15.5.5.115 show ip bgp summary

The **show ip bgp summary** command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is “IP” and SAFI is “unicast” information.

Command Mode

EXEC

Command Syntax

show ip bgp summary [**VRF_INSTANCE**]

Parameters

- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Display Values

Header Row

- **BGP router identifier**: the router identifier loopback address or highest IP address.
- **Local AS Number**: AS number assigned to the switch.

Neighbor Table Columns

- **(First) Neighbor**: neighbor’s IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: neighbor's AS number.
- **(Fourth) MsgRcvd**: messages received from the neighbor.
- **(Fifth) MsgSent**: messages sent to neighbor.
- **(Sixth) InQ**: messages queued from neighbor.
- **(Seventh) OutQ**: messages queued to send neighbor.
- **(Eighth) Up/Down**: period the BGP session has been **Established**, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays **PfxRcd**, and the connection becomes **Idle**. Maximum number of routes is set using the **maximum paths (BGP)** command.

Related Command

show ipv6 bgp summary

Example

This command displays the status of the switch’s BGP connections.

```
switch# show ip bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
  Neighbor         V  AS       MsgRcvd   MsgSent  InQ OutQ  Up/Down State   PfxRcd PfxAcc
  10.1.0.100       4  64496      1075      1083    0    0 00:04:04 Connect
  10.2.0.101       4  64510      1079      1088    0    0 00:04:14 Connect
switch#
```

15.5.5.116 show ip community-list

The **show ip community-list** command displays the BGP community lists configured on the switch.

Command Mode

EXEC

Command Syntax

show ip community-list [**COMMUNITY_LIST**]

Parameters

COMMUNITY_LIST community list for which command displays information. Options include:

- ***no parameter*** command displays information for all community lists.
- ***listname*** name of the community list (text string).

Example

This command displays the BGP paths in the switch's database.

```
switch# show ip community-list hs-comm-list
ip community-list hs-comm-list permit 0:10
switch#
```

15.5.5.117 show ip extcommunity-list

The **show ip extcommunity-list** command displays the BGP extended community lists configured on the switch.

Command Mode

EXEC

Command Syntax

show ip extcommunity-list [**COMMUNITY_LIST**]

Parameters

COMMUNITY_LIST extended community list for which command displays information. Options include:

- ***no parameter*** command displays information for all extended community lists.
- ***listname*** command displays information for the specified extended community list.

Example

This command displays information for all extended extcommunity lists on the switch.

```
switch# show ip extcommunity-list
ip extcommunity-list hs-extcomm-list permit rt 3050:20
ip extcommunity-list hs-extcomm-list permit soo 172.17.52.2:30
ip extcommunity-list hs-extcomm-list permit rt 3050:70000
switch#
```

15.5.5.118 show ipv6 bgp

The **show ipv6 bgp** command displays IPv6 Border Gateway Protocol (BGP) routing-table entries. The output format depends on the command parameters:

- **data-block format** displays comprehensive information for each specified BGP routing-table entry.
- **tabular format** displays routing-table entries for specified IPv6 addresses.

Command Mode

EXEC

Command Syntax

show ipv6 bgp [**FILTER**][**VRF_INSTANCE**]

Parameters

- **FILTER** routing table entries that the command displays. Options include:
  - ***no parameter*** displays all routing-table entries in tabular format.
  - **detail** displays all routing-table entries in data-block format.
  - ***ipv6_addr*** displays IPv6 host address in data-block format.
  - ***ipv6_prefix*** displays the route information of specified IPv6 prefix address in data-block format. Options include:
    - **detail** displays the detailed route information of specified IPv6 prefix address in data-block format.
    - **longer-prefixes** displays the route information of IPv6 prefix in data-block format.
    - **longer-prefixes detail** displays detailed route information of specified IPv6 prefix in data-block format.
  - **community-list *cmnty_list_name*** displays BGP routes filtered by the specified community list.
  - **installed** displays the information of installed BGP routes.
  - **labeled-unicast** displays the information of labeled-unicast BGP routes only.
  - **not-installed** displays the information of BGP routes that are not installed.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Guidelines

You must provide the IPv6 prefix in CIDR notation.

Related Command

show ip bgp

Example

This command displays the route information of ***2001:10:1:0::102/64*** in data-block format.

```
switch# show ipv6 bgp 2001:10:1:0::102/64
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:1::/64

      Rx SAFI: Unicast
switch#
```

15.5.5.119 show ipv6 bgp match community

The **show ipv6 bgp match community** command displays IPv6 Border Gateway Protocol (BGP) routing-table entries, filtered by community.

Command Mode

EXEC

Command Syntax

show ipv6 bgp match community [**COMM_1 ... COMM_n**][**MATCH_TYPE**][**INFO**] [**VRF_INSTANCE**]

Parameters

- **COMM_x** community number or name, as specified in the route map that sets the community-list number. Options include:
  - ***aa:nn*** AS and network number, separated by colon. Each value ranges from ***1*** to ***4294967295***.
  - ***comm_num*** community number. Values range from *1* to ***4294967040***.
  - **internet** advertises route to Internet community.
  - **local-as** advertises route only to local peers.
  - **no-advertise** does not advertise route to any peer.
  - **no-export** advertises route only within BGP AS boundary.
- **MATCH_TYPE** routes are filtered based on their communities. Options include:
  - ***no parameter*** routes must match at least one community in the list.
  - **exact** route must match all communities and include no other communities.
- **INFO** type of information the command displays. Options include:
  - ***no parameter*** displays table of the routing entry-line items.
  - **detail** displays data block for each routing-table entry.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing-table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Example

This command displays information in data-block format for each routing-table entry with community ***655:23590***.

```
switch(config)# show ipv6 bgp match community 655:23590 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:100:1::/64
 Paths: 1 available
  64496 64497 65536
    2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
      Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0,
 received 01:09:29 ago, valid, external, best
      Community: 655:23590 64496:1000
      Rx SAFI: Unicast
switch(config)#
```

15.5.5.120 show ipv6 bgp peers

The **show ipv6 bgp peers** command displays IPv6 Border Gateway Protocol (BGP) and TCP session data for a specified neighbor. Command displays data for all neighbors if an address is not included.

Command Mode

EXEC

Command Syntax

show ipv6 bgp peers [**NEIGHBOR_ADDR**] [**VRF_INSTANCE**]

Parameters

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
  - ***no parameter*** command displays information for all neighbors.
  - ***ipv6_addr*** command displays information for the specified neighbor.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for the context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for the default VRF.

Related Command

show ip bgp peer-group

Example

This command displays information for the neighbor at ***2001:10:1:0::100***.

```
switch# show ipv6 bgp peers 2001:10:1:0::100

15.5.5.121 show ipv6 bgp peers (route type)

The **show ipv6 bgp peers (route type)** command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The **show ipv6 bgp peers (route type) community** command displays the same information for routes filtered by communities. Commands that do not include a route type revert to the **show ipv6 bgp peers** command.

The output format depends on the selected **FILTER** parameter:

- **data-block format** displays comprehensive information for each specified route.
- **tabular format** displays routing table entries in tabular format for the specified IP addresses.

Output produced by the **longer-prefixes** option includes the specified route and all more specific routes.

Command Mode

EXEC

Command Syntax

show ipv6 bgp peers ***neighbor_addr*** **HOPDIRECT** [**FILTER**] [**VRF_INSTANCE**]

show ipv6 bgp peers ***neighbor_addr*** [**ROUTE_TYPE**] **HOPDIRECT** [detail]

Parameters

- ***neighbor_addr*** location of the neighbor.
- **ROUTE_TYPE** filters route on route type. Options include:
  - **ipv4 unicast** displays IPv4 unicast routes.
  - **ipv6 unicast** displays IPv6 unicast routes.
- **HOPDIRECT** filters route on the basis of direction from neighbor. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- **FILTER** routing table entries that the command displays. Options include:
  - ***no parameter*** displays all routing table entries in tabular format.
  - **detail** displays all routing table entries in data-block format.
  - ***ipv6_addr*** displays the IPv6 host address in data-block format.
  - ***ipv6_prefix*** displays the route information of specified IPv6 prefix in data-block format. Additional option:
    - **longer-prefixes** displays the route information of IPv4 prefix in data-block format.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Related Commands

show ipv6 bgp peers (route type) community

Example

This command displays information of all routes advertised to the neighbor at ***2001:10:1:0::100***.

```
switch# show ipv6 bgp peers 2001:10:1:0::100 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
```

```
                    S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local

switch#
```

15.5.5.122 show ipv6 bgp peers (route type) community

The **show ipv6 bgp peers (route type) community** command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The routes are filtered by community.

The **show ipv6 bgp peers (route type)** command displays the same information for routes filtered by IP addresses and prefixes.

Command Mode

EXEC

Command Syntax

show ipv6 bgp peers ***addr*** **RTE community CM_1** [**CM_2...CM_n**] [**MATCH**] [**INFO**] [**VRF_INST**]

Parameters

- ***addr*** neighbor location (IPv6 address).
- **RTE** type of route that the command displays. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- **CM_x** community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - ***GSHUT*** well-known graceful shutdown community.
  - ***aa:nn*** AS and network number, separated by colon. Each value ranges from ***1*** to ***4294967295***.
  - ***comm_num*** community number. Values range from ***1*** to ***4294967040***.
  - **internet** advertises route to Internet community.
  - **local-as** advertises route only to local peers.
  - **no-advertise** does not advertise route to any peer.
  - **no-export** advertises route only within BGP AS boundary.
- **MATCH** routes are filtered based on their communities. Options include:
  - ***no parameter*** routes must match at least one community in the list.
  - **exact** route must match all communities and include no other communities.
- **INFO** type of information the command displays. Values include:
  - ***no parameter*** displays table of the routing entry line items.
  - **detail** displays data block for each routing table entry.
- **VRF_INST** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Related Command

show ipv6 bgp peers

Example

This command lists the routes advertised to the neighbor at ***2001:10:1:0::102*** with the community ***64496:1000***.

```
switch# show ipv6 bgp peers 2001:10:1:0::102 advertised-routes community 64496:1000
BGP routing table information for VRF default
Router identifier 10.0.0.100, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
```

```
                    S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop

         Network                Next Hop            Metric  LocPref Weight  Path

 65536 i
switch#
```

15.5.5.123 show ipv6 bgp peers regexp

The **show ipv6 bgp peers regexp** command displays information about routes (advertised or received) from a specified IPv6 neighbor that match the AS-path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

show ipv6 bgp peers ***addr*** **ROUTE regexp** ***as_paths*** [**VRF_INST**]

Parameters

- ***addr*** neighbor location (IPv6 address).
- **ROUTE** type of route that the command displays. Options include:
  - **advertised-routes** displays routes advertised to the specified neighbor.
  - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
  - **routes** displays routes received and accepted from specified neighbor.
- ***as_paths*** list of AS paths, formatted as a regular expression. Regular expressions are pattern-smatching strings that are composed of text characters and operators.
- **VRF_INST** specifies VRF instances. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Related Commands

- **show ip bgp regexp**
- **show ipv6 bgp peers**

Example

This command displays information for routes received from the neighbor at ***2001:10:1:0::100*** which include AS number ***64496*** in their AS paths.

```
switch# show ipv6 bgp peers 2001:10:1:0::100 received-routes regex 64496
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop

         Network                Next Hop              Metric  LocPref Weight Path

 * >     2001:10:100::/64       2001:10:1::100        200     -       -      64496 i
 * >     2001:10:100:1::/64     2001:10:1::100        -       -       -      64496 64497
 65536 i
 * >     2001:10:100:2::/64     2001:10:1::100        42      -       -      64496 ?
switch#
```

15.5.5.124 show ipv6 bgp regexp

The **show ipv6 bgp regexp** command displays Border Gateway Protocol (BGP) IPv6 routing-table entries that match the AS-path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

show ipv6 bgp regexp as_paths [**VRF_INSTANCE**]

Parameters

- ***as_paths*** slist of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- **VRF_INSTANCE** specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - ***no parameter*** displays routing table for context-active VRF.
  - **vrf *vrf_name*** displays routing table for the specified VRF.
  - **vrf all** displays routing table for all VRFs.
  - **vrf default** displays routing table for default VRF.

Related Command

show ip bgp regexp

Examples

This command displays information about the BGP IPv6 routes in the context-active VRF that pass through AS ***64496***.

```
switch# show ipv6 bgp regex _64496_
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
 e - ECMP
                    S - Stale, c - Contributing to ECMP,  b - backup, L = labeled-unicast
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local
 Nexthop

        Network                Next Hop               Metric  LocPref Weight  Path
 *       2001:10:1::/64      2001:10:1::100   42      100     0       64496 ?
 * >     2001:10:100::/64    2001:10:1::100   200     100     0       64496 i
 * >     2001:10:100:1::/64  2001:10:1::100   0       100     0       64496 64497 65536 i
 * >     2001:10:100:2::/64  2001:10:1::100   42      100     0       64496 ?
switch#
```

15.5.5.125 show ipv6 bgp summary

The **show ipv6 bgp summary** command displays the summary of all IPv4 and IPv6 BGP neighbors based on Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI) negotiations where AFI is “IPv6” and SAFI is “Unicast” information.

Command Mode

EXEC

Command Syntax

show ipv6 bgp summary [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE specifies VRF instances. Options include:

- ***no parameter*** displays routing table for context-active VRF.
- **vrf *vrf_name*** displays routing table for the specified VRF.
- **vrf all** displays routing table for all VRFs.
- **vrf default** displays routing table for default VRF.

Display Values

Header Row

- **BGP router identifier**: the router identifier; sloopback address or highest IP address.
- **Local AS number**: AS number assigned to switch.

Neighbor Table Columns

- **(First) Neighbor**: neighbor’s IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: neighbor’s AS number.
- **(Fourth) MsgRcvd**: messages received from the neighbor.
- **(Fifth) MsgSent**: messages sent to neighbor.
- **(Sixth) InQ**: messages queued from neighbor.
- **(Seventh) OutQ**: messages queued to send neighbor.
- **(Eighth) Up/Down**: period the BGP session has been **Established**, or its current status.
- **(Ninth) State**: state of the BGP session and the number of routes received from a neighbor.
- **(Tenth) PfxRcd**: the count of prefixes received by BGP per neighbor.
- **(Eleventh) PfxAcc**: the count of prefixes added to the BGP RIB among all received prefixes.

Related Command

show ip bgp summary

Example

This command displays the status of the switch’s BGP connections.

```
switch# show ipv6 bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
  Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State   PfxRcd
 PfxAcc
  2001:10:1::100   4  64496            37        36    0    0 00:29:33 Estab   4      4
  2001:10:2::101   4  64510            35        38    0    0 00:29:37 Estab   4      4
switch#
```

15.5.5.126 show peer-filter

The **show peer-filter** command displays the definition of a peer filter.

Command Mode

EXEC

Command Syntax

show peer-filter ***filter_name***

Parameters

filter_name name of the peer-filter group.

Example

This command displays the peer-filter group information for ***group3***.

```
switch# show peer-filter group3
peer-filter group3
   10 match as-range 65003 result accept
   20 match as-range 65007 result accept
   30 match as-range 65009 result accept
switch#
```

15.5.5.127 show run|section bgp

When using the **`show run`** command, it displays the entire running configuration. Sometimes this is unnecessary, so to target your output you can use the **`show run|section bgp`** command which will display only the BGP section.

Command Mode

bgp-router

Command Syntax

`show run | section bgp` [***name***]

Parameter

name name of the peer-group.

Example

Once the peer group request are completed, then run the **`show run|section bgp`** command to display only the BGP section of the running configuration.

```
switch(config-router-bgp)# show run|section bgp router bgp 300
switch(config-router-bgp)# neighbor interface Et1-2,4-6 peer-group PG1
 remote-as 100
switch(config-router-bgp)# neighbor interface Et3 peer-group PG2 remote-
as 200
switch(config-router-bgp)# neighbor interface vlan2000-2002 peer-group
 PG1 remote-as 100
```

15.5.5.128 show tunnel rib brief

The **show tunnel rib brief** command displays the preferred tunnels for various IP endpoints, optionally filtered by endpoint. Each tunnel RIB entry in the output displays the type of the tunnel (such as BGP LU) and a numerical index uniquely identifying that tunnel within the type-specific tunnel table.

Command Mode

EXEC

Command Syntax

show bgp tunnel rib brief

Example

This command displays the tunnel type and the index value.

```
switch# show tunnel rib brief
Endpoint          Tunnel Type       Indexes
----------------- ----------------- -------
10.1.1.0/32       BGP LU            2
11.1.1.0/32       BGP LU            1, 3
switch#
```

15.5.5.129 shutdown (BGP)

The **shutdown** command disables BGP on the switch without modifying the BGP configuration.

The **no shutdown** and **default shutdown** commands enable the BGP instance by removing the **shutdown** command from ***running-config***.

Command Mode

Router-BGP Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands disable BGP on the switch.

```
switch(config)# router bgp 9
switch(config-router-bgp)# shutdown
switch(config-router-bgp)#
```

- These commands enable BGP on the switch.

```
switch(config)# router bgp 9
switch(config-router-bgp)# no shutdown
switch(config-router-bgp)#
```

15.5.5.130 timers bgp

The **timers bgp** command configures the BGP keepalive and hold times.Timer settings apply to each peer connection. The **neighbor timers** command configures the times on a specified peer connection.

- **Keepalive time**: period between the transmission of consecutive keepalive messages.
- **Hold time**: period the switch waits for a keepalive or UPDATE message before it disables peering.

The hold time must be at least ***3*** seconds and should be three times longer than the keepalive setting.

The **no timers bgp** and **default timers bgp** commands return the time settings to their default values by removing the **timers bgp** command from ***running-config***. The default values are:

- **keepalive**: ***60*** seconds.
- **hold time**: ***180*** seconds.

Command Mode

Router-BGP Configuration

Command Syntax

timers bgp ***keep_alive hold_time***

no timers bgp

default timers bgp

Parameters

- ***keep_alive*** keepalive period, in seconds. Values include:
  - ***0*** keepalive messages are not sent.
  - ***1*** to ***3600*** keepalive time (seconds).
- ***hold_time*** hold time. Values include:
  - ***0*** peering is not disabled by timeout expiry; keepalive packets are not sent.
  - ***3*** to ***7200*** hold time (seconds).

Example

This command sets the keepalive time to ***30*** seconds and the hold time to ***90*** seconds.

```
switch(config)# router bgp 9
switch(config-router-bgp)# timers bgp 30 90
switch(config-router-bgp)#
```

15.5.5.131 update wait-for-convergence

The **update wait-for-convergence** command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

The **no update wait-for-convergence** command allows FIB updates and route advertisement irrespective of the BGP convergence state.

Command Mode

Router-BGP Configuration

Command Syntax

update wait-for-convergence

no update wait-for-convergence

default update wait-for-convergence

Related Commands

- **clear ip bgp** removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.
- **bgp convergence slow-peer time** configures the BGP convergence idle peer timeout value.
- **bgp convergence time** configures the BGP convergence timeout value.
- **show bgp convergence** displays information about the BGP convergence state; and other statistics about the BGP instance in either the specified VRF or all VRFs.

Guidelines

The initiation of BGP instance includes the following scenarios:

- the BGP instance starts for the first time after a switch is reloaded.
- the BGP instance restarts.
- all sessions are cleared by using the **clear ip bgp *** command.

Configuration changes made by using this command are effective from the next initiation of a BGP instance.

Example

This command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

```
switch(config)# router bgp 9
switch(config-router-bgp)# update wait-for-convergence
switch(config-router-bgp)#
```

15.5.5.132 vrf

The **vrf** command places the switch in BGP VRF configuration mode for the specified VRF. Commands issued in this mode will override global BGP configuration for the specified VRF.

Command Mode

Router-BGP Configuration

Command Syntax

vrf ***vrf_instance***

Parameters

vrf_instance VRF to be configured.

Example

These commands place the switch in BGP VRF configuration mode for VRF ***purple***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)#
```

15.6 Maintenance Mode

This section describes configuration for performing maintenance of switch elements.

This section contains these topics:

15.6.1 Overview

Using maintenance mode, you can perform several maintenance activities such as:

- EOS image upgrade.
- Initial configuration or reconfiguration of a production system.
- Replacement of hardware.
- Changing linecards or transceiver modules.
- Replace, reattach, and reroute cables.

Maintenance mode uses BGP to divert traffic away from the switch on which the maintenance tasks need to be performed, minimizing traffic impact. You can set the traffic thresholds and time limits at which the switch, or parts of the switch, is considered to be available for maintenance tasks.

Maintenance mode can be activated on a switch at boot-up or during operation. The mode provides the following benefits:

- Rerouting of traffic when the mode is activated during operation and other routes are present.
- Replacement of hardware in modular systems or systems with redundant hardware.

The switch is placed into maintenance mode, serviced, and then returned to normal operation.

15.6.2 Maintenance Mode Elements

Maintenance mode elements include Units, Groups of Interfaces and BGP Peers, and Profiles. Arista Network switches provide maintenance mode operations performed on a fundamental, configurable element, referred to as a Unit. Maintenance mode will quiesce a unit, which places the unit into maintenance mode by gracefully transitioning traffic away from it.

The most common maintenance mode operations such as removing from service an entire switch system or individual components of the switch, including a single linecard, interface, or BGP peer, can be achieved using minimal configuration.

15.6.2.1 Units

Units are configurable maintenance mode elements that comprise a collection of various groups. In addition, units contain policies which decide whether the member groups should be put into maintenance mode automatically upon boot. Built-in units are configured by default, such as the System unit representing the entire system. All maintenance mode operations are executed at the unit level.

An interface, interface range, and BGP peer (or peer-group) can be directly put under maintenance.

15.6.2.1.1 Built-in Units

There are various built-in units such as **System** and **Linecard<n>**. Fixed systems contain only one built-in unit called **System**, which comprises the interface group containing all Ethernet interfaces and sub-interfaces; and BGP groups per VRF containing all the peers in the respective VRF.

Modular Systems have both **System** and **Linecard<n>** units. **Linecard<n>** units are present for each linecard which comprises the **Linecard<n>** groups containing all Ethernet interfaces and sub-interfaces of that linecard.

15.6.2.1.2 User-configured Units

You can also configure customized units containing user-defined groups and policies as shown in the following example. A custom group called ***BG1*** with a custom interface ***IG1*** and a unit profile ***UP1*** is created. The show command displays the details.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group bgp BG1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# profile unit UP1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)# show maintenance units
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Bgp Groups:
AllBgpNeighborVrf-default
Interface Groups:
AllEthernetInterface
Unit Name: UNIT1
Origin: User Configured
Status: Under Maintenance
Unit Profile: UP1
Time Since Last State Change: 0:00:08 ago
Bgp Groups:
BG1
Interface Groups:
IG1
```

15.6.2.2 Groups of Interfaces and BGP Peers

Maintenance mode group types include the groups for interfaces and BGP peers. Groups are identified by a group name unique to a particular group type.

By default, several built-in groups are available on the device such as **linecard** groups containing physical interfaces.

15.6.2.2.1 Built-in Groups

There are several built-in groups such as **AllEthernetInterface**, **Linecard1**, **Linecard2**, etc., **AllBgpNeighborVrf-<vrf_name>**. **AllEthernetInterface** is the built-in interface group which contains all physical Ethernet interfaces and sub-interfaces on the switch, and is a part of **System** unit. Whereas on modulars **Linercard1**, **Linecard2**, etc., are the built-in groups which contain respective linecard interfaces and sub-interfaces; and are part of the **Linecard1** and **Linecard2** units respectively. **AllBgpNeighborVrf-<vrf_name>** is the built-in BGP group which contains all the BGP peers in that particular VRF.

15.6.2.2.2 User-defined Groups

The following set of commands sets up a custom group (***IG1***) of interfaces, which includes physical ports, port-channels and SVIs.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet1
switch(config-group-if-IG1)# interface Port-Channel1,20
switch(config-group-if-IG1)# interface Vlan1-20
switch(config-group-if-IG1)# exit
switch(config)#
```

Note: User-defined interface groups do not contain sub-interfaces.

The following set of commands sets up a custom group (***BG1***) of BGP peers.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 10.0.0.1
switch(config-group-bgp-BG1)# neighbor BGP_PG1
switch(config-group-bgp-BG1)# vrf vrf1
switch(config-group-bgp-BG1)# exit
switch(config)#
```

Note: BGP groups are specific to VRF.

15.6.2.3 Profiles

Profiles are configurable maintenance mode elements that define policies for related software or hardware components to carry out maintenance mode operations.

15.6.2.3.1 Default Profiles

Default profiles are the built-in policies which are applied to groups interface/BGP and unit.

The default profile is used in the absence of an explicit interface/BGP profile associated with the group, or explicit unit profile associated with the unit.

BGP Profile

Default BGP profile has route-map with set clausesset community GSHUT additive and set local-preference 0.

```
switch(config-maintenance)# show maintenance profile bgp default
Bgp Profile: Default
Initiator route-map: SystemGenerated
route-map SystemGenerated permit 10
Description:
description System generated initiator route-map
Match clauses:
SubRouteMap:
Set clauses:
set local-preference 0
set community GSHUT additive
```

Interface Profile

Default interface profile has rate-monitoring load-interval set to ***60*** seconds, threshold set to ***100*** kbps, and shutdown disabled as shown. The max-delay parameter is set to ***300*** seconds but is not enabled.

```
switch(config-maintenance)# show maintenance profile interface default
Interface Profile: Default
Rate Monitoring:
load-interval: 60 seconds
threshold (in/out): 100 kbps
shutdown:
enabled: no
max-delay: 300 seconds
```

Unit Profile

Default unit profile has on-boot setting disabled.

```
switch(config-maintenance)# show maintenance profiles unit default
Unit Profile: Default
On-boot:
enabled: no
duration: 300 seconds
```

15.6.2.3.2 User-defined Profiles

You can define your own profiles which can be associated to groups or set as default profiles.

Interface Profile: The following set of commands sets up an Interface Profile (***IP1***) with load interval set to ***10*** seconds, rate-monitoring threshold set to ***100kbps*** and the maximum delay for shutting down the interface set to ***100*** seconds. The interface will be shutdown with cause maint-down if traffic does not drain below the threshold even after the specified maximum delay period of ***100*** seconds.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 10
switch(config-profile-intf-IP1)# rate-monitoring threshold 100
switch(config-profile-intf-IP1)# shutdown max-delay 100
switch(config-profile-intf-IP1)# exit
switch(config-maintenance)#
```

An interface profile can be associated to only interface groups using the following set of commands.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# maintenance profile interface IP1
switch(config-group-if-IG1)# exit
switch(config)#
```

You can set the interface profile as the default interface profile using the following set of commands.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1 default
switch(config-maintenance)# exit
switch(config)#
```

BGP Profile: The following set of commands sets up a BGP profile (***BP1***) with initiator route-map called RM which will be applied for both inbound and outbound directions.

```
switch(config)# maintenance
```

```
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map RM inout
switch(config-profile-bgp-BP1)# exit
switch(config-maintenance)#
```

A BGP profile can be associated to both interface and bgp groups using the following commands.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# maintenance profile bgp BP1
switch(config-group-if-IG1)# exit
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# maintenance profile bgp BP1
switch(config-group-bgp-BG1)# exit
switch(config)#
```

You can set the bgp profile as the default bgp profile using the following set of commands.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1 default
switch(config-maintenance)# exit
switch(config)#
```

Unit Profile: The following set of commands sets up a Unit profile (***UP1***) with on-boot duration of ***300*** seconds. The unit will enter into maintenance mode at boot-up and exit maintenance mode at the end of ***5*** minutes (***300sec***) after boot-up.

```
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 300
switch(config-profile-unit-UP1)# exit
switch(config-maintenance)#
```

A Unit profile can be associated to a Unit using the following commands.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# profile unit UP1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)#
```

You can set the Unit profile as the default Unit profile using the following set of commands.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1 default
switch(config-maintenance)# exit
switch(config)#
```

15.6.3 Maintenance Mode Features

Arista Network switches provide maintenance mode features including rate monitoring, BGP maintenance route map, on-boot maintenance, and EventMgr integration.

15.6.3.1 Rate Monitoring

Rate monitoring provides a mechanism to monitor traffic on interfaces identified for maintenance. You can set the traffic threshold and a time limit for the interface to be shutdown for maintenance tasks.

A shutdown parameter can be configured in the interface profile that signals the interface to be shutdown after it has entered maintenance mode.

The max-delay parameter specifies the maximum number of seconds to allow for traffic to dissipate from the interface before the interface is shutdown. The default interface profile settings are shown in the output of the **`show maintenance profile interface default`** command.

Note: The exclusive rate monitoring of sub-interfaces is not supported. Sub-interfaces inherit the interface profile from its parent interface. In case of multiple sub-interfaces configured for single parent interface, rate monitoring of parent interface include aggregate values of all respective sub-interfaces.

15.6.3.2 BGP Maintenance Route Map

Route-maps are used within a BGP maintenance profile to tag the inbound and outbound routes in order to direct traffic away from the unit.

The default profile tags the inbound and outbound routes with the global shutdown community. Other methods can be configured under the route-map such as alternate communities, or by using **AS_PATH** prepend operations.

15.6.3.3 On-boot Maintenance

There are two ways of placing a unit in maintenance mode on switch boot-up:

- The unit is placed into maintenance mode prior to the switch reboot, and the running-config is saved prior to switch boot-up.
- The on-boot property in the unit maintenance profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remains so for the specified duration.

Note: The duration value in the on-boot unit maintenance profile starts as soon as the unit is put into maintenance mode on boot-up.

15.6.3.4 Single Event Upset handling

All electronic devices are subject to interference from cosmic radiation. Arista products use a combination of hardware and software to automatically detect and correct the results of this interference. For instance, many chip memories contain parity or Error Correcting Code (ECC) bits. However, Single Event Handling (SEU) is a random event, and following configuration determines the handling behavior.

```
switch(config)# platform sand seu
switch(config-sand-seu)#
```

The system, by default corrects the first instance of an ECC or parity event without any logging. If a further error occurs within a 4 hour time window, related to the first or not, a log message will be emitted.

The default 4 hours logging window can be changed as following. For example, a second SEU is detected within ***3*** hours of a prior SEU.

```
switch(config-sand-seu)# log window 10800 seconds
```

Static memories are used by hardware to hold configuration to determine switching behaviour. When SEUs occur, repairs are made automatically. The following command disables automatic repair by a specific agent.

```
switch(config-sand-seu)# repair table static manager SandFap disabled
```

The following command disables automatic repair by a specific memories, overriding any specific configurations.

```
switch(config-sand-seu)# repair table static disabled
```

Note: Repair of static tables should only be disabled in consultation with the Support team.

The following command disables automatic repair of fabric chip memories on the modular or fixed systems which use fabric chip.

```
switch(config-sand-seu)# repair table fabric manager SandFabric disabled
switch(config-sand-seu)# repair table fabric disabled
```

The following command disables dynamic memories globally. Dynamic memories are internal memories utilized by hardware to hold transient data, such as packet header encapsulations.

```
switch(config-sand-seu)# repair table dynamic disabled
```

The following command disables SEU resets without affecting other dynamic table repairs.

```
switch(config-sand-seu)# repair table dynamic action reset full disabled
```

The following command configures the SEU to ***12*** hours, by default the minimum interval between SEUs is ***24*** hours.

```
switch(config-sand-seu)#repair action reset full interval 43200 seconds
```

Show Command

SEU events generate interrupts, it can be seen along with all other interrupts.

```
switch# show platform fap interrupts
 Jericho0
 ------------------------------------------------------------------------------------------
 | Interrupt Bit                | Count | First Occurrence    | Last Occurrence     |
 ------------------------------------------------------------------------------------------
 | ...                          |   ... |                     |                     |
 | CFC_ECC_Ecc_2bErrInt[0]      |     2 | 2020-10-15 04:27:59 | 2020-10-15 04:31:41 |
 | ...                          |   ... |                     |                     |
 ------------------------------------------------------------------------------------------
```

All SEU interrupt names take the form **<block>_ECC_<type>Int**. The block indicates the part of a switch chip affected. The type can be one of the following:

- **Ecc_1bErr** - Single bit error in ECC protected memory, corrected automatically in hardware.
- **Ecc_2bErr** - Two bit error in ECC protected memory detected, requires software correction.
- **ParityErr** - Single bit error in parity protected memory detected, requires software correction.

Single bit ECC errors do not affect correct operation of the switch. Two bit ECC and parity errors can disrupt correct operation, for example, by dropping one or more packets, or by mis-forwarding packets. The exact effect depends on the memory and location affected by the SEU.

15.6.4 Maintenance Mode Configuration

You can configure maintenance mode for the entire device, specific linecards, or any other Unit. You can set up configuration for maintenance mode for the device at boot-up or while it is running.

Note: Explicit maintenance of sub-interfaces is not supported. Sub-interfaces are put into maintenance implicitly in case of built-in unit maintenance and interface maintenance but not in case of user-configured units.

15.6.4.1 Unit Configuration

Arista Network switches provide the ability to place the switch in maintenance mode, and configuration options for groups, profiles, associating profiles with groups, units, and maintenance mode operations. **System** is a predefined (built-in) unit on all switches. Built-in groups include **AllEthernetInterface**, **AllBgpNeighborVRF-<vrf_name>**, and **Linecardn**. **Linecardn** can also be a built-in unit and can be differentiated depending on the command being used as shown.

- ```
  switch(config-maintenance)# unit Linecardn
  ```
- ```
  switch(config)# group interface Linecardn
  ```

Built-in unit **System** comprises the following groups:

- **AllEthernetInterface** - a built-in interface group which contains all physical Ethernet interfaces on the switch on a fixed system.
- **Linecardn** - a built-in interface group which contains all interfaces for the linecard numbered n for modular systems.
- **AllBgpNeighborVRF-<vrf_name>** - a built-in BGP group which contains all the BGP peers in the named VRF.

For each Linecard n, there is a built-in unit which consists of all the **Linecardn** groups.

By default, the default interface and BGP profiles are applied to the built-in interface and BGP groups and the default built-in unit profile is applied to the built-in unit. You can also configure your own profiles and choose a default.

In the following example, traffic is flowing through multiple switches in the spine to and from one switch to another, when you elect to put one of the Units (entire switch or parts thereof) in the spine switch in maintenance mode. The traffic is then gracefully steered away from the Unit, provided other paths are available. Traffic will continue to flow through the Unit placed into maintenance mode, if no other path is available.

Example

Note: The illustration shows an entire switch as the Unit. You can replace switch with Linecardn or another relevant Unit as appropriate.

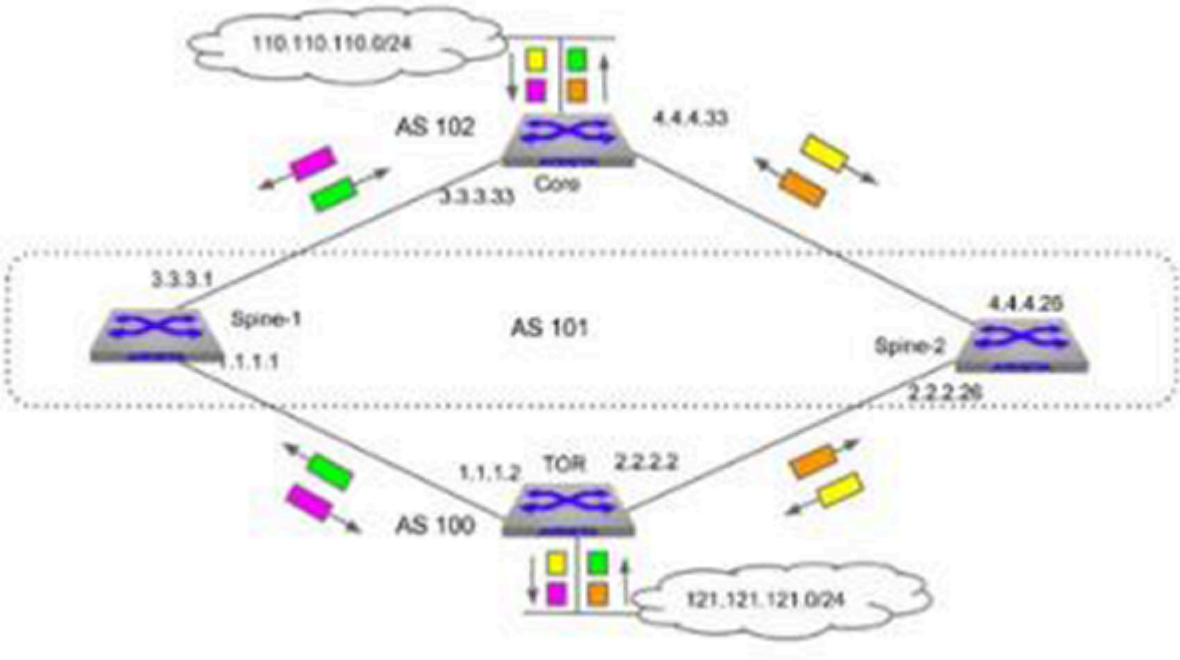

Figure 62: Traffic flow pattern between TOR and Core Before Maintenance

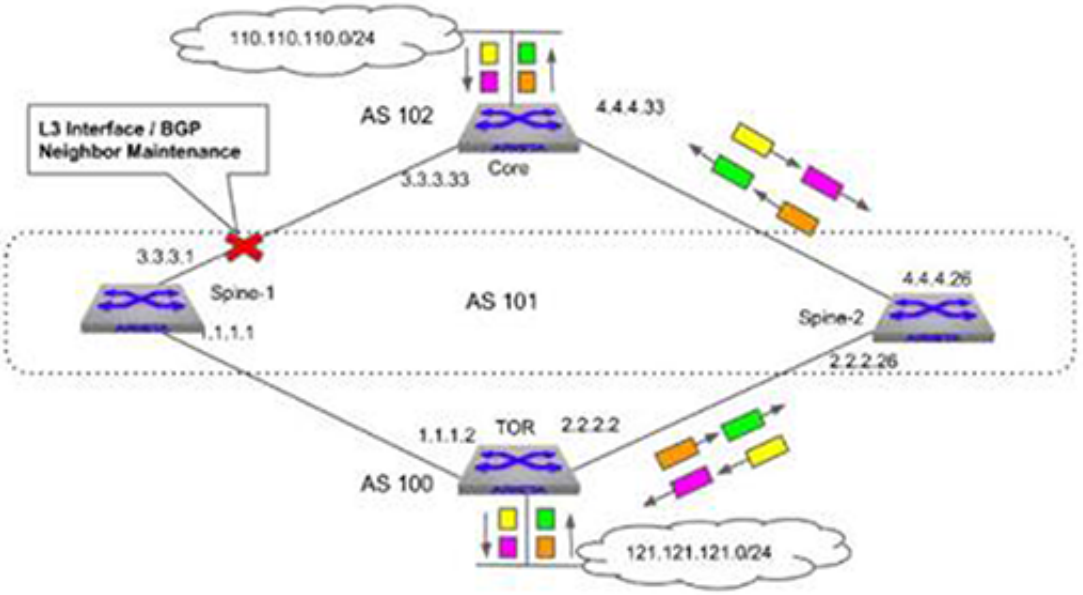

Figure 63: Traffic flow pattern between TOR and Core After unit on Spine-1 is put into Maintenance

You can see the status of the Unit (System) using the **`show maintenance units System`** command for the example above before the system is placed into maintenance mode. If the device being placed into maintenance mode is modular and the Unit is a linecard, replace the argument **System** with **Linecardn** to see the status of the Unit (Linecardn).

```
switch(config)# show maintenance units System
Unit Name: System
   Origin: Built-in
   Status: Not Under Maintenance
   Unit Profile: Default
```

```
   Time Since Last State Change: never
   Bgp Groups:
     AllBgpNeighborVrf-default
   Interface Groups:
     AllEthernetInterface
```

You can then place the Unit (System) into maintenance mode and recheck the status using the sequence of commands shown.

```
switch(config-maintenance)# unit System
switch(config-builtin-unit-System)# quiesce
switch(config-builtin-unit-System)# exit
switch(config-maintenance)# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold

Unit Name              Status                    Time since last change    Flags
---------------------- ------------------------ ------------------------- -----
System                 Under Maintenance              0:02:03 ago

switch(config-maintenance)# show ip bgp summary
BGP summary information for VRF default
Router identifier 1.1.1.1, local AS number 101
Neighbor Status Codes: m - Under maintenance
  Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State
PfxRcd PfxAcc
m 1.1.1.2          4  100               24        17    0    0 00:00:40 Estab  5      5
m 3.3.3.33         4  102               15        16    0    0 00:06:23 Estab  1      1
```

Note: The **o** flag is shown for on-boot maintenance in the **show maintenance** command and the **m** neighbor status flag in the **show ip bgp summary** command indicates that the peer is in maintenance mode.

15.6.4.2 On-boot Maintenance Mode Configuration

To configure on-boot maintenance, you can use one of two methods:

- Use **quiesce config**, or
- Use on-boot profile

15.6.4.2.1 Using quiesce config

You must perform the following tasks to place the Unit in maintenance mode on boot-up using the **quiesce** command.

1. Place the unit into maintenance mode prior to switch reboot using the following commands.

```
switch(config)# maintenance
switch(config-maintenance)# unit System
switch(config-unit-System)# quiesce
switch(config-unit-System)# exit
switch(config-maintenance)# show maintenance

Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
--------- ------ ---------------------- -----
System Under Maintenance 00:01:10 ago
```

2. Save the ***running-config*** using the following command.

```
switch(config)# copy running-config startup-config
```

```
Copy completed successfully
switch(config)#
```

3. Reload the device.

```
switch(config)# reload
Proceed with reload? [Confirm] Yes
Connection to switch closed.
```

4. After the device comes up, you must execute the **no quiesce** command for the Unit to come out of maintenance mode. You can check the status of the device after it comes up using the **show maintenance** command.

```
switch# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
--------- ------ ---------------------- -----
System Under Maintenance 00:03:10 ago
```

15.6.4.2.2 Using on-boot profile

The on-boot property in the Unit maintenance profile specifies that the Unit will be placed into maintenance mode as part of boot-up for the specified duration. You must perform the following tasks to use this method.

1. Check to see if the on-boot maintenance mode is enabled using the **show maintenance profiles unit default**.

```
switch# show maintenance profiles unit default
Unit Profile: Default
On-boot:
enabled: no
duration: 300 seconds
```

2. Configure an on-boot profile with on-boot enabled and a duration specified. Make this the default Unit profile. The following code example shows the creation of an on-boot duration of ***300*** seconds in the profile unit ***UP1***.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 300
switch(config-profile-unit-UP1)# exit
switch(config-maintenance)# profile unit UP1 default
switch(config-maintenance)# show maintenance profiles unit default
Unit Profile: UP1
On-boot:
enabled: yes
duration: 300 seconds
switch(config-maintenance)#
```

3. Save the ***running-config*** and reload the device.

```
switch(config)# copy running-config startup-config
Copy completed successfully
switch(config)# reload
Connection to switch closed.
```

4. After the device comes up, execute the **show maintenance** and **show maintenance units System** commands.

```
switch(config)# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
--------- ------ ---------------------- -----
System Under Maintenance 00:00:08 ago o
switch(config)# show maintenance units System
Unit Name: System
Origin: Built-in
Status: Under Maintenance (on-boot)
Unit Profile: UP1
Time Since Last State Change: 0:00:16 ago
Will come out of on-boot Maintenance after 0:04:43
Interface Groups:
AllEthernetInterface
History:
2017-01-18 00:44:39 old state: 'maintenanceModeEnter' to new state:
'underMaintenance' 0:00:16 ago
2017-01-18 00:43:54 old state: 'active' to new state: 'maintenanceM
odeEnter'
0:01:01 ago
```

The o - flag shows that unit System is under maintenance due to on-boot profile. Also, **show maintenance units System** output shows the following - Will come out of on-boot Maintenance after ***0:04:43***, which is the time remaining of the specified duration of ***5*** minutes.

The Unit will come up in maintenance mode when the device boots up and will exit maintenance mode once the specified duration of ***300*** seconds in the default profile is completed. The BGP sessions will remain under maintenance for the duration and will resume after the specified duration is over.

15.6.4.3 Interface-level Maintenance Mode Configuration

To configure the maintenance mode at interface-level, you must perform the following tasks:

1. Configure an interface-level profile (or use a pre-configured one). The following code example creates a user-defined interface profile IP1 with a rate-monitoring load-interval of ***100*** seconds, a rate-monitoring threshold of ***500*** kbps and a maximum shutdown delay of ***100*** seconds.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-maint-if-Et5)# rate-monitoring load-interval 100
switch(config-maint-if-Et5)# rate-monitoring threshold 500
switch(config-maint-if-Et5)# shutdown max-delay 100
```

2. Make the user-defined interface profile IP1 as the default interface profile.

```
switch(config-maintenance)# profile interface IP1 default
```

3. Place the interface into maintenance mode.

```
switch(config)# maintenance
switch(config-maintenance)# interface Ethernet 1
switch(config-maint-if-Et1)# quiesce
```

4. Remove the interface from maintenance mode once the service has been performed.

```
switch(config-maintenance)# interface Ethernet 1
```

```
switch(config-maint-if-Et1)# no quiesce
```

Note: If interface ***Et1*** has sub-interfaces (***Et1.1***, ***Et1.2***,...) with BGP peers on these sub-interfaces, then these sub-interfaces are also placed into maintenance mode. The **`show maintenance interface sub-interface detail`** command displays the maintenance state of sub-interfaces.

15.6.4.4 Entering Maintenance Mode

Enter configuration commands **`unit`** and **`quiesce`** using the **`maintenance profile bgp`** mode command to place the switch into maintenance mode. The following code sequence places unit foo, the ***interface 3/3***, and BGP **`1.1.1.1`** in maintenance mode.

Example

```
switch(config)# maintenance
switch(config-maintenance)# unit foo
switch(config-unit-foo)# quiesce
switch(config-unit-foo)# exit
switch(config-maintenance)# interface ethernet 3/3
switch(config-maint-if-Et3/3)# quiesce
switch(config-unit-if-Et3/3)# exit
switch(config-maintenance)# bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1)# quiesce
switch(config-maint-bgp-1.1.1.1)# exit
switch(config-maintenance)#
```

15.6.4.5 Exiting Maintenance Mode

Enter configuration commands **`unit`** and **no** **`quiesce`** using the **`maintenance profile bgp`** mode command for the switch to exit maintenance mode. The following code sequence causes unit foo, the ***interface 3/3***, and BGP ***1.1.1.1*** to exit maintenance mode.

Example

```
switch(config)# maintenance
switch(config-maintenance)# unit foo
switch(config-unit-foo)# no quiesce
switch(config-unit-foo)# exit
switch(config-maintenance)# interface ethernet 3/3
switch(config-maint-if-Et3/3)# quiesce
switch(config-unit-if-Et3/3)# exit
switch(config-maintenance)# bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1)# no quiesce
switch(config-maint-bgp-1.1.1.1)# exit
switch(config-maintenance)#
```

15.6.4.6 Configuring Event Handlers

Enter configuration options for the **`show maintenance`** command to fire at different stages while entering or exiting maintenance mode.

Example for Maintenance Mode Event Handler for all Stages

```
switch(config)# event-handler foo
switch(config-handler-foo)# trigger on-maintenance enter unit unit-foo
 all
```

```
switch(config-handler-foo)# action bash /mnt/flash/mm-event-handler-
script
switch(config-handler-foo)# timeout 20
switch(config-handler-foo)# exit
switch(config)#
```

Note: The user is expected to configure the timeout value. This is time within which the script should complete execution and exit. If the script has not exited by the end of this period, then the following will occur:

1. Send the **SIGUSR1** signal to the script.
2. Wait for a **GRACE-PERIOD** of ***10*** seconds for the script to exit.
3. If the script does not exit even after that **GRACE-PERIOD**, then send a **SIGKILL** to the script.
4. The maintenance operation progresses to the next stage.
5. **GRACE-PERIOD** is not configurable.

```
switch(config)# event-handler bar
switch(config-handler-bar)# trigger on-maintenance exit unit unit-foo
 before
stage ratemon
switch(config-handler-bar)# action bash /mnt/flash/mm-event-handler-
script
switch(config-handler-bar)# exit
switch(config)#
```

15.6.4.7 Configuring Groups

Enter the maintenance mode configuration options for groups with the **maintenance** and **group bgp** commands.

Example for Group Interface IG1

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet1
switch(config-group-if-IG1)# interface Port-Channel1,20
switch(config-group-if-IG1)# interface Vlan1-20
switch(config-group-if-IG1)# exit
switch(config)#
```

Example for Group BGP BG1

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 10.0.0.1
switch(config-group-bgp-BG1)# neighbor BGP_PG1
switch(config-group-bgp-BG1)# vrf vrf1
switch(config-group-bgp-BG1)# exit
switch(config)#
```

Note: BGP groups are specific to VRF.

15.6.4.8 Configuring Profiles

Enter the maintenance mode configuration options for profiles with the **profile interface**, **rate-monitoring threshold**, **profile bgp**, and **profile unit <profile_name>** commands.

These command examples assign a user configured profile as the **default** profile.

Example for Profile Interface IP1

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 10
switch(config-profile-intf-IP1)# rate-monitoring threshold 100
switch(config-profile-intf-IP1)# shutdown max-delay 100
switch(config-profile-intf-IP1)# profile interface IP1 default
switch(config-profile-intf-IP1)# exit
switch(config-maintenance)#
```

Example for Profile BGP BP1

```
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map rmap inout
switch(config-profile-bgp-BP1)# profile bgp BP1 default
switch(config-profile-bgp-BP1)# exit
switch(config-maintenance)#
```

Example for Profile Unit UP1

```
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 300
switch(config-profile-unit-UP1)# profile unit UP1 default
switch(config-profile-unit-UP1)# exit
switch(config-maintenance)#
```

15.6.4.9 Associating Profiles with Groups

Enter the maintenance mode configuration options for associating profiles with groups using the **maintenance** and **group bgp** command.

Example

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# maintenance profile bgp BP1
switch(config-group-if-IG1)# maintenance profile interface IP1
switch(config-group-if-IG1)#
```

Note: An interface/BGP profile can be associated with the interface group, and a BGP profile can be associated with the BGP group.

15.6.4.10 Configuring Units

Enter the maintenance mode configuration options for units using the **unit**, **group bgp**, and **maintenance** commands.

Example

```
switch(config)# maintenance
switch(config-maintenance)# unit foo
switch(config-unit-foo)# group bgp BG1
switch(config-unit-foo)# group interface IG1
```

```
switch(config-unit-foo)#profile unit UP1
```

15.6.5 Maintenance Mode Commands

Global Configuration Commands

- group bgp
- group interface
- maintenance

Group Configuration Commands

- interface
- maintenance profile bgp
- maintenance profile interface
- neighbor
- vrf

Maintenance Configuration Commands

- bgp <peer> [vrf <vrf_name>]
- interface intf-name
- profile bgp
- profile bgp <profile_name> default
- profile interface
- profile interface <profile_name> default
- profile unit
- profile unit <profile_name>
- profile unit <profile_name> default
- unit

Unit Configuration Commands

- group bgp <group_name>
- group interface <group_name>
- quiesce

Interface Profile Configuration Commands

- rate-monitoring load-interval
- rate-monitoring threshold
- shutdown max-delay

BGP Profile Configuration Commands

- initiator route-map <route-map-name> inout

Unit Profile Configuration Commands

- on-boot duration

EventMgr Configuration Commands

- trigger on-maintenance

Display Commands

- show interface
- show interface <intf_name> status
- show ip | ipv6 bgp
- show ip | ipv6 bgp summary [vrf <vrf_name>]
- show maintenance
- show maintenance bgp
- show maintenance bgp receiver route-map
- show maintenance debug
- show maintenance groups
- show maintenance interface
- show maintenance interface status
- show maintenance interface status quiesced
- show maintenance profiles
- show maintenance stages
- show maintenance summary
- show maintenance units

15.6.5.1 bgp <peer> [vrf <vrf_name>]

The **bgp <peer> [vrf <vrf-name>]** command places the switch in maintenance dynamic BGP unit configuration mode. If no VRF is specified, the BGP peer is considered to be in the DEFAULT VRF, otherwise, in the specified VRF.

The command creates the dynamic BGP unit if the specified dynamic BGP unit does not exist prior to issuing the command.

The **no bgp <peer> [vrf <vrf_name>]** and **default bgp <peer> [vrf <vrf_name>]** removes the dynamic BGP unit from ***running-config***.

Command Mode

Maintenance Configuration

Command Syntax

bgp ***ipv4_addr*** [vrf ***vrf_name***]

bgp ***ipv4_addr*** [vrf ***vrf_name***]

bgp ***ipv4_addr*** [vrf ***vrf_name***]

no bgp [***ipv4_addr*** | ***ipv6_addr*** | ***peer_group_name***][vrf ***vrf_name***]

default bgp [***ipv4_addr*** | ***ipv6_addr*** | ***peer_group_name***][vrf ***vrf_name***]

Parameters

- ***ipv4_addr*** BGP neighbor IPv4 address.
- ***ipv6_addr*** BGP neighbor IPv6 address.
- ***peer_group_name*** BGP peer group name.
- **vrf *vrf_name*** name of the VRF to which the BGP peer belongs.

Commands available in maintenance dynamic interface unit configuration mode:

quiesce

Example

This command creates dynamic BGP unit for IPv4 address ***1.0.1.1***, IPv6 addr ***1::1*** with quiesce and peer-group ***PG*** in ***VRF VRF1*** under maintenance configuration.

```
switch(config)# maintenance
switch(config-maintenance)# bgp 1.0.1.1
switch(config-maint-bgp-1.0.1.1)# exit
switch(config-maintenance)# bgp 1::1
switch(config-maint-bgp-1::1)# quiesce
switch(config-maint-bgp-1::1)# exit
switch(config-maintenance)# bgp PG vrf VRF1
switch(config-maint-bgp-PG)# exit
switch(config-maint-bgp-PG)# show active
maintenance
    bgp 1.0.1.1
    !
    bgp 1::1
        quiesce
    !
    bgp PG vrf VRF1
switch(config-maintenance)#
```

15.6.5.2 group bgp

The **group bgp <group_name>** command places the switch in group-BGP configuration mode for configuring the members of a BGP group in a particular VRF and associating a BGP maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command.

The **no group bgp <group_name>** and **default group bgp <group_name>** removes the BGP group.

Command Mode

Global Configuration

Command Syntax

group bgp *group_name*

no group bgp *group_name*

default group bgp *group_name*

Parameters

group_name name of the BGP group.

Commands available in group-BGP configuration mode:

- **neighbor (ipv4 address | ipv6 address | peer-group)**
- **vrf (vrf-name)**
- **maintenance profile bgp**

Note: Built-in BGP groups like ***AllBgpNeighborVrf-default*** and ***AllBgpNeighborVrf-<vrf_name>*** do not allow neighbor configuration. Only BGP maintenance profile can be associated to them.

Examples

- This command creates a BGP group ***BG1*** and enters into group ***BGP BG1*** configuration mode.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# show active
group bgp BG1
exit
switch(config-group-bgp-BG1)#
```

- This command enters into ***BGP*** built-in configuration mode for ***AllBgpNeighborVrf-default***.

```
switch(config)# group bgp AllBgpNeighborVrf-default
switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)#
group bgp AllBgpNeighborVrf-default
exit
switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)# exit
switch(config)# show maintenance groups bgp AllBgpNeighborVrf-default
BGP Group: AllBgpNeighborVrf-default
Origin: Built-in
Neighbors:
Ipv4 Peers: 1.0.0.1, 1.0.1.2
Bgp Profile: Default
Vrf: default
Units: System
switch(config)#
```

15.6.5.3 group bgp <group_name>

The **group bgp <group_name>** command adds a BGP group to a unit.

The **no group bgp <group_name>** and **default group bgp <group_name>** removes the BGP group from a unit.

Command Mode

Maintenance Unit Configuration

Command Syntax

group bgp ***group_name***

no group bgp ***group_name***

default group bgp ***group_name***

Parameters

group_name name of the BGP group.

Example

This command adds a BGP group ***BG1*** to unit ***UNIT1***.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group bgp BG1
switch(config-unit-UNIT1)# show active
maintenance
    unit UNIT1
group bgp BG1
switch(config-unit-UNIT1)
```

15.6.5.4 group interface

The **group interface** command places the switch in group-intf configuration mode for configuring the members of interface group and associating a BGP/interface maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command.

The **no group interface <group_name>** and **default group interface <group_name>** removes the interface group.

Command Mode

Global Configuration

Command Syntax

group interface ***group_name***

no group interface ***group_name***

default group interface ***group_name***

Parameters

group_name name of the interface group.

Commands available in group-BGP configuration mode:

- **interface**
- **maintenance profile bgp**
- **maintenance profile interface**

Note: Built-in Interface groups like ***AllEthernetInterface***, ***Linecard3***, ***Linecard4***, etc. do not allow interface configurations. Only BGP/interface maintenance profiles can be associated to them.

Examples

- This command creates an interface group ***IG1*** and enters into ***group interface IG1*** configuration mode.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# show active
group interface IG1
exit
switch(config-group-if-IG1)#
```

- This command enters into built-in interface group ***AllEthernetInterface***.

```
switch(config)#group interface AllEthernetIntetrface
switch(config-builtin-group-if-AllEthernetInterface)# show active
group interface AllEthernetInterface
exit
switch(config-builtin-group-if-AllEthernetInterface)# exit
switch(config)# show maintenance groups interface AllEthernetInterface
Interface Group: AllEthernetInterface
Origin: Built-in
Interfaces:
Et1, Et2, Et3, Et4, Et5/1, â€¦ Et34, Et35, Et36
Profiles:
Interface Profile: Default
Bgp Profile: Default
Units: System#
```

15.6.5.5 group interface <group_name>

The **group interface <group_name>** command adds an interface to a unit.

The **no group interface <group_name>** and **default group interface <group_name>** removes the interface group from a unit.

Command Mode

Maintenance Unit Configuration

Command Syntax

group interface ***group_name***

no group interface ***group_name***

default group interface ***group_name***

Parameters

group_name name of the interface group.

Example

This command adds an ***group interface IG1*** to unit ***UNIT1***.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# show active
maintenance
    unit UNIT1
group interface IG1
switch(config-unit-UNIT1)
```

15.6.5.6 initiator route-map <route-map-name> inout

The **initiator route-map <route-map-name> inout** command is a maintenance BGP profile configuration option for assigning the initiator route-map, which will be applied to inout (inbound and outbound).

The **no initiator route-map <route-map-name> inout** and **default initiator route-map <route-map-name> inout** removes this configuration from the BGP profile.

Command Mode

Maintenance-Profile-BGP Configuration

Command Syntax

initiator route-map ***route-map-name*** **inout**

no initiator route-map

default initiator route-map

Parameters

route-map-name initiator route-map name.

Example

This command configures initiator route-map ***RM1*** within a BGP profile ***BP1***.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map RM1 inout
switch(config-profile-bgp-BP1)# show active
maintenance
    profile bgp BP1
        initiator route-map RM1 inout

switch(config-profile-bgp-BP1)#
```

15.6.5.7 interface

The **interface** command adds interfaces to interface group.

The **interface <intf-name>** and **default interface <intf-name>** removes the interface from the group.

Command Mode

Group-Interface Configuration

Command Syntax

interface ***interface-name***

no interface ***interface-name***

default interface ***interface-name***

Parameters

- ***interface-name*** name of the interface.
- ***ethernet e_range*** Ethernet interfaces specified by ***e_range***.
- port-channel ***p_range*** port channel interfaces specified by ***p_range***.
- vlan ***v_range*** vlans specified by ***v_range***.

Valid ***e_range***, ***p_range***, and ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

Example

- This command adds ***Ethernet8***, ***Ethernet9***, and ***port-channel10*** to the interface group ***IG1***.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet8-9
switch(config-group-if-IG1)# interface port-channel10
switch(config-group-if-IG1)# show active
group interface IG1
interface Et8-9
interface Po10
switch(config-group-if-IG1)# exit
switch(config)#
```

15.6.5.8 interface intf-name

The **`interface <intf-name>`** command places the switch in maintenance dynamic interface unit configuration mode.

The command creates the dynamic interface unit if the specified dynamic interface unit does not exist prior to issuing the command.

The **`no interface <intf-name>`** and **`default interface <intf-name>`** removes the dynamic interface unit from ***running-config***.

Command Mode

Maintenance Configuration

Command Syntax

`interface` ***interface-name***

`no interface` ***interface-name***

`default interface` ***interface-name***

Parameters

- ***interface-name*** name of the interface.
- **ethernet** ***e_range*** Ethernet interfaces specified by ***e_range***.
- **port-channel** ***p_range*** port channel interfaces specified by ***p_range***.
- **vlan** ***v_range*** vlans specified by ***v_range***.

Valid ***e_range***, ***p_range*** and ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Note: Different dynamic interface units are created for each interface in the range.

Commands available in maintenance dynamic interface unit configuration mode:

`quiesce`

Example

This command creates two dynamic interface units for interfaces ***Ethernet1-2*** under maintenance configuration.

```
switch(config)# maintenance
switch(config-maintenance)# interface Ethernet1-2
switch(config-maint-if-Et1-2)# exit
switch(config-maintenance)# show active
maintenance
    interface Ethernet1
    !
    interface Ethernet2
switch(config-maintenance)#
```

15.6.5.9 maintenance

The **maintenance** command allows you to enter maintenance configuration mode and specify maintenance configuration options.

The **no maintenance** and **default maintenance** command removes the maintenance configuration from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

maintenance

no maintenance

default maintenance

Commands available in maintenance configuration mode:

- **unit**
- **bgp**
- **interface**
- **profile bgp**
- **profile interface**
- **profile unit**
- **profile interface <profile-name> default**
- **profile bgp <profile-name> default**
- **profile unit <profile-name> default**

Example

This example shows the commands to enter maintenance configuration mode and configure maintenance related parameters.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit foo
switch(config-profile-unit-foo)# on-boot duration 300
switch(config-profile-unit-foo)# exit
switch(config-maintenance)# unit U1
switch(config-unit-U1)# group interface IG1
switch(config-unit-U1)# group bgp BG1
switch(config-unit-U1)# profile unit foo
switch(config-unit-U1)# exit
switch(config-maintenance)# show active
maintenance
    profile unit foo
        on-boot duration 300
    unit U1
        group interface IG1
        group bgp BG1
        profile unit foo
switch(config-maintenance)#
```

15.6.5.10 maintenance profile bgp

The **maintenance profile bgp <profile-name>** command associates a BGP maintenance profile to an interface/BGP group. A BGP profile can be associated to both the interface and BGP group.

The **no maintenance profile bgp <profile-name>** and **default maintenance profile bgp <profile-name>** removes the profile from the interface/BGP group.

Command Mode

Group-Interface Configuration

Group-BGP Configuration

Built-in-Group-Interface Configuration

Built-in-Group-BGP Configuration

Command Syntax

maintenance profile bgp ***profile-name***

no maintenance profile bgp ***profile-name***

default maintenance profile bgp ***profile-name***

Parameters

profile name name of the BGP profile.

Examples

- This command adds ***BGP profile BP1*** to a BGP group ***BG1***.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 1.0.1.1
switch(config-group-bgp-BG1)# neighbor 1::1
switch(config-group-bgp-BG1)# neighbor PG
switch(config-group-bgp-BG1)# maintenance profile bgp BP1
switch(config-group-bgp-BG1)# show active
group bgp BG1
    neighbor 1.0.1.1
    neighbor 1::1
    neighbor PG
    maintenance profile bgp BP1
switch(config-group-bgp-BG1)# exit
switch(config)#
```

- This command adds BGP ***profile BP1*** to interface group ***IG1***.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet8-9
switch(config-group-if-IG1)# maintenance profile bgp BP1
switch(config-group-if-IG1)# show active
group interface IG1
    interface Et8-9
    maintenance profile bgp BP1
switch(config-group-if-IG1)# exit
switch(config)#
```

- This command adds BGP ***profile BP1*** to built-in interface group ***AllEthernetInterface***.

```
switch(config)# group interface AllEthernetInterface
switch(config-builtin-group-if-AllEtherentInterface)# maintenance
 profile bgp BP1
switch(config-builtin-group-if-AllEtherentInterface)# show active
```

```
group interface AllEthernetInterface
    maintenance profile bgp BP1

switch(config-builtin-group-if-AllEtherentInterface)#
```

15.6.5.11 maintenance profile interface

The **maintenance profile interface <profile-name>** command associates interface profile to interface group.

The **no maintenance profile interface <profile-name>** and **default maintenance profile interface <profile-name>** removes the interface profile from interface group.

Command Mode

Group-Interface Configuration

Built-in-Group-Interface Configuration

Command Syntax

maintenance profile interface ***profile-name***

no maintenance profile interface ***profile-name***

default maintenance profile interface ***profile-name***

Parameters

profile-name name of the interface profile.

Example

- This command adds ***profile interface IP1*** to interface group ***IG1***.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet8-9
switch(config-group-if-IG1)# maintenance profile interface IP1
switch(config-group-if-IG1)# show active
group interface IG1
    interface Et8-9
    maintenance profile interface IP1

switch(config-group-if-IG1)#
```

- This command adds ***profile interface IP1*** to built-in interface group ***AllEthernetInterface***.

```
switch(config)# group interface AllEthernetInterface
switch(config-builtin-group-if-AllEtherentInterface)# maintenance
 profile
interface IP1
switch(config-builtin-group-if-AllEtherentInterface)# show active
group interface AllEthernetInterface
    maintenance profile interface IP1

switch(config-builtin-group-if-AllEtherentInterface)#
```

15.6.5.12 neighbor

The **neighbor** command adds BGP peer(s) to a BGP group. The neighbors can be IPv4, IPv6, or a peer group. The **no neighbor <peer>** and **default neighbor <peer>** removes the BGP peer from the group.

Command Mode

Group-BGP Configuration

Command Syntax

neighbor ***ipv4_addr***

no neighbor ***ipv4_addr***

default neighbor ***ipv4_addr***

neighbor ***ipv6_addr***

no neighbor ***ipv6_addr***

default neighbor ***ipv6_addr***

neighbor ***peer group name***

no neighbor ***peer group name***

default neighbor ***peer group name***

Parameters

- ***ipv4_addr*** BGP neighbor ipv4 address.
- ***ipv6_addr*** BGP neighbor ipv6 address.
- ***peer group name*** BGP peer group name.

Example

- This command adds ipv4 peer ***1.0.1.1***, ipv6 peer ***1::1***, and peer group ***PG*** to the BGP group ***BG1***.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 1.0.1.1
switch(config-group-bgp-BG1)# neighbor 1::1
switch(config-group-bgp-BG1)# neighbor PG
switch(config-group-bgp-BG1)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 1.0.1.1
switch(config-group-bgp-BG1)# neighbor 1::1
switch(config-group-bgp-BG1)# neighbor PG
switch(config-group-bgp-BG1)# exit
switch(config)#
```

15.6.5.13 on-boot duration

The **`on-boot duration`** command is a maintenance unit profile configuration option for specifying the duration after which the associated unit will be brought out of maintenance after reboot. The on-boot property in the maintenance unit profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remain so for the specified duration.

The **`no on-boot`** and **`default on-boot`** removes this configuration from the unit profile.

Command Mode

Maintenance-Profile-Unit Configuration

Command Syntax

`on-boot duration` ***duration***

`no on-boot`

`default on-boot`

Parameters

duration number of seconds for which unit will remain under maintenance after reboot (from ***300*** to ***3600*** seconds).

Example

This command configures on-boot duration of ***1000*** seconds in profile unit ***UP1***.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 1000
switch(config-profile-unit-UP1)# show active
maintenance
    profile unit UP1
        on-boot duration 1000

switch(config-profile-unit-UP1)#
```

15.6.5.14 profile bgp

The **`profile bgp`** command places the switch in maintenance profile BGP configuration mode for configuring initiator route-map.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The **`no profile bgp <profile-name>`** and **`default profile bgp <profile-name>`** removes the profile from ***running-config***.

Command Mode

Maintenance Configuration

Command Syntax

`profile bgp` ***profile-name***

`no profile bgp` ***profile-name***

`default profile bgp` ***profile-name***

Parameters

profile-name name of the BGP profile.

Commands available in maintenance profile BGP configuration mode:

`initiator route-map (route-map name) inout`

Example

This command creates BGP profile ***BP1***.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# show active
maintenance
    profile bgp BP1

switch(config-profile-bgp-BP1)#
```

15.6.5.15 profile bgp <profile_name> default

The **profile bgp <profile_name> default** command configures a user-configured BGP profile as default BGP profile.

The **no profile bgp <profile_name> default** and **default profile bgp <profile_name> default** removes the user-configured BGP profile as default BGP profile.

Command Mode

Maintenance Configuration

Command Syntax

profile bgp *profile_name* default

no profile bgp *profile_name* default

default profile bgp *profile_name* default

Parameters

profile_name name of the BGP profile.

Example

This command configures user configured BGP profile BP1 as default BGP profile.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map RM1 inout
switch(config-profile-bgp-BP1)# exit
switch(config-maintenance)#
switch(config-maintenance)# show maintenance profile bgp default
Bgp Profile: Default
  Initiator route-map: SystemGenerated
   route-map SystemGenerated permit 10
     Description:
       description System generated initiator route-map
     Match clauses:
     Set clauses:
       set community GSHUT additive
       set local-preference 0

switch(config-maintenance)# profile bgp BP1 default
switch(config-maintenance)# show maintenance profile bgp default
Bgp Profile: BP1
  Initiator route-map: RM1
switch(config-maintenance)#
switch(config-maintenance)# show active
maintenance
    profile bgp BP1
        initiator route-map RM1 inout
    profile bgp BP1 default

switch(config-maintenance)#
```

15.6.5.16 profile interface

The **profile interface** command places the switch in maintenance profile interface configuration mode for configuring rate-monitoring threshold, load-interval, and shutdown max-delay.

The command creates the profile if the specified interface profile does not exist prior to issuing the command.

The **no profile interface <profile-name>** and **default profile interface <profile-name>** removes the profile from ***running-config***.

Command Mode

Maintenance Configuration

Command Syntax

profile interface ***profile-name***

no profile interface ***profile-name***

default profile interface ***profile-name***

Parameters

profile-name name of the interface profile.

Commands available in maintenance profile interface configuration mode:

- **rate-monitoring load-interval**
- **rate-monitoring threshold**
- **shutdown max-delay**

Example

This command creates interface profile ***IP1***.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1

switch(config-profile-intf-IP1)#
```

15.6.5.17 profile interface <profile_name> default

The **`profile interface <profile_name> default`** command configures a user-configured interface profile as default interface profile.

The **`no profile interface <profile_name> default`** and **`default profile interface <profile_name> default`** removes the user-configured interface profile as default interface profile.

Command Mode

Maintenance Configuration

Command Syntax

`profile interface` ***`profile_name`*** **`default`**

`no profile interface` ***`profile_name`*** **`default`**

`default profile interface` ***`profile_name`*** **`default`**

Parameters

`profile_name` name of the interface profile.

Example

This command configures user configured interface profile ***IP1*** as default interface profile.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 100
switch(config-profile-intf-IP1)# rate-monitoring threshold 500
switch(config-profile-intf-IP1)# shutdown max-delay 100
switch(config-profile-intf-IP1)# exit
switch(config-maintenance)#
switch(config-maintenance)# show maintenance profile interface default
Interface Profile: Default
  Rate Monitoring:
    load-interval: 60 seconds
    threshold (in/out): 100 kbps
  shutdown:
    enabled: no
    max-delay: 300 seconds

switch(config-maintenance)#
switch(config-maintenance)# profile interface IP1 default
switch(config-maintenance)# show maintenance profile interface default
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 100 seconds
    threshold (in/out): 500 kbps
  shutdown:
    enabled: yes
    max-delay: 100 seconds
switch(config-maintenance)#
switch(config-maintenance)# show active
maintenance
    profile interface IP1 default
    profile interface IP1
        rate-monitoring load-interval 100
        rate-monitoring threshold 500
        shutdown max-delay 100

switch(config-maintenance)#
```

15.6.5.18 profile unit

The **`profile unit`** command places the switch in maintenance profile unit configuration mode for configuring on-boot duration.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The **`no profile unit <profile-name>`** and **`default profile unit <profile-name>`** removes the profile from ***running-config***.

Command Mode

Maintenance Configuration

Command Syntax

`profile unit` ***profile-name***

`no profile unit` ***profile-name***

`default profile unit` ***profile-name***

Parameters

profile-name name of the unit profile.

Commands available in maintenance profile unit configuration mode:

`on-boot duration`

Example

This command creates unit profile ***UP1***.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# show active
maintenance
    profile unit UP1

switch(config-profile-unit-UP1)#
```

15.6.5.19 profile unit <profile_name>

The **`profile unit <profile_name>`** command associates unit profile to a particular unit.

The **`no profile unit <profile_name>`** and **`default profile unit <profile_name>`** removes the unit profile from a unit.

Command Mode

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

Command Syntax

`profile unit` ***profile-name***

`no profile unit` ***profile-name***

`default profile unit` ***profile-name***

Parameters

profile-name name of the unit profile.

Examples

- This command adds ***profile unit UP1*** to ***UNIT1***.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)# show maintenance units UNIT1
Unit Name: UNIT1
   Origin: User Configured
   Status: Not Under Maintenance
   Unit Profile: Default
   Time Since Last State Change: never
   Interface Groups:
     IG1

switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)# show maintenance units UNIT1
Unit Name: UNIT1
   Origin: User Configured
   Status: Not Under Maintenance
   Unit Profile: UP1
   Time Since Last State Change: never
   Interface Groups:
     IG1
switch(config-unit-UNIT1)# show active
maintenance
    unit UNIT1
        group interface IG1
        profile unit UP1

switch(config-unit-UNIT1)#
```

- This command adds ***profile unit UP2*** to built-in ***unit System***.

```
switch(config)# maintenance
switch(config-maintenance)#profile unit UP2
switch(config-profile-unit-UP2)# on-boot duration 600
switch(config-profile-unit-UP2)# exit
switch(config-maintenance)#
switch(config-maintenance)# unit System
switch(config-builtin-unit-System)# show active
maintenance
    unit System
switch(config-builtin-unit-System)# exit
switch(config-maintenance)# show maintenance units System
Unit Name: System
   Origin: Built-in
```

```
   Status: Not Under Maintenance
   Unit Profile: Default
   Time Since Last State Change: never
   Interface Groups:
     AllEthernetInterface

switch(config-maintenance)#
switch(config-maintenance)# unit System
switch(config-builtin-unit-System)# profile unit UP2
switch(config-builtin-unit-System)# show active
maintenance
    unit System
        profile unit UP2
switch(config-builtin-unit-System)# exit
switch(config-maintenance)# show maintenance units System
Unit Name: System
   Origin: Built-in
   Status: Not Under Maintenance
   Unit Profile: UP2
   Time Since Last State Change: never
   Interface Groups:
     AllEthernetInterface

switch(config-maintenance)#
```

15.6.5.20 profile unit <profile_name> default

The **`profile unit <profile_name> default`** command configures a user-configured unit profile as default unit profile.

The **`no profile unit <profile_name> default`** and **`default profile unit <profile_name> default`** removes the user-configured unit profile as default unit profile.

Command Mode

Maintenance Configuration

Command Syntax

`profile unit` ***profile_name*** **`default`**

`no profile unit` ***profile_name*** **`default`**

`default profile unit` ***profile_name*** **`default`**

Parameters

profile_name name of the interface profile.

Example

This command configures user-configured unit profile ***UP1*** as the default unit profile.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 1000
switch(config-profile-unit-UP1)# exit
switch(config-maintenance)#
switch(config-maintenance)# show maintenance profiles unit default
Unit Profile: Default
    On-boot:
         enabled: no
         duration: 300 seconds

switch(config-maintenance)# profile unit UP1 default
switch(config-maintenance)# show maintenance profile unit default
Unit Profile: UP1
    On-boot:
         enabled: yes
         duration: 1000 seconds
switch(config-maintenance)#
switch(config-maintenance)# show active
maintenance
    profile unit UP1 default
    profile unit UP1
         on-boot duration 1000

switch(config-maintenance)#
```

15.6.5.21 quiesce

The **quiesce** command places a unit or dynamic interface/BGP unit into maintenance mode, gracefully transitioning traffic away from it.

The **no quiesce** and **default quiesce** exits the unit from maintenance.

Command Mode

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

Maintenance Dynamic-Interface Unit Configuration

Maintenance Dynamic-Bgp Unit Configuration

Command Syntax

quiesce

no quiesce

default quiesce

Example

This command places unit ***UNIT1***, ***interface Et1***, BGP peer ***1.0.1.1*** in VRF default, and BGP peer ***1::1*** in **vrf *VRF1*** into maintenance.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet3-6

switch(config-maintenance)#
```

15.6.5.22 rate-monitoring load-interval

The **`rate-monitoring load-interval`** command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring load interval with a load interval value between 5 and 600 seconds.

Command Mode

Maintenance-Profile-Interface Configuration

Command Syntax

`rate-monitoring load-interval` ***load_interval***

`no rate-monitoring load-interval` ***load_interval***

`default rate-monitoring load-interval` ***load_interval***

Parameters

load_interval load interval value between ***5*** and ***600*** seconds.

Example

This command configures the rate monitoring load interval for the profile interface ***IP1*** to a load interval of ***10*** seconds.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 10
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
        rate-monitoring load-interval 10

switch(config-profile-intf-IP1)#
```

15.6.5.23 rate-monitoring threshold

The **`rate-monitoring threshold`** command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring threshold with a threshold value between ***1*** and ***4294967295*** kilobytes.

The **`no rate-monitoring threshold`** and **`default rate-monitoring threshold`** removes this configuration from the interface profile.

Command Mode

Maintenance-Profile-Interface Configuration

Command Syntax

`rate-monitoring threshold` ***threshold_in_kbps***

`no rate-monitoring threshold` ***threshold_in_kbps***

`default rate-monitoring threshold` ***threshold_in_kbps***

Parameters

threshold_in_kbps threshold in kilobytes per second (kbps) between ***1*** and ***4294967295*** kilobytes.

Example

This command configures the rate monitoring threshold for the profile interface ***IP1*** to a threshold of ***1000*** kilobytes per second (kbps).

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring threshold 1000
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
        rate-monitoring threshold 1000

switch(config-profile-intf-IP1)#
```

15.6.5.24 show interface

The **show interface** command displays detailed information about the interface.

It displays an extra line that reads: Under maintenance for time in hours and minutes.

Command Mode

EXEC

Command Syntax

show interface ***intf_name***

Parameters

intf_name name of the interface.

- **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
- **port-channel *p_range*** port channel interfaces specified by ***p_range***.
- **vlan *v_range*** vlans specified by ***v_range***.

Note: Valid ***e_range***, ***p_range***, and ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

Example

This command displays detailed information about ***interface ethernet 16/1***.

```
switch# show interface ethernet 16/1
Ethernet16/1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.7373.efc7
  Internet address is 1.0.1.1/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes, BW 40000000 kbit
  Full-duplex, 40Gb/s, auto negotiation: off, uni-link: n/a
  Up 4 hours, 44 minutes, 36 seconds
  Under maintenance for 4 hours, 22 minutes, 26 seconds
  Loopback Mode : None
  2 link status changes since last clear
  Last clearing of "show interface" counters 4:45:12 ago
  5 minutes input rate 20 bps (0.0% with framing overhead), 0 packets/sec
  5 minutes output rate 20 bps (0.0% with framing overhead), 0 packets/sec
     580 packets input, 46286 bytes
     Received 1 broadcasts, 0 multicast
     0 runts, 0 giants
     0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
     0 PAUSE input
     601 packets output, 48954 bytes
     Sent 7 broadcasts, 15 multicast
     0 output errors, 0 collisions
     0 late collision, 0 deferred, 0 output discards
     0 PAUSE output
switch#
```

15.6.5.25 show interface <intf_name> status

The **`show interface <intf_name> status`** command displays an m flag if the interface is undergoing maintenance operation.

Command Mode

EXEC

Command Syntax

`show interface` [***intf_name***] **`status`**

Parameters

intf_name name of the interface.

- **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
- **port-channel *p_range*** port channel interfaces specified by ***p_range***.
- **vlan *v_range*** vlans specified by ***v_range***.

Note: Valid ***e_range***, ***p_range***, and ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

Example

This command display tabular output and shows `m` flag for ***Ethernet16/1*** status.

```
switch# show interface Ethernet16/1 status
Port Name Status Vlan Duplex Speed Type Flags
Et1 disabled 1 auto auto 1000BASE-T
...
Et14/1 connected 2 full 40G 40GBASE-CR4
Et15/1 connected 2 full 40G 40GBASE-CR4
Et16/1 connected routed full 40G 40GBASE-CR4 m
Et17/1 notconnect 1 full 10G Not Present
...
switch#
```

15.6.5.26 show ip | ipv6 bgp

The **`show ip | ipv6 bgp`** command displays maintenance related information when relevant.

Command Mode

EXEC

Command Syntax

`show ip bgp neighbors` ***peer_addr*** [vrf ***vrf_name***]

`show ipv6 bgp peers` ***peer_addr*** [vrf ***vrf_name***]

Parameters

peer_addr name of the peer.

- ***ipv4_addr*** BGP neighbor IPv4 address.
- ***ipv6_addr*** BGP neighbor IPv6 address.
- ***peer-group-name*** BGP peer group name.
- ***vrf_name*** name of the VRF.

Example

This command displays the **`m`** flag in **`show ip bgp summary`** output for peer ***1.0.1.2*** which is in maintenance mode.

```
switch# show ip bgp neighbors 1.0.1.2
BGP neighbor is 1.0.1.2, remote AS 300, external link

switch#
```

15.6.5.27 show ip | ipv6 bgp summary [vrf <vrf_name>]

The **show ip | ipv6 bgp summary [vrf <vrf_name>]** command displays the m flag if the BGP IPv4 or IPv6 peer is undergoing maintenance operation.

Command Mode

EXEC

Command Syntax

show ip bgp summary [vrf ***vrf_name***]

show ipv6 bgp summary [vrf ***vrf_name***]

Parameter

vrf_name name of the VRF.

Example

This command displays the m flag in **show ip bgp summary** output for peer ***1.0.1.2*** which is in maintenance mode.

```
switch# show ip bgp summary
BGP summary information for VRF default
Router identifier 0.0.1.1, local AS number 200
Neighbor Status Codes: m - Under maintenance
  Neighbor V  AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd
PfxAcc
  1.0.0.1 4 100 292 296 0 0 04:47:44 Estab 1 1
m 1.0.1.2 4 300 292 296 0 0 04:47:44 Estab 1 1
switch#
```

15.6.5.28 show maintenance

The **show maintenance** command provides brief information about all units/dynamic interface unit/ dynamic bgp unit and status.

o'- flag displays that unit is undergoing or has undergone a maintenance operation because of on-boot.

v - flag displays that one/some of the interfaces are violating traffic, i.e. traffic for those interfaces is above threshold.

Command Mode

EXEC

Command Syntax

show maintenance

Example

This command displays maintenance mode details.

```
switch# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name  Status                  Time since last change Flags
---------- ----------------------- ---------------------- -----
System Not Under Maintenance       never
Foo        Under Maintenance       0:00:40 ago             o

Interface Name Status               Time since last change Flags
-------------- -------------------- ---------------------- -----
Ethernet16/1   Entering Maintenance 0:00:02 ago            v

Bgp Neighbor(vrf: defa Status          Time since last change Flags
-------------- ---------------------- ---------------------- -----
1.0.0.2        Not Under Maintenance   never

Bgp Neighbor(vrf: red) Status          Time since last change Flags
-------------- ---------------------- ---------------------- -----
2.0.1.2       Under Maintenance        0:00:16 ago

switch#
```

15.6.5.29 show maintenance bgp

The **show maintenance bgp** command displays detailed maintenance information about BGP peers.

Command Mode

EXEC

Command Syntax

show maintenance bgp ***ipv4_addr*** [vrf ***vrf_name***] | ***ipv6_addr*** [vrf ***vrf_name***] | ***peer_group*** [vrf ***vrf_name***] | ip all [vrf ***vrf_name*** | vrf all] | ipv6 all [vrf ***vrf_name*** | vrf all]

Parameters

- ***ipv4_addr*** BGP neighbor ipv4 address.
- ***ipv6_addr*** BGP neighbor ipv6 address.
- ***peer_group*** BGP peer group name.
- ***vrf_name*** name of the VRF to which peer belongs.
- **ip all vrf** ***vrf_name*** all ipv4 peers in specified VRF.
- **ipv6 all vrf** ***vrf_name*** all ipv6 peers in specified VRF.
- **ip all vrf all** all ipv4 peers in all the VRFs.
- **ipv6 all vrf all** all ipv6 peers in all the VRFs.

Example

This command displays maintenance information about BGP peers ***1.0.0.1*** and ***1.0.1.1*** and maintenance route-map applied.

```
switch# show maintenance bgp ip all vrf all
BGP peer maintenance information for VRF default
Router identifier 0.0.1.1, local AS number 200
  Neighbor: 1.0.0.1
    Maintenance state: Under Maintenance
    Maintenance route-map: SystemGenerated
  Neighbor: 1.0.1.2
    Maintenance state: Under Maintenance
    Maintenance route-map: SystemGenerated

switch#
```

15.6.5.30 show maintenance bgp receiver route-map

The **show maintenance bgp receiver route-map** command displays receiver route-map which is applied during maintenance operation.

Command Mode

EXEC

Command Syntax

show maintenance bgp receiver route-map

Example

This command displays receiver route-map contents.

```
switch# show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
    description System generated receiver route-map
  Match clauses:
    match community GSHUT-LIST
  SubRouteMap:
  Set clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
  SubRouteMap:
  Set clauses:
switch#
```

15.6.5.31 show maintenance interface status quiesced

This example of the **show maintenance interface status quisced** command displays maintenance mode interface status details for quiesced interfaces.

Example

```
switch(config)#show maintenance interface status quiesced
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface Status            In  Out Flags
--------- ----------------- --- --- -----
Ethernet1 Under Maintenance 0.3 0.0 v
Ethernet2 Under Maintenance 0.0 0.0
Ethernet4 Under Maintenance 0.0 0.0

switch(config)#
```

15.6.5.32 show maintenance debug

The **show maintenance debug** command displays the history of various maintenance operations on a unit/interface/BGP peer.

Command Mode

EXEC

Command Syntax

show maintenance debug bgp [***peer_name***] | interface [***intf_name***] | units [***unit_name***]

Parameters

- **bgp** display history of all dynamic BGP units which have undergone maintenance operation.
- **interface** display history of all dynamic interface units which have undergone maintenance operation.
- **units** display history of all units which have undergone maintenance operation.
- ***peer_name*** name of the peer.
  - ***ipv4_addr*** BGP neighbor IPv4 address.
  - ***ipv6_addr*** BGP neighbor IPv6 address.
  - ***peer-group-name*** BGP peer group name.
- ***intf_name*** name of the interface.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** port channel interfaces specified by ***p_range***.
  - **vlan *v_range*** vlans specified by ***v_range***.

  Note: Valid ***e_range***, ***p_range***, and ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.
- ***unit_name*** name of the unit.

Example

This command displays history of maintenance operation on ***Ethernet 16/1***.

```
switch# show maintenance debug interface Ethernet 16/1-4
Interface Ethernet16/1
History:
Maintenance Enter Stage Progression started 4:07:07 ago @ 2016-08-29 22:38:54

15.6.5.33 show maintenance groups

The **show maintenance groups** command displays all the interface/BGP groups along with their members and associated profiles.

Command Mode

EXEC

Command Syntax

show maintenance groups interface | bgp ***group_name***

Parameters

- ***interface*** display only interface groups
- **bgp** display only BGP groups
- ***group_name*** name of the group

Example

This command displays group details for built-in interface group ***AllEthernetInterface*** and built-in BGP group ***AllBgpNeighborVrf-default*** and user-configured interface group ***IG1***.

```
switch# show maintenance groups
Interface Group: AllEthernetInterface
  Origin: Built-in
  Interfaces:

switch#
```

15.6.5.34 show maintenance interface

The **`show maintenance interface`** command displays detailed information about interfaces and their maintenance status with traffic rates.

Command Mode

EXEC

Command Syntax

`show maintenance interface` [***intf_name*** [detail] | detail]

Parameters

- ***intf_name*** name of the interface or sub-interface. Options include:
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** port channel interfaces specified by ***p_range***.
  - **vlan *v_range*** vlans specified by v_range.
- **detail** provides the detailed rate-monitoring information

Guidelines

Valid ***e_range***, ***p_range***, and ***p_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Examples

- This command displays interface status and traffic rates.

```
switch# show maintenance interface
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
 Rate (Mbps)
Interface            Status                         In        Out        Flags
-------------------- ------------------------------ --------- ---------- ------
Ethernet1 Not Under Maintenance -  -
Ethernet2 Not Under Maintenance -  -
Ethernet3 Under Maintenance 0.0 0.0
Ethernet4 Not Under Maintenance -  -
...
Ethernet35 Entering Maintenance 8.7 2.9
Ethernet36 Not Under Maintenance - -
switch#
```

- This command displays detailed information about the ***interface Ethernet16/1***.

```
switch# show maintenance interface Ethernet16/1 detail
Ethernet16/1 is Under Maintenance
Groups: AllEthernetInterface
Selected profiles from Interface groups:
Interface Maintenance profile: low-load-interval-profile
Bgp Maintenance profile: Default
Bgp:

```

15.6.5.35 show maintenance interface status

The **show maintenance interface status** command displays maintenance status and rates for interfaces.

Command Mode

EXEC

Command Syntax

show maintenance interface status active | **entering** | **exiting** | quiesced

Parameters

- **active** interfaces which are active.
- ***entering*** interface which are entering maintenance.
- ***exiting*** interface which are exiting maintenance.
- ***quiesced*** interface which are under maintenance.

Example

This command displays interface status and traffic rates of interfaces which are quiesced.

```
switch# show maintenance interface status quiesced
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
 Rate (Mbps)
Interface            Status                         In    Out    Flags
-------------------- ------------------------------ ----- ------ ------
Ethernet1 Not Under Maintenance -  -
Ethernet2 Not Under Maintenance -  -
Ethernet3 Not Under Maintenance -  -
Ethernet4 Not Under Maintenance -  -
Ethernet16/1 Under Maintenance 0.0 0.0
Port-Channel10 Under Maintenance 100.5 50.5v
Port-Channel11 Entering Maintenance 15.5 10.5
Port-Channel10 Under Maintenance -  -

switch#
```

15.6.5.36 show maintenance profiles

The **show maintenance profiles** command displays all the interface/BGP/unit profiles configuration.

Command Mode

EXEC

Command Syntax

show maintenance profiles interface | bgp | unit ***profile_name***

Parameters

- **interface** display only interface profiles.
- **bgp** display only BGP profiles.
- **unit** display only unit profiles.
- ***profile_name*** name of the profile.

Example

This command displays profile configuration details for interface profile ***IP1***, ***unit profile UP1*** and BGP profile ***BP1***.

```
switch# show maintenance profiles
Interface Profile: IP1
    Rate Monitoring:
        load-interval: 444 seconds
        threshold (in/out): 4000 Kbps
    shutdown:
        enabled: yes
        max-delay: 399 seconds
Bgp Profile: BP1
    Initiator route-map:
        name: RM1
Unit Profile: UP1
    On-boot:
        enabled: yes
        duration: 340 seconds

switch #
```

15.6.5.37 show maintenance stages

The **show maintenance stages** command displays stages of maintenance operation while entering/exiting maintenance.

Command Mode

EXEC

Command Syntax

show maintenance stages [enter | exit]

Parameters

- **enter** display maintenance stages during maintenance enter operation.
- **exit** display maintenance stages during maintenance exit operation.

Examples

- This command displays maintenance mode stages details.

```
switch# show maintenance stages
No.         Stage          Description
---------   -------------  -----------------
1 bgp       BGP            Maintenance processing
2 ratemon   Interface      Rate Monitoring
Maintenance Exit           Stage Sequence
No.         Stage          Description
---------   -------------  ------------------
1 ratemon Interface Rate Monitoring
2 bgp BGP Maintenance processing
switch #
```

- This command displays maintenance mode stage details during entry.

```
switch# show maintenance stages enter
No.       Stage         Description
--------- ------------- --------------------
1 bgp     BGP           Maintenance processing
2 ratemon Interface     Rate Monitoring
switch#
```

15.6.5.38 show maintenance summary

The **show maintenance summary** command displays summarized information about the maintenance mode operations such as number of units configured, number of units Entering/Exiting maintenance etc.

Command Mode

EXEC

Command Syntax

show maintenance summary

Example

This command displays summary of maintenance mode operations.

```
switch# show maintenance summary
Number of Units Configured: 0
Number of Units Exiting Maintenance: 0
Number of Units Entering Maintenance: 0
Number of Units Not Under Maintenance: 1
Number of Units Under Maintenance: 0
Directly Put Under Maintenance:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of bgp peers Entering Maintenance: 0
  Number of bgp peers Under Maintenance: 1
Rate Monitoring:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of interfaces Under Maintenance with threshold violation: 0
  Number of interfaces shutdown for maintenance: 0

switch#
```

15.6.5.39 show maintenance units

The **show maintenance units** command displays detailed information about the particular unit.

Command Mode

EXEC

Command Syntax

show maintenance units [***unit_name***]

Parameters

unit_name name of unit.

Example

This command displays maintenance units details.

```
switch# show maintenance units
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Bgp Groups:
AllBgpNeighborVrf-default
Interface Groups:
AllEthernetInterface

Unit Name: UNIT1
Origin: User Configured
Status: Under Maintenance
Unit Profile: UP1
Time Since Last State Change: 0:00:08 ago
Bgp Groups:
BG1
Interface Groups:
IG1
History:
2016-08-29 23:05:30 old state: 'maintenanceModeEnter' to new state:
'underMaintenance' 0:00:08 ago
2016-08-29 23:05:30 old state: 'active' to new state: 'maintenanceModeEnter'
0:00:08 ago

switch#
```

15.6.5.40 shutdown max-delay

The **shutdown max-delay** command is a maintenance interface profile configuration option for configuring the maximum duration after which the interface is shutdown with a value between ***1*** and ***4294967295*** seconds.

The **no shutdown** and **default shutdown** removes this configuration from the interface profile.

Command Mode

Maintenance-Profile-Interface Configuration

Command Syntax

shutdown max-delay ***delay***

no shutdown max-delay ***delay***

default shutdown max-delay ***delay***

Parameters

delay maximum shutdown delay between ***1*** and ***4294967295*** seconds.

Example

This command configures the shutdown max-delay for the profile interface ***IP1*** to ***500*** seconds or ***1*** hour.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# shutdown max-delay 500
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
        shutdown max-delay 500

switch(config-profile-intf-IP1)#
```

15.6.5.41 trigger on-maintenance

The **`trigger on-maintenance`** command is an event handler configuration for triggering actions during the maintenance operation of a unit, interface and BGP peer at specified stages.

The event-handler configuration takes effect only after exiting the event-handler configuration mode.

Command Mode

Event-handler Configuration

Command Syntax

`trigger on-maintenance` [enter | exit][unit ***unit_name*** | bgp [***ipv4_addr*** | ***ipv6_addr*** | ***peer_group***][vrf ***vrf_name***] | [interface ***intf_name***] [begin | end | all] |[before | after][stage ***stage_name***]

Parameters

- **enter** trigger on-maintenance event-handler on maintenance enter operation.
- **exit** trigger on-maintenance event-handler on maintenance exit operation.
- **bgp** trigger event-handler on dynamic BGP unit maintenance operation.
  - ***pv4_addr*** BGP neighbor ipv4 address.
  - ***pv6_addr*** BGP neighbor ipv6 address.
  - ***peer_group*** BGP peer group name.
- ***vrf vrf_name*** name of the VRF to which BGP peer belongs.
- **interface** trigger event-handler on dynamic interface unit maintenance operation.
  - ***intf_name*** name of the interface.
    - **ethernet** trigger event-handler on specified Ethernet interface.
    - **port-channel** trigger event-handler on specified port channel interface.
    - **vlan** trigger event-handler on specified VLAN.

    Note: Comma-delimited list, ranges are not supported.
- **unit** trigger event-handler on maintenance operation of unit.
- **begin** action is triggered in the beginning of maintenance operation.
- **end** action is triggered at the end of maintenance operation.
- ***stage_name*** action is triggered at specified stage.
  - **bgp** and **ratemon** are the two stages.
- **all** action is triggered at all the stages
- **before** action is triggered before the specified stage
- **after** action is triggered after the specified stage

Examples

- This command configures event-handler *E1*, which triggers on maintenance an enter operation of unit ***UNIT1*** at all the stages.

```
switch(config)# event-handler E1
switch(config-handler-E1)# trigger on-maintenance enter unit UNIT1 all
switch(config-handler-E1)# action bash FastCli -c "show maintenance"
switch(config-handler-E1)# exit
switch(config)# show event-handler E1
Event-handler E1
Trigger: Asynchronous on-maintenance enter unit UNIT1 all delay 0
 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance"
Action expected to finish in less than 10 seconds
```

```
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#
```

- This command configures event-handler ***E2***, which triggers on maintenance an exit operation of dynamic interface unit ***Ethernet1*** before stage bgp.

```
switch(config)# event-handler E2
switch(config-handler-E2)# trigger on-maintenance exit interface
 Ethernet1 before
stage bgp
switch(config-handler-E2)# action bash FastCli -c "show maintenance
 summary"
switch(config-handler-E2)# exit
switch(config)# show event-handler E2
Event-handler E2
Trigger: Asynchronous on-maintenance exit interface Ethernet1 before
 stage bgp
delay 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance summary"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#
```

- This command configures event-handler ***E3***, which triggers on maintenance an enter operation of dynamic BGP unit ***1::1*** in VRF ***VRF1*** at the last stage end.

```
switch(config)# event-handler E3
switch(config-handler-E3)# trigger on-maintenance enter bgp 1::1 vrf
 VRF1 end
switch(config-handler-E3)# action bash FastCli -c "show maintenance bgp
 ip all vrf
all"
switch(config-handler-E3)# exit
switch(config)# show event-handler E3
Event-handler E3
Trigger: Asynchronous on-maintenance enter bgp 1::1 vrf VRF1 end delay
 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance bgp ip all vrf all"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#
```

15.6.5.42 unit

The **unit <unit_name>** command places the switch in maintenance unit configuration mode for configuring BGP/interface groups in the unit.

The command creates the unit if the specified unit profile does not exist prior to issuing the command.

The **no unit <unit-name>** and **default unit <unit-name>** removes the unit from ***running-config***.

Command Mode

Maintenance Configuration

Command Syntax

unit linecard [***l_range*** | ***unit_name***]

no unit linecard [***l_range*** | ***unit_name***]

default unit linecard [***l_range*** | ***unit_name***]

Parameters

- ***l_range*** name of the Linecard built-in unit.
- ***0 l_range*** linecards available on the switch.
- ***unit_name*** name of the user-configured unit.

Commands available in maintenance unit configuration mode:

- **group interface**
- **group bgp**
- **profile unit**
- **quiesce**

Note: Built-in units like System, Linecard3, Linecard4, etc. do not allow group configuration but unit profile can be associated to these units.

Examples

- This command creates maintenance unit ***UNIT1***.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# show active
maintenance
unit UNIT1
switch(config-unit-UNIT1)#
```

- This command enters the built-in ***Linecard1*** unit configuration mode.

```
switch(config)# maintenance
switch(config-maintenance)# unit Linecard1
switch(config-builtin-unit-Linecard1)# show active
maintenance
unit Linecard1
switch(config-builtin-unit-Linecard1)#
```

15.6.5.43 vrf

The **vrf** command specifies the VRF for BGP group. All the neighbors configured in the BGP group are considered to be members of the BGP group in the particular VRF context.

The **no vrf <vrf-name>** and **default vrf <vrf-name>** removes the VRF configuration from the BGP group and sets the VRF context to default.

Command Mode

Group-BGP Configuration

Command Syntax

vrf ***vrf_name***

no vrf ***vrf_name***

default vrf ***vrf_name***

Parameters

vrf_name name of the VRF in a group belonging to neighbors in that group.

Example

This command specifies VRF ***VRF1*** for the neighbors in the BGP group ***BGP1***.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 1.0.1.1
switch(config-group-bgp-BG1)# neighbor 1::1
switch(config-group-bgp-BG1)# neighbor PG
switch(config-group-bgp-BG1)# vrf VRF1
switch(config-group-bgp-BG1)# show active
group bgp BG1
    neighbor 1.0.1.1
    neighbor 1::1
    neighbor PG
    vrf VRF1
switch(config-group-bgp-BG1)# exit
switch(config)#
```

15.7 Bidirectional Forwarding Detection

This section describes Bidirectional Forwarding Detection (BFD) and how it is configured in relation to various protocols. Topics in this section include:

- Introduction
- BFD Configuration
- Hardware Accelerated BFD Transmit
- BFD Commands

15.7.1 Introduction

In networks without data link signaling, connection failures are usually detected by the hello mechanisms of routing protocols. Detection can take over a second, and reducing detection time by increasing the rate at which hello packets are exchanged can create an excessive burden on the participating CPUs.

Bidirectional Forwarding Detection (BFD) is a low-overhead, protocol-independent mechanism which adjacent systems can use instead for faster detection of faults in the path between them. BFD is strictly a failure-detection mechanism, and does not discover neighbors or reroute traffic.

BFD is a simple mechanism which detects the liveness of a connection between adjacent systems, allowing it to quickly detect failure of any element in the connection. It does not operate independently, but only as an adjunct to routing protocols. The routing protocols are responsible for neighbor detection, and create BFD sessions with neighbors by requesting failure monitoring from BFD.

Once a BFD session is established with a neighbor, BFD exchanges control packets to verify connectivity and informs the requesting protocol of failure if a specified number of successive packets are not received. The requesting protocol is then responsible for responding to the loss of connectivity.

Routing protocols using BFD for failure detection continue to operate normally when BFD is enabled, including the exchange of hello packets.

The basic behavior of BFD is defined in ***RFC 5880***.

15.7.1.1 BFD Modes

BFD functions in asynchronous or demand mode, and also offers an echo function. EOS supports asynchronous mode and the echo function.

- Asynchronous Mode
- Demand Mode

15.7.1.1.1 Asynchronous Mode

In asynchronous mode, BFD control packets are exchanged by neighboring systems at regular intervals. If a specified number of sequential packets are not received, BFD declares the session to be down.

15.7.1.1.2 Demand Mode

In demand mode, once the BFD session is established, the participating systems can request that BFD packets not be sent, then request an exchange of packets only when needed to verify connectivity. EOS does not support demand mode.

15.7.1.2 Echo Function

When the echo function is in use, echo packets are looped back through the hardware forwarding path of the neighbor system without involving the CPU. Failure is detected by an interruption in the stream of echoed packets. The minimum reception rate for BFD control packets from the neighbor is also changed automatically when the echo function is operational, because liveness detection is supplied by the echo packets.

While BFD control messages are transmitted to port ***3784***, BFD echo messages use UDP port ***3785*** for both source and destination.

15.7.1.3 BFD on Port Channels

On port channels, the BFD per-link feature can be used to add resiliency to the port channel's BFD sessions. When BFD per-link is enabled, BFD considers the port channel "up" as long as any link in the port channel is functioning properly.

BFD per-link can be configured in full compliance with ***RFC 7130***, causing member ports to be removed from the port channel when their BFD micro sessions are down, or in legacy mode, which relies on the LAG itself to detect and remove unresponsive member ports. By default, BFD per-link operates in legacy mode, which allows the switch to inter-operate more effectively with older equipment, but which may drop traffic if downed links are not detected by other means. ***RFC7130*** mode allows for faster detection and removal of downed links within the port channel and can be used in situations where LACP is not supported. For the BFD session to come up, both peers must be configured in the same way.

15.7.2 BFD Configuration

To use BFD as the failure detection mechanism for a routing protocol, it must be enabled for each participating protocol.

These sections describe BFD configuration tasks:

- Configuring BFD on an Interface
- Configuring BFD on a Port Channel
- Configuring the Echo Function
- Configuring BFD for PIM
- Configuring BFD for BGP
- Configuring BFD for VRRP
- Configuring BFD for OSPF
- Configure BFD for IS-IS
- Configuring BFD Session Telemetry
- Displaying BFD Neighbor Information

15.7.2.1 Configuring BFD on an Interface

The transmission rate for BFD control packets, the minimum rate at which control packets are expected from the peer, and the multiplier (the number of packets that must be missed in succession before BFD declares the session to be down) can all be configured per interface. The values configured apply to all BFD sessions that pass through the interface.

The default values for these parameters are:

- **`transmission rate`** ***300*** milliseconds
- **`minimum receive rate`** ***300*** milliseconds
- **`multiplier`** ***3***

To configure different values for these parameters on an interface, use the **bfd interval** command.

For BFD to function as a failure detection mechanism, it must be enabled for each participating protocol.

Example

These commands set the transmit and receive intervals to ***200*** milliseconds and the multiplier to ***3*** for all BFD sessions passing through ***interface ethernet 3/20***.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# bfd interval 200 min-rx 200 multiplier 3
switch(config-if-Et3/20)#
```

15.7.2.2 Configuring BFD on a Port Channel

Basic BFD parameters are configured on a port channel as described in **Configuring BFD on an Interface** above.

Additionally, BFD can be configured in per-link mode on a port channel so that the port channel will be considered up as long as any link in the channel is up. BFD per-link can be configured in compliance with ***RFC 7130*** (causing member ports to be removed from the port channel when their BFD micro session is down), or in legacy mode for interoperability with older equipment. For the BFD session to come up, both peers must be configured in the same way (either ***RFC 7130*** or legacy mode).

Note: In ***RFC 7130*** mode, if multiple IP addresses are configured for a member of a port channel (e.g., one IPv4 address and one IPv6 address), the member will be removed from the port channel if the micro session associated with either IP address goes down.

15.7.2.2.1 Enabling BFD Per-link

To enable BFD per-link on a port channel, use the **bfd per-link** command.

Example

These commands enabled BFD per-link on port channel ***5***.

```
switch(config)# interface port-channel 5
switch(config-if-Po5)# bfd per-link
switch(config-if-Po5)#
```

15.7.2.2.2 Configuring BFD Per-link in RFC 7130 Mode

By default, BFD per-link operates in legacy mode. To enable ***RFC 7130*** mode (in which a member port is removed from the port channel when its BFD micro session is down), configure the switch as follows.

1. If you are configuring an L2 interface, specify a local L3 BFD address for the switch using the **bfd local-address** command. This is not necessary when configuring an L3 interface with an IP address configured on the port channel.
2. Enable BFD per-link on the port channel using the **bfd per-link** command.
3. Specify the L3 address of the port channel's BFD neighbor using the **bfd neighbor** command. For an L2 port channel, the address is the globally configured BFD local address on the peer switch. For an L3 port channel, the address is the IP address configured on the peer port channel.

   Examples

   - These commands configure BFD per-link in ***RFC 7130*** mode over an L2 port channel.

   Switch 1 configuration:

   ```
   switch1(config)# bfd local-address 10.0.0.5
   switch1(config)# interface port-channel 5
   ```

```
switch1(config-if-Po5)# bfd per-link rfc-7130
switch1(config-if-Po5)# bfd neighbor 10.0.0.4
switch1(config-if-Po5)#
```

Switch 2 configuration:

```
switch2(config)# bfd local-address 10.0.0.4
switch2(config) #interface port-channel 5
switch2(config-if-Po5)# bfd per-link rfc-7130
switch2(config-if-Po5)# bfd neighbor 10.0.0.5
switch2(config-if-Po5)#
```

These commands configure BFD per-link in ***RFC 7130*** mode over an L3 port channel.

Switch 1 configuration:

```
switch1(config)# interface port-channel 5
switch1(config-if-Po5)# no switchport
switch1(config-if-Po5)# bfd per-link rfc-7130
switch1(config-if-Po5)# ip address 10.0.0.5/24
switch1(config-if-Po5)# bfd neighbor10.0.0.4
switch1(config-if-Po5)#
```

Switch 2 configuration:

```
switch2(config)# interface port-channel 5
switch2(config-if-Po5)# no switchport
switch2(config-if-Po5)# bfd per-link rfc-7130
switch2(config-if-Po5)# ip address 10.0.0.4/24
switch2(config-if-Po5)# bfd neighbor 10.0.0.5
```

15.7.2.3 Configuring the Echo Function

The echo function is disabled by default, and is enabled on an interface using the **bfd echo** command.

When the BFD echo function is enabled, a "slow-timer" value replaces the minimum receive interval value in BFD packets sent from the switch. The default value is 2000 milliseconds. To configure a different value for the slow-timer, use the **bfd slow-timer** command.

Examples

- These commands enable the BFD echo function on ***interface ethernet 5***. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to ***2000*** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# bfd echo
switch(config-if-Et5)#
```

- This command configures BFD to expect control packets from the peer every ***10000*** milliseconds when the BFD echo function is enabled.

```
switch(config)# bfd slow-timer 10000
switch(config)#
```

15.7.2.4 Configuring BFD for PIM

The **bfd (Router-PIM Sparse-mode)** command enables or disables Bidirectional Forwarding Detection (BFD) globally for all Protocol-Independent Multicast (PIM) neighbors.

To enable or disable PIM BFD on a specific interface, use the **pim ipv4 bfd** command. The interface-level configuration supersedes the global setting.

Example

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# bfd
switch(config-router-pim-sparse-ipv4)#
```

- These commands configure ***interface vlan 200*** to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config)# interface vlan 200
switch(config-if-VL200)# pim ipv4 bfd
switch(config-if-VL200)#
```

15.7.2.5 Configuring BFD for BGP

To enable or disable Bidirectional Forwarding Detection (BFD) for border gateway protocol (BGP) connections with a BGP neighbor or peer group, use the **neighbor bfd** command.

Example

These commands enable BFD failure detection for BGP connections with the neighbor at ***10.13.64.1***.

```
switch(config)# router bgp 300
switch(config-router-bgp)# neighbor 10.13.64.1 bfd
switch(config-router-bgp)#
```

15.7.2.6 Configuring BFD for VRRP

To enable or disable Bidirectional Forwarding Detection (BFD) for Virtual Router Redundancy Protocol (VRRP), use the **vrrp bfd ip** command.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

Example

These commands enable BFD on ***interface ethernet 3/20*** for VRRP ID ***15*** with a connection to a router at IP address ***192.168.2.1***.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```

15.7.2.7 Configuring BFD for OSPF

To enable or disable BFD globally for all OSPF neighbors, use the **bfd default (OSPF)** command in OSPF configuration mode.

To enable or disable BFD for OSPF on a specific interface, use the **ip ospf neighbor bfd** command. The interface-level configuration supersedes the global setting.

Examples

- These commands enable BFD in OSPF instance ***100*** for all OSPF neighbors on BFD-enabled interfaces except those connected to interfaces on which OSPF BFD has been explicitly disabled.

```
switch(config)# router ospf 100
switch(config-router-ospf)# bfd default
switch(config-router-ospf)#
```

- This command enables OSPF BFD on ***interface ethernet 3/21***.

```
switch(config)# interface ethernet 3/21
switch(config-if-Et3/21)# ip ospf neighbor bfd
switch(config-if-Et3/21)#
```

15.7.2.8 Configure BFD for IS-IS

The **isis bfd** and command configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

Examples

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-af)# bfd default
switch(config-router-af)#
```

- These commands enable BFD on IS-IS interfaces.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6)#
```

15.7.2.9 Configuring BFD Session Telemetry

The BFD session telemetry automatically collects the per-session statistics and the rbfd kernel module statistics at a set interval and stores them in a shared memory where Cloud Vision Portal (CVP) or other applications may collect this information. Also, several new statistics have been added which are updated within the session-stats interval and provides a finer snapshot view of the session health. The BFD session telemetry supports both hardware-accelerated and software (kernel module) accelerated BFD sessions.

Use the **`session stats snapshot interval`** command to enable the BFD session telemetry. This command is configured under the ***router-bfd*** configuration mode. By default, this command is disabled and the telemetry interval is set to ***0*** seconds. A telemetry interval between ***10*** and ***3600*** seconds may be configured.

Use the **no** and **default** form of the command to disable the session stats snapshot interval command from the running configuration and sets the telemetry interval is set to .

Example

```
switch(config-router-bfd)# session stats snapshot interval 10
```

A telemetry interval may be configured to a value less than ***10*** seconds and as little as ***1*** second using an additional keyword **dangerous**, as follows:

```
switch(config-router-bfd)# session stats snapshot interval dangerous 1
```

However, note that, configurations including a telemetry interval of less than ***10*** seconds are not advised for systems with a large-scale BFD deployment as this may cause delays in the rbfd kernel module and result in BFD session instability.

15.7.2.10 Displaying BFD Neighbor Information

Use the **show bfd peers** command to display information about Bidirectional Forwarding Detection (BFD) neighbors.

Examples

- This command displays general information about BFD neighbors.

```
switch> show bfd peers
DstAddrMyDiscYoDiscIfLUpLDownLdiagState

10.168.1.561613et52_1(81)17151450 0NoDiagnosticUp

10.168.1.581714et52_2(65)17151883 0NoDiagnosticUp

10.168.1.241815et51_1(73)17152175 0NoDiagnosticUp
```

- This command displays detailed information about BFD neighbors.

```
switch> show bfd peers detail
Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up
VRF default, LAddr 10.168.1.57, LD/RD 16/13
Last Up 17151450
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 433987, Tx Count: 433829
Detect Time: 900
Registered protocols: bgp

Peer Addr 10.168.1.58, Intf Ethernet52/2, State Up
VRF default, LAddr 10.168.1.59, LD/RD 17/14
Last Up 17151883
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 434235, Tx Count: 434050
Detect Time: 900
Registered protocols: bgp
```

15.7.3 Hardware Accelerated BFD Transmit

Hardware Accelerated BFD Transmit adds support for offloading BFD Transmit path to hardware (ASIC) for specific types of BFD sessions.

Hardware Accelerated BFD Transmit improves accuracy of transmit timer implementations for BFD (especially with fast timers like ***50*** ms) and relieves pressure on the main CPU in scenarios of scale. The RX packet processing for all BFD sessions is still handled by the BFD agent on the main CPU. The feature does not add any additional timer interval or multiplier configurations.

On supported platforms, hardware acceleration-capable BFD sessions is offloaded by default. Memory resources are required on ASIC to offload sessions (one unit per discriminator). Currently, the number of session discriminators that can be offloaded is restricted to ***200*** per ASIC.

Only single-hop BFD sessions on front panel ports are capable of being offloaded. In ***EOS Release 4.23.0F***, the following sessions types **cannot** be offloaded:

- BFD sessions over Port-Channel Sub-Interfaces
- BFD sessions over L3 Sub-Interfaces
- BFD sessions over an entire Port-Channel (not per member BFD)
- BFD sessions over a Switched Virtual Interface
- BFD sessions over a Loopback interface
- BFD sessions over Tunnel interfaces
- Multi-hop BFD sessions
- BFD sessions with Authentication configured

From ***EOS Release 4.23.1F*** onwards, the following additional session types **can** be offloaded:

- BFD sessions over L3 Sub-Interfaces

From ***EOS Release 4.24.0F*** onwards, hardware acceleration is only supported on certain SSO redundancy protocol configured modular systems.

Note: For the purposes of memory management in hardware, each discriminator occupies one unit of memory. When echo mode is enabled on a session, both asynchronous mode and the echo function have separate discriminators and each take up a unit each amongst the 200 available per ASIC.

15.7.3.1 Configuration

The Hardware Accelerated BFD Transmit feature is enabled by default on supported platforms. No explicit configuration is required.

The feature may be disabled using the following command:

```
switch(config-router-bfd)# hardware acceleration disabled
```

15.7.3.2 Show Commands

Hardware Acceleration Information

To view whether hardware acceleration is running use the **`show bfd hardware acceleration`** command. In this example, hardware acceleration is running.

Example

```
switch(config)# show bfd hardware acceleration
Hardware acceleration is running
```

The following example displays when hardware acceleration is not enabled and the reasons why.

Example

```
switch# show bfd hardware acceleration
Hardware acceleration is not running: user disabled, no eligible
 sessions, not supported with SSO
```

The reasons listed for when hardware acceleration could be a subset of the following:

- **User disabled**: The feature was explicitly disabled in the CLI configuration.
- **No eligible sessions**: There are no BFD sessions configured that could be hardware accelerated. For example, all current BFD sessions have authentication enabled.
- **Not supported with SSO**: On certain modular systems, the feature is not supported when the redundancy protocol is configured to SSO.

The following example output of the command is when the hardware acceleration feature is not supported on a product:

```
Hardware acceleration is not supported
```

Session Information

Use the **show bfd peers detail** command to display whether an individual session is hardware accelerated or not. An additional line has been added to the command to display hardware acceleration as shown in the following example.

```
switch# show bfd peers detail
VRF name: default
-----------------
Peer Addr 10.0.0.2, Intf Ethernet3/1/1, Type normal, State Down
VRF default, LAddr 0.0.0.0, LD/RD 1157402594/0
Session state is Down and not using echo function
Hardware Acceleration: Async On, Echo On
…
```

Async On denotes the Asynchronous Transmit component of the session has been offloaded.

Echo On denotes the Echo Transmit function of the session has been offloaded.

Note: There is no guarantee that both the Asynchronous transmit component and the echo function will be offloaded together to the hardware.

Hardware Acceleration Summary

Use the **show bfd hardware utilization** command to display a summary of the number of offloaded discriminators per ASIC.

Example

```
switch# show bfd hardware utilization
Chip Name  Number Of Sessions  Maximum Number Of Sessions
---------- ------------------- --------------------------
Jericho0                   20                        200
Jericho1                    0                        200
```

Detailed Hardware Acceleration Information

Use the show **bfd hardware utilization detail** command to display a detailed list of the BFD discriminators whose transmit path is offloaded can be viewed per ASIC using:

Example

```
switch# show bfd hardware utilization detail
sh bfd hardware utilization detail
Chip: Jericho0
Dst Addr   My Disc    Interface    VRF      Type
---------- ---------- ------------ -------- ------
1.1.6.2    3175653802 Ethernet1/1  default  normal
1.1.3.2    1151992021 Ethernet2/1  default  normal

Chip: Jericho1
Dst Addr   My Disc    Interface    VRF      Type
---------- ---------- ------------ -------- -----
```

15.7.3.3 Limitations

The following limitations are associated with the Hardware Accelerated BFD Transmit feature.

- Hardware acceleration is not supported on certain modular systems configured with SSO redundancy protocol.
- Before ***EOS Release 4.24.0F***, on 7500 series modular systems with both 7500E series and 7500R series line cards, hardware acceleration is not supported if the systems **`Forwarding Mode`** is ***Arad***, as shown by **`show platform sand compatibility`** command display output. From the ***EOS Release 4.24.0F*** onwards, this does not apply because the 7500E series line cards are deprecated.
- Hardware acceleration is not supported on Port-Channel Sub-Interfaces.
- In the ***EOS Release 4.23.0F***, hardware acceleration is not supported on L3 Sub-Interfaces.
- Hardware acceleration is not supported on Switched Virtual Interfaces.
- Hardware acceleration is not supported on Port-Channel interfaces (non-per-link BFD).
- Hardware acceleration is not supported on Loopback interfaces.
- Hardware acceleration is not supported on Tunnel interfaces.
- Hardware acceleration is not supported on front-panel or Port-Channel sub-interfaces.
- Hardware acceleration is not supported with Multi-hop BFD.
- Hardware acceleration is not supported when Authentication is enabled.
- Configuring authentication on an already offloaded session results in the session being migrated back to software. Similarly, deconfiguring authentication migrates the session to hardware if the session is hardware acceleration capable and if resources are available on the ASIC in question.
- Hardware acceleration limits the number of accelerated transmit discriminators to 200 per ASIC.
- Configuring more than 200 session discriminators on interfaces attached to an ASIC results in the additional session discriminators falling back to the default software transmit implementation, where the accuracy of transmit timers are dependent on the host CPU load.
- When enabling hardware acceleration with a high enough number of existing offload-capable software sessions, **a flap in some sessions may be observed once at the time of migration from software to hardware.**
- When disabling hardware acceleration with a high enough number of existing offloaded sessions, **a flap in some sessions may be observed once at the time of migration from hardware to software**.
- Sessions are offloaded to hardware in a first-come, first-served fashion. Currently, in an overflow scenario with more than 200 session discriminators per chip, there is no guarantee that shorter intervals are always offloaded.

15.7.4 BFD Commands

BFD Configuration Command

- bfd echo
- bfd interval
- bfd local-address
- bfd neighbor
- bfd per-link
- bfd slow-timer
- hardware acceleration disabled
- session stats snapshot interval (BFD)

BFD Display Commands

- show bfd hardware acceleration
- show bfd hardware utilization
- show bfd peers
- show bfd peers detail

PIM-BFD Configuration Commands

- bfd (Router-PIM Sparse-mode)
- pim ipv4 bfd

BGP-BFD Configuration Commands

- neighbor bfd

VRRP-BFD Configuration Commands

- vrrp bfd ip

OSPF-BFD Configuration Commands

- bfd default (OSPF)
- ip ospf neighbor bfd

ISIS-BFD Configuration Commands

- isis bfd
- bfd default (ISIS)

15.7.4.1 bfd (Router-PIM Sparse-mode)

The **bfd (Router-PIM Sparse-mode)** command enables Bidirectional Forwarding Detection (BFD) globally for use as a failure-detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM) on the switch. To override the global configuration for a specific interface, use the **pim ipv4 bfd** command. All PIM-SM interfaces will use the global setting if they are not individually configured.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The **no bfd** and **default bfd** commands disable PIM BFD globally by deleting the **bfd** statement from **running-config**. When this is done, only interfaces with PIM BFD explicitly enabled will use PIM BFD.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

bfd

no bfd

default bfd

Example

These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# bfd
switch(config-router-pim-sparse-ipv4)#
```

15.7.4.2 bfd default (ISIS)

The **bfd default** command places the switch in address-family configuration mode.

The **bfd default** and **isis bfd** commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

Command Mode

Router-Address-Family Configuration

Command Syntax

bfd default

Example

These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-af)# bfd default
switch(config-router-af)#
```

15.7.4.3 bfd default (OSPF)

The **bfd default** command globally configures OSPF to use Bidirectional Forwarding Detection (BFD). When this command is issued, BFD sessions will be established with all OSPF neighbors connected to BFD-enabled interfaces unless OSPF BFD has been disabled on a participating interface using the **ip ospf neighbor bfd** command. BFD is globally disabled in OSPF by default.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the **bfd interval** command.

The **no bfd default** and **default bfd default** commands disable OSPF BFD on all interfaces except those where it has been explicitly enabled using the **ip ospf neighbor bfd** command.

Command Mode

Router-OSPF Configuration

Command Syntax

bfd default

no bfd default

default bfd default

Examples

These commands enable BFD for OSPF instance ***100*** on all interfaces except those on which OSPF BFD has been explicitly disabled.

```
switch(config)# router ospf 100
switch(config-router-ospf)# bfd default
switch(config-router-ospf)#
```

15.7.4.4 bfd echo

The **bfd echo** command enables the BFD echo function on the configuration mode interface.

The **no bfd echo** and **default bfd echo** commands disable the BFD echo function by removing the corresponding **bfd echo** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

bfd echo

no bfd echo

default bfd echo

Example

These commands enable the BFD echo function on ***interface ethernet 5***. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to ***2000*** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# bfd echo
switch(config-if-Et5)#
```

15.7.4.5 bfd interval

The **bfd interval** command configures the BFD control packet transmission rate, minimum control packet receive rate, and the number of missed packets that will signal that the session is down. These parameters can be configured globally for the switch or for the configuration mode interface. If a parameter is configured both globally and on the interface, the value configured on the interface takes precedence.

Note: For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The **no bfd interval** and **default bfd interval** commands return the BFD parameters on the configuration mode interface to default values by removing the corresponding **bfd interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

bfd interval ***transmit_rate*** **min-rx** ***receive_minimum*** **multiplier** ***factor***

no bfd interval

default bfd interval

Parameters

- ***transmit_rate*** rate in milliseconds at which control packets will be sent. Values range from ***50*** to ***60000***; the default value is ***300***.
- ***receive_minimum*** rate in milliseconds at which control packets will be expected. Values range from ***50*** to ***60000***.
- ***factor*** number of consecutive missed BFD control packets after which BFD will declare the session as down. Values range from ***3*** to ***50***.

Example

These commands configure BFD on ***interface ethernet 5*** to expect packets from the peer every ***200*** milliseconds and declare the session down after failing to receive ***5*** consecutive packets. This configuration overrides any values configured globally.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# bfd interval 200 min-rx 200 multiplier 5
switch(config-if-Et5)#
```

15.7.4.6 bfd local-address

The **bfd local-address** command specifies the local L3 address for use in Bidirectional Forwarding Detection (BFD). When configuring an L2 interface, specification of a local L3 address is required in order to run BFD per-link in ***RFC 7130*** mode. (This is not necessary when configuring an L3 interface with an IP address configured on the port channel.)

The **no bfd local-address** and **default bfd local-address** commands remove the local L3 address by removing the corresponding **bfd local-address** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

bfd local-address [***address***

no bfd local-address [***address***]

default bfd local-address [***address***]

Parameters

address local IPv4 or IPv6 address for BFD.

Example

This command specifies the local L3 address for BFD.

```
switch(config)# bfd local-address 10.0.0.4
switch(config#
```

15.7.4.7 bfd neighbor

The **bfd neighbor** command specifies the L3 address of the BFD neighbor of the port channel being configured. This is required to run BFD per-link in ***RFC 7130*** mode. For an L2 port channel, this address should be the BFD per-link "local address" globally configured on the peer switch. For an L3 port channel, this address should be the IP address configured on the peer port channel.

The **no bfd neighbor** and **default bfd neighbor** commands remove the BFD neighbor address by removing the corresponding **bfd neighbor** command from ***running-config***.

Command Mode

Interface-Port-channel Configuration

Command Syntax

bfd neighbor ***address***]

no bfd neighbor [***address***]

default bfd neighbor [***address***]

Parameters

address IPv4 or IPv6 address of the port channel's BFD neighbor.

Example

These commands specify the L3 address of the port channel's BFD neighbor.

```
switch(config)# interface port-channel 5
switch(config-if-Po5)# bfd neighbor 10.0.0.5
switch(config-if-Po5)#
```

15.7.4.8 bfd per-link

The **bfd per-link** command enables the BFD per-link function on the port channel being configured. When BFD per-link is enabled, BFD sub-sessions are run on each link of the port channel; BFD considers the port-channel to be up as long as any one of the links is live.

BFD per-link runs by default in legacy mode, which allows downed links to remain members of the port channel and relies on LACP or other means to prune the dead links. Legacy mode is provided for interoperability with older switches.

RFC 7130 mode runs BFD per-link in full compliance with ***RFC 7130***, and automatically removes links in down state from the port-channel, then adds them back again when they come up. Use the **rfc-7130** keyword to enable per-link in ***RFC 7130*** mode. You must also configure an L3 BFD neighbor address for each port-channel running ***RFC 7130*** per-link using the **bfd neighbor** command. When configuring an L2 interface, you must also globally configure a local L3 BFD address on the switch using the **bfd local-address** command.

For the BFD session to come up, both peers must be configured in the same way (either **rfc-7130** or legacy mode).

The **no bfd per-link** and **default bfd per-link** commands disable the BFD per-link function by removing the corresponding **bfd per-link** command from ***running-config***.

Command Mode

Interface-Port-channel Configuration

Command Syntax

bfd per-link [**rfc-7130**]

no bfd per-link [**rfc-7130**]

default bfd per-link [**rfc-7130**]

Examples

- These commands enable the BFD per-link function in legacy mode on ***port-channel 5***.

```
switch(config)# interface port-channel 5
switch(config-if-Po5)# bfd per-link
switch(config-if-Po5)#
```

- These commands globally specify a local L3 BFD address for the switch, enable the BFD per-link function in the ***rfc-7130*** mode on ***port-channel 5***, and specify the L3 address of the port channel's BFD neighbor.

```
switch(config)# bfd local-address 10.0.0.5
switch(config)# interface port-channel 5
switch(config-if-Po5)# bfd per-link rfc-7130
switch(config-if-Po5)# bfd neighbor 10.0.0.4
switch(config-if-Po5)#
```

15.7.4.9 bfd slow-timer

The **bfd slow-timer** command configures the minimum reception rate for BFD control packets which will be used if the BFD echo function is enabled. The default value is ***2000*** milliseconds.

Note: For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The **no bfd slow-timer** and **default bfd slow-timer** commands return the BFD slow-timer to the default value of ***2000*** milliseconds by removing the corresponding **bfd interval** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

bfd slow-timer ***receive_minimum***

no bfd slow-timer

default bfd slow-timer

Parameters

receive_minimum rate in milliseconds at which control packets will be expected when the BFD echo function is enabled. Values range from ***2000*** to ***60000***; default value is ***2000***.

Examples

This command configures BFD to expect control packets from the peer every ***10000*** milliseconds when the BFD echo function is enabled.

```
switch(config)# bfd slow-timer 10000
switch(config)#
```

15.7.4.10 hardware acceleration disabled

Hardware acceleration is enabled by default on supported platforms and no explicit configuration is needed. Use the **hardware acceleration disabled** command to disable hardware acceleration.

Command Mode

BFD configuration mode

Command Syntax

hardware acceleration disabled

Example

```
switch(config-router-bfd)# hardware acceleration disabled
```

15.7.4.11 ip ospf neighbor bfd

The **ip ospf neighbor bfd** command enables Bidirectional Forwarding Detection (BFD) for the Open Shortest Path First protocol (OSPF) on the configuration mode interface regardless of the global settings for the OSPF instance. All OSPF neighbors associated with the interface become BFD peers, and OSPF uses BFD for failure detection.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the **bfd interval** command.

The **no ip ospf neighbor bfd** command disables OSPF BFD on the interface and terminates all BFD sessions with the interface OSPF peers. The **default ip ospf neighbor bfd** command causes the interface to follow global OSPF BFD settings configured by the **bfd default (OSPF)** command.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf neighbor bfd

no ip ospf neighbor bfd

default ip ospf neighbor bfd

Examples

- These commands enable BFD on ***interface ethernet 3/20***.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# ip ospf neighbor bfd
switch(config-if-Et3/20)#
```

- These commands cause ***interface ethernet 3/20*** to follow the global OSPF BFD configuration.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# default ip ospf neighbor bfd
switch(config-if-Et3/20)#
```

15.7.4.12 isis bfd

The **isis bfd** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

isis bfd

no isis bfd

default isis bfd

Example

These commands enable BFD on IS-IS interfaces.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6)#
```

15.7.4.13 neighbor bfd

The **neighbor bfd** command enables Bidirectional Forwarding Detection (BFD) for use as a failure detection mechanism for Border Gateway Protocol (BGP) connections to the specified BGP neighbor or peer group.

Once a BFD session is established with a BGP neighbor, if the BFD session goes down the status of the BGP session is changed to down as well.

The **no neighbor bfd** and **default neighbor bfd** commands disable BFD for BGP connections to the specified neighbor or peer group by removing the corresponding **neighbor bfd** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor ***NEIGHBOR_ID*** bfd

no neighbor ***NEIGHBOR_ID*** bfd

default neighbor ***NEIGHBOR_ID*** bfd

Parameters

NEIGHBOR_ID IP address or peer group name. Values include:

- ***ipv4_addr*** neighbor IPv4 address.
- ***ipv6_addr*** neighbor IPv6 address.
- ***group_name*** peer group name.

Example

These commands enable BFD failure detection for BGP connections with the neighbor at ***10.13.64.1***.

```
switch(config)# router bgp 300
switch(config-router-bgp)# neighbor 10.13.64.1 bfd
switch(config-router-bgp)#
```

15.7.4.14 pim ipv4 bfd

The **pim ipv4 bfd** command enables Bidirectional Forwarding Detection (BFD) on the configuration mode interface as a failure detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM). To enable PIM BFD globally on the switch, use the **bfd (Router-PIM Sparse-mode)** command. Interface-level settings override the global setting.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM-SM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The **no pim ipv4 bfd** disables PIM BFD on the configuration mode interface regardless of global settings. The **default pim ipv4 bfd** command causes the configuration mode interface to follow the global setting for PIM BFD by removing the corresponding **pim ipv4 bfd** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration I

nterface-VLAN Configuration

Command Syntax

pim ipv4 bfd

no pim ipv4 bfd

default pim ipv4 bfd

Example

These commands configure ***interface vlan 200*** to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config)# interface vlan 200
switch(config-if-VL200)# pim ipv4 bfd
switch(config-if-VL200)#
```

15.7.4.15 show bfd hardware acceleration

The **show bfd hardware acceleration** command displays the status of hardware acceleration on the switch for Bidirectional Forwarding Detection (BFD) session. The **show bfd peers detail** command displays the status of hardware acceleration.

Command Mode

EXEC

Command Syntax

show bfd hardware acceleration

Examples

- This command displays the status for hardware acceleration for BFD.

```
switch# show bfd hardware acceleration
Output when hardware acceleration is enabled(default) and running
Hardware acceleration is running
```

- Output when hardware acceleration is disabled with explanation.

```
Hardware acceleration is not running:
user disabled, no eligible sessions, not supported with SSO
```

- Output when hardware acceleration is not supported by switch.

```
Hardware acceleration is not supported
```

15.7.4.16 show bfd hardware utilization

The **show bfd hardware utilization** command displays the status of hardware acceleration on the switch for Bidirectional Forwarding Detection (BFD) session.

Command Mode

EXEC

Command Syntax

show bfd hardware utlization [**INFO_LEVEL**]

Parameters

INFO_LEVEL amount of information that is displayed. Options include:

- ***no parameter*** command displays a summary of offloaded discriminators per ASIC.
- **detail** command displays details of the BFD discriminators whose transmit path is offloaded per ASIC.

Examples

- This command displays a summary of offloaded discriminators per ASIC for BFD.

```
switch# show bfd hardware utilization
Chip Name          Number Of Sessions    Maximum Number Of Sessions
---------------- ---------------------- --------------------------
Jericho0                          20                          200
Jericho1                           0                          200
```

- This command displays a details list of offloaded discriminators per ASIC for BFD.

```
switch# show bfd hardware utilization detail
sh bfd hardware utilization detail
Chip: Jericho0

15.7.4.17 show bfd peers

The **show bfd peers** command displays information about the neighbors with which the switch currently has a Bidirectional Forwarding Detection (BFD) session.

Command Mode

EXEC

Command Syntax

show bfd peers [**INFO_LEVEL**]

Parameters

INFO_LEVEL amount of information that is displayed. Options include:

- ***no parameter*** command displays data block for each specified interface.
- **detail** command displays table that summarizes interface data.
- **summary** displays the summary of the interface.

Display Values

- **DstAddr** IP address of the BFD neighbor.
- **MyDisc** Local discriminator value of the BFD session.
- **YoDisc** Neighbor's discriminator value for the BFD session.
- **If** Interface to which the neighbor is connected.
- **LUp** Last up.
- **LDown** Last down.
- **Ldiag** Diagnostic for the last change in session state.
- **State** State of the BFD session.
- **TxInt** Transmit interval of the local interface.
- **RxInt** Minimum receive interval set on the local interface.
- **Multiplier** Local multiplier (number of packets that must be missed to declare session down).
- **Received RxInt** Minimum receive interval set on the neighbor interface.
- **Received Multiplier** Neighbor's multiplier (number of packets that must be missed to declare session down).
- **Rx Count** BFD control packets transmitted.
- **Tx Count** BFD control packets received.
- **Detect** Time Total time in milliseconds it takes for BFD to detect connection failure.
- **Registered Protocols** Protocols using BFD with this neighbor.

Examples

- This command displays general information about BFD neighbors.

```
switch> show bfd peers

```

15.7.4.18 show bfd peers detail

Use the **show bfd peers detail** to display whether an individual session is hardware accelerated or not. An extra line has been added to to highlight hardware acceleration.

Command Mode

EXEC

Command Syntax

show bfd peers detail

Parameter

detail Displays a comprehansive view of the individual session.

Guidelines

- **Async On** Denotes the Asynchronous Transmit component of the session has been offloaded.
- **Echo On** Denotes the Echo Transmit function of the session has been offloaded.

Note: There is no guarantee that both the Asynchronous transmit component and the echo function are offloaded to hardware together.

Example

```
switch# show bfd peers detail
VRF name: default
-----------------
Peer Addr 10.0.0.2, Intf Ethernet3/1/1, Type normal, State Down
VRF default, LAddr 0.0.0.0, LD/RD 1157402594/0
Session state is Down and not using echo function
Hardware Acceleration: Async On, Echo On
…
```

15.7.4.19 session stats snapshot interval (BFD)

The **session stats snapshot interval** enables the BFD session telemetry on a switch. By default, this command is disabled and the telemetry interval is set to ***0*** seconds. A telemetry interval between ***10*** and ***3600*** seconds may be configured. A telemetry interval may be configured to a value less than ***10*** seconds and as small as ***1*** second using an additional keyword **dangerous**.

Note: Configurations including a telemetry interval of less than ***10*** seconds are not advised for systems with a large-scale BFD deployment as this may cause delays in the rbfd kernel module and result in BFD session instability.

The **no session stats snapshot interval** and **default session stats snapshot interval** commands disbales the BFD telemetery command from the **running-config** and sets the telemetry interval is set to ***0***.

Command Mode

Router BFD Configuration

Command Syntax

session stats snapshot interval ***timer_interval*** dangerous

no session stats snapshot interval

default session stats snapshot interval

Parameters

- ***timer_interval*** Session statistics timer interval in seconds between 10-3600.
- **dangerous** Set session statistics timer interval less than 10 seconds.

Examples

- The following commands places the switch in router BFD mode and enanles the BFD session telemetery. In this example a BFD telemetery session with a time interval of ***10*** seconds is configured.

```
switch(config)# router bfd
switch(config-router-bfd)# session stats snapshot interval 10
```

- In this example a BFD telemetery session with a time interval of ***1*** second is configured using a keyword **dangerous**.

```
switch(config-router-bfd)# session stats snapshot interval dangerous 1
```

15.7.4.20 vrrp bfd ip

The **vrrp bfd ip** command enables and configures Bidirectional Forwarding Detection (BFD) for Virtual Router Redundancy Protocol (VRRP) on the configuration mode interface.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

The **no vrrp bfd ip** and **default vrrp bfd ip** commands disable BFD for VRRP on the configuration mode interface by removing the corresponding **vrrp bfd ip** statement from **running-config**. The **no vrrp** command also removes the **vrrp bfd ip** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** bfd ip ***ipv4_address***

no vrrp ***group*** bfd ip

default vrrp ***group*** bfd ip

Parameters

- ***group*** virtual router identifier (VRID). Values range from ***1*** to ***255***.
- ***ipv4_address*** IPv4 address of the other VRRP router. On the master router, enter the physical IP address of the backup; on the backup, enter the physical IP address of the master.

Example

These commands enable BFD on ***interface ethernet 3/20*** for VRRP ID ***15*** with a connection to a router at IP address ***192.168.2.1***.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```

Chapter 16

Multicast

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Sections covered in this chapter include:

- Multicast Architecture
- IGMP and IGMP Snooping
- Protocol Independent Multicast
- Multicast Source Discovery Protocol (MSDP)
- Audio Video Bridging (AVB)

16.1 Multicast Architecture

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Arista switches support multicast transmissions through IGMP, IGMP Snooping, and PIM-SM. These topics describe the Arista multicast architecture.

16.1.1 Overview

Arista switches provide Layer 2 multicast filtering and Layer 3 routing features for applications requiring IP multicast services. The switches support over a thousand separate routed multicast sessions at wire speed without compromising other Layer 2/3 switching features. Arista switches support IGMP, IGMP snooping, PIM-SM, and MSDP to simplify and scale data center multicast deployments.

Supported Features

Feature support varies by platform; consult the release notes for multicast support information by platform.

Multicast and unicast use the same routing table. Unicast routes use TCAM resources, which may also impact the maximum number of multicast routes.

Features Not Supported

The multicast functions not supported by Arista switches include (*,*,G) forwarding or boundary routers, multicast MIBs, and router applications joining multicast groups.

16.1.2 Multicast Architecture Description

IP multicast is data transmission to a subset of all hosts through a single multicast group address. Multicast packets are delivered using best-effort reliability, similar to unicast packets. Senders use the multicast address as the destination address. Any host, regardless of group membership, can send to a group. However, only group members receive messages sent to a group address.

IP multicast addresses range from ***224.0.0.0*** to ***239.255.255.255***. Multicast routing protocol control traffic reserves the address range ***224.0.0.0*** to ***224.0.0.255***. The address ***224.0.0.0*** is never assigned to any group.

Multicast group membership is dynamic; a groups activity level and membership can vary over time. A host can also simultaneously belong to multiple multicast groups.

Multicast Architecture depicts the components that comprise the multicast architecture. The remainder of this section describes the multicast components depicted in the figure.

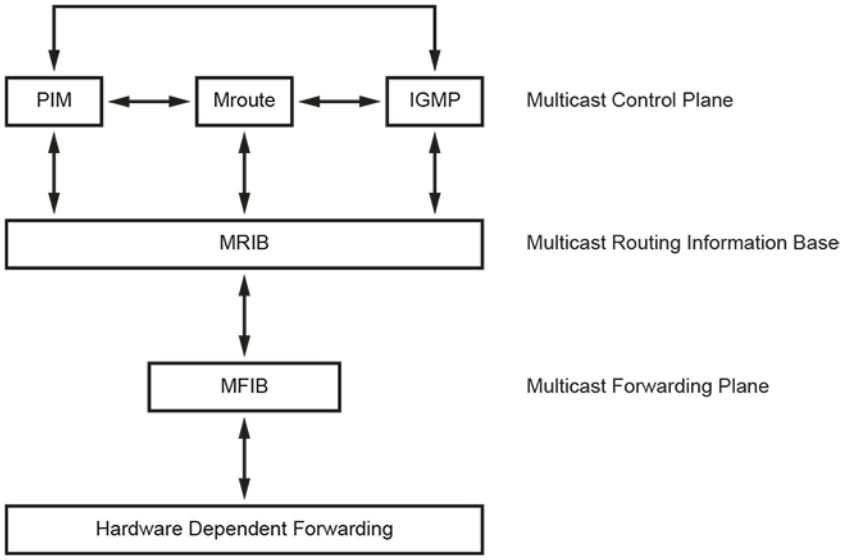

Figure 64: Multicast Architecture

16.1.2.1 Multicast Control Plane

The multicast control plane builds and maintains multicast distribution trees. It communicates changes in the multicast routing table to the MFIB for multicast forwarding.

- Protocol Independent Multicast (PIM) builds and maintains multicast routing trees using Reverse Path Forwarding (RPF) on a unicast routing table.
- Internet Group Management Protocol (IGMP) identifies multicast group members on subnets directly connected to the switch. Hosts manage multicast group membership with IGMP messages.
- The switch maintains an mroute (multicast routing) table when running PIM to provide forwarding tables used to deliver multicast packets.

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

16.1.2.2 Multicast Routing Information Base (MRIB)

The MRIB is the channel between multicast control plane clients and the multicast forwarding plane. The **`show ip mroute`** command displays MRIB entries as (*, G), (S, G), and (*, G/m) multicast entries.

MRIB entries are based on source, group, and group masks. The entries are associated with a list of interfaces whose forwarding state is described with flags. MRIB communication is based on the state change of entry and interface flags. Flags are significant to MRIB clients but are not interpreted by the MRIB.

16.1.2.3 Multicast Forwarding Plane

The multicast forwarding plane consists of the Multicast Forwarding Information Base (MFIB), a forwarding engine that is independent of multicast routing protocols.

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware Multicast Expansion Table (MET) and the hardware FIB.

MFIB uses a core forwarding engine for interrupt-level (fast switching) and process-level (process switching) forwarding. MFIB fast-switches inbound multicast packets that match an MFIB forwarding entry and process-switches packets requiring a forwarding entry if a matching entry does not exist.

16.1.2.4 Hardware Dependent Forwarding and Fast Drop

In IP multicast protocols, each (S,G) and (*,G) route corresponds to an inbound Reverse Path Forwarding (RPF) interface. Packets arriving on non-RPF interfaces may require PIM processing, as performed by the CPU subsystem software.

By default, hardware sends all packets arriving on non-RPF interfaces to the CPU subsystem software. However, the CPU can be overwhelmed by non-RPF packets that do not require software processing. The CPU subsystem software prevents CPU overload by creating a fast-drop entry in hardware for inbound non-RPF packets not requiring PIM processing. Packets matching a fast-drop entry are bridged in the ingress VLAN but not sent to the software, avoiding CPU subsystem software overload. Fast-drop entry usage is critical in topologies with persistent RPF failures.

Protocol events, such as links going down or unicast routing table changes, can change the set of packets that can be fast dropped. Packets that were correctly fast dropped before a topology change may require forwarding to the CPU subsystem software after the change. The CPU subsystem software handles fast-drop entries that respond to protocol events so that PIM can process all necessary non-RPF packets.

16.1.3 Multicast Listener Discovery (MLD)

Networks use Multicast Listener Discovery (MLD) to control the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

In an MLD Report or Done message, the multicast address field holds a specific IPv6 multicast address to which the message sender is listening or is ceasing to listen, respectively.

16.1.3.1 MLDv2 Snooping

MLDv2 Snooping optimizes the transmission of multicast packets in Layer 2 by using Layer 3 information contained in MLDv2 and PIM packets. MLDv2 is the protocol used to manage the membership of hosts in multicast groups for IPv6.

RFC 3810 talks about MLDv2 functionality. MLDv2 is the IPv6 counterpart of IGMPv3. Beginning with ***EOS Release 4.25.0F***, MLDv2 snooping is supported on MLAG deployments.

16.1.3.1.1 Limitations

- Extraneous “Switch” interface should be ignored in **`show mld snooping counters`** and **`show mld snooping counters errors`** command outputs.
- MLDv2 Snooping with EVPN is not supported.
- On CCS-720XP, CCS-750, DCS-7050CX3, DCS-7050SX3, DCS-7050TX3 and DCS-7300X3 for MLDv2 snooping to be enabled on a vlan, IGMP snooping needs to be enabled on it too for IPv6 unknown multicast traffic to be forwarded over IPv4 and IPv6 mrouter ports, else such traffic would be flooded to entire vlan. Forwarding IPv6 unknown multicast traffic over only IPv6 mrouter ports is not supported on these platforms.

16.1.3.2 Configuring Multicast Listener Discovery

16.1.3.2.1 Enabling MLD

Use **mld** command to enable MLD on an interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the MLD group. By default, MLD is disabled on an interface.

Examples

- This command enables MLD on the ***interface Ethernet 1***.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# mld
```

- This command disables MLD on the ***interface Ethernet 1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# no mld
```

16.1.3.2.2 Configuring MLD

An interface that runs MLD uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

MLD

The switch supports MLD versions 1 through 2. The **mld** command configures multicast routers on the configuration mode interface. Version 2 is the default MLD version.

Example

This command enables MLD on ***interface Ethernet 1***.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# mld
```

Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The **mld startup-query-interval** command specifies the interval between membership queries that an interface sends immediately after it starts up. The **mld startup-query-count** command specifies the number of queries that the switches sends from the interface at the startup interval rate.

Examples

- This command configures the startup query count of ***4*** on ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-count 4
```

- This command configures the startup query interval of ***100*** seconds on ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-interval 100
```

Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the MLD querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The **mld query-interval** command configures the frequency at which the active interface, as an MLD querier, sends membership query messages.

The **mld query-response-interval** command configures the time that a host has to respond to a membership query.

Examples

- This command configures the query interval of ***30*** seconds on ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-interval 30
```

- This command configures the query response interval of ***30*** seconds on ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-response-interval 30
```

Last Member Query

When the querier receives an MLD leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The **mld last-listener-query-count** command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The **mld last-listener-query-interval** command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Examples

- This command configures the last listener query count to ***3*** on ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld last-listener-query-count 3
```

- This command configures the last listener query interval to ***2*** seconds on ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld last-listener-query-interval 2
```

Static Groups

The **mld static-group** command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

Example

This command configures static groups on ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
```

```
switch(config-if-Et1)# mld static-group ff30::1 a::1
```

16.1.3.3 MLDv2 Snooping Configuration

16.1.3.3.1 Enabling or Disabling MLDv2 Snooping

You can configure MLDv2 snooping globally and per VLAN. A configuration mode is available for MLD related snooping commands in the ***global*** configuration mode.

Example

```
switch(config)# mld snooping
switch(config-mld-snooping)# disabled
switch(config-mld-snooping)# vlan 1-100
switch(config-mld-snooping)# vlan 101
switch(config-mld-snooping-vlan-101)# disabled
```

Items to consider:

- You must explicitly configure VLANs inside the ***mld-snooping*** configuration mode to enable snooping for those VLANs.
- Use the global **disabled** to disable the mld-snooping for all VLANs. **disabled** is *not* configured by default.
- Snooping can be explicitly **disabled** for a given VLAN. This is useful once there is configuration within the VLAN. **disabled** is not configured by default.
- Snooping cannot be explicitly enabled for a given VLAN if it is disabled globally.
- Beginning with the ***EOS Release 4.25.0F***, it allows the configuration of MLDvs snooping on PIM non DR (Designated Router) VLANs.

16.1.3.3.2 Static Groups and Multicast Router

To configure static groups, refer to the following commands:

```
switch(config)# mld snooping
switch(config-mld-snooping)# vlan 100
switch(config-mld-snooping-vlan-100)# member ipv6-group-addr
 interface intfs
```

To configure a static multicast router, refer to the following commands:

```
switch(config)# mld snooping
switch(config-mld-snooping)# vlan 100
switch(config-mld-snooping-vlan-100)# multicast-router
 interface intfs
```

In the examples above, ***intfs*** can be a group of similar interfaces (for example, ***Ethernet1-5,8*** or ***port-channel 1-5,8***).

16.1.3.4 Displaying MLDv2 Snooping Status

The following show commands display the MLD snooping status of the switch:

- ```
  switch# show mld snooping
     Global MLD Snooping configuration:
  ----------------------------------------
  MLD snooping                    : Enabled
  Robustness variable             : 2

  VLAN 1 :
  ----------
  MLD snooping                    : Disabled
  MLD max group limit             : No limit set
  Recent attempt to exceed limit : No
  MLD snooping pruning active     : False
  Flooding traffic to VLAN        : True
  VLAN 100 :
  ----------
  MLD snooping                    : Enabled
  MLD max group limit             : No limit set
  Recent attempt to exceed limit : No
  MLD snooping pruning active     : True
  Flooding traffic to VLAN        : False
  ```
- ```
  switch# show mld snooping
     Global MLD Snooping configuration:
  ----------------------------------------
  MLD snooping                    : Enabled
  Robustness variable             : 2

  VLAN 1 :
  ----------
  MLD snooping                    : Disabled
  MLD max group limit             : No limit set
  Recent attempt to exceed limit : No
  MLD snooping pruning active     : False
  Flooding traffic to VLAN        : True
  VLAN 100 :
  ----------
  MLD snooping                    : Enabled
  MLD max group limit             : No limit set
  Recent attempt to exceed limit : No
  MLD snooping pruning active     : True
  Flooding traffic to VLAN        : False
  ```
- Use the **`show mld snooping groups`** command to display MLDv2 snooping by group.

  ```
  switch# show mld snooping groups
  IGMP Snooping Group Membership
  EX : Filter mode Exclude
  IN : Filter mode Include
  IR : Ingress Replication
  VLAN  Group            Members
  ----  ---------------  ------------------------
  100   ff05::2          Cpu, Et4
  100   ff08::11         Et1
  100   ff08::21         Et2
  100   ff08::31         Et3
  100   *                Et3, Et4
  ```

- Use the **show mld snooping groups detail** command to display detailed MLDv2 snooping information.

```
switch(config-mld-snooping-vlan-100)# show mld snooping groups detail
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group            Source     Mode  Uptime       Members
----  ---------------  ---------  ----  -----------  ----------
100   ff05::2          *           -     0d00h13m20   Cpu, Et4
100   ff08::11         *           -     0d00h13m17   Et1
100   ff08::21         1::1        IN    0d00h13m20   Et2
100   ff08::31         2::1        EX    0d00h01m31   Et3
100   *                *           -     -            Et3, Et4
```

The **show mld snooping groups** output can be further filtered to output just the

- **local** groups, that is groups learned locally using the **show mld snooping groups local** command.
- **user** groups, that is groups configured by user.
- **mlag** groups, that is groups learned from the MPLAG peer.

16.1.4 Multicast Route Counters

Multicast Route Counters provides per multicast route ingress packet and byte counters for multicast routed packets.

16.1.4.1 Configuration

To enable multicast route ingress packet and byte counters use the following command:

```
switch(config)# hardware counter feature multicast ipv4
```

To disable multicast route ingress packet and byte counters use the following command:

```
switch(config)# no hardware counter feature multicast ipv4
```

On DCS-7020R, DCS-7280R/R2 and 7500R/R2 platforms, create and apply user defined TCAM profile with multicast counter feature db enabled. This example reates a profile copying it from the default, then modifying the profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile <profileName> copy default
switch(config-hw-tcam-profileName)# feature counter multicast ipv4
switch(config-hw-tcam-profileName-feature-counter-multicast-ipv4))# exit
switch(config-hw-tcam-profileName)# no feature mirror ip
switch(config-hw-tcam-profileName)# exit
switch(config-hw-tcam)# system profile <profileName>
```

16.1.4.2 Show Commands

Use the **show ip mfib counters** command to display per multicast route ingress packet and byte counters:

```
switch# show ip mfib 225.1.2.1 10.46.1.2 counters
Activity poll time: 60 seconds
```
```

```
   225.1.2.1 10.46.1.2
      Byte: 1200200
      Packet: 12002
      Ethernet46 (iif)
      Ethernet47
      Activity 0:02:52 ago
switch#
```

```
switch# show ip mfib counters
Activity poll time: 60 seconds
   225.1.1.1 0.0.0.0/0
      Byte: 234100
      Packet: 2341
      1 (rpaIndex)
      Ethernet21
      Ethernet23
      Activity 1:00:52 ago
   225.1.2.1 10.46.1.2
      Byte: 1200200
      Packet: 12002
      Ethernet46 (iif)
      Ethernet47
      Activity 0:02:52 ago
   224.0.0.0/4 10.45.1.0/24
      Byte: N/A
      Packet: N/A
      Ethernet45 (iif)
      Cpu
      Activity 0:02:04 ago
switch#
```

To clear all counters including per multicast route ingress counters, use the **clear counters** command.

```
switch# clear counters
```

To clear per multicast route ingress counters or clear counters for a particular multicast route, use the **clear ip multicast counters** command.

```
switch# clear ip multicast <vrf [vrf-name]> counters <group_addr>
 <source_addr>
```

16.1.4.3 Limitations

This feature contains the following limitations:

- Counters are not supported on fastdrop multicast routes.
- For Pim sparse mode, counters are supported only on (***Source_addr***, ***Group_addr***) multicast routes.

- Counting is supported for IPv4 multicast packets only.

16.1.5 Multicast (S,G) Counters

The Multicast Route Counters count the packets and bytes per group, source, and VRF. Every multicast route is counted when the Multicast (S,G) counters is enabled, and if there are sufficient hardware counter resources available. Since the number of hardware counter resources is limited, selected multicast routes can be **prioritized** to provide them the needed hardware counter resources over the **non-priority** multicast routes in case of resource contention.

Priority multicast routes can be configured if:

- Hardware counter resources are available:
  - The priority multicast routes do not affect the existing non-priority multicast route counters.
- In case there are insufficient hardware counter resources:
  - If there are non-priority multicast routes, one non-priority multicast route counter resource will be freed, which results in losing the counters for the non-priority multicast route, and the priority multicast route will be programmed, meanwhile the non-priority multicast route will be pending to be programmed until there are hardware counter resources available.
  - If there are only priority multicast groups, the newly configured priority multicast groups will wait till the resources are freed by existing priority groups.

16.1.5.1 Configuring Multicast (S,G) Counters

- The multicast (S, G) counters feature is configured using the following command in the configuration mode:

  `hardware counter feature multicast` [ipv4 | ipv6]

  The **`hardware counter feature multicast`** command enables counting for all groups as non-priority groups unless the groups that require priority treatment have been configured under router multicast as described in the next paragraph. Use the **no** form of the command to disable the multicast (S, G) counters on a switch.
- Certain multicast routes can be configured as priority multicast routes for counting purposes, and they will be counted with higher priority. In case of running out of hardware counter resources, this could result in deleting the existing multicast (S, G) counters. The following configuration shows how the IPv6 version is configured, it's similar to IPv4. Use the **`no counters`** command to disable the priority routes.

  ```
  switch(config)# router multicast
  switch(config-router-multicast)# ipv6
  switch(config-router-multicast-ipv6)# counters
  switch(config-router-multicast-ipv6)# counters ff08::e101:101
   2002::a01:101
  ```

  Of the above configuration steps, the following command is required before configuring the specific multicast routes:

  ```
  switch(config-router-multicast-ipv6)#
  ```

  Otherwise the system prompts the following error:

  ```
  ! 'counters' not configured, packet will not be counted
  ```

- Clear counters:

  `clear ipv6 multicast` [vrf [***vrf-name***]] counters ***group source***

The above CLI command can either clear the counters for all multicast routes or the specific (vrf, group, source). The default VRF will be used if it is not specified. All the IPv6 counters are cleared if no group and source are specified. The IPv4 version of the command is:

`clear ip multicast` [vrf [***vrf-name***]] counters ***group source***

The below command clears the counters of all multicast routes along with all other counters.

```
switch# clear counters
```

16.1.5.2 Multicast (S,G) Counters Show Commands

- The hardware counter resources are allocated if the Multicast (S,G) Counters is configured. The configuration state is shown as the following: **`Mcast`** is listed in the **`Feature ID`** field and the **`Counters`** column indicates the total number of hardware counter resources assigned to the Multicast (S,G) Counters:

```
switch# show platform trident flexcounters summary
Feature ID   Type        Request ID   Pool ID    Start Index   Counters
-------------------------------------------------------------------------
Mcast        ingress     0            0          1             8191
```

- The current counter resource allocation for each multicast route is shown using the following CLI command.The **`Pool ID`** column indicates which pool is used, and the **`Base Counter Index`** indicates the entry index in that pool.

```
switch# show platform trident flexcounters multicast summary
Group           Source         VRF  VLAN  Counter Index  Pool ID  Offset Mode Base
 Counter Index
--------------- -------------- ---- ----- -------------- -------- -----------
 ------------------
ff08::e101:101  2002::a01:105  0    2570  1              0        0           1
225.1.1.1       10.1.1.5       0    2571  2              0        0           2
```

- The raw counter value of the each multicast route is shown using the following command. The **`cntTbl`** reflects the hardware table, the counters are copied from **`ctnTbl`** to **`snapTbl`** when the **`clear counter`** command is issued. The difference between **`ctnTbl`** and ***snapTbl*** is the current counter.

```
switch# show platform trident flexcounters multicast values
Group           Source       VRF VLAN Counter Index  Offset Bytes (cntTbl)  Bytes (snapTbl) Pkts
 (cntTbl) Pkts (snapTbl)
--------------- ------------- --- ---- -------------- ---------------------  ---------------
 ------------- --------------
ff08::e101:101 2002::a01:105 0   2570 1              6600                    0              100
     0
225.1.1.1      10.1.1.5      0   2571 2              8800                    0              100
     0
```

- The multicast (S,G) counters is shown using the following CLI command. In the following example **`Byte`** and **`Packet`** are the counters:

```
switch# show multicast fib ipv6 <vrf [vrf-name]> <group> <source>
 counters
Activity poll time: 60 seconds
ff08::e101:101 2002::a01:101
    Byte: 66
    Packet: 1
    Vlan2780 (iif)
    Ethernet6/4
    Vlan2899

switch# show multicast fib ipv4 <vrf [vrf-name]> <group> <source>
 counters
```

```
Activity poll time: 60 seconds
255.1.1.1 10.1.1.5
    Byte: 66
    Packet: 1
    Vlan2781 (iif)
    Ethernet8/4
    Vlan2999
```

16.1.5.3 Limitations

The number of counters for which the hardware counters can be enabled simultaneously will be limited by the availability of counter hardware resources in the system.

When the configured hardware features exceed the available counter resources not all counters for all features will be available, the following CLI command shows the current allocation of the hardware resources:

```
switch# show platform trident flexcounters summary
Feature ID   Type       Request ID   Pool ID   Start Index   Counters

---------------------------------------------------------------------

Mcast        ingress    0            0         1             8191
```

16.1.6 Static IP Mroute

The Static IP Multicast route (or Static Mroute) interface overrides the interface that is ordinarily selected from the matching route in the unicast routing table, providing a means for breaking dependency on the unicast topology for the multicast topology. Let us assume that, PIM routers in a multicast network sends PIM joins towards a source to receive traffic from that source. The interface on which to send a PIM join is determined by looking up the unicast routing table for the source address. This interface is the upstream or RPF interface for that source. When traffic is received from that source, it is ensured it is received on the RPF interface for that source. This mechanism causes multicast traffic to take the same path through a network as unicast traffic would. In some cases, it is desirable to have the multicast traffic take a different path than the unicast traffic. For example, to avoid a slow firewall required for unicast traffic but not for multicast traffic or to receive multicast across a low latency, low bandwidth microwave link while unicast traverses a higher latency, higher bandwidth fiber path.

To overcome this situation, a static IP multicast route (or Static Mroute) command **`ip mroute`** command is introduced. The **`ip mroute`** command specifies a candidate for the RPF interface of any (S,G) multicast route where the source falls within the given source/mask. This interface potentially overrides the interface that would ordinarily have been selected from the matching route in the unicast routing table. This command, therefore, provides a means of breaking the dependence of the multicast topology on the unicast topology. The method of selecting the RPF interface for an (S,G) route is described next.

Example

This command configures a Static IP mroute for a source ***1.1.1.1/32*** with an administrative distance ***20*** on ***interface ethernet 2/1***.

```
switch(config)# ip mroute 1.1.1.1/32 ethernet 2/1 20
```

16.1.6.1 Selecting Static Mroute

The Static Mroute is selected based the following parameters:

- Longest Match

- Administrative Distance
- Interface Status

Longest Match

When a given source matches multiple static Mroutes in the MRIB, the longest match will be selected. The order in which the static Mroutes were configured will not be a factor.

Example

If the following static mroutes were configured in order:

```
ip mroute 0.0.0.0/0 Ethernet1
ip mroute 192.168.0.0/16 Ethernet2
ip mroute 192.168.1.0/24 Ethernet3
```

For an (S,G) route where S = ***192.168.1.1***, the third static mroute listed above would be selected since it is the most specific route to the source. The RPF interface would therefore be ***Ethernet3***. The table below shows the selected RPF interface for three different sources based on the configuration above:

Source	RPF Interface
192.168.1.1	Ethernet 3
192.168.1.2	Ethernet 3
192.168.2.1	Ethernet 2
10.0.0.1	Ethernet 1

Administrative Distance

User is allowed to specify an administrative distance with each static Mroute. While selecting a Static Mroute for a source, if multiple Static Mroute exist in the MRIB with the same source/mask, then, the one with the lowest Admin distance is selected. The default administrative distance for a Static Mroute is ***1***.

Interface Status

For a Static Mroute to be considered for selection, the specified interface must be UP and PIM must be enabled on it.

16.1.6.2 Selecting RPF interface

Static Mroutes are BGP IP Multicast (SAFI 2) learned routes. These routes are stored in the Multicast Routing Information Base (MRIB), a separate routing table. The RPF interface is selected for a source as follows:

Initially, a source route is looked up in the MRIB. If the MRIB lookup yields a route, that route is used for selecting the RPF interface. Therefore, any configured Static Mroutes matching the source wins the selection process over a 'Connected' route to the source. For a static mroute to be considered for selection, the specified interface must be up and PIM must be enabled on it. By default, Static Mroute have an Admin distance of ***1***. If multiple Static Mroutes exist with equal longest prefix match, the mroute with the lowest Admin distance will win. Admin distance is not be used to compare selection between unicast RIB and MRIB routes. Successful Static Mroute looked up in the MRIB are always chosen over unicast RIB lookups.

If MRIB lookup does not yield a route, then the unicast RIB is looked up for a route to select the RPF interface. If the selected route has ECMP, one of the corresponding paths is selected as RPF neighbor.

Note: The path to choose RPF neighbor is selected based on the hashing scheme; and protocols specified for valid paths, multi-path configuration, directly connected sources, and assert winners.

Example

Let us assume that the Static Mroute is configured, and for this example let us consider that the default Admin distance for connected routes is ***0***, ***1*** for static routes, and ***110*** for OSPF routes.

```
ip mroute 172.16.0.0/16 Ethernet1
ip mroute 192.168.0.0/16 Ethernet2
ip mroute 192.168.1.0/24 Ethernet3
ip mroute 192.168.1.0/24 Ethernet4 255
ip mroute 192.168.1.3/32 Ethernet5 255
ip mroute 200.10.0.0/16 Ethernet5
ip mroute 200.11.0.32/16 Ethernet5
```

So the MRIB table contains the following:

Prefix	Interface	Admin Distance
172.16.0.0/16	Ethernet 1	1
192.168.0.0/16	Ethernet 2	1
192.168.1.0/24	Ethernet 3	1
192.168.1.0/24	Ethernet 4	255
192.168.1.3/32	Ethernet 5	255
200.10.0.0/16	Ethernet 5	1
200.11.0.1/32	Ethernet 5	1

And let us assume the unicast RIB table contains the following:

Prefix	Interface	Protocol	Admin Distance
10.0.0.0/24	Ethernet 6	OSPF	110
172.16.1.0/24	Ethernet 7	OSPF	110
192.168.0.0/16	Ethernet 8	OSPF	110
192.168.1.0/24	Ethernet 9	Static	1
192.168.1.3/32	Ethernet 10	OSPF	110
200.10.0.0/16	Ethernet 11	Connected	0

The table below shows the RPF interface selections for a set of sources along with which Static Mroute was chosen, which unicast RIB route was chosen, which was the eventual winner, and the reasoning behind the selection.

Source	Static Mroute	Unicast Route	Winner	RPF Interface	Reasoning
10.0.0.1	-	1	Unicast Route	Ethernet 6	• Only the unicast Rib yields a route to the source so it wins
200.11.0.1	7	-	Static Mroute	Ethernet 5	• Only the MRIB yields a route to the source so it wins

192.168.1.3	5	5	Unicast Route	Ethernet 10	• In the MRIB (5) is the longest match • While comparing the static mroute and the unicast route, the unicast route is the winner because it has a lower Admin distance
192.168.2.1	2	3	Static Mroute	Ethernet 2	• In the MRIB (2) is the longest match • While comparing the static mroute and the unicast route, the static Mroute is the winner because it has a lower Admin distance
192.168.1.1	3	4	Static Mroute	Ethernet 3	• In the MRIB both (3) and (4) are the longest match but (3) has the lower Admin distance • While comparing the static mroute and the unicast route, the static mroute is the winner even though both have the same distance

16.1.7 Static Multicast

Static Multicast enables to configure multicast routes statically on any Arista switches and even at per VRF granularity. However, static multicast routes do not, at this point, perform any VRF validation for the interfaces involved in the route, which can cause some possibility of route leakage. The Static Multicast co-exists with PIM-SM and PIM-BIDIR protocols which are dynamic variants of programming multicast routes. However, choose the appropriate route selection method before the static routes are programmed to obtain the best results.

Static multicast routes compete with the routes provided by PIM-SM and PIM-BIDIR mainly because this static variant, allows the operator to configure a PIM-SM-like or PIM-BIDIR-like route among other routes. The route chosen depends upon setting up the priority on the route.

At present, PIM-SM/PIM-BIDIR installs routes with a priority value of 0 (zero) while static route installs routes with a priority of ***255***, by default.

The priorities of PIM-SM and PIM-BIDIR are subject to future change. Higher priority wins in case of conflicts while programming the hardware. Conflicts here imply the same route present as static multicast route and in PIM-SM/PIM-BIDIR. It concludes that, by default, static multicast routes will always be the winner.

16.1.8 Configuring Multicast

This section describes the following configuration tasks:

- Enabling IPv4 Multicast Routing
- Enabling IPv6 Multicast Routing
- Multicast-Routing Configuration Example
- Multicast Boundary Configuration

- Multicast multipath router-ID (IPv4)
- Configuring MFIB
- Configuring Static Multicast
- Displaying and Clearing the Mroute Table

16.1.8.1 Enabling IPv4 Multicast Routing

Enabling IPv4 multicast routing allows the switch to forward multicast packets. The **routing** command enables multicast routing. When multicast routing is enabled, ***running-config*** contains a **routing** statement.

Example

These commands enable IPv4 multicast routing on the switch.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# routing
```

16.1.8.2 Enabling IPv6 Multicast Routing

Enabling IPv6 Multicast routing allows the switch to distribute IPv6 datagrams to one or more recipients. IPv6 PIM builds and maintains Multicast routing using Reverse Path Forwarding (RPF) based on unicast routing table. IPv6 PIM is protocol-independent and can use routing tables consisting of OSPFv3, IPv6 BGP or static routes, for RPF lookup. MLD is used to discover Multicast hosts and maintain group membership on directly attached link. This feature is supported on 7280R and 7500R. Source-specific multicast (SSM) is currently supported on L3 routed port.

PIM Sparse Mode

In PIM-SM, each host (sender and/or receiver) is associated with a Designated Router (DR) which acts for all directly connected hosts in PIM-SM transactions. Upon receiving of MLD report from host or PIM join from downstream PIM neighbor, (S,G) route is created or programmed and router sends a PIM join to upstream PIM neighbor with shortest path to the source.

Configuring IPv6 Multicast Routing

The following steps are to configure IPv6 multicast routing on the switch.

1. Enabling IPv6 multicast-routing. By default, multicast-routing is disabled on switch. The following commands are used to enable IPv6 multicast-routing.

   Example

   ```
   switch(config)# router multicast
   switch(config-router-multicast)# ipv6
   switch(config-router-multicast-ipv6)# routing
   ```

2. Enabling IPv6 PIM Sparse Mode.

   By default, IPv6 PIM is disabled on an interface. The **pim ipv6 sparse-mode** command enables an interface to participate in IPv6 multicast-routing domain.

   Example

   ```
   switch(config)# interface ethernet 15/1
   switch(config-if-Et15/1)# pim ipv6 sparse-mode
   ```

   Note: SVI is not supported.

3. Enabling MLD.

By default, MLD is disabled on an interface. Enabling MLD is needed only on the interface that is connected to the MLD host which would like to receive IPv6 multicast traffic.

Example

```
switch(config)# interface ethernet 15/1
switch(config-if-Et15/1)# mld
```

16.1.8.3 Multicast-Routing Configuration Example

```
router multicast
   ipv6
      Routing
interface Ethernet15/1
   no switchport
   ipv6 enable
   ipv6 address 40:1::3/64
   mld
   pim ipv6 sparse-mode
```

Displaying IPv6 Multicast Routing Information

- The **show mld membership** command displays the MLD group membership table as shown.

```
switch# show mld membership
Interface            Group               Source

Filter Mode
-------------------------------------------------
Ethernet2/1.1        ff33::1:0:0:1       101:1::2

include
Ethernet2/1.1        ff33::1:0:0:2       101:1::2

include
Ethernet2/1.1        ff33::1:0:0:3       101:1::2

include
Ethernet2/1.1        ff33::1:0:0:4       101:1::2

include
Ethernet2/1.1        ff33::1:0:0:5       101:1::2

include
Ethernet2/1.1        ff33::1:0:0:6       101:1::2

include
Ethernet2/1.1        ff33::1:0:0:7       101:1::2

include

Vlan1307(Et6/1) Vlan1337(Et4/1)
```

16.1.8.4 Multicast Boundary Configuration

The multicast boundary specifies subnets where source traffic entering an interface is filtered to prevent the creation of mroute states on the interface. The interface is not included in the Outgoing Interface List (OIL). Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

In addition, an interface with a boundary ACL will filter any joins (RX or TX) for groups that are not allowed by the ACL. This also applies to multicast boundary ACLs with the **s** option.

The **ip multicast boundary** command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Examples

- These commands configure the multicast address of ***229.43.23.0/24*** as a multicast boundary where source traffic is restricted from ***interface vlan 300***.

```
switch(config)# interface vlan 300
switch(config-if-vl300)# ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```

- These commands create a standard ACL, then implement the ACL in an **ip multicast boundary** command to allow multicast for subnet (***224.0.0.0/4***) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)# ip access-list standard mbac1
switch(config-std-acl-mbac1)# 10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)# 20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)# 30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)# exit
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip multicast boundary mbac1
switch(config-if-Vl200)# exit
switch(config)#
```

16.1.8.5 Multicast multipath router-ID (IPv4)

The **multipath deterministic** command with the **router-ID** allows downstream PIM neighbors to direct traffic for a group or source-group to be routed through only the specified upstream PIM

neighbor for all downstream PIM neighbors with the same ECMP routes. Traffic is load balanced by group or source-group across upstream PIM neighbors as in the default multipath mode.

Multipath router-ID uses the Interface Identifier (from the Hello Option for PIM) to give PIM-enabled devices a globally unique router ID for each of their PIM neighbors.

The following configures the switch to use the router_ID.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# multipath deterministic router-id
```

The following displays the switch before the configuration.

```
sSwitch(config-router-multicast-ipv4)# show active all
router multicast
   ipv4
      counters bytes
      activity polling-interval 60
      no routing
      multipath deterministic
      max-fastdrops 1024
      unresolved cache-entries max 4000
      unresolved packet-buffers max 3
      software-forwarding kernel
```

The following displays the switch after the configuration.

```
Switch(config-router-multicast-ipv4)# show active all
router multicast
   ipv4
      counters bytes
      activity polling-interval 60
      no routing
      multipath deterministic router-id
      max-fastdrops 1024
      unresolved cache-entries max 4000
      unresolved packet-buffers max 3
      software-forwarding kernel
```

16.1.8.6 Configuring MFIB

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware Multicast Expansion Table (MET) and the hardware FIB.

MFIB Polling Interval

The switch records activity levels for multicast routes in the MFIB after polling the corresponding hardware activity bits. The **activity polling-interval** command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

Example

These commands set the MFIB activity polling period to *15* seconds.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# activity polling-interval 15
switch(config-router-multicast-ipv4)#
```

MFIB Fast Drops

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound Reverse Path Forwarding (RPF) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The **no ip mfib fastdrop** command disables MFIB fast drop for the configuration mode interface.

Example

This command disables MFIB fast drop for the ***interface vlan 120***.

```
switch(config)# interface vlan 120
switch(config-if-Vl120)# no ip mfib fastdrop
switch(config-if-Vl120)#
```

The **ip mfib max-fastdrops** command limits the number of fast-drop routes that the switchs MFIB table can contain. The default fast-drop route limit is ***1024***.

Example

This command sets the maximum number of fast-drop routes to ***2000***.

```
switch(config)# ip mfib max-fastdrops 2000
switch(config)#
```

The **clear ip mfib fastdrop** command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

Example

This command removes all fast-drop entries from the MFIB table.

```
switch# clear ip mfib fastdrop
switch#
```

The **show multicast fib ipv4** command displays information about the routes and interfaces in the IPv4 MFIB.

- **show multicast fib ipv4** displays MFIB information for hardware-forwarded routes.
- **show multicast fib ipv4 software** displays MFIB information for software-forwarded routes.

Example

This command displays MFIB information for hardware-forwarded routes.

```
switch# show multicast fib ipv4
Activity poll time: 60 seconds
239.255.255.250 172.17.26.25
    Vlan26 (iif)
    Vlan2028
    Cpu
      Activity 0:02:11 ago
239.255.255.250 172.17.26.156
    Vlan26 (iif)
    Vlan2028
```

```
    Cpu
      Activity 0:02:11 ago
239.255.255.250 172.17.26.178
    Vlan26 (iif)
    Vlan2028
    Cpu
      Activity 0:03:37 ago
switch#
```

MFIB Unresolved Cache-entries Max

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. All packets belonging to (S,G) routes exceeding the limit are dropped. The default buffer size is ***4000*** routes. See **ip multicast boundary** to limit the number of cached packets per S,G.

Example

This command sets the maximum MFIB unresolved cache-entry buffer size to ***6000*** routes in the default VRF.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```

MFIB Unresolved Packet-buffers Max

The **ip multicast boundary** command specifies the number of packets per unresolved route that are queued while the route is being resolved by the switch. The limit for **ip multicast boundary** is for an individual route, packets that exceed this limit are dropped. By default, the switch processes three unresolved packets for an individual route. See unresolved cache-entries max to limit the number of unresolved routes that are cached.

Example

This command configures the switch in the default VRF to cache up to ***30*** multicast packets from any route before that route is resolved.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```

16.1.8.7 Configuring Static Multicast

Use the **route** command to configure the Static Multicast in the Router Multicast mode.

Example

```
switch(config)# router multicast
switch(config-router-multicast)# route
```

Configuring Static Multicast routes for a VRF

The Static Multicast route can be configured on a VRF in the Router Multicast VRF IPv4 Configuration mode. Note, static multicast commands belong in the router multicast mode. To maintain backward compatibility for default VRF, static multicast commands for default VRF can be entered without changing to router multicast mode.

Example

```
switch(config)# router multicast
switch(config-router-multicast)# route
```

Source address can be optionally entered. When no source address is entered, it is assumed to be ***0.0.0.0***.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif
```

Note, the IIF must belong to the same VRF for which the command is being executed for the configuration to take effect.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30
 oif
```

Multiple interfaces can be entered following the OIF. However, OIF is also optional. When there are no OIFs, then traffic for the S,G on the incoming interface is dropped.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30
 oif ethernet
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30
 oif ethernet 30 ethernet 32
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30
 oif ethernet 30 ethernet 32 cpu priority
```

The CPU option can be used to have CPU in the OIF set, it is optional. The **priority** is an optional and the value ranges from ***1*** to ***255***. By default, the value is ***255***.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30
 oif ethernet 30 ethernet 32 cpu priority 40
```

Displaying Static Multicast Information

Use the **show multicast fib ipv4** command verify the status of the Static Multicast configured interfaces.

```
switch# show multicast fib ipv4
Activity poll time: 60 seconds
  225.1.1.1 10.1.1.1
    Ethernet1 (iif)
    Ethernet2
    Cpu
```

16.1.8.8 Displaying and Clearing the Mroute Table

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

Clearing mroute Entries

The **clear ip mroute** command removes route entries from the mroute table:

- **clear ip mroute *** all entries from the mroute table.
- **clear ip mroute *gp_ipv4*** all entries for the specified multicast group.
- **clear ip mroute *gp_ipv4 src_ipv4*** all entries for the specified source sending to a specified group.

Examples

- This command removes all route entries from the mroute table.

```
switch# clear ip mroute *
switch#
```

- This command removes entries for source ***228.3.10.1*** sending to multicast group ***224.2.205.42***.

```
switch# clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

Displaying the mroute Table

The **show ip mroute count** command displays IP multicast routing table statistics.

Example

This command displays IP multicast routing table statistics.

```
switch# show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1
switch>
```

The **show ip mroute** command displays information from the IP multicast routing table.

- **show ip mroute** displays information for all routes in the table.
- **show ip mroute *gp_addr*** displays information for the specified multicast group.

Example

This command displays the IP multicast routing table for the multicast group ***225.1.1.1***.

```
switch# show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
Port-Channel999
switch>
```

16.1.9 Multicast Commands

Multicast Configuration Commands (Global)

- activity polling-interval
- hardware counter feature multicast ipv4
- ip mfib max-fastdrops
- ip mroute
- ip multicast static
- mld last-listener-query-count
- mld last-listener-query-interval
- mld query-interval
- mld query-response-interval
- mld robustness
- mld snooping
- mld startup-query-count
- mld startup-query-interval
- mld static-group
- mld
- multipath deterministic
- multipath none
- route
- router multicast
- routing
- rpf route
- unresolved cache-entries max
- unresolved packet-buffers max

Multicast Configuration Commands (Interface)

- ip mfib fastdrop
- ip multicast boundary

Multicast Clear Commands

- clear ip mfib fastdrop
- clear ip multicast counters
- clear ip mroute

Multicast Display Commands

- show ip mroute
- show ip mfib counters
- show ip mroute count
- show ip multicast boundary
- show mld membership
- show mld querier
- show mld snooping
- show mld statistics
- show mld summary
- show multicast fib ipv4
- show multicast fib ipv4 software

- show multicast fib ipv6
- show pim ipv6 sparse-mode route
- show platform fap mroute ipv6

16.1.9.1 activity polling-interval

The switch records activity levels for multicast routes in the mfib after polling the corresponding hardware activity bits. The **`activity polling-interval`** command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

The **`no activity polling-interval`** and **`default activity polling-interval`** commands restore the default interval of ***60*** seconds by removing the **`activity polling-interval`** command from ***running-config***.

Command Mode

Router Multicast IPv4 Configuration

Command Syntax

`activity polling-interval` ***period***

`no activity polling-interval`

`default activity polling-interval`

Parameter

period interval (seconds) between polls. Values range from ***1*** to ***60***. Default is ***60***.

Example

These commands set the MFIB activity polling period to ***15*** seconds.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# activity polling-interval 15
switch(config-router-multicast-ipv4)#
```

16.1.9.2 clear ip mfib fastdrop

The **clear ip mfib fastdrop** command removes all fast-drop entries from the MFIB table.

Command Mode

Privileged EXEC

Command Syntax

clear ip mfib fastdrop

Example

This command removes all fast-drop entries from the MFIB table.

```
switch# clear ip mfib fastdrop
switch#
```

16.1.9.3 clear ip mroute

The **clear ip mroute** command removes route entries from the mroute table, as follows:

- **clear ip mroute *** removes all entries from the mroute table.
- **clear ip mroute *gp_ipv4*** removes all entries for the specified multicast group.
- **clear ip mroute *gp_ipv4src_ipv4*** removes all entries for the specified source sending to the specified group.

Command Mode

Privileged EXEC

Command Syntax

`clear ip mroute` **ENTRY_LIST**

Parameters

ENTRY_LIST entries that the command removes from the mroute table. Options include:

- * all route entries.
- ***gp_ipv4*** all entries for multicast group ***gp_ipv4*** (dotted decimal notation)
- ***gp_ipv4 src_ipv4*** all entries for source (***src_ipv4***) sending to group (***gp_ipv4***)

Examples

- This command removes all route entries from the mroute table.

```
switch# clear ip mroute *
switch#
```

- This command removes entries for the source ***228.3.10.1*** sending to multicast group ***224.2.205.42***.

```
switch# clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

16.1.9.4 clear ip multicast counters

To clear per multicast route ingress counters or clear counters for a particular multicast route, use the **`clear ip multicast counters`** command.

Command Mode

EXEC

Command Syntax

`clear ip multicast` [vrf [***vrf-name***]] counters ***group_addr source_addr***

Parameters

- **vrf *vrf-name*** VRF name.
- **counters** Counter for bytes/packets.
- ***group_addr*** Group address.
- ***source_addr*** Source address.

16.1.9.5 hardware counter feature multicast ipv4

Use the **hardware counter feature multicast ipv4** command to enable per multicast router ingress packets and byte counters. The **no** and **default** forms of the command disables the feature. The feature is disabled by default.

Command Mode

Configuration mode

Command Syntax

hardware counter feature multicast ipv4

no hardware counter feature multicast ipv4

default hardware counter feature multicast ipv4

Example

On DCS-7020R, DCS-7280R/R2 and 7500R/R2 platforms, create and apply user defined TCAM profile with multicast counter feature db enabled. This example creates a profile copying it from the default, then modifying the profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile <profileName> copy default
switch(config-hw-tcam-profileName)# feature counter multicast ipv4
switch(config-hw-tcam-profileName-feature-counter-multicast-ipv4))# exit
switch(config-hw-tcam-profileName)# no feature mirror ip
switch(config-hw-tcam-profileName)# exit
switch(config-hw-tcam)# system profile <profileName>
```

16.1.9.6 ip mfib fastdrop

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound Reverse Path Forwarding (RPF) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The **`no ip mfib fastdrop`** command disables MFIB fast drop for the configuration mode interface.

The **`ip mfib fastdrop`** and **`default ip mfib fastdrop`** commands enable MFIB fast drop for the configuration mode interface by removing the corresponding **`no ip mfib fastdrop`** command from ***running-config***.

The **`clear ip mfib fastdrop`** command, in the ***global*** configuration mode, removes all MFIB fast-drop entries on all interfaces.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

`ip mfib fastdrop`

`no ip mfib fastdrop`

`default ip mfib fastdrop`

Example

This command disbles MFIB fast drop for ***interface vlan 120***.

```
switch(config)# interface vlan 120
switch(config-if-Vl120)# no ip mfib fastdrop
switch(config-if-Vl120)#
```

16.1.9.7 ip mfib max-fastdrops

The **ip mfib max-fastdrops** command limits the number of fast-drop routes that the switchs MFIB table can contain.

The **no ip mfib max-fastdrops** and **default ip mfib max-fastdrops** commands restore the default fast-drop route limit of ***1024*** by removing the **ip mfib max-fastdrops** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip mfib max-fastdrops ***quantity***

no ip mfib max-fastdrops

default ip mfib max-fastdrops

Parameters

quantity maximum number of fast-drop routes. Value ranges from ***0*** to ***1000000*** (one million). Default is ***1024***.

Example

This command sets the maximum number of fast-drop routes to ***2000***.

```
switch(config)# ip mfib max-fastdrops 2000
switch(config)#
```

16.1.9.8 ip mroute

The **ip mroute** command configures the Static Mroute on the switch.

The **no ip mroute** and **default ip mroute** commands remove the specified static mroute from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip mroute [***source-prefix*** | ***source-address mask***] [***rpf-interface*** | ***rpf-neighbor***] [admin ***distance***]

Example

This command configures a Static IP mroute for a source ***1.1.1.1/32*** with an administrative distance ***20*** on ***interface ethernet 2/1***.

```
switch(config)# ip mroute 1.1.1.1/32 ethernet 2/1 20
```

16.1.9.9 ip multicast boundary

The **ip multicast boundary** command specifies subnets where source traffic entering the configuration mode interface is dropped, preventing the creation of mroute states on the interface. The interface is not included in the Outgoing Interface List (OIL). The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The **no ip multicast boundary** and **default ip multicast boundary** commands delete the specified subnet restriction by removing the corresponding **ip multicast boundary** command from ***running-config***. When these commands do not specify a subnet address, all **ip multicast boundary** statements for the configuration mode interface are removed.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip multicast boundary **SUBNET** [**TCAM**]

no ip multicast boundary [**SUBNET**]

default ip multicast boundary [**SUBNET**]

Parameters

- **SUBNET** the subnet address configured as the multicast boundary. Options include:
  - ***net_addr*** multicast subnet address (CIDR or address mask).
  - ***acl_name*** standard Access Control List (ACL) that specifies the multicast group addresses.
- **TCAM** specifies address inclusion in the routing table. Options include:
  - ***no parameter*** boundaries ((S,G) entries) are added to routing table.
  - **out** boundaries are not added to routing table.

Guidelines

When **out** is selected, the first inbound data packet corresponding to the **SUBNET** may be sent to the CPU. In response, the packet is dropped and the boundary prefix is added to the hardware table. In this scenario, the mroute entry is added only when data traffic is received.

Restrictions

Only one command that specifies an ACL can be assigned to an interface. Commands that specify an ACL and a subnet cannot be simultaneously assigned to an interface.

Examples

- This command configures the multicast address of ***229.43.23.0/24*** as a multicast boundary where source traffic is restricted from ***interface vlan 300***.

```
switch(config)# interface vlan 300
switch(config-if-vl300)# ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```

- These commands create a standard ACL, then implement the ACL in an ip multicast boundary command to allow multicast for subnet (***224.0.0.0/4***) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)# ip access-list standard mbac1
switch(config-std-acl-mbac1)# 10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)# 20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)# 30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)# exit
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip multicast boundary mbac1
switch(config-if-Vl200)# exit
switch(config)#
```

16.1.9.10 ip multicast static

The **ip multicast static** command enables static multicast routing on the switch.

The **exit** command returns the switch to global configuration mode.

Command Mode

Interface Ethernet Configuration

Command Syntax

ip multicast static

Example

The following commands configure the static multicast routing on the switch.

```
switch(config)# interface ethernet 1/2
switch(config-if-Et1/2)# no switchport
switch(config-if-Et1/2)# ip address 1.1.1.1/24
switch(config-if-Et1/2)# ip multicast static
```

16.1.9.11 mld last-listener-query-count

The **mld last-listener-query-count** command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by **mld last-listener-query-interval**. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

The **no mld last-listener-query-count** and **default mld last-listener-query-count** commands reset the last-listener-query-count to the default value by removing the corresponding **mld last-listener-query-count** command from the ***running-config***. Default value is ***2***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld last-listener-query-count *number*

no mld last-listener-query-count

default mld last-listener-query-count

Parameter

number the last listener query count. Values range from ***0*** to ***100***. Default value is ***2***.

Example

This command configures the last listener query count to ***3*** on an ***interface Ethernet 1***.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# mld last-listener-query-count 3
```

16.1.9.12 mld last-listener-query-interval

The **mld last-listener-query-interval** command configures the switchs transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group, it sends query messages at intervals set by this command. The **mld last-listener-query-count** specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The **no mld last-listener-query-interval** and **default mld last-listener-query-interval** commands reset the last-listener-query-interval to the default value by removing the corresponding **mld last-listener-query-interval** command from the ***running-config***. Default value is ***1*** second.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld last-listener-query-interval ***period***

no mld last-listener-query-interval

default mld last-listener-query-interval

Parameter

period the last listener query interval in seconds. Values range from ***1*** to ***3175***.

Example

This command configures the last listener query interval to ***2*** seconds on an ***interface Ethernet1***.

```
switch(config) #interface Ethernet1
switch(config-if-Et1)# mld last-listener-query-interval 2
```

16.1.9.13 mld query-interval

The **`mld query-interval`** command configures the frequency at which the configuration mode interface, as an MLD querier, sends host-query messages.

An MLD querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of ***125*** seconds.

The **`no mld query-interval`** and **`default mld query-interval`** commands reset the query interval to the default value by removing the corresponding **`mld query-interval`** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`mld query-interval` ***period***

`no mld query-interval`

`default mld query-interval`

Parameters

period the interval between query messages in seconds. Values range from ***1*** to ***3175***.

Example

This command configures the query interval of ***30*** seconds on an ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-interval 30
```

16.1.9.14 mld query-response-interval

The **mld query-response-interval** command configures the maximum response time that the recipient can wait before responding with a membership report on receipt of a general query.

The **no mld query-response-interval** and **default mld query-response-interval** commands reset the query interval to the default value by removing the corresponding **mld query-response-interval** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld query-interval ***period***

no mld query-interval

default mld query-interval

Parameter

period the query response interval in seconds. Values range from ***1*** to ***3175***.

Example

This command configures the query response interval of ***30*** seconds on an ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-response-interval 30
```

16.1.9.15 mld robustness

The **mld robustness** command configures the number of general queries to be sent before the router assumes there are no more listeners.

The **no mld robustness** and **default mld robustness** commands reset the robustness to the default value by removing the corresponding **mld robustness** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld robustness ***robust_value***

no mld robustness

default mld robustness

Parameter

robust_value the robustness count. Values range from ***1*** to ***100***.

Example

This command configures the robustness value to ***2*** on an ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld robustness 2
```

16.1.9.16 mld snooping

Multicast Listener Discovery (MLD) snooping constrains the flooding of IPv6 multicast traffic on VLANs and IGMP snooping for IPv4 environments. When MLD snooping is enabled on a VLAN, the device examines MLD messages between the hosts and multicast routers and learns which hosts are interested in receiving traffic for a multicast group. You can use the **mld snooping** command to configure MLDv2 snooping globally and per VLAN.

The **no** and the **default** forms of the command removes the mld snooping configuration.

Command Mode

Global configuration mode

Command Syntax

mld snooping

no mld snooping

default mld snooping

Example

The following example configures MLDv2 snooping globally and per VLAN.

```
switch(config)# mld snooping
switch(config-mld-snooping)# disabled
switch(config-mld-snooping)# vlan 1-100
switch(config-mld-snooping)# vlan 101
switch(config-mld-snooping-vlan-101)# disabled
```

16.1.9.17 mld startup-query-count

The **`mld startup-query-count`** command specifies the number of query messages that an interface sends during the startup query interval.

When an interface starts running MLD, it can establish the group state more quickly by sending query messages at a higher frequency. The **`mld startup-query-interval`** and **`mld startup-query-count`** commands define the startup period and the query message transmission frequency during that period.

The **`no mld startup-query-count`** and **`default mld startup-query-count`** commands restore the default startup-query-count value by removing the corresponding mld startup-query-count command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`mld startup-query-count` ***number***

`no mld startup-query-count`

`default mld startup-query-count`

Parameters

number the startup query count. Values range from ***1*** to ***100***.

Example

This command configures the startup query count of ***4*** on an ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-count 4
```

16.1.9.18 mld startup-query-interval

The **mld startup-query-interval** command specifies the interval between the general queries sent by a querier on startup.

When an interface starts running MLD, it can establish the group state quicker by sending query messages at a higher frequency. The **mld startup-query-interval** and **mld startup-query-count** commands define the startup period and the query message transmission frequency during that period.

The **no mld startup-query-count** and **default mld startup-query-interval** commands restore the default startup-query-interval value by removing the corresponding **mld startup-query-interval** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld startup-query-interval ***period***

no mld startup-query-interval

default mld startup-query-interval

Parameters

period the startup query interval in seconds. Values range from ***1*** to ***3175***.

Example

This command configures the startup query interval of ***100*** seconds on an ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-interval 100
```

16.1.9.19 mld static-group

The **mld static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast traffic of the specified group is fast-switched.

The **no mld static-group** and **default mld static-group** commands remove the configuration mode interfaces group membership by removing the corresponding **mld startup-group** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld static-group ***source_address*** [***group_address*** | access-list ***acl_name***]

no mld static-group ***source_address*** [***group_address*** | access-list ***acl_name***]

default mld static-group ***source_address*** [***group_address*** | access-list ***acl_name***]

Parameters

- ***source_address*** IP address of the host that originates multicast data packets.
- ***group_address*** IPv6 address of a multicast group.
- ***access-list*** IPv6 access list to use as a static group list.
- ***acl_name*** specifies access-list name

Examples

- This command configures static groups on an ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld static-group ff30::1 a::1
```

- This command configures multiple static groups using an access list on an ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld static-group access-list testAccessList
```

16.1.9.20 mld

The **mld** command enables multicast listener discovery on an interface which controls the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

The **no mld** and **default mld** commands restore the default behavior by removing the corresponding **mld** command from the ***running-config***.

Note: It is possible to change the values of the querier parameters used by MLD.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld [***last-listener-query-count*** | ***last-listener-query-interval*** | ***query-interval*** | ***query-response-interval*** | ***robustness*** | ***startup-query-count*** | ***startup-query-interval*** | ***static-group***]

no mld

default mld

Parameters

- ***last-listener-query-count*** the number of group-specific or group-source-specific queries to send before the router assumes there are no more listeners.
- ***last-listener-query-interval*** the interval between the last listener queries.
- ***query-interval*** the interval between the general queries regularly sent by a querier.
- ***query-response-interval*** the interval that the host has to respond to a general query.
- ***robustness*** the number of general queries to send before the router assumes there are no more listeners.
- ***startup-query-count*** the number of queries a router sends at startup.
- ***startup-query-interval*** the interval between the general queries sent by a querier at startup.
- ***static-group*** the number of static groups or sources of MLD messages.

Example

This command enables MLD on the ***interface Ethernet1***.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld
```

16.1.9.21 multipath deterministic

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The **no multipath deterministic** command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The **multipath deterministic** and **default multipath deterministic** commands restore the default behavior of randomly distributing multicast traffic over all ECMP links.

Command Mode

Router Multicast IPv4 Configuration

Command Syntax

multipath deterministic

no multipath deterministic

default multipath deterministic

Related Commands

The **multipath none** command performs the same function as **no multipath deterministic**.

Examples

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# no multipath deterministic
switch(config-router-multicast-ipv4)#
```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# multipath deterministic
switch(config-router-multicast-ipv4)#
```

- These commands configure the switch to load balance multicast traffic by enabling the behavior of RPF selection.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# multipath deterministic router-id
switch(config-router-multicast-ipv4)#
```

16.1.9.22 multipath none

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The **multipath none** command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The **no multipath none** and **default multipath none** commands restore the default behavior of randomly distributing multicast traffic over all ECMP links by removing the **multipath none** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

multipath none

no multipath none

default multipath none

Related Commands

The **multipath deterministic** commsnd performs the same function as **no multipath none**

Examples

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# multipath none
switch(config-router-multicast-ipv4)#
```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# no multipath none
switch(config-router-multicast-ipv4)#
```

16.1.9.23 route

The **route** command configures a static multicast route for the specified source, destination group, and incoming interface on the router.

The **no route** and **default route** commands remove the specified static multicast route by removing the corresponding **route** command from ***running-config***.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

route ***group_address*** [***source_address***] iif ***interface*** [oif ***interface***] [cpu] [iifFrr ***interface***] [priority ***priority_num***]

no route ***group_address***

default route ***group_address***

Parameters

- ***group_address*** the multicast group address.
- ***source_address*** the optional source address for the multicast route.
- **iif** ***interface*** specifies an incoming interface for the static route.
- **cpu** optionally mirrors multicast packets to the CPU.
- **oif** ***interface*** specifies an optional outgoing interface to be included among those on which the multicast traffic is forwarded.
- **iifFrr** ***interface*** specifies an optional interface for multicast-only fast reroute.
- ***interface*** options include:
  - **Ethernet** ***ethernet_port*** Ethernet interface.
  - **Null0** drops all traffic.
  - **Port-Channel** ***lag_no*** port-channel interface or sub-interface; values range from ***1***-***2000*** or ***1***-***2000***.***1***-***4094***.
  - **Register0** drops all incoming traffic.
  - **Vlan** ***vlan_no*** VLAN interface.
- **priority** ***priority_num*** specifies an optional priority for the multicast route. If the same route is present in several multicast routing tables, the priority number is used to select the best available route. Values range from ***0*** to ***255***; PIM routes by default have a priority of ***0***, while static multicast routes by default have a priority of ***255***.

Example

These commands create a static multicast route in the default VRF. The static route has a group address of ***225.3.3.3*** and source address of ***1.1.1.1***. It uses ***Vlan100*** as its incoming interface, VLANs ***200*** and ***300*** as its outgoing interfaces, and ***interface Ethernet2*** as its multicast-only fast reroute interface.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# route 225.3.3.3 1.1.1.1 iif Vlan100
 oif
Vlan200 Vlan300 iifFrr Ethernet2
switch(config-router-multicast-ipv4)#
```

16.1.9.24 router multicast

The **`router multicast`** command places the switch in router-multicast configuration mode to configure IPv4 and IPv6 router multicast traffic.

Command Mode

Global Configuration

Command Syntax

`router multicast`

Example

The following command places the switch in ***router-multicast*** configuration mode.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv6
switch(config-router-multicast-ipv6)#routing
```

16.1.9.25 routing

The **routing** command allows the switch to forward multicast packets. Multicast routing is disabled by default.

The **no routing** and **default routing** commands disable multicast routing by removing the **routing** command from ***running-config***.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

routing

no routing

default routing

Example

These commands enable multicast routing on the switch.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# routing
switch(config-router-multicast-ipv4)#
```

16.1.9.26 rpf route

The **rpf route** command specifies a candidate for the multicast Reverse Path Forwarding (RPF) interface of any (S,G) multicast route (mroute), where the source falls within the given network prefix. Static mroutes are stored in a separate routing table, the Multicast Routing Information Base (MRIB).

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

rpf route {***source_prefix*** | ***source_address*** | ***mask***}{***rpf_interface*** | ***rpf_neighbor***>} [***admin_distance***]

no rpf route {***source_prefix*** | ***source_address*** | ***mask***}{***rpf_interface*** | ***rpf_neighbor***}

default rpf route {***source_prefix*** | ***source_address mask***}{***rpf_interface*** | ***rpf_neighbor***}

Parameters

- ***source_prefix*** specifies the source prefix.
- ***source_address*** specifies the source address.
- *mask* specifies the address mask.
- ***rpf_interface*** specifies the multicast RPF interface.
- ***rpf_neighbor*** specifies the multicast RPF neighbor.
- ***admin_distance*** specifies the administrative distance (optional). Values range from ***1*** to ***255***.

Examples

- These commands select the longest match when a source matches multiple static mroutes in the MRIB.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)# rpf route 11.10.1.0/24 Ethernet 5
switch(config-router-multicast-ipv4)# rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#
```

- These commands include an administrative distance of ***255*** on ***interface Ethernet 5*** with static mroute.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)# rpf route 11.10.1.0/24 Ethernet 5
 255
switch(config-router-multicast-ipv4)# rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#
```

16.1.9.27 show ip mfib counters

Use the **show ip mfib counters** command to display per multicast route ingress packet and byte counters.

Command Mode

EXEC

Command Syntax

show ip mfib vrf [***vrf-name***] ***group_addr source_addr*** counters

Parameters

- **vrf** [***vrf-name***] VRF name.
- ***group_addr*** Group address.
- ***source_addr*** Source address.
- **counters** Counter for bytes/packets.

Example

```
switch# show ip mfib 225.1.2.1 10.46.1.2 counters
Activity poll time: 60 seconds
   225.1.2.1 10.46.1.2
      Byte: 1200200
      Packet: 12002
      Ethernet46 (iif)
      Ethernet47
      Activity 0:02:52 ago
switch#
```

16.1.9.28 show ip mroute

The **show ip mroute** command displays information from the IP multicast routing table.

- **show ip mroute** displays information for all routes in the table.
- **show ip mroute** ***gp_addr*** displays information for the specified multicast group.

Command Mode

EXEC

Command Syntax

show ip mroute

show ip mroute ***gp_addr***

Parameters

gp_addr group IP address (dotted decimal notation).

Example

This command displays the IP multicast routing table entry for the multicast group ***225.1.1.11***.

```
switch# show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1

Incoming interface: Vlan281
Outgoing interface list:
Port-Channel999
switch#
```

16.1.9.29 show ip mroute count

The **show ip mroute count** command displays IP multicast routing table statistics.

The **show ip mroute** command displays information from the IP multicast routing table.

Command Mode

EXEC

Command Syntax

show ip mroute count

Example

This command displays IP multicast routing table statistics.

```
switch# show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1
switch#
```

16.1.9.30 show ip multicast boundary

The **show ip multicast boundary** command displays the summary of all IP multicast boundaries across all interfaces.

Command Mode

EXEC

Command Syntax

show ip multicast boundary [***group_prefix*** | ***group_prefix/length*** [out] | interface {ethernet ***e_num*** | loopback ***l_num*** | management ***m_num*** | port-channel ***p_num*** | vlan ***v_num***} | out]

Parameters

- ***no parameters*** displays the summary of all IP multicast boundaries across all interfaces.
- ***group_prefix*** displays the list of IP multicast boundaries matching the specified group address with subnet mask.
- ***group_prefix/length*** displays the list of IP multicast boundaries matching the specified group address with CIDR notation. Option includes:
  - **out** displays the specified group addresss IP multicast boundaries whose control plane filtering is enabled.
- **interface** displays IP multicast boundary of the specified interface. Options include:
  - **ethernet *e_num*** displays IP multicast boundaries of the specified Ethernet interface.
  - **loopback *l_num*** displays IP multicast boundaries of the specified Loopback interface.
  - **management *m_num*** displays IP multicast boundaries of the specified management interface.
  - **port-channel *p_num*** displays IP multicast boundaries of the specified port channel interface.
  - **vlan *v_num*** displays IP multicast boundaries of the specified VLAN interface.
- **out** displays all IP multicast boundaries whose only control plane filtering is enabled.

Examples

- This command displays the summary of all IP multicast boundaries across all interfaces.

```
switch(config-if-Et24)# show ip multicast boundary
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24 Yes
Ethernet1 224.6.6.0/24 Yes
Ethernet2 224.4.4.0/24 Yes
Ethernet3 224.5.5.0/24 No
```

- This command displays all IP multicast boundaries matching ***224.5.5.0 255.255.255.255***.

```
switch(config-if-Et24)# show ip multicast boundary 224.5.5.0
 255.255.255.255
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0 255.255.255.255
Ethernet3 224.5.5.0 255.255.255.255 No
```

- This command displays all IP multicast boundaries matching ***224.5.5.0/24***.

```
switch(config-if-Et24)# show ip multicast boundary 224.5.5.0/24
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24
Ethernet3 224.5.5.0/24 No
```

- This command displays all IP multicast boundaries of ***interface Ethernet1***.

```
switch(config-if-Et24)# show ip multicast boundary interface Ethernet1
Interface Denied Prefix Data Plane Filtered
```

```
Ethernet1 224.5.5.0/24
Ethernet1 224.6.6.0/24 No
```

- This command displays the list of IP multicast boundaries whose only control plane filtering is enabled.

```
switch(config-if-Et24)# show ip multicast boundary out
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24 No
Ethernet3 224.5.5.0/24 No
```

16.1.9.31 show mld membership

The **show mld membership** command displays MLD group and source membership information on a specific interface.

Command Mode

EXEC

Command Syntax

show mld membership [dynamic | group | interface | static]

Parameters

- **dynamic** displays MLD information for a dynamic group.
- **group** displays MLD information for a specified multicast group address.
- **interface** displays MLD information for the specified interface.
- **static** displays MLD information for statically configured group.

Example

This command displays MLD group and source information on the Ethernet interfaces ***3*** and ***6***.

```
switch# show mld membership
Interface      Group        Source       Filter Mode
---------      -----        ------       -----------
Ethernet3      ff30::1      a::2         include
Ethernet3      ff30::1      a::1         include
Ethernet6      ff30::2      a::2         include
```

16.1.9.32 show mld querier

The **show mld querier** command displays information about the MLD querier and querier parameters.

Command Mode

EXEC

Command Syntax

show mld querier [interface | parameters]

Parameters

- **interface** displays MLD querier information.
- **parameters** displays MLD querier parameters.

Example

- This command displays MLD querier on the Ethernet interface ***Et3*** and ***Et6***.

```
switch# show mld querier
Interface    Querier                General    Other      Version
                                    Query      Querier
                                    Expiry     Expiry
---------    -----------------      ---------- ---------  -------
Et3          fe80::1:ff:fe01:0      0:01:14    N/A        2
Et6          fe80::1:ff:fe01:0      0:01:14    N/A        2
```

- This command displays MLD querier parameters on the Ethernet interface ***Et3*** and ***Et6***.

```
switch# show mld querier parameters
Interface     Robustness Query      Query      Startup    Startup    Last       Last
                         Interval   Response   Query      Query      Listener   Listener
                                    Interval   Interval   Count      Query      Query
                                                                     Interval   Count
---------     ---------- --------   ---------  ---------  -------    --------   --------
Et3           2          125        10         31.25      2          1          2
Et6           2          125        10         31.25      2          1          2
```

16.1.9.33 show mld snooping

Use the **show mld snooping** command to display the snooping status of the switch.

Command Mode

EXEC

Command Syntax

show mld snooping [counters [errors] | groups [***A:B:C:D:E:F:G:H*** | count | detail | local | mlag | user | vlan] | mrouter [detail | vlan] | querier [vlan] | vlan [*num*]]

Parameters

- **counters** MLD counter information.
  - **errors** Error counters.
- **groups** MLD group information.
  - ***A:B:C:D:E:F:G:H*** IPv6 address.
  - **count** Displays membership count.
  - **detail** Displays a comprehensive output.
  - **local** Displays groups learned locally via MLD.
  - **mlag** Displays groups learned via MLAG peer.
  - **user** Displays groups configured by the user.
  - **vlan** Specifies VLAN.
- **mrouter** MLD multicast router information.
  - **detail** Displays a comprehensive output.
  - **vlan** Specifies VLAN.
- **querier** MLD querier information.
  - **vlan** Specifies VLAN.
- **vlan** Specifies VLAN.
  - ***num 1-4094*** Identifier for Virtual LAN.

Examples

- Use the **show mld snooping** command to display the MLD snooping status of the switch.

```
switch# show mld snooping
   Global MLD Snooping configuration:
----------------------------------------
MLD snooping                   : Enabled
Robustness variable            : 2

VLAN 1 :
----------
MLD snooping                   : Disabled
MLD max group limit            : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active    : False
Flooding traffic to VLAN       : True
VLAN 100 :
----------
MLD snooping                   : Enabled
MLD max group limit            : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active    : True
Flooding traffic to VLAN       : False

switch##show mld snooping vlan 100
   Global MLD Snooping configuration:
----------------------------------------
MLD snooping                   : Enabled
Robustness variable            : 2
```

```
VLAN 100 :
----------
MLD snooping                  : Enabled
MLD max group limit           : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active    : True
Flooding traffic to VLAN       : False
```

- Use the **show mld snooping groups** command to display VLANs by group.

```
switch# show mld snooping groups
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group           Members
----  --------------  -------------------
100   ff05::2         Cpu, Et4
100   ff08::11        Et1
100   ff08::21        Et2
100   ff08::31        Et3
100   *               Et3, Et4
```

- Use the **show mld snooping groups detail** command to display detailed VLANs information by group.

```
switch(config-mld-snooping-vlan-100)# show mld snooping groups detail
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group           Source          Mode  Uptime       Members
----  --------------  --------------  ----  -----------  ------------
100   ff05::2         *               -     0d00h13m20   Cpu, Et4
100   ff08::11        *               -     0d00h13m17   Et1
100   ff08::21        1::1            IN    0d00h13m20   Et2
100   ff08::31        2::1            EX    0d00h01m31   Et3
100   *               *               -     -            Et3, Et4
```

The **show mld snooping groups** command output can be further filtered to output just the:

- **local** groups, That is groups learned locally using **show mld snooping groups local** command.
- **user** groups, that is groups configured by user using the **show mld snooping groups user** command.
- **mlag** groups, that is groups learned from the MLAG peer using the **show mld snooping groups mlag** command.
-

- Use the **show mld snooping mrouter** to display MLD multicat router information.

```
switch# show mld snooping mrouter
Vlan    Interface-ports
---------------------------------------------------------
100     Et3(dynamic), Et4(static)

switch#show mld snooping mrouter detail

   0
```

The **`Switch`** interface in the above output can be ignored.

16.1.9.34 show mld statistics

The **show mld statistics** command displays total statistics information of incoming and outgoing MLD messages on a specific interface.

Command Mode

EXEC

Command Syntax

show mld statistics version ***value***

Parameters

- **version** specifies MLD version.
- ***value*** specifies the MLD version number. Accepted version values are 1 and 2.

Example

This command displays total MLD statistics on the Ethernet interface ***Et3*** and ***Et6***.

```
switch# show mld statistics
             MLD Total (Version1 + Version2) Statistics
           Received                                    | Sent
Interface  Queries  Reports  Dones   Others   Errors | Queries
-----------------------------------------------------------------
Et3        0        12       0       0        0        12
Et6        0        11       0       0        0        12
```

16.1.9.35 show mld summary

The **show mld summary** command displays MLD summary information.

Command Mode

EXEC

Command Syntax

show mld summary

Parameters

interface displays MLD summary on a specified interface.

Example

This command displays MLD summary on the interface ***Ethernet3*** and ***Ethernet6***.

```
switch# show mld summary
Interface     IPv6 link-local address      Group Count     Querier State

---------     -----------------------      -----------     -------------

Ethernet3     fe80::1:ff:fe01:0            2               querier

Ethernet6     fe80::1:ff:fe01:0            2               querier

Number of MLD interfaces: 2
Number of total groups joined across all MLD interfaces: 4
```

16.1.9.36 show multicast fib ipv4 software

The **show multicast fib ipv4 software** command displays information about the interfaces and the software-forwarded routes included in the IPv4 multicast forwarding information base (MFIB). Use the **show multicast fib ipv4** command for hardware-forwarded routes.

Parameter options are available to filter output by group address or group and source address.

Command Mode

EXEC

Command Syntax

show multicast fib ipv4 software [**INFO_LEVEL**] [**ROUTE**]

Parameters

- **INFO_LEVEL** specifies the type of information displayed. Options include
  - ***no parameter*** displays packet reception counters.
  - **detail** displays packet reception counters and packet queued/dropped counters.

  :
- **ROUTE** routes displayed, filtered by multicast group and source IP addresses:
  - ***no parameter*** shows information for all software-forwarded routes in the MFIB.
  - ***group_addr*** shows information only for the specified multicast group.
  - ***group_addr source address*** shows information only for the specified group and source.

Examples

- This command displays MFIB information for all software-forwarded routes in the MFIB.

```
switch# show multicast fib ipv4 software
239.255.255.250 172.17.41.150
        Vlan3040 (iif)
        Packets Received: 18
        Bytes Received  : 9147
        RPF Failures    : 0
239.255.255.250 172.17.41.120
        Vlan3040 (iif)
        Packets Received: 6
        Bytes Received  : 966
        RPF Failures    : 0
switch#
```

- This command displays detailed MFIB information for all software-forwarded routes in the MFIB.

```
switch# show multicast fib ipv4 software detail
239.255.255.250 172.17.41.150
Vlan3040 (iif)
Packets Received: 18
Bytes Received: 9147
RPF Failures: 0
Packets Queued/Dropped : 0 / 0
239.255.255.250 172.17.41.120
Vlan3040 (iif)
Packets Received: 6
Bytes Received: 966
RPF Failures: 0
Packets Queued/Dropped : 0 / 0
switch#
```

16.1.9.37 show multicast fib ipv4

The **show multicast fib ipv4** command displays information about interfaces and the hardware-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB).

Command Mode

EXEC

Command Syntax

show multicast fib ipv4 [***group_address*** [***source_address***] | bidirectional | count | counter | df | rpa | software | sparse-mode | static | summary | vrf]

Parameters

- no parameters displays information for all hardware-forwarded routes in the MFIB.
- ***group_address*** displays the information of the specified multicast group address. Options include:
  - ***source_address*** displays the information of the specified multicast group and source addresses.
  - **count** displays the multicast routes count of the specified group address.
  - **counters** displays the multicast route traffic count of the specified group address.
- **bidirectional** displays the information of bidirectional routes.
- **count** displays the count of multicast routes.
- **counter** displays the count of multicast route traffic in either bytes or packets.
- **df** displays the bidirectional Protocol Independent Multicast (PIM) Designated Forwarder (DF) bitmap.
- **rpa** displays the bidirectional PIM Rendezvous Point Address (RPA) index.
- **software** displays the software multicast FIB.
- **sparse-mode** displays the sparse-mode information.
- **static** displays the static multicast information.
- **summary** displays the multicast FIB summary.
- **vrf *vrf_name*** displays information of the corresponding VRF.

Guidelines

The counter is not available (N/A) if a multicast route does not have an associated counter. If the counter value for any source in a group address is N/A, then the sum of counters for the group address is N/A. However, the counter values for other sources are still displayed.

Examples

- This command displays the bidirectional PIM RPA index.

```
switch# show multicast fib ipv4 rpa
Prefix                                  Rpa Index
225.0.0.0/8                             1
226.0.0.0/8                             1
```

- This command displays the static multicast route information.

```
switch# show multicast fib ipv4 static count
(S,G) routes: 34
(*,G) routes: 31
Fastdrop routes:  0
Prefix routes: 12
```

- This command displays the multicast routes count of the specified group and source addresses.

```
switch# show multicast fib ipv4 229.0.0.0 10.1.5.101 count
Activity poll time: 60 seconds
```

```
(S,G) routes:  1
Fastdrop routes:  0
```

- This command displays the multicast route traffic count of the specified group and source addresses.

```
switch# show multicast fib ipv4 229.0.0.0 10.1.5.101 counters
Activity poll time: 60 seconds
 229.0.0.0 10.1.5.101
   Byte: 46128
   Packet: 93
   Port-Channel100 (iif)
     Activity 0:53:52 ago
```

- This command displays the multicast FIB summary.

```
switch# show multicast fib ipv4 summary
Number of multicast routes: 12
Number of fastdrop routes : 45
```

16.1.9.38 show multicast fib ipv6

The **show multicast fib ipv6** command displays the Multicast Forwarding Information Base (MFIB) table.

Command Mode

EXEC

Command Syntax

show multicast fib ipv6

Example

The command output displays the Multicast Forwarding Information Base (MFIB) table as shown.

```
switch# show multicast fib ipv6
Activity poll time: 60 seconds
  ff33::1:0:0:1 101:1::2
    Ethernet11/1 (iif)
    Ethernet9/1.1
    Ethernet2/1.1
    Ethernet3/1.1

16.1.9.39 show pim ipv6 sparse-mode route

The **show pim ipv6 sparse-mode route** command displays the PIM Sparse Mode Multicast Routing table.

Command Mode

EXEC

Command Syntax

show pim ipv6 sparse-mode route

Example

The command output displays the PIM Sparse Mode Multicast Routing table as shown.

```
switch# show pim ipv6 sparse-mode route
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
    R - RPT bit is set, S - SPT bit is set, L - Source is attached
    W - Wildcard entry, X - External component interest
    I - SG Include Join alert rcvd, P - (*,G) Programmed in hardware
    H - Joining SPT due to policy, D - Joining SPT due to protocol
    Z - Entry marked for deletion, C - Learned from a DR via a register
    A - Learned via Anycast RP Router, M - Learned via MSDP
    N - May notify MSDP, K - Keepalive timer not running
    T - Switching Incoming Interface, B - Learned via Border Router
RPF route: U - From unicast routing table
           M - From multicast routing table
ff33::1:0:0:1
  101:1::2, 2:03:00, flags: S
    Incoming interface: Ethernet11/1
    RPF route: [U] 101:1::/64 [110/1] via fe80::464c:a8ff:feb7:39e9
    Outgoing interface list:
      Ethernet6/1.1
      Ethernet4/1.1
      Ethernet7/1.1
      Ethernet9/1.1
      Ethernet8/1.1
      Ethernet2/1.1
      Ethernet5/1.1
      Ethernet3/1.1
```

16.1.9.40 show platform fap mroute ipv6

The **show platform fap mroute ipv6** command displays the Platform Hardware Forwarding table.

Command Mode

EXEC

Command Syntax

show platform fap mroute ipv6

Example

The command output displays the Platform Hardware Forwarding table as shown

```
switch# show platform fap mroute ipv6
Jericho0 Multicast Routes:
--------------------------
Location    GroupId    Group              Source

IIF           McId        OIF
  FLP/TT                FLP/TT         TT
FLP                   FLP           FLP                FLP
-------------------------------------------------------------------------

Vlan1357 21504     Vlan1044(Et7/1) Vlan1123(Et9/1)

Vlan1200(Et8/1) Vlan1223(Et2/1)

Vlan1226(Et5/1) Vlan1232(Et3/1)
```

16.1.9.41 unresolved cache-entries max

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. The default buffer size is ***4000*** (S,G) routes.

The **no unresolved cache-entries max** and **default unresolved cache-entries max** commands restore the default unresolved cache-entries buffer size of ***4000*** (S,G) routes by removing the **unresolved cache-entries max** command from ***running-config***. See **ip multicast boundary** to limit the number of cached packets per S,G.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

unresolved cache-entries max ***quantity_entries***

no unresolved cache-entries max

default unresolved cache-entries max

Parameter

quantity_entries maximum buffer size (routes). Value ranges from ***10*** to ***10000000***. Default is ***4000***.

Example

This command sets the maximum MFIB unresolved cache-entry buffer size to ***6000*** routes in the default VRF.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```

16.1.9.42 unresolved packet-buffers max

The **unresolved packet-buffers max** command specifies the number of (S,G) multicast packets for an individual route that the switch can process before the (S,G) entry is entered into cache. Packets that are received in excess of this limit before the route is programmed into the cache are dropped. By default, the switch processes 3 unresolved packets for an individual route.

The **no unresolved packet-buffers max** and **default unresolved packet-buffers max** commands restore the number of unresolved packets that the switch processes to the default value of ***3*** packets by removing the **unresolved packet-buffers max** command from ***running-config***. See **unresolved cache-entries max** to limit the number of unresolved routes that are cached.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

unresolved packet-buffers max ***quantity_packets***

no unresolved packet-buffers max

default unresolved packet-buffers max

Parameters

quantity_packets packets per unresolved route that the switch processes. Values range from ***3*** to ***10000000***. Default is ***3***.

Example

This command programs the switch in the default VRF to process ***30*** multicast packets from any route regardless of its entrys presence in the multicast routing cache.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```

16.2 IGMP and IGMP Snooping

16.2.1 IGMP Snooping

IGMP snooping is a Layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mrouters). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient's port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient's port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router's port to the port list for all multicast groups.

Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

IGMP Snooping Proxy

IGMP snooping proxy is an enhancement over IGMP snooping. When snooping proxy is enabled, the switch starts sending proxy queries periodically to the downstream hosts and collects the IGMP reports and updates the local state. Later, when the switch receives an IGMP query from an upstream router, the switch immediately responds with a report based on its local state.

When IGMP snooping proxy is disabled, the IGMP queries in VLAN, and the reports from hosts are flooded. Enabling IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to every query. It also reduces the number of reports that the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.

16.2.2 IGMP Host Proxy Description

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch's ***Ethernet 1*** interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

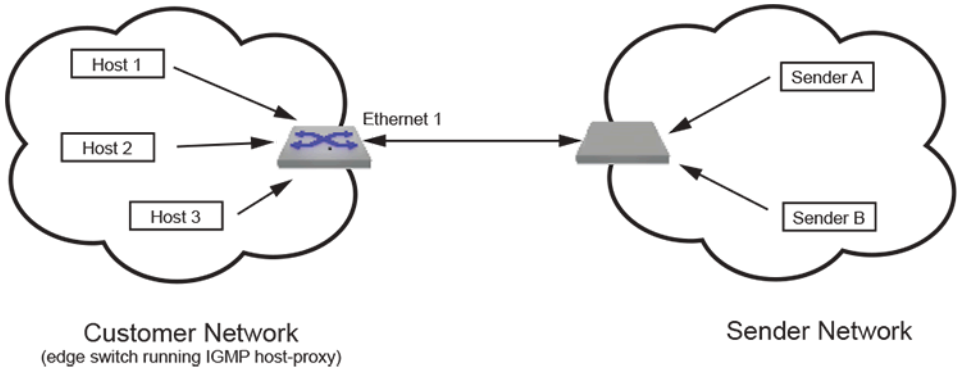

Figure 65: IP IGMP Host Proxy Implementation

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM Multicast Border Router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

16.2.3 Supported Features

For a list of the IGMP features that each Arista switch platform supports, refer to the supported features table here: https://www.arista.com/en/support/product-documentation/supported-features.

16.2.4 IGMP Protocols

- IGMP
- IGMP Snooping

16.2.4.1 IGMP

Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. Multicast routers use IGMP to maintain a membership list of active multicast groups for each attached network.

- IGMP version 1 is defined in ***RFC 1112***. Hosts can join multicast groups without a method to leave a group. Routers use a timeout-based process to determine when hosts lose interest in a group.
- IGMP version 2 is defined in ***RFC 2236***. Version 2 adds leave messages that hosts use to terminate group membership.
- IGMP version 3 is defined in ***RFC 4604***. Version 3 allows hosts to specify IP addresses within a group from where they receive traffic. Traffic from all other group addresses is blocked from the host.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

Queriers solicit group membership information by periodically sending General Query messages. Queriers also receive unsolicited messages from hosts joining or leaving a multicast group. When a querier receives a message from a host, it updates its membership list for the group referenced in the message and the network where the message originated.

Queriers forward multicasts from remote sources only to networks as specified by its membership list. If a querier does not receive a report from a network host for a specific group, it removes the corresponding entry from the table and discontinues forwarding multicasts for that group on the network. Queriers also send group-specific queries after receiving a leave request from a host to determine if the network still contains active multicast group members. If it does not receive a membership report during the period defined by the **last member query response interval**, the querier removes the group-network entry from the membership list.

When a host receives a General Query, it responds with Membership Report messages for each of its multicast groups within the interval specified by the Max Response Time field in the query. IGMP suppresses multiple messages from different hosts on a network for the same group. Hosts send unsolicited Membership reports to join a multicast group and send leave messages to exit a group.

16.2.5 Configuring IGMP

This section describes the following configuration tasks:

- Enabling IGMP
- Configuring IGMP Settings

16.2.5.1 Enabling IGMP

Enabling PIM also enables IGMP on that interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the IGMP group.

By default, PIM and IGMP are disabled on an interface. Use the **pim ipv4 sparse-mode** or **pim ipv4 bidirectional** command to enable PIM and IGMP on the configuration mode interface.

Example

This command enables PIM and IGMP on ***interface vlan 8***.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# pim ipv4 sparse-mode
switch(config-if-Vl8)#
```

In the unlikely event that the IGMP agent needs to run on an interface without PIM being enabled, use the **ip igmp** command.

Example

This command enables IGMP on ***interface vlan 8*** without enabling PIM.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# ip igmp
switch(config-if-Vl8)#
```

16.2.5.2 Configuring IGMP Settings

An interface that runs IGMP uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

IGMP Version

The switch supports IGMP versions 1 through 3. The **ip igmp version** command configures the IGMP version on the configuration mode interface. Version 3 is the default IGMP version.

Example

This command configures ***IGMP version 3*** on ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp version 3
switch(config-if-Vl4)#
```

Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The **ip igmp startup-query-interval** command specifies the interval between membership queries that an interface sends immediately after it starts up. The **ip igmp startup-query-count** command specifies the number of queries that the switches sends from the interface at the startup interval rate.

- **Example**

  These commands define a startup interval of ***15*** seconds for the first ***10*** membership queries sent from ***interface vlan 12***.

  ```
  switch(config)# interface vlan 12
  switch(config-if-Vl12)# ip igmp startup-query-interval 150
  switch(config-if-Vl12)# ip igmp startup-query-count 10
  switch(config-if-Vl12)#
  ```

Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The **ip igmp query-interval** command configures the frequency at which the active interface, as an IGMP querier, sends membership query messages.

The **igmp query-max-response-time** command configures the time that a host has to respond to a membership query.

Example

These commands define a membership query interval of ***75*** seconds and a query response timer reset value of ***45*** seconds for queries sent from ***interface vlan 15***.

```
switch(config)# interface vlan 15
switch(config-if-Vl15)# ip igmp query-interval 75
switch(config-if-Vl15)# igmp query-max-response-time 450
switch(config-if-Vl15)#
```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The **ip igmp last-member-query-count** (LMQC) command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The **ip igmp last-member-query-interval** command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Example

These commands program the switch to send ***3*** query messages, one every ***25*** seconds, when ***interface vlan 15*** receives an IGMP leave message.

```
switch(config)# interface vlan 15
switch(config-if-Vl15)# ip igmp last-member-query-interval 250
switch(config-if-Vl15)# ip igmp last-member-query-count 3
switch(config-if-Vl15)#
```

Static Groups

The **ip igmp static-group** command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

Note: To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the **pim ipv4 dr-priority** command to make it the DR by configuring its PIM DR value to be the highest on the network.

Example

These commands configure ***interface vlan 15*** as the PIM designated router, then configure it as a static member of the multicast group at address ***231.1.1.15*** for multicast data packets that originate at ***10.1.1.1***.

```
switch(config)# interface vlan 15
switch(config-if-Vl15)# pim ipv4 dr-priority 5000
switch(config-if-Vl15)# ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#
```

16.2.6 Configuring IGMP Snooping

This section describes the following configuration tasks:

- Enabling Snooping
- Configuring Snooping Parameters
- Snooping Querier
- IGMP Snooping L2 Report Flooding
- IGMP Snooping Filters
- Configuring IGMP Snooping Proxy

16.2.6.1 Enabling Snooping

The switch provides two control settings for snooping IGMP packets:

- Global settings control the availability of IGMP snooping on the switch. Snooping is globally enabled by default.
- Per-VLAN settings control IGMP on individual VLANs. If snooping is enabled on the VLAN, it follows the global snooping state.

The **ip igmp snooping** command controls the global snooping setting. The **ip igmp snooping vlan** command configures snooping on individual VLANs.

Examples

- This command globally enables snooping on the switch.

```
switch(config)# ip igmp snooping
switch(config)#
```

- This command disables snooping on VLANs ***2***, ***3***, and ***4***.

```
switch(config)# no ip igmp snooping vlan 2-4
switch(config)#
```

16.2.6.2 Configuring Snooping Parameters

Specifying a Static Multicast Router Connection

The ip igmp snooping vlan multicast-router command statically configures a port that connects to a multicast router to join all multicast groups. The port to the router must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command is for IGMP queriers that are known to connect through the network to a port on the switch.

Example

This command configures the static connection to a multicast router through Ethernet port 3.

```
switch(config)# ip igmp snooping vlan 2 mrouter interface ethernet 3
switch(config)#
```

Adding a Port to a Multicast Group

The **ip igmp snooping vlan member** command adds an a port to a multicast group. The IP address must be an unreserved IPv4 multicast address. The interface to the port must be in the specified VLAN range.

Example

This command configures the static connection to a multicast group at ***237.2.1.4*** through ***interface ethernet 3***.

```
switch(config)# ip igmp snooping vlan 7 member 237.2.1.4 interface
 ethernet 3
switch(config)#
```

Robustness Variable

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The **ip igmp snooping robustness-variable** command configures the robustness variable for all snooping packets sent from the switch. The default value is ***2***.

Example

This command sets the robustness-variable value to ***3***.

```
switch(config)# ip igmp snooping robustness-variable 3
switch(config)#
```

Configuring Interface Startup Initial Query Times

The **ip igmp snooping interface-restart-query** command configures the interface startup initial query times in milliseconds. If nothing is configured, a default value of ***2000*** milliseconds is used. Issuing the command replaces any values already configured. Multiple values may be input in a single command; this makes the mechanism more resilient in the case of dropped packets.

Examples

- This command configures interfaces to send IGMP queries at ***1000***, ***2000***, and ***4000*** milliseconds (i.e., ***1*** second, ***2*** seconds, and ***4*** seconds) after an interface restart or spanning tree change.

  ```
  switch(config)# ip igmp snooping interface-restart-query 1000 2000 4000
  switch(config)#
  ```

- This command configures interfaces to send a single IGMP query of ***5000*** milliseconds (***5*** seconds) after an interface restart or spanning tree change.

  ```
  switch(config)# ip igmp snooping interface-restart-query 5000
  switch(config)#
  ```

16.2.6.3 Snooping Querier

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch. Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

16.2.6.3.1 Enabling the Snooping Querier

Enabling the snooping querier on an interface requires the explicit configuration of a global querier address or a local querier address for the interface. See **Configuring Snooping Querier Parameters**.

The switch provides two control settings for controlling the snooping querier:

- The global setting controls the querier on VLANs for which there is no snooping querier command.
- VLAN querier settings take precedence over the global querier setting.

The **ip igmp snooping querier** command controls the global querier setting. When enabled globally, the querier is controlled on individual VLANs through the **ip igmp snooping vlan querier** command.

The **ip igmp snooping vlan querier** command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- **`ip igmp snooping vlan querier`** enables the querier on specified VLANs.
- **`no ip igmp snooping vlan querier`** disables the querier on specified VLANs.

Example

- These commands globally enables the snooping querier on the switch, explicitly disables snooping on VLANs ***1-4***, and explicitly enables snooping on VLANs ***5-8***.

```
switch(config)# ip igmp snooping querier
switch(config)# no ip igmp snooping vlan 1-4 querier
switch(config)# ip igmp snooping vlan 5-8 querier
switch(config)#
```

- This command removes the querier setting for VLANs ***3-6***:

```
switch(config)# default ip igmp snooping vlan 3-6 querier
switch(config)#
```

Globally Set the Snooping Querier Version

The **ip igmp snooping querier version** command configures the IGMP snooping querier version. ***Version 2*** is the default IGMP snooping version.

Example

This command globally configures IGMP snooping querier ***version 2***.

```
switch(config)# ip igmp snooping querier version 2
switch(config)#
```

The **ip igmp snooping vlan querier version** command configures IGMP globally on the VLAN. Version 2 is the default IGMP snooping version.

Example

This command configures IGMP snooping vlan querier version ***vlan 5***.

```
switch(config)# ip igmp snooping vlan 5 querier version 2
switch(config)#
```

16.2.6.3.2 Configuring Snooping Querier Parameters

Querier Address

The switch provides two IP addresses for setting the querier source:

- The global address is used by VLANs for which there is no querier address command.
- VLAN querier address settings take precedence over the global querier address.

The snooping querier address specifies the source IP address for IGMP snooping query packets that the switch transmits. The source address is also used to elect a snooping querier when the subnet contains multiple snooping queriers.

The default global querier address is not defined. When the configuration includes a snooping querier, a querier address must be defined globally or for each interface that enables a querier.

The **ip igmp snooping querier address** command sets the global querier source IP address for the switch. VLANs use the global address unless overwritten with the **ip igmp snooping vlan querier address** command. The default global address is not defined.

The **ip igmp snooping vlan querier address** command sets the source IP address for query packets transmitted from the specified VLAN. This command overrides the **ip igmp snooping querier address** for the specified VLAN.

Examples

- This command sets the source IP address for query packets that the switch transmits to ***10.1.1.41***.

```
switch(config)# ip igmp snooping querier address 10.1.1.41
switch(config)#
```

- This command sets the source IP address for query packets that ***vlan 2*** transmits to ***10.14.1.1***.

```
switch(config)# ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#
```

Membership Query Interval

The query interval is the period (seconds), between IGMP Membership Query message transmissions. The interval ranges from ***5*** to ***3600*** seconds.

The **ip igmp snooping querier query-interval** command specifies the global query interval for packets the switch sends as a snooper querier. The default global setting is ***125*** seconds.

The **ip igmp snooping vlan querier query-interval** command specifies the query interval for packets sent from the snooping querier to the specified VLAN, overriding the global setting. VLANs that do not specify a query interval use the global setting.

Examples

- This command sets a query interval of ***150*** seconds for queries transmitted from VLANs for which a query interval is not configured.

```
switch(config)# ip igmp snooping querier query-interval 150
switch(config)#
```

- This command sets the query interval of ***240*** seconds for queries transmitted from ***vlan 2***.

```
switch(config)# ip igmp snooping vlan 2 querier query-interval 240
switch(config)#
```

Membership Query Response Interval

The Max Response Time field, in Membership Query messages, specifies the longest time a host can wait before responding with a Membership Report message. In all other messages, the sender sets the field to zero and the receiver ignores it. The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no Max Response Time command.
- VLAN values take precedence over the global value for the specified VLAN.

The **ip igmp snooping querier max-response-time** command specifies the global Max Response Time value used in snooping query packets transmitted from the switch. Values range from ***1*** to ***25*** seconds with a default of ***10*** seconds. VLANs use the global setting unless overwritten with the **ip igmp snooping vlan querier max-response-time** command.

The **ip igmp snooping vlan querier max-response-time** command configures the Max Response Time field contents for packets transmitted from the specified VLAN, overriding the global setting.

Examples

- This command sets the maximum response time of ***15*** seconds for queries transmitted from VLANs for which a maximum response time is not configured.

```
switch(config)# ip igmp snooping querier max-response-time 15
switch(config)#
```

- This command sets a maximum response time of ***5*** seconds for queries that ***vlan 2*** transmits.

```
switch(config)# ip igmp snooping vlan 2 querier max-response-time 5
switch(config)#
```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no last-member-query-interval defined.
- VLAN values take precedence over the global value for the specified VLAN.

The **ip igmp snooping querier last-member-query-interval** command specifies the global last-member-query-interval used in snooping query packets transmitted from the switch. This value is used for VLANs that do not have a value specified. Values range from ***1*** to ***25*** seconds with a global default of one second.

The **ip igmp snooping vlan querier last-member-query-interval** command configures the last-member-query-interval field contents for packets transmitted from the specified VLAN, overriding the global setting.

Example

This command sets the global snooping querier last-member-query-interval to ***5*** seconds and the ***vlan 10*** last-member-query-interval to ***12*** seconds.

```
switch(config)# ip igmp snooping querier last-member-query-interval 5
switch(config)# ip igmp snooping vlan 10 querier last-member-query-
interval 12
switch(config)#
```

Interface Restart Query Spoofing

When the port status (link status or spanning tree status) changes, an IGMP general query is spoofed based on the information of the last known IGMP querier. This facilitates faster network convergence time.

By default, interfaces wait ***2000*** milliseconds before sending the spoofed IGMP query. To configure the delay before the spoofed query is sent, use the **ip igmp snooping interface-restart-query** command. This setting is applied to all ports.

Example

This command configures the switch to send general IGMP queries at ***100*** milliseconds, ***200*** milliseconds, and ***300*** milliseconds after interface restart or spanning tree status change.

```
switch(config)# ip igmp snooping interface-restart-query 100 200 300
```

16.2.6.4 IGMP Snooping L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Report flooding is disabled by default and must be enabled globally before it can be enabled on individual interfaces.

The list of ports that can forward membership report messages must be explicitly configured. Commands are available to define lists of ports that are valid for all VLANs and port lists that are valid for specified VLAN ranges. Ports can forward membership reports only if they are configured to handle VLAN traffic, regardless of any report flooding configuration settings.

Enabling L2 Report Flooding

These commands enable L2 report flooding:

- **ip igmp snooping report-flooding** enables report flooding globally.
- **ip igmp snooping vlan report-flooding** enables report flooding on a specified VLAN range.

Example

These commands enable L2 report flooding globally, and on VLANs ***201-205***.

```
switch(config)# ip igmp snooping report-flooding
switch(config)# ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

Configuring Forwarding Ports

These commands specify the ports that forward membership report messages:

- **ip igmp snooping report-flooding switch-port** configures ports globally.
- **ip igmp snooping vlan report-flooding switch-port** configures ports for a specified VLAN range.

Example

These commands enable Ethernet ports ***5-9*** to forward reports on all VLANs and ports ***12-15*** on VLANs ***201-205***.

```
switch(config)# ip igmp snooping report-flooding switch-port ethernet 5-9
switch(config)# ip igmp snooping vlan 201-205 report-flooding switch-port
 ethernet
12-15
switch(config)#
```

16.2.6.5 IGMP Snooping Filters

IGMP snooping filters assigns IGMP profiles only to Layer 2 interfaces, and for Layer 3 interfaces use multicast boundary filters to control the multicast groups that the interfaces can join. An IGMP profile specifies a filter type and a list of address ranges. The address ranges comprise the multicast groups covered by the profile. The filter type determines an interface's accessibility to the multicast groups:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are created in IGMP-profile configuration mode, then applied to an interface in interface configuration mode.

The **ip igmp profile** command places the switch in IGMP profile configuration mode. The **permit / deny** and **range** commands specify the profile's filter type and address range. A profile may contain multiple range statements to define a discontiguous address range.

Example

These commands create an IGMP profile named ***list_1*** by entering IGMP-profile configuration mode, configure the profile to permit multicast groups ***231.22.24.0*** through ***231.22.24.127***, and return the switch to ***global*** configuration mode.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#range 231.22.24.0 231.22.24.127
switch(config-igmp-profile-list_1)#exit
switch(config)#
```

The **ip igmp snooping filter** command applies an IGMP profile to the configuration mode interface.

Example

These commands apply the ***list_1*** snooping profile to ***interface ethernet 7***.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```

16.2.6.5.1 Verifying IGMP Snooping

Show commands are available to display various configurations and IGMP snooping status. IGMP snooping that are viewable include:

- **show ip igmp snooping**
- **show ip igmp snooping counters**
- **show igmp snooping querier**
- **show igmp snooping querier counters**
- **show igmp snooping querier membership**

IGMP Snooping Status

The **show ip igmp snooping** command displays the switch's IGMP snooping configuration.

Example

This command displays the switch's IGMP snooping configuration.

```
switch>show ip igmp snooping
   Global IGMP Snooping configuration:
-------------------------------------------
IGMP snooping                   : Enabled
Robustness variable             : 2

Vlan 1 :
----------
IGMP snooping                   : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 20 :
----------
IGMP snooping                   : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 2028 :

switch>
```

IGMP Snooping Counters

The **show ip igmp snooping counters** command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

Example

This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters
                        Input                  |            Output
Port    Queries Reports  Leaves  Others  Errors|Queries Reports  Leaves  Others
-------------------------------------------------------------------------------
Cpu       15249  106599       4  269502       0   30242  102812     972    3625
Et1           0       0       0       0       0       0       0       0       0
Et2           0       6       1      26       0    5415       0       0     731
Et3           0   10905     222    1037       0   15246       0       0    1448

Et21          0       0       0       0       0       0       0       0       0
Et22          0       0       0      52       0   15247       0       0    2435
Et23          0    5439     181     138       0   15247       0       0    2349
Et24          0    2251      21       4       0   15247       0       0    2483
Po1       45360  540670    8853  464900       0   15249  224751     618    2576
Po2           0  101399      58      17       0   15120       0       0    1121
Switch        0       0       0       0       0       0       0       0       0
```

IGMP Snooping Querier

The **show igmp snooping querier** command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

Example

This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show igmp snooping querier
Vlan  IP Address       Version  Port
----------------------------------------
1     172.17.0.37      v2       Po1
20    172.17.20.1      v2       Po1
26    172.17.26.1      v2       Cpu
2028  172.17.255.29    v2       Po1
switch>
```

IGMP Snooping Querier Counters

The **show igmp snooping querier counters** command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

This command displays the counters from the querier.

```
switch>show igmp snooping querier counters
------------------------------------------------------------------------
Vlan: 1    IP Addr: 100.0.0.1       Op State: Querier     Version:  v3

v1 General Queries Sent         :0
v1 Queries Received             :0
v1 Reports Received             :0
v2 General Queries Sent         :1
v2 Queries Received             :0
v2 Reports Received             :25
v2 Leaves Received              :0
v3 General Queries Sent         :655
v3 GSQ Queries Sent             :0
v3 GSSQ Queries Sent            :8
v3 Queries Received             :654
v3 Reports Received             :2385
Error Packets                   :0
Other Packets                   :0
switch>
```

IGMP Snooping Querier Membership

The **show igmp snooping querier membership** command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

This command displays the membership from the querier from ***vlan 1***.

```
switch>show igmp snooping querier membership
------------------------------------------------------------------------
Vlan: 1    Elected: 100.0.0.1       QQI: 125  QRV: 2  QRI: 10  GMI: 260

Groups           Mode  Ver  Num of Sources
------------------------------------------------------------------------
10.0.0.2        EX    v3   0 []
10.0.0.3        IN    v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4        EX    v3   0 []
10.0.0.13       EX    v3   0 []

switch>
```

16.2.6.6 Configuring IGMP Snooping Proxy

Use the ip igmp snooping proxy command to enable IGMP snooping proxy globally. Enabling IGMP snooping proxy enables it for all VLANs where IGMP snooping is enabled. IGMP snooping proxy is globally disabled by default.

Use the **ip igmp snooping proxy** command to enable IGMP snooping proxy globally. Use the no ip igmp snooping vlan proxy command to disable IGMP snooping proxy on specified VLANs.

Examples

- This command globally enables IGMP snooping proxy on the switch.

```
switch(config)# ip igmp snooping proxy
switch(config)#
```

- This command disables IGMP snooping proxy on ***vlan 2***, ***vlan 3***, and ***vlan 4***.

```
switch(config)# no ip igmp snooping proxy vlan 2-4 proxy
switch(config)#
```

16.2.6.6.1 Configuring Snooping Proxy Querier

To configure the IGMP snooping proxy querier use the existing **`ip igmp snooping querier`** commands. For more information on these commands, refer to **IGMP and IGMP Snooping Commands**.

Note: The proxy querier by default uses ***0.0.0.0*** as the IP address.

Example

In this example, IGMP snooping proxy is enabled using the **`ip igmp snooping proxy`** command and the snooping proxy is set to reports for all the VLANs except VLANs ***100*** through ***110*** using the **`ip igmp snooping vlan`** command. The proxy querier operates in version 3 and sends queries at a ***15***-second interval and hosts can take up to ***5*** seconds to respond.

```
switch(config)#ip igmp snooping proxy
switch(config)#no ip igmp snooping vlan 100-110 proxy
switch(config)#ip igmp snooping querier query-interval 15
switch(config)#ip igmp snooping querier max-response-time 5
switch(config)#ip igmp snooping querier version 3
switch(config)#ip igmp snooping querier
switch(config)#
```

16.2.7 IGMP Host Proxy

Interfaces on the switch can be configured to serve as IGMP host proxies. An IGMP host proxy exchanges IGMP reports (joins/leaves) between networks whose connection does not support PIM along network boundaries.

- IGMP Host Proxy Description
- IGMP Host Proxy Configuration

16.2.7.1 IGMP Host Proxy Description

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch's ***Ethernet 1*** interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

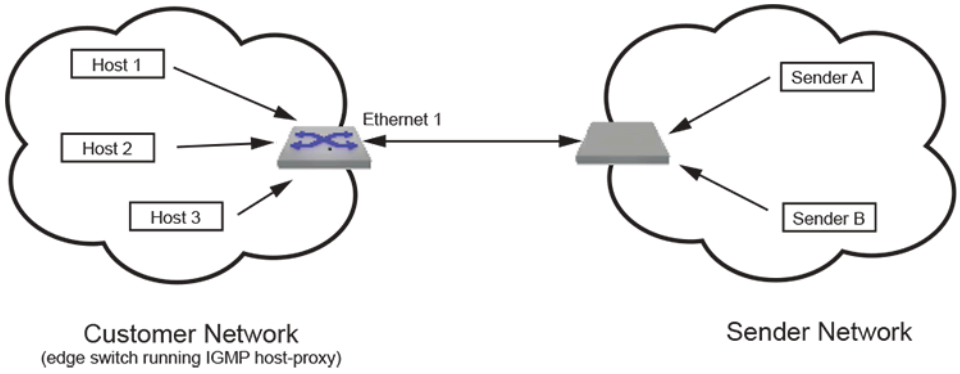

Figure 66: IP IGMP Host Proxy Implementation

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM Multicast Border Router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

16.2.7.2 IGMP Host Proxy Configuration

Enabling IGMP Host Proxy

Enable PIM MBR on the interface using the **pim ipv4 border-router** command. The IGMP host proxy service is then configured on the interface using the **ip igmp host-proxy** command. When the host proxy is configured, it sends reports for (S,G) entries in the multicast routing (mroute) table if these are the only routes there; if there are any (*,G) entries, it sends reports only for these. To send reports for a specific group even when there is no (*, G) entry in the mroute table for that group, include the group address in the **`ip igmp host-proxy`** command. Multiple **`ip igmp host-proxy`** statements are required to specify multiple groups. The interval between IGMP reports is configured by **ip igmp host-proxy report-interval**.

Host Proxy IGMP Version and Source Filtering

IGMP host proxies can be configured with IGMP versions 1, 2, or 3, and uses version 3 by default. When the host-proxy IGMP version is set to 3, the proxy can explicitly include or exclude source addresses. Otherwise, include/exclude configuration for source addresses is ignored. The IGMP version of unsolicited reports is specified with the **ip igmp host-proxy version** command. Reports that are triggered by IGMP queries, however, are sent in the same IGMP version as the received query. (An interface may also have a different IGMP version configured on it for other purposes using the **ip igmp version** command.)

Using ACLs

IGMP host proxy can also be enabled for the addresses defined by an ACL; if one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group

is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Disabling Host Proxy or Removing an Individual Group or Source

The **no igmp host-proxy** command can be entered with group or source parameters to remove the specified group or source from the list. Entering the **no igmp host-proxy** command without specifying group or source disables the forwarding of all IGMP reports on the interface.

Examples

- These commands enable IGMP host proxy on ***interface ethernet 17*** for all multicast group addresses.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on ***interface ethernet 18*** for the multicast group at ***231.10.10.1***. The list of source addresses is not restricted.

```
switch(config)# interface ethernet 18
switch(config-if-Et18)# pim ipv4 border-router
switch(config-if-Et18)# ip igmp host-proxy 231.10.10.1
switch(config-if-Et18)#
```

- These commands enable IGMP host proxy on ***interface ethernet 19*** for the multicast group at ***231.10.10.2***. The list of source addresses only excludes ***10.4.4.1*** and ***10.4.5.2***.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# pim ipv4 border-router
switch(config-if-Et19)# ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et19)# ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
switch(config-if-Et19)#
```

- These commands enable IGMP host proxy on ***interface ethernet 16*** for the multicast group at ***231.10.10.3***. The list of source address for this group only includes ***10.5.5.1*** and ***10.5.5.2***.

```
switch(config)# interface ethernet 16
switch(config-if-Et16)# pim ipv4 border-router
switch(config-if-Et16)# ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et16)# ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et16)#
```

- These commands configure an IGMP host proxy interval of ***5*** seconds on ***interface port-channel 100***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# ip igmp host-proxy report-interval 5
switch(config-if-Po100)#
```

- These commands enable IGMP host proxy on ***interface ethernet 17*** for the group address(es) specified in ACL ***acl1***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy access-list acl1
switch(config-if-Et17)#
```

16.2.8 IGMP and IGMP Snooping Commands

IGMP Configuration Commands (Interface Configuration Mode)

- igmp query-max-response-time
- ip igmp last-member-query-count
- ip igmp last-member-query-interval
- ip igmp query-interval
- ip igmp router-alert
- ip igmp startup-query-count
- ip igmp startup-query-interval
- ip igmp static-group
- ip igmp static-group acl
- ip igmp static-group range
- ip igmp version

IGMP Clear Commands

- clear ip igmp group
- clear ip igmp statistics

IGMP Display Commands

- show ip igmp groups
- show ip igmp groups count
- show ip igmp interface
- show ip igmp static-groups
- show ip igmp static-groups acl
- show ip igmp static-groups group
- show ip igmp statistics

IGMP Snooping Configuration Commands (Global Configuration Mode)

- ip igmp
- ip igmp profile
- ip igmp snooping
- ip igmp snooping interface-restart-query
- ip igmp snooping proxy
- ip igmp snooping querier
- ip igmp snooping querier address
- ip igmp snooping querier last-member-query-count
- ip igmp snooping querier last-member-query-interval
- ip igmp snooping querier max-response-time
- ip igmp snooping querier query-interval
- ip igmp snooping querier startup-query-count
- ip igmp snooping querier startup-query-interval
- ip igmp snooping querier version
- ip igmp snooping report-flooding
- ip igmp snooping report-flooding switch-port
- ip igmp snooping restart query-interval
- ip igmp snooping robustness-variable
- ip igmp snooping vlan

- ip igmp snooping vlan fast-leave
- ip igmp snooping vlan max-groups
- ip igmp snooping vlan member
- ip igmp snooping vlan multicast-router
- ip igmp snooping vlan proxy
- ip igmp snooping vlan querier
- ip igmp snooping vlan querier address
- ip igmp snooping vlan querier last-member-query-count
- ip igmp snooping vlan querier last-member-query-interval
- ip igmp snooping vlan querier max-response-time
- ip igmp snooping vlan querier query-interval
- ip igmp snooping vlan querier startup-query-count
- ip igmp snooping vlan querier startup-query-interval
- ip igmp snooping vlan querier version
- ip igmp snooping vlan report-flooding
- ip igmp snooping vlan report-flooding switch-port

IGMP Configuration Commands (Interface Configuration Mode)

- ip igmp snooping filter

IGMP Snooping Clear Commands

- clear ip igmp snooping counters

IGMP Snooping Display Commands

- show igmp snooping querier
- show igmp snooping querier counters
- show igmp snooping querier membership
- show ip igmp profile
- show ip igmp snooping
- show ip igmp snooping counters
- show ip igmp snooping counters ethdev-pams
- show ip igmp snooping groups
- show ip igmp snooping groups count
- show ip igmp snooping mrouter
- show ip igmp snooping report-flooding

IGMP Profile Configuration Mode Commands

- permit / deny
- range

IGMP Host Proxy Commands

- ip igmp host-proxy
- ip igmp host-proxy report-interval
- ip igmp host-proxy version
- show ip igmp host-proxy config-sanity
- show ip igmp host-proxy interface

16.2.8.1 clear ip igmp group

The **clear ip igmp group** command deletes IGMP cache entries as follows:

- **clear ip igmp group** all entries from the IGMP cache.
- **clear ip igmp group** ***gp_addr*** all entries for a specified multicast group.
- **clear ip igmp group interface** ***int_id*** all entries that include a specified interface.
- **clear ip igmp group** ***gp_addr*** **interface** ***int_id*** all entries for a specified interface in a specified group.

Command Mode

Privileged EXEC

Command Syntax

clear ip igmp group [***gp_addr***][interface **INT_ID**]

Parameters

- ***gp_addr*** multicast group IP address (dotted decimal notation).
- **INT_ID** interface name. Options include:
  - **ethernet** ***e_num*** Ethernet interface specified by ***e_num***.
  - **loopback** ***l_num*** Loopback interface specified by ***l_num***.
  - **management** ***m_num*** Management interface specified by ***m_num***.
  - **port-channel** ***p_num*** Port-channel interface specified by ***p_num***.
  - **vlan** ***v_num*** VLAN interface specified by ***v_num***.
  - **vxlan** ***vx_num*** VXLAN interface specified by ***vx_num***.

Examples

- This command deletes all IGMP cache entries for the multicast group ***231.23.23.14***.

```
switch# clear ip igmp group 231.23.23.14
switch#
```

- This command deletes IGMP cache entries for ***interface ethernet 16*** in multicast group ***226.45.10.45***.

```
switch# clear ip igmp group 226.45.10.45 interface ethernet 16
switch#
```

16.2.8.2 clear ip igmp snooping counters

The **`clear ip igmp snooping counters`** command resets the snooping message counters for the specified interface. The snooping counters for all interfaces are reset if the command does not include an interface name.

The **`show ip igmp snooping counters`** command displays the counter contents. See the **show ip igmp snooping counters** command description for a list of available snooping counters.

Command Mode

Privileged EXEC

Command Syntax

`clear ip igmp snooping counters` [**INT_NAME**]

Parameters

INT_NAME interface name. Formats include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **port-channel *p_num*** Port-channel interface specified by ***p_num***.
- **switch** virtual interface to an L2 querier.

Example

This command clears the snooping counters for messages received on ***interface ethernet 15***.

```
switch(config)# clear ip igmp snooping counters ethernet 15
switch(config)#
```

16.2.8.3 clear ip igmp statistics

The **`clear ip igmp statistics`** command resets IGMP transmission statistic counters for the specified interface.

Command Mode

Privileged EXEC

Command Syntax

`clear ip igmp statistics` [**INTF_ID**]

Parameters

INTF_ID nterface name. Options include:

- ***no parameter*** all interfaces.
- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by ***l_num***.
- **interface management *m_num*** Management interface specified by ***m_num***.
- **interface port-channel *p_num*** Port-channel interface specified by ***p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.
- **interface xlan *vx_num*** VXLAN interface specified by ***vx_num***.

Example

This command resets IGMP transmission statistic counters on ***interface tehernet 1***.

```
switch# clear ip igmp statistics interface ethernet 1
switch#
```

16.2.8.4 igmp query-max-response-time

The **igmp query-max-response-time** command configures the **query-max-response-time** variable for the configuration mode interface. This variable is used to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The **no igmp query-max-response-time** and **default igmp query-max-response-time** commands restore the default query-max-response-time of ***10*** seconds for the configuration mode interface by removing the corresponding **igmp query max-response-time** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

igmp query-max-response-time ***period***

no igmp query-max-response-time

default igmp query-max-response-time

Parameters

period maximum response time (deciseconds). Values range from ***1*** to ***31744*** (***52*** minutes, ***54*** seconds). Default is ***100*** (***10*** seconds).

Example

This command configures the query-max-response-time of ***180*** seconds for ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# igmp query-max-response-time 180
switch(config-if-Vl4)#
```

16.2.8.5 ip igmp

The **ip igmp** command enables IGMP on a routed interface or on SVI (VLAN interface) without enabling PIM.

The **no ip igmp** command removes the corresponding ip igmp command from ***running-config***.

Command Mode

Interface Configuration

Command Syntax

ip igmp

no ip igmp

Example

This command enables IGMP on ***interface ethernet 5/2***.

```
switch(config)# interface ethernet 5/2
switch(config-if-Et5/2)# ip igmp
switch(config-if-Et5/2)#
```

16.2.8.6 ip igmp host-proxy

The **ip igmp host-proxy** command enables the IGMP host proxy service on the configuration mode interface. The IGMP host proxy performs IGMP joins and leaves between networks that are directly connected by an exchange that does not support PIM on the network boundary.

Note: For an interface to serve as an IGMP host proxy, PIM MBR must also be enabled on that interface using the **pim ipv4 border-router** command.

The IGMP host proxy sends unsolicited IGMP join reports when an (S,G) or (*,G) entry arrives in the multicast routing (mroute) table. Reports are subsequently sent upon the arrival of queries on the interface. The interval between IGMP reports is configured through **ip igmp host-proxy report-interval**.

The **ip igmp host-proxy** command can also specify a group address; this ensures that reports are generated for the specified group even if there is no (*,G) entry in the mroute table for that group. Multiple **ip igmp host-proxy** statements are required to specify multiple groups.

When the host proxy IGMP version is set to 3 using the **ip igmp host-proxy version** command, the **ip igmp host-proxy** command can also include or exclude source addresses. These options are ignored when the interface runs host proxy IGMP version 1 or 2. Note that the IGMP version set using the **ip igmp version** command does not affect host proxy behavior.

An ACL can also be used in place of a group address by using the **access-list** option. If one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

The **no ip igmp host-proxy** and **default ip igmp host-proxy** commands remove the corresponding **ip igmp host-proxy** command from ***running-config***. When these commands do not include a group address, all **ip igmp host-proxy** statements are deleted. When inclusion or exclusion parameters are not specified, all statements with the specified group address are deleted.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp host-proxy [**GROUP_ADDRESS** [**SOURCE_ADDRESS**]]|[access-list ***acl***]

no ip igmp host-proxy [**GROUP_ADDRESS** [**SOURCE_ADDRESS**]]

default ip igmp host-proxy [**GROUP_ADDRESS** [**SOURCE_ADDRESS**]]

Parameters

- **GROUP_ADDRESS** IPv4 address of group address for which host proxy sends reports.
  - ***no parameter*** only groups for which there is a (*,G) entry in the mroute table.
  - ***ipv4_address*** IP address of multicast group (dotted decimal notation). This ensures that reports are generated for this group even if it does not have a (*,G) entry in the mroute table.
- **SOURCE_ADDRESS** IP address of a host that originates multicast data packets.
  - ***no parameter*** Proxy sends report for all received or configured groups regardless of source address.
  - **exclude *ipv4_address*** Proxy does not send reports for specified source address.
  - **include *ipv4_address*** Proxy always sends reports for specified source address.

Commands that list at least one parameter must specify a group address. Parameters may be listed in any order. When a command specifies include and exclude parameters, the exclude parameter is ignored.

- **access-list acl** specifies an access control list (ACL); a join is sent for all groups and/or sources obtained by processing the rules from all configured ACLs.
- **version *version*** specifies the IGMP version on IGMP host-proxy interface. The value ranges from ***1*** to ***3***. Default value is ***3***.

Guidelines

Multiple statements for a group address may be configured. The effect of entering a command depends on previously entered commands. The following describes command combination:

- **`ip igmp host-proxy`**: IGMP host proxy is enabled for all multicast groups and their source addresses. When enabled for all group addresses, the source address list cannot be restricted.
- **`ip igmp host-proxy`** ***group_ipv4***: IGMP host proxy is enabled for a specified multicast group. The list of source addresses for this group is not restricted. Enabling host proxy for another group address requires another **`ip igmp host-proxy`** command.
- **`ip igmp host-proxy`** ***group_ipv4*** **exclude** ***source_ipv4***: IGMP host proxy is enabled for the specified multicast group. Sources for this group include all addresses not in an exclude statement. Multiple source addresses for the group are excluded by multiple statements.
- **`ip igmp host-proxy`** ***group_ipv4*** **include** ***source_ipv4***: IGMP host proxy is enabled for the specified group address for only the specified source address. Additional statements are required to include other source addresses for the group. The presence of one include parameter invalidates all exclude statements for the specified multicast group.
- **`ip igmp host-proxy access-list`** **acl**: IGMP host proxy is enabled for the addresses defined by the specified ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a **deny all** rule for a group, then this filter takes precedence over configurations with include /exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Examples

- These commands enable IGMP host proxy on ***interface ethernet 17*** for all multicast group addresses.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on ***interface ethernet 17*** for the multicast group at ***231.10.10.1***. The list of source addresses is not restricted.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.1
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on ***interface ethernet 17*** for the multicast group at ***231.10.10.2***. The list of source addresses only excludes ***10.4.4.1*** and ***10.4.5.2***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on ***interface ethernet 17*** for the multicast group at ***231.10.10.3***. The list of source address for this group only includes ***10.5.5.1*** and ***10.5.5.2***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on ***interface ethernet 17*** for the group address(es) specified in ACL ***acl1***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy access-list acl1
switch(config-if-Et17)#
```

16.2.8.7 ip igmp host-proxy report-interval

The **ip igmp host-proxy report-interval** command configures the period between unsolicited join reports that the switch sends as an IGMP host proxy from the configuration mode interface to a sender network after a (S,G) or (*,G) entry arrives in the multicast route (mroute) table. When the interface receives a query in response, this interval is set to the **ip igmp last-member-query-interval**. This command also enables the host proxy on the configuration mode interface if it was not previously enabled.

The **no ip igmp host-proxy report-interval** and **default ip igmp host-proxy report-interval** commands reset the query interval to the default value of one second by removing the corresponding **ip igmp host-proxy report-interval** command from running-config. The **no ip igmp host-proxy** and **default ip igmp host-proxy** commands also remove the corresponding **report-interval** command.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp host-proxy report-interval ***period***

no ip igmp host-proxy report-interval

default ip igmp host-proxy report-interval

Parameters

period transmission interval (seconds) between consecutive reports. Value range: ***1*** (one second) to ***31744*** (8 hours, 49 minutes, 4 seconds). Default is ***1*** (one second).

Example

These commands configures a IGMP host proxy interval of ***5*** seconds on port channel ***100***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# ip igmp host-proxy report-interval 5
switch(config-if-Po100)#
```

16.2.8.8 ip igmp host-proxy version

The **ip igmp host-proxy version** command configures the version number to be used in unsolicited reports when the interface is serving as an IGMP host proxy. To configure the IGMP version used by the interface for other purposes, use the **ip igmp version** command instead.

The **no ip igmp host-proxy version** and **default ip igmp host-proxy version** commands reset the version to the default value of ***3***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp host-proxy version *version_number*

no ip igmp host-proxy version

default ip igmp host-proxy version

Parameters

version_number values range from ***1*** to ***3***. The default value is ***3***.

Example

These commands configure the IGMP host proxy version on port channel interface ***100*** to ***2***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# ip igmp host-proxy version 2
switch(config-if-Po100)#
```

16.2.8.9 ip igmp last-member-query-count

The **`ip igmp last-member-query-count`** command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by ip igmp last-member-query-interval. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

Setting the Last Member Query Count (LMQC) to ***1*** causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by **ip igmp query-interval**.

The **`no ip igmp last-member-query-count`** and **`default ip igmp last-member-query-count`** commands reset the LMQC to the default value by removing the corresponding **`ip igmp last-member-query-count`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`ip igmp last-member-query-count` *number*

`no ip igmp last-member-query-count`

`default ip igmp last-member-query-count`

Parameters

number query message quantity. Values range from ***0*** to ***3***. Default is ***2***.

Example

This command configures the last-member-query-count to ***3*** on ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp last-member-query-count 3
switch(config-if-Vl4)#
```

16.2.8.10 ip igmp last-member-query-interval

The **ip igmp last-member-query-interval** command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group it sends query messages at intervals set by this command. The **ip igmp startup-query-count** specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The **no ip igmp last-member-query-interval** and **default ip igmp last-member-query-interval** commands reset the query interval to the default value of one second by removing the **ip igmp last-member-query-interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp last-member-query-interval ***period***

no ip igmp last-member-query-interval

default ip igmp last-member-query-interval

Parameter

period transmission interval (deciseconds) between consecutive group-specific query messages. Value range: ***10*** (one second) to ***317440*** (8 hours, 49 minutes, 4 seconds). Default is ***10*** (one second).

Example

This command configures the last member query interval of ***6*** seconds for ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp last-member-query-interval 60
switch(config-if-Vl4)#
```

16.2.8.11 ip igmp profile

The **ip igmp profile** command places the switch in the ***IGMP-profile*** configuration mode to configure an IGMP profile. IGMP profiles control the multicast groups that an interface can join.

Profiles consist of the filter type and an address range:

Filter types specify accessibility to the listed address range:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are deny filters by default.

Address ranges specify a list of addresses and ranges:

- In permit filters, permitted groups are specified by the address range.
- In deny filters, all groups are permitted except those specified by the address range.

Implementing IGMP filtering affects IGMP report forwarding as follows:

- IGMPv2: Report is forwarded to mrouters for permitted groups and dropped for disallowed groups.
- IGMPv3: There may be multiple group records in a report.
    - No groups are allowed: The report is dropped.
    - All groups are allowed: The report is forwarded to mrouter ports as normal.
    - Some groups are allowed: A revised report is forwarded to mrouter ports.

The revised report includes records for the allowed group addresses with the same source MAC and IP addresses.

The **no ip igmp profile** and **default ip igmp profile** commands delete the specified IGMP profile from ***running-config***.

The ***IGMP-profile*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting IGMP-profile configuration mode does not affect the configuration. The **exit** command returns the switch to ***global*** configuration mode.

Command Mode

Global Configuration

Command Syntax

ip igmp profile ***profile_name***

no ip igmp profile ***profile_name***

default igmp profile ***profile_name***

Parameters

profile_name name of the IGMP profile.

Commands Available in igmp-profile Configuration Mode

- **permit / deny**
- **range**

Related Commands

ip igmp snooping filter applies an IGMP snooping filter to a configuration mode interface.

Example

These commands enter the ***IGMP-profile*** configuration mode and configure the profile as a permit list.

```
switch(config)# ip igmp profile list_1
switch(config-igmp-profile-list_1)# permit
```

```
switch(config-igmp-profile-list_1)#
```

16.2.8.12 ip igmp query-interval

The **ip igmp query-interval** command configures the frequency at which the configuration mode interface, as an IGMP querier, sends host-query messages.

An IGMP querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of ***125*** seconds.

The **no ip igmp query-interval** and **default ip igmp query-interval** commands reset the IGMP query interval to the default value of ***125*** seconds by removing the **ip igmp query-interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp query-interval ***period***

no ip igmp query-interval

default ip igmp query-interval

Parameter

period interval (seconds) between IGMP query messages. Values range from ***1*** to ***3175*** (52 minutes, 55 seconds). Default is ***125***.

Example

This command configures the query-interval of ***2*** minutes, ***30*** seconds for ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp query-interval 150
switch(config-if-Vl4)#
```

16.2.8.13 ip igmp router-alert

The **ip igmp router-alert** command configures the switch disposition of inbound IGMP packets to the configuration mode interface based on the presence of the router-alert option in the IP header. By default, the port accepts all IGMP packets that arrive on the local subnet and rejects all other packets that arrive without the router-alert option.

The command provides three IGMP packet disposition options:

- **mandatory**: packets are accepted only when router-alert is present.
- **optional**: packets are accepted regardless of router-alert presence.
- **optional connected**: packets are accepted from the same subnet; other packets require router-alert.

The **no ip igmp router-alert** and **default ip igmp router-alert** commands reset the default setting of optional connected on the configuration mode interface by removing the corresponding **ip igmp router-alert** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp router-alert DISPOSITION

no ip igmp router-alert

default ip igmp router-alert

Parameters

DISPOSITION IGMP packet disposition method. Options include:

- **mandatory** Rejects packets if router-alert is not present.
- **optional** Accepts packets regardless of router-alert presence.
- **optional connected** Accepts packets from same subnet. Other packets require router-alert.

Example

This command configures the switch to accept IGMP packets on ***interface ethernet 8*** only if the IP header contains router alert.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# ip igmp router-alert mandatory
switch(config-if-Et8)#
```

16.2.8.14 ip igmp snooping

The **ip igmp snooping** command enables snooping globally. By default, global snooping is enabled.

When global snooping is enabled, **ip igmp snooping vlan** enables or disables snooping on individual VLANs. When global snooping is disabled, snooping cannot be enabled on individual VLANs.

QoS cannot be used for IGMP packets when IGMP snooping is enabled.

The **no ip igmp snooping** command disables global snooping. The **default ip igmp snooping** command restores the global snooping default setting of enabled by removing the **ip igmp snooping** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping

no ip igmp snooping

default ip igmp snooping

Example

This command globally enables snooping on the switch.

```
switch(config)# ip igmp snooping
switch(config)#
```

16.2.8.15 ip igmp snooping filter

The **ip igmp snooping filter** command applies the specified IGMP snooping profile to the configuration mode interface. An IGMP snooping profile specifies the multicast groups that an interface may join. Profiles consist of the filter type and an address range:

- Filter type: Specifies accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.
- Address range: Specifies a list of addresses and ranges.
  - In permit filters, the permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

An interface without a snooping profile assignment may join any multicast group.

Snooping profiles are configured in IGMP-profile configuration mode (**ip igmp profile**).

The **no ip igmp snooping filter** and **default ip igmp snooping filter** commands restore the default setting of allowing an interface to join any multicast group by deleting the corresponding **ip igmp snooping filter** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

ip igmp snooping filter ***profile_name***

no ip igmp snooping filter [***profile_name***]

default ip igmp snooping filter [***profile_name***]

Parameters

profile_name name of profile assigned to interface.

Example

This command applies the ***list_1*** snooping profile to ***interface ethernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# ip igmp snooping filter list_1
switch(config-if-Et7)#
```

16.2.8.16 ip igmp snooping interface-restart-query

The **ip igmp snooping interface-restart-query** command configures the interface startup initial query time used for IGMP query spoofing. When an interface restarts or there is a change to the spanning tree, the interface will send general IGMP queries after this interval. The query is based on the information of the last known IGMP querier, and serves to facilitate faster network convergence times.

Multiple values can be configured with a single command; issuing the command again replaces any previously configured value(s).

The **no ip igmp snooping interface-restart-query** and **default ip igmp snooping interface-restart-query** commands restore the default setting of ***2000*** milliseconds by deleting the corresponding **ip igmp snooping interface-restart-query** command from ***running-config***.

Command Mode

General Configuration

Command Syntax

ip igmp snooping interface-restart-query ***query_time***

no ip igmp snooping interface-restart-query

default ip igmp snooping interface-restart-query

Parameters

query_time interval (in milliseconds) after an interface restart or spanning tree change at which the interface will send general IGMP queries. Values range from ***100*** to ***50000*** milliseconds; default is ***2000***.

Example

This command configures interfaces to send IGMP queries at ***100***, ***200***, and ***300*** milliseconds after an interface restart or spanning tree change.

```
switch(config)# ip igmp snooping interface-restart-query 100 200 300
switch(config)#
```

16.2.8.17 ip igmp snooping proxy

The **ip igmp snooping proxy** command enables snooping proxy globally. By default, IGMP snooping proxy is disabled globally.

When the snooping proxy is enabled globally, it enables IGMP snooping proxy on an individual VLANs and when the IGMP snooping proxy is globally disabled the snooping proxy is disabled on individual VLANs.

The **no ip igmp snooping proxy** and **default ip igmp snooping proxy** commands disable snooping proxy globally and on individual VLANs by removing the **ip igmp snooping proxy** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping proxy

no ip igmp snooping proxy

default ip igmp snooping proxy

Examples

- This command globally enables snooping proxy on the switch.

```
switch(config)# ip igmp snooping proxy
switch(config)#
```

- This command explicitly disables IGMP snooping proxy on ***vlan 20***.

```
switch(config)# no ip igmp snooping vlan 20 proxy
switch(config)#
```

16.2.8.18 ip igmp snooping querier

The **ip igmp snooping querier** command enables the snooping querier globally, which controls the querier for VLANs that are not configured with a snooping querier command. The **ip igmp snooping vlan querier** command controls the querier on individual VLANs.

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The **no ip igmp snooping querier** and **default ip igmp snooping querier** commands disable the snooping querier globally by removing the **ip igmp snooping querier** statement from ***running-config***. The snooping querier is globally disabled by default.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping querier

no ip igmp snooping querier

default ip igmp snooping querier

Guidelines

- Enabling a querier after it was disabled is equivalent to establishing a new querier.
- Changing the querier IP address is equivalent to establishing a new querier.

Example

This command globally enables the snooping querier on the switch.

```
switch(config)# ip igmp snooping querier
switch(config)#
```

16.2.8.19 ip igmp snooping querier address

The **ip igmp snooping querier address** command sets the global querier source IP address, which specifies the source address for packets transmitted from VLANs for which a querier address (**ip igmp snooping vlan querier address**) is not configured. To use a snooping querier, an address must be explicitly configured globally or for the VLAN.

The switch does not define a default global querier address.

The **no ip igmp snooping querier address** and **default ip igmp snooping querier address** commands remove the global querier address command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping querier address ***ipv4_address***

no ip igmp snooping querier address

default ip igmp snooping querier address

Parameter

ipv4_address source IPv4 address.

Example

This command sets the source IP address to ***10.1.1.41*** for query packets transmitted from the switch.

```
switch(config)# ip igmp snooping querier address 10.1.1.41
switch(config)#
```

16.2.8.20 ip igmp snooping querier last-member-query-count

The **ip igmp snooping querier last-member-query-count** command configures the global **igmp snooping querier last member query count** (LMQC) value. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **igmp snooping querier last member query count**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

Setting LMQC to ***1*** causes the loss of one packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by **ip igmp snooping querier query-interval**.

VLANs use the global value when they are not assigned a value (**ip igmp snooping vlan querier last-member-query-count**). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (**ip igmp snooping robustness-variable**).

The **no igmp snooping querier last-member-query-count** and **default igmp snooping querier last-member-query-count** commands reset the LMQC to the default value by removing the corresponding **ip igmp snooping querier last-member-query-count** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping querier last-member-query-count ***number***

no ip igmp snooping querier last-member-query-count

default ip igmp snooping querier last-member-query-count

Parameter

number query message quantity. Value ranges from ***1*** to ***3***. Default is set by robustness-variable.

Example

This command configures the global last-member-query-count to ***3***.

```
switch(config)# ip igmp snooping querier last-member-query-count 3
switch(config)# show igmp snooping querier status
   Global IGMP Querier status
-----------------------------------------------------
admin state                     : Disabled
source IP address               : 0.0.0.0
query-interval (sec)            : 125.0
max-response-time (sec)         : 10.0
querier timeout (sec)           : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count         : 3
startup-query-interval (sec)    : 31.25 (query-interval/4)
startup-query-count             : 2 (robustness)
Vlan Admin    IP              Query    Response Querier Operational Ver
     State                    Interval Time     Timeout State
-----------------------------------------------------------------------
1    Disabled 0.0.0.0         125.0    10.0     255.0   Non-Querier v2
100  Disabled 0.0.0.0         125.0    10.0     255.0   Non-Querier v2
101  Disabled 0.0.0.0         125.0    10.0     255.0   Non-Querier v2
switch(config)#
```

16.2.8.21 ip igmp snooping querier last-member-query-interval

The **`ip igmp snooping querier last-member-query-interval`** command sets the global IGMP snooping last member query interval. The default interval is ***1*** second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The **last-member-query-interval** determines when the group record is deleted if no subsequent reports are received.

VLANs not assigned a **last-member-query-interval** value (**ip igmp snooping vlan querier last-member-query-interval**) use the global value. VLAN commands take precedence over the global value.

The **`no ip igmp snooping querier last-member-query-interval`** and **`default ip igmp snooping querier last-member-query-interval`** commands reset the **last-member-query-interval** value the default interval of one second by removing the **`ip igmp snooping querier last-member-query-interval`** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip igmp snooping querier last-member-query-interval` ***period***

`no ip igmp snooping querier last-member-query-interval`

`default ip igmp snooping querier last-member-query-interval`

Parameter

period last member query interval (seconds). Value ranges from ***1*** to ***25***. Default is ***1*** second.

Related Commands

ip igmp snooping vlan querier last-member-query-interval assign a last member query interval value to the specified VLANs.

Example

This command sets the IGMP snooping querier last-member-query-interval to ***5*** seconds.

```
switch(config)# ip igmp snooping querier last-member-query-interval 5
switch(config)#
```

16.2.8.22 ip igmp snooping querier max-response-time

The **`ip igmp snooping querier max-response-time`** command specifies the global **max-response-time** value. The switch uses **max-response-time** to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

VLANs not assigned a **max-response-time** value (**ip igmp snooping vlan querier max-response-time**) use the global value. VLAN commands take precedence over the global value.

Values range from ***1*** to ***25*** seconds. The default global value is ***10*** seconds.

The **`no ip igmp snooping querier max-response-time`** and **`default ip igmp snooping querier max-response-time`** commands restore the global **max-response-time** default value by removing the **`ip igmp snooping querier max-response-time`** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip igmp snooping querier max-response-time` ***resp_sec***

`no ip igmp snooping querier max-response-time`

`default ip igmp snooping querier max-response-time`

Parameters

resp_sec **max-response-time** value (seconds). Values range from ***1*** to ***25***. Default (global) is ***10***.

Example

This command sets the global max-response-time to ***15*** seconds.

```
switch(config)# ip igmp snooping querier max-response-time 15
switch(config)#
```

16.2.8.23 ip igmp snooping querier query-interval

The **`ip igmp snooping querier query-interval`** command sets the global query interval. This command also sets the query-interval of IGMP Snooping when using IGMP version 2. Values range from ***5*** to ***3600*** seconds. The default global value is ***125*** seconds. The query interval is the period between IGMP Membership Query messages sent from the querier. The global value specifies the query interval for VLANs with no query-interval command.

VLANs not assigned a query interval value (**ip igmp snooping vlan querier query-interval**) use the global value. VLAN commands take precedence over the global value.

The **`no ip igmp snooping querier query-interval`** and **`default ip igmp snooping querier query-interval`** commands reset the global query-interval value to ***125*** seconds by removing the **`ip igmp snooping querier query-interval`** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip igmp snooping querier query-interval` ***query_sec***

`no ip igmp snooping querier query-interval`

`default ip igmp snooping querier query-interval`

Parameter

query_sec query interval (seconds). Values range from ***5*** to ***3600***. Default (global) is ***125***.

Example

This command sets the global query interval to ***150*** seconds.

```
switch(config)# ip igmp snooping querier query-interval 150
switch(config)#
```

16.2.8.24 ip igmp snooping querier startup-query-count

The **`ip igmp snooping querier startup-query-count`** command configures the global **startup query count** value. The **startup query count** specifies the number of query messages that the querier sends on a VLAN during the **startup query interval** (**ip igmp snooping querier startup-query-interval**).

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global **startup query count** value when they are not assigned a value (**ip igmp snooping vlan querier startup-query-count**). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (**ip igmp snooping robustness-variable**).

The **`no ip igmp snooping querier startup-query-count`** and **`default ip igmp snooping querier startup-query-count`** commands restore the default startup-query-count value by removing the corresponding **`ip igmp snooping querier startup-query-count`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip igmp snooping querier startup-query-count` ***number***

`no ip igmp snooping querier startup-query-count`

`default ip igmp snooping querier startup-query-count`

Parameter

number global startup query count. Value ranges from ***1*** to ***3***.

Example

These commands configure the global startup query count value of ***2***, then displays the status of the snooping querier.

```
switch(config)# ip igmp snooping querier startup-query-count 2
switch(config)# show igmp snooping querier status
   Global IGMP Querier status
-------------------------------------------------------
admin state                     : Disabled
source IP address               : 0.0.0.0
query-interval (sec)            : 125.0
max-response-time (sec)         : 10.0
querier timeout (sec)           : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count         : 2 (robustness)
startup-query-interval (sec)    : 31.25 (query-interval/4)
startup-query-count             : 2

Vlan Admin    IP              Query    Response Querier Operational Ver
     State                    Interval Time     Timeout State
-------------------------------------------------------------------------
1    Disabled 0.0.0.0         125.0    10.0     255.0   Non-Querier v2
100  Disabled 0.0.0.0         125.0    10.0     255.0   Non-Querier v2
101  Disabled 0.0.0.0         125.0    10.0     255.0   Non-Querier v2
switch(config)#
```

16.2.8.25 ip igmp snooping querier startup-query-interval

The **ip igmp snooping querier startup-query-interval** command configures the global startup query interval value. The **startup query interval** specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global **startup query interval** value when they are not assigned a value (**ip igmp snooping vlan querier startup-query-interval**). VLAN commands take precedence over the global value. The default global value equals the query interval divded by four. (**ip igmp snooping querier query-interval**).

The **no ip igmp snooping querier startup-query-interval** and **default ip igmp snooping querier startup-query-interval** commands restore the default method of specifying the startup query interval by removing the corresponding **ip igmp snooping querier startup-query-interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping querier startup-query-interval ***period***

no ip igmp snooping querier startup-query-count

default ip igmp snooping querier startup-query-count

Parameter

period startup query interval (seconds). Value ranges from ***1*** to ***3600*** (***1*** hour).

Example

This command configures the startup query count of one minute for ***interface vlan 4***.

```
switch(config)# ip igmp snooping querier startup-query-interval 40
switch(config)# show igmp snooping querier status
   Global IGMP Querier status
-------------------------------------------------------
admin state                     : Enabled
source IP address               : 0.0.0.0
query-interval (sec)            : 125.0
max-response-time (sec)         : 10.0
querier timeout (sec)           : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count         : 2 (robustness)
startup-query-interval (sec)    : 40.0
startup-query-count             : 2

Vlan Admin    IP              Query    Response Querier Operational Ver
     State                    Interval Time     Timeout State
-------------------------------------------------------------------------
1    Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
100  Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
101  Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
switch(config)#
```

16.2.8.26 ip igmp snooping querier version

The **ip igmp snooping querier version** command configures the Internet Group Management Protocol (IGMP) snooping querier version on the configuration mode interfaces. Version 3 is the default IGMP version.

IGMP is enabled by the **pim ipv4 sparse-mode** or **pim ipv4 bidirectional** command. The **ig igmp snooping querier version** command does not affect the IGMP enabled status.

The **no ip igmp snooping querier version** and **default ip igmp snooping querier version** commands restore the configuration mode to IGMP version 3 by removing the **ip igmp snooping querier version** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping querier version ***version_number***

no ip igmp snooping querier startup-query-count

default ip igmp snooping querier startup-query-count

Parameter

version_number IGMP version number. Value ranges from ***1*** to ***3***. Default value is ***3***.

Examples

- This command configures IGMP snooping querier version 2.

```
switch(config)# ip igmp snooping querier version 2
switch(config)#
```

This command restores the IGMP snooping querier to version 3.

```
switch(config)# no ip igmp snooping querier version
switch(config)#
```

16.2.8.27 ip igmp snooping report-flooding

The **ip igmp snooping report-flooding** command globally enables L2 report flooding on the switch. When report flooding is globally enabled, the **ip igmp snooping vlan report-flooding** configures a VLAN range to forward membership report messages to specified ports. When report flooding is not globally enabled, L2 report flooding cannot be enabled on individual VLANs.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can result in performance issues. L2 report flooding addresses this by facilitating report message transmissions through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

The **no ip igmp snooping report-flooding** and **default ip igmp snooping report-flooding** commands disable global L2 report flooding by removing **ip igmp report flooding** from ***running-config***. L2 report flooding is disabled by default.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping report-flooding

no ip igmp snooping report-flooding

default ip igmp snooping report-flooding

Related Command

ip igmp snooping vlan report-flooding enables L2 report flooding on a specified VLAN range.

Example

This command globally enables the snooping L2 report-flooding.

```
switch(config)# ip igmp snooping report-flooding
switch(config)#
```

16.2.8.28 ip igmp snooping report-flooding switch-port

The **ip igmp snooping report-flooding switch-port** command specifies Ethernet ports or port channels that can forward IGMP membership report messages for all VLANs where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The **ip igmp snooping vlan report-flooding switch-port** command configures a list of forwarding ports for a specified VLAN range.

The **no ip igmp snooping report-flooding switch-port** and **default ip igmp snooping report-flooding switch-port** commands remove the specified ports from the global report flooding port list by deleting the corresponding **ip igmp snooping report-flooding switch-port** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping report-flooding switch-port INTERFACE

no ip igmp snooping report-flooding switch-port INTERFACE

default ip igmp snooping report-flooding switch-port INTERFACE

Parameters

INTERFACE Membership report message forwarding is enabled on these ports:

- **ethernet *e_range*** where ***e_range*** is the number, range, or list of ethernet ports.
- **port-channel *p_range*** where ***p_range*** is the number, range, or list of channel ports.

Related Commands

- **ip igmp snooping report-flooding** globally enables L2 report flooding.
- **ip igmp snooping vlan report-flooding switch-port** specifies a port list for a VLAN range.

Example

This command configures Ethernet ports ***7-9*** for report message forwarding for any VLAN where L2 report flooding is enabled.

```
switch(config)# ip igmp snooping report-flooding switch-port ethernet 7-9
switch(config)#
```

16.2.8.29 ip igmp snooping restart query-interval

The **ip igmp snooping restart query-interval** command sets the query interval for all VLANs during an IGMP snooping restart. By default, the query interval during an IGMP snooping restart is a VLAN configured query interval divided by five. This accelerates the transmission of robustness queries to establish the IGMP snooping state more quickly. However, some large scale configurations may not be able to process all of the queries at this query interval rate. The restart query interval, when configured, is valid for all VLANs.

The **no ip igmp snooping resrtart query-interval** and **default ip igmp snooping restart query-interval** commands removes the global restart query interval by deleting the **ip igmp snooping restart query-interval** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping restart query-interval ***query_sec***

no ip igmp snooping restart query-interval

default ip igmp snooping restart query-interval

Parameter

query_sec query interval (seconds). Values range from ***2*** to ***400***. Default (global) is ***125***.

Example

This command sets the global query interval to ***35*** seconds.

```
switch(config)# ip igmp snooping restart query-interval 35
switch(config)#
```

16.2.8.30 ip igmp snooping robustness-variable

The **ip igmp snooping robustness-variable** command configures the robustness variable for snooping packets sent from any VLAN.

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The **no ip igmp snooping robustness-variable** and **default ip igmp snooping robustness-variable** commands reset the robustness variable to 2 by removing the **ip igmp snooping robustness-variable** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping robustness-variable ***robust_value***

no ip igmp snooping robustness-variable

default ip igmp snooping robustness-variable

Parameter

robust_value robustness variable. Values range from ***1*** to ***3***. Default is ***2***.

Example

This command sets the robustness-variable value to ***3***.

```
switch(config)# ip igmp snooping robustness-variable 3
switch(config)#
```

16.2.8.31 ip igmp snooping vlan

The **ip igmp snooping vlan** command enables snooping on the specified VLANs if snooping is globally enabled. IGMP snooping is globally enabled by default. The **ip igmp snooping** command enables snooping globally.

Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

The **no ip igmp snooping vlan** command disables snooping on the specified VLANs.

The **default ip igmp snooping vlan** command returns the snooping setting for the specified VLANs to enabled by removing the corresponding **ip igmp snooping vlan** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_range***

no ip igmp snooping vlan ***v_range***

default ip igmp snooping vlan ***v_range***

Parameter

v_range VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.

Example

This command disables snooping on ***vlan 2***, ***vlan 3***, and ***vlan 4***.

```
switch(config)# no ip igmp snooping vlan 2-4
switch(config)#
```

16.2.8.32 ip igmp snooping vlan fast-leave

The **ip igmp snooping vlan fast-leave** command enables fast-leave processing on specified VLANs. When fast-leave processing is enabled, the removal of a VLAN interface's multicast group entry from the IGMP table is not preceded by an IGMP group-specific query to the interface. The switch removes an interface from the forwarding table when it detects an IGMP leave message on the interface. IGMP fast-leave processing is enabled on all VLANs by default.

The **no ip igmp snooping vlan fast-leave** command disables fast-leave processing on the specified VLANs. The **default ip igmp snooping vlan fast-leave** command restores fast-leave processing on the specified VLANs by removing the corresponding **no ip igmp snooping vlan fast-leave** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan *v_range* fast-leave

no ip igmp snooping vlan *v_range* fast-leave

default ip igmp snooping vlan *v_range* fast-leave

Parameter

v_range VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.

Example

This command enables IGMP fast-leave processing on ***vlan 10***.

```
switch(config)# ip igmp snooping vlan 10 fast-leave
switch(config)#
```

16.2.8.33 ip igmp snooping vlan max-groups

The **ip igmp snooping vlan max-groups** command configures the quantity of multicast groups that the specified VLAN forwarding table can contain. After the limit is reached, attempts to join new groups are ignored. There is no default limit.

The **no ip igmp snooping vlan max-groups** and **default ip igmp snooping vlan max-groups** removes the maximum group limit by deleting the **ip igmp snooping vlan max-groups** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan *v_range* max-groups *quantity*

no ip igmp snooping vlan *v_range* max-groups

default ip igmp snooping vlan *v_range*max-groups

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***quantity*** maximum number of groups that can access the VLAN. Value ranges from ***0*** to ***65534***.

Examples

- This command limits the number of multicast groups that hosts on ***vlan 6*** can simultaneously access to ***25***.

```
switch(config)# ip igmp snooping vlan 6 max-groups 25
switch(config)#
```

- This command allows each VLAN between ***8*** and ***15*** to receive multicast packets from ***30*** groups.

```
switch(config)# ip igmp snooping vlan 8-15 max-groups 30
switch(config)#
```

- This command removes the maximum group restriction from all VLAN interfaces between ***1*** and ***50***.

```
switch(config)# no ip igmp snooping vlan 1-50 max-groups
switch(config)#
```

16.2.8.34 ip igmp snooping vlan member

The **ip igmp snooping vlan member** command adds ports as static members to a multicast group. The ports must be in the specified VLAN range.

The **no ip igmp snooping vlan member** and **default ip igmp snooping vlan member** commands remove the specified ports from the multicast group by deleting the corresponding ip igmp snooping member statements from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_num*** **member** ***ipv4_addr*** interface **STATIC_INT**

no ip igmp snooping vlan ***v_num*** **member** ***ipv4_addr*** interface **STATIC_INT**

default ip igmp snooping vlan ***v_num*** **member** ***ipv4_addr*** interface **STATIC_INT**

Parameters

- ***v_num*** VLAN number. Value ranges from ***1*** to ***4094***.
- ***ipv4_addr*** multicast group IPv4 address.
- **STATIC_INT** interface the command configures as the static group member. Options include:
  - **ethernet** ***e_range***, where ***e_range*** is the number, range, or list of Ethernet ports.
  - **port-channel** ***p_range***, where ***p_range*** is the number, range, or list of channel ports.

Example

This command configures the static connection to a multicast group at ***237.2.1.4*** through ***interface ethernet 3***.

```
switch(config)# ip igmp snooping vlan 7 member 237.2.1.4 interface
 ethernet 3
switch(config)#
```

16.2.8.35 ip igmp snooping vlan multicast-router

The **ip igmp snooping vlan multicast-router** command adds a multicast router as a static port to the specified VLANs. The router port must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command should specify IGMP queriers that are known to connect to the network through a port on the switch.

The **no ip igmp snooping vlan multicast-router** and **default ip igmp snooping vlan multicast-router** commands remove the specified static port configuration by deleting the corresponding **ip igmp snooping vlan multicast-router** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_range*** **multicast-router interface** **STATIC_INT**

no ip igmp snooping vlan ***v_range*** **multicast-router interface** **STATIC_INT**

default ip igmp snooping vlan ***v_range*** **multicast-router interface** **STATIC_INT**

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- **STATIC_INT** interface the command configures as a static port. Selection options include:
  - **ethernet** ***e_range*** where ***e_range*** is the number, range, or list of ethernet ports.
  - **port-channel** ***p_range*** where ***p_range*** is the number, range, or list of channel ports.
- The **STATIC_INT** interface must route traffic through a VLAN specified within ***v_range***.

Example

This command configures the static connection to a multicast router through ***interface ethernet 3***.

```
switch(config)# ip igmp snooping vlan 2 multicast-router interface
 ethernet 3
switch(config)#
```

16.2.8.36 ip igmp snooping vlan proxy

The **ip igmp snooping vlan proxy** command enables snooping proxy on individual VLAN. To enable or disable IGMP snooping vlan proxy globally, use the **ip igmp snooping proxy** command.

Note: The **ip igmp snooping proxy** command enables snooping proxy on all VLANs only where IGMP snooping is enabled.

The **no** and **default** form of **ip igmp snooping vlan proxy** command disables snooping proxy globally and on individual VLANs by removing the **ip igmp snooping vlan proxy** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan [***ID*** | ***range***]**proxy**

no ip igmp snooping vlan [***ID*** | ***range***] **proxy**

default ip igmp snooping vlan [***ID*** | ***range***] **proxy**

Parameters

- ***ID*** specifies a individual VLAN ID. Numbers range from ***1*** to ***4094***.
- ***range*** specifies the range of VLAN IDs. Numbers range from ***1*** to ***4094***.

Examples

- This command globally enables IGMP snooping proxy on the switch and on all VLANs where IGMP snooping is enabled.

```
switch(config)# ip igmp snooping proxy
switch(config)#
```

- This command enables IGMP snooping proxy on ***vlan 20***.

```
switch(config)# ip igmp snooping vlan 20 proxy
switch(config)#
```

- This command disables IGMP snooping proxy on ***vlan 20***.

```
switch(config)# no ip igmp snooping vlan 20 proxy
switch(config)#
```

16.2.8.37 ip igmp snooping vlan querier

The **ip igmp snooping vlan querier** command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- **ip igmp snooping vlan querier** enables the querier on specified VLANs.
- **no ip igmp snooping vlan querier** disables the querier on specified VLANs.

VLAN querier commands take precedence over the global querier setting. The **ip igmp snooping querier** controls the querier for VLANs with no snooping querier command.

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The **default ip igmp snooping vlan querier** command restores the usage of the global setting for the specified VLAN by removing the corresponding **ip igmp snooping vlan querier** or **no ip igmp snooping vlan querier** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan *v_range* querier

no ip igmp snooping vlan *v_range* querier

default ip igmp snooping vlan *v_range* querier

Parameters

v_range VLAN IDs. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.

Examples

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs ***1-3***, and explicitly enable snooping on VLANs ***4-6***.

```
switch(config)# ip igmp snooping querier
switch(config)# no ip igmp snooping vlan 1-3 querier
switch(config)# ip igmp snooping vlan 4-6 querier
```

  After running these commands, the ***running-config*** file contains these lines, which indicate that the snooping querier is enabled on VLANs ***4-6***.

```
switch(config)# show running-config

                <-------OUTPUT OMITTED FROM EXAMPLE-------->
no ip igmp snooping vlan 1 querier
no ip igmp snooping vlan 2 querier
no ip igmp snooping vlan 3 querier
ip igmp snooping vlan 4 querier
ip igmp snooping vlan 5 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
```

```
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

- This command removes the querier setting for VLANs ***2-5***:

```
switch(config)# default ip igmp snooping vlan 2-5 querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs ***1-2***, enabled implicitly on VLANs ***3-6***, and enabled explicitly on VLANs ***7-8***, as shown by ***running-config***:

```
<-------OUTPUT OMITTED FROM EXAMPLE-------->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
                <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

- This command sets the global snooping querier to disabled by removing the global querier setting from ***running-config***:

```
switch(config)# no ip igmp snooping querier
switch(config)#
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs ***1-2***, disabled implicitly on VLANs ***3-6*** and enabled explicitly on VLANs ***7-8***, as shown by ***running-config***.

```
<-------OUTPUT OMITTED FROM EXAMPLE-------->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
                <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

16.2.8.38 ip igmp snooping vlan querier address

The **ip igmp snooping vlan querier address** command sets the source address for query packets sent from specified VLANs. VLANs not assigned an address use the global address (**ip igmp snooping querier address**). VLAN querier address commands take precedence over the global address.

To use a snooping querier, an address must be explicitly configured globally or for the querier VLAN.

The **no ip igmp vlan snooping querier address** and **default ip igmp snooping vlan querier address** commands reset the specified VLAN to use the global address by removing the corresponding **ip igmp snooping vlan querier address** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_range*** **querier address** ***ipv4_address***

no ip igmp snooping vlan ***v_range*** **querier address**

default ip igmp snooping vlan ***v_range*** **querier address**

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***ipv4_address*** source IPv4 address.

Example

This command sets the source IPv4 address of ***10.14.1.1***. for query packets transmitted from ***vlan 2***.

```
switch(config)# ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#
```

16.2.8.39 ip igmp snooping vlan querier last-member-query-count

The **ip igmp snooping vlan querier last-member-query-count** command specifies an **IGMP snooping querier last-member-query-count** (LMQC) value for the specified VLANs. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

VLANs not assigned an LMQC value use the global value (**ip igmp snooping querier last-member-query-count**). VLAN commands take precedence over the global command.

Setting the last member query count (LMQC) to ***1*** causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by **ip igmp snooping querier query-interval l**.

The **no igmp snooping vlan querier last-member-query-count** and **default igmp snooping vlan querier last-member-query-count** commands reset the specified VLAN to use the global LMQC by removing the corresponding **ip igmp snooping vlan querier last-member-query-count** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan *v_range* querier last-member-query-count *number*

no ip igmp snooping vlan *v_range* querier address

default ip igmp snooping vlan *v_range* querier address

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***number*** query message quantity. Value ranges from ***1*** to ***3***.

Example

This command configures the last-member-query-count to ***1*** on ***vlan 3***.

```
switch(config)# ip igmp snooping vlan 3 querier last-member-query-count 1
switch(config)#
```

16.2.8.40 ip igmp snooping vlan querier last-member-query-interval

The **ip igmp snooping vlan querier last-member-query-interval** command configures **last-member-query-interval** for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (**ip igmp snooping querier last-member-query-interval**). VLAN commands take precedence over the global value. The global default is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

The **no ip igmp snooping vlan querier last-member-query-interval** and **default ip igmp snooping vlan querier last-member-query-interval** commands reset the specified VLAN to use the global **last-member-query-interval** by removing the corresponding **ip igmp snooping vlan querier last-member-query-interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_range*** **querier last-member-query-interval** ***period***

no ip igmp snooping vlan ***v_range*** **querier last-member-query-interval**

default ip igmp snooping vlan ***v_range*** **querier last-member-query-interval**

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***period*** last member query interval (seconds). Value ranges from ***1*** to ***25***.

Example

This command sets the last-member-query-interval for ***vlan 10*** to ***12*** seconds.

```
switch(config)# ip igmp snooping vlan 10 querier last-member-query-
interval 12
switch(config)#
```

16.2.8.41 ip igmp snooping vlan querier max-response-time

The **`ip igmp snooping vlan querier max-response-time`** command configures **max-response-time** for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (**ip igmp snooping querier max-response-time**). VLAN commands take precedence over the global value. The global default is ***10*** seconds.

Switches use **max-response-time** to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The **`no ip igmp snooping vlan querier max-response-time`** and **`default ip igmp snooping vlan querier max-response-time`** commands reset the specified VLAN to use the global **max-response-time** by removing the corresponding **`ip igmp snooping vlan querier max-response-time`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip igmp snooping vlan` ***v_range*** **`querier max-response-time`** ***resp_sec***

`no ip igmp snooping vlan` ***v_range*** **`querier max-response-time`**

`default ip igmp snooping vlan` ***v_range*** **`querier max-response-time`**

Parameters

- ***v_range*** VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***resp_sec*** **max-response-time** value (seconds). Values range from ***1*** to ***25***.

Example

This command sets the max-response-time for ***vlan 2*** to ***5*** seconds.

```
switch(config)# ip igmp snooping vlan 2 querier max-response-time 5
switch(config)#
```

16.2.8.42 ip igmp snooping vlan querier query-interval

The **ip igmp snooping vlan querier query-interval** command sets the query interval for the specified VLAN. VLANs not assigned a value use the global value (**ip igmp snooping querier query-interval**). VLAN commands have precedence over the global value. The query interval is the period between IGMP Membership Query messages sent from the querier.

The **no ip igmp snooping vlan querier query-interval** and **default ip igmp snooping vlan querier query-interval** commands reset the specified VLAN to use the global value by removing the corresponding **ip igmp snooping vlan querier query-interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_range*** **querier query-interval** ***query_sec***

no ip igmp snooping vlan ***v_range*** **querier query-interval**

default ip igmp snooping vlan ***v_range*** **querier query-interval**

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***query_sec*** query interval (seconds). Values range from ***5*** to ***3600***. Default (global) is ***125***.

Example

This command sets the query interval for ***vlan 10*** to ***240*** seconds.

```
switch(config)# ip igmp snooping vlan 10 querier query-interval 240
switch(config)#
```

16.2.8.43 ip igmp snooping vlan querier startup-query-count

The **ip igmp snooping vlan querier startup-query-count** command specifies the startup query count value for the specified VLANs. The **startup query count** specifies the number of query messages that the querier sends on a VLAN during the **startup query interval** (**ip igmp snooping vlan querier startup-query-interval**).

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period and the query message transmission frequency during that period.

VLANs not assigned a **startup query count** value use the global value (**ip igmp snooping querier startup-query-count**). VLAN commands take precedence over the global command.

The **no ip igmp snooping vlan querier startup-query-count** and **default ip igmp snooping vlan querier startup-query-count** commands restore the default condition of using the global **startup query count** value by removing the corresponding **ip igmp snooping vlan querier startup-query-count** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_range*** **querier startup-query-count** ***number***

no ip igmp snooping vlan ***v_range*** **querier startup-query-count**

default ip igmp snooping vlan ***v_range*** **querier startup-query-count**

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***number*** startup query count. Value ranges from ***1*** to ***3***.

Example

This command configures the startup query count of ***3*** for ***vlan 100***.

```
switch(config)# ip igmp snooping vlan 100 querier startup-query-count 3
switch(config)#
```

16.2.8.44 ip igmp snooping vlan querier startup-query-interval

The **ip igmp snooping vlan querier startup-query-interval** command specifies the **startup query interval** value for the specified VLANs. The **startup query interval** specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs not assigned a **startup query interval** value use the global value (**ip igmp snooping querier startup-query-count**). VLAN commands take precedence over the global command.

The **no ip igmp snooping vlan querier startup-query-interval** and **default ip igmp snooping vlan querier startup-query-interval** commands restore the default condition of using the global **startup query interval** value by removing the corresponding **ip igmp snooping vlan querier startup-query-interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan *v_range* querier startup-query-interval *period*

no ip igmp snooping vlan *v_range* querier startup-query-interval

default ip igmp snooping vlan *v_range* querier startup-query-interval

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***period*** startup query interval (seconds). Value ranges from ***1*** to ***3600*** (1 hour). Default is ***31***.

Example

This command configures the startup query count of ***60*** seconds for ***vlan 100***.

```
switch(config)# ip igmp snooping vlan 100 querier startup-query-interval
 60
switch(config)#
```

16.2.8.45 ip igmp snooping vlan querier version

The **ip igmp snooping vlan querier version** command configures the Internet Group Management Protocol (IGMP) snooping querier function on the VLAN. Version 3 is the default IGMP snooping version.

IGMP is enabled by the **pim ipv4 sparse-mode** or **pim ipv4 bidirectional** command. The **ig igmp snooping vlan querier version** command does not affect the IGMP enabled status.

The **no ip igmp snooping vlan querier version** and **default ip igmp snooping vlan querier version** commands restore the configuration mode interface to IGMP snooping VLAN querier version 3 by removing the **ip igmp snooping vlan querier version** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan *v_range* querier version *version_number*

no ip igmp snooping vlan *v_range* querier version

default ip igmp snooping vlan *v_range* querier version

Parameters

- ***v_range*** VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- ***version_number*** IGMP version number. Value ranges from ***1*** to ***3***. Default value is ***3***.

Example

- The example sets the querier to ***version 2*** on ***vlan 5***.

```
switch(config)# ip igmp snooping vlan 5 querier version 2
switch(config)#
```

- This command restores IGMP snooping querier ***version 3*** to ***vlan 5***.

```
switch(config)# no ip igmp snooping vlan 5 querier version
switch(config)#
```

16.2.8.46 ip igmp snooping vlan report-flooding

The **ip igmp snooping vlan report-flooding** command enables L2 report flooding on the specified VLANs if report flooding is globally enabled. When L2 report flooding is not globally enabled, this command has no effect. The **ip igmp snooping report-flooding** command globally enables L2 report flooding.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

Two commands specify the ports that forward reports:

- **ip igmp snooping vlan report-flooding switch-port** for a VLAN range.
- **ip igmp snooping report-flooding switch-port** for all VLANs where report flooding is enabled.

The **no ip igmp snooping vlan report-flooding** and **default ip igmp snooping vlan report-flooding** commands disable L2 report flooding for the specified VLAN by removing the corresponding **ip igmp snooping vlan report-flooding** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan ***v_range*** **report-flooding**

no ip igmp snooping vlan ***v_range*** **report-flooding**

default ip igmp snooping vlan ***v_range*** **report-flooding**

Parameters

v_range VLAN IDs Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.

Related Commands

ip igmp snooping report-flooding globally enables L2 report flooding.

Example

These commands enable L2 report flooding globally and on VLANs ***201*** through ***205***.

```
switch(config)# ip igmp snooping report-flooding
switch(config)# ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

16.2.8.47 ip igmp snooping vlan report-flooding switch-port

The **ip igmp snooping vlan report-flooding switch-port** command configures Ethernet ports or port channels to forward IGMP membership report messages for a specified VLAN range where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The **ip igmp snooping report-flooding switch-port** command configures a list of forwarding ports for all VLANs where L2 report flooding is enabled.

The **no ip igmp snooping vlan report-flooding switch-port** and **default ip igmp snooping vlan report-flooding switch-port** commands remove the listed ports from the specified report flooding port list by deleting the corresponding **ip igmp snooping vlan report-flooding switch-port** statements from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip igmp snooping vlan *v_range* report-flooding switch-port INTERFACE

no ip igmp snooping vlan *v_range* report-flooding switch-port INTERFACE

default ip igmp snooping vlan *v_range*report-flooding switch-port INTERFACE

Parameters

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.
- **INTERFACE** Membership report message forwarding is enabled on these ports:
  - **ethernet *e_range*** where ***e_range*** is the number, range, or list of ethernet ports.
  - **port-channel *p_range*** where ***p_range*** is the number, range, or list of channel ports.

Related Commands

- **ip igmp snooping report-flooding** globally enables L2 report flooding.
- **ip igmp snooping vlan report-flooding switch-port** specifies a port list for a VLAN range.
- **ip igmp snooping report-flooding switch-port** specifies a port list for all VLANs.

Example

These commands globally enable L2 report flooding, enable flooding on VLANs ***201*** through ***205***, and specify Ethernet ports ***8-10*** as the report flooding port list for VLANS ***201-205***.

```
switch(config)# ip igmp snooping report-flooding
switch(config)# ip igmp snooping vlan 201-205 report-flooding
switch(config)# ip igmp snooping vlan 201-205 report-flooding switch-port
 ethernet 8-10
switch(config)#
```

16.2.8.48 ip igmp startup-query-count

The **`ip igmp startup-query-count`** command specifies the number of query messages that an interface sends during the startup interval defined by **ip igmp startup-query-interval**.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period and the query message transmission frequency during that period.

The **`no ip igmp startup-query-count`** and **`default ip igmp startup-query-count`** commands restore the default **startup-query-count** value of ***2*** for the configuration mode interface by removing the corresponding **`ip igmp startup-query-count`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`ip igmp startup-query-count` ***number***

`no ip igmp startup-query-count`

`default ip igmp startup-query-count`

Parameter

number quantity of queries. Values range from ***1*** to ***65535***. Default is ***2***.

Example

This command configures the startup query count of ***10*** for ***vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp startup-query-count 10
switch(config-if-Vl4)#
```

16.2.8.49 ip igmp startup-query-interval

The **ip igmp startup-query-interval** command specifies the configuration mode interface IGMP startup period, during which query messages are sent at an accelerated rate.

When an interface starts running IGMP, it can establish the group state quicker by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period and the query message transmission frequency during that period.

The **no ip igmp startup-query-interval** and **default ip igmp startup-query-interval** commands restore the configuration mode interface default IGMP startup-query-interval of ***31*** seconds by removing the corresponding **ip igmp startup-query-interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp startup-query-interval ***period***

no ip igmp startup-query-interval

default ip igmp startup-query-interval

Parameter

period startup query interval, in deciseconds. Value ranges from ***10*** (one second) to ***317440*** (8 hours, 49 minutes, 4 seconds). Default is ***31*** seconds.

Example

This command configures the startup query count of ***600*** deciseconds for ***vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp startup-query-interval 600
switch(config-if-Vl4)#
```

16.2.8.50 ip igmp static-group

The **ip igmp static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

Note: To become a static member of a multicast group, the switch must be the PIM Designated Router (DR) for the network. If it is not, you can use the **pim ipv4 dr-priority** command to make it the DR by configuring its PIM DR value to be the highest on the network.

The **no ip igmp static-group** and **default ip igmp static-group** commands remove the configuration mode interface group membership by removing the corresponding **ip igmp static-group** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp static-group ***group_address*** [**SOURCE_ADDRESS**]

no ip igmp static-group ***group_address*** [**SOURCE_ADDRESS**]

default ip igmp static-group ***group_address*** [**SOURCE_ADDRESS**]

Parameters

- ***group_address*** IPv4 address of multicast group for which the interface fast-switches packets.
- **SOURCE_ADDRESS** IP address of host that originates multicast data packets.
  - ***no parameter*** all multicast messages of the specified group are fast-switched.
  - ***ipv4_address*** source IP address (dotted decimal notation).

Related Commands

- **ip igmp static-group acl** configures the configuration mode interface as a static member of the multicast groups specified by an IP Access Control List (ACL).
- **ip igmp static-group range** configures the configuration mode interface as a static member of multicast groups specified by an address range.

  One **ip igmp static-group range** command is equivalent to multiple **ip igmp static-group** commands.

Example

These commands configure ***interface vlan 15*** as the PIM designated router, then configure it as a static member of the multicast group at address ***231.1.1.15*** for multicast data packets that originate at ***10.1.1.1***.

```
switch(config)# interface vlan 15
switch(config-if-Vl15)# pim ipv4 dr-priority 5000
switch(config-if-Vl15)# ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#
```

16.2.8.51 ip igmp static-group acl

The **ip igmp static-group acl** command configures the configuration mode interface as a static member of the multicast groups specified by an IP Access Control List (ACL). This command is a variant of the **ip igmp static-group** command that uses ACL rules to specify a set of source-multicast group address pairs instead of specifying a single pair. Multiple static-group ACLs can be assigned to an interface. Static groups can be assigned manually and through ACLs simultaneously.

Access control lists that this command references must contain rules of the following format.

- **permit <protocol><source><destination>**, where
  - **<protocol>** has no effect on the static group.
  - **<source>** address of host originating multicast data packets. Must be a host address.
  - **<destination>** multicast group IP address or subnet. Must be a valid multicast.

An ACL can contain multiple rules. An ACL can be applied to an interface only when all of its rules comply to the specified restrictions. The **show ip igmp static-groups acl** displays the source-multicast group pairs that the specified list configures and lists issues with illegal rules.

The **no ip igmp static-group acl** and **default ip igmp static-group acl** commands remove the specified static group ACL command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp static-group acl ***list_name***

no ip igmp static-group acl

default ip igmp static-group acl

Parameters

list_name ACL that specifies multicast group addresses for which interface fast-switches packets.

Example

This command configures ***vlan 4*** as a static member of the multicast group specified by the ACL named ***LIST_1***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp static-group acl LIST_1
switch(config-if-Vl4)#
```

16.2.8.52 ip igmp static-group range

The **ip igmp static-group range** command configures the configuration mode interface as a static member of multicast groups specified by an address range. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, no static group memberships are configured on interfaces.

This command is a variant of the **ip igmp static-group** command that allows the assignment of a subnet range of source addresses or a subnet range of multicast groups. A single **ip igmp static-group range** command is the equivalent of multiple **ip igmp static-group** commands, each of which can only assign a single multigroup-source pair to an interface. Running-config converts the range command to the equivalent list of **ip igmp static-group** commands.

If the command includes a source address range, only multicast group messages received from the range are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

The **no ip igmp static-group range** and **default ip igmp static-group range** commands remove the specified range of static group statements from ***running-config***. The **no ip igmp static-group** and **default ip igmp static-group** commands can remove an individual static-group command that was initially added to ***running-config*** by an **ip igmp static-group range** command.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp static-group range **GROUP_ADDR**[**SOURCE_ADDR**]

no ip igmp static-group range **GROUP_ADDR**[**SOURCE_ADDR**]

default ip igmp static-group range **GROUP_ADDR**[**SOURCE_ADDR**]

Parameters

- **GROUP_ADDR** address of multicast group for which the interface fast-switches packets.
  - ***gp_ipv4_addr*** multicast group IPv4 address.
  - ***gp_ipv4_subnet*** IPv4 subnet address of multicast groups (CIDR or address-mask).
- **SOURCE_ADDR** IP address of a host range that originates multicast data packets.
  - ***no parameter*** all multicast messages of the specified range are fast-switched.
  - **source *sr_ipv4_address*** source IPv4 address (dotted decimal notation).
  - **source *sr_ ipv4_subnet*** IPv4 subnet address of source hosts (CIDR or address- mask).

Note: A command cannot specify a subnet address for both multicast group and source.

Examples

- This command configures ***interface vlan 4*** as a static member of the multicast group range ***241.1.4.1/24*** for data packets that originate at ***10.1.1.1***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp static-group range 239.1.4.1/24 source
 10.1.1.1
switch(config-if-Vl4)#
```

- This command attempts to configure ***interface vlan 4*** as a static member of the multicast group range ***241.1.4.1/24*** for data packets that originate at the ***10.1.1.1/29*** subnet. Because the range and source cannot both be subnets, this command generates an error message.

```
switch(config-if-Vl4)# ip igmp static-group range 239.1.1.1/29 source
 16.1.1.1/29
% Error: cannot specify source range with group range
switch(config-if-Vl4)#
```

16.2.8.53 ip igmp version

The **ip igmp version** command configures the Internet Group Management Protocol (IGMP) version on the configuration mode interface. Version 3 is the default IGMP version.

IGMP is enabled by the **pim ipv4 sparse-mode** or **pim ipv4 bidirectional** command. The **ig igmp version** command does not affect the IGMP enabled status.

The **no ip igmp version** and **default ip igmp version** commands restore the configuration mode interface to IGMP version 3 by removing the **ip igmp version** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp version ***version_number***

no ip igmp version

default ip igmp version

Parameters

version_number IGMP version number. Value ranges from ***1*** to ***3***.

Example

This command configures IGMP version 3 on ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp version 3
switch(config-if-Vl4)#
```

16.2.8.54 permit / deny

The **permit** command configures the configuration mode IGMP profile as a permit list. Applying a permit list to an interface restricts that interface from joining any multicast group not included in the list.

IGMP profiles are deny lists by default. When applied to an interface, a deny list allows the interface to join any multicast group that is not included in the list.

The **deny** command restores the IGMP list to its default type by removing the corresponding **permit** statement from ***running-config***.

The **range** command adds and removes address ranges from the configuration mode profile.

Command Mode

IGMP-profile Configuration

Command Syntax

permit

deny

Related Commands

ip igmp profile places the switch in ***igmp-profile*** configuration mode.

Example

These commands enter ***igmp-profile*** configuration mode and configure the profile as permit ***list_1***.

```
switch(config)# ip igmp profile list_1
switch(config-igmp-profile-list_1)# permit
switch(config-igmp-profile-list_1)#
```

16.2.8.55 range

The **range** command specifies an address range for the configuration mode IGMP profile. A permit range specifies the groups that an interface is permitted to join. A deny range specifies the groups that an interface is not permitted to join. The **permit / deny** command specifies the range type.

A profile may contain multiple range statements to define a discontiguous address range.

The **no range** and **default range** commands remove the specified address range from a previous specified list.

Command Mode

igmp-profile Configuration

Command Syntax

range ***init_address*** [**UPPER_RANGE**]

no range ***init_address*** [**UPPER_RANGE**]

default range ***init_address*** [**UPPER_RANGE**]

Parameters

- ***init_address*** IP address of lower boundary of the address range (dotted decimal notation).
- **UPPER_RANGE** sets the upper boundary of the address range. Options include:
  - ***no parameter*** upper boundary is equal to lower boundary: range consists of one address.
  - ***range_address*** IP address of upper boundary.

    All addresses must be multicast addresses (***10.0.0.0*** to ***239.255.255.255***).

Related Commands

ip igmp profile places the switch in the ***igmp-profile*** configuration mode.

Example

These commands enter the ***igmp-profile*** configuration mode, configure the profile as a permit list, and define the permit address list of ***232.1.1.0 to 232.1.1.255*** and ***233.1.1.10***.

```
switch(config)# ip igmp profile list_1
switch(config-igmp-profile-list_1)# permit
switch(config-igmp-profile-list_1)# 232.1.1.0 232.1.1.255
switch(config-igmp-profile-list_1)# 233.1.1.10
switch(config-igmp-profile-list_1)# ip igmp profile
```

16.2.8.56 show igmp snooping querier

The **show igmp snooping querier** command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

Command Mode

EXEC

Command Syntax

show igmp snooping querier [**STATUS**][**VLAN_ID**][**DATA**]

Parameters

- **STATUS** specifies the type of information displayed. Options include:
  - ***no parameter*** querier IP address, port, and IGMP version.
  - **status** querier configuration parameters.
- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - ***no parameter*** displays VLAN number and port-list for each group.
  - **detail** displays port-specific data for each group; includes transmission times and expiration.

Examples

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch> show igmp snooping querier
Vlan  IP Address       Version  Port
---------------------------------------
1     172.17.0.37      v2       Po1
20    172.17.20.1      v2       Po1
26    172.17.26.1      v2       Cpu
2028  172.17.255.29    v2       Po1
switch>
```

- This command displays the querier configuration parameters for each VLAN.

```
switch> show igmp snooping querier status
   Global IGMP Querier status
-----------------------------------
admin state              : Enabled
source IP address        : 0.0.0.0
query-interval (sec)     : 125.0
max-response-time (sec)  : 10.0
querier timeout (sec)    : 130.0

Vlan Admin    IP             Query    Response Querier Operational
     State                   Interval Time     Timeout State
-----------------------------------------------------------------------
1    Enabled  0.0.0.0         125.0    10.0     130.0   Non-Querier
4    Enabled  0.0.0.0         125.0    10.0     130.0   Non-Querier
20   Enabled  0.0.0.0         125.0    10.0     130.0   Non-Querier
22   Enabled  0.0.0.0         125.0    10.0     130.0   Non-Querier
28   Enabled  0.0.0.0         125.0    10.0     130.0   Non-Querier
```

16.2.8.57 show igmp snooping querier counters

The **show igmp snooping querier counters** command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Command Mode

EXEC

Command Syntax

show igmp snooping querier counters [**VLAN_ID**]

Parameters

VLAN_ID specifies VLANs for which command displays information. Options include:

- ***no parameter*** displays information for all VLANs.
- **vlan *v_num*** displays information for specified VLAN.

Example

This command displays the counters from the querier.

```
switch> show igmp snooping querier counters
---------------------------------------------------------------------------
Vlan: 1    IP Addr: 100.0.0.1       Op State: Querier     Version:  v3

v1 General Queries Sent         :0
v1 Queries Received             :0
v1 Reports Received             :0
v2 General Queries Sent         :1
v2 Queries Received             :0
v2 Reports Received             :25
v2 Leaves Received              :0
v3 General Queries Sent         :655
v3 GSQ Queries Sent             :0
v3 GSSQ Queries Sent            :8
v3 Queries Received             :654
v3 Reports Received             :2385
Error Packets                   :0
Other Packets                   :0
switch>
```

16.2.8.58 show igmp snooping querier membership

The **show igmp snooping querier membership** command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Command Mode

EXEC

Command Syntax

show igmp snooping querier membership [**VLAN_ID** [**GROUP_LIST**]]

Parameters

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - ***no parameter*** displays information for all VLANs.
  - **vlan *v_num*** displays information for specified VLAN.
- **GROUP_LIST** list of groups for which the command displays information. Options include:
  - ***no parameter*** all multicast groups within specified VLAN.
  - **group *ipv4_addr*** single multicast group address (dotted decimal notation).

Example

This command displays the membership from the querier for ***vlan 1***.

```
switch> show igmp snooping querier membership
-------------------------------------------------------------------------
Vlan: 1    Elected: 10.0.0.1       QQI: 125  QRV: 2  QRI: 10  GMI: 260

Groups           Mode  Ver  Num of Sources
-------------------------------------------------------------------------
10.0.0.2        EX    v3   0 []
10.0.0.3        IN    v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4        EX    v3   0 []
10.0.0.13       EX    v3   0 []
10.0.0.22       EX    v3   0 []
10.0.0.1        IN    v3   3 [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```

16.2.8.59 show ip igmp groups

The **show ip igmp groups** command displays multicast groups that have receivers directly connected to the switch, as learned through Internet Group Management Protocol (IGMP).

- **show ip igmp groups** all multicast groups.
- **show ip igmp groups *group_addr*** listed multicast group.
- **show ip igmp groups interface *int_name*** all multicast groups on specified interfaces
- **show ip igmp groups *group_addr* interface *int_name*** listed multicast group on specified interface.

Command Mode

EXEC

Command Syntax

show ip igmp groups GROUP_LIST [**DATA**]

Parameters

- **GROUP_LIST** list of groups for which the command displays information. Options include:
  - ***no parameter*** all multicast groups.
  - ***group_addr*** single multicast group address (dotted decimal notation).
  - **interface ethernet *e_num*** all multicast groups on specified Ethernet interface.
  - **interface loopback *l_num*** all multicast groups on specified Loopback interface.
  - **interface management *m_num*** all multicast groups on specified Management interface.
  - ***interface port-channel p_num*** all multicast groups on specified Port-Channel Interface.
  - ***interface vlan v_num*** all multicast groups on specified VLAN interface.
  - **interface vxlan *vx_num*** all multicast groups on specified VXLAN interface.
- **DATA** specifies the type of information displayed. Options include:
  - ***no parameter*** provides uptime, expiration, and address of reporter.
  - **detail** also include group mode and group source list.

Example

This command displays multicast groups with receivers directly connected to the switch.

```
switch> show ip igmp groups
NOTE: static-group information not shown below.  Use the
      'show ip igmp static-groups' command.
IGMP Connected Group Membership

switch>
```

16.2.8.60 show ip igmp groups count

The **show ip igmp groups count** command displays the number of multicast groups that are joined across the specified interfaces.

Command Mode

EXEC

Command Syntax

show ip igmp groups [**GROUP_LIST**] **count**

Parameters

- **INTERF** Specifies the interface for which the command displays information. Options include:
  - ***no parameter*** all IGMP interfaces.
  - **interface ethernet *e_num*** Ethernet interface.
  - **interface loopback *l_num*** Loopback interface.
  - **interface management *m_num*** Management interface.
  - **interface port-channel *p_num*** Port-Channel Interface.
  - **interface vlan *v_num*** VLAN interface.
  - **interface vxlan *vx_num*** VXLAN interface.

Examples

- This command displays the number of multicast groups joined across all interfaces.

```
switch> show ip igmp groups count
Number of total groups joined across all IGMP interfaces: 5
switch>
```

- This command displays the number of multicast groups joined on ***interface ethernet 3/4***.

```
switch> show ip igmp groups interface ethernet 3/4 count
Number of groups joined on Ethernet3/4: 2
switch>
```

16.2.8.61 show ip igmp host-proxy config-sanity

The **show ip igmp host-proxy config-sanity** command displays diagnostic information about an IGMP host proxy configuration.

Command Mode

EXEC

Command Syntax

show ip igmp host-proxy config-sanity

Example

This command displays IGMP host proxy configuration diagnostic information.

```
switch> show ip igmp host-proxy config-sanity
Below are hints of potential IGMP Host-Proxy misconfigurations
IGMP host-proxy configured on interface Test3:
Access-lists having "deny ip any any" rule:
acl1
acl2
Groups with overlapping permit and deny configurations:
192.168.1.1/32
192.168.2.2/32
192.168.4.4/32
Groups with source filters configured with IGMP Host-Proxy set to version
 2 :
192.168.2.2/32
192.168.3.0/24
192.168.3.3/32
192.168.8.8/32
switch>
```

16.2.8.62 show ip igmp host-proxy interface

The **show ip igmp host-proxy interface** command displays per-interface IGMP host-proxy configuration information, including the IGMP groups joined on the interface. Command filters allow the list to display only data for a specified interface and to include packet counter statistics in the display.

Command Mode

EXEC

Command Syntax

show ip igmp host-proxy interface [***interface***] [**detail**]

Parameters

- ***interface*** optional parameter to limit the display to a single interface. Omitting the parameter displays host-proxy configuration information for all interfaces on which IGMP host-proxy is configured. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** port-channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
- **detail** use this optional keyword to include packet counter statistics in the display.

Examples

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured.

```
switch> show ip igmp host-proxy interface
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface Group Address IncludeSrc ExcludeSrc
Test2 172.16.89.0
Test2 172.16.0.0 20.0.0.0
Test2 172.16.0.0 10.0.0.0
Test2 192.168.110.0 20.0.0.0
```

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured, plus host-proxy statistics.

```
switch> show ip igmp host-proxy interface detail
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface Group Address IncludeSrc ExcludeSrc
Test2 172.16.89.0
Test2 172.16.0.0 20.0.0.0
Test2 172.16.0.0 10.0.0.0
Test2 192.168.110.0 20.0.0.0
IGMP host-proxy statistics:
IGMP v1 Queries received: 0
IGMP v2 General-Queries received: 0
IGMP v2 Group-Queries received: 0
IGMP v3 General-Queries received: 0
IGMP v3 Group-Queries received: 0
IGMP v3 Group-Source Queries received: 0
IGMP v1 Reports sent: 0
IGMP v2 Reports sent: 0
IGMP v3 Reports sent: 1
```

16.2.8.63 show ip igmp interface

The **show ip igmp interface** command displays multicast information about the specified interface.

Command Mode

EXEC

Command Syntax

show ip igmp interface [**INT_NAME**]

Parameters

INT_NAME Interface type and number. Values include:

- ***no parameter*** Displays information for all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *p_num*** VLAN interface specified by ***p_num***.
- **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.

Example

This command displays multicast related information about ***vlan 26***.

```
switch> show ip igmp interface vlan 26
Vlan26 is up
  Interface address: 172.17.26.1/23
  IGMP on this interface: enabled
  Multicast routing on this interface: enabled
  Multicast TTL threshold: 1
  Current IGMP router version: 2
  IGMP query interval: 125 seconds
  IGMP max query response time: 100 deciseconds
  Last member query response interval: 10 deciseconds
  Last member query response count: 2
  IGMP querier: 172.17.26.1
  Robustness: 2
  Require router alert: enabled
  Startup query interval: 312 deciseconds
  Startup query count: 2
  General query timer expiry: 00:00:22
  Multicast groups joined:
    239.255.255.250
switch>
```

16.2.8.64 show ip igmp profile

The **show ip igmp profile** command displays the contents of the specified IGMP profile. IGMP snooping filters use an IGMP profile to control the multicast groups that an interface can join.

Command Mode

EXEC

Command Syntax

show ip igmp profile [**PROFILES**]

Parameters

PROFILES IGMP profiles for which command displays contents. Options include:

- ***no parameter*** displays all IGMP profiles.
- ***profile_name*** displays specified profile.

Example

This command displays the IGMP profiles configured on the switch.

```
switch> show ip igmp profile
IGMP Profile list_1
permit
range 229.1.24.0 229.1.25.255
IGMP Profile list_2
deny
range 234.1.1.0 234.1.255.255
switch>
```

16.2.8.65 show ip igmp snooping

The **show ip igmp snooping** command displays the switch IGMP snooping configuration.

Command Mode

EXEC

Command Syntax

show ip igmp snooping [**VLAN_ID**]

Parameters

VLAN_ID specifies VLANs for which command displays information. Options include:

- ***no parameter*** displays information for all VLANs.
- **vlan *v_num*** displays information for specified VLAN.

Example

This command displays the switch IGMP snooping configuration.

```
switch> show ip igmp snooping
   Global IGMP Snooping configuration:
-------------------------------------------
IGMP snooping                   : Enabled
Robustness variable             : 2

Vlan 1 :
----------
IGMP snooping                   : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 20 :
----------
IGMP snooping                   : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 26 :
----------
IGMP snooping                   : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 2028 :
----------
IGMP snooping                   : Enabled
Multicast router learning mode : pim-dvmrp
switch>
```

16.2.8.66 show ip igmp snooping counters

The **show ip igmp snooping counters** command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

Command Mode

EXEC

Command Syntax

show ip igmp snooping counters [**DATA_TYPE**][**DATA_LEVEL**]

Parameters

- **DATA_TYPE** Information displayed by the command. Options include:
  - ***no parameter*** displays transmission counters.
  - **errors** displays error counters.
- **DATA_LEVEL** specifies the type of information displayed. Options include:
  - ***no parameter*** number of packets on physical ports.
  - **detail** number of packets on physical ports.

Example

This command displays the number of messages received on each port.

```
switch> show ip igmp snooping counters
                      Input                    |            Output

```

16.2.8.67 show ip igmp snooping counters ethdev-pams

The **show ip igmp snooping counters** command displays the number of dropped IGMP packets messages sent and received through each switch port at the kernel level. The display table sorts the messages by type.

Command Mode

EXEC

Command Syntax

show ip igmp snooping counters ethdev-pams

Example

This command displays the number of messages dropped at the kernel level.

```
switch> show ip igmp snooping counters ethdev-pams
  IntfName   rxErrors   txErrors    txDrops
       et9          1          0          0

16.2.8.68 show ip igmp snooping groups

The **show ip igmp snooping groups** command displays IGMP snooping statistics. Available information includes the physical ports that send and receive information, the time when multicast data was originally and most recently heard on the ports, and the version number of the IGMP messages. Command provides options that restrict the output to specific VLANs, ports, and groups.

Command Mode

EXEC

Command Syntax

show ip igmp snooping groups ***proxy*** [**VLAN_ID**][**PORT_INT**][**GROUPS**][**DATA local**]

Parameters

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - ***no parameter*** displays information for all VLANs.
  - **vlan *v_num*** displays information for VLAN ***v_num*** (***1*** to ***4094***).
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - ***no parameter*** displays information for all physical ports.
  - **interface ethernet *e_range***, where ***e_range*** is the number, range, or list of Ethernet ports.
  - **interface port-channel *p_range***, where ***p_range*** is the number, range, or list of channel ports.
- **GROUPS** specifies the multicast groups. Options include:
  - ***no parameter*** all multicast groups on all specified ports.
  - ***mgroup_address*** multicast group specified by IPv4 address (dotted decimal notation).
  - **dynamic** multicast groups learned through IGMP.
  - **user** multicast groups manually added.
- **DATA** specifies the type of information displayed. Options include:
  - ***no parameter*** VLAN number and port-list for each group.
  - **detail** port-specific information for each group, including transmission times and expiration.
- **proxy** displays IGMP snooping proxy information.
- **local** displays the overlay with locally attached receivers.

Examples

- This command displays the port lists for all multicast groups.

```
switch> show ip igmp snooping groups
Vlan  Group            Type     Version      Port-List
-----------------------------------------------------------------------

Note: Tthe port PIM-Tunnel indicates that packets destined to these groups is encapsulated in a multicast header and sent over the underlay network.

16.2.8.69 show ip igmp snooping groups count

The **show ip igmp snooping groups count** command displays the number of multicast groups on the switch. Command provides options to only include specific VLANs and ports.

Command Mode

EXEC

Command Syntax

show ip igmp snooping groups [**VLAN_ID**][**PORT_INT**] **count** [**DATA**]

Parameters

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** specified VLAN.
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - ***no parameter*** all physical ports.
  - **interface ethernet *e_range*** specified Ethernet ports.
  - **interface port-channel *p_range*** specified port channels.

    Valid ***e_range*** and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **DATA** specifies the type of information displayed. Options include:
  - ***no parameter*** number of multicast group on specified VLAN and ports.
  - **detail** number of multicast group on specified VLAN and ports.

Example

This command displays the number of multicast groups on the switch.

```
switch> show ip igmp snooping groups count
Total number of multicast groups: 2
switch>
```

16.2.8.70 show ip igmp snooping mrouter

The **show ip igmp snooping mrouter** command displays the status of dynamic and static multicast router ports. Command provides options to include only specific VLANs.

Command Mode

EXEC

Command Syntax

show ip igmp snooping mrouter [**VLAN_ID**][**DATA**]

Parameters

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - ***no parameter*** displays VLAN number and port-list for each group.
  - **detail** displays port-specific data for each group; includes transmission times and expiration.

Examples

- This command displays port information of each multicast router on all VLANs.

```
switch> show ip igmp snooping mrouter
Vlan    Interface-ports
---------------------------------------
1       Po1(dynamic)
20      Po1(dynamic)
26      Cpu(dynamic)
2028    Cpu(dynamic), Po1(dynamic)
switch>
```

- This command displays multicast router information for each port.

```
switch> show ip igmp snooping mrouter detail
Vlan   Intf      Address           FirstHeard LastHeard  Expires    Type
------------------------------------------------------------------------------
1      Po1       172.17.0.37       31549:12   0:12       1:33       pim
20     Po1       172.17.20.1       7066:51    0:19       1:26       pim
26     Cpu       172.17.26.1       31549:16   0:28       1:17       pim
2028   Po1       172.17.255.29     31549:10   0:18       1:27       pim
2028   Cpu       172.17.255.30     31549:14   0:28       1:17       pim
switch>
```

16.2.8.71 show ip igmp snooping report-flooding

The **`show ip igmp snooping report-flooding`** command displays IGMP snooping L2 report flooding configuration and status information. Command provides options to only include specific VLANs.

Command Mode

EXEC

Command Syntax

`show ip igmp snooping report-flooding` [**VLAN_ID**][**DATA**]

Parameters

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
  - ***no parameter*** displays VLAN number and port-list for each group.
  - **detail** displays port-specific data for each group; includes transmission times and expiration.

16.2.8.72 show ip igmp static-groups

The **show ip igmp static-groups** command displays information about all configured IGMP multicast static groups. IGMP multicast static groups are assigned with the **ip igmp static-group** command.

Command Mode

EXEC

Command Syntax

show ip igmp static-groups [**INFO_LEVEL**][interface **INT_NAME**]

Parameters

- **INFO_LEVEL** specifies the type of information displayed. Options include:
  - ***no parameter*** VLAN number and port-list for each group.
  - **detail** port-specific information for each group, including transmission times and expiration.
- **INT_NAME** Interface type and number. Values include:
  - ***no parameter*** static groups on all interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.

Related Commands

- **show ip igmp static-groups acl**
- **show ip igmp static-groups group**

Examples

- This command displays information about all multicast static groups.

```
switch> show ip igmp static-groups
Interface Vlan281:
        Manually configured groups:
Interface Port-Channel999:
        Manually configured groups:
switch>
```

- This command displays information about the multicast static groups on ***interface vlan 21***.

```
switch> show ip igmp static-groups interface vlan 21
Interface Vlan281:
        Manually configured groups:
switch>
```

16.2.8.73 show ip igmp static-groups acl

The **show ip igmp static-groups acl** command displays information about the IGMP multicast static groups that are configured by the specified Access Control List (ACL). The command also displays problems with an ACL that prevent its assignment to an interface.

Command Mode

EXEC

Command Syntax

show ip igmp static-groups acl

Examples

- The following **show ip igmp static-group acl** command example references these ACLs:

```
ip access-list 1
   10 permit igmp host 10.1.1.1 10.1.1.0/29
   20 permit igmp host 10.1.1.2 10.1.1.0/29
!
ip access-list 2
   10 permit igmp 10.1.1.0/29 host 10.1.1.1
!
ip access-list 3
   10 deny igmp host 10.1.1.1 255.1.1.0/29
!
ip access-list 4
   10 permit igmp host 10.1.1.1 10.1.1.0/29
   20 permit igmp 10.1.1.0/29 host 10.1.1.1
```

- This command displays static group configuration data about the various ACLs.

```
switch> show ip igmp static-group acl 1
acl 1
        ( 10.1.1.1, 10.1.1.0/29 )
        ( 10.1.1.2, 10.1.1.0/29 )
Interfaces using this ACL for static groups:
        Ethernet12
switch>show ip igmp static-group acl 2
acl 2
        Seq no 30: source address must be a single host or *, not a
 range
Interfaces using this ACL for static groups:
        Ethernet8
switch>show ip igmp static-group acl 3
acl 4
        Seq no 10: action must be 'permit'
Interfaces using this ACL for static groups:
         none
switch>show ip igmp static-group acl 4
acl 5
        ( 10.1.1.1, 10.1.1.0/29 )
       Seq no 20: source address must be a single host or *, not a
 range
Interfaces using this ACL for static groups:
         none
switch>
```

16.2.8.74 show ip igmp static-groups group

The **`show ip igmp static-groups group`** command displays information about all specified IGMP multicast static groups. IGMP multicast static groups are assigned with the **ip igmp static-group** command.

Command Mode

EXEC

Command Syntax

`show ip igmp static-groups group` [**GROUP_LIST**]

Parameters

GROUP LIST Groups for which command displays information:

- ***no parameter*** all multicast groups.
- ***group_address*** single multicast group address (dotted decimal notation).

Related Commands

show ip igmp static-groups

16.2.8.75 show ip igmp statistics

The **`show ip igmp statistics`** command displays IGMP transmission statistics for the specified interface.

Command Mode

EXEC

Command Syntax

`show ip igmp statistics` [**INTERFACE_ID**]

Parameters

INTERFACE_ID Specifies tnterface for which command returns data. Options include:

- ***no parameter*** all interfaces.
- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by***l_num***.
- **interface management *m_num*** Management interface specified by ***m_num***.
- **interface port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.
- **interface vxlan *vx_num*** VXLAN interface specified by***vx_num***.

Example

This command displays IGMP transmission statistics for ***interface ethernet 1***.

```
switch> show ip igmp statistics interface ethernet 1
IGMP counters for Ethernet1:
  V1 queries sent: 0
  V2 queries sent: 0
  V3 queries sent: 3
  Total general queries sent: 3
  V3 group specific queries sent: 0
  V3 group-source specific queries sent: 0
  V1 queries received: 0
  V2 queries received: 0
  V3 queries received: 0
  V1 reports received: 0
  V2 reports received: 0
  V3 reports received: 14
  V2 leaves received: 0
  Error Packets received: 0
  Other Packets received: 0
switch>
```

16.3 Protocol Independent Multicast

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. Arista switches support two types of PIM: PIM Sparse Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

These sections describe the Arista PIM implementation:

16.3.1 Introduction

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in ***RFC 4601***, is a multicast routing protocol intended for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks. Bidirectional PIM (Bidir-PIM), defined in ***RFC 5015***, is a variant of PIM-SM designed for cases in which the receivers of multicast traffic are also sources and where scalability could affect optimization.

Arista switches support both PIM Sparse-Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

16.3.2 Overview

PIM builds and maintains multicast routing trees using Reverse Path Forwarding (RPF) on a unicast routing table. PIM is protocol-independent, and can use routing tables consisting of OSPF, BGP, RIP, and static routes. All sources send traffic to multicast groups through shared trees that have a common root node called the Rendezvous Point (RP).

PIM uses a Multicast Routing Information Base (MRIB) that is populated from the unicast table. The MRIB provides the next-hop router for each multicast destination subnet. This determines the next-hop neighbor for sending PIM join or prune messages.

16.3.2.1 PIM Sparse Mode

In PIM-SM, each host (sender or receiver) is associated with a Designated Router (DR) that acts for all directly connected hosts in PIM-SM transactions, and trees are unidirectional. Once sufficient traffic is flowing on a route it usually does not pass through the RP.

PIM-SM establishes multicast routes through three phases:

- Establishing the RP Tree
- Eliminating Encapsulation
- Establishing the Shortest Path Tree (SPT)

16.3.2.1.1 Establishing the RP Tree (Phase 1)

The RP tree is a distribution network that all sources share to deliver multicast data. The root of the RP tree is the Rendezvous Point.

The process starts when a receiver requests multicast data from a group (G). The receiver's DR sends a PIM (*,G) Join message toward the multicast group's RP. As the message travels towards the RP, it instantiates the multicast (*,G) state in each router on the path. Join messages converge on the RP to form the RP tree.

The DR resends Join messages periodically, while it has a receiver in the group, to prevent state timeout expiry in the routers along the path. When all receivers on a DRs subnet leave a group, the DR sends a (*,G) Prune message towards the RP to remove the state from the routers.

A multicast sender transmits multicast data to the RP through its DR. The DR encapsulates the multicast packets and sends them as unicast packets. The RP extracts the native multicast packet and sends it to the RP tree towards the group members.

16.3.2.1.2 Eliminating Multicast Encapsulation (Phase 2)

Data encapsulation, while initially required before the multicast path is established, is inefficient because it requires the transmission of data that is extraneous to multicast. Phase 2 establishes states in the routers that support the transmission of native multicast packets.

When the RP receives an encapsulated packet from source S on group G, it sends an (S,G) join message toward the source. As the message travels towards S, it instantiates the (S,G) state on each router in the path which is used to forward packets from source S destined for group G. Data packets on the (S,G) path are also routed into the RP tree when they encounter an (*,G) router.

When the RP starts receiving native packets from the sources, it sends a Register-Stop message to the sources DR, halting packet encapsulation. At this time, traffic flows natively from the source along a source-specific tree to the RP, then along the shared RP tree to the receivers.

16.3.2.1.3 Establishing the Shortest Path Tree (Phase 3)

The third phase establishes the shortest path from the multicast source to all receivers.

When a multicast packet arrives at the receiver, its router (typically the DR) sends a Join message towards the source to instantiate the (S,G) state in all routers along its path. The message eventually reaches either the sources subnet or a router that already has an (S,G) state. This causes data to flow from the source to the receiver following the (S,G) path. At this time, the receiver is receiving data from the Shortest Path Tree (SPT) and the RP tree (RPT).

The DR (or upstream router) eliminates the data transmission along the RPT by sending a prune message (S,G,rpt) towards the RP. The message instantiates the state on each router in the path, continuing until it reaches the RP or a router that needs traffic from the same source for other receivers.

16.3.2.2 Bidirectional PIM

Bidirectional PIM (Bidir-PIM) builds shared trees, rooted at the rendezvous point (RP), for each multicast group. Because the trees are based only on (*,G) routes, they can accommodate a much larger number of sources without overfilling the MFIB.

In Bidir-PIM, there is no multicast encapsulation or SPT establishment. All packets are natively forwarded toward the RP along shared, bidirectional trees. There are also no designated routers. Instead, a single designated forwarder (DF) is elected on each link to each RP, usually during the RP discovery process. The DF is the router with the shortest route to the RP based on the unicast routing table. It is responsible for forwarding upstream traffic toward the RP and forwarding downstream traffic toward the groups on its link. All routes pass through the RP, and multicast packets are sent from sources toward the RP and to receivers at each hop along the route.

Bidir-PIM elects DFs when a new RP is discovered, when the DF fails, or when there is a change that affects the topology of the link.

16.3.2.3 Rendezvous Points (RP)

In PIM-SM, an RP is a router that is configured as the root of multicast groups distribution tree. These distribution trees are not source-specific. The RP is the destination for both join messages from receivers and data from senders, allowing receivers discover sender identity and begin receiving group

traffic. In PIM-SM, paths through RP routers are temporary; when traffic volume reaches a sufficient level, the receiver joins a source-specific tree and the path through the RP is dropped. In Bidir-PIM, all paths pass through the RP, and all packets destined for a given multicast group are forwarded to the RP for that group.

RP addresses in Bidir-PIM must be routable from all sources in the domain, but do not have to correspond to any specific physical interface. Multiple groups can use the same RP for distribution.

The switch supports two methods of mapping RPs to multicast groups:

- **Static**: RPs are statically configured through a CLI statement.
- **Dynamic**: RPs are dynamically selected by a bootstrap router from a set of candidate RPs.

While dynamic RP mappings have priority over static maps by default, a static RP can be configured to override dynamic mappings.

Rendezvous Points (RPs) describes the configuration of rendezvous points.

16.3.3 Configuring PIM

This section describes the following configuration tasks:

- Enabling PIM IPv4 Sparse Mode
- Enabling PIM IPv6 Sparse Mode
- Enabling the S, G Expiry Timer Interval
- Enabling PIM Bidirectional
- Rendezvous Points (RPs)
- Hello Messages
- Hello Hold Time
- Designated Router Election
- Designated Forwarder Election
- Join-Prune Messages
- Legacy PIM Configuration in Global Configuration Mode
- Configuring PIM in a Non-default VRF

16.3.3.1 Enabling PIM IPv4 Sparse Mode

By default, IPv4 PIM is disabled on an interface. The **pim ipv4 sparse-mode** command enables PIM IPv4 Sparse Mode (PIM-SM) on the configuration mode interface. Enabling PIM on an interface enables IGMP on the interface as well.

Example

This command enables IPv4 PIM-SM and IGMP on ***interface vlan 8***.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# pim ipv4 sparse-mode
switch(config-if-Vl8)#
```

16.3.3.2 Enabling PIM IPv6 Sparse Mode

By default, IPv6 PIM is disabled on an interface. The **pim ipv6 sparse-mode** command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

Example

This command enables IPv6 PIM-SM on ***interface ethernet 15***.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# pim ipv6 sparse-mode
switch(config-if-Et15)#
```

16.3.3.3 Enabling the S, G Expiry Timer Interval

The **sg-expiry-timer** command enables expiry timer interval for the PIM-SM multicast routes. By default, thes command applies to the default VRF when the command is issued in the Router-Multicast Configuration mode. During the time of interval, there is no multicast traffic activity on the route.

Example

This command configures ***150*** seconds as the (S,G) expiry timer interval is in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#
```

16.3.3.4 Enabling PIM Bidirectional

By default, PIM is disabled on an interface. The **pim ipv4 bidirectional** command enables Bidirectional PIM (Bidir-PIM) on the configuration mode interface. Enabling PIM on an interface also enables IGMP on that interface.

Example

These commands enable Bidir-PIM and IGMP on ***interface vlan 9***.

```
switch(config)# interface vlan 9
switch(config-if-Vl9)# pim ipv4 bidirectional
switch(config-if-Vl9)#
```

16.3.3.5 Rendezvous Points (RPs)

The switch supports dynamic RPs, static RPs, and anycast RPs.

Configuring Static RPs

The **rp address** command configures a static RP, providing an option to override dynamic RPs.

Examples

- This command creates a static RP at ***10.17.255.83*** in the default VRF that maps to all multicast groups (***224/4***) and overrides dynamic RPs.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp address 10.17.255.83 override
switch(config-router-pim-sparse-ipv4)#
```

- This command creates a static RP at ***10.21.18.23*** in the default VRF that maps to the multicast groups at ***238.1.12.0/24***.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp address 10.21.18.23
 238.1.12.0/24
switch(config-router-pim-sparse-ipv4)#
```

Configuring Dynamic RPs

Dynamic RP selection is implemented through a BootStrap Router (BSR), which is a PIM router within the PIM domain that selects RPs from a list of candidates. A subset of PIM routers within the domain are configured as Candidate BootStrap Routers (C-BSRs). Through the exchange of BootStrap Messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. Holdtime is designated by the BSR router and communicated to other routers through BSMs.

Another subset of domain PIM routers are configured as Candidate RPs (C-RPs). The BSR creates a set of qualifying RPs from the list of C-RPs, then distributes the group-to RP mapping set to all domain routers through BSMs. Each PIM router, after receiving this set, uses a standard algorithm defined in ***RFC 6226*** to select one RP per multicast group.

The **candidate** command configures the switch as a Candidate BSR router (C-BSR). Command parameters specify the switchs BSR address, the interval between BSM transmissions, and the

switchs BSR priority rating. Priority ratings range from ***0*** to ***255*** with a default of ***64***. Higher numbers denote higher priority during BSR elections.

Example

These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to ***vlan interface 24*** as its BSR address. The BSM transmission interval is set to ***30*** seconds and the priority is set to ***192***.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# candidate vlan 24 priority 192
 interval 30
switch(config-router-pim-bsr-ipv4)#
```

The **holdtime** command specifies the value the switch inserts in the ***holdtime*** field of BootStrap Messages (BSMs) that it sends. This value becomes the holdtime for the PIM domain if the switch is elected as the BSR.

Example

These commands specify ***75*** seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# holdtime 75
switch(config-router-pim-bsr-ipv4)#
```

The rp candidate command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast groups dynamic RP set from the list of C-RPs. Command parameters specify the switchs RP address, C-RP advertisement interval, and priority rating. The priority rating is used by the BSR when selecting RPs. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

Running-config may contain multiple **`rp candidate`** statements to support multiple multicast groups:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from ***running-config***.
- ***Running-config*** stores the **interval** setting in a separate statement that applies to all **rp candidate** statements. Commands that specify an interval that differs from the previously configured value place the new value in ***running-config***. This new value applies to all **rp candidate** statements.

Example

These commands configure a switch as a candidate RP for the multicast group ***235.1.1.0/24***, with a priority of ***48*** and a RP advertisement interval of ***45*** seconds, in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp candidate vlan 24 235.1.1.0/24
 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```

By default, the switch transmits BootStrap router Messages (BSMs) over all PIM-enabled interfaces. The **pim bsr ipv4 border** command prevents the switch from transmitting BSMs over the configuration mode interface.

Example

This command prevents the switch from sending BSMs from ***interface vlan 10***.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# pim bsr ipv4 border
switch(config-if-Vl10)#
```

Anycast Rendezvous Points

A PIM anycast Rendezvous Point (anycast RP) defines a single RP address that exists on multiple devices. An anycast-RP set consists of the routers configured with the same anycast-RP address. An anycast RP provides redundancy protection and load balancing. The anycast-RP set supports all multicast groups.

The **anycast-rp** command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

Example

These commands configure a switch (IP address ***10.1.1.14***) into an anycast-RP set with an RP address of ***10.17.255.2*** in the default VRF. The anycast-RP set contains three other routers, located at 1***0.1.2.14***, ***10.1.3.14***, and ***10.1.4.14***. It sets the number of unacknowledged register messages it sends to each router at ***15***.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.1.14
 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.2.14
 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.3.14
 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.4.14
 register-count 15
switch(config-router-pim-sparse-ipv4)#
```

16.3.3.6 Hello Messages

PIM-SM multicast routers send PIM router query messages (hello messages) to elect a Designated Router (DR) for each subnet. The DR then sends registration messages to the RP.

The **pim ipv4 hello interval** command specifies the transmission interval between PIM hello messages originating from the specified VLAN interface.

Example

This command configures ***45*** second intervals between hello messages originating from ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 hello interval 45
switch(config-if-Vl4)#
```

16.3.3.7 Hello Hold Time

A PIM interface maintains a hold timer for each of its neighbors. The timer is reset whenever a hello message is received from the neighbor. When the timer expires, the neighbor is considered DOWN. The PIM interface can advertise its neighbor to use a higher hold time by modifying the hello interval, or by setting a higher hello count using the **pim ipv4 hello count** command. The hello count specifies

how many hello messages can be missed before the neighbor is considered down; the hold time is therefore the hello interval multiplied by the hello count.

Examples

- This command configures the PIM hold time on ***interface vlan2925*** to ***225*** seconds (7.5 times the 30-second hello interval).

```
switch(config)# interface vlan2925
switch(config-if-Vl2925)# pim ipv4 hello count 7.5
```

- This command displays the hold time on ***interface vlan2925***.

```
switch# show ip pim interface vlan2925 details
Interface Vlan2925 address is 1.0.1.1
Vif number is 0
PIM: enabled
PIM version: 2, mode: sparse
PIM neighbor count: 0
PIM Effective DR: 1.0.1.1 (this system)
PIM Effective DR Priority: 1
PIM Effective Propagation Delay: 500 milliseconds
PIM Effective Override Interval: 2500 milliseconds
PIM Effective Tracking Support: disabled
PIM Hello Interval: 30 seconds
PIM Hello Hold Time: 225 seconds <====== New Hold Time ( = 7.5 * 30 )
PIM Hello Priority: 1 seconds
PIM Hello Lan Delay: 500 milliseconds
PIM Assert Override Interval: 3 seconds
switch#
```

16.3.3.8 Designated Router Election

PIM-SM uses these criteria for electing a Designated Router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The **group-expiry-timer** command sets the DR priority value that the switch advertises. If ***running-config*** does not contain a **pim ipv4 dr-priority** statement, the switch does not advertise a DR priority value.

Examples

- This command configures a DR priority value of ***15*** on ***interface vlan 4***.

```
switch(config-if-Vl4)# pim ipv4 dr-priority 15
switch(config-if-Vl4)#
```

- This command removes the DR priority from ***interface vlan 4***.

```
switch(config-if-Vl4)# no pim ipv4 dr-priority
switch(config-if-Vl4)#
```

16.3.3.9 Designated Forwarder Election

Designated Forwarders (DFs) are elected based on route metrics in the unicast routing table; there are no configuration options that affect the selection of DFs.

16.3.3.10 Join-Prune Messages

Join/prune messages are sent by the PIM-SM Designated Router (DR) or the Bidir-PIM Designated Forwarder (DF) toward the Rendezvous Point (RP). These messages inform other PIM routers about clients that want to become receivers (join) or stop being receivers (prune) for the groups.

The **pim ipv4 join-prune interval** command specifies the period between join/prune messages that the switch originates from the specified VLAN interface and sends to the upstream RPF neighbor.

Example

This command configures ***75*** second intervals between join/prune messages originating from ***interface vlan 4***.

```
switch(config-if-Vl4)# pim ipv4 join-prune interval 75
switch(config-if-Vl4)#
```

16.3.3.11 Legacy PIM Configuration in Global Configuration Mode

Earlier versions of the EOS managed all non-interface-specific PIM configuration from Global Configuration Mode. Legacy configurations retain these global commands in ***running-config*** after upgrading to a newer version of the EOS, and the configurations are applied unchanged to the default VRF. PIM configuration commands entered in ***global*** onfiguration mode which can be applied to either PIM-SM or Bidir-PIM will be applied to PIM-SM. If any commands are added to ***running-config*** using the new configuration modes, all legacy commands will be converted to the new modal commands and applied in the default VRF.

Note: Multicast configuration commands issued in ***global*** configuration mode are now deprecated, and Arista recommends configuring all multicast parameters in the appropriate configuration mode (i.e., ***Router-Multicast*** Configuration, ***Router-PIM Sparse-mode*** Configuration, ***Router-PIM Bidirectional*** Configuration, ***Router-PIM BSR*** Configuration, or ***Router-MSDP*** Configuration).

16.3.3.12 Configuring PIM in a Non-default VRF

For PIM to function in a non-default VRF, the VRF must be created and configured for multicast traffic, and routed ports must be added to the VRF. Once this is accomplished, configure VRF-global PIM parameters by using the **vrf** command within a PIM configuration mode to place the switch in a PIM VRF configuration submode.

Interface-specific PIM parameters are configured in the ***interface-configuration*** mode for VRF-member interface.

Legacy multicast routing commands issued in ***global*** configuration mode are applied to the default VRF, but are now deprecated and are available only for backward compatibility. If any PIM commands are issued in the new format, all legacy commands remaining in ***running-config*** will be replaced with their updated equivalents and applied to the default VRF.

16.3.3.12.1 Preparing the VRF for PIM Configuration

The following steps prepare a non-default VRF to use PIM:

1. Enable unicast routing in the default VRF.

```
switch(config)# ip routing vrf default
```

2. Create the non-default VRF if not already created.

```
switch(config)# vrf instance purple
```

3. Enable enable unicast routing on the new VRF.

```
switch(config-vrf-purple)# exit
switch(config)# ip routing vrf purple
```

4. Add participating routed ports to the new VRF.

```
switch(config)# interface ethernet 9/2-9/4
switch(config-if-Et9/2-4)# no switchport
switch(config-if-Et9/2-4)# vrf purple
switch(config-if-Et9/2-4)# exit
```

5. Enable multicast routing on the new VRF.

```
switch(config)# router multicast
switch(config-router-multicast)# vrf purple
switch(config-router-multicast-vrf-purple)# ipv4
switch(config-router-multicast-vrf-purple-ipv4)# routing
```

16.3.3.12.2 Configuring Global PIM Parameters in a Non-default VRF

Global PIM parameters for non-default VRFs are configured in the VRF submode of the appropriate PIM configuration mode.

Example

These commands configure a switch as a candidate RP for the multicast group ***235.1.1.0/24***, with a priority of ***48*** and a RP advertisement interval of ***45*** seconds, in VRF ***purple***.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# vrf purple
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-vrf-purple-ipv4)# rp candidate vlan 24
 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-vrf-purple-ipv4)#
```

16.3.3.12.3 Configuring Interface-specific PIM Parameters in a Non-default VRF

Interface-specific PIM parameters for member interfaces of a non-default VRF are configured just as they are for the default VRF: in the ***interface-configuration*** mode for the interface.

16.3.4 Multicast Example

This section provides an example network that implements multicast (PIM-SM) in the default VRF and includes the required commands.

16.3.4.1 Diagram

Figure 67: Multicast Example displays the multicast network example. The network contains four routers. Multicast routing (PIM-SM) is enabled on two switches. One switch has its IGMP Snooping Querier enabled.

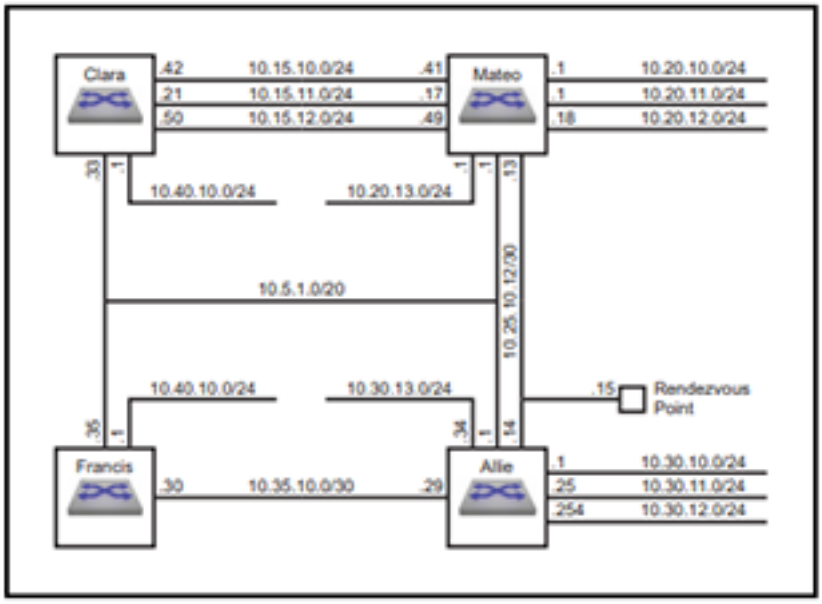

Figure 67: Multicast Example

The example multicast network implements these multicast parameters:

Rendezvous Point Address: 10.25.10.15

Switch Clara

- IGMP Snooping: disabled
- Subnet Summary:
  - ***10.40.10.0/24***: ***vlan 11***
  - ***10.15.10.0/24***: ***vlan 12***
  - ***10.15.11.0/24***: ***vlan 13***
  - ***10.15.12.0/24***: ***vlan 14***
  - ***10.5.1.0/20***: ***vlan 10***

Switch Mateo

- IGMP Snooping: disabled
- Subnet Summary:
  - ***10.20.13.0/24***: ***vlan 18***
  - ***10.20.10.0/24***: ***vlan 15***
  - ***10.20.11.0/24***: ***vlan 16***
  - ***10.20.12.0/24***: ***vlan 17***
  - ***10.15.10.0/24***: ***vlan 12***
  - ***10.15.11.0/24***: ***vlan 13***
  - ***10.15.12.0/24***: ***vlan 14***
  - ***10.25.10.12/30***: ***vlan 19***
  - ***10.5.1.0/20***: ***vlan 10***

Switch Allie

- IGMP Snooping: enabled

- Multicast Routing: enabled
- Querier: enabled
- Rendezvous Point Address: ***10.25.10.15***
- MFIB activity polling interval: ***5*** second
- Subnet Summary:
  - ***10.30.13.0/24***: ***vlan 23***
  - ***10.30.10.0/24***: ***vlan 20*** PIM-SM enabled
  - ***10.30.11.0/24***: ***vlan 21*** PIM-SM enabled
  - ***10.30.12.0/24***: ***vlan 22***
  - ***10.25.10.12/30***: ***vlan 19***
  - ***10.35.10.0/30***: ***vlan 24*** PIM-SM enabled
  - ***10.5.1.0/20***: ***vlan 10*** PIM-SM enabled

Switch Francis

- IGMP Snooping: enabled
- Multicast Routing: enabled
- Subnet Summary:
  - ***10.40.10.0/24***: ***vlan 25*** PIM-SM enabled
  - ***10.35.10.0/30***: ***vlan 24*** PIM-SM enabled
  - ***10.5.1.0/20***: ***vlan 10***

16.3.4.2 Example

This example configures PIM-SM.

1. Configure the interface addresses.
   a. Router Clara interfaces.

```
Clara(config)# interface vlan 11
Clara(config-if-vl11)# ip address 10.40.10.1/24
Clara(config-if-vl11)# interface vlan 12
Clara(config-if-vl12)# ip address 10.15.10.42/24
Clara(config-if-vl12)# interface vlan 13
Clara(config-if-vl13)# ip address 10.15.11.21/24
Clara(config-if-vl13)# interface vlan 14
Clara(config-if-vl14)# ip address 10.15.12.50/24
Clara(config-if-vl14)# interface vlan 10
Clara(config-if-vl10)# ip address 10.5.1.33/20
Clara(config-if-vl10)# router ospf 1
Clara(config-router-ospf)# redistribute static
```

   b. Router Mateo interfaces.

```
Mateo(config)# interface vlan 18
Mateo(config-if-vl18)# ip address 10.20.13.1/24
Mateo(config-if-vl18)# interface vlan 15
Mateo(config-if-vl15)# ip address 10.20.10.1/24
Mateo(config-if-vl15)# interface vlan 16
Mateo(config-if-vl16)# ip address 10.20.11.1/24
Mateo(config-if-vl16)# interface vlan 17
Mateo(config-if-vl17)# ip address 10.20.12.16/24
Mateo(config-if-vl17)# interface vlan 12
Mateo(config-if-vl12)# ip address 10.15.10.41/24
Mateo(config-if-vl12)# interface vlan 13
Mateo(config-if-vl13)# ip address 10.15.11.17/24
```

```
Mateo(config-if-vl13)# interface vlan 14
Mateo(config-if-vl14)# ip address 10.15.12.49/24
Mateo(config-if-vl14)# interface vlan 19
Mateo(config-if-vl19)# ip address 10.25.10.13/30
Mateo(config-if-vl19)# interface vlan 10
Mateo(config-if-vl10)# ip address 10.5.1.1/20
Mateo(config-if-vl10)# router ospf 1
Mateo(config-router-ospf)# redistribute static
```

c. Router Allie interfaces.

```
Allie(config)# interface vlan 23
Allie(config-if-vl23)# ip address 10.30.13.34/24
Allie(config-if-vl23)# interface vlan 20
Allie(config-if-vl20)# ip address 10.30.10.1/24
Allie(config-if-vl20)# interface vlan 21
Allie(config-if-vl21)# ip address 10.30.11.25/24
Allie(config-if-vl21)# interface vlan 22
Allie(config-if-vl22)# ip address 10.30.12.254/24
Allie(config-if-vl22)# interface vlan 19
Allie(config-if-vl19)# ip address 10.25.10.14/30
Allie(config-if-vl19)# interface vlan 24
Allie(config-if-vl24)# ip address 10.35.10.29/30
Allie(config-if-vl24)# interface vlan 10
Allie(config-if-vl10)# ip address 10.5.1.1/20
Allie(config-if-vl10)# router ospf 1
Allie(config-router-ospf)# redistribute static
```

d. Router Francis interfaces.

```
Francis(config)# interface vlan 25
Francis(config-if-vl25)# ip address 10.40.10.1/24
Francis(config-if-vl25)# interface vlan 24
Francis(config-if-vl24)# ip address 10.35.10.30/24
Francis(config-if-vl24)# interface vlan 10
Francis(config-if-vl10)# ip address 10.5.1.35/24
Francis(config-if-vl10)# router ospf 1
Francis(config-router-ospf)# redistribute static
```

2. Configure the interface multicast parameters.

a. Router Allie interfaces.

```
Allie(config-router-ospf)# interface vlan 20
Allie(config-if-vl20)# pim ipv4 sparse-mode
Allie(config-if-vl20)# interface vlan 21
Allie(config-if-vl21)# pim ipv4 sparse-mode
Allie(config-if-vl21)# interface vlan 24
Allie(config-if-vl24)# pim ipv4 sparse-mode
Allie(config-if-vl24)# interface vlan 10
Allie(config-if-vl10)# pim ipv4 sparse-mode
```

b. Router Francis interfaces.

```
Francis(config-router-ospf)# interface vlan 25
Francis(config-if-vl25)# pim ipv4 sparse-mode
Francis(config-if-vl25)# interface vlan 24
Francis(config-if-vl24)# pim ipv4 sparse-mode
```

3. Configure the router multicast parameters.

a. Router Clara parameters.

```
Clara(config-router-ospf)# exit
Clara(config)# no ip igmp snooping
```

b. Router Mateo router.

```
Mateo(config-router-ospf)# exit
Mateo(config)# no ip igmp snooping
```

c. Router Allie router.

```
Allie(config-if-vl10)# exit
Allie(config)# router multicast
Allie(config-router-multicast)# ipv4
Allie(config-router-multicast-ipv4)# routing
Allie(config-router-multicast-ipv4)# activity polling-interval 5
Allie(config-router-multicast-ipv4)# router pim sparse-mode
Allie(config-router-pim-sparse)# ipv4
Allie(config-router-pim-sparse-ipv4)# rp address 10.25.10.15
```

d. Router Francis router.

```
Francis(config-if-vl24)# exit
Francis(config)# router multicast
Francis(config-router-multicast)# ipv4
Francis(config-router-multicast-ipv4)# routing
Francis(config-router-multicast-ipv4)# router pim sparse-mode
Francis(config-router-pim-sparse)# ipv4
Francis(config-router-pim-sparse-ipv4)# rp address 10.25.10.15
```

16.3.5 PIM Commands

PIM Configuration Commands (Global)

- anycast-rp
- candidate
- fast-reroute
- group-expiry-timer
- holdtime
- ip pim dr-notify-delay
- log neighbors
- register local-interface
- router pim bidirectional
- router pim bsr
- router pim sparse-mode
- rp address
- rp allow
- rp candidate
- rp-candidate advertisement-filter
- rp hash algorithm modulo
- sg-expiry-timer
- spt threshold
- ssm range

PIM Configuration Commands (Interface)

- ipv4
- pim bsr ipv4 border
- pim ipv4 bidirectional
- pim ipv4 border-router
- pim ipv4 dr-priority
- pim ipv4 hello count
- pim ipv4 hello interval
- pim ipv4 join-prune count
- pim ipv4 join-prune interval
- pim ipv4 neighbor-filter
- pim ipv4 sparse-mode
- pim ipv6 sparse-mode
- sztimeout

PIM Display Commands

- show ip pim bsr
- show ip pim config-sanity
- show ip pim interface
- show ip pim neighbor
- show ip pim protocol counters
- show ip pim register-source
- show ip pim rp
- show ip pim rp-candidate
- show ip pim rp-hash

- show ip pim upstream joins

16.3.5.1 anycast-rp

The **anycast-rp** command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

When the command is issued in ***router-multicast ipv4*** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast ***router-multicast ipv4*** configuration mode.

The **no anycast-rp** and **default anycast-rp** commands remove the corresponding **anycast-rp** command from ***running-config***. When the **no** and **default** commands do not include a peer address, all commands for the specified RP address are removed.

Command Mode

Router-Multicast IPv4 Configuration

Router-Multicast VRF IPv4 Configuration

Command Syntax

anycast-rp ***rp_addr peer_addr*** [**REGISTER**]

no anycast-rp ***rp_addr*** [***peer_addr***]

default anycast-rp ***rp_addr*** [***peer_addr***]

Parameters

- ***rp_addr*** Rendezvous point IP address (dotted decimal notation).
- ***peer_addr*** IP address of another anycast-RP set member (dotted decimal notation). Note, the peer-addr for a local anycast RP must be a ***/32*** address configured under a loopback interface. To enable anycast RP on the router, each RP requires one local peer address. Use the **show ip pim anycast-rp [vrf <vrfName>]** command to verify the configured local and remote peers.
- **REGISTER** Number of unacknowledged register messages the switch sends to the peer router.
  - ***no parameter*** register count is set to default value of ***10***.
  - **register-count** ***r_num*** where ***r_num*** is an integer that ranges from *1* to ***4294967295***.
  - **register-count infinity**

Example

These commands configure a switch (IP address ***10.1.1.14***) into an anycast-RP set with an RP address of ***10.17.255.2*** in the default VRF. The anycast-RP set contains three other routers, located at ***10.1.2.14***, ***10.1.3.14***, and ***10.1.4.14***. It sets the number of unacknowledged register messages it sends to each router at ***15***.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.1.14
 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.2.14
 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.3.14
 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.4.14
 register-count 15
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.2 candidate

The **candidate** command configures the switch as a Candidate BSR router (C-BSR). A BSR is a PIM router within the PIM domain through which dynamic RP selection is implemented. The BSR selects RPs from a list of candidate RPs and exchange BootStrap Messages (BSM) with all routers in the domain. The BSR is elected from one of the C-BSRs through an exchange of BSMs.

A subset of PIM routers within the domain are configured as Candidate BootStrap Routers (C-BSRs). Through the exchange of BootStrap Messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

Command parameters specify the switchs BSR address, the interval between BSM transmissions, the length of the hash mask, and the priority assigned to the switch when electing a BSR.

Entering an **candidate** command replaces any previously configured **candidate** command. If the new command does not specify a priority, hash mask length, or interval, the previously configured values persist in ***running-config***.

When the command is issued in the ***router-pim bsr ipv4*** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in ***router-pim bsr vrf ipv4*** configuration mode for the appropriate VRF.

The **no candidate** and **default candidate** commands remove the corresponding **candidate** commands from ***running-config***. The **no** and **default** commands restore the priority, hash mask length, and interval parameters to their default values.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

candidate INTERFACE [**HASHMASK_LENGTH**][**INTERVAL_PERIOD**][**PRIORITY_NUM**]

no candidate [***priority***][***interval***]

default candidate[***priority***][***interval***]

Parameters

- **INTERFACE** Switch uses IP address of specified interface as its BSR address. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
- **HASHMASK_LENGTH** Length (in bits) of the hash mask.
  - ***no parameter*** hash mask remains unchanged from previous setting.
  - **hashmask *0 - 32*** hash mask length (in bits). Default value is ***30***.
- **INTERVAL_PERIOD** Period between the transmission of BSMs (seconds). Default value is ***60***.
  - ***no parameter*** interval remains unchanged from previous setting.
  - **interval *10 - 536870906*** transmission interval in seconds.
- **PRIORITY_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is ***64***.
  - ***no parameter*** priority remains unchanged from previous setting.
  - **priority *0 - 255*** priority rating.

Example

These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to ***interface vlan 24*** as its BSR address. The BSM transmission interval is set to ***30*** seconds and the priority is set to ***192***.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# candidate vlan 24 priority 192
 interval 30
switch(config-router-pim-bsr-ipv4)#
```

16.3.5.3 fast-reroute

The **fast-reroute** command enables Multicast only Fast Re-Route (MoFRR) to minimize traffic loss in a network when a link or node failure occurs. Traffic loss is minimized by allowing the traffic to flow from the secondary path upon the failure of the primary path.

The **no fast-reroute** and **default fast-reroute** commands disable MoFRR by removing the corresponding fast-reroute command from ***running-config***.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

fast-reroute ***acl_name***

no fast-reroute ***acl_name***

default fast-reroute ***acl_name***

Parameters

acl_name standard access list name.

Examples

- These commands enable fast reroute for ACL ***acl2*** in the default VRF under the IPv4 configuration.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# fast-reroute acl2
switch(config-router-pim-sparse-ipv4)#
```

- These commands enable fast reroute for ACL ***acl2*** in ***vfr red*** under the IPv4 configuration.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# vrf red
switch(config-router-pim-sparse-vrf-red)# ipv4
switch(config-router-pim-sparse-vrf-red-ipv4)# fast-reroute acl2
switch(config-router-pim-sparse-vrf-red-ipv4)#
```

16.3.5.4 group-expiry-timer

The **group-expiry-timer** command sets the group-expiry-timer in seconds after which a group with no activity gets deleted from the PIM Rendezvous Point (RP) tree.

When the command is configured in the ***global*** configuration mode, the configuration is applied globally on the switch. To apply the configuration only in the ***bidir-pim*** mode, the command is configured in the Router-PIM Bidirectional configuration mode. To apply the configuration for a specific VRF, the command is configured in the VRF sub-mode of the Router-PIM Bidirectional configuration mode. Use the **pim ipv4 bidirectional** command to enter Router-PIM Bidirectional Configuration Mode.

The **no group-expiry-timer** and **default group-expiry-timer** applies the system default configuration and removes the corresponding **group-expiry-timer** command from ***running-config***.

Command Mode

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

group-expiry-timer ***value***

no group-expiry-timer ***value***

default group-expiry-timer ***value***

Parameter

value specifies the time in seconds after which a group with no activity expires from the PIM RP. Values range from ***1*** to ***210***. There is no default value.

Examples

- This command configures PIM expiry-timer of ***40*** seconds in ***pim-bidirectional*** sub-mode.

```
switch(config)# router pim bidirectional
switch(config-router-pim-bidir)# ipv4
switch(config-router-pim-bidir-ipv4)# group-expiry-timer 40
```

- This command configures PIM expiry-timer of ***120*** seconds for ***vrf v1***.

```
switch(config)# router pim bidirectional
switch(config-router-pim-bidir)# vrf v1
switch(config-router-pim-bidir-vrf-v1)# ipv4
switch(config-router-pim-bidir-vrf-v1-ipv4)# group-expiry-timer 120
```

16.3.5.5 holdtime

The **holdtime** command specifies the value the switch inserts in the ***holdtime*** parameter field in BootStrap Messages (BSM) that it sends. The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. BSR holdtime is designated by the BSR router and communicated to other routers through BSMs.

When the command is issued in ***router-pim bsr ipv4*** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in ***router-pim bsr vrf ipv4*** configuration mode for the appropriate VRF.

The **no holdtime** and **default holdtime** commands restore the default holdtime parameter field insertion value of ***130*** seconds by removing the **holdtime** statement from ***running-config***.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

holdtime ***period***

no holdtime

default holdtime

Parameter

period BSR holdtime (seconds). Value ranges from ***12*** to ***1073741823*** (1.073 billion seconds, approximately 34 years). Default is ***130***.

Example

These commands specify ***75*** seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# holdtime 75
switch(config-router-pim-bsr-ipv4)#
```

16.3.5.6 ip pim dr-notify-delay

The **ip pim dr-notify-delay** command configures the designated router (DR) notification delay time. (This is equivalent to issuing the **dr-notify-delay** command in Router-PIM Sparse-mode Configuration Mode.) The command is more effective when all PIM routers on the LAN segment have PIM DR priority that is greater than ***1***.

The **no ip pim dr-notify-delay** and **default ip pim dr-notify-delay** commands remove the previously configured DR notification delay time.

Note: while this command is VRF-aware, delay time is not configurable per-VRF. The configuration will apply to all VRFs configured with PIM.

Command Mode

Global Configuration

Command Syntax

ip pim dr-notify-delay ***notify_delay_time***

no ip pim dr-notify-delay

default ip pim dr-notify-delay

Parameter

notify_delay_time The PIM designated router notify delay time in seconds. Values range from -32767 to 32768.

Guidelines

The notification delay time can be configured with a positive or negative value. The timer influences DR election timing when a router with the highest DR priority on a LAN segment is reloaded. In an MLAG configuration, the notification delay time begins shortly after the MLAG reload delay expires (before which the PIM hello messages are sent with a priority of ***1***). In a non-MLAG configuration, the notification delay time begins as soon as the PIM is first configured on the interface.

Positive values for notify delay time cause the device to send PIM hello messages with a priority of ***1*** until the time the notify delay time expires. During this time, DR responsibilities of the device will continue according to configured DR priority. Negative values configured for the notification delay time will not modify the priority sent in PIM hello messages, but the device will not perform any DR responsibility until the notify delay time expires. Positive values are used to avoid loss of multicast packets, but they may create a few duplicate packets from multiple PIM routers forwarding traffic for the same S,G. Negative values are used to avoid duplicate packets, but they may cause packet loss when there are no PIM routers forwarding traffic for an S,G.

Example

This command configures a DR notification delay time of 2 seconds.

```
switch(config)# ip pim dr-notify-delay 2
switch(config)#
```

16.3.5.7 ipv4

The **ipv4** command places the switch in the IPv4 submode for the PIM configuration mode in which it is entered.

Command Mode

Router Multicast Configuration

Router-PIM Bidirectional Configuration

Router-PIM BSR Configuration

Router-PIM Sparse-mode Configuration

Command Syntax

ipv4

Examples

- These commands place the switch in the ***router multicast ipv4*** configuration mode.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)#
```

- These commands place the switch in the ***router-pim bidirectional ipv4*** configuration mode.

```
switch(config)# router pim bidirectional
switch(config-router-pim-bidir)# ipv4
switch(config-router-pim-bidir-ipv4)#
```

- These commands place the switch in the ***router-pim bsr ipv4*** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)#
```

- These commands place the switch in the ***router-pim sparse-mode ipv4*** configuration mode.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.8 log neighbors

The **log neighbors** command configures the switch to generate a log message when a neighbor entry is added or removed from the PIM Neighbor table. This function is enabled by default.

The **no log neighbors** command disables log message generation based on changes to the PIM Neighbor table; this command is stored in the ***running-config***. The **log neighbors** and **default log neighbors** commands restore the default setting of generating log messages by deleting the **no log neighbors** statement from ***running-config***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

log neighbors

no log neighbors

default log neighbors

Examples

- These commands configure the switch to stop generating log messages based on PIM Neighbor table changes in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# no log neighbors
switch(config-router-pim-sparse-ipv4)#
```

- These commands configure the switch to generate log messages when a neighbor entry is added or removed from the PIM Neighbor table in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# log neighbors
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.9 pim bsr ipv4 border

The **pim bsr ipv4 border** command prevents the switch from sending BootStrap router Messages (BSMs) over the configuration mode interface. By default, BSMs are transmitted over all PIM-enabled interfaces.

The **no pim bsr ipv4 border** and **default pim bsr ipv4 border** commands restore the transmission of BSMs over the configuration mode interface by removing the corresponding **pim bsr ipv4 border** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim bsr ipv4 border

no pim bsr ipv4 border

default pim bsr ipv4 border

Example

This command prevents the switch from sending BSMs from ***interface vlan 10***.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# pim bsr ipv4 border
switch(config-if-Vl10)#
```

16.3.5.10 pim ipv4 bidirectional

The **pim ipv4 bidirectional** command enables PIM bidirectional and IGMP (router mode) on the configuration mode interface.

Note: PIM and Multicast Border Router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv4 bidirectional**, **no pim ipv4**, **default pim ipv4 bidirectional**, and **default pim ipv4** commands restore the default PIM and IGMP (router mode) settings of ***disabled*** on the configuration mode interface by removing the **pim ipv4 bidirectional** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 bidirectional

no pim ipv4

no pim ipv4 bidirectional

default pim ipv4

default pim ipv4 bidirectional

Example

This command enables PIM bidirectional on ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 bidirectional
switch(config-if-Vl4)#
```

16.3.5.11 pim ipv4 border-router

The **pim ipv4 border-router** command configures the configuration mode interface as a PIM Multicast Border Router (MBR). A PIM MBR interface allows multicast traffic from sources that are outside of the PIM domain.

This command does not control the transmission or reception of PIM protocol packets by the interface.

Sources learned through an MBR interface are treated as local sources (directly connected to the switch). The border-bit is set in all PIM register messages sent for these sources.

Note: Configuration as an MBR and configuration in PIM sparse mode must be mutually exclusive. Ensure that PIM sparse mode is not configured by issuing the **pim ipv4 sparse-mode** command on the interface before issuing this command.

The **no pim ipv4 border-router** and **default pim ipv4 border-router** commands removes the PIM MBR configuration for the configuration mode interface by removing the corresponding **pim ipv4 border-router** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 border-router

no pim ipv4 border-router

default pim ipv4 border-router

Example

These commands configure ***interface vlan 200*** as a PIM MBR, then display its status.

```
switch(config)# interface vlan 200
switch(config-if-VL200)# ip address 10.44.2.1/24
switch(config-if-VL200)# no pim ipv4 sparse-mode
switch(config-if-VL200)# pim ipv4 border-router
switch(config-if-VL200)# show active
interface Vlan200
ip address 10.44.2.1/24
pim ipv4 border-router
switch(config-if-VL200)#exit
switch(config)# show ip pim interface
AddressInterfaceModeNeighborHello DRDR
AddressPktsQedPktsDropped
CountIntvl Pri
10.44.2.1Vlan200mbr030110.44.2.100
switch(config)#
```

16.3.5.12 pim ipv4 dr-priority

PIM-SM uses these criteria for electing a Designated Router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The **pim ipv4 dr-priority** command sets the DR priority value that the configuration mode interface advertises. By default, the interface does not advertise a DR priority value.

The **no pim ipv4 dr-priority** and **default pim ipv4 dr-priority** commands force the use of IP addresses to elect the designated router by removing the corresponding **pim ipv4 dr-priority** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 dr-priority ***level***

no pim ipv4 dr-priority [***level***]

default pim ipv4 dr-priority [***level***]

Parameters

level DR selection priority rating. Value ranges from ***0*** to ***4294967295***.

Examples

- This command configures the dr-priority value of ***15*** on ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 dr-priority 15
switch(config-if-Vl4)#
```

- This command force the use of IP addresses to elect the designated router.

```
switch(config-if-Vl4)# no pim ipv4 dr-priority
switch(config-if-Vl4)#
```

16.3.5.13 pim ipv4 hello count

The **pim ipv4 hello count** command sets the PIM hello count for the interface being configured. PIM hold time is calculated by multiplying the configured hello interval by the hello count, ensuring that the PIM neighbor stays up for the specified time after which the neighbor expires.

The no **pim ipv4 hello count** command removes the corresponding **pim ipv4 hello count** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 hello count [***multiple***]

no pim ipv4 hello count [***multiple***]

Parameter

multiple hello count multiplier. Value ranges from ***1.5*** to ***65535***. The hello hold time is the configured hello interval multiplied by the hello count.

Examples

- This command configures a hold time interval of ***225*** seconds on ***interface vlan2925*** by multiplying the default ***30***-second hello interval by a hello count of ***7.5***.

```
switch(config)# interface vlan2925
switch(config-if-Vl2925)# pim ipv4 hello count 7.5
switch(config-if-Vl2925)#
```

- This show command displays the hold time and other configuration details on ***interface vlan2925***.

```
switch# show ip pim interface vlan2925 details
Interface Vlan2925 address is 1.0.1.1
Vif number is 0
PIM: enabled
PIM version: 2, mode: sparse
PIM neighbor count: 0
PIM Effective DR: 1.0.1.1 (this system)
PIM Effective DR Priority: 1
PIM Effective Propagation Delay: 500 milliseconds
PIM Effective Override Interval: 2500 milliseconds
PIM Effective Tracking Support: disabled
PIM Hello Interval: 30 seconds
PIM Hello Hold Time: 225 seconds <====== New Hold Time (= 7.5 * 30)
PIM Hello Priority: 1 seconds
PIM Hello Lan Delay: 500 milliseconds
PIM Assert Override Interval: 3 seconds
mrtr1#
```

16.3.5.14 pim ipv4 hello interval

The **pim ipv4 hello interval** command specifies the transmission interval between PIM hello messages originating from the configuration mode interface.

The **no pim ipv4 hello interval** and **default pim ipv4 hello interval** commands restore the default query interval of ***30*** seconds for the configuratiom mode interface by removing the corresponding **pim ipv4 hello interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 hello interval ***period***

no pim ipv4 hello interval [***period***]

default pim ipv4 hello interval [***period***]

Parameter

period query interval (seconds). Value ranges from ***1*** to ***1000000*** (1 million). Default is ***30***.

Example

This command configures ***45*** second intervals between hello messages originating from ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 hello interval 45
switch(config-if-Vl4)#
```

16.3.5.15 pim ipv4 join-prune count

The **pim ipv4 join-prune count** command configures the number of times a join or prune messages can be missed before the upstream neighbor time expires.

The join-prune interval multiplied by the count is considered as join or prune hold time (specified in seconds), which is used in the join or prune messages. It is recommended to use the default configuration for **pim ipv4 join-prune interval**, and modify the **pim ipv4 join-prune count** to increase the join or prune holdtime. Increasing the join-prune hold time delays the deletion of an S,G route on the upstream neighbor when join-prune messages are not sent to the neighbor. The maximum possible value for join or prune hold-time is ***65535***.

The **no pim ipv4 join-prune count** and **default pim ipv4 join-prune count** commands restore the default join or prune count for the configuration mode interface by removing the corresponding **pim ipv4 join-prune count** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 join-prune count ***count_value***

no pim ipv4 join-prune count ***count_value***

default pim ipv4 join-prune count ***count_value***

Parameter

count_value The number of missed join or prune after which the route expires. Value ranges from ***1.5*** to ***65535***.

Example

This command indicates the number of times a join or prune messages can be missed.

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# pim ipv4 join-prune count 5
switch(config-if-Et1/1)#
```

16.3.5.16 pim ipv4 join-prune interval

The **pim ipv4 join-prune interval** command specifies the period between join or prune messages that the configuration mode interface originates and sends to the upstream RPF neighbor.

The **no pim ipv4 join-prune interval** and **default pim ipv4 join-prune interval** commands restores the default join or prune interval to ***60*** seconds for the configuration mode interface by removing the corresponding **pim ipv4 join-prune interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 join-prune interval [***period***]

no pim ipv4 join-prune interval [***period***]

default pim ipv4 join-prune interval [***period***]

Parameter

period join or prune interval (seconds). Value ranges from ***1*** to ***18724***. Default is ***60***.

Example

This command configures ***75***-second intervals between join or prune messages originating from ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 join-prune interval 75
switch(config-if-Vl4)#
```

16.3.5.17 pim ipv4 neighbor-filter

The **pim ipv4 neighbor-filter** command configures the configuration mode interface to filter PIM control packets on the basis of neighbor addresses listed in a specified standard access list.

The **no pim ipv4 neighbor-filter** and **default pim ipv4 neighbor-filter** commands disable the configuration mode interface from filtering PIM control packets by removing the corresponding **ip pim ipv4 neighbor-filter** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 neighbor-filter ***access_list***

no pim ipv4 neighbor-filter

default pim ipv4 neighbor-filter

Parameter

access_list name of the standard IP access list.

Example

This command configures the IP access list named ***filter_1*** to filter neighbor PIM control messages for ***interface vlan 4***.

```
switch(config)# ip access-list standard filter_1
switch(config-std-acl-filter_1)# permit 10.13.24.9/24
switch(config-std-acl-filter_1)# exit
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 neighbor-filter filter_1
switch(config-if-Vl4)#
```

16.3.5.18 pim ipv4 sparse-mode

The **pim ipv4 sparse-mode** command enables PIM IPv4 Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Note: PIM and Multicast Border Router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv4 sparse-mode**, **no pim ipv4, default pim ipv4 sparse-mode**, and **default pim ipv4** commands restore the default PIM and IGMP (router mode) settings of **disabled** on the configuration mode interface by removing the **pim ipv4 sparse-mode** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 sparse-mode

no pim ipv4

no pim ipv4 sparse-mode

default pim ipv4

default pim ipv4 sparse-mode

Example

This command enables PIM sparse mode on ***interface vlan 4*** interface.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 sparse-mode
switch(config-if-Vl4)#
```

16.3.5.19 pim ipv6 sparse-mode

The **pim ipv6 sparse-mode** command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

Note: PIM and Multicast Border Router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv6 sparse-mode**, **no pim ipv6, default pim ipv6 sparse-mode**, and **default pim ipv6** commands restore the default PIM settings of **disabled** on the configuration mode interface by removing the **pim ipv6 sparse-mode** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv6 sparse-mode

no pim ipv6

no pim ipv6 sparse-mode

default pim ipv6

default pim ipv6 sparse-mode

Example

This command enables IPv6 PIM sparse mode on ***interface vlan 8***.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# pim ipv6 sparse-mode
switch(config-if-Vl8)#
```

16.3.5.20 register local-interface

The **register local-interface** command programs the switch to fill the source field in all outbound PIM SM register packets with the IP address of a specified interface or the incoming interface of the group specified by the message. By default, the source field is filled with the IP address from the interface associated with the best route to the RP.

When the command is issued in Router-PIM Sparse-mode IPv4 ConfigurationMode, it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration.

The **no register local-interface** and **default register local-interface** commands restore the default method of filling the register packet source field by removing the **ip register local-interface** statement from ***running-config***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

register local-interface **INT_NAME**

no register local-interface

default register local-interface

Parameters

INT_NAME Interface type and number. Values include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port channel interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.

Example

These commands program the switch to fill the source field of outbound PIM SM register packets in the default VRF with the IPv4 address of ***interface loopback 2***.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# register local-interface loopback
 2
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.21 router pim bidirectional

The **`router pim bidirectional`** command places the switch in the ***router-pimbidirectional*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`router pim bidirectional`

Example

This command places the switch in the ***router-pim bidirectional*** configuration mode.

```
switch(config)# router pim bidirectional
switch(config-router-pim-bidir)#
```

16.3.5.22 router pim bsr

The **`router pim bsr`** command places the switch in the ***router-pim bsr*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`router pim bsr`

Example

This command places the switch in the ***router-pim bsr*** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)#
```

16.3.5.23 router pim sparse-mode

The **`router pim sparse-mode`** command places the switch in the ***router-pim sparse-mode*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`router pim sparse-mode`

Example

This command places the switch in the ***router-pim sparse-mode*** configuration mode.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)#
```

16.3.5.24 rp address

The **rp address** command configures the address of a Protocol Independent Multicast (PIM) static Rendezvous Point (RP) for a specified multicast subnet. If the command does not specify a subnet, the static RP maps to all multicast groups (***224/4***). Dynamic RPs override static RPs unless the static RP is given priority by using the **override** option of this command.

Multicast groups use RPs to connect sources and receivers. A PIM domain requires that all routers have consistently configured RP addresses.

The switch uses multiple **rp address** commands to configure multiple RPs or to assign multiple subnets to an RP. When the address of a multicast group falls within multicast subnets configured by multiple **rp address** commands, the groups RP address is selected by comparing the commands multicast subnet size.

- Different size subnets: group uses command with the largest subnet.
- Same size subnets: group uses command as determined by hash algorithm.

When the command is issued in the ***router-multicast*** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the ***router-multicast vrf*** configuration mode.

The **no rp address** and **default rp address** commands remove the corresponding **rp address** command from ***running-config***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

rp address ***rp_addr*** [**MULTICAST_SUBNET**][**HASHMASK_LENGTH**][**BSR_OVERRIDE**] [**PRIORITY_NUM**]

no rp address ***rp_addr*** [**MULTICAST_SUBNET**]

default rp address ***rp_addr*** [**MULTICAST_SUBNET**]

Parameters

- ***rp_addr*** Rendezvous point IP address (dotted decimal notation).
- **MULTICAST_SUBNET** Multicast IP address space (CIDR or address-mask).
  - ***no parameter*** Default multicast group IP address of ***224/4***.
  - ***gp_addr*** Multicast group IP address (CIDR or address-mask).
  - **access-list** ***acl_name*** Standard access control list that specifies the multicast group address.
  - ***acl_name*** Standard access control list that specifies the multicast group address.
- **HASHMASK_LENGTH** Length (in bits) of the hash mask.
  - ***no parameter*** hash mask remains unchanged from previous setting.
  - **hashmask** ***0 - 32*** hash mask length (in bits). Default value is ***30***.
- **BSR_OVERRIDE** Configures priority relative to dynamic RPs selected by BSR.
  - ***no parameter*** Dynamic RPs have priority over specified RP.
  - **override** RP has priority over dynamic RPs.
- **PRIORITY_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is 0.
  - ***no parameter*** priority remains unchanged from previous setting.
  - **priority** ***0 - 255*** priority rating.

Example

These commands configures ***10.17.255.2*** as a static RP for all multicast groups in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp address 10.17.255.2
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.25 rp allow

The **rp allow** command accepts and allows PIM (*,G) join message with an RP address that is different from the configured RPs for that particular (*,G).

The **no rp allow** and **default rp allow** commands disable this behavior by removing the corresponding **rp allow**command from ***running-config***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

rp allow

no rp allow

default rp allow

Examples

- These commands configure the switch to accept PIM (*,G) join messages in the default VRF that include RP addresses not configured on the switch for that (*,G) route.

```
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp allow
```

- These commands configure the switch to accept PIM (*,G) join messages in VRF blue that include RP addresses not configured on the switch for that (*,G) route.

```
switch(config-router-pim-sparse)# vrf blue
switch(config-router-pim-sparse-vrf-blue)# ipv4
switch(config-router-pim-sparse-vrf-blue-ipv4)# rp allow
```

16.3.5.26 rp candidate

The **rp candidate** command configures the switch as a Candidate Rendezvous Point (C-RP). The BSR selects a multicast groups dynamic RP set from the list of C-RPs in the PIM domain. The command specifies the interface (used to derive the RP address), C-RP advertisement interval, and priority rating. The BSR selects the RP set by comparing C-RP priority ratings. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

Running-config supports multiple multicast groups through multiple **rp candidate** statements:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from ***running-config***.
- The ***running-config*** stores the **interval** setting in a separate statement that applies to all **rp candidate** statements. When a command specifies an interval that differs from the previously configured value, the new value replaces the old value and applies to all configured **rp candidate** statements. The default **interval** value is ***60*** seconds.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the ***router-multicast vrf*** configuration mode.

The **no rp candidate** and **default rp candidate** commands remove **rp candidate** from ***running-config*** for the specified group. When these commands do not specify a multicast group, all **rp candidate** statements are removed from ***running-config***.

The **no rp candidate interval** and **default rp candidate interval** commands restore the interval setting to the default value of ***60*** seconds. The **no rp candidate priority** and **default rp candidate priority** commands restore the priority setting to the default value of ***192***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

Note: The **INTERFACE** parameter is always listed first. All other parameters can be placed in any order.

rp candidate **INTERFACE** [**GROUP_ADDR**][**PRIORITY_NUM**][**INTERVAL_PERIOD**]

no rp candidate [**INTERFACE**][**GROUP_ADDR**]

no rp candidate [**INTERFACE**] interval

no rp candidate [**INTERFACE**] priority

default rp candidate [**INTERFACE**][**GROUP_ADDR**]

default rp candidate [**INTERFACE**] interval

default rp candidate [**INTERFACE**] priority

Parameters

- **INTERFACE** Switch uses IP address of specified interface as its C-RP address. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.

  - **vlan** ***v_num*** VLAN interface specified by ***v_num***.
  - **vxlan** ***vx_num*** VXLAN interface specified by ***vx_num***.
- **GROUP_ADDR** address of multicast group for which candidate is configured. Options include:
  - ***no parameter*** default multicast group (***224.0.0.0/4***).
  - ***net_addr*** multicast IPv4 subnet address (CIDR or address mask).
  - **access-list** ***acl_name*** standard access control list that specifies the multicast group address.
- **PRIORITY_NUM** RP selection priority rating. Smaller numbers denote higher priority.
  - ***no parameter*** priority rating is set to the default value of ***192***.
  - **priority** ***0 - 255*** priority rating.
- **INTERVAL_PERIOD** Period between consecutive RP-advertisement message transmissions (seconds). Value also applies to previously configured **`rp candidate`** statements.
  - ***no parameter*** interval remains unchanged from previous setting.
  - **interval** ***10 - 16383*** transmission interval.

Example

These commands configure a switch as a candidate RP for the multicast group ***235.1.1.0/24*** with a priority of ***48*** and an RP advertisement interval of ***45*** seconds in the default VRF. The switch advertises the IP address assigned to ***vlan 24*** as its RP address.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp candidate vlan 24 235.1.1.0/24
 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.27 rp hash algorithm modulo

The **rp hash algorithm modulo** command configures the load-balancing scheme across available Rendezvous Points (RP).

The configuration results in a round robin-based load balancing across available RPs, achieved by module operation of the destination group address with the number of RPs available.

The **no rp hash algorithm modulo** and **default rp hash algorithm modulo** commands result in the default load-balancing scheme which is to use a hash function to get a group-RP mapping.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Sparse-mode IPv6 Configuration

Router-PIM Sparse-mode VRF IPv6 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

rp hash algorithm modulo

no rp hash algorithm modulo

default rp hash algorithm modulo

Examples

- These commands configures the hash algorithm module for a VRF named ***blue*** in the ***router-pim sparse-mode ipv4*** configuration mode.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# vrf red
switch(config-router-pim-sparse-vrf-red-ipv4)# rp hash algorithm modulo
```

- These commands configures the hash algorithm module for a VRF named ***blue*** in the ***router-pim bidirectional-mode vrf ipv4*** configuration mode.

```
switch(config)# router pim bidirectional
switch(config-router-pim-bidir)# ipv4
switch(config-router-pim-bidir-ipv4)# vrf red
switch(config-router-pim-bidir-vrf-red-ipv4)# rp hash algorithm modulo
```

16.3.5.28 rp-candidate advertisement-filter

The **rp-candidate advertisement-filter** command filters the RP candidate advertisements from certain IP addresses. When **rp-candidate advertisement-filter** command is configured, PIM BSR filters RP candidate messages from ip-addresses matching the prefix list from the access-list that is configured.

The **no rp-candidate advertisement-filter** and **default rp-candidate advertisement-filter** commands removes **rp-candidate advertisement-filter** from ***running-config*** for the specified group.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

rp-candidate advertisement-filter access-list ***access-list_name***

no rp-candidate advertisement-filter access-list***access-list_name***

default rp-candidate advertisement-filter access-list***access-list_name***

Parameter

access-list_name Standard access control list that specifies the multicast group address.

Example

These commands configure the switch as a candidate RP advertisement filter for the multicast group in the non-default VRF.

```
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# rp-candidate advertisement-filter
 access-list test1
switch(config-router-pim-bsr-vrf-red-ipv4)# rp-candidate advertisement-
filter access-list test2
```

16.3.5.29 sg-expiry-timer

The **sg-expiry-timer** command configures the (S, G) expiry timer interval for PIM-SM (S, G) multicast routes. The command does not apply to (*, G) mroutes.

When the command is issued in the ***router-multicast*** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the ***router-multicast vrf*** configuration mode.

The **no sg-expiry-timer** and **default sg-expiry-timer** commands restore the default setting of ***210*** seconds by removing the **sg-expiry-timer** statement from ***running-config***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

sg-expiry-timer ***period***

no sg-expiry-timer

default sg-expiry-timer

Parameter

period expiry timer interval (seconds). Value ranges from ***120*** to ***65535*** seconds. The default value is ***210*** seconds.

Example

These commands configure ***150*** seconds as the (S,G) expiry timer interval is in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.30 show ip pim bsr

The **show ip pim bsr** command displays the switchs BootStrap Router (BSR) information.

Command Mode

EXEC

Command Syntax

show ip pim bsr [**GROUP_FILTER**]

Parameters

GROUP_FILTER specifies groups for which command displays information.

- ***no parameter*** Displays data for all groups.
- ***net_addr*** Displays message for specified group address. (CIDR or address mask).

Example

This command configures the switch's BSR information.

```
switch> show ip pim bsr
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
BSR address: 10.1.1.1
Uptime:      00:14:42, BSR Priority: 0, Hash mask length: 30
Next bootstrap message in 00:00:05
```

16.3.5.31 show ip pim config-sanity

The **show ip pim config-sanity** command displays diagnostic information about the switch's PIM configuration.

Command Mode

EXEC

Command Syntax

show ip pim config-sanity

Example

This command displays PIM configuration diagnostic information.

```
switch> show ip pim config-sanity
DISCLAIMER: Below are only hints of potential PIM misconfiguration.
They do not necessary imply that there is a real problem.

The interfaces with PIM which are down: Vl4

switch>
```

16.3.5.32 show ip pim interface

The **show ip pim interface** command displays information about interfaces configured for PIM.

Command Mode

EXEC

Command Syntax

show ip pim interface [**INT_NAME**][**INFO_LEVEL**]

Parameters

- **INT_NAME** Interface type and number. Values include:
  - ***no parameter*** displays information for all interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
  - **INFO_LEVEL** specifies level of information detail provided by the command.
    - ***no parameter*** table of basic configuration information.
    - **detail** list of complete configuration information.

Examples

- This command displays information about all interfaces on which PIM is enabled.

```
switch> show ip pim interface
Address InterfaceModeNeighbor Hello DR DR Address  PktsQed
 PktsDropped Count  Intvl Pri
10.17.254.30   Vlan3910        sparse1     30         1    10.17.254.30
    0         0
10.17.254.162  Vlan3925        sparse2     30         1
 10.17.254.163   0         0
10.17.254.106  Vlan3912        sparse1     30         1
 10.17.254.106   0         0
10.17.254.137  Ethernet12      sparse1     30         1
 10.17.254.138   0         0
switch>
```

- This command displays detailed PIM information for ***interface vlan 26***.

```
switch> show ip pim interface vlan 26 detail
Interface address is 172.17.26.1
Vif number is 1
PIM: enabled
  PIM version: 2, mode: sparse
  PIM DR: 172.17.26.1 (this system)
  PIM DR Priority: 1
  PIM neighbor count: 0
  PIM Hello Interval: 30 seconds
  PIM Hello Priority: 1
  PIM Hello Lan Delay: 500 milliseconds
  PIM Hello Override Interval: 2500 milliseconds
  PIM Hello Lan Prune Delay in use
  PIM Hello Generation ID: 0x4a05aa0
  PIM Hello Generation ID is not required
  PIM Triggered Hello Delay: 5 seconds
  PIM Join-Prune Interval: 60 seconds
  PIM State-Refresh processing: disabled
  PIM State-Refresh Interval: unknown seconds
  PIM Graft Retry Interval: unknown seconds
```

```
  PIM domain border: disabled
switch>
```

16.3.5.33 show ip pim neighbor

The **show ip pim neighbor** command displays information about Protocol Independent Multicast (PIM) neighbors discovered by hello messages.

Command Mode

EXEC

Command Syntax

show ip pim neighbor [**INT_NAME**][**BFD_DATA**]

Parameters

- **INT_NAME** Interface type and number. Values include:
  - ***no parameter*** displays information for all interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **BFD_DATA** Specifies inclusion of BFD data.
  - ***no parameter*** BFD data is not displayed.
  - **bfd** BFD data is displayed.

Examples

- This command displays information about neighbor PIM routers.

```
switch> show ip pim neighbor
PIM Neighbor Table
Neighbor Address   Interface       Uptime     Expires    Mode
10.17.255.2        Vlan2028        21d22h     00:01:31   sparse

switch>
```

- This command displays information about neighbor PIM routers and the status of BFD.

```
switch> show ip pim neighbor bfd
PIM Neighbor Table
Flags: U - BFD is enabled and is UP
       I - BFD is enabled and is INIT
       D - BFD is enabled and is DOWN
       N - Not running BFD

Neighbor Address   Interface       Uptime     Expires    ModeFlags
10.17.255.2        Vlan2028        21d22h     00:01:31   sparseU

switch>
```

16.3.5.34 show ip pim protocol counters

The **show ip pim protocol** command displays statistics about Protocol Independent Multicast (PIM) control messages sent and received by the switch.

Command Mode

EXEC

Command Syntax

show ip pim protocol counters [**INT_NAME**]

Parameters

INT_NAME Interface type and number. Values include:

- ***no parameter*** displays information for all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.

Example

This command displays statistics about inbound and outbound PIM control messages.

```
switch> show ip pim protocol counters
PIM Control Counters
                         Received          Sent      Invalid
Assert                          0            37            0
Bootstrap Router                0             0            0
CRP Advertisement               0             0            0
Graft                           0             0            0
Graft Ack                       0             0            0
Hello                       63168        126355            0
J/P                        275714        143958            0
Join                            0             0            0
Prune                           0             0            0
Register                        0         13643            0
Register Stop               11839             0            0
State Refresh                   0             0            0

switch>
```

16.3.5.35 show ip pim register-source

The **show ip pim register-source** command displays the name of the interface from where the switch derives the IP address that it uses to fill the source field in all outbound PIM SM register packets. The **register local-interface** command specifies this interface.

By default, the source field is filled with the IP address from the interface associated with the best route to the RP. The **show ip pim register-source** command does not return a value when the source field is filled with the default value.

Command Mode

EXEC

Command Syntax

show ip pim register-source

Example

This command displays the register-source interface.

```
switch> show ip pim register-source
Ethernet22
switch>
```

16.3.5.36 show ip pim rp

The **show ip pim rp** command displays the status and multicast group of each cached Rendezvous Point (RP).

Command Mode

EXEC

Command Syntax

show ip pim rp

Example

This command displays the cached RPs.

```
switch> show ip pim rp
show ip pim rp
The PIM RP Set
Group: 224.0.0.0/4
RP: 10.1.2.3
Uptime: 00:05:12, Expires: never, Priority: 1 Override: 1
```

16.3.5.37 show ip pim rp-candidate

The **show ip pim rp-candidate** command displays the Rendezvous Point (RP) that is used for a specified multicast group.

Command Mode

EXEC

Command Syntax

show ip pim rp-candidate

Example

This command displays the switch's candidate-RP information.

```
switch> show ip pim rp-candidate
Candidate RP information
Candidate RP Address: 10.0.12.2
CRP Holdtime: 150 seconds
Group 224.2.0.0/16 Priority 2
```

16.3.5.38 show ip pim rp-hash

The **show ip pim rp-hash** displays the group to RP-hash mapping for the specified group and the list of qualifying candidate RPs.

Command Mode

EXEC

Command Syntax

show ip pim rp-hash ***ipv4_addr*** [**INFO_LEVEL**]

Parameters

- ***ipv4_addr*** multicast group IPv4 address.
- **INFO_LEVEL** specifies level of information detail provided by the command.
  - ***no parameter*** RP-hash map and list of candidate RPs.
  - **detail** includes data about the selected RP.

Example

This command displays the RP that the switch uses for multicast group ***224.1.0.0***.

```
switch> show ip pim rp-hash 224.1.0.0
RP 10.1.2.3
```

16.3.5.39 show ip pim upstream joins

The **show ip pim upstream joins** command displays the join messages that the switch is scheduled to send.

Command Mode

EXEC

Command Syntax

show ip pim upstream joins [**JOIN_ADDRESSES**] [**NEIGHBOR_FILTER**]

Parameters

- **JOIN_ADDRESSES** Filters messages by source and group addresses.
  - ***no parameter*** displays all join messages.
  - ***source_addr*** displays all join messages for specified source group IPv4 address.
  - ***group_addr*** displays all join messages for specified multicast IPv4 address.
  - ***source_addr group_addr*** displays join message with specified source and group addresses.
  - ***group_addr source_addr*** displays join message with specified group and source addresses.

    group_addr must be a valid multicast IPv4 address.
- **NEIGHBOR_FILTER** specifies neighbors for which command provides data.
  - ***no parameter*** Displays messages for all neighbors.
  - **neighbor *neighbor_addr*** Displays message for specified neighbor address.

Example

This command displays the list of join messages the switch is scheduled to send. The example only displays the first two messages.

```
switch> show ip pim upstream joins

------------- show ip pim upstream joins -------------

Neighbor address: 10.1.1.1
Via interface: 10.1.1.2
Next message in 1 seconds
  Group: 10.10.10.3
    Joins:
      10.25.1.1/32 SPT
    Prunes:
      No prunes included
Neighbor address: 10.1.1.6
Via interface: 10.1.1.5
Next message in 1 seconds
  Group: 10.14.1.69
    Joins:
      10.105.14.3/32 SPT
    Prunes:
      No prunes included
switch>
```

16.3.5.40 spt threshold

The **spt threshold** command configures Shortest Path Tree (SPT) threshold actions for IPv4 multicast groups. To specify the threshold action for multicast groups that match a specified Access Control List (ACL), use the **match list** option. When the command is issued without this option, it is applied throughout the configuration-mode VRF. Any ACL-based configuration overrides the ***global*** configuration.

- When ***running-config*** does not list this command, the switch joins the SPT immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending PIM join message toward the source.
- When ***running-config*** lists this command with a value of infinity, the switch never joins the SPT.

The **no spt threshold** and **default spt threshold** commands remove the corresponding **spt threshold** command from ***running-config***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

spt threshold {*0* | infinity}[match list ***acl_name***]

no spt threshold {*0* | infinity}[match list ***acl_name***]

default spt threshold{*0* | infinity} [match list ***acl_name***]

Parameters

- ***0*** The switch immediately joins the SPT. This is the default value.
- **infinity** The switch never joins the SPT.
- ***acl_name*** name of access control list. If no ACL is supplied, the configuration is applied to all multicast groups within the VRF which are not configured by an ACL.

Example

This command configures the switch in the default VRF to immediately join the SPT for multicast groups matched by the ***ACL group-1***.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# spt threshold 0 match list group-1
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.41 ssm range

The **ssm range** command defines the Source Specific Multicast (SSM) range of IP multicast addresses.

SSM is a multicast packet delivery method where only packets originating from a specific source address requested by a receiver are routed to that receiver. SSM explicitly excludes the use of (*,G) join for applicable multicast groups. Source-specific multicast differs from Any-Source Multicast (ASM), where a receiver expresses interest in traffic to a multicast address, then receives traffic from all multicast sources sending to that address.

When the command is issued in the ***router-pim sparse-mode ipv4*** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the ***router-pim sparse-mode vrf ipv4*** configuration mode.

The **no ssm range** and **default ssm range** commands remove the SSM IP multicast address range by deleting the **ssm range** statement from ***running-config***.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

ssm range {***acl_name*** | **standard**}

no ssm range

default ssm range

Parameters

- ***acl_name*** sets the SSM range to address set specified by the standard ACL.
- **standard** sets the SSM range to ***232/8***.

Examples

- These commands configure the SSM address range to ***232/8*** in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# ssm range standard
switch(config-router-pim-sparse-ipv4)#
```

- These commands configure the SSM address range to those permitted by the ***LIST_1*** standard ACL in the default VRF. The ACL permits the subnet address range ***233.0.0.0/24***.

```
switch(config)# ip access-list standard LIST_1
switch(config-std-acl-LIST_1)# permit 233.0.0.0/24
switch(config-std-acl-LIST_1)# exit
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# ssm range LIST_1
switch(config-router-pim-sparse-ipv4)#
```

16.3.5.42 sztimeout

The **sztimeout** command configures the maximum span of active scope-zone.

The **no sztimeout** and **default sztimeout** commands delete the current scope zoned timeout configuration.

Command Modes

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Syntax

sztimeout timeout

no sztimeout

default sztimeout

Parameter

timeout Maximum span of active scope-zone in seconds. The value ranges from ***120*** to ***4294967295***. The default value is ***1300***.

Guideline

The scope zoned timeout must contain a minimum value of ***10*** times of configured holdtime; else the system displays a warning message.

Examples

- This command configures ***600*** seconds as the maximum of active scope-zone in the ***router-pim bsr ipv4*** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# sztimeout 600
switch(config-router-pim-bsr-ipv4)#
```

- This command configures ***2200*** seconds as the maximum of active scope-zone in the ***router-pim bsr vrf ipv4*** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# vrf vrf01
switch(config-router-pim-bsr-vrf-vrf01)# ipv4
switch(config-router-pim-bsr-vrf-vrf01-ipv4)# sztimeout 2200
switch(config-router-pim-bsr-vrf-vrf01-ipv4)#
```

16.4 Multicast Source Discovery Protocol (MSDP)

Multicast Source Discovery Protocol (MSDP) describes a topology that connects multiple IPv4 Protocol Independent Multicast Sparse-Mode (PIM-SM) domains. Each PIM-SM domain uses its independent Rendezvous Point (RP) without depending on RPs in other domains.

These sections describe the Arista MSDP implementation.

- MSDP Introduction
- MSDP Description
- MSDP Configuration
- MSDP Commands

16.4.1 MSDP Introduction

Arista switches support these MSDP features:

- Basic MSDP speaker functions.
- MSDP peer configuration: description, connect-source interface, keepalive time, and hold time.
- ACL filtering of inbound and outbound Source-Active (SA) messages.
- Mesh groups.
- Display of peer status.
- Display of filtered SA messages received from MSDP peers.

These MSDP features are not supported:

- MSDP is not supported with Anycast-RP (***RFC4610***).
- IP packet encapsulation.

16.4.2 MSDP Description

The Multicast Source Discovery Protocol (MSDP) defines a topology connecting Protocol Independent Multicast sparse mode (PIM-SM) domains.

MSDP provides inter-domain access to multicast sources in all domains by enabling all Rendezvous Points (RPs) to discover multicast sources outside of their domains. RPs also use MSDP to announce sources that are sending to a multicast group.

- MSDP Speakers
- Network Configuration
- MSDP Exchange Processes

16.4.2.1 MSDP Speakers

An MSDP speaker is a router in a PIM-SM domain that has MSDP peering sessions with MSDP peers in other domains. An MSDP peering session is a TCP connection through which peers exchange MSDP control information. An MSDP peer is a router that is connected to the speaker through a peering session.

PIM uses MSDP to register a local source with remote domain RPs through Source Active (SA) messages, which originate at the local domain's RP. Receivers in remote PIM-SM domains depend only on RPs in their domains to learn of multicast data sources in other domains. Multicast data is subsequently delivered from a source to receivers in different domains through a PIM-SM source tree.

MSDP Speaker Configuration describes the process of configuring MSDP speakers.

16.4.2.2 Network Configuration

The TCP connections between RPs are defined either through an underlying unicast routing table or by configuring a default MSDP peer. A typical MSDP configuration utilizes a BGP specified routing table. SA messages are MSDP control messages that peers exchange during peering sessions.

- Source Active Messages
- Reverse Path Forwarding
- Default MSDP Peers

16.4.2.2.1 Source Active Messages

A Source Active (SA) message is a message that an RP creates and sends to MSDP peers when it learns of a new multicast source through a PIM register message. RPs that intend to originate or receive SA messages must establish MSDP peering with other RPs, either directly or through intermediate MSDP peers. An RP that is not a DR on a shared network should only originate SAs in response to register messages it receives from the DR. It does not originate SA's for directly connected sources in its domain.

SA messages contain the following fields:

- Source address of the data source.
- Group address that receives data sent by the source.
- IP address of the RP.

Th SA Cache is the repository of SA messages received by the MSDP speaker. The switch always stores received SA messages. Managing the SA Cache describes procedures that limit the size of the SA cache and options for displaying the cache.

16.4.2.2.2 Reverse Path Forwarding

Reverse Path Forwarding (RPF) is a multicast packet transport technique that ensures loop-free packet forwarding by using a router’s unicast routing table. Traffic forwarding is based on source addresses instead of destination addresses. RPF is implemented as defined in ***RFC 3618***.

Packet forwarding is based on the packet’s unicast reverse path. An RPF router prevents network loops by only forwarding a packet when it enters through the interface holding its source routing entry.

When a multicast packet enters a router's interface, the router checks the reverse path of the packet by examining the list of networks that are reachable through the input interface. If the list contains a matching routing entry for the multicast packet’s source IP address, the packet is forwarded to all other interfaces that are participants in the multicast group. Otherwise, the packet is dropped.

RPF requires that the unicast routing table is correct and converged. It also assumes that the use of symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links.

Displaying RPF Peers describes commands that display RPF peers.

16.4.2.2.3 Default MSDP Peers

The default peer is the MSDP peer from which the MSDP speaker accepts SA messages. If there is only one MSDP peer, all of its SA messages will be accepted. When multiple default peers are configured the switch uses the first default peer to appear in the ***running-config***. Default MSDP peers invalidate the use of RPF over unicast routing tables.

Each default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages. When the ***running-config*** contains multiple default peers with prefix lists, an SA is accepted from the first default peer in the ***running-config*** whose prefix list contains the RP in the SA. The speaker accepts all remaining SAs from the first default peer that is not associated with a prefix list.

Configuring the Default Peer describes commands that configure default peers.

16.4.2.3 MSDP Exchange Processes

- **Control Information Exchange**
- **MSDP Data Exchange**

16.4.2.3.1 Control Information Exchange

An RP originates an SA message when a source registers with the RP to send data to a multicast group. RPs periodically originate SA messages while its registered sources send data to maintain messages in SA caches of its MSDP peers. RPs that have no registered sources periodically send keepalive messages to maintain TCP connections with its peers.

MSDP defines the following timers that specify the transmission frequency of control messages:

- SA Advertisement Time: Duration of SA Advertisement intervals. An RP sends periodic SA messages to reference each registered source once per interval. SA advertisement time is ***60*** seconds.
- Keepalive Time: Period between the transmission of consecutive keepalive messages. Default keepalive time is ***60*** seconds. Minimum keepalive time is one second.
- Hold Timer: Period an MSDP speaker maintains a peer TCP connection after receiving an SA or keepalive message from the peer. Default time is ***75*** seconds. Minimum hold time is three seconds.

16.4.2.3.2 MSDP Data Exchange

This sequence describes the exchange of multicast data across PIM domains through MSDP:

1. When a source's first data packet is registered by the first hop router, the RP extracts the data from the packet and forwards it down the shared tree in the PIM domain.
2. The RP informs MSDP peers of the new source by sending a Source-Active (SA) message that identifies the source, the recipient group, and the RP's address or originator ID.
3. Upon receiving the SA message, an MSDP peer which is the RP for a multicast tree that includes members interested in the multicast sends a PIM join message (S,G) toward the data source.
4. After the RP on another domain joins the PIM Designated Router (DR) in the first domain, multicast data traffic flows natively over the multicast tree to the second domain's RP.
5. If the source times out, this process repeats when the source goes active again.

16.4.3 MSDP Configuration

These sections describe the configuration of the switch as an MSDP speaker and the establishment of MSDP peering sessions.

- MSDP Speaker Configuration
- Establishing MSDP Peers
- MSDP Network Configuration
- Managing the SA Cache
- Configuring MSDP in a non-default VRF

MSDP requires that TCP ***port 639*** (MSDP) is open on the control plane. The default control-plane ACL includes a permit rule that allows TCP packets access through the MSDP port.

16.4.3.1 MSDP Speaker Configuration

The switch is configured as an MSDP speaker when MSDP is enabled. MSDP is enabled by configuring an MSDP peer. Configuring an MSDP Peer describes the process of configuring an MSDP peer.

Source-Address (SA) messages that an MSDP speaker originates contain the speaker's Rendezvous Point (RP) address, as configured through PIM statements and processes. MSDP provides a method of assigning an originator ID address, which the speaker uses in place of its RP address when advertising SA messages. The originator-id local-interface command configures the switch to set the RP address to the specified interface's IP address in SA messages that it originates as an MSDP speaker.

Only RPs originate SA messages and only for its registered sources. RPs do not originate periodic SA messages for sources in other PIM domains. MSDP speakers that are not RPs do not originate periodic SA messages. Intermediate MSDP speakers forward SA messages received from other domains. Intermediate speakers are not required to be RPs.

Example

These commands configure the switch to use the IP address assigned to ***interface loopback 100*** as the RP address in SA messages that it originates.

```
switch(config)# router msdp
switch (config-router-msdp)# originator-id local-interface loopback 100
switch (config-router-msdp)#
```

16.4.3.2 Establishing MSDP Peers

These sections describe MSDP Peer configuration tasks.

- Configuring an MSDP Peer
- Mesh Groups
- Filtering SA Messages
- Keep-alive, Hold Time, and Reset Time Configuration
- Displaying Peer Information

16.4.3.2.1 Configuring an MSDP Peer

The switch attempts to establish MSDP peering sessions through IP addresses configured as MSDP peers. The **peer** command configures a specified address as an MSDP peer and enables the switch as an MSDP speaker if no other peers are configured. The peering session with the device at the specified network is established over a TCP connection. The **local-interface** command can be used to specify an interface through which the switch establishes the TCP session. When no interface is specified, the connection is established through an interface determined by existing routing algorithms.

To display MSDP peer information, enter **show ip msdp peer** .

Example

These commands assign an IP address to ***loopback interface 100***, then configure ***10.4.4.12*** as an MSDP peer and establish the TCP peer session through the loopback.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.6.8.6/24
switch(config-if-Lo100)# exit
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
```

```
switch(config-router-msdp-peer-10.4.4.12)#
```

To associate descriptive text with the specified MSDP peer, use the description (MSDP) command.

Example

These commands associate the string ***NORTH*** with the MSDP peer located at ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# description NORTH
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

To close the peering session with the specified MSDP peer, use the disabled (MSDP) command. This terminates the TCP connection between the switch and the peer. The peer remains configured and the peer session can be resumed by removing the **disabled** command from ***running-config***.

Examples

- This command closes the peering session with the MSDP peer at ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# disabled
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Disbled
   Resets: 0
   Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

- This command reopens the peering session with the peer at ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# no disabled
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

16.4.3.2.2 Mesh Groups

Each node in a fully meshed network is directly connected to every other node in the network. Each peer in a fully meshed MSDP speaker network can be configured as a member of a mesh group. SA messages received from a mesh group peer are not forwarded to other members of the mesh group.

To configure an MSDP peer connection as an MSDP mesh group member, use the **mesh-group** command. An MSDP peer can be assigned to multiple mesh groups. Multiple peer connections can be assigned to the same mesh group.

Note: Peer-specific mesh-group configuration is performed in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode. To remove all configured connections from a mesh group, use the **no mesh-group** command in Router MSDP Configuration Mode.

To display the mesh group membership of configured MSDP peers, enter **show msdp mesh-group**.

Example

These commands configure the MSDP peer connection to ***10.1.1.14*** as a member of the ***AREA-1*** mesh group, then displays members of mesh groups to which configured MSDP peers belong.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)# mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)# show msdp mesh-group
Mesh Group: AREA-1
        10.1.1.14
Mesh Group: tier_01
        10.24.18.13
Mesh Group: tier_02
        10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#
```

16.4.3.2.3 Filtering SA Messages

The switch can filter Source-Active (SA) messages that it sends and receives with Access Control Lists (ACLs). The commands accept standard and extended ACLs. The address field in standard ACLs filters an SA message on its multicast source address.

The **sa-filter in** command assigns an ACL to filter inbound SA messages from the MSDP peer connection being configured. The switch only accepts SA messages from the peer that pass the ACL. The switch accepts all SA messages from peers that are not assigned an input ACL. A peer can be assigned only one input filter ACL. Subsequent **sa-filter in** commands for a peer replace the existing command.

The **sa-filter out** command assigns an ACL as a filter for outbound SA messages to the MSDP peer connection being configured. The switch only sends SA messages to the peer that pass the ACL. The switch sends all specified SA messages to peers not assigned an output filter ACL. A peer can be assigned only one output ACL. Subsequent **sa-filter out** commands for a peer replace the existing command.

Example

These commands assign the IP ACLs named ***LIST-IN*** as the inbound SA message filter and ***LIST-OUT*** as the outbound SA message filter for the MSDP peer connection to ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)# sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Listen
   Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
Input Filter: LIST-IN
```

```
Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
```

16.4.3.2.4 Keep-alive, Hold Time, and Reset Time Configuration

To configure the MSDP keep-alive and hold time intervals for a specified MSDP peer connection, use the **keepalive (MSDP)** command.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is ***60*** seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is ***75*** seconds.

The hold time interval must be longer than or equal to the keep-alive time interval.

Example

This command sets the keep-alive time to ***45*** seconds and the hold time to ***80*** seconds for the MSDP peer connection to ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp) #peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# keepalive 45 80
switch(config-router-msdp-peer-10.4.4.12)#
```

To specify the period that the switch waits after an MSDP peering session is reset before attempting to reestablish the session, enter **connection retry interval**. The default period is ***30*** seconds.

Example

This command configures the switch to wait ***45*** seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config)# router msdp
switch(config-router-msdp)# connection retry interval 45
switch(config-router-msdp)#
```

To enable the encapsulation of multicast data packets on the sending MSDP peer and the decapsulation and forwarding of register packets on the receiving MSDP peer, use the **forward register-packets** command. The default is to not forward the data encapsulated in PIM register messages.

Example

This command enables the forwarding of encapsulated register packets.

```
switch(config)#router msdp
switch(config-router-msdp)#forward register-packets
switch(config-router-msdp)#
```

16.4.3.2.5 Displaying Peer Information

To display the MSDP peers, enter **show ip msdp summary**. The command also displays the operational status of each peer and the number of messages from the peers in the SA cache.

Example

This command displays the configured peers, the status of the peers, and the number of SA messages received from those peers.

```
switch(config)# show ip msdp summary
```

```
MSDP Peer Status Summary
Peer Address      State   SA Count
192.168.3.18      Up      0
192.168.3.16      Up      0
192.168.3.37      Listen  0
192.168.3.46      Up      0
192.168.3.47      Up      0
```

16.4.3.3 MSDP Network Configuration

- Displaying RPF Peers
- Configuring the Default Peer

16.4.3.3.1 Displaying RPF Peers

The switch uses the unicast routing table to define TCP connections between RPs by selecting the next hop peer toward the originating RP of an SA message as the Reverse Path Forwarding (RPF) peer. The switch forwards SA messages that it receives from the RPF peer to all other MSDP peers. The switch rejects SA messages that it receives from non-RPF peers.

To display MSDP information for the peer from which the switch accepts SA messages for a specified Rendezvous Point (RP), enter **show msdp rpf-peer**.

Example

This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at ***10.5.29.4***.

```
switch(config)# show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

16.4.3.3.2 Configuring the Default Peer

The default peer is the MSDP peer from which the MSDP speaker is configured to accept all SA messages. A default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in ***running-config***. Other listed default peers take effect only if the peer named in the first default-peer statement is not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent **default-peer** statements.

To configure the specified MSDP peer connection as a default peer on the switch, use the **default-peer** command. The default peer address must be a previously configured MSDP peer (configured using the peer command).

Example

These commands configure an MSDP default peer.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.5.2.2
```

```
switch(config-router-msdp-peer-10.5.2.2)# default-peer
switch(config-router-msdp-peer-10.5.2.2)#
```

16.4.3.4 Managing the SA Cache

The switch stores Source Active (SA) messages after forwarding the information. This allows new group members to learn about the source before the next SA message is received. The caching action is not configurable and cannot be disabled.

SA messages have an expiration period of ***90*** seconds and remain in the SA cache until they expire. A peer's SA limit defines the number of SA messages the switch stores from the peer. The switch does not store SA messages from a peer whose SA limit is reached until its cached messages start expiring.

- Limiting SA Cache Contents
- Displaying SA Cache Contents
- Verifying Consistency Between the SA Cache and the Routing Table

16.4.3.4.1 Limiting SA Cache Contents

To configure the maximum number of SA messages from a specified MSDP peer that the switch stores in the SA cache, use the **sa-limit** command. The default limit of SA messages that the switch can store from a specified peer is ***40000***.

Example

This command sets the SA limit of ***500*** for the MSDP peer at ***10.1.1.5***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5)# sa-limit 500
switch(config-router-msdp-peer-10.1.1.5)#
```

The maximum number of SA messages that the switch can store in the SA cache for a specified multicast group address is configured by the **group-limit** command. The default limit of SA messages that the switch can store from a specified group is ***40000***.

Example

This command sets the maximum number of 1000 SAs for multicast group ***225.13.15.8/29***.

```
switch(config)# router msdp
switch(config-router-msdp)# group-limit 1000 source 225.13.15.8/29
```

The maximum number of rejected SA messages that the switch can store in the SA cache is configured by the **ip msdp rejected-limit** command. The default limit of rejected SA messages that the switch can store is ***40000***.

Example

This command sets ***5000*** as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config)# router msdp
switch(config-router-msdp)# ip msdp rejected-limit 5000
```

Contents of the SA message cache are removed by the **clear ip msdp sa-cache** command. The command provides options for removing all cache contents or only contents of a specific multicast group.

Example

This command deletes all SA message cache contents.

```
switch(config)# router msdp
switch(config-router-msdp)# clear ip msdp sa-cache
```

16.4.3.4.2 Displaying SA Cache Contents

SA message cache contents are displayed by the **show ip msdp sa-cache** command. Filter options provided by the command for displaying partial cache contents include:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs rejected by ACL filters or cache limit exceeded conditions.

Example

This command displays the contents of the SA message cache.

```
switch(config)# show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
(10.53.71.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
(10.10.101.24, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
(10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
```

Information about specified MSDP peers, including SAs accepted from the peer is displayed by the **show ip msdp peer** command.

Example

This command displays data for the peer at ***10.2.42.4***, including SAs accepted from the peer.

```
switch(config)# show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 (10.2.43.4)
SA Filtering:
Input Filter: allow-multicast-for-msdp
Output Filter: allow-multicast-for-msdp
SAs accepted:
(10.62.79.30, 234.1.4.2), RP 10.2.42.4
(10.61.79.29, 234.1.4.1), RP 10.2.42.4
(10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

The SA cache for the local PIM domain is displayed by the **show ip msdp pim sa-cache** command.

Example

This command displays the SA cache for the local PIM domain.

```
switch(config)# show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

16.4.3.4.3 Verifying Consistency Between the SA Cache and the Routing Table

To check the consistency between the multicast routing table and the MSDP Source-Address (SA) caches, enter **show ip msdp sanity**. When the command detects inconsistencies, it displays the cache entries that are not in the table.

Example

This command displays a sanity check that detects inconsistencies between the SA cache and the multicast routing table.

```
switch(config)# show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
4.1), RP 10.2.42.4
```

16.4.3.5 Configuring MSDP in a non-default VRF

The MSDP can also be configured in a non-default VRF, when the default VRF used does not have a name. The following commands configure MSDP in a non-default VRF.

Example

These commands configure MSDP peer ***1.1.1.1*** in a non-default VRF ***blue***.

```
switch(config)# router msdp
switch(config-router-msdp)# vrf blue
switch(config-router-msdp-vrf-blue)# peer 1.1.1.1
```

16.4.4 MSDP Commands

MSDP Configuration Commands (Global)

- connection retry interval
- forward register-packets (MSDP)
- group-limit
- ip msdp rejected-limit
- originator-id local-interface
- peer
- router msdp

MSDP Peer Configuration Commands

- default-peer
- description (MSDP)
- disabled (MSDP)
- keepalive (MSDP)
- local-interface
- mesh-group
- sa-filter in
- sa-filter out
- sa-limit

MSDP SA Cache Commands

- clear ip msdp sa-cache

MSDP Display Commands

- show ip msdp peer
- show ip msdp pim sa-cache
- show ip msdp sa-cache
- show ip msdp sanity
- show ip msdp summary
- show msdp mesh-group
- show msdp rpf-peer

16.4.4.1 clear ip msdp sa-cache

The **clear ip msdp sa-cache** command removes contents of the Source-Active (SA) message cache. The command provides these filter options for removing partial cache contents:

- contents of a multicast group by specifying its group address.
- all cache contents.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

clear ip msdp sa-cache [**ADDRESS_FILTER**]

Parameters

ADDRESS_FILTER IPv4 address used to select table entries for removal.

- ***no parameter*** All SA messages.
- ***grp_addr*** Multicast group address (IPv4 address). The ***grp_addr*** must be a valid multicast address.

Example

This command deletes all SA message cache contents.

```
switch(config)# router msdp
switch(config-router-msdp)# clear ip msdp sa-cache
```

16.4.4.2 connection retry interval

The **connection retry interval** command specifies the period that the switch waits after an MSDP peering session is reset before trying to reestablish the session. The default period is ***30*** seconds.

The **no connection retry interval** and **default connection retry interval** commands reset the timer interval to the default period of ***30*** seconds by removing the **connection retry interval** command from ***running-config***.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

connection retry interval ***connect_retry***

no connection retry interval ***connect_retry***

default connection retry interval ***connect_retry***

Parameter

connect_retry Reconnect period (seconds). Value ranges from ***1*** to ***65535***. Default is ***30***.

Example

This command configures the switch to wait ***45*** seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config)# router msdp
switch(config-router-msdp)# connection retry interval 45
```

16.4.4.3 default-peer

The **default-peer** command configures the specified MSDP peer connection as a default peer on the switch. The default peer configuration defines the peers from which the switch accepts Source-Active (SA) messages. When the command includes a **prefix list** parameter, the specified peer is the default peer for only SA messages originating from rendezvous points (RPs) covered by prefix list entries. The default peer address must be a previously configured MSDP peer (configured using the **peer** command).

Default peers provide an alternative to Reverse Packet Forwarding (RPF) typically used by MSDP to specify the peers from which a switch accepts SA messages. However, RPF requires a unicast routing table that is correct and converged. RPF also assumes symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Default MSDP peers invalidate the use of RPF over unicast routing tables.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in ***running-config***. Other listed default peers are used only when peers listed before them in ***running-config*** are not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent **default-peer** statements.

The **no default-peer** and **default default-peer** commands remove the corresponding **default-peer** command from ***running-config***.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

default-peer [**PREFIX**]

no default-peer

default default-peer

Parameters

PREFIX List of RPs from the SA messages originate for whiich the default peer is valid.

- ***no parameter*** default peer is valid for SAs from all originating RPs.
- **prefix-list** ***list_name*** name of the prefix list that defines affected originating RP prefixes.

Example

These commands configure two MSDP peers and configure the peer at ***10.5.2.2*** as the default peer.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.6.2.2
switch(config-router-msdp-peer-10.6.2.2)# exit
switch(config-router-msdp)# peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)# default-peer
switch(config-router-msdp-peer-10.5.2.2)#
```

16.4.4.4 description (MSDP)

The **description** command associates descriptive text with the configuration-mode MSDP peer.

The **no description** and **default description** commands remove the text association from the specified peer.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

description ***description_string***

no description

default description

Parameters

description_string text string that is associated with the peer.

Example

These commands associate the string ***NORTH*** with the MSDP peer located at ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# description NORTH
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

16.4.4.5 disabled (MSDP)

The **disabled** command closes the peering session with the specified MSDP peer by terminating the TCP connection between the switch and the peer. The connection is not resumed until the shutdown command is removed from ***running-config***.

The **no disabled** and **default disabled** commands establish an MSDP peering session with the specified peer by removing the corresponding **disabled** command from ***running-config***.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

disabled

no disabled

default disabled

Examples

- This command closes the peering session with the MSDP peer at ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# disabled
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Disbled
   Resets: 0
   Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

- This command reopens the peering session with the peer at ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# no disabled
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

16.4.4.6 group-limit

The **group-limit** command specifies the maximum number of Source-Active (SA) messages that the switch allows in the SA cache for a specified multicast group address.

SA messages have an expiration period of ***90*** seconds and remain in the SA cache until they expire. The switch does not accept SA messages for a group whose cache limit is reached until its cached messages start expiring.

The **no group-limit** and **default group-limit** command removes the maximum group limit for the specified prefix by removing the corresponding **group-limit** statement from ***running-config***.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

group-limit ***quantity*** source***src_subnet***

no group-limit ***quantity*** source ***src_subnet***

default group-limit ***quantity*** source ***src_subnet***

Parameters

- ***quantity*** maximum number of groups that can access the interface. Value ranges from ***1*** to ***40000***.
- ***src_subnet*** Source IPv4 subnet (CIDR or address-mask notation).

Example

This command sets the maximum number of ***1000*** SAs for multicast group ***10.13.15.8/29***.

```
switch(config)# router msdp
switch(config-router-msdp)# group-limit 1000 source 10.13.15.8/29
```

16.4.4.7 ip msdp rejected-limit

The **ip msdp rejected-limit** command specifies the maximum number of rejected Source-Active messages that the switch allows in the SA cache.

SA messages have an expiration period of ***90*** seconds. They remain in the SA cache during this time. The default limit of rejected SA messages that the switch can store is ***40000***.

The **no ip msdp rejected-limit** and **default ip msdp rejected-limit** commands restore the rejected SA limit of ***40000*** by removing the **ip msdp rejected-limit** statement from ***running-config***.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

ip msdp rejected-limit ***quantity***

no ip msdp rejected-limit

default ip msdp rejected-limit

Parameter

quantity maximum rejected SA messages the SA cache can store. Value ranges from ***0*** to ***40000***.

Example

This command sets ***5000*** as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config)# router msdp
switch(config-router-msdp)# ip msdp rejected-limit 5000
```

16.4.4.8 keepalive (MSDP)

The **keepalive** command configures the MSDP keep-alive and hold time intervals for a specified MSDP peer connection.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is ***60*** seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is ***75*** seconds.

The **no keepalive** and **default keepalive** commands restore the default keep-alive and hold time intervals for the specified MSDP peer connection by removing the corresponding **keepalive** command from ***running-config***.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

keepalive ***keep_alive hold_time***

no keepalive

default keepalive

Parameters

- ***keep_alive*** keep-alive period in seconds. Value ranges from ***1*** to ***65535***. Default value is ***60***.
- ***hold_time*** hold time in seconds. Value ranges from ***1*** to ***65535***. Default value is ***75***.

Note: The hold time interval must be longer than or equal to the keep-alive time interval.

Example

This command sets the keep-alive time to ***45*** seconds and the hold time to ***80*** seconds for the connection with the MSDP peer at ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# keepalive 45 80
switch(config-router-msdp-peer-10.4.4.12)#
```

16.4.4.9 local-interface

MSDP peering sessions are established over a TCP connection. The **`local-interface`** command specifies the interface through which the TCP connection is established with the configuration-mode MSDP peer. When the **`local-interface`** command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The **`no local-interface`** and **`default local-interface`** commands remove the corresponding **`local-interface`** command from ***running-config***, returning selection of the connecting interface to the routing algorithm.

Command Mode

Router MSDP Peer Configuration

Router MSDP VRF Peer Configuration

Command Syntax

`local-interface` ***interface***

`no local-interface`

`default local-interface`

Parameters

interface local interface through which the TCP connection is established. Options include:

- **ethernet *e_num*** Ethernet interface.
- **loopback *l_num*** Loopback interface.
- **management *m_num*** Management interface.
- **port-channel *p_num*** Port-Channel Interface.
- **vlan *v_num*** VLAN interface.
- **vxlan *vx_num*** VXLAN interface.

Example

These commands assign an IP address to ***interface loopback 100***, then establish the TCP peer session to the MSDP peer at ***10.4.4.12*** through the loopback in the default VRF.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.6.8.6/24
switch(config-if-Lo100)# exit
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

16.4.4.10 mesh-group

The **mesh-group**command configures the configuration-mode MSDP peer connection as an MSDP mesh group member. A peer can be assigned to multiple mesh groups. Multiple MSDP peers can be assigned to a common mesh group.

An MSDP mesh group is a network of MSDP speakers where each speaker directly connects to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

The **no mesh-group** and **default mesh-group** commands delete the configuration-mode peer connection from a mesh group by removing the corresponding **mesh-group** command from ***running-config*** when issued in the ***router msdp peer*** configuration or the ***router msdp peer vrf*** configuration mode.

Note: To delete all configured connections from a specified mesh group, use the **no mesh-group** command in Router MSDP Configuration mode.

Command Mode

Router MSDP Configuration

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

mesh-group ***group_name***

no mesh-group ***group_name***

default mesh-group ***group_name***

Parameters

group_name name of mesh group.

Related Command

show msdp mesh-group .

Examples

- These commands configure the MSDP peer connection to ***10.1.1.14*** as a member of the ***AREA-1*** mesh group, then display members of mesh groups to which configured MSDP peers belong.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)# mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)# show msdp mesh-group
Mesh Group: AREA-1
        10.1.1.14
Mesh Group: tier_01
        10.24.18.13
Mesh Group: tier_02
        10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#
```

- These commands delete all configured connections from the ***AREA-1*** mesh group.

```
switch(config)# router msdp
switch(config-router-msdp)# no mesh-group AREA-1
switch(config-router-msdp)#
```

16.4.4.11 originator-id local-interface

The **originator-id local-interface** command configures an originator ID to replace the Rendezvous Point (RP) address in Source-Address (SA) messages that it originates as an MSDP speaker.

SA messages that an MSDP speaker originates contain the speaker's rendezvous point (RP) address, as configured through PIM statements and processes. An originator ID is an alternative IPv4 address that a speaker uses in place of its RP address when advertising SA messages. This command configures the switch to use the specified interface's IP address as the RP address in SA messages that it originates.

The **no originator-id local-interface** and **default originator-id local-interface** commands configure the switch to use its RP address in SA messages that it sends by removing the **originator-id local-interface** command from ***running-config***.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

originator-id local-interface INTERFACE

no originator-id local-interface INTERFACE

default originator-id local-interface INTERFACE

Parameters

INTERFACE Specifies the interface from which the IP address is derived. Options include:

- **ethernet *e_num*** Ethernet interface.
- **loopback *l_num*** Loopback interface.
- **management *m_num*** Management interface.
- **port-channel *p_num*** Port-Channel Interface.
- **vlan *v_num*** VLAN interface.
- **vxlan *vx_num*** VXLAN interface.

Example

These commands configure the switch to use the IP address assigned to ***interface loopback 100*** as the RP address in SA messages that it originates.

```
switch(config)# router msdp
switch (config-router-msdp)# originator-id local-interface loopback 100
switch (config-router-msdp)#
```

16.4.4.12 peer

The **peer** command configures the specified address as an MSDP peer, enables MSDP on the switch if it was not previously enabled, and places the switch in Router MSDP Peer Configuration Mode for the specified peer.

The peering session with the device at the specified network is established over a TCP connection. The **local-interface** command can specify an interface through which the TCP connection is established. When the **local-interface** command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The **no peer** and **default peer** commands remove the specified MSDP peer configuration by deleting the corresponding **peer** command from ***running-config***. MSDP is disabled when the last **peer** command is removed.

Command Mode

Router MSDP Configuration

Command Syntax

peer ***ip_address***

Parameters

ip_address IP address of the MSDP peer to be configured.

Commands Available in Router MSDP Peer Configuration Mode

- **default-peer**
- **description (MSDP)**
- **disabled (MSDP)**
- **keepalive (MSDP)**
- **local-interface**
- **mesh-group**
- **sa-filter in**
- **sa-filter out**
- **sa-limit**

Example

These commands establish an MSDP peer relationship with the peer at ***192.168.3.17*** and place the switch in the ***router msdp peer*** configuration mode for that peer.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 192.168.3.17
switch(config-router-msdp-peer-192.168.3.17)#
```

16.4.4.13 router msdp

The **`router msdp`** command places the switch in the ***router msdp*** configuration mode, and allows to configure the *global* IP configuration commands and VRF commands in this mode.

The **`no router msdp`** and **`default router msdp`** commands removes the corresponding **`router msdp`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`router msdp`

`no router msdp`

`default router msdp`

Related Commands

- **connection retry interval**
- **default-peer**
- **description (MSDP)**
- **disabled (MSDP)**
- **group-limit**
- **ip msdp rejected-limit**
- **keepalive (MSDP)**
- **mesh-group**
- **originator-id local-interface**
- **peer**
- **sa-filter in**
- **sa-filter out**
- **sa-limit**

Example

This command places the switch in the ***router msdp*** configuration mode.

```
switch(config)# router msdp
switch(config-router-msdp)#
```

16.4.4.14 sa-filter in

The **sa-filter in** command assigns an IP Access Control List (ACL) as a filter for inbound Source-Active (SA) messages from the configuration-mode MSDP peer connection. The switch only accepts SA messages from the peer that are accepted by the assigned ACL. The switch accepts all SA messages from the peer when an ACL is not assigned as an inbound filter.

Only one ACL can be assigned as an inbound filter to an MSDP peer. Any subsequent **sa-filter in** commands for the peer replace the existing command.

The **no sa-filter in** and **default sa-filter in** commands remove the ACL assignment as an inbound filter by removing the corresponding **sa-filter in** command from ***running-config***.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

sa-filter in list ***list_name***

no sa-filter in

default sa-filter in

Parameters

- ***peer_id*** MSDP peer address (IPv4 address).
- ***list_name*** name of ACL that filters SA messages.

Related Command

sa-filter out

Guideline

The command accepts standard and extended ACLs. The address field in a standard ACL filters an SA message on its group address.

Example

These commands create an IP ACL named LIST-IN as the inbound SA message filter for the MSDP peer connection to ***10.4.4.12***. The ACL permits SAs from the multicast group ***239.14.4.2/28***.

```
switch(config)# ip access-list LIST-IN
switch(config-acl-LIST-IN)# permit ip any 239.14.4.2/28
switch(config-acl-LIST-IN)# exit
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Listen
   Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
Input Filter: LIST-IN
```

16.4.4.15 sa-filter out

The **sa-filter out** command assigns an IP Access Control List (ACL) as a filter for outbound Source-Active (SA) messages to the configuration-mode MSDP peer connection, after which the permit statement allows matching SAs to be advertised outbound to the peer. The **deny any/deny ip any any** at the end of an ACL statement filters any other SAs not matching explicit permit statements. The switch sends all SA messages to the peer when an ACL is not assigned as an output filter to the peer.

Only one ACL can be assigned as an outbound filter to an MSDP peer. Any subsequent **sa-filter out** commands for the peer replace the existing command.

The **no sa-filter out** and **default sa-filter out** commands remove the ACL assignment as an outbound filter by removing the corresponding **sa-filter out** command from ***running-config***.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

sa-filter out list ***list_name***

no sa-filter out

default sa-filter out

Parameters

- ***peer_id*** MSDP peer address (IPv4 address).
- ***list_name*** name of ACL that filters SA messages.

Related Command

sa-filter in assigns an IP ACL to filter inbound SA messages from the MSDP peer being configured.

Guidelines

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its multicast stream source addresss.

Example

These commands assign the IP ACL named LIST-OUT as the outbound SA message filter for the MSDP peer connection to ***10.4.4.12***.

```
switch(config)# router msdp
switch(config-router-msdp)# ip access-list LIST-OUT
switch(config-acl-LIST-OUT)# permit ip any  239.14.4.2/28
switch(config-acl-LIST-OUT)# exit
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Listen
   Connection Source: Loopback100 ( 10.6.8.6 )
SA Filtering:
Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
```

16.4.4.16 sa-limit

The **sa-limit** command specifies the maximum number of Source-Active messages from a specified MSDP peer that the switch allows in the SA cache. SA messages have an expiration period of ***90*** seconds, during which time they remain in the SA cache. The switch does not accept SA messages from a peer after the peer's SA limit is reached. By default, The limit to the number of SA messages that the switch can store from a specified peer is ***40000***, by default.

The **no sa-limit** and **default sa-limit** commands restore the SA limit of ***40000*** for the specified MSDP peer by removing the corresponding **sa-limit** statement from ***running-config***.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

sa-limit ***quantity***

no sa-limit

default sa-limit

Parameters

- ***peer_id*** MSDP peer (IPv4 address).
- ***quantity*** maximum number of SA messages that the switch can store. Value ranges from ***0*** to ***40000***.

Example

This command sets the SA limit of ***500*** for the MSDP peer at ***10.1.1.5***.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5)# sa-limit 500
switch(config-router-msdp-peer-10.1.1.5)#
```

16.4.4.17 show ip msdp peer

The **show ip msdp peer** command displays information about specified MSDP peers. The command includes an optional parameter for displaying SAs accepted from the peer.

Command Mode

EXEC **Command Syntax**

show ip msdp peer [**PEER_ADDR**][**SA_ACCEPT**]

Parameters

- ***PEER_ADDR*** Peers for which command displays information.
  - ***no parameter*** All peers configured on the switch.
  - ***ipv4_addr*** Address of specified MSDP peer.
- **SA_ACCEPT** Command displays SAs accepted from the specified peers.
  - ***no parameter*** Accepted SAs are not displayed.
  - **accepted-sas** Accepted SAs are displayed.

Example

This command displays MSDP information concerning the peer located at ***10.2.42.4***, including SAs that the switch accepted from this peer.

```
switch(config)# show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 ( 10.2.43.4 )
SA Filtering:
Input Filter: allow-multicast-for-msdp
Output Filter: allow-multicast-for-msdp
SAs accepted:
(10.62.79.30, 234.1.4.2), RP 10.2.42.4
(10.61.79.29, 234.1.4.1), RP 10.2.42.4
(10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

16.4.4.18 show ip msdp pim sa-cache

The **show ip msdp pim sa-cache** command displays the SA cache for the local PIM domain configured on the switch. An SA cache is a table of Source-Active messages that are generated or accepted by the PIM domain.

Command Mode

EXEC

Command Syntax

show ip msdp pim sa-cache

Example

This command displays the SA cache for the local PIM domain.

```
switch(config)# show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.51.71.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.1), RP 10.2.43.4
(10.51.79.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.24, 234.1.4.2), RP 10.2.43.4
(10.51.79.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.2), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

16.4.4.19 show ip msdp sa-cache

The **show ip msdp sa-cache** command displays contents of the Source-Active (SA) message cache. The command provides these filter options for displaying partial cache contents:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs that were rejected by ACL filters or cache limit exceeded conditions.

Command Mode

EXEC

Command Syntax

show ip msdp sa-cache [**ADDRESS_FILTER**][**CONTENTS**]

Parameters

- **ADDRESS_FILTER** IPv4 address used to filter SA messages.
  - ***no parameter*** All SA messages.
  - ***grp_addr*** Multicast group address (IPv4 address).
  - ***src_addr grp_addr*** Source and multicast group addresses (two IPv4 addresses).
  -
- ***grp_addr*** must be a valid multicast address.
  - ***no parameter*** Displays contents of SA Cache.
  - **rejected** Displays rejected SAs in addition to the SA cache contents.
- **CONTENTS** type of SAs that the command displays.

Example

This command displays the contents of the SA message cache.

```
switch(config)# show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4

```

16.4.4.20 show ip msdp sanity

The **show ip msdp sanity** command performs a consistency check between the multicast routing table and the MSDP Source-Address (SA) caches. When the command detects inconsistencies, it displays the cache entries that are not in the table.

Command Mode

EXEC

Command Syntax

show ip msdp sanity

Examples

- This command displays a sanity check that detects no inconsistencies between the SA cache and the multicast routing table.

```
switch(config)# show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
```

- This command displays inconsistencies between the SA cache and the multicast routing table.

```
switch(config)# show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.19, 224.1.246.1)
(192.168.3.17, 224.1.204.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
(192.168.3.26, 224.1.198.1)
(192.168.3.33, 224.1.195.1)
(192.168.3.4, 224.1.246.1)
(192.168.3.37, 224.1.188.1)
(192.168.3.12, 224.1.245.1)
(192.168.3.31, 224.1.206.1)
(192.168.3.35, 224.1.178.1)
(192.168.3.6, 224.1.155.1)
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
4.1), RP 10.2.42.4
```

16.4.4.21 show ip msdp summary

The **show ip msdp summary** command displays a list of peer addresses, the operational status of the peer, and the number of Source-Active messages in the SA cache from that peer.

Command Mode

EXEC

Command Syntax

show ip msdp summary

Example

This command displays the configured peers, the status of the peers, and the number of SA message received from those peers.

```
switch(config)# show ip msdp summary
MSDP Peer Status Summary
Peer Address      State   SA Count
192.168.3.18      Up      0
192.168.3.16      Up      0
192.168.3.37      Listen  0
192.168.3.46      Up      0
192.168.3.47      Up      0
```

16.4.4.22 show msdp mesh-group

The **show msdp mesh-group** command displays the mesh group membership of MSDP peers that are configured on the switch. An MSDP mesh group is a network of MSDP speakers where each speaker is directly connected to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

Command Mode

EXEC

Command Syntax

show msdp mesh-group

Related Command

mesh-group configures the MSDP peer connection as an MSDP mesh group member.

Example

This command displays the mesh group membership of configured MSDP peers.

```
switch(config)# show msdp mesh-group
Mesh Group: tier_01
        10.24.18.13
Mesh Group: tier_02
        10.26.101.18
```

16.4.4.23 show msdp rpf-peer

The **show msdp rpf-peer** command displays MSDP information for the peer from which the switch accepts SA messages for a specified Rendezvous Point (RP).

The switch examines the BGP routing table to determine the next hop peer toward the originating RP of an SA message. This next hop peer is the Reverse Path Forwarding (RPF) peer. Because the switch receives SA messages from the RPF peer, it forwards the message to all other MSDP peers. The switch rejects identical SA messages that it receives from a non-RPF peer.

Command Mode

EXEC

Command Syntax

show msdp rpf-peer *rp_addr*

Parameter

rp_addr PIM RP IPv4 address.

Example

This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at ***10.5.29.4***.

```
switch(config)# show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

16.5 Audio Video Bridging (AVB)

Arista switches support Audio Video Bridging (AVB) and the associated protocols. This section describes AVB concepts and the implementation of associated protocols.

Topics in this section include:

16.5.1 AVB Overview

Audio Video Bridging (AVB) is a protocol set that provides precision time synchronization, admission control, queuing reservation, and guaranteed bandwidth of professional grade quality audio and video across an IP network.

Supported AVB protocols include:

- Generalized Precision Time Protocol (gPTP)
- Multiple Stream Reservation Protocol (MSRP)
- Multiple VLAN Registration Protocol (MVRP)

These AVB features are supported on Arista 7280, 7150 Series, and 7500E Series switches:

- gPTP with hardware time stamping
- gPTP Grandmaster function
- MSRP protocol on Ethernet interfaces: stream admission control and propagation
- Control plane protection for PTP and MSRP control frames
- MVRP
- Traffic classes 2 and 3 for AVB traffic
- Traffic shaping on egress ports

These AVB features are not available on Arista switches:

- MSRP protocol on LAGs
- MSRP co-ordination with gPTP; streams are allowed even when gPTP is not in sync
- MMRP
- Signaling message support in gPTP
- Running peer delay mechanism on STP blocked ports
- Grandmaster-specific state machines (gPTP)

16.5.2 AVB Protocols

This section describes supported AVB protocols:

16.5.2.1 gPTP

Generalized Precision Time Protocol (gPTP) is a network time synchronization standard for bridged Local Area Networks based on the IEEE 1588v2 Precision Time Protocol and supports the AVB protocol standards.

Time synchronization in a gPTP domain is conducted the same way as in a PTP 1588 domain. A grandmaster is selected through the best grand master clock algorithm and distributes timing synchronization information to all directly attached peers. This information is propagated across the network to provide a common time reference to all Audio and Video end stations.

16.5.2.2 MVRP

Multiple VLAN Registration Protocol (MVRP) is an application of Multiple Registration Protocol used by AVB endpoints to dynamically register and unregister VLANs on an interface.

When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receiving the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

MVRP events post Syslog messages, with the severity level of **INFO** for each message.

- **MVRP_VLAN_JOIN**

MVRP VLAN Join received/transmitted on an interface.

- **MVRP_VLAN_LV**

MVRP VLAN Leave received/transmitted on an interface.

- **MVRP_ERROR**

MVRP Join was discarded due to an error.

16.5.2.3 MSRP

Multiple Stream Registration Protocol (MSRP) is a signaling protocol that allows end stations (nodes) to reserve network resources and ensure QoS for communicating with other end stations.

MSRP nodes are specified as talkers or listeners:

- Talker nodes transmit multimedia streams to other nodes in the AVB network.
- Listener nodes receive multimedia streams from the AVB talker nodes.

MSRP is implemented by the switch on individual interfaces. MSRP is active when it is enabled on at least one interface, and stopped when it is disabled on all interfaces. MSRP uses Multiple Registration Protocol (MRP) to facilitate attribute registrations and distribution across connected end points in a LAN environment.

MSRP events post Syslog messages, with the severity level of INFO for each message.

- **MSRP_SR_CLASS_TRANSITION**

  MSRP SR Class state transition occurred on an interface.

- **MSRP_TALKER_ADV_JOIN**

  Talker Advertise Join message for a stream was transmitted/received on an interface.
- **MSRP_TALKER_FAIL_JOIN**

  Talker Failed Join message for a stream was transmitted/received on an interface.
- **MSRP_LISTENER_JOIN**

  Listener Join message for a stream was transmitted/received on an interface.
- **MSRP_DOMAIN_JOIN**

  Domain Join message was transmitted/received on an interface.
- **MSRP_TALKER_ADV_LV**

  Talker Advertise Leave message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_LV**

  Talker Failed Leave message for a stream was transmitted/received on an interface.
- **MSRP_LISTENER_LV**

  Listener Leave message for a stream was transmitted/received on an interface.
- **MSRP_DOMAIN_LV**

  Domain Leave message was transmitted/received on an interface.
- **MSRP_BW_ALLOC_SUCCESS**

  MSRP Bandwidth was allocated for a listener on an interface.
- **MSRP_BW_ALLOC_FAIL**

  MSRP Bandwidth could not be allocated for a listener on an interface.
- **MSRP_BW_DEALLOC**

  MSRP Bandwidth was de-allocated for a listener on an interface.
- **MSRP_ERROR**

  MSRP Join was discarded because of an error.

16.5.2.4 MRP

Multiple Registration Protocol (MRP) protocol includes MSRP and MVRP, and allows participants in an MRP application to register attributes with participants in a Bridged Local Area Network (BLAN).

16.5.3 AVB Configuration

This section describes the AVB configuration:

- Enabling gPTP
- Enabling MSRP
- Displaying MSRP Configuration and Status
- Enabling MVRP
- Displaying MVRP Configuration and Status

16.5.3.1 Enabling gPTP

Configure gPTP on the switch though the **`ptp mode gptp`** command. PTP is enabled on individual interfaces with the **`ptp enable`** command.

Example

These commands configure gPTP on the switch and enable PTP on interface ethernet ***41-45***.

```
switch(config)# ptp mode gptp
switch(config)# interface ethernet 41-45
switch(config-if-Et41-45)# ptp enable
switch(config)# show running-config
    <-------OUTPUT OMITTED FROM EXAMPLE-------->
!
ptp mode gptp
!
    <-------OUTPUT OMITTED FROM EXAMPLE-------->
end
switch(config-if-Et41-45)#show active
interface Ethernet41
   speed forced 10000full
   msrp
   ptp enable
interface Ethernet42
```

```
   speed forced 10000full
   msrp
   ptp enable
interface Ethernet43
   speed forced 10000full
   msrp
   ptp enable
interface Ethernet44
   speed forced 10000full
   ptp enable
interface Ethernet45
   ptp enable
switch(config-if-Et41-45)#
```

16.5.3.2 Enabling MSRP

MSRP is enabled on an interface with the **msrp** command.

Example

These commands enable MSRP on interface ethernet ***41-43***.

```
switch(config)# interface ethernet 41-43
switch(config-if-Et41-43)#msrp
switch(config-if-Et41-43)#show active
interface Ethernet41
   speed forced 10000full
   msrp
interface Ethernet42
   speed forced 10000full
   msrp
interface Ethernet43
   speed forced 10000full
   msrp
switch(config-if-Et41-43)#
```

16.5.3.3 Displaying MSRP Configuration and Status

MSRP configuration information and status is displayed with the **show msrp** command.

Example

This command displays the MSRP status for interfaces ethernet ***41-43***.

```
switch(config)# show msrp interfaces ethernet 41-43

  MSRP Global Status : Enabled
  Max Frame Size : 1522
  Max Fan-In Ports : No limit

                             Delta
  Class Supported Priority Bandwidth
  ----- --------- -------- ---------
      A         Y        3       75%
      B         Y        2        0%

Legend
------

  Et43 Disabled    3

switch(config)#
```

Stream data is available for the talker and listener. The **show msrp interfaces** command displays the status and configuration information for each stream.

Examples

- This command displays data for listener station streams on interfaces ethernet ***1-2***.

```
switch(config)# show msrp interfaces ethernet 1-2
MSRP Global Status : Enabled
  Max Frame Size : 1522
  Max Fan-In Ports : No limit

                              Delta
  Class Supported Priority Bandwidth
  ----- --------- -------- ---------
      A         Y        3       75%
      B         Y        2        0%

switch(config)#
```

16.5.3.4 Enabling MVRP

MVRP is disabled by default. To enable MVRP on an interface, use the **mvrp** command. MVRP is enabled globally if it is enabled on at least one interface.

Example

These commands enable MVRP on ***interface ethernet 34***.

```
switch(config)# interface ethernet 34
switch(config-if-Et34)# mvrp
switch(config-if-Et34)#
```

16.5.3.5 Displaying MVRP Configuration and Status

MVRP configuration information and status are displayed with the **show mvrp** command.

Example

This command displays the MVRP status for interfaces Ethernet ***30-40***.

```
switch(config)# show mvrp interfaces Ethernet 30-40

  MVRP Global Status : Enabled

  Port      Admin State   Registered Vlans      Declared Vlans
  --------  ------------  --------------------  --------------------
  Et30      Disabled
  Et31      Disabled
  Et32      Disabled
  Et33      Disabled
  Et34      Active
  Et35      Disabled
  Et36      Disabled
  Et37      Disabled
  Et38      Disabled
  Et39      Disabled
  Et40      Disabled
switch(config)#
```

16.5.4 AVB Commands

MSRP Commands

- msrp
- msrp streams load-file
- show msrp
- show msrp interfaces
- show msrp streams

MRP Commands

- mrp leave-all-timer
- mrp leave-timer

MVRP Commands

- show mvrp

16.5.4.1 mrp leave-all-timer

The **mrp leave-all-timer** command specifies the mrp leave all timer interval for the configuration mode interface.

When starting MRP, a participant starts its LeaveAll timer. Upon timer expiry, it sends a LeaveAll message and restarts its timer. When other participants receive the message, they register their attributes and restart their leave-all timers.

The default leave-all timer interval is a randomly selected value from ***10*** to ***15*** seconds. Under normal conditions, this value should not be adjusted.

The **no mrp leave-all-timer** and **default mrp leave-all-timer** commands restore the default leave-all timer interval on the configuration mode interface by removing the corresponding **mrp leave-all-timer** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mrp leave-all-timer ***period***

mrp leave-all-timer

default mrp leave-all-timer

no mrp leave-all-timer

Parameter

period leave all timer interval (seconds). Values range from ***10*** to ***60***. Default value is a randomly selected value from ***10*** to ***15***.

Example

This command sets the MRP leave-all timer interval on ***interface ethernet 17*** to ***12*** seconds.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# mrp leave-all-timer 12
switch(config-if-Et17)#
```

16.5.4.2 mrp leave-timer

The leave-timer controls the deregistration of attributes. If an MRP participant needs other participants to unregister their attributes, it sends a Leave message. When receiving a Leave message, the Leave-timer starts and unregisters the attributes if it does not receive Join messages for the attributes before the Leave-timer expires.

The **`mrp leave-timer`** command specifies the mrp leave-timer interval for the configuration mode interface. The default leave-timer interval is ***0.6*** seconds. Under normal operation conditions, this value should not be adjusted.

The **`no mrp leave-timer`** and **`default mrp leave-timer`** commands restore the default leave-timer interval of ***0.6*** seconds on the configuration mode interface by removing the corresponding **`mrp leave-timer`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`mrp leave-timer` ***period***

`no mrp leave-timer`

`default mrp leave-timer`

Parameter

period leave all timer interval (seconds). Values range from ***10*** to ***60***. Default value is a randomly selected value from ***10*** to ***15***.

Example

This command sets the MRP leave timer interval on ***interface ethernet 17*** to ***0.8*** seconds.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# mrp leave-timer 12
switch(config-if-Et17)#
```

16.5.4.3 msrp

MSRP enables Multiple Stream Registration Protocol (MSRP), which is a signaling protocol that provides nodes with the ability to reserve network resources to ensure Quality of Service (QoS) between talker and listener endpoints. The Stream Reservation Protocol (SRP) utilizes MSRP to reserve bandwidth for data streams, and configure a complete path between endpoints.

The **msrp** command enables MSRP on the configuration mode interface. If MSRP was not previously enabled on any interface, the MSRP agent is launched by this command.

The **no msrp** and **default msrp** commands disable MSRP on the configuration mode interface, and removes the corresponding **msrp** command from ***running-config***. The command stops the MSRP agent when MSRP is no longer enabled on any interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

msrp

no msrp

default msrp

Examples

- These commands enable MSRP on ***interface ethernet 3/3/3***. Because it was not previously enabled on any other interface, the command launches the MSRP agent.

```
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# msrp
Launching MSRP Agent
switch(config-if-Et3/3/3)# show active
 interface Ethernet3/3/3
 msrp
switch(config-if-Et3/3/3)#
```

- These commands disable the MSRP agent on ***interface ethernet 3/3/3***. Because it is not enabled on any other interface, the command stops the MSRP agent.

```
switch(config-if-Et3/3/3)# no msrp
Stopping MSRP agent
switch(config-if-Et3/3/3)# show active
interface Ethernet3/3/3
switch(config-if-Et3/3/3)# msrp
```

16.5.4.4 msrp streams load-file

The load-file for MSRP streams provides a file that contains an alias that can be substituted in the name (stream-id) of a string.

The **msrp streams load-file** command allows users to include a line in the file (example: ***0102.0304.0506 XYZW4*** or ***0102.0304 XYZW5***) that causes the bytes to be replaced with the accompanying string in **show msrp streams** commands.

The **no msrp streams load-file** and **default msrp streams load-file** commands remove the alias assignment by removing the corresponding **msrp streams load-file** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

msrp streams load-file [**FILE TYPE**]

no msrp streams load-file

default msrp streams load-file

Parameters

FILE TYPE The options include:

- **certificate:** device name, directory, or file name
- **extension:** device name, directory, or file name
- **file:** device name, directory, or file name
- **flash:** device name, directory, or file name
- **ftp:** device name, directory, or file name
- **http:** device name, directory, or file name
- **https:** device name, directory, or file name
- **scp:** device name, directory, or file name
- **sftp:** device name, directory, or file name
- **sslkey:** device name, directory, or file name
- **system:** device name, directory, or file name
- **terminal:** device name, directory, or file name
- **tftp:** device name, directory, or file name
- **usb1:** device name, directory, or file name

Example

This command indicates that the file named ***file1*** contains the alias names that is used in MSRP stream names.

```
switch(config)# msrp streams load-file file1
switch(config)#
```

16.5.4.5 show msrp

The **show msrp** command displays MSRP operational information for the specified interfaces.

Command Mode

EXEC

Command Syntax

show msrp [**INTERFACE_NAME**]

Parameters

INTERFACE_NAME Interface type and number. Values include:

- ***no parameter*** all Ethernet interfaces.
- interfaces ethernet ***e_range*** Ethernet interface list.
- Valid ***e_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command displays the MSRP status for interfaces ethernet ***41-43***.

```
switch(config)# show msrp interfaces ethernet 41-43

  MSRP Global Status : Enabled
  Max Frame Size : 1522
  Max Fan-In Ports : No limit

  Class Supported Priority Delta Bandwidth
  ----- --------- -------- ---------
      A         Y        3       75%

16.5.4.6 show msrp interfaces

The **`show msrp interfaces`** command displays station stream information for the specified station type, interfaces and streams.

Command Mode

EXEC

Command Syntax

`show msrp interfaces` [**INTERFACE_NAME**] **STATION_TYPE_NAME** [**STREAMS**]

Parameters

- **INTERFACE_NAME** Interface type and number. Values include:
  - ***no parameter*** all Ethernet interfaces.
  - **ethernet *e_range*** Ethernet interface list.
  - **STATION_TYPE** Endpoint type. Values include:
  - **`talker`** Command displays data for talker station streams.
  - **`listeners`** Command displays data for listener station streams.
  - **`streams`** Command displays data for talker and listener station streams.
- **STREAMS** Streams for which command displays information. Options include:
  - ***no parameter*** all streams.
  - ***stream-id hex_string*** specifies the stream command for which command displays information.
  - Valid ***e_range*** formats include number, range, or comma-delimited list of numbers and ranges.
  - Valid ***hex_string*** formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from ***0*** to ***FFFF***.

Examples

- This command displays data for listener station streams on interfaces ethernet ***1*** and ***2***.

```
switch(config)# show msrp interfaces ethernet 1-2 listeners

16.5.4.7 show msrp streams

The **show msrp streams** command displays configuration and status information on the specified MSRP streams.

Command Mode

EXEC

Command Syntax

show msrp streams [**STREAM_NAME**] [**INFO_LEVEL**]

Parameters

- **STREAMS** Streams for which command displays information. Options include:
  - ***no parameter*** all streams.
  - **stream-id *hex_string*** specifies the stream command for which command displays information.
  - Valid ***hex_string*** formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from ***0*** to ***FFFF***.
- **INFO_LEVEL** type of information that the command displays. Options include:
  - ***no parameter*** command displays stream identification information.
  - **detail** command displays identification and transmission characteristics.
  - **propagation** command displays ingress and egress port information.

Examples

- This command displays stream identification information.

```
switch(config)# show msrp interfaces streams

Chapter 17

Virtual Extensible LANs (VXLANs)

This chapter describes Arista's Virtual Extensible LAN (VXLAN) implementation. Sections in this chapter include:

17.1 VXLAN Introduction

Virtual Extensible LAN (VXLAN) is a networking technology that encapsulates MAC-based Layer 2 Ethernet frames within Layer 3 UDP packets to aggregate and tunnel multiple Layer 2 networks across a Layer 3 infrastructure. VXLAN scales up to 16 million logical networks and supports Layer 2 adjacency across IP networks. Multicast transmission architecture is used for broadcast, multicast, and unknown unicast traffic.

For a list of VXLAN feature support in a specific EOS release, consult the appropriate release notes here: https://www.arista.com/en/support/software-download.

For a list of VXLAN feature support by platform in the latest EOS release, see https://www.arista.com/en/support/product-documentation/supported-features.

Note: VXLAN and NAT cannot co-exist.

17.2 VXLAN Description

These sections describe VXLAN architecture, the data objects that comprise a VXLAN network, and process of bridging packets through a VXLAN network.

17.2.1 VXLAN Architecture

The VXLAN architecture extends a Layer 2 network by connecting VLANs from multiple hosts through UDP tunnels called VXLAN segments. VXLAN segments are identified by a 24-bit Virtual Network Identifier (VNI). Within a host, each VLAN whose network is extended to other hosts is associated with a VNI. An extended Layer 2 network comprises the devices attached to VLANs from all hosts that are on VLANs that are associated with the same VNI.

The following figure displays the data objects that comprise a VXLAN implementation on a local host.

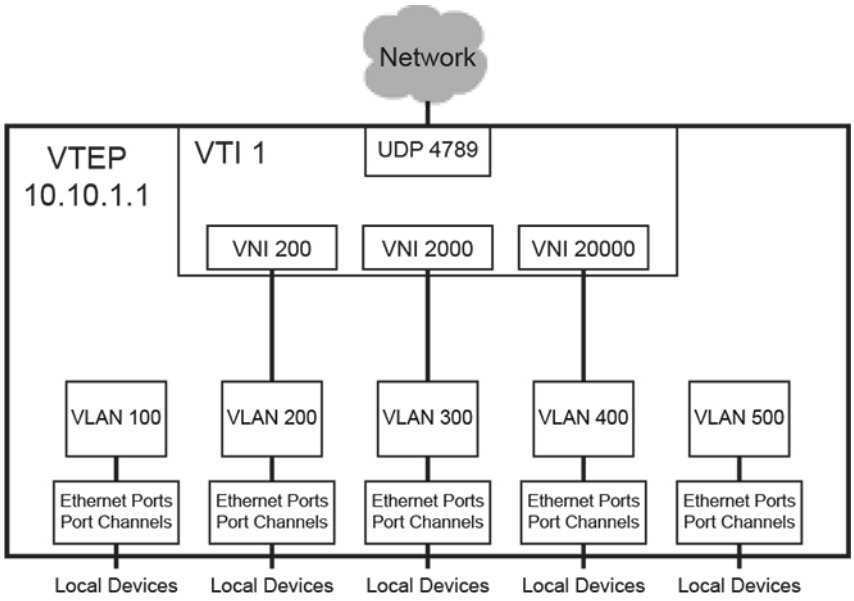

Figure 68: VXLAN Architecture

- **VXLAN Tunnel End Point (VTEP):** a host with at least one VXLAN Tunnel Interface (VTI).
- **VXLAN Tunnel Interface (VTI):** a switchport linked to a UDP socket that is shared with VLANs on various hosts. Packets bridged from a VLAN to the VTI are sent out the UDP socket with a VXLAN header. Packets arriving on the VTI through the UDP socket are demuxed to VLANs for bridging.
- **Virtual Network Identifier (VNI):** a 24-bit number that distinguishes between the VLANs carried on a VTI. It facilitates the multiplexing of several VLANs over a single VTI.

VNIs can be expressed in digital or dotted decimal formats. VNI values range from ***1*** to ***16777215*** or from ***0.0.1*** to ***255.255.255***.

The network in the figure above has the following assignments:

- VTEP IP address of ***10.10.1.1***.
- UDP port of ***4789***.
- One VTI that supports three VXLAN segments (UDP tunnels): VNI ***200***, VNI ***2000***, and VNI ***20000***
- Five VLANs, of which three VLANs can communicate with remote devices over Layer 2.

17.2.2 VXLAN Gateway

A VXLAN gateway is a service that exchanges VXLAN data and packets with devices connected to different network segments. VXLAN traffic must pass through a VXLAN gateway to access services on physical devices in a distant network.

A VXLAN gateway requires the following information:

- An IP address that is designated as the VXLAN interface source.
- VLAN to VNI mapping.
- VTEP list for each VNI.
- A method for handling broadcast, unknown unicast, and multicast (BUM) packets.

Arista switches manually perform VXLAN gateway services. The switch connects to VXLAN gateways that serve other network segments. MAC address learning is performed in hardware from inbound VXLAN packets.

17.2.3 VXLAN Processes

When a packet enters a VLAN from a member (ingress) port, the VLAN learns the source address by adding an entry to the MAC address table that associates the source to the ingress-port. The VLAN then searches the table for destination address. If the MAC address table lists the address, the packet is sent out the corresponding port. If the MAC address table does not lists the address, the packet is flooded to all ports except the ingress port.

VXLANs extend VLANs through the addition of a VXLAN address table that correlates remote MAC addresses to their port and resident host IP address. Packets that are destined to a remote device are sent to the VXLAN tunnel interface (VTI), which is the switchport that is linked to the UDP socket. The packet is encapsulated with a VXLAN header which includes the VNI associated with the VLAN and the IP mapping of the destination host. The packet is sent through a UDP socket to the destination VTEP IP. The VTI on the remote host extracts the original packet and bridges it to the VLAN associated with the VNI on the remote host.

UDP port 4789 is recognized as the VXLAN socket and listed as the destination port on the UDP packets. The UDP source port field is filled with a hash of the inner header to facilitate load balancing.

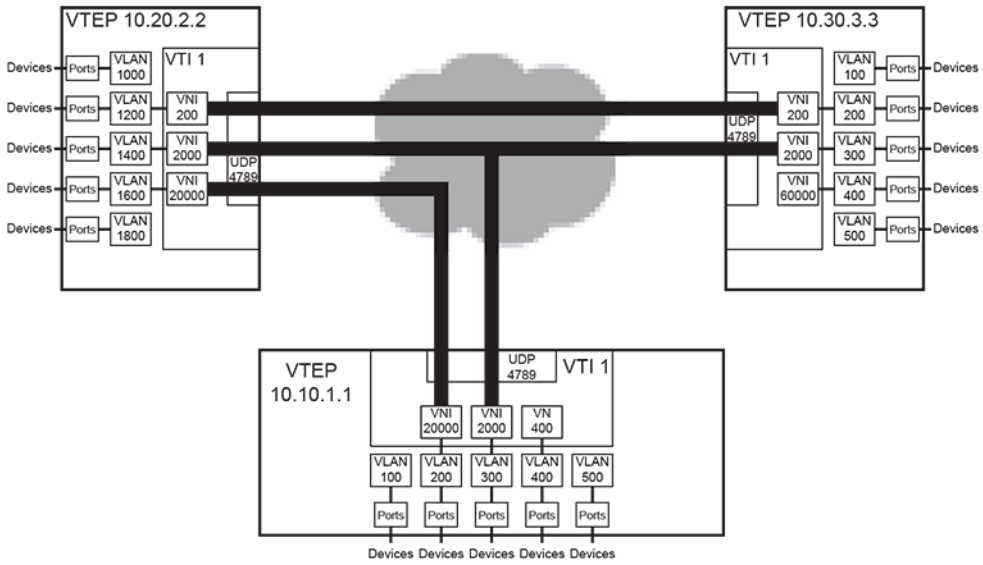

Figure 69: VXLAN Implementation

The figure above displays a configuration that includes three VTEPs. The VXLAN defines three inter-host L2 networks. The VLANs that comprise the networks include:

- ***VNI 200***: ***VTEP 10.20.2.2: VLAN 1200*** and ***VTEP 10.30.3.3: VLAN 200***
- ***VNI 2000***: ***VTEP 10.10.1.1: VLAN 300***, ***VTEP 10.20.2.2: VLAN 1400***, and ***VTEP 10.30.3.3: VLAN 300***
- ***VNI 20000***: ***VTEP 10.10.1.1: VLAN 200***, and ***VTEP 10.20.2.2: VLAN 1600***

VXLAN Routing

VXLAN routing is enabled by creating a VLAN interface on the VXLAN-enabled VLAN and assigning an IP address to the VLAN interface. The IP address serves as VXLAN gateway for devices that are accessible from the VXLAN-enabled VLAN.

17.2.4 Multicast and Broadcast over VXLAN

These sections describe multicast and broadcast over VXLANs. Multicast packet flooding describes broadcast and multicast transmission by associating a multicast group to a VTI through a configuration command.

Head-end Replication (HER) optimizes flooding of inter VTEP broadcast, unknown unicast and broadcast (BUM) traffic by using hardware and flood lists to perform replication on the supported platform.

- Multicast Packet Flooding
- Head-end Replication

17.2.4.1 Multicast Packet Flooding

Multicast packet flooding is supported with VXLAN bridging without MLAG. A VTI is associated with a multicast group through a configuration command.

VXLAN and Broadcast

When a VLAN receives or sends a broadcast packet the VTI is treated as a bridging domain L2 interface. The packet is sent from this interface on the multicast group associated with the VTI. The VTIs on remote VTEPs that receive this packet extract the original packet, which is then handled by the VLAN associated with the packet's VNI. The VLAN floods the packet, excluding the VTI. When the broadcast results in a response, the resulting packet can be unicast back to the originating VTEP because the VXLAN address table obtained the host MAC to VTEP association from the broadcast packet.

VXLAN and Multicast

A VTI is treated as an L2 interface in the VLAN for handling multicast traffic, which is mapped from the VLAN to the multicast group associated with the VTI. All VTEPs join the configured multicast group for inter-VTEP communication within a VXLAN segment; this multicast group is independent of any other multicast groups that the hosts in the VLAN join.

The IP address space for the inter-host VXLAN communication may be sourced from a different VRF than the address space of the hosts in the VLAN. The multicast group for inter-VTEP transmissions must not be used for other purposes by any device in the VXLAN segment space.

17.2.4.2 Head-end Replication

Head-end replication uses a flood list to support broadcast, unknown unicast, and multicast (BUM) traffic over VXLAN. The flood list specifies a list of remote VTEPs. The switch replicates BUM data locally for bridging across the remote VTEPs specified by the flood list. This data flooding facilitates remote MAC address learning by forwarding data with unknown MAC addresses.

Head-end replication is required for VXLAN routing and to support VXLANs over MLAG.

17.2.5 VXLAN and MLAG

VXLAN over MLAG provides redundancy in hardware VTEPs. VTI configuration must be identical on each MLAG peer for them to act as a single VTEP. This also prevents the remote MAC from flapping between the remote VTEPs by ensuring that the rest of the network sees a host that is connected to the MLAG interface as residing behind a single VTEP.

Differences between VXLAN bridging and routing implementations over MLAG are applicable for the DCS-7050X series platform.

- VXLAN routing recirculates a packet twice, with the first iteration performing the routing action involving an L2 header rewrite, and the second recirculation performing VXLAN encap and decap operations. Recirculation is achieved by MAC loopback on dedicated loopback interfaces.
- The configuration for VXLAN routing on an MLAG VTEP includes separate Recirc-Channel configuration on both peers. The virtual IP, virtual MAC, and virtual VARP VTEP IP addresses are identical on both peers.

The following VTI elements must be configured identically on both MLAG peers:

- VLAN-VNI mappings
- VTEP IP address of the source loopback interface
- Flood VTEP list used for head-end replication

If OSPF is also in use, configure the OSPF router ID manually to prevent the switch from using the common VTEP IP address as the router ID.

The following rules are observed by MLAG switches so that they behave as a single VXLAN VTEP:

- Only the MLAG peer that receives a packet performs VXLAN encapsulation on it.
- Packets are not VXLAN encapsulated if they are received from the peer link.
- If a packet is decapsulated and sent over the peer link, it should not be flooded to active MLAG interfaces.
- If a packet is sent over the peer link to the CPU, it is not head-end replicated to other remote VTEPs.
- If a packet's destination is the VTEP IP address, it is terminated by the MLAG peer that receives it.

Examples

- These commands complete the configuration required for a VXLAN routing deployment.

```
switch(config)# interface Vxlan1
switch(config-if-Vx1)# vxlan source-interface Loopback0
switch(config-if-Vx1)# vxlan udp-port 4789
switch(config-if-Vx1)# vxlan vlan 2417 vni 8358534

 S        1.0.3.1/32 [1/0] via 1.0.88.2, Port-Channel1.4095
```

There are 2 remote VTEPs configured ***1.0.2.1***, and ***1.0.3.1***. The remote ***VTEP 1.0.2.1*** is reachable through ***Ethernet54/1.4095*** and remote ***VTEP 1.0.3.1*** is reachable through ***port-channel1.4095***.

Configuring Unconnected Ethernet Interfaces for Recirculation

On systems where bandwidth is not fully used by the front panel ports, unused bandwidth is used for recirculation.

The following example is applicable to the DCS-7050X series platform.

Example

These commands expose unconnected Ethernet interfaces which are used for recirculation, in order to use them to replace or use along with front panel Ethernet interfaces.

```
switch(config)# service interface unconnected expose
switch(config)# interface UnconnectedEthernet 2
switch(config-if-Ue2)# traffic-loopback source system device mac
switch(config-if-Ue2)# channel-group recirculation 627
```

The following example enables display of the inactive interfaces using the show command.

Example

```
switch(config)# service interface inactive expose
```

Running a show command generates the following output:

```
switch(config)# switch(config)#show int et21/1-4 stat
```

```
Port    Name   Status    Vlan  Duplex Speed  Type      Flags
 Encapsulation
Et21/1         connected 1     full   100G   100GBASE-CR4
Et21/2         inactive  1     full   25G    100GBASE-CR4
Et21/3         inactive  1     full   25G    100GBASE-CR4
Et21/4         inactive  1     full   25G    100GBASE-CR4
```

On previous releases, Ethernet 21/2, 21/4 do not exist and the output would be the following:

```
switch(config)# switch(config)#show int et21/1-4 stat
```

```
Port    Name   Status    Vlan  Duplex Speed  Type      Flags
 Encapsulation
Et21/1         connected 1     full   100G   100GBASE-CR4
Et21/3         inactive  1     full   25G    100GBASE-CR4
```

17.2.6 VXLAN Bridging and Routing Support

Describes the support of VXLAN Bridging and Routing on the R3 series of DCS 7280, 7500, and 7800 Arista switches.

17.2.6.1 Differences with DCS-7500R2 Implementation

The following are notable differences with respect to implementation of VXLAN on the R3 Series of switches.

- There is no need to configure the VXLAN-routing TCAM profile to enable VXLAN routing on the R3 Series switches. The command is still accepted for backward compatibility reasons.
- CPU bound traffic after VXLAN decapsulation (such as routing protocol packets) use the same CoPP queues used by the non VXLAN decapsulated packets. This is an improvement over the R2 series behavior where the CPU bound traffic after VXLAN decapsulation took a different CoPP queue that was shared with other IP Unicast packets.

17.2.6.2 Limitations

There is no EVPN VXLAN Multicast (Type 6/7/8 NLRI) support.

17.2.7 Data Structures

VXLAN implementation requires two VXLAN tables and a MAC address table accommodation.

17.2.7.1 MAC Address Table VXLAN Support

MAC address table entries correlate MAC addresses with the port upon which packets arrive. In addition to Ethernet and port channels, the port column may specify a VTI for packets that arrive on a VLAN from a remote port through the VXLAN segment.

17.2.7.2 VTEP-MAC Address Table

VTEP-MAC address table entries correlate MAC address with the IP address of the VTEP from where packets bearing the MAC address arrive. The VTI uses this table to determine the destination address for packets that are sent to remote hosts.

17.2.7.3 VNI-VLAN Map

The VNI-VLAN map displays the one-to-one correspondence between the VNIs assigned on the switch and the VLANs to which they are assigned. Each VNI can be assigned to only one VLAN; each VLAN can be assigned a maximum of one VNI. Each VNI-VLAN assignment constitutes a VXLAN segment.

17.3 VXLAN Configuration

These sections describe VXLAN configuration tasks:

- Configuring the VTI

- Head End Replication Configuration
- VXLAN Routing Configuration
- Configuring VXLAN Routing with Overlay VRFs
- Configuring VXLAN over MLAG
- Configuring VXLAN Control Service
- Configuring VXLAN Multicast Decapsulation
- VXLAN Rules Support for Mirror ACLs Configuration
- Configuring EVPN VXLAN
- Displaying VXLAN Configuration
- Displaying VXLAN Bridging and Routing Support

17.3.1 Configuring the VTI

Configuring the VTI enables VXLAN bridging and is a requirement for VXLAN Routing. The following sections describe the steps required to enabling VXLAN bridging by bringing up the VXLAN line protocol. **VXLAN Routing Configuration** describes the additional steps required to enable VXLAN routing.

Instantiating the VTI and VXLAN Configuration Mode

The **interface vxlan** command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN Tunnel Interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Example

These commands create VXLAN tunnel interface ***1***, place the switch in VXLAN-interface configuration mode, and display parameters of the new VTI.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

Assigning an IP address to the VTEP

The **vxlan source-interface** command specifies the loopback interface from which the VTEP derives the source address (IP) that it uses when exchanging VXLAN frames. This address is used by UDP headers to specify source and destination addresses of hosts that send or receive VXLAN encapsulated packets.

There is no default source interface assignment. A valid VXLAN configuration requires the assignment of a loopback interface to the VTEP and the assignment of a valid IP address to the specified interface.

Example

These commands configure VTI 1 to use IP address ***10.25.25.3*** (***interface loopback 15***) as the source interface in the encapsulation fields of outbound VXLAN frames.

```
switch(config)# interface loopback 15
switch(config-if-Lo15)# ip address 10.25.25.3/24
switch(config-if-Lo15)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 15
switch(config-if-Vx1)#  show active
```

```
interface Vxlan1
   vxlan source-interface Loopback15
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

Assigning a UDP Port to the VTEP

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header, then sent through a pre-configured UDP port. Packets that arrive through this port are assumed to be VXLAN encapsulated and sent to the bridging domain of the recipient VLAN as determined by the VNI in the VXLAN header and the VNI-VLAN map.

The **vxlan udp-port** command associates a UDP port with the configuration mode VXLAN Interface (VTI). By default, UDP ***port 4789*** is associated with the VTI.

Note: UDP ***port 4789*** is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

Examples

- This command associates UDP ***port 5500*** with ***interface vxlan 1***.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan udp-port 5500
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 5500
switch(config-if-Vx1)#
```

- This command resets the ***interface vxlan 1*** UDP port association of ***4789***.

```
switch(config-if-Vx1)# no vxlan udp-port
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

Assigning a VNI to a VLAN

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace existing VLAN assignment statements in **running-config**. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The **vxlan vlan vni** command associates a VLAN ID with a Virtual Network Identifier (VNI).

Example

These commands associate ***vlan 100*** to ***vni 100*** and ***vlan 200*** to ***vni 10.10.200***.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan vlan 100 vni 100
switch(config-if-Vx1)# vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 200 vni 658120
   vxlan vlan 100 vni 100
```

```
switch(config-if-Vx1)# vxlan vni notation dotted
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 100 vni 0.0.100
   vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#
```

Verifying the VXLAN Configuration

The **`show interface vxlan 1`** displays the configuration and connection status of the VXLAN.

Example

This command indicates that the VXLAN line protocol status is ***up.***

```
switch(config-if-Vx1)# show interface vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback15 and is active with 10.25.25.3
  Static vlan to vni mapping is
    [100, 0.0.100]    [200, 10.10.200]
switch(config-if-Vx1)#
```

17.3.2 Head End Replication Configuration

Head-end replication is a data distribution method that supports broadcast, unknown unicast traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs specified by a flood list. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MAC addresses.

Each **vxlan flood vtep** statement in ***running-config*** associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured.

The VTEP flood list is created and modified through the **vxlan flood vtep** command.

Examples

- These commands create a default VXLAN head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)# show active
 interface Vxlan1
   vxlan flood vtep 10.1.1.1 10.1.1.2
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through ***vlan 101*** and ***vlan 102***.

```
switch(config-if-Vx1)# vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2
 11.1.1.3
switch(config-if-Vx1)# show active
 interface Vxlan1
   vxlan flood vtep 10.1.1.1 10.1.1.2
   vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
   vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

17.3.3 VXLAN Routing Configuration

17.3.3.1 Implementing VXLAN Routing

VXLAN routing is enabled by creating a VLAN Interface (SVI) on a VLAN that is associated to a VNI. In the figure below, VXLAN routing is enabled on ***Switch A*** by configuring a VLAN interface with an IP address of ***10.10.10.1***. Packets from Devices ***A-1*** and ***B-2*** that have destinations other than ***10.10.10.0/28*** are VXLAN-bridged to the default gateway (***10.10.10.1***), then routed from ***Switch A***.

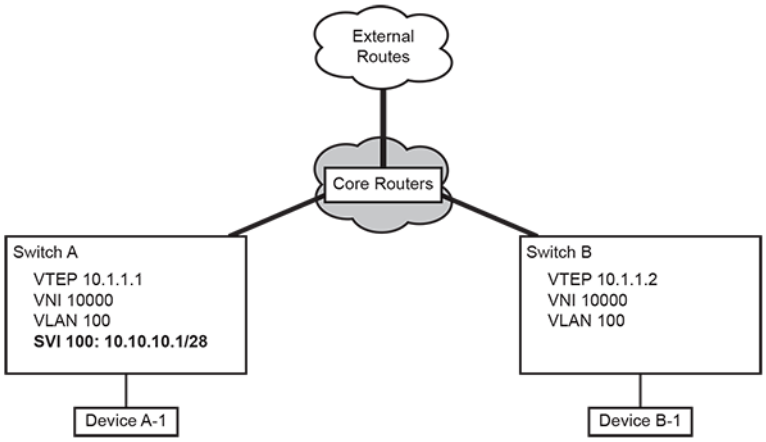

Figure 70: Implementing VXLAN Routing

Note: For R and R2 series Arista platforms, VXLAN routing must be enabled in hardware with the **`hardware tcam profile vxlan-routing`** command. This command will cause a brief data-plane interruption. It should be run while the switch is in maintenance mode, or in an interval when a brief data-plane interruption is acceptable.

```
switch(config)#hardware tcam profile vxlan-routing
switch(config)#
```

Note: For Trident2 and some Tomahawk platforms, VXLAN routing requires that recirculation channels be configured with the command **`channel-group recirculation`**.

```
switch(config)#channel-group recirculation 1
switch(config)#
```

Example

These commands configure ***Switch A*** to perform VXLAN routing. The example includes OSPF routing that is used for underlay routing.

```
switch-A(config)# route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan)# match interface loopb5
switch-A(config-route-map-vxlanvlan)# exit
switch-A(config)# route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan)# match interface vlan 100
switch-A(config-route-map-vxlanvlan)# exit
switch-A(config)# router ospf 1
switch-A(config-router-ospf)# redistribute connected route-map vxlanvlan
```

```
switch-A(config-router-ospf)# exit
switch-A(config)# interface loopback 5
switch-A(config-if-Lo5)# ip address 10.25.25.3/24
switch-A(config-if-Lo5)# exit
switch-A(config)# interface vxlan 1
switch-A(config-if-Vx1)# vxlan source-interface loopback 5
switch-A(config-if-Vx1)# vxlan vlan 100 vni 10000
switch-A(config)# interface vlan 100
switch-A(config-if-Vl100)# ip address 10.10.10.1/28
switch-A(config-if-Vl100)# exit
```

17.3.3.2 Configuring Direct VXLAN Routing

Figure **Implementing VXLAN Routing** , VXLAN routing is enabled on ***Switch A*** only; ***Switch B*** supports VXLAN bridging. Traffic from ***Switch B*** devices to the external routes must go through the core route twice: once as they are bridged to is VXLAN gateway and once when routed to its next hop device.

Direct VXLAN routing with VXLAN enabled addresses this issue by configuring each VTEP with all VLANs. This allows packets to be VXLAN-bridged to a local VTEP and routed to remote VTEPs. Indirect routing scales well but is complex to engineer efficiently, and naked routing provides the same scalability to indirect routing. Direct routing leads to the most efficient traffic flows, with the number of virtual subnets or virtual machines increasing at scale, and is thereby optimal from a data plane viewpoint.

The following sections describe conventions required to implement Direct VXLAN Routing, then presents a direct VXLAN routing implementation.

Configuring VARP addresses

For direct routing, an anycast IP address is used as the gateway address on the SVI for a VLAN on all hardware VTEPs associated with that VLAN.

Examples

- These commands configure an IP virtual-router and virtual MAC address.

```
switch(config)# interface Vlan2417
switch(config-if-Vl2417)# ip address 1.0.4.50/24
switch(config-if-Vl2417)# ip virtual-router address 1.0.4.1
switch(config-if-Vl2417)# ip virtual-router mac-address 00:00:11:11:2
2:22
switch(config)#
```

- These commands configure an IP virtual address (instead of IP virtual-router address) for the VLAN SVI, and a secondary address on the loopback interface for the virtual VTEP IP. The virtual VTEP IP is the logical VTEP hosting the virtual MAC address.

```
switch(config)# interface Vlan2417
switch(config-if-Vl2417)# ip address virtual 1.0.4.1/24
switch(config-if-Vl2417)# exit
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 1.0.1.1/32
switch(config-if-Lo0)# ip address 1.0.1.2/32 secondary
switch(config-if-Lo0)# ip virtual-router mac-address 00:00:11:11:22:22
switch(config)#
```

Virtual IP and MAC Addresses

Virtual-router IP addresses can be configured on VLAN interfaces in addition to a primary address. All VTEPs in a direct VXLAN network can be configured with the same virtual router address. This allows devices to use a common IP address as their VXLAN gateway.

The **ip address virtual** command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. This results in the virtual MAC address (**ip virtual-router mac-address**) assignment to the VLAN interface. In large VXLAN networks, using distinct primary IP addresses for each VTEP limits the number addresses on its subnet for connected hosts. Defining a common virtual IP address for all VTEPs and using that their primary addresses conserves subnet addresses

Example

These commands specify a virtual router address of ***00:00:00:00:00:48*** for the switch and, for ***vlan 100***, a primary address of ***10.10.10.10/28*** and a virtual IP address of ***10.10.10.10***.

```
switch(config)# ip virtual-router mac-address 00:00:00:00:00:48
switch(config)# interface vlan 100
switch(config-if-Vl100)# ip address virtual 10.10.10.10/28
switch(config-if-Vl100)# show active
 interface Vlan100
   ip address virtual 10.10.10.10/28
switch(config-if-Vl100)#
```

Virtual VTEP Configuration

A virtual VTEP address is specified by configuring a secondary address on the loopback interface designated as the VXLAN's source interface. All VTEPs in the direct routing topology share the same virtual VTEP address.

You must also configure the secondary VTEP IP on the flood-list of the downstream VXLAN VTEPS as shown below.

Example

These commands specify a primary (***10.1.1.1***) and virtual VTEP address (***10.2.2.2***).

```
switch1
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.1.1.1/24
switch(config-if-Lo5)# ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# show active
 interface Loopback5
   ip address 10.1.1.1/24
   ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 5
switch(config-if-Vx1)# show active
 interface Vxlan1
   vxlan source-interface Loopback5
   vxlan udp-port 4789
   vxlan vlan 100 vni 10000
switch(config-if-Vx1)#

switch2
switch(config)# interface vxlan1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1
switch(config-if-Vx1)# vxlan flood vtep 10.2.2.2
```

Direct VXLAN Topology

The following figure displays a direct VXLAN topology, where each VTEP is configured with the same set of VNIs, VLAN interfaces, and virtual VTEP address.

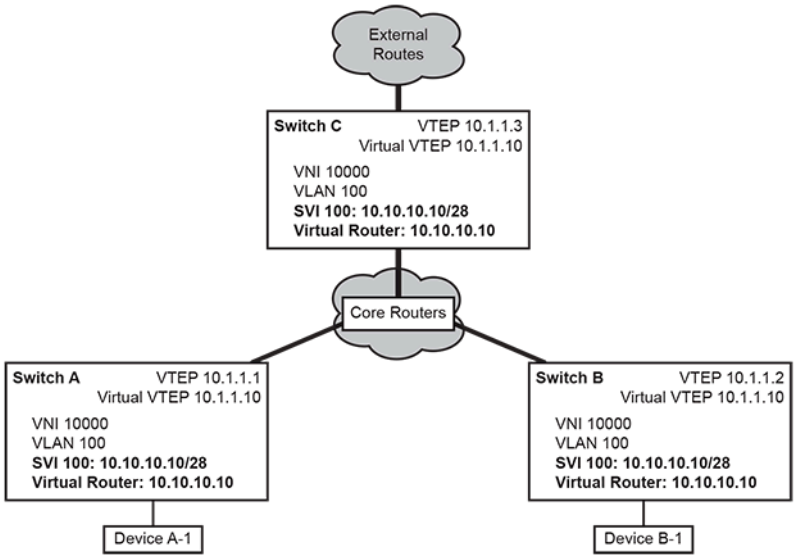

Figure 71: Direct VXLAN Routing

Example

These commands configure VXLAN parameters for ***Switch-A***.

```
switch-A(config)# route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan)# match interface loopb5
switch-A(config-route-map-vxlanvlan)# exit
switch-A(config)# route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan)# match interface vlan 100
switch-A(config-route-map-vxlanvlan)# exit
switch-A(config)# router ospf 1
switch-A(config-router-ospf)# redistribute connected route-map vxlanvlan
switch-A(config-router-ospf)# exit
switch-A(config)# ip virtual-router mac-address 00:00:00:00:00:48
switch-A(config)# interface loopback 5
switch-A(config-if-Lo5)# ip address 10.1.1.3/24
switch-A(config-if-Lo5)# ip address 10.1.1.10/24 secondary
switch-A(config-if-Lo5)# exit
switch-A(config)# interface vxlan 1
switch-A(config-if-Vx1)# vxlan source-interface loopback 5
switch-A(config-if-Vx1)# vxlan vlan 100 vni 10000
switch-A(config)# interface vlan 100
switch-A(config-if-Vl100)# ip address virtual 10.10.10.10/28
switch-A(config-if-Vl100)# exit
```

17.3.3.3 Configuring VXLAN VTEP Counters

The VXLAN VTEP counters feature enables a device to count VXLAN packets received and sent by the device on a per VTEP basis. Specifically, it enables the device to count bytes and packets that are getting encapsulated and decapsulated as they are passing through.

The counters are logically split up in the two VXLAN directions. Encapsulated on the device and directed to the core, “encap” counters count packets coming from the edge. Decapsulated on the device and heading towards the edge, “decap” counters count packets coming from the core.

To be able to count VXLAN packets the device has to support VXLAN and have a VXLAN interface correctly configured.

Examples

- This command configures the enabling of VXLAN VTEP counters for encap.

```
switch(config)# hardware counter feature vtep encap
switch(config)#
```

- This command configures the disabling of VXLAN VTEP counters for encap.

```
switch(config)# no hardware counter feature vtep encap
switch(config)#
```

- This commands configures the enabling of VXLAN VTEP counters for decap.

```
switch(config)# hardware counter feature vtep decap
switch(config)#
```

- This commands configures the disabling of VXLAN VTEP counters for decap.

```
switch(config)# no hardware counter feature vtep decap
switch(config)#
```

17.3.3.4 VXLAN Auto Flood-List Construction

With the introduction of wireless Access Points (APs), VXLAN flood-lists learned from the data-plane is added to or removed from the flood-lists created in the control-plane. When a VXLAN packet is received on a new VNI from a VTEP, it is added to the dynamic flood-list for that VNI and the flood-list is merged with flood-lists from other sources. When all MACs behind a remote VTEP have been removed through aging, for example, the remote VTEP is removed from all dynamic VXLAN flood-lists.

To restrict VTEPs from being added to dynamic flood-lists, when VXLAN traffic is received from untrusted sources, use the **vxlan learn-restrict** command. MAC learning is disabled from the specified IP ranges. The learning restrictions is placed on all platforms including APs.

VXLAN Configuration for Learning Data-plane Flood-lists

The following example is applicable to all platforms.

These commands enable VXLAN flood-lists learning from data-plane.

```
switch(config)# interface Vxlan1
switch(config-if-Vx1)# vxlan flood vtep learned data-plane
```

The following example restricts learning from VTEPs not in a prefix range.

```
switch(config-if-Vx1)# vxlan learn-restrict vtep <prefixes>
```

The following example restricts learning to VTEPs with IP in range.

```
switch(config-if-Vx1)# vxlan learn-restrict vtep 1.1.1.1/24
```

The following command shows the VXLAN flood-lists programmed in hardware.

```
switch(config)# switch(config)#show vxlan flood vtep
```

The following command shows the dynamic VXLAN flood-lists.

```
switch(config)# switch(config)#show l2Rib input vxlan-dynamic
```

The following command shows the VXLAN flood-lists sent to platform.

```
switch(config)# switch(config)#show l2Rib output floodset
```

The following command shows the VXLAN learning restrictions for all VLANs.

```
switch(config)# switch(config)#show vxlan learn-restrict vtep
```

The following command shows the VXLAN learning counters for all VLANs.

```
switch(config)# switch(config)#show vxlan counters learn-restrict all
```

17.3.4 Configuring VXLAN Routing with Overlay VRFs

VXLAN SVIs configured in non-default VRFs are supported with VXLAN routing using overlay VRFs. Overlay SVIs are configured in non-default VRFs but underlay SVIs, which provide IP connectivity between VTEPs, must remain in the default VRF. VXLAN routing is deployable by allowing users to configure separate overlay routing domains using VRFs per tenant, thereby allowing support for overlapping IP addresses in the overlay. This provides separation between overlay and underlay traffic, including simpler and cleaner protocol configuration, without using complicated route-maps to control distribution of prefixes to peers in the overlay VRFs and underlay SVIs. IPv4 based VXLAN routing is currently supported.

17.3.5 Configuring VXLAN over MLAG

VTI configuration must be identical on each MLAG peer for them to act as a single VTEP.

The following VTI elements must be configured identically on both MLAG peers:

VLAN-VNI Mappings

Configure identical VLAN to VNI mappings on both MLAG peers using the **vxlan vlan vni** command.

Example

These commands associate ***vlan 100*** to ***vni 100*** and ***vlan 200*** to ***vni 10.10.200***.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan vlan 100 vni 100
switch(config-if-Vx1)# vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#
```

VTEP IP Address of the Source Loopback Interface

Configure the same VTEP IP address for the source loopback interface on both MLAG peers using the **vxlan source-interface** command.

Example

These commands configure a primary VTEP address.

```
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.1.1.1/24
switch(config-if-Lo5)# exit
switch(config)# interface vxlan 1
```

```
switch(config-if-Vx1)# vxlan source-interface loopback 5
switch(config-if-Vx1)#
```

Flood VTEP List

Configure the same VTEP flood list on both MLAG peers using the **vxlan flood vtep** command.

Example

These commands create a default VXLAN head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)#
```

OSPF Configuration

If OSPF is in use, configure the OSPF router ID using the **router-id (OSPFv2)** command to prevent the switch from using the common VTEP IP address as the router ID.

Example

These commands assign ***10.0.0.1*** as the OSPFv2 router ID.

```
switch(config)# router ospf 100
switch(config-router-ospf)# router-id 10.0.0.1
switch(config-router-ospf)#
```

17.3.6 Configuring VXLAN Control Service

The VXLAN Control Service (VCS) provides a mechanism by which hardware VTEPs share states between each other in order to establish VXLAN tunnels, without the need for a multicast control plane. This feature enables the use of a VCS client.

Examples

- These commands connect a switch to the VCS running on CVX. The server host IP address is the management IP address of the CVX controller or the IP address that CVX is listening on for client connections.

  ```
  switch(config)# management cvx
  switch(config-mgmt-cvx)# server host 172.27.6.248
  switch(config-mgmt-cvx)# no shutdown
  switch(config-mgmt-cvx)#
  ```

- These commands configure the VXLAN interface, except for the multicast group configuration, in order to learn from the controller.

  ```
  switch(config)# interface vxlan 1
  switch(config-if-Vx1)# vxlan controller-client
  switch(config-if-Vx1)#
  ```

17.3.7 Configuring VXLAN Multicast Decapsulation

VXLAN multicast decapsulation enables VTEPs that support Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

Examples

- These commands enable VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#
```

- These commands disable VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# no vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#
```

17.3.8 VXLAN Rules Support for Mirror ACLs Configuration

VXLAN rules support for mirror ACLs configuration permit VXLAN deep inspection rules to be specified in the mirroring ACLs when the switch is operating in normal mode.

Examples

The following are examples of VXLAN rules specified in mirroring ACLs.

- These commands permit all VXLAN traffic (udp protocol and destination ***port 4789***).

```
switch(config)# ip access-list miracl
switch(config-acl-miracl)# permit vxlan any any
switch(config-acl-miracl)#
```

- These commands permit VXLAN traffic with ***vni 1001*** only.

```
switch(config)# ip access-list miracl
switch(config-acl-miracl)# permit vxlan any any vni 1001 0x000000
switch(config-acl-miracl)#
```

- These commands deny VXLAN traffic with ***vni 0x1000*** through ***0x100f***.

```
switch(config)# ip access-list miracl
switch(config-acl-miracl)# permit vxlan any any vni 0x1000 0x100f
switch(config-acl-miracl)#
```

17.3.9 Configuring EVPN VXLAN

Supported Configurations

- Static EVPN VXLAN Configuration
- VXLAN Bridging and Routing Configuration
- EVPN VXLAN All Active Multihoming
- EVPN VXLAN Single-Active Multihoming
- VARP and Virtual VTEP with VXLAN Routing
- Overlay Multicast using VXLAN Underlay Multicast Tree
- Bridging Over EVPN IPv6 VXLAN Underlay

17.3.9.1 Static EVPN VXLAN Configuration

```
switch(config)# service routing protocols model multi-agent
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 172.16.1.1/32
!
switch(config)# interface Vxlan1
switch(config-if-Vx1)# vxlan source-interface Loopback0
```

```
switch(config-if-Vx1)# vxlan udp-port 4789
switch(config-if-Vx1)# vxlan vrf test vni 12345
!
switch(config)# ip routing vrf test
switch(config)# Ipv6 unicast-routing vrf test
!
switch(config)# ip route vrf test 192.168.1.0/24 vtep 10.1.1.2 vni 20000
 router-mac-address 00:00:78:01:00:00
switch(config)# ipv6 route vrf test 1:0:5::0/64 vtep 10.1.1.2 vni 30000
 router-mac-address 00:00:80:01:00:00
```

17.3.9.2 VXLAN Bridging and Routing Configuration

```
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 172.16.1.1/32
!
switch(config)# ip virtual-router mac-address 00:02:03:04:05:06
!

switch(config)# ip routing
!
switch(config)# interface Vxlan1
switch(config-if-Vx1)# vxlan source-interface Loopback0
switch(config-if-Vx1)# vxlan udp-port 65330
switch(config-if-Vx1)# vxlan vlan 300 vni 945438
switch(config-if-Vx1)# vxlan vlan 200 vni 654677
switch(config-if-Vx1)# vxlan flood vtep 172.16.1.2 172.16.1.3 172.16.1.1
```

17.3.9.3 EVPN VXLAN All Active Multihoming

Multi-homing is activated in an EVPN environment by assigning an ethernet segment identifier to the participating Ethernet or Port-Channel interfaces.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# evpn ethernet-segment
switch(config-evpn-es)# identifier 00aa:bbbb:cccc:dddd:eeee
switch(config-evpn-es)# route-target import 12:23:34:45:56:67
```

The optional **`designated-forwarder election hold-time`** command can configure a wait time before selecting the designated forwarder and allow potential forwarders a chance to advertise their EVPN ethernet segment (type 4) routes. The default hold time is three (***3***) seconds, as specified in section 8.5 of ***RFC7432*** [1].

The route target configured here is the ES import route target described in section 7.6 of ***RFC7432*** [1]. It can be set to any MAC address, but for each Ethernet segment every participating interface in the network must use the same ES import route target. A suggested value is the MAC address of the CE connected to the multi-homing PEs via this interface.

17.3.9.4 EVPN VXLAN Single-Active Multihoming

Multi-homing allows in an EVPN environment by assigning an ethernet segment identifier or a single Customer Edge (CE) to the participating multiple Provider Edge (PE). The default mode of operation is All-active. Introduced in the ***EOS 4.26.0F*** for VxLAN, singe-active is another mode of operation in which only one PE per VLAN accepts traffic for that ethernet segment.

Single-active multihoming is useful for:

- Manually controlled traffic flows
- Prioritizing links over others

- Connecting separate CE devices to a single ethernet segment
- Connecting a CE that does not support link aggregation to multiple PEs.

To configure single-active multi-homing, use the **redundancy single-active** command on a physical ethernet or aggregate Port-channel interface.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0123:0123:0123:0123:0123
switch(config-evpn-es)# route-target import 12:34:12:34:12:34
switch(config-evpn-es)# redundancy single-active
```

When **don't preempt** mode is enabled, a flag bit is included with preference value. Each VLAN specifies ***high/low*** rule with preference-based DF election. The default election rule is ***high*** and the default preference is ***32767*** from ***0*** to ***65535***.

```
interface Port-Channel1
   switchport mode trunk
   switchport trunk allowed vlan 100-200
   evpn ethernet-segment
      identifier 0123:0123:0123:0123:0123
      route-target import 12:34:12:34:12:34
      redundancy single-active
      designated-forwarder election algorithm preference 10000 [dont-
preempt]

router bgp 10
   vlan 100
      designated-forwarder election preference rule low
      ...
   vlan-aware-bundle red
      designated-forwarder election preference rule low
      vlan 120-140
      ...
```

Show commands

show bgp evpn instance command takes the name of a configured EVPN instance to limit the output for that instance.

```
switch# show bgp evpn instance vlan 10
EVPN instance: VLAN 10
  Route distinguisher: 10.255.0.0:10
  Route target import: Route-Target-AS:64500:10
  Route target export: Route-Target-AS:64500:10
  Service interface: VLAN-based
  Local IP address: 10.255.0.0
  Encapsulation type: VXLAN
  Local ethernet segment:
    ESI: 0011:1111:1111:1111:1111
      Interface: Ethernet6
      Mode: single-active
      State: up
      ES-Import RT: 00:01:00:01:00:01
      DF election algorithm: preference
      Designated forwarder: 10.255.0.0
      Non-Designated forwarder: 10.255.0.1
```

Each ethernet segment shows the modes, single-active or all-active, the DF election algorithm, the elected designated forwarder and all other candidate forwarders.

When a port/VLAN is inactive, it is not shown by **show vlan** command. It is possible to see configured but inactive VLANs in **show vlan configured** command.

```
switch# show vlan configured
VLAN  Name                             Status Ports
----- -------------------------------- --------- -------------
------------------
1  default                        active Et1, Et2, Et4, Et5, Et6
10 VLAN0010                       active Et6, Vx1
11 VLAN0011                       active Et6#, Vx1

# indicates a port on which traffic is currently being blocked
```

show bgp evpn detail command shows the EVPN routes contributing to the multihoming state of a device with **route-type ethernet-segment** and any other appropriate filters.

```
switch# show bgp evpn route-type ethernet-segment esi 0011:1111:111
1:1111:1111 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for ethernet-segment 0011:1111:1111:1111:1111
 10.255.0.0, Route Distinguisher: 10.255.0.0:1
 Paths: 1 available
  Local
 - from - (0.0.0.0)
   Origin IGP, metric -, localpref -, weight 0, valid, local, best
   Extended Community: TunnelEncap:tunnelTypeVxlan EvpnEsImportR
t:00:01:00:01:00:01
DF Election: Preference 200
BGP routing table entry for ethernet-segment 0011:1111:1111:1111:1111
 10.255.0.1, Route Distinguisher: 10.255.0.1:1
 Paths: 1 available
  303 301
 10.255.0.1 from 10.0.0.2 (0.0.1.1)
   Origin IGP, metric -, localpref 100, weight 0, valid, external, best
   Extended Community: TunnelEncap:tunnelTypeVxlan EvpnEsImportR
t:00:01:00:01:00:01
DF Election: Preference 100
```

Limitations

- Single-active multihoming with MPLS is not supported.
- Single-active redundancy is currently only supported on trunk ports. Access ports will not drop traffic when inactive.
- Designated forwarder can not be reset in non-revertive mode.

17.3.9.5 VARP and Virtual VTEP with VXLAN Routing

```
interface Loopback0
   ip address 172.16.1.1/32
   ip address 20.0.0.1/32 secondary
!
ip virtual-router mac-address 00:02:03:04:05:06
!
ip routing
!
interface Vlan200
   ipv6 address 2000:0:0:41::2/64
   ip address virtual 1.0.7.1/24
   ipv6 virtual-router address 2000:0:0:41::1
```

```
!
interface Vxlan1
   vxlan source-interface Loopback0
   vxlan udp-port 65330
   vxlan vlan 300 vni 945438
   vxlan vlan 200 vni 654677
   vxlan flood vtep 172.16.1.2 172.16.1.3 172.16.1.1 20.0.0.1
```

17.3.9.6 Overlay Multicast using VXLAN Underlay Multicast Tree

To inject a source route, configure the **ip multicast source route export** command on the incoming interface.

```
switch(config)# interface Vlan10
switch(config-Vl10)# ip pim sparse-mode
switch(config-Vl10)# ip multicast source route export
```

To redistribute the source routes in the MRIB via BGP while running multi-agent protocol model, configure the **redistribute attached-host** command for the IPv4 multicast address-family. Activate the neighbor to establish a BGP connection.

```
switch(config-router-bgp)# address-family ipv4 multicast
switch(config-router-bgp-af)# neighbor 3.0.0.2 activate
switch(config-router-bgp-af)# redistribute attached-host
```

To redistribute the source routes in the URIB via BGP while running ribd protocol model, configure the **redistribute attached-host** command under the ***router bgp*** mode.

```
switch(config-router-bgp)# redistribute attached-host
```

This following is a sample configuration for a VTEP for the setup above using multi-agent protocol model.

```
switch(config)# service routing protocol model multi-agent

switch(config)# ip pim rp-address 15.15.15.15 225.1.1.1/32

switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 1.1.1.1/32

switch(config)# interface vxlan1
switch(config-if-Vx1)# vxlan source-interface Loopback0
switch(config-if-Vx1)# vxlan vlan10 vni 10000

! Interface to the underlay
switch(config)# interface Ethernet1
switch(config-if-Et1)# ip address 3.0.0.1/24
switch(config-if-Et1)# ip pim sparse-mode

switch(config)# interface vlan10
switch(config-if-Vl10)# ip address 10.1.1.1/24
switch(config-if-Vl10)# ip pim sparse-mode
switch(config-if-Vl10)# ip multicast source route export

switch(config)# router bgp 10
switch(config-router-bgp)# router-id 0.0.0.2

switch(config-router-bgp)# address-family ipv4 multicast
switch(config-router-bgp-af)# neighbor 3.0.0.2 activate
```

```
switch(config-router-bgp-af)# redistribute attached-host
```

This following is a sample configuration for a VTEP for the setup above using the ribd protocol model.

```
switch(config)# service routing protocol model ribd

switch(config)# ip pim rp-address 15.15.15.15 225.1.1.1/32

switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 1.1.1.1/32

switch(config)# interface vxlan1
switch(config-if-Vx1)# vxlan source-interface Loopback0
switch(config-if-Vx1)# vxlan vlan10 vni 10000

! Interface to the underlay
switch(config)# interface Ethernet1
switch(config-if-Et1)# ip address 3.0.0.1/24

switch(config-if-Et1)# ip pim sparse-mode

switch(config)# interface vlan10
switch(config-if-Vl1)# ip address 10.1.1.1/24
switch(config-if-Vl1)# ip pim sparse-mode
switch(config-if-Vl1)# ip multicast source route export

switch(config)# router bgp 10
switch(config-router-bgp)# router-id 0.0.0.2
switch(config-router-bgp)# redistribute attached-host
```

17.3.9.7 Bridging Over EVPN IPv6 VXLAN Underlay

The following example configuration is for VXLAN bridging over EVPN IPv6 VXLAN underlay.

```
switch(config)# interface loopback 0
switch(config-if-Lo0)# ip address 20001::100/128
!
switch(config)# vlan 10
switch(config-vlan-10)#
switch(config)# vlan 20
switch(config-vlan-20)#
!
switch(config)# hardware tcam
switch(config-tcam)# system profile vxlan-v6-underlay
!
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport access vlan 10
switch(config)# interface Ethernet2
switch(config-if-Et2) #switchport access vlan 20
!
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 0
switch(config-if-Vx1)# vxlan encapsulation ipv6
switch(config-if-Vx1)# vxlan vlan 10 vni 10
switch(config-if-Vx1)# vxlan vlan 20 vni 20
!
```

17.3.10 Displaying VXLAN Configuration

The following section describes the commands that control the display format of VNIs and the commands that list VXLAN configuration and transmission information.

Configuring VNI Display Format

The **vxlan vni notation dotted** command configures the switch to display VNIs in dotted decimal notation. VNI values range from ***1*** to ***16777215*** in decimal notation and from ***0.0.1*** to ***255.255.255*** in dotted decimal notation.

The command affects the VNI number display in all **show** commands, including **show running-config**. Commands that include VNI as a parameter may use decimal or dotted decimal notion regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

Examples

- These commands configure the switch to display vni numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)# vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 333 vni 3.4.5
switch(config-if-Vx1)#
```

- These commands configure the switch to display vni numbers in decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)# no vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 333 vni 197637
switch(config-if-Vx1)#
```

MAC Address Table

The MAC address table indicates a MAC address from a device on a remote host by indicating Vx interface as the port that corresponds to the address.

Example

The **show mac address-table** command displays a MAC address table that includes entries of devices from remote hosts by specifying Vx1 as the corresponding port.

```
switch> show mac address-table
          Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
   1    0050.5682.6725    DYNAMIC     Et16       1       0:02:01 ago
   1    0050.568e.58e9    DYNAMIC     Et23       2       0:08:53 ago
   1    0050.56a0.474a    DYNAMIC     Et16       1       0:18:04 ago
  51    0000.0051.0004    DYNAMIC     Et5        1       12 days, 1:02:44 ago
  51    0000.0051.0005    DYNAMIC     Et5        1       12 days, 1:02:44 ago
  51    0000.0051.0101    DYNAMIC     Vx1        1       12 days, 0:17:30 ago
  51    0000.0051.0102    DYNAMIC     Vx1        1       12 days, 0:17:30 ago
  61    0000.0061.0005    DYNAMIC     Et5        1       12 days, 1:02:44 ago
Total Mac Addresses for this criterion: 8
```

```
          Multicast Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
Total Mac Addresses for this criterion: 0
switch>
```

VXLAN MAC Address Table

VXLAN MAC address table entries correlate MAC addresses accessible through remote VTEPs with the local VLAN and the IP address of the VTEP through which the addressed device is accessed. The VTI uses this table when constructing the VXLAN encapsulation to specify the destination IP address of the recipient VTEP and the VNI segment through which the device's remote VLAN is accessed.

The **show vxlan address-table** command displays the VXLAN MAC address table.

Example

This command displays the VXLAN address table.

```
switch> show vxlan address-table
          Vxlan Mac Address Table
----------------------------------------------------------------------

Vlan  Mac Address     Type      Prt  Vtep             Moves   Last Move
----  -----------     ----      ---  ----             -----   ---------
  51  0000.0051.0101  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
  51  0000.0051.0102  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
  51  0000.0051.0103  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
  51  0000.0051.0104  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
  51  0000.0051.0105  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
  61  0000.0061.0103  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
  61  0000.0061.0104  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
  61  0000.0061.0105  DYNAMIC   Vx1  10.25.2.12       1       4 days, 0:37:14 ago
switch>
```

VXLAN MAC Address Table

The **show vxlan vtep** command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch> show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps:  1
switch>
```

VXLAN Counters

The **clear vxlan counters** command resets the VXLAN counters. The **show vxlan counters** command displays the VXLAN counters.

Example

This command displays the VXLAN counters

```
switch> show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
```

```
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:1427
decap_bytes_total:382412426
decap_pkts_total:2259858
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:45128
decap_bytes_filter:5908326
decap_discard_vxhdr:0
decap_discard_vlan_map:2214730
decap_timeout:0
decap_sock_err:1
switch>
```

17.3.11 Displaying VXLAN Bridging and Routing Support

All show commands applicable to prior VXLAN implementations on R2 series are also available on R3 series for VXLAN debugging.

The **`show interfaces vxlan`** command displays operational status and configuration information of the specified VXLAN.

```
switch(config)# show interfaces vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is
    [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
        Use 'show vxlan vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
   100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
  VTEP address mask is Non
```

The **`show arp`** command displays all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface vxlan 1
Address         Age (sec)  Hardware Addr   Interface
192.168.10.1              -  0000.abab.abab  Vlan100, Vxlan1
```

The **`show arp interface summary`** command displays a summary of all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface vxlan 1 summary
Total: 1
Static: 1
Dynamic: 0
Not learned: 0
```

The **`show vxlan counters software`** command displays the VXLAN software counters.

```
switch(config)# show vxlan counters software
Rx bytes for encapsulation                          :  0
```

```
Rx pkts for encapsulation                                 :  0
Rx high priority bytes for encapsulation                  :  0
Rx high priority pkts for encapsulation                   :  0
Rx low priority bytes for encapsulation                   :  0
Rx low priority pkts for encapsulation                    :  0
…..
```

```
switch(config)# show vxlan vni
VNI to VLAN Mapping for Vxlan1
VNI       VLAN       Source       Interface         802.1Q Tag
--------- ---------- ------------ ----------------- ----------
100       100        static       Ethernet2/1       untagged

17.4 VXLAN Commands

VXLAN Global Configuration Commands

- interface vxlan
- ip address virtual
- vxlan vni notation dotted

VXLAN Interface Configuration Commands

- vxlan flood vtep
- vxlan multicast-group decap
- vxlan source-interface
- vxlan udp-port
- vxlan vlan vni

VXLAN Bridging and Routing Commands

- designated-forwarder election hold-time
- redistribute attached-host

VXLAN Display and Clear Commands

- clear vxlan counters
- show arp
- show interfaces vxlan
- show service vxlan
- show vxlan address-table
- show vxlan counters
- show vxlan flood vtep
- show vxlan vtep

17.4.1 clear vxlan counters

The **clear vxlan counters** command resets the VXLAN counters.

Command Mode

Privileged EXEC

Command Syntax

clear vxlan counters ROUTE_TYPE

Parameters

ROUTE_TYPE Specifies the type of VXLAN counter reset by the command.

- **software** Command resets software counters.
- **varp** Command resets virtual-ARP counters.

Related Command

show vxlan counters displays the VXLAN counters.

Example

This command resets the VXLAN counters

```
switch# clear vxlan counters software
switch# show vxlan counters software
encap_bytes:0
encap_pkts:0
encap_read_err:0
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:0
decap_bytes_total:0
decap_pkts_total:0
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:0
decap_bytes_filter:0
decap_discard_vxhdr:0
decap_discard_vlan_map:0
decap_timeout:0
decap_sock_err:0
switch#
```

17.4.2 designated-forwarder election hold-time

The optional **designated-forwarder election hold-time** command can configure a wait time before selecting the designated forwarder and allow potential forwarders a chance to advertise their EVPN ethernet segment (type 4) routes. The **no** and **default** forms of the command removes the election hold time.

Command Mode

EVPN Ethernet segment identifier configuration mode

Command Syntax

designated-forwarder election hold-time ***sec***

no designated-forwarder election hold-time ***sec***

default designated-forwarder election hold-time ***sec***

Parameter

sec Number of seconds for the timer waiting to receive updates from other PE. Range ***0***-***1800***.

Example

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# evpn ethernet-segment
switch(config-evpn-es)# designated-forwarder election hold-time 20
```

17.4.3 interface vxlan

The **`interface vxlan`** command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN Tunnel Interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **`no interface vxlan`** deletes the specified VTI interface, including its configuration statements, from ***running-config***. The **`default interface vxlan`** command removes all configuration statements for the specified VTI from ***running-config*** without deleting the interfaces.

Command Mode

Global Configuration

Command Syntax

`interface vxlan` ***vx_range***

`no interface vxlan` ***vx_range***

`default interface vxlan` ***vx_range***

Parameter

vx_range VXLAN interface number. The only permitted value is ***1***.

Commands Available in link-flap Configuration Mode

- vxlan source-interface
- vxlan udp-port
- vxlan vlan vni

Examples

- These commands create ***interface vxlan 1***, place the switch in ***vxlan-interface*** configuration mode, then display parameters of the new VTI.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

- This command exits ***vxlan-interface*** configuration mode, placing the switch in ***global*** configuration mode.

```
switch(config-if-Vx1)# exit
switch(config)#
```

17.4.4 ip address virtual

The **ip address virtual** command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. The address resolves to the virtual MAC address configured through the **ip virtual-router mac-address** command. The command includes a subnet designation that is required in primary IP address assignments.

This command is typically used in VXLAN routing configurations as an alternative to assigning a unique IP address to each VTEP. All existing IPv4 addresses must be removed from the interface before executing this command.

The **no ip address virtual** and **default ip address virtual** commands remove the IPv4 address and virtual IP assignment from the configuration mode interface by deleting the **ip address virtual** command from ***running-config***.

Removing the IPv4 address assignments from an interface disables IPv4 processing on that port.

Command Mode

Interface-VLAN Configuration

Command Syntax

ip address virtual *ipv4_subnet* | secondary

no ip address virtual

default ip address virtual

Parameters

- ***ipv4_subnet*** IPv4 and subnet address (CIDR or address-mask notation).
- **secondary** Configures a secondary address on the loopback interface designated as the VXLAN's source interface.

Related Commands

- **ip address**
- **ip virtual-router mac-address**

Examples

This command configures ***10.10.10.1*** as the IPv4 address and virtual address for ***vlan 100***.

```
switch(config-if-Vl100)# show active
 interface Vlan100
   ip address virtual 10.10.10.1/28
switch(config-if-Vl100)#
```

These commands configure ***10.1.1.1*** as the primary address and ***10.2.2.2*** as the virtual VTEP address.

```
switch1
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.1.1.1/24
switch(config-if-Lo5)# ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# show active
  interface Loopback5
    ip address 10.1.1.1/24
    ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 5
switch(config-if-Vx1)# show active
  interface Vxlan1
    vxlan source-interface Loopback5
```

```
    vxlan udp-port 4789
    vxlan vlan 100 vni 10000
switch(config-if-Vx1)#

switch2
switch(config)# interface vxlan1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1
switch(config-if-Vx1)# vxlan flood vtep 10.2.2.2
```

17.4.5 redistribute attached-host

Use the **`redistribute attached-host`** to redistribute the source routes in the MRIB via BGP while running multi-agent protocol model for the IPv4 multicast address-family. Thius activates the neighbor to establish a BGP connection.

Command Mode

BGP router address-family configuration mode

Command Syntax

`redistribute attached-host` route-map ***name***

`no redistribute attached-host` route-map ***name***

`default redistribute attached-host` route-map ***name***

Parameter

route-map *name* Name of the route map.

Example

```
switch(config-router-bgp)# address-family ipv4 multicast
switch(config-router-bgp-af)# neighbor 3.0.0.2 activate
switch(config-router-bgp-af)# redistribute attached-host
```

17.4.6 show arp

Use the **show arp** command to display and modify entries in the Address Resolution Protocol (ARP) cache.

Command Mode

EXEC

Command Syntax

show arp [agent [ipv4 | ipv6] | host ***name*** | ***A.B.C.D*** [host | interface | mac-address | summary] | interface [Ethernet | Fabric | Loopback | Management | Port-Channel | Switch | Tunnel | Vlan | Vxlan] | mac-address ***H.H.H*** | monitor [summary | vrf] | remote vlan | resolve [host | interface | mac-address | ***A.B.C.D***] | summary total | vrf [***word*** | all]]

Parameters

- **agent** ARP Agent information.
  - **ipv4** Details related to IPv4.
  - **ipv6** Details related to IPv6.
- **host *name*** Hostname filter name.
- ***A.B.C.D*** IP address filter.
  - **host** Hostname filter.
  - **interface** Interface selector.
  - **mac-address** MAC address filter.
  - **summary** Displays a summary of ARP entries.
- **interface** Interface selector.
  - **Ethernet** Ethernet interface.
  - **Fabric** Fabric interface.
  - **Loopback** Hardware interface used in looping packets.
  - **Management** Management interface.
  - **Port-Channel** Port-Channel sub interface.
  - **Switch** Switch interface.
  - **Tunnel** Tunnel interface.
  - **Vlan** Logical interface into a VLAN.
  - **Vxlan** VXLAN tunnel interface.
- **mac-address *H.H.H*** MAC address filter Ethernet address.
- **monitor** Monitored IP/IPv6 addresses.
  - **summary** Displays a summary of monitored IP/IPv6 addresses.
  - **vrf** Displays monitored IP/IPv6 addresses in a VRF.
- **remote vlan** Remote host bindings displaying information about the specified VLAN.
- **resolve** Resolves host names.
  - **host** Hostname filter.
  - **interface** Interface selector.
  - **mac-address** MAC address filter.
  - ***A.B.C.D*** IP address filter.
- **summary** Displays a summary of the ARP entries.
  - **total** Displays a count of the total ARP entries.
- **vrf** Displays ARP entries in a VRF.
  - ***word*** The VRF name.
  - **all** All virtual routing and forwarding instances.

Examples

- The **show interfaces vxlan** command displays operational status and configuration information of the specified VXLAN.

```
switch(config)# show interfaces vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is
    [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
        Use 'show vxlan vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
   100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
  VTEP address mask is Non
```

- The **show arp** command displays all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface vxlan 1
Address         Age (sec)  Hardware Addr   Interface
192.168.10.1              -  0000.abab.abab  Vlan100, Vxlan1
```

- The **show arp interface summary** command displays a summary of all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface vxlan 1 summary
Total: 1
Static: 1
Dynamic: 0
Not learned: 0
```

17.4.7 show interfaces vxlan

Use the **show interfaces vxlan** command to display the operational status and configuration information of the specified VXLAN.

Command Mode

EXEC

Command Syntax

show interfaces vxlan ***num***

Parameter

num VXLAN tunnel interface number. Range ***1***-***1***.

Example

```
switch(config)# show interfaces vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is
    [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
        Use 'show vxlan vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
   100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
  VTEP address mask is Non
```

17.4.8 show service vxlan

The **show service vxlan** command displays the status of the Vxlan Control Service (VCS) and the received (from all connected VTEPs) and advertised (to all connected VTEPs) MAC address reachability information.

Command Mode

EXEC

Command Syntax

show service vxlan [status | switch [**SWITCH_TYPE**] | vni [**VNI_INFO**]]

Parameters

- **SWITCH_TYPE** displayed by switch type. Options include:
  - ***word*** hostname, IP address, or ID of the switch.
  - **all** all switches.
- **VNI_INFO** displayed with VNI information. Options include:
  - **advertised** advertised MAC addresses.
  - **received** received MAC addresses.

Example

This command displays the status of the VCS.

```
switch(config)# show service vxlan status
Vxlan Controller Service is   : stopped
Mac learning                  : Control plane
Resync period                 : 300 seconds
Resync in progress            : No
Capability                    : VXLAN v4 overlay routing
                                VXLAN v4 overlay indirect routing
fm319(config-if-Vx1)#show service vxlan status
Vxlan Controller Service is   : stopped
Mac learning                  : Control plane
Resync period                 : 300 seconds
Resync in progress            : No
Capability                    : VXLAN v4 overlay routing
                                VXLAN v4 overlay indirect routing

switch(config)#
```

17.4.9 show vxlan address-table

The **show vxlan address-table** command displays the VXLAN address table. Entries are created by extracting information from packets received from remote VTEPs.

The VXLAN address table correlates MAC addresses that are accessible through remote VTEPs with the local VLAN and the IP address of the VTP through which the addressed device is accessible. The VTI uses this table when constructing the VXLAN encapsulation fields to specify the destination IP address of the recipient VTEP and the VNI segment through which the device's remote VLAN is accessed.

Command Mode

EXEC

Command Syntax

show vxlan address-table [**ENTRY_TYPE**] [**MAC_ADDR**] [**VLANS**] [**REMOTE_VTEP**]

Parameters

- **ENTRY_TYPE** command filters display by entry type. Options include:
  - ***no parameter*** all table entries.
  - **configured** static entries; includes unconfigured VLAN entries.
  - **dynamic** entries learned though packet receipts.
  - **static** entries entered by CLI commands.
  - **unicast** entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - ***no parameter*** all MAC addresses table entries.
  - **address *mac_address*** displays entries with specified address (dotted hex notation – H.H.H).
- **VLANS** command filters display by VLAN.
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLAN specified by ***v_num***.
- **REMOTE_VTEP** Filters entries by IP address of the remote VTEPs. Options include:
  - ***no parameter*** all items.
  - **vtep *ipaddr_1*** [***ipaddr_2***...***ipaddr_n***] Identifies VTEPs by their IP address.

Example

This command displays the VXLAN address table.

```
switch> show vxlan address-table
          Vxlan Mac Address Table
----------------------------------------------------------------------

Vlan  Mac Address     Type      Prt  Vtep            Moves   Last Move

  61  0000.0061.0105  DYNAMIC   Vx1  10.25.2.12      1       4 days, 0:37:14 ago
switch>
```

17.4.10 show vxlan counters

The **show vxlan counters** command displays the VXLAN counters.

Command Mode

EXEC

Command Syntax

show vxlan counters ROUTE_TYPE

Parameters

- **ROUTE_TYPE** Specifies the type of VXLAN counter displayed by the command.
  - **software** Command displays software routers.
  - **varp** Command displays virtual-ARP counters.
- **vtep** Command displays counters for VTEPs which are identified by their IP address. An optional keyword allows the user to view a single direction of the counters:
  - **encap** "encap" counters count packets coming from the edge, encapsulated on the device and directed to the core.
  - **decap** "decap" counters count packets coming from the core, decapsulated on the device and heading towards the edge.

Related Command

clear vxlan counters resets the VXLAN counters.

Examples

- This command displays the VXLAN counters for software routers.

```
switch> show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0

switch>
```

17.4.11 show vxlan flood vtep

The **show vxlan flood vtep** command displays the flood list that the switch is using to perform head-end replication. Head-end replication is a data distribution method that supports Broadcast, Unknown unicast, and Multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. The command displays the VLAN ID that references the configured VNIs (vxlan vlan vni).

The flood list is determined by the vxlan flood vtep command.

Command Mode

EXEC

Command Syntax

show vxlan flood vtep [**VLANS**]

Parameters

VLANS command filters display by the reference VLAN.

- ***no parameter*** all VLANs.
- **vlan *v_range*** VLANs specified by ***v_range***.

  Valid ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Guidelines

The command displays flood list contents only when the VLAN line protocol status is **up**.

Related Command

vxlan flood vtep configures the flood list.

Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch> show vxlan flood vtep vlan 100-102

          Vxlan Flood Vtep Table
------------------------------------------------------

Vlan   Ip Address
----   ---------------------------------------------
100    3.3.3.3
101    11.1.1.1         11.1.1.2         11.1.1.3
102    11.1.1.1         11.1.1.2         11.1.1.3
       12.1.1.1
switch>
```

17.4.12 show vxlan vtep

The **show vxlan vtep** command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

Command Mode

EXEC

Command Syntax

show vxlan vtep

Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch> show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps:  1
switch>
```

17.4.13 vxlan flood vtep

The **vxlan flood vtep** command supports VXLAN head-end replication by creating or modifying a list that specifies remote VTEPs to which the switch bridges replicated traffic. Head-end replication is a data distribution method that supports Broadcast, Unknown unicast, and Multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MACs.

Each **vxlan flood vtep** statement in ***running-config*** associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured. The **vxlan flood vtep** command is available in the following formats to create or modify corresponding ***running-config*** statements:

- **vxlan flood vtep** creates a statement for a specified VNI and replaces existing statements for that VNI.
- **vxlan flood vtep add** modifies an existing flood statement by adding the specified VTEPs. This statement creates a list if it references a VNI that has no flood statement.
- **vxlan flood vtep remove** modifies an existing flood statement by deleting the specified VTEPs. This statement has no effect if it references a VNI that has no flood statement.

The vxlan flood vtep command specifies a VNI by referencing its associated VLAN ID (vxlan vlan vni). The command provides these options for specifying the reference VLANs:

- **a single VLAN**: creates or modifies a single statement referenced by the command.
- **a range of VLANs**: creates or modifies all statements referenced by the VLAN range.
- **no VLAN**: creates or modifies the default list.

The **no vxlan flood vtep** and **default vxlan flood vtep** commands remove the specified flood list by deleting the corresponding vxlan flood vtep statements from ***running-config***. Commands that specify a VLAN range remove all corresponding statements.

Command Mode

Interface-VXLAN Configuration

Command Syntax

vxlan [**ACCESS_VNI**] **flood vtep**] **MODIFY**] **VTEP_1** [**VTEP_2**]...[**VTEP_N**]

no vxlan [**ACCESS_VNI**] **flood vtep**

default vxlan [**ACCESS_VNI**] **flood vtep**

Parameters

- **ACCESS_VNI** VLAN ID associated to the flood list's target VNI. Value ranges from ***1*** to ***4094***.
  - ***no parameter*** default list.
  - **vlan *vlan_range*** List of VLANs. (Number, range, comma-delimited list of numbers and ranges). Numbers range from ***1*** to ***4094***.
- **MODIFY** Statement modification method. Options include:
  - ***no parameter*** creates new list for specified VLANs. Current list is overwritten.
  - **add** specified VTEPs are added to existing list.
  - **remove** specified VTEPs are deleted from existing list.
- **VTEP_X** IPv4 address of VTEPs that are added or removed from the list.

Examples

- These commands create a default VXLAN head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
```

```
switch(config-if-Vx1)# show active
 interface Vxlan1
   vxlan flood vtep 10.1.1.1 10.1.1.2
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through ***vlan101*** and ***vlan 102***.

```
switch(config-if-Vx1)# vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2
 11.1.1.3
switch(config-if-Vx1)# show active
 interface Vxlan1
   vxlan flood vtep 10.1.1.1 10.1.1.2
   vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
   vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

- These commands add two VTEPs for the VNI access through ***vlan 102***.

```
switch(config-if-Vx1)# vxlan vlan 102 flood vtep add 12.1.1.1
switch(config-if-Vx1)# show active
 interface Vxlan1
   vxlan flood vtep 10.1.1.1 10.1.1.2
   vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
   vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3 12.1.1.1
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

17.4.14 vxlan multicast-group decap

The **vxlan multicast-group decap** command enables VXLAN multicast decapsulation.

VTEPs are enabled by VXLAN multicast decapsulation, supporting Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

The **no vxlan multicast-group decap** and **default vxlan multicast-group decap** commands disable VXLAN multicast decapsulation.

Command Mode

Interface-VXLAN Configuration

Command Syntax

vxlan multicast-group decap ***group_addr***

no vxlan multicast-group decap

default vxlan multicast-group decap

Parameter

group_addr IPv4 address of multicast group. Dotted decimal notation of a valid multicast address.

Examples

- This command enables VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#
```

- This command disables VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# no vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#
```

17.4.15 vxlan source-interface

The **vxlan source-interface** command specifies the interface from which the configuration mode VXLAN Interface (VTI) derives the source address (IP) that it uses when exchanging VXLAN frames. There is no default source interface assignment.

The **no vxlan source-interface** and **default vxlan source-interface** commands remove the source interface assignment from the ***interface-vxlan*** configuration mode by deleting the corresponding **ip vxlan source-interface** command from ***running-config***.

Command Mode

Interface-VXLAN Configuration

Command Syntax

vxlan source-interface INT_NAME

no vxlan source-interface

default vxlan source-interface

Parameters

INT_NAME Interface type and number. Options include:

- **loopback *l_num*** Loopback interface specified by ***l_num***.

Guidelines

A VXLAN interface is inoperable without the source-interface assignment.

Related Command

interface vxlan places the switch in VXLAN interface configuration mode.

Example

These commands configure VTI 1 to use the IP address ***10.25.25.3*** as the source address of outbound VXLAN frames.

```
switch(config)# interface loopback 15
switch(config-if-Lo15)# ip address 10.25.25.3/24
switch(config-if-Lo15)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 15
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan source-interface Loopback15
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

17.4.16 vxlan udp-port

The **vxlan udp-port** command associates a UDP port with the configuration mode VXLAN Interface (VTI). By default, UDP ***port 4789*** is associated with the VTI.

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header that includes the VNI associated with the VLAN and the IP address of the VTEP that connects to the recipient, then sent through the UDP port. Packets that arrive through the UDP port are sent to the bridging domain of the recipient VLAN as determined by the VNI number in the VXLAN header and the interface's VNI-VLAN map.

The **no vxlan udp-port** and **default vxlan udp-port** command restores the default UDP port association (***4789***) on the configuration mode interface by deleting the corresponding **vxlan udp-port** command from ***running-config***.

Command Mode

Interface-VXLAN Configuration

Command Syntax

vxlan udp-port ***port_id***

no vxlan udp-port

default vxlan udp-port

Parameters

port_id UDP port number. Value ranges from ***1024*** to ***65535***.

Guidelines

UDP ***port 4789*** is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

Related Commands

interface vxlan places the switch in ***interface-vxlan*** configuration mode.

Examples

- This command associates UDP ***port 5500*** with ***interface vxlan 1***.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan udp-port 5500
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 5500
switch(config-if-Vx1)#
```

- This command resets the ***interface vxlan 1*** UDP port association of ***4789***.

```
switch(config-if-Vx1)# no vxlan udp-port
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
switch(config-if-Vx1)#
```

17.4.17 vxlan vlan vni

The **vxlan vlan vni** command associates a VLAN ID with a virtual network identifier (VNI). A VNI is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN Tunnel Interface (VTI). VNI values range from ***1*** to ***16777215*** in decimal notation and from ***0.0.1*** to ***255.255.255*** in dotted decimal notation.

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI that is associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace the existing VLAN assignment statement in ***running-config***. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The **no vxlan vlan vni** and **default vxlan vlan vni** commands remove the specified VLAN-VNI association from the configuration mode interface by deleting the corresponding **vxlan vlan** command from ***running-config***.

Command Mode

Interface-VXLAN Configuration

Command Syntax

vxlan vlan ***vlan_id*** **vni** [***vni_id***]

no vxlan vlan ***vlan_id*** **vni** [***vni_id***]

default vxlan vlan ***vlan_id*** **vni** [***vni_id***]

Parameters

- ***vlan_id*** number of access VLAN. Value ranges from ***1*** to ***4094***.
- ***vni_id*** VNI number. Valid formats: decimal ***1*** to ***16777215*** or dotted decimal ***0.0.1*** to ***255.255.255***.

Example

These commands associate ***vlan 100*** to ***vni 100*** and ***vlan 200*** to ***vni 10.10.200***.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan vlan 100 vni 100
switch(config-if-Vx1)# vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 200 vni 658120
   vxlan vlan 100 vni 100
switch(config-if-Vx1)# vxlan vni notation dotted
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 200 vni 10.10.200
   vxlan vlan 100 vni 0.0.100
switch(config-if-Vx1)#
```

17.4.18 vxlan vni notation dotted

The **vxlan vni notation dotted** command configures the switch to display VNIs in dotted decimal notation. A Virtual Network Identifier (VNI) is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface. VNI values range from ***1*** to ***16777215*** in decimal notation and from ***0.0.1*** to ***255.255.255*** in dotted decimal notation.

The command affects the VNI number display in all **show** commands, including **show running-config**. Commands that include VNI as a parameter may use decimal or dotted decimal notion regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

The **no vxlan vni notation dotted** and **default vxlan vni notation dotted** commands restore the default setting of displaying vni numbers in decimal notation by deleting the **vxlan vni notation dotted** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

vxlan vni notation dotted

no vxlan vni notation dotted

default vxlan vni notation dotted

Examples

- These commands configure the switch to display VNI numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)# vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 333 vni 3.4.5
switch(config-if-Vx1)#
```

- These commands configure the switch to display VNI numbers in decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)# no vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
   vxlan udp-port 4789
   vxlan vlan 333 vni 197637
switch(config-if-Vx1)#
```

Chapter 18

Ethernet VPN (EVPN)

This chapter describes Arista's EVPN implementation. Sections in this chapter include:

18.1 EVPN Overview

Ethernet VPN (EVPN) is a standards-based BGP control plane to advertise MAC addresses, MAC and IP bindings and IP Prefixes. This document focuses on EVPN and its operation with a VXLAN data plane for building overlay networks in the data center.

A number of control planes exist today for VXLAN, based on specific use cases, whether it be a requirement to integrate with an SDN overlay controller, or operate in a standards based flood and learn control plane model.

Current flood and learn models operate either with a multicast control plane, or ingress replication, where the operator manually configures the remote VTEPs in the flood list. Both of these are data-plane driven, that is, MAC's are learned via flooding. In the IP multicast model MAC's are learned in the underlay via flooding to an IP multicast group, while ingress replication (HER) floods to configured VTEP endpoints and no IP Multicast is required in the underlay.

The controller based solution with Cloud Vision eXchange (CVX), locally learned MAC's are published to a centralized controller and these MAC's are then programed to all participating VTEPs.

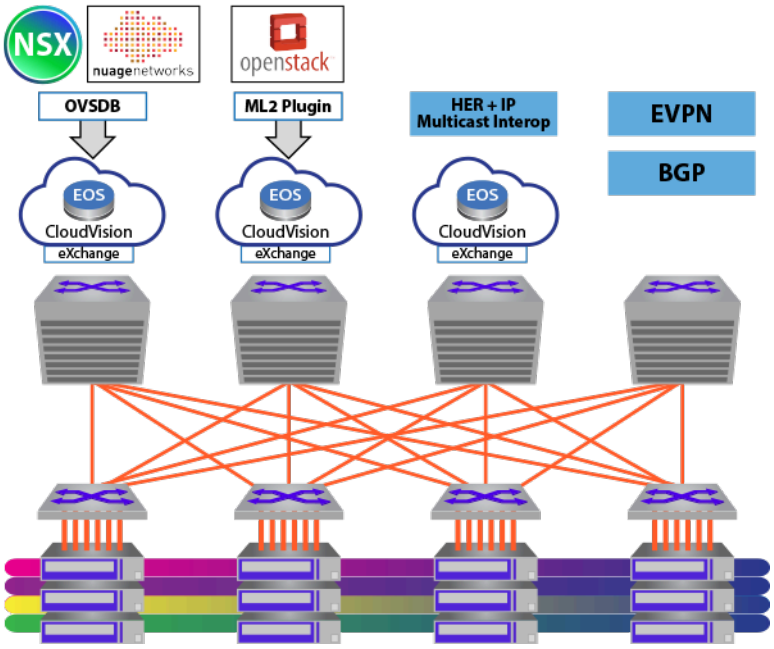

Figure 72: Different VXLAN Control Planes

A controller-less BGP EVPN MAC learning is a standards-based control-plane (MP-BGP) is used to discover remote VTEPs and advertise MAC address and MAC/IP bindings in the VXLAN overlay, thus eliminating the flood and learn paradigms of the previously mentioned (multicast or HER) controller-less approaches. As a standards-based approach, the discovery and therefore the advertisement of the EVPN service models can inter-operate amongst multiple vendors.

This highlights an important and powerful advantage of BGP EVPN; that being, it is a single control plane for multiple data-plane encapsulations and defines both Layer 2 and Layer 3 VPN services. As network operators drive toward simplicity and automation, having one control plane protocol and address family for all data-planes and VPN services will prove extremely powerful.

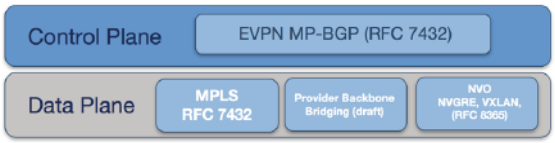

Figure 73: VXLAN Control Plane and Data-plane Definitions

The initial EVPN standard is ***RFC 7432*** defined the BGP EVPN control plane and specifies an MPLS data-plane. The control plane with an MPLS data plane was extended to consider additional data plane encapsulations models including VXLAN, NVGRE, and MPLS over GRE.

18.1.1 EVPN Terminology

The EVPN standard in the context of an NVO environment, defines the functionality for delivering multi-tenant Layer 2/3 VPN services using either VXLAN, NVGRE or MPLS over GRE encapsulation, across a common physical IP infrastructure. The standard introduces new terminology specific to a NVO environment, which are summarized below in relation to VXLAN encapsulation.

Network Virtualization Overlay (NVO): The overlay network used to deliver the Layer 2 and Layer 3 VPN services. For VXLAN encapsulation, this would define a VXLAN domain, which would include one or more VNIs, for the transportation of tenant traffic over a common IP underlay infrastructure.

- **Network Virtualization End-Point (NVE):** The provider edge node within the NVO environment responsible for the encapsulation of tenant traffic into the overlay network. For a VXLAN data plane, this defines the Virtual Tunnel End-Point (VTEP).
- **Virtual Network Identifier (VNI):** The label identifier within the VXLAN encapsulated frame, defining a Layer 2 domain in the overlay network.
- **EVPN instance (EVI):** A logical switch within the EVPN domain which spans and interconnects multiple VTEPs to provide tenant Layer 2 and Layer 3 connectivity.
- **MAC-VRF:** A Virtual Routing and Forwarding table for storing Media Access Control (MAC) addresses on a VTEP for a specific tenant.

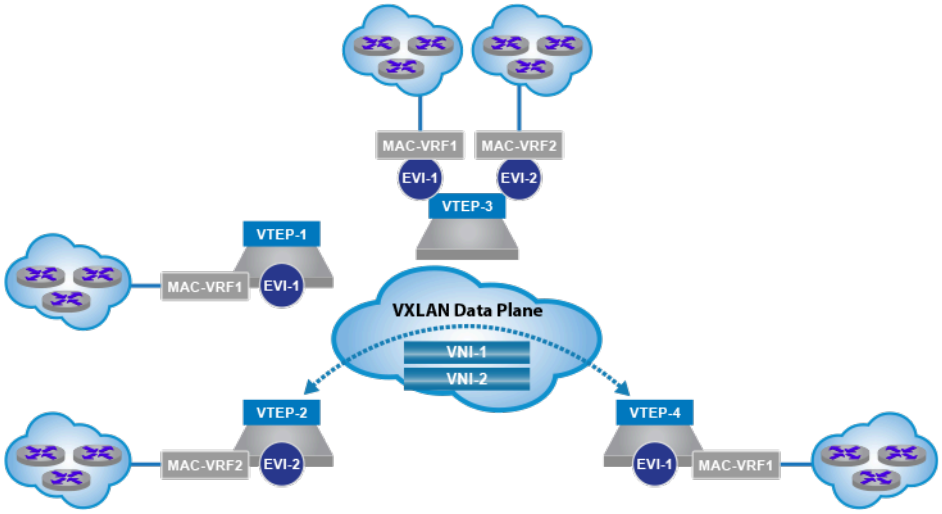

Figure 74: EVPN Terminology for a VXLAN Data Plane

The new EVPN Network Layer Reachability Information (NLRI) is carried in BGP using Multi-protocol BGP Extensions with a newly defined Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI).

To provide multi-tenancy, the standard uses the above traditional VPN methods to control the import and export of routes and provide support for overlapping IP address between tenants.

Multi-protocol BGP for EVPN: A new AFI and SAFI have been defined for EVPN. These are AFI=25 (Layer 2 VPN) and SAFI = 70 (EVPN).

- **EVPN Layer 2/Layer 3 tenant segmentation:** Similar to standard MPLS VPN configurations Route Distinguisher's (RD's) and Route Targets (RT's) are defined for the VPN.
- **Route Target (RT):** To control the import and export of routes across VRFs, EVPN routes are advertised with Route-Target (RT) (BGP extended communities). The RT can be auto derived to simplify the rule configuration, typically this is based on the AS number and the VNI of the MAC-VRF.
- **Route Distinguisher (RD):** Unique number prepended to the advertised address within the VRF, ensuring support for overlapping IPs and MACs across different tenants.

The format of the MP_REACH_NLRI/MP_UNREACH_NLRI attribute, holding the new EVPN NLRI is illustrated below, where the next-hop address within the NLRI is the IP address of the VTEP advertising the EVPN route.

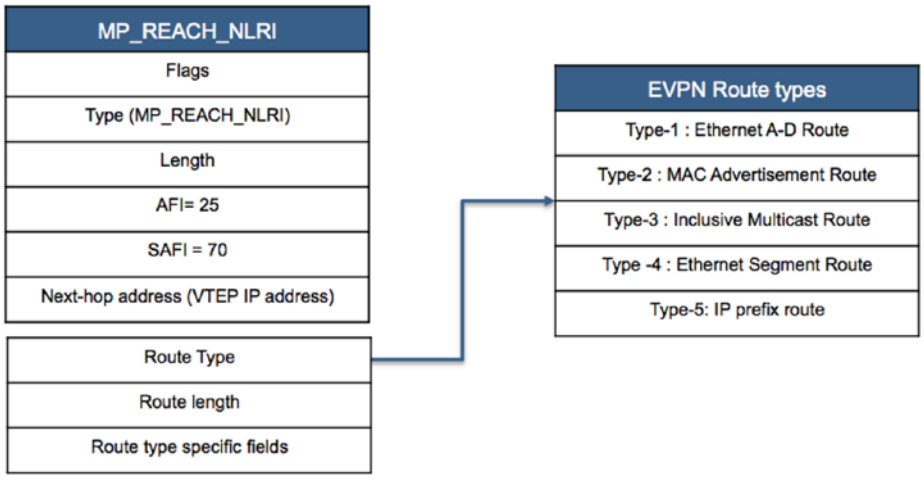

Figure 75: EVPN NLRI Route Format

As illustrated, the original ***MPLS RFC (7348)*** and subsequent IP prefix draft (**EVPN Terminology**), introduce five unique EVPN route types.

Type-1 Route: Ethernet A-D route

Ethernet A-D route per ESI route, announces the reachability of a multi-homed Ethernet Segment. The route type is used for fast convergence (ie: 'mass withdraw') functions, as well as split horizon filtering used for active-active multi-homing.

Ethernet A-D route per EVI route, is used to implement the Aliasing and Backup Path features of EVPN associated with active-active multi-homing.

Type-2 Route: Host advertisement Route

Used to advertise the reachability of a MAC address, or optionally a MAC and IP binding as learned by a specific EVI. With the advertisement of the optional IP address of the host, EVPN provides the ability for VTEPs to perform ARP suppression and ARP proxy to reduce flooding within the Layer 2 VPN.

Type-3 Route: Inclusive Multicast route

The type-3 route is used to advertise the membership of a specific Layer 2 domain (VNI within the VXLAN domain), allowing the dynamic discovery of remote VTEPs in a specific VNI and the population of a VTEP ingress flood list for the forwarding of Broadcast Unknown unicast and Multicast (BUM) traffic.

Type-4 Route: Ethernet Segment Route

The type-4 route is specific to VTEPs supporting the EVPN multi-homing model, for active-active and active-standby forwarding. The route is used to discover VTEPs which are attached to the same shared Ethernet Segment. Additionally, this route type is used in the Designated Forwarder (DF) election process.

Type-5 Route: IP-prefix route advertisement

The type-5 route is used to advertise IP prefixes rather the MAC and IP hosts addresses of the type-2 route. This advertisement of prefixes into the EVPN domain provides the ability to build classic Layer 3 VPN topologies.

A detailed understanding of the function of each of these route types in the operation of EVPN to provide multi-tenant Layer 2 and 3 VPN services, is defined in Section 4 of this document.

While this guide focuses on EVPN with VXLAN data-plane encapsulation, it's important to note that, in addition to the new routes type, a BGP encapsulated extended community is included in all advertisements to determine the data-plane encapsulation.

The Encapsulation extended community is defined in ***RFC 5512***. The different IANA registered tunnel types for an NVO environment are summarized in the table below.

Extended Community Value	Name	Reference
8	VXLAN	draft-ietf-bess-evpn-overlay-08
9	NVGRE	draft-ietf-bess-evpn-overlay-08
10	MPLS	RFC 7342
11	MPLSoGRE	draft-ietf-bess-evpn-overlay-08

Figure 76: Defined Data-Plane Encapsulations

18.1.2 EVPN Service Models

An EVPN Instance (EVI), can contain, one or more Layer 2 broadcast domains (VLANs).

The association of a VLAN-IDs to a specific EVI instance and how a VLAN tag can be transported within the EVI if required, is defined by three EVPN service models: VLAN based, VLAN Bundle, and VLAN aware bundle.

18.1.2.1 VLAN Based Service Interface

In the VLAN based service there is a one-to-one mapping between the VLAN-ID and the MAC-VRF of the EVPN instance. With the MAC-VRF mapping directly to the associated VLAN, there will be a single bridge table within the MAC-VRF. The VLAN tag is not carried in any route update and the VNI label in the route advertisement is used to uniquely identify the bridge domain of the MAC-VRF in the VXLAN forwarding plane.

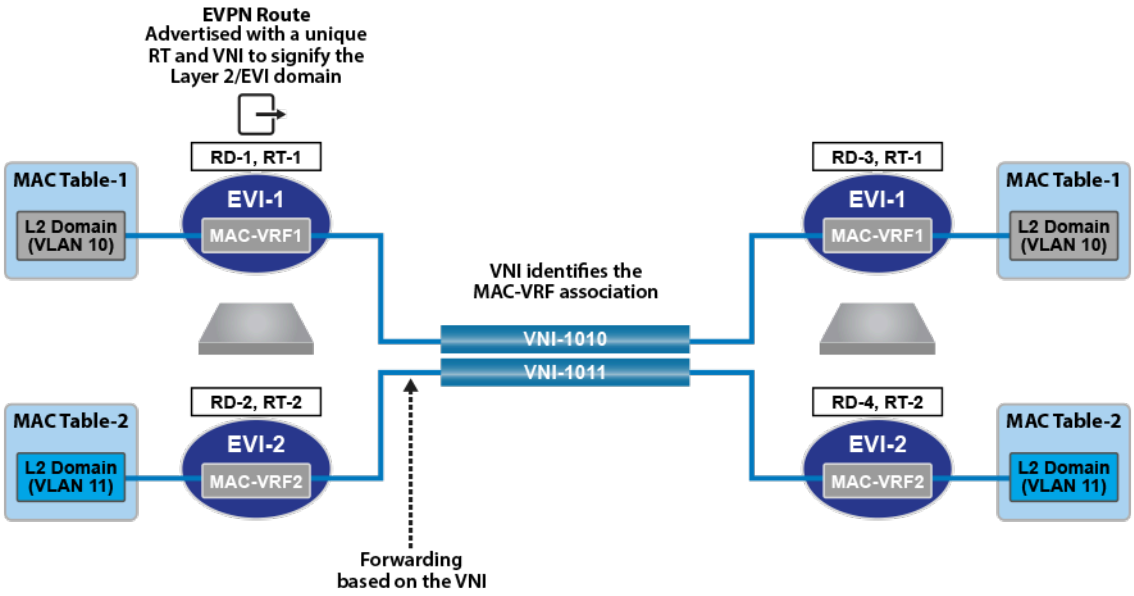

Figure 77: VLAN Based Service Interface

With a one-to-one mapping between the VLAN-ID and the MAC-VRF of EVI instance, the EVI will represent an individual tenant subnet/VLAN in the overlay. The one-to-one mapping also means the route-target associated with the MAC-VRF, uniquely identifies the tenant's subnet/VLAN, providing granular importing of MAC routes on a per VLAN basis on each VTEP.

In this service, the associated MAC-VRF table is identified by the Route-Target in the control plane and by the VNI in the data plane and the MAC-VRF table corresponds to a single VLAN bridge domain.

18.1.2.2 VLAN Bundle Service Interface

In the VLAN bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. The MAC-VRF however only contains a single Layer 2 bridge table and VNI label, thus MAC addresses must be unique across all associated VLANs.

With the MAC-VRF containing a single Layer 2 bridge table and a single VNI, the original VLAN tag has no significance in the control plane and is not carried in any EVPN route update. The original Ethernet tag and the VNI label are carried in the VXLAN data plane, to allow forwarding to the correct tenant VLAN.

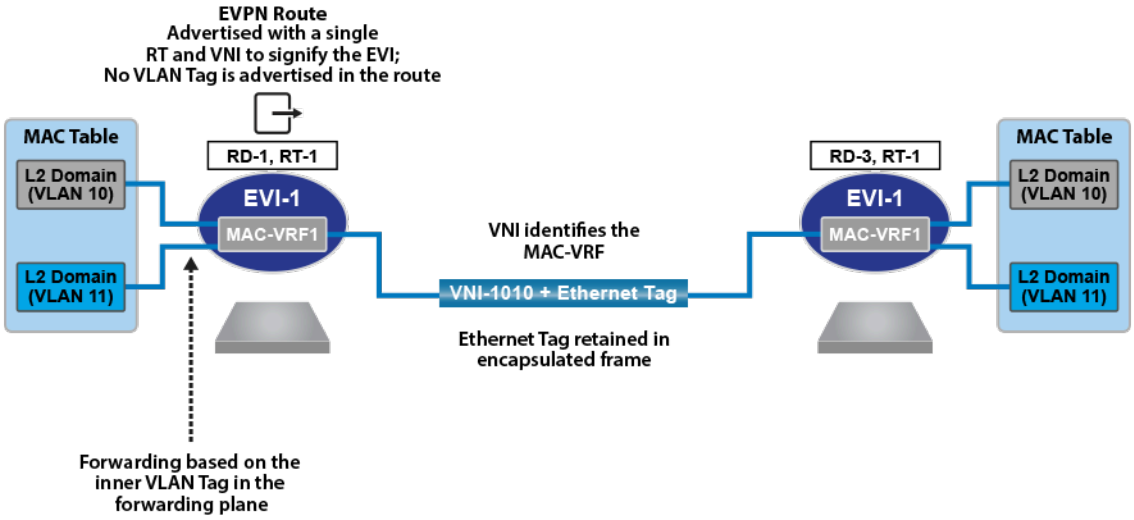

Figure 78: VLAN Bundle Service Interface

In this service, the Route-Target associated with the MAC-VRF identifies the tenant rather than an individual subnet/VLAN of a tenant. This means all MAC routes for the tenant will be imported on the VTEP regardless of whether or not the specific tenant VLAN exists. The MAC-VRF table is identified by the Route-Target in the control plane and forwarding to the appropriate tenant VLAN is achieved via a combination of the VNI and Ethernet tag in the VXLAN data plane.

18.1.2.3 VLAN Aware Bundle Service Interface

In the VLAN aware bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. However, the MAC-VRF contains a unique Layer 2 bridge table for each associated VLAN-ID and a unique VNI label for each bridge domain.

With the MAC-VRF containing multiple Layer 2 bridge tables, the VLAN tag is carried in any EVPN route update to allow mapping to the correct tenant bridge table within the MAC-VRF. Only the unique VNI label is carried in the VXLAN data plane, to allow forwarding to the correct VLAN with the MAC-VRF.

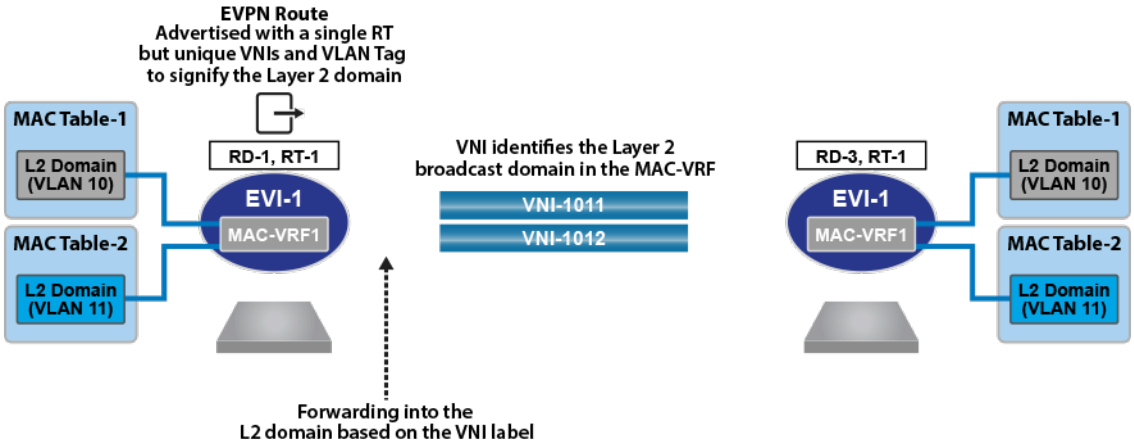

Figure 79: VLAN Aware Bundle Service

In this service, the MAC-VRF of the EVI instance represents multiple subnet/VLANs of the tenant. The Layer 2 bridge table of the MAC-VRF is identified by a combination of the Route-Target and the Ethernet tag in the control plane and by the unique VNI and in the VXLAN data plane.

This service type is a common DCI/WAN deployment, where a tenant's VLANs are bundled into single EVI instance, while VLAN "awareness" can be retained in the EVPN service as the VNI tag is advertised in the MAC-IP route (which now identifies the VLAN within the EVI). Bundling into a service like this reduces the number of EVI's that need to be configured, reducing complexity and the control-plane signaling between PE's.

18.1.3 VCS and EVPN in DCI

When VXLAN Control Services (VCS) is enabled on a CloudVision eXchange (CVX) of a Data Center (DC), each VXLAN Tunnel End Point (VTEP) connects to the corresponding CVX for sharing the Layer 2 bridging information of it's attached hosts. In turn, CVX advertises this information to all VTEPs within the DC.

In a topology consisting of multiple DCs where each DC runs its own CVX instance as shown below, a federation of CVXs can be created by using BGP-EVPN. In such Data Center Interconnect (DCI) topologies, CVX in each DC performs the following functions to advertise the Layer 2 bridging information (MAC-VTEP bindings) to all VTEPs in different DCs:

- Receives the local Layer 2 bridging information in CVX control plane format from all VTEPs within the DC; and advertises it to remote CVXs in the BGP-EVPN NLRI format.
- Receives the Layer 2 bridging information in BGP-EVPN NLRI format from remote CVXs; and advertises it to local VTEPs in the CVX control plane format.

Note: The distribution of Layer 2 bridging information as described above allows a Layer 2 overlay network to be stretched across multiple DCs without additional VTEP configurations.

The following graphic illustrates the federation of CVX across multiple DCs.

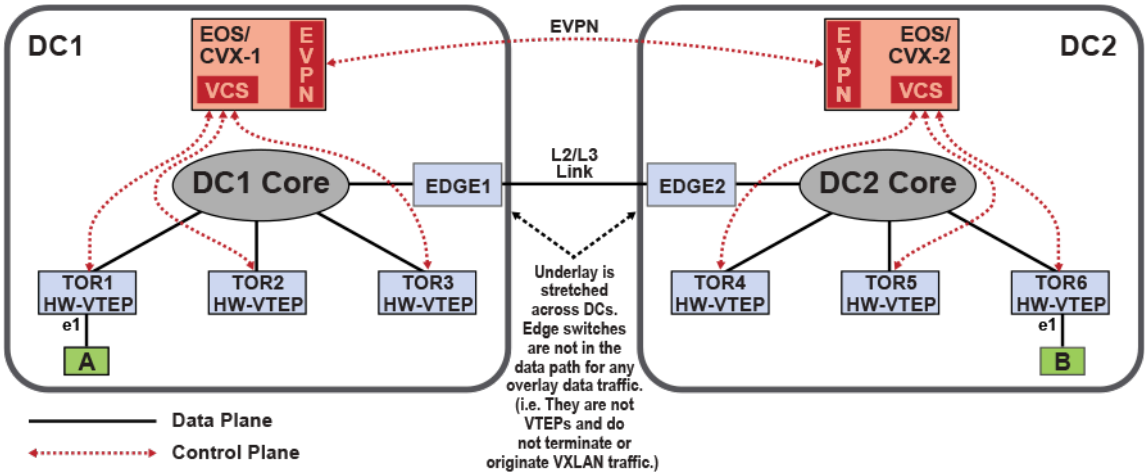

Figure 80: CVX Connected from Multiple DCs

18.1.4 EVPN MPLS LAYER 3 VPN (Type-5 Route)

Ethernet VPN (EVPN) is an extension of the BGP protocol introducing a new address family: Layer 2 VPN (address family number 25) / EVPN (subsequent address family number 70). It is used to exchange overlay MAC and IP address reachability information between BGP peers using type-2 routes. Additionally, EVPN supports the exchange of layer 3 IP overlay routes through the extensions described in (type 5 EVPN routes).

An IP VRF is used on a PE router for each Layer 3 overlay. VRF IP routes are exported into the EVPN BGP table and advertised to remote VTEPs as type 5 routes. The exported EVPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the EVPN type 5 routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IP table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the Layer 3 (type 5) EVPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by an IP backbone.

The type-5 routes provide the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP address, optimized the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The format of the new type-5 IP-prefix route is illustrated in the figure below. Unlike when VXLAN is used as a transport, BGP route update for MPLS does not specify the router-mac extended community and sets the tunnel encapsulation to MPLS. Unlike with VXLAN encapsulation, which uses the VNI as the overlay index, the MPLS Type-5 route uses the MPLS label.

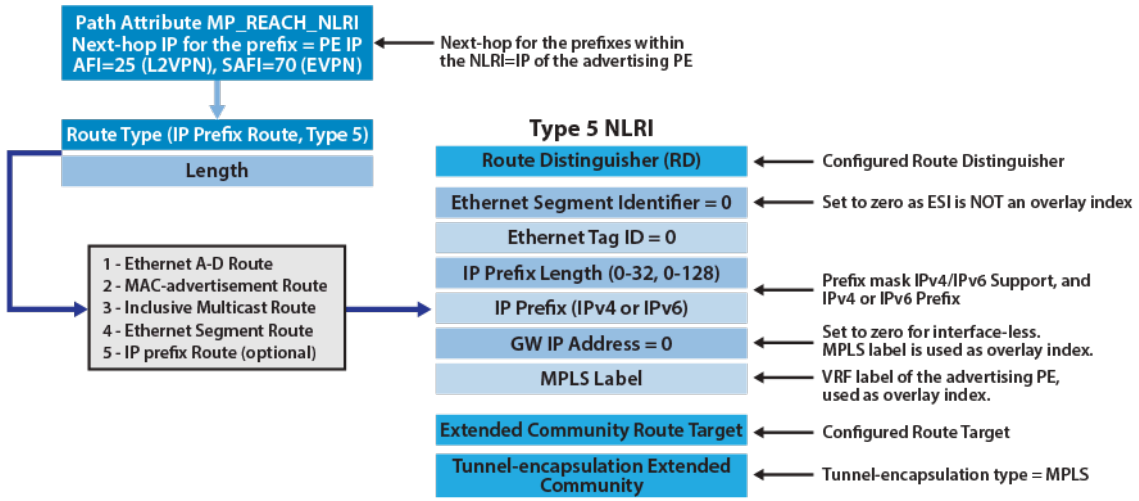

Figure 81: EVPN Route Type-5, for Advertisement of IP-Prefixes over MPLS

The following example offers a more detailed view of the route as displayed on a PE router.

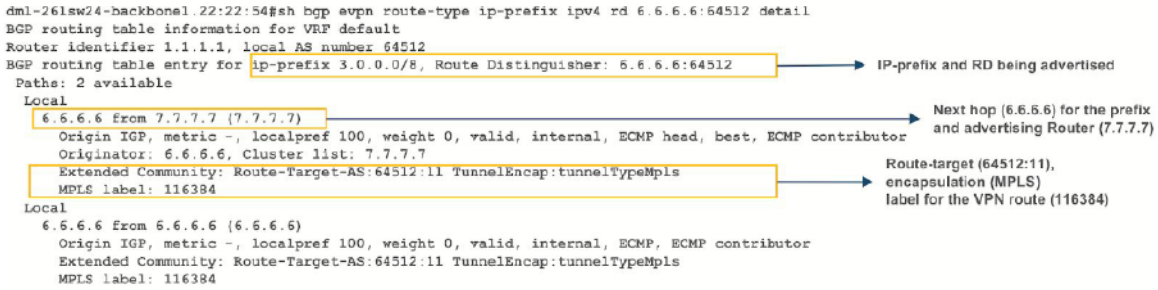

Figure 82: EVPN Route Type-5 as Shown on PE

As shown in the example, the route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the extended communities of tunnel type (MPLS), MPLS Label value and route-target.

Note: You require ***Release EOS 4.21.1F*** and later versions with Jericho/Jericho+ platforms.

18.1.5 EVPN VxLAN IPv6 Overlay

Beginning with ***EOS Release 4.22.0F***, the EVPN VXLAN L3 Gateway using EVPN IRB supports routing traffic from one IPv6 host to another IPv6 host on a stretched VXLAN VLAN.

18.2 EVPN Layer 3 Core Operations

The EVPN standard defines a number of operations and functionality to allow the dynamic learning of MAC and IP bindings, management of MAC moves (VM/host mobility), ARP suppression, automated discovery of remote VTEPs and multi-homing to support active-active topologies.

18.2.1 MAC Address Learning

MAC address learning on the local interface of a VTEP is flow-based learning, however once the MAC addresses are learned locally they are advertised to BGP peers within the EVI via an EVPN route update. The next hop of the update is set to IP of the advertising VTEP. In the case of EVPN VXLAN

the label advertised in the update is the VNI, which identifies the MAC-VRF in the case of a VLAN Based service, or the EVI for a VLAN aware bundle service.

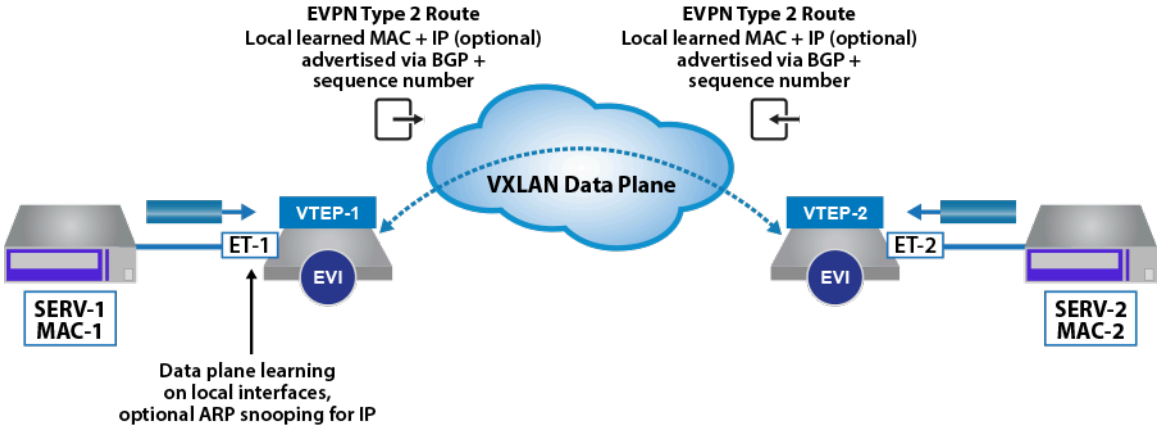

Figure 83: EVPN Type 2 Route Announcement

The route advertisements are EVPN type-2 routes, which can advertise just the MAC address of the host, or optionally the MAC and IP address of the host. The format of the type-2 route is illustrated in the figure below, along with the mandatory and optional extended community attached to the route.

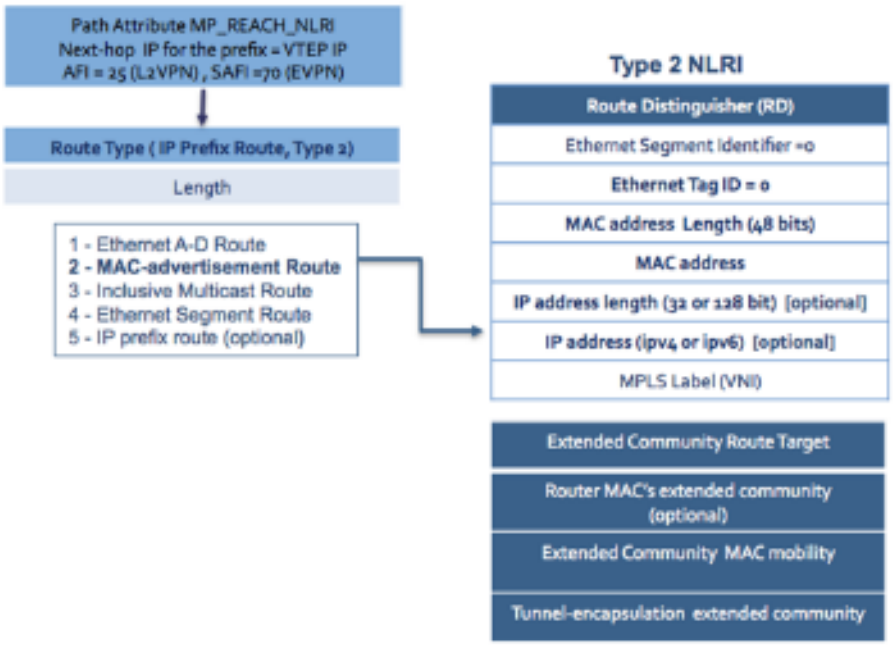

Figure 84: EVPN Type 2 MAC and IP Route Format

Notable fields:

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF.

- Ethernet Segment Identifier (ESI), this field is populated when the VTEP participating in a multi-homed topology. This is discussed in the following sections.
- Ethernet tag ID that will be 0 for VLAN-based service, and the customer VLAN ID in a VLAN-aware bundle service.
- IP address of the host which is associated with advertised MAC address. The advertisement of the Host's IP address is optional.
- Label in the context of a VXLAN forwarding plane is the VNI associated with the MAC-VRF/Layer 2 domain the advertised MAC address has been learned on.
- Route Target associated with the MAC-VRF advertised with route to allow the control of the import and export of routes.

The MAC mobility extended community, as discussed in the following section is used during MAC moves to update all VTEPs of the new location of the host.

18.2.2 ARP Suppression

Providing the option to advertise the MAC and IP binding in the type-2 route, ARP suppression can be supported on the remote VTEPs. The MAC to IP binding can be learned locally, via ARP snooping or DHCP traffic on the VTEP. Once the MAC and IP binding has been learned, it is advertised to the remote VTEPs as a type-2 route. This allows remote VTEPs to respond to any ARP requests for the host locally, thus reducing the amount of ARP traffic across the EVI.

Importantly, the optional MAC and IP route can be advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, i.e. ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.

18.2.3 MAC Mobility

A common scenario in a data center environment is Virtual Machines (VMs) moving between physical servers, for maintenance or performance reasons, this will result in the MAC of the VM being learned and advertised by a new VTEP.

To cater for this situation a sequence number is attached to the new MAC advertisement ensuring an EVI wide refresh of the MAC table, with VTEPs updating their forwarding tables to point to the advertising VTEP as the new next-hop for MAC address.

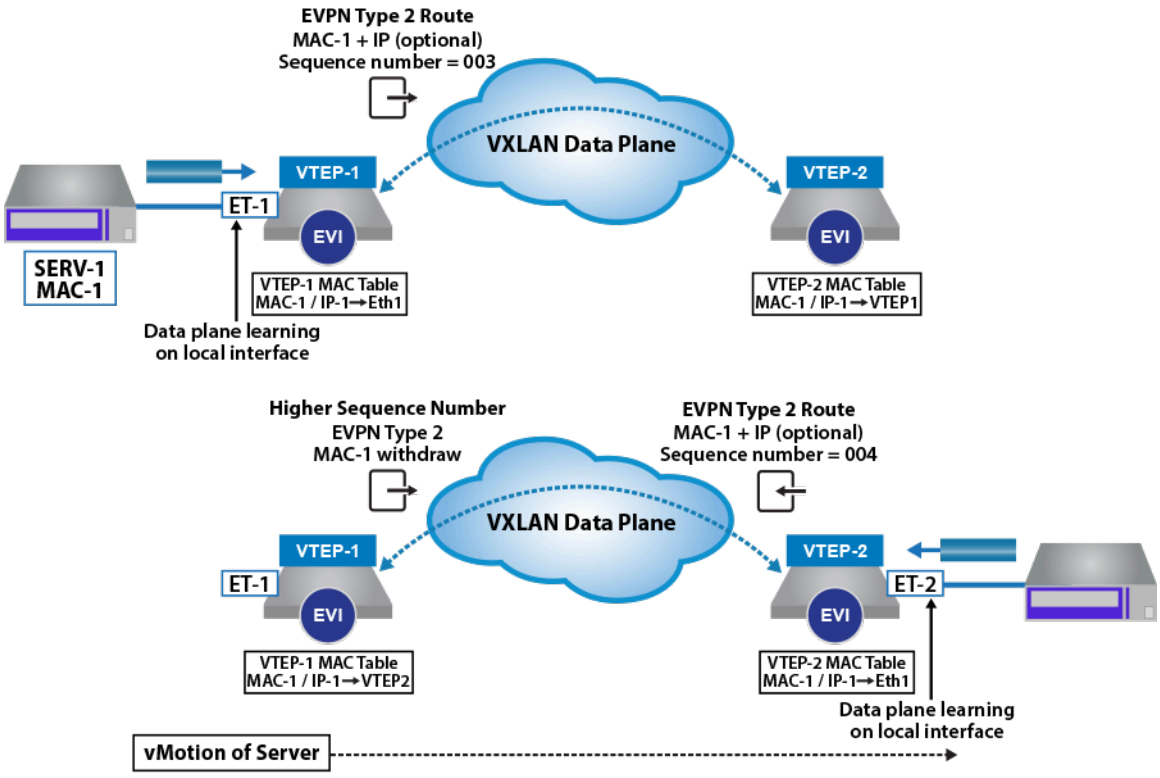

Figure 85: EVPN type-2 MAC Mobility Behavior

When a MAC address is learned and advertised for the first time, it is advertised without a sequence number and the receiving VTEP assume the sequence to be zero. On detection of a MAC move, such as a MAC is learned locally when the same MAC route is active via a type-2 advertisement, then the sequence number is incremented by one, and the MAC route is advertised to the remote peers. The original advertising VTEP, receives the MAC route with a now higher sequence number and withdraws its own local MAC route. All other VTEPs flush the original MAC route, and update their tables with the new higher sequence number route.

18.2.4 MAC Address Damping

In addition to MAC mobility, EVPN defines a protection mechanism to detect and prevent MAC routes flapping between VTEPs, which can occur during network instability or when hosts have been mis-configured with the same (duplicate) MAC address.

On advertising a locally learned MAC, the VTEP will start a M second counter (default is 180s), if the VTEP detects N MAC moves (default is 5) for the route within the M second window, it will generate a syslog message and stop sending and processing any further updates for the route.

18.2.5 Broadcast and Multicast Traffic

Broadcast, Unknown unicast and Multicast (BUM) traffic is handled within the EVPN forwarding model using ingress replication. Where the BUM frame is replicated on the ingress VTEP to each of the remote VTEPs in the associated EVI/VNI. The VTEP replication list for the EVI, is dynamically populated based on Type-3 route advertisements (Inclusive Multicast Ethernet Tag Route), where VTEPs advertise type-3 routes for each EVI they are members.

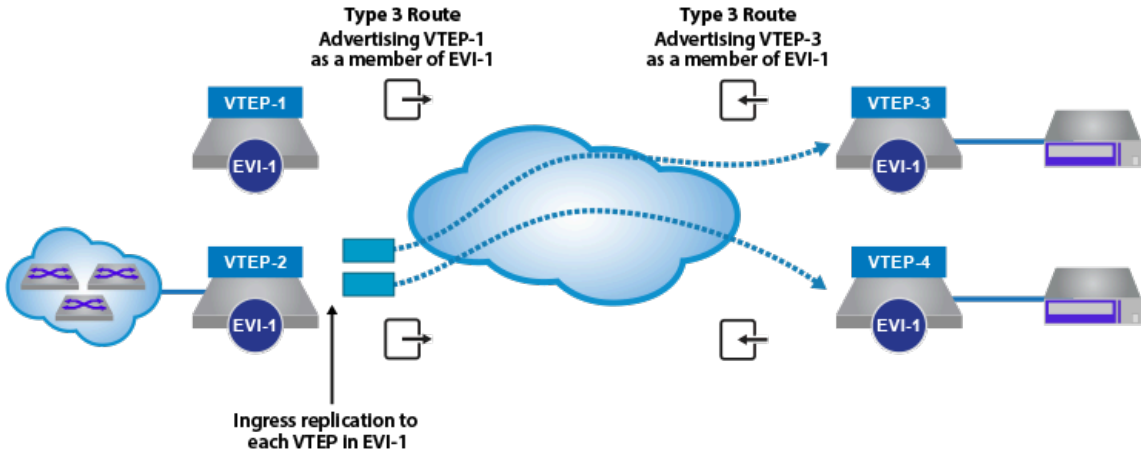

Figure 86: EVPN type-3 IMET Route Behavior for Ingress Replication

The format of the type-3 route is illustrated below.

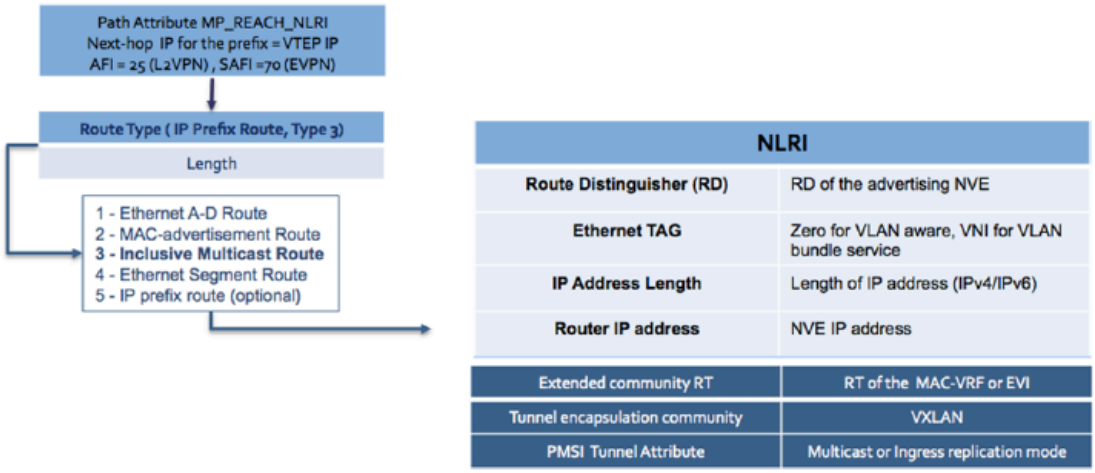

Figure 87: EVPN Type-3 IMET Route Format

Notable fields of the type-3 route:

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF.
- Ethernet tag that will be 0 for VLAN-based service, and the MAC-VRF VNI for a VLAN-aware bundle service.
- IP address of the VTEP advertising the type 3 route.
- Route Target associated with the MAC-VRF or the EVI in a VLAN-aware bundle service.
- PMSI Tunnel Attribute, to advertise the replication model the VTEP is supporting. The supported options defined within the standard are ingress replication and IP multicast.

18.3 Integrated Routing and Bridging

In traditional data center design, inter-subnet forwarding is provided by a centralized router, where traffic traverses across the network to a centralized routing node and back again to its final destination. In a large multi-tenant data center environment this operational model can lead to inefficient use of bandwidth and sub-optimal forwarding.

To provide a more optimal forwarding model and avoid traffic tromboning, the IETF draft Integrated Routing and Bridging in EVPN proposes integrating routing and bridging functionality directly onto the VTEP, thereby allowing the routing operation to occur as close to the end host as possible. The draft proposes two forwarding models for the Integrated Routing and Bridging (IRB) functionality, which are termed asymmetric IRB and symmetric IRB. These two models are described in the following sections.

In the asymmetric IRB model, the inter-subnet routing functionality is performed by the ingress VTEP, with the packet after the routing action being VXLAN bridged to the destination VTEP. The egress VTEP only then needs to remove the VXLAN header and forward the packet onto the local Layer 2 domain based on the VNI to VLAN mapping. In the return path, the routing functionality is reversed with the destination VTEP now performing the ingress routing and VXLAN bridging operation, hence the term asymmetric IRB.

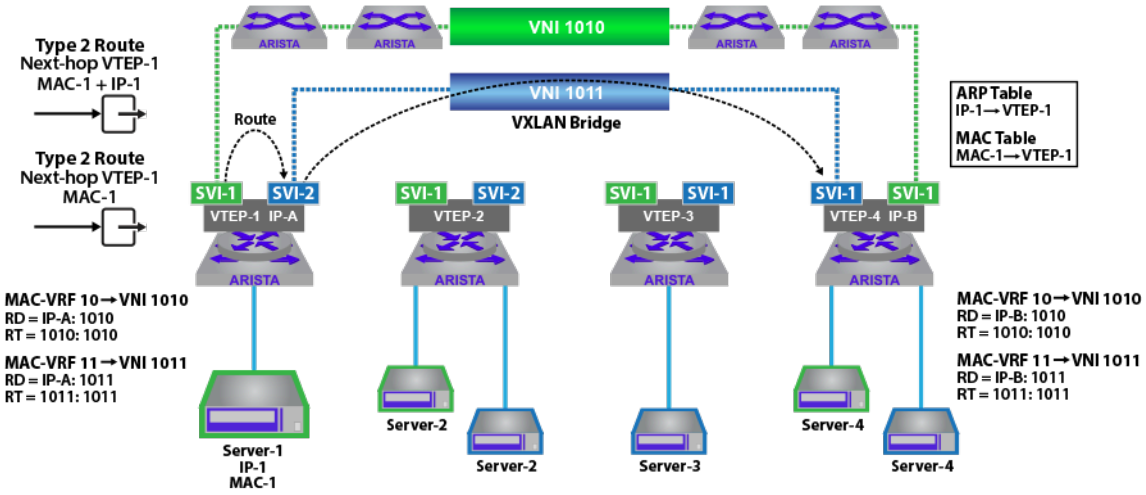

Figure 88: EVPN Asymmetric IRB

To provide inter-subnet routing on all VTEPs for all subnets, an anycast IP address is utilized for each subnet and configured on each VTEP. The anycast IP acts as the default gateway for the hosts, therefore regardless of where the host resides the directly attached VTEPs can act as the host's default gateway. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisement from remote VTEPs.

In a typical implementation, the optional MAC and IP, type-2 route is advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, for example the ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.

The format of the two advertised type-2 routes for Server-1 are illustrated below, where the ***RD IP-A:1010*** and route-target ***1010:1010*** are used to distinguish the uniqueness of the route and allow the route to be imported into the correct remote MAC-VRF based on the route-target import policy of the VTEP.

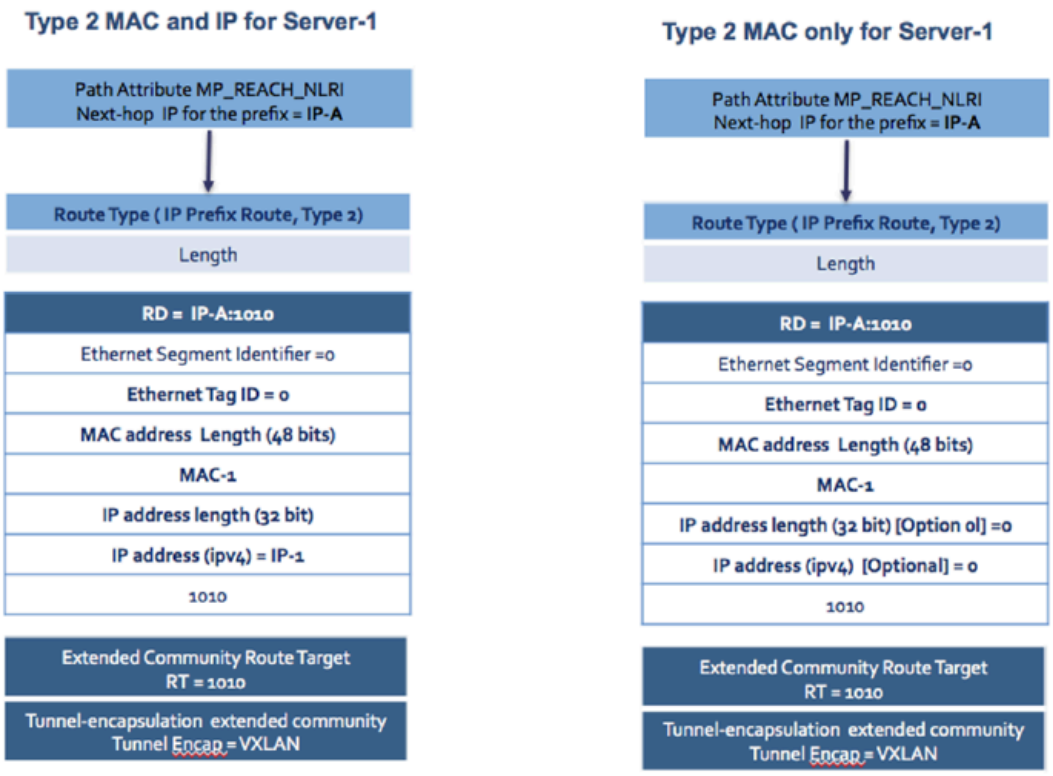

Figure 89: EVPN Comparison of MAC & MAC+IP Type 2 Route in Asymmetric IRB

For the traffic flow between ***Server-1*** in ***subnet-10*** and ***Server-4*** in ***subnet-11***, the ingress VTEP (***VTEP-1***) locally routes the packet into ***subnet-11/VNI 1011*** and then VXLAN bridges the frame, inserting the ***VNI 1011*** into the VXLAN header with an inner DMAC equal to the destination host, ***Server-4***. This requires the receiving VTEP, (***VTEP-4***) to only perform a local Layer 2 lookup, based on the VNI to VLAN mapping, for the DMAC of ***Server-4***.

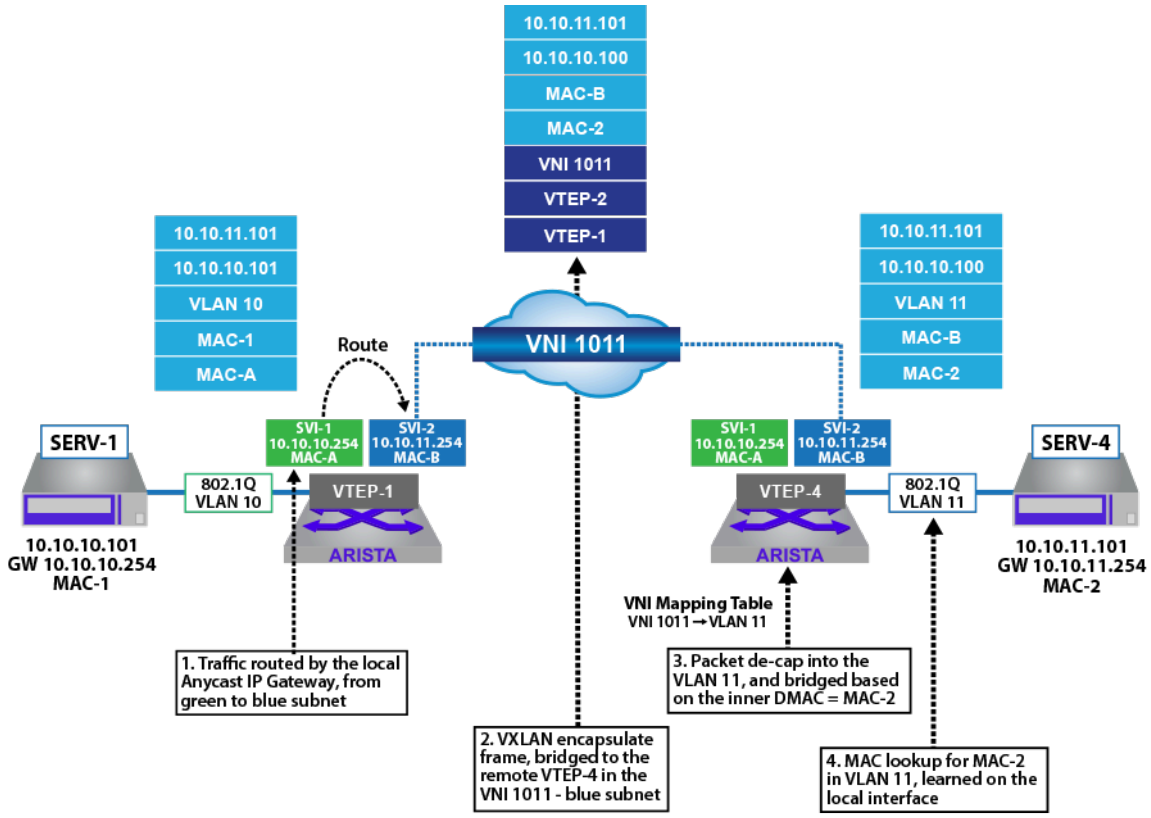

Figure 90: EVPN Asymmetric IRB VxLAN Data-plane Forwarding Detail

For the asymmetric model to operate the sending VTEP needs the information for all the tenant's hosts (MAC and MAC to IP binding), to route and bridge the packet. This means the VTEP needs to be member of all the tenant's subnets/VNI and have an associated SVI with anycast IP for all the subnets, and this will be required on all VTEPs participating in the routing functionality for the tenant. This introduces scaling issues on multiple fronts.

- **VNI Scaling**: The number of VNIs supported on a hardware VTEP will be finite, so not all VNIs can reside on all VTEPs. This is especially true in data-center deployments, where the TOR's have traditionally been more resource constrained than chassis-based edge systems.
- **Forwarding memory scaling**: The VTEPs needs to store all host MACs and ARP entries for all subnets in the network, on leaf switch this is hardware resource which again will be a finite resource defined by the specific hardware platform deployed at the leaf.

Symmetric IRB

To address the scale issues of the asymmetric model, in the symmetric model the VTEP is only configured with the subnets that are present on the directly attached hosts. Connectivity to non-local subnets on a remote VTEP is achieved through an intermediate IP-VRF. The subsequent forwarding model for symmetric IRB is illustrated in the figure below, for traffic between ***Server-1*** on ***subnet-10*** (Green) and ***Server-4*** on the remote ***subnet-11*** (Blue). In this model, the ingress VTEP routes the traffic between the local ***subnet-10***) and the IP-VRF, which both VTEPs are a member of, the egress VTEP then routes the frame from the IP-VRF to the destination subnet. The forwarding model results in both VTEPs performing a routing function, hence the term symmetric IRB.

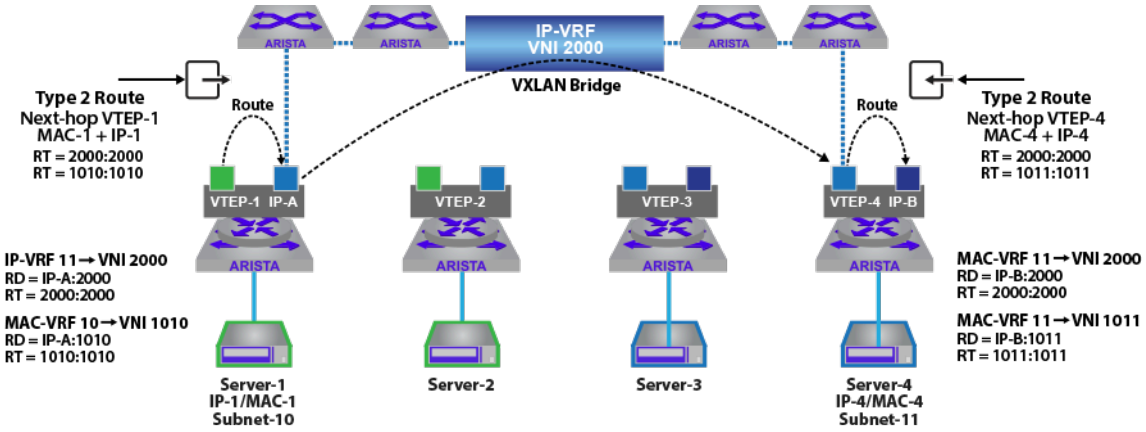

Figure 91: EVPN Symmetric IRB

To provide the inter-subnet routing, when the subnet is stretched across multiple VTEPs, an anycast IP address is utilized for each subnet, but only configured on the VTEP's where the subnet exists. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisements.

For the symmetric IRB model the type-2 (MAC and IP) route is advertised with two labels and two route-targets corresponding to the MAC-VRF the MAC address is learned on and the IP-VRF. Remote VTEP's receiving the route, import the IP host route into the corresponding IP-VRF based on the IP-VRF route-target and if the corresponding MAC-VRF exists on the VTEP the MAC address is imported into the local MAC-VRF based on the MAC-VRF's Route-Target. The import behavior for the type-2 route is illustrated in the diagrams below for the host Server-1.

If the MAC-VRF exists locally on the receiving router, both the IP host route will be installed in the IP-VRF, and the MAC address will be installed in the MAC-VRF. With both a MAC route in the MAC-VRF and an IP host route in the IP-VRF, the VNI used in the data-path will depend on whether the traffic is being VXLAN bridged between hosts in the same VNI (***1010***) or VXLAN routed (***VNI 2000***).

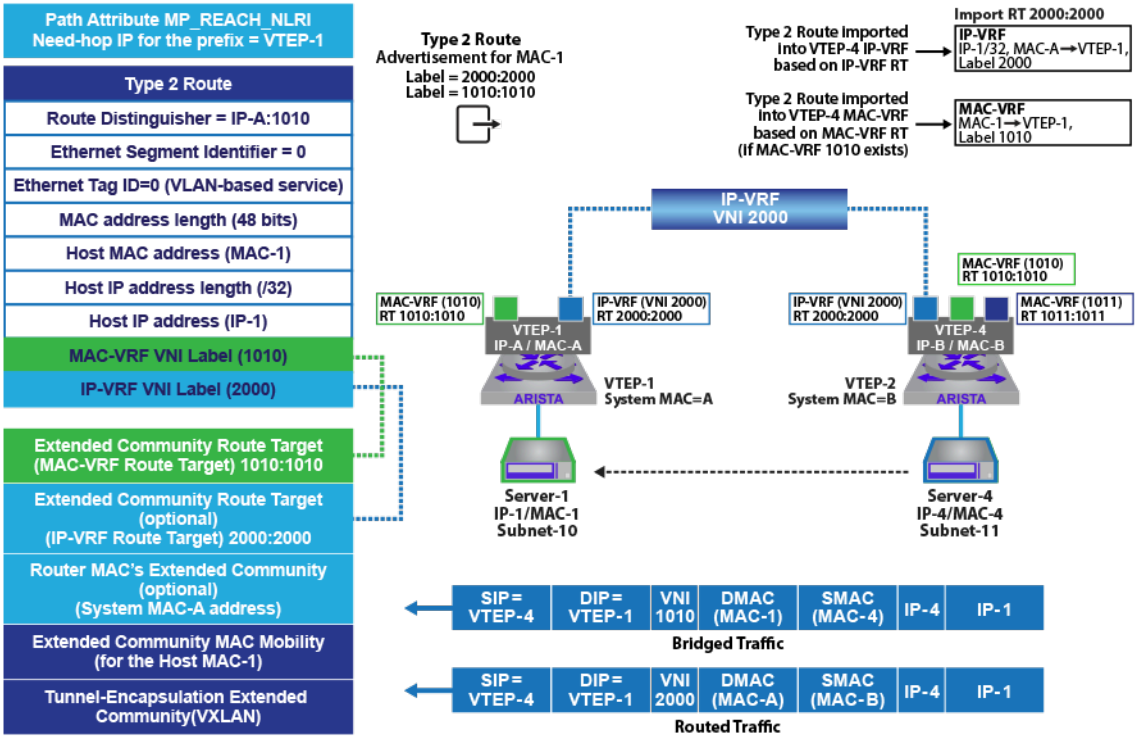

Figure 92: EVPN Type 2 Route in Symmetric IRB - MAC-VRF on Both VTEPs

Compare this to the figure below, where the MAC-VRF does not exist on the receiving VTEP (***VTEP-2***). In this case the MAC route is not installed and ignored, as there is no corresponding Route Target on the VTEP. In this scenario, only the IP-VRF host route is installed on ***VTEP-2***. Traffic from ***VTEP-2*** destined to hosts on ***subnet-10***, are therefore always VXLAN routed via the IP-VRF, ***VNI 2000***.

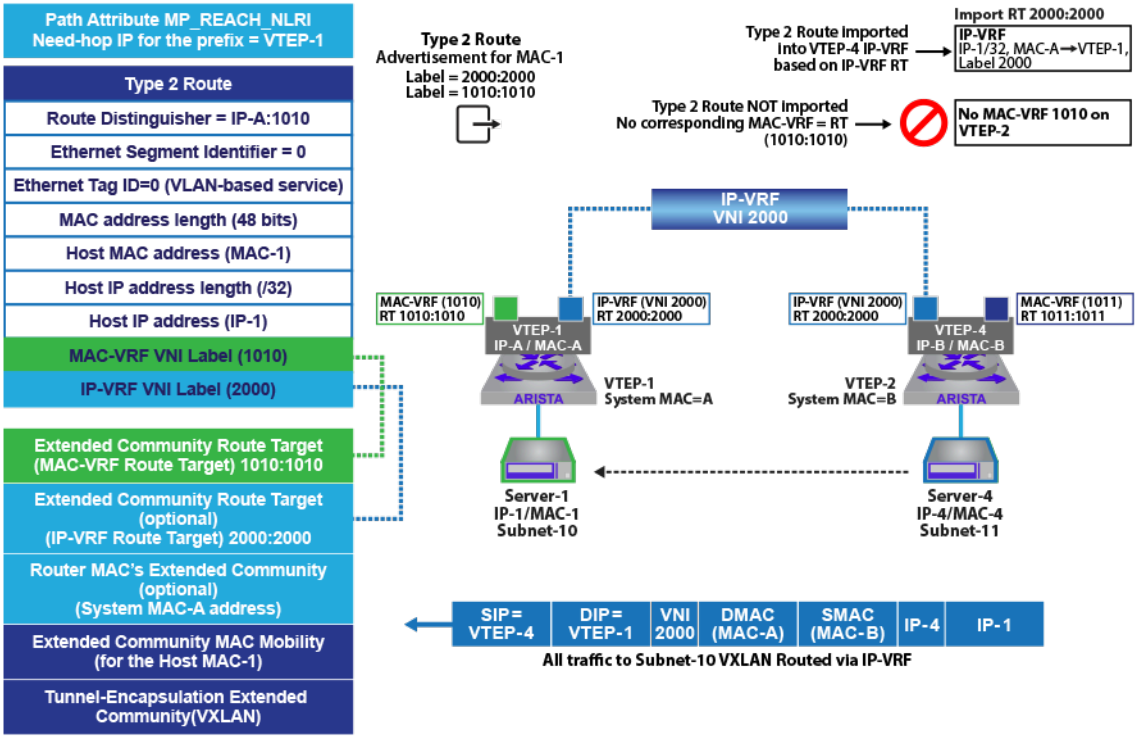

Figure 93: EVPN Type 2 Route in Symmetric IRB - MAC-VRF Only Exists on Sending VTEP

The symmetric IRB type-2 route contains a number of additional extended community attributes over the asymmetric IRB type-2 route, the salient fields of the route are summarized below.

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF. For ***Server-1*** in the example above this would be ***IPA:1010***.
- MAC address field contains the 48-bit MAC address of the host being advertised. For ***Server-1*** in the example above this would be ***MAC-1***.
- IP address and length field contain the IP address and 32-bit mask for the host being advertised. For ***Server-1*** in the example above this would be ***IP-1***.
- MAC-VRF label, this contains the VNI number (label) corresponding to the local Layer 2 domain/ MAC-VRF the host MAC was learned on. For ***Server-1*** in the example above this would be ***VNI 1010***.
- IP-VRF label, this contains the VNI number (label) corresponding to the MAC-VRF's associated IP-VRF. For ***MAC-VRF 10*** in the example above this would be ***IP-VRF 2000***.
- Extended community Route Target for the IP-VRF. This contains the route-target of the IP-VRF associated with the learned MAC address.
- Extended community Router MAC. This field advertises the system MAC of the advertising VTEP and is used as the DMAC for any packet sent to the VTEP via the IP-VRF.
- Extended community Route Target for the MAC-VRF. This contains the route-target of the MAC-VRF associated with the learned MAC address.

18.3.1 IP VPN

RFC 4364 allows Service Providers and Enterprises to use their backbone infrastructure to provide the services to multiple customers, or internal departments; while performing the following functions:

- Maintaining privacy.

- Allowing for IP address overlap amongst customers.
- Constraining route distribution - so that only the service provider routers which need the routes have them.

This is achieved through the usage of VRFs, Route Distinguishers and Route-Targets

The IPv4/IPv6 VPN Standard RFC 4364 does the following:

- Specifics an BGP IPv4 VPN control plane with a MPLS data plane.
- BGP control plane, new address family to advertise IP VPN prefixes.
- This RFC obsoleted the original ***RFC 2547***.
- MPLS data-plane defined in multiple RFCs and drafts.

The RED circle in the figure below highlights the main Drafts and RFCs in use today for an MPLS data-plane.

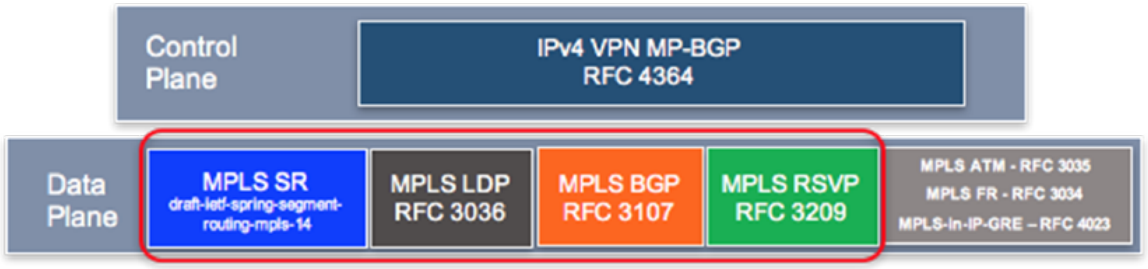

Figure 94: MPLS Data-Plane

IPv4 VPN and IPv6 VPN are an extensions of the BGP protocol introducing new address families: IPv4 (address family number ***1***), IPv6 (address family number ***2***), and a subsequent address family number ***128***: MPLS Layer 3 VPN unicast. It is used to exchange overlay IP prefix reachability information between MP-BGP peers.

Figure 95: IPv4 VPN and IPv6 VPN

IPv4 VPN defines two route types:

- Update
- Withdrawal

Each route type has its own NLRI prefix format and ach route type advertises its own set of prefixes to update/withdraw.

The format of the IPv4 VPN prefix update route is illustrated in the following figure. As detailed, the update route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the MPLS Label, along with a number of path attributes (where the RT extended communities are defined), which are associated with these IPv4 NLRIs.

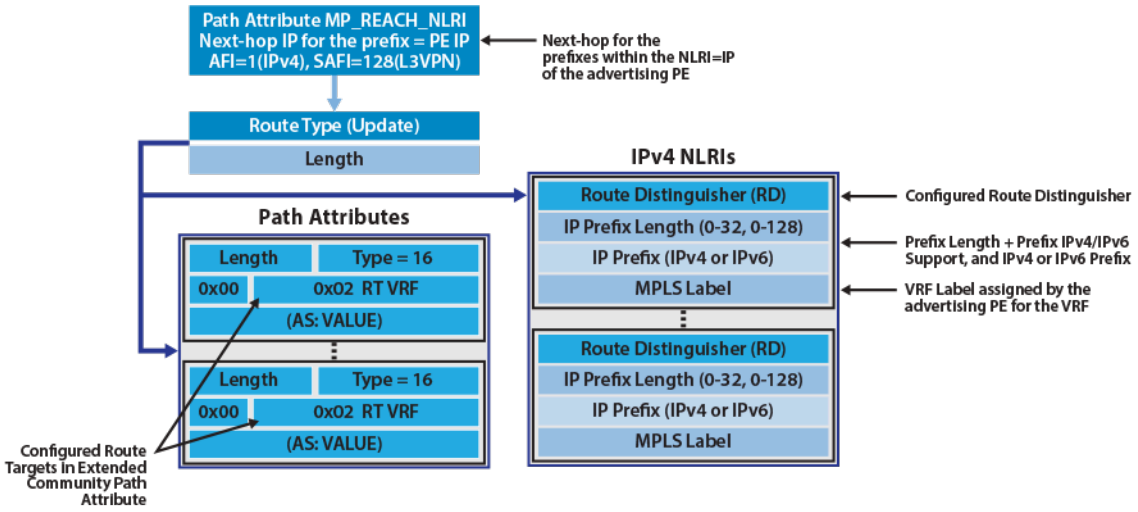

Figure 96: IPv4 and IPv6 VPN Update Route Detail

The output in IPv4 VPN route as shown on PE, and the IPv6 VPN route as shown on PE offers a more detailed view of the route as displayed on a PE router.

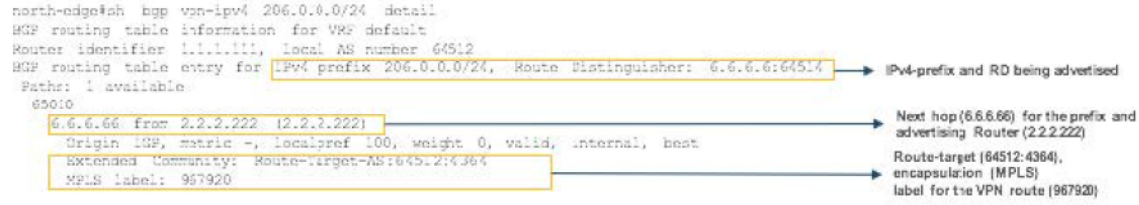

Figure 97: IPv4 VPN Route as Shown on PE

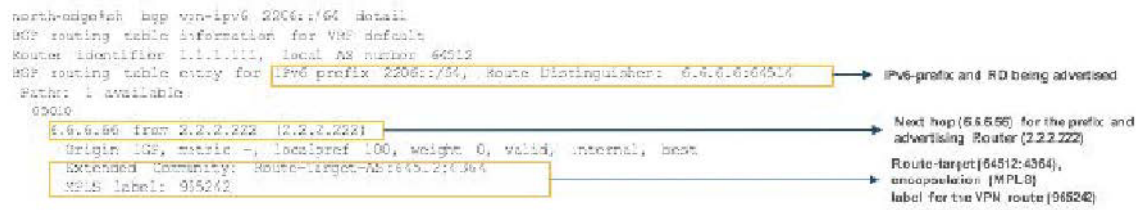

Figure 98: IPv6 VPN Route as Shown on PE

The following is an illustration of a basic MPLS Layer 3 VPN topology.

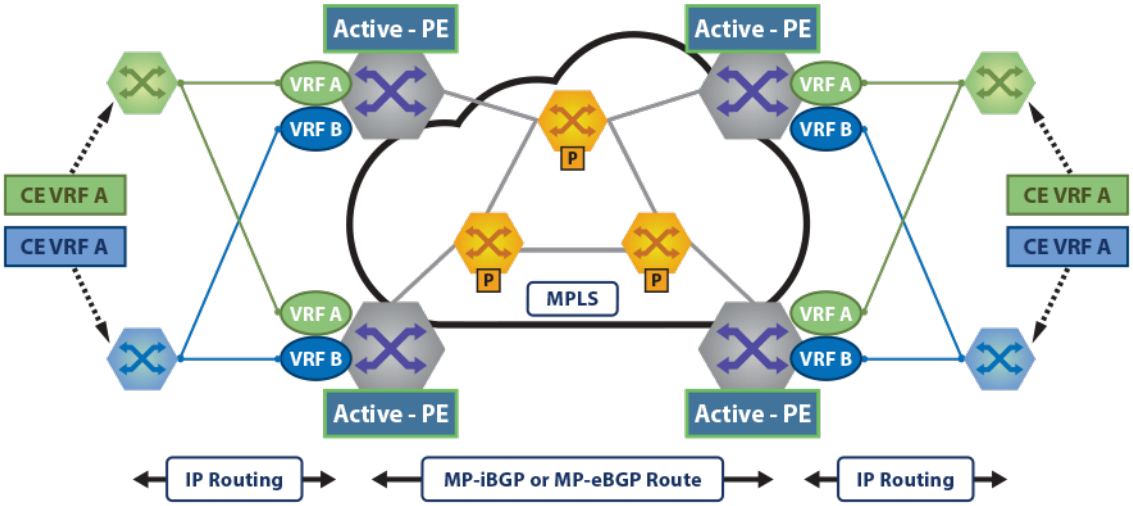

Figure 99: MPLS Layer 3 VPN Topology

An IP VRF is used on a PE router for each customer (Layer 3 overlay). VRF IP routes are exported into the MP-BGP table and advertised to remote PEs as VPN routes. The exported VPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the VPN routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IPv4 or IPv6 table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the VPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by a backbone.

Note: You require Release ***EOS 4.21.1F*** and later versions with Jericho/Jericho+ platforms.

18.4 VPN MPLS Transport Options

EVPN-MPLS and IP-VPN sample topologies illustrate co-existing LDP, BGP-SR, and ISIS-SR on the core.

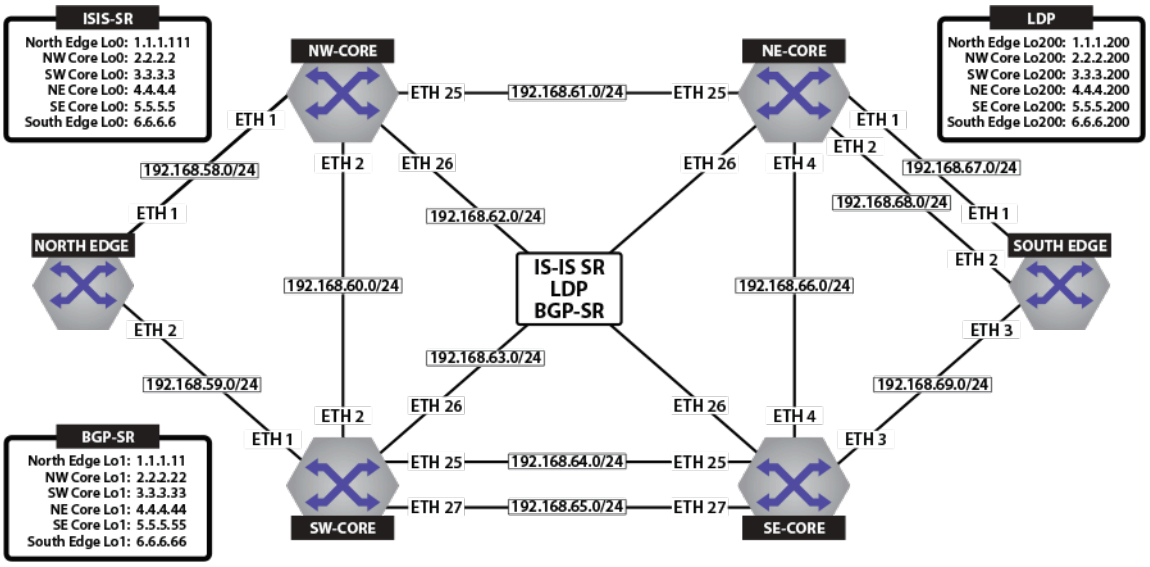

Figure 100: Physical Topology For ISIS-SR, LDP and BGP-SR Transport

LDP, ISIS-SR, and BGP-LU (BGP-SR) demonstrate the corresponding Label Switched Paths (LSPs) as the MPLS transport LSPs for Layer 3 EVPN and IP VPN services.

EVPN Sample Topology

In the figures below **Tenant-A DCI** and **Tenant-B DCI**, the prefixes from each DC are transported over the WAN/DCI domain, maintaining the Layer 3 multi-tenancy in tenant-a and tenant-b.

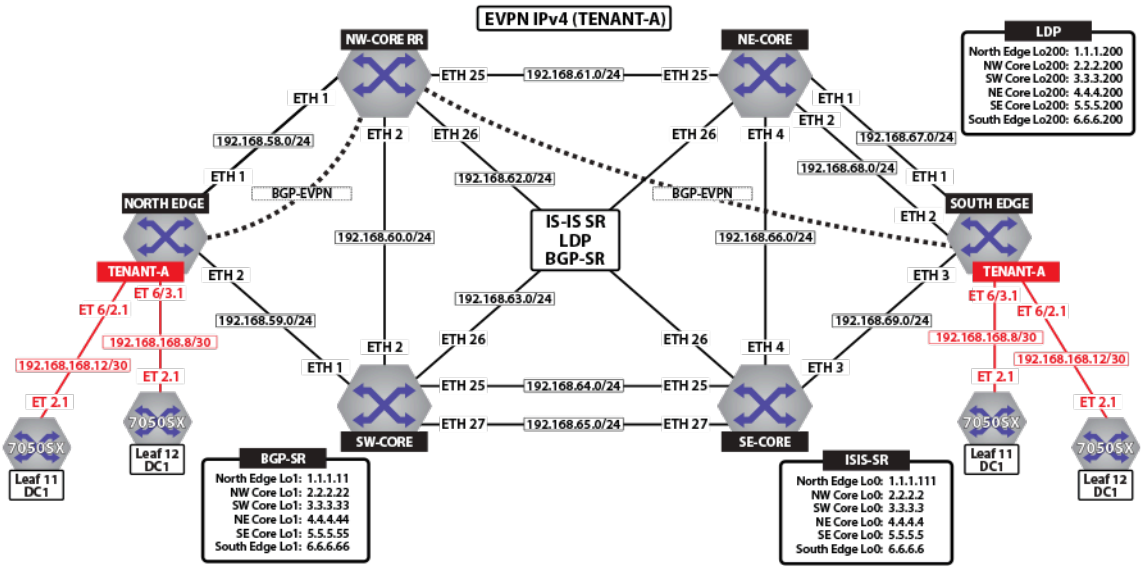

Figure 101: Tenant-A DCI

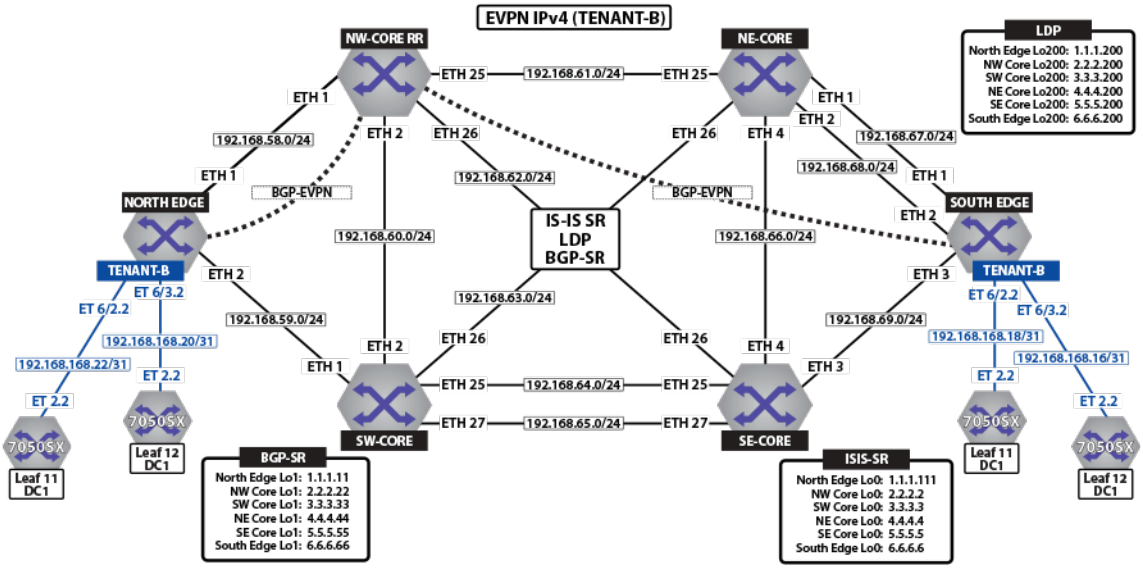

Figure 102: Tenant-B DCI

To provide external connectivity from the DC into the MPLS domain, leaf-11 and leaf-12 are eBGP peering via the tenants VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and ip-prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (leaf-21 and leaf-2) re-advertise the prefixes into the tenant's VRF via a type-5 route advertisement, with a next-hop equal to the advertising PE.

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the Provider Edge (PE) routers to identify a particular tenant.

EVPN MPLS Sample Configuration displays BGP route updates and how the tenant VRF is transported over these transport LSPs.

IP VPN Sample Topology

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the Provider Edge (PE) routers to identify a particular tenant.

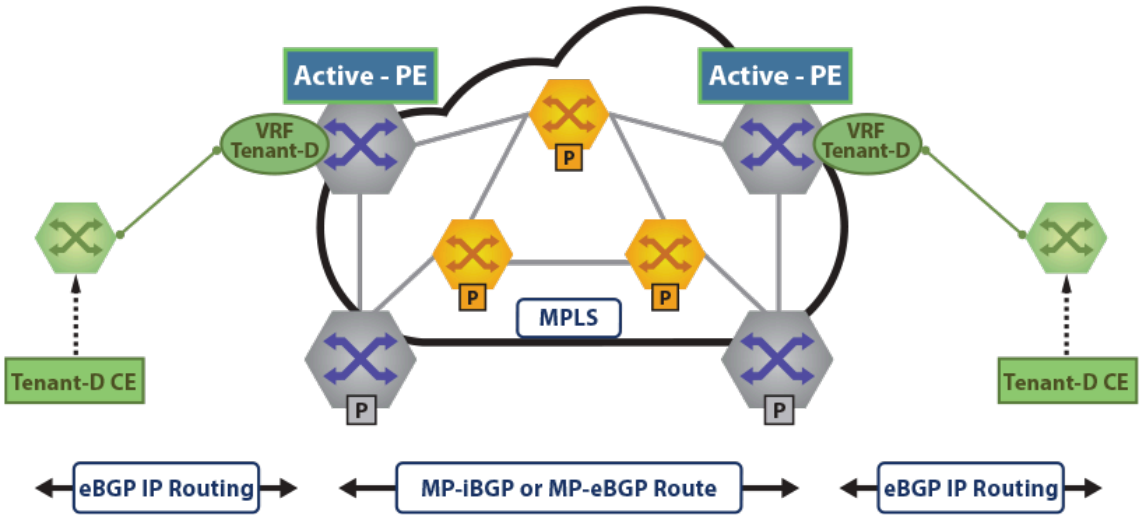

Figure 103: IPv4 & IPv6 VPN Sample Topology

In the figures **Tenant-D IPv4 VPN** and **Tenant-D IPv6 VPN**, the prefixes for VRF tenant-d are transported over the MPLS WAN between North Edge and South Edge routers.

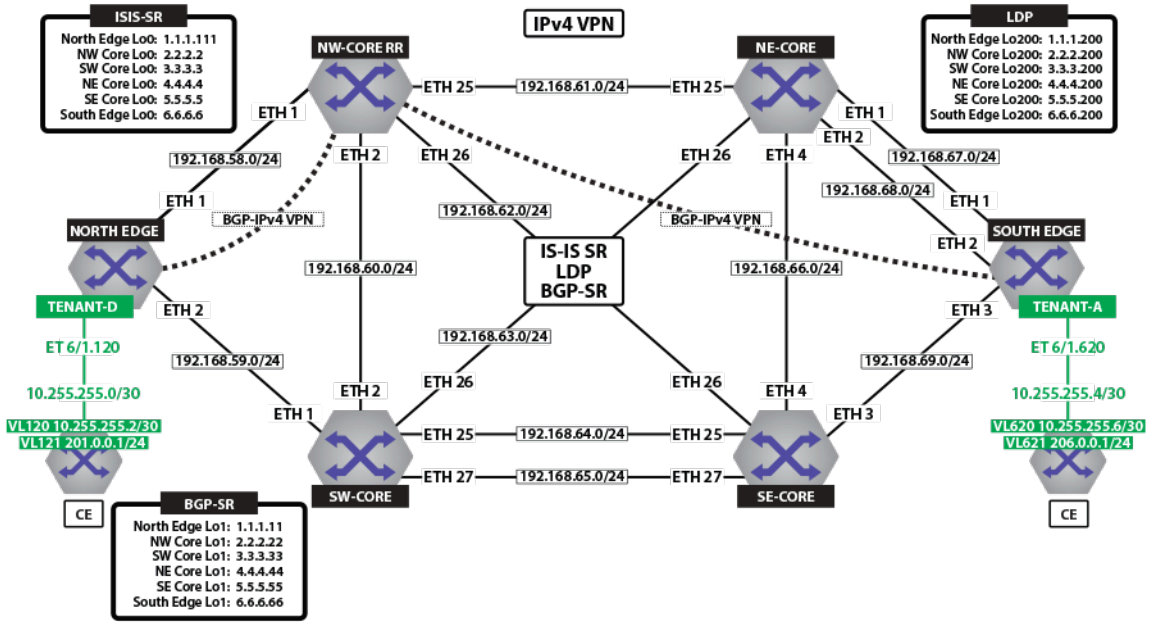

Figure 104: Tenant-D IPv4 VPN

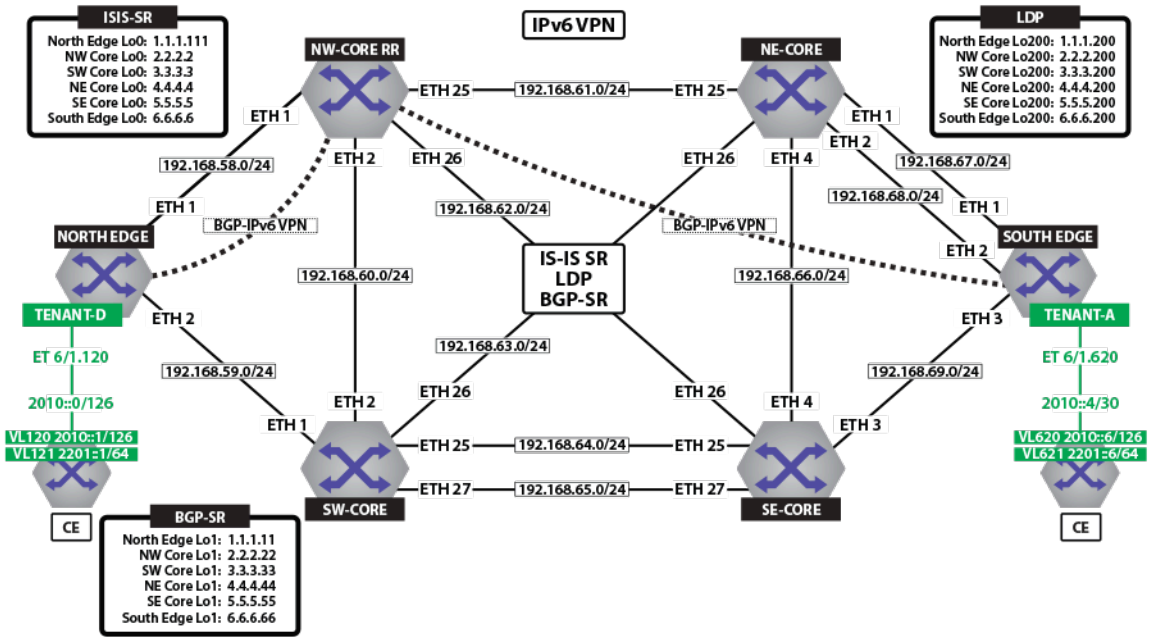

Figure 105: Tenant-D IPv6 VPN

18.4.1 LDP

The figure below illustrates how LDP neighbor relationships are built. First each router sends a discovery to a destination multicast address (TTL=1) ***224.0.0.2*** on ***port 646***. This discovery contains the router-id and the transport IPv4 address the router wants to use. The second stage is building the TCP peering session using the transport IP addresses specified. This is normally loopback to loopback.

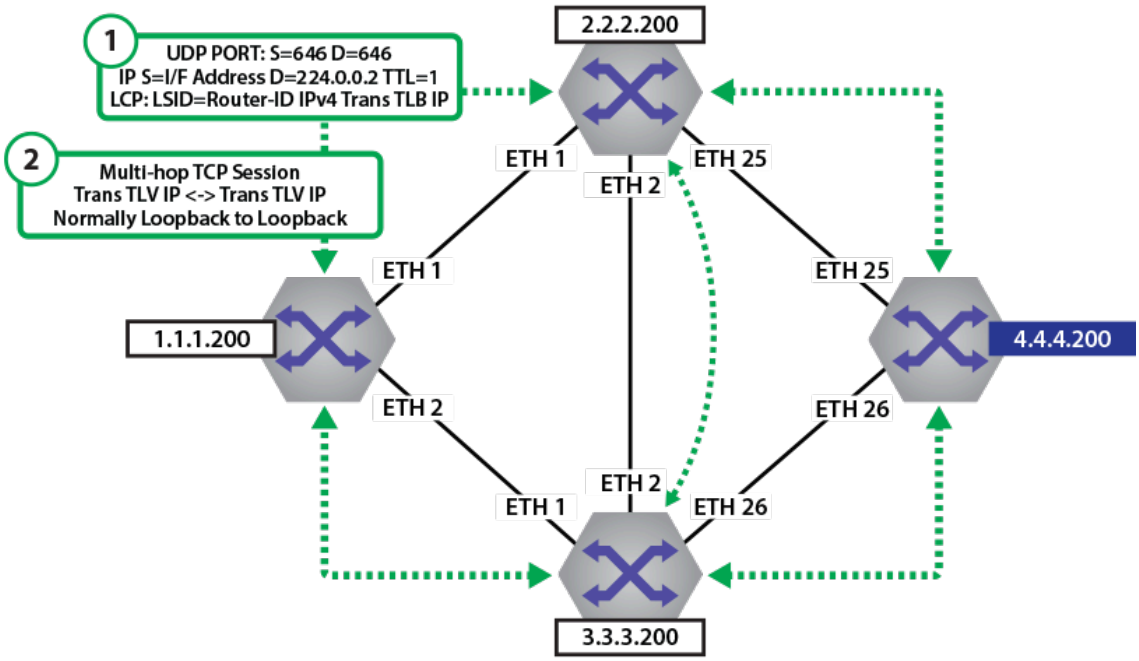

Figure 106: LDP Peering Establishment

Examples

- The **show mpls ldp neighbor** command on the North Edge router displays more detail on TCP session establishment, and the local addresses of the LDP neighbor for which it is binding a label.

  Note: All connected interfaces are advertised as bound. However, EOS currently advertised labels for /32 addresses, and FEC filter is configured to install only x.x.x.200/32 prefixes.

```
North Edge.17:51:17# show mpls ldp neighbor
Peer LDP ID: 2.2.2.200:0; Local LDP ID: 1.1.1.200:0
   TCP Connection: 2.2.2.200:38395 - 1.1.1.200:646

                    interface Ethernet2/1
```

18.4.2 ISIS-SR

The figure below illustrates how ISIS-SR distributes the SID index information in the ISIS TLVs and sub-TLVs

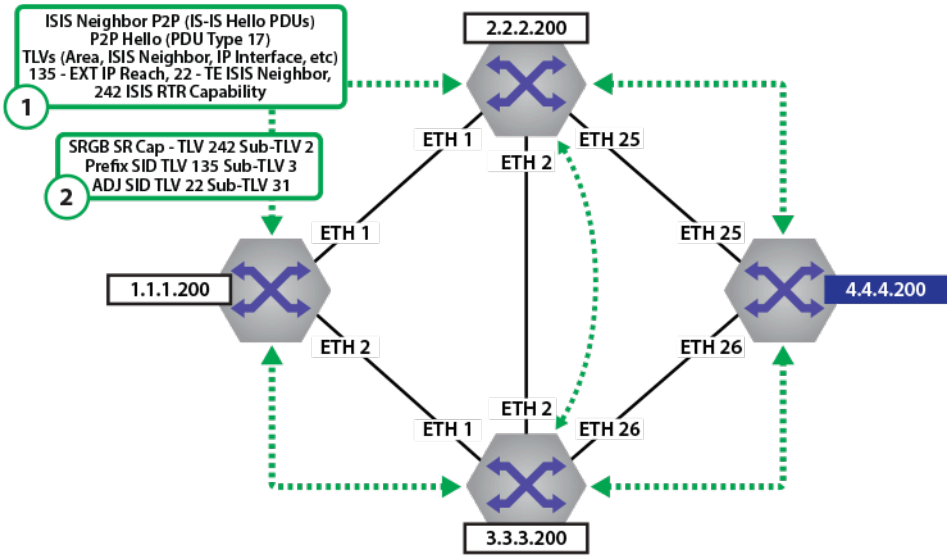

Figure 107: ISIS Neighbor Adj and TLVs

The Prefix SID index, SRGB, and ADJ SID values are populated in the sub-TLVs in the ISIS neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels) and locally assigned ADJ labels.

Examples

- The **`show isis neighbors detail`** command on the North Edge router displays the detailed information of all ISIS neighbors.

```
north-edge# show isis neighbors detail

18.4.3 BGP-LU (BGP-SR)

BGP-LU Label Distribution illustrates how BGP-LU distributes the label information in BGP.

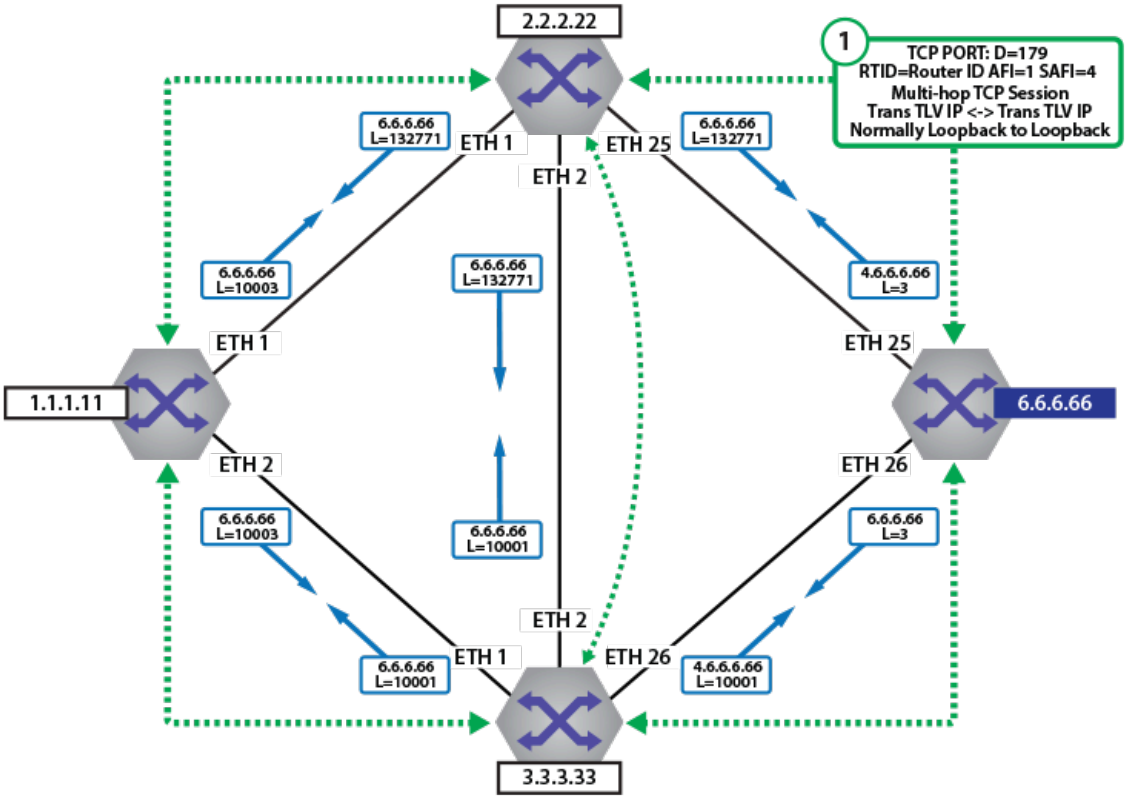

Figure 108: BGP-LU Label Distribution

BGP-SR Index and SRGB Distribution illustrates how BGP-LU distributes the Label SRGB and SID index information in BGP. This is known as BGP-SR.

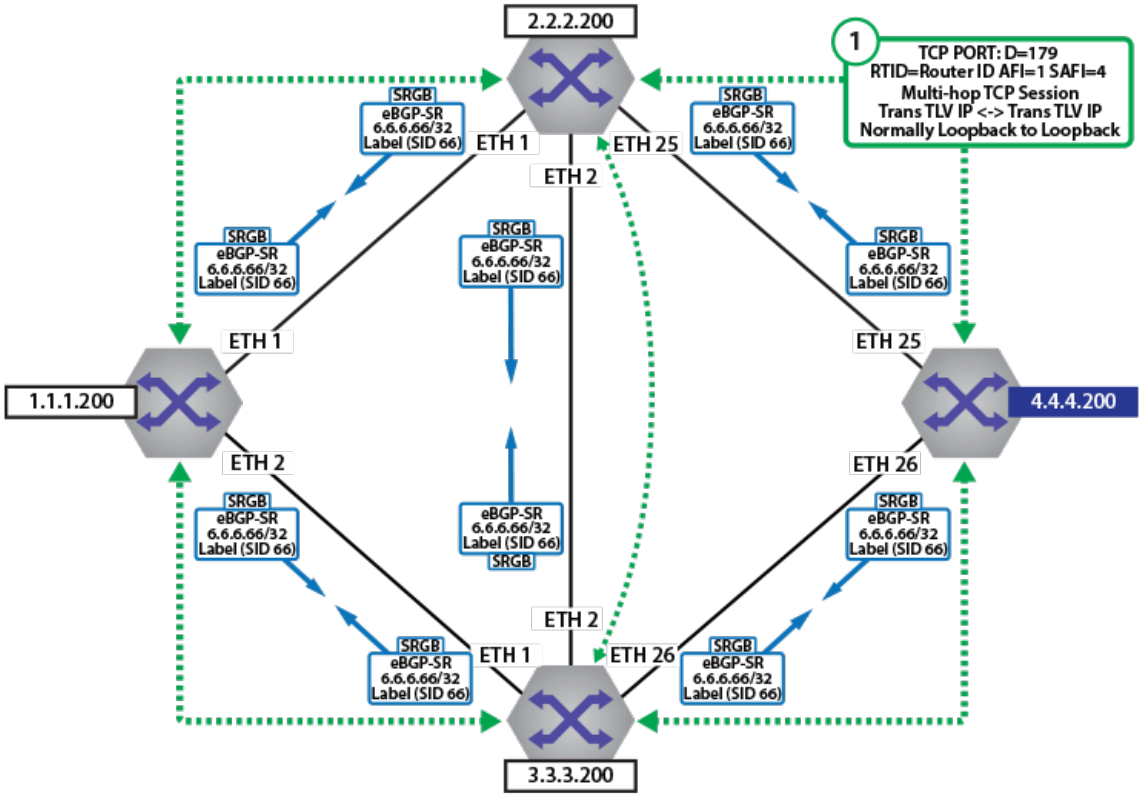

Figure 109: BGP-SR Index and SRGB Distribution

The Prefix SID index, and SRGB values are populated in the TLVs in the BGP neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels).

Examples

- The **`show bgp neighbor`** command displays BGP-SR neighbors.

```
north-edge# show bgp neighbor | include BGP neighbor|Multiprotocol IPv4
 MplsLabel

BGP neighbor is 192.168.2.10, remote AS 64512, internal link
    Multiprotocol IPv4 MplsLabel: received
BGP neighbor is 192.168.3.9, remote AS 64512, internal link
    Multiprotocol IPv4 MplsLabel: advertised and received and
 negotiated
BGP neighbor is 192.168.3.10, remote AS 64512, internal link
    Multiprotocol IPv4 MplsLabel: advertised
BGP neighbor is 192.168.58.12, remote AS 2, external link
    Multiprotocol IPv4 MplsLabel: advertised and received and
 negotiated
BGP neighbor is 192.168.59.12, remote AS 3, external link
```

- The **`show ip bgp labeled-unicast 6.6.6.66/32 detail`** command displays the detailed information of BGP labeled routes unicast with ***6.6.6.66/32***.

```
north-edge(config-if-Et2/1)# show ip bgp labeled-unicast 6.6.6.66/32
 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512

18.5 EVPN Type-5 Routes: IP Prefix Advertisement

The EVPN type 2 routes can be used to advertise IP prefixes by making use of the optional IP address and IP address length fields in the route, however they are explicitly linked to the MAC address advertised within the route. The EVPN type-5 route defined within the IETF draft, provides the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP address, optimize the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The figure below displays the format of the new type-5 IP-prefix route.

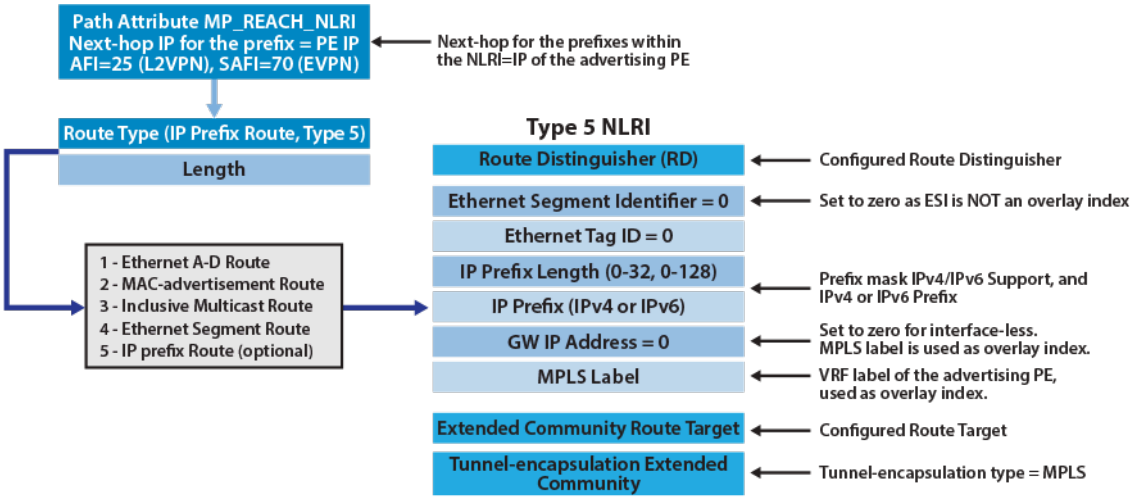

Figure 110: EVPN Route Type-5, for Advertisement of IP Prefixes

The IP prefix draft defines a number of specific use cases for the type-5 route, which consequently affect the format and content of the fields within the route. The different deployment scenarios and use cases defined within the draft are summarized below.

- Advertising of IP prefixes behind an appliance, when the appliance is not running a routing protocol and only supporting static routes. This could be the typical use case for a Virtual Firewall with a number of local subnets directly attached, but the firewall is only supporting static routes into the associated EVI.
- Support for active-standby deployment of appliances using a shared floating IP model. This is an extension of the previous case where there is now a virtual IP (or VIP) for clustering the appliances, rather than a dedicated physical IP address on the appliance.
- Support for Layer 2 appliances, acting as a “bump in the wire” with no physical IP addresses configured, where instead of the appliances having an IP next-hop there is only a MAC next-hop.
- IP-VRF to IP-VRF model, which is similar to inter-subnet forwarding for host routes (detailed in the symmetric/asymmetric section), except only Type-5 routes and IP prefixes are advertised,

allowing announcement of IP prefixes into a tenant's EVI domain for external connectivity outside the domain.

Interface-less

In interface-less mode, the IP prefixes within the type-5 route, whether they are local or learned from a connected router are advertised to remote peers via the shared IP-VRF, as illustrated in the figure below.The IP-VRF to IP-VRF model, is further divided in the draft into three distinct use cases.

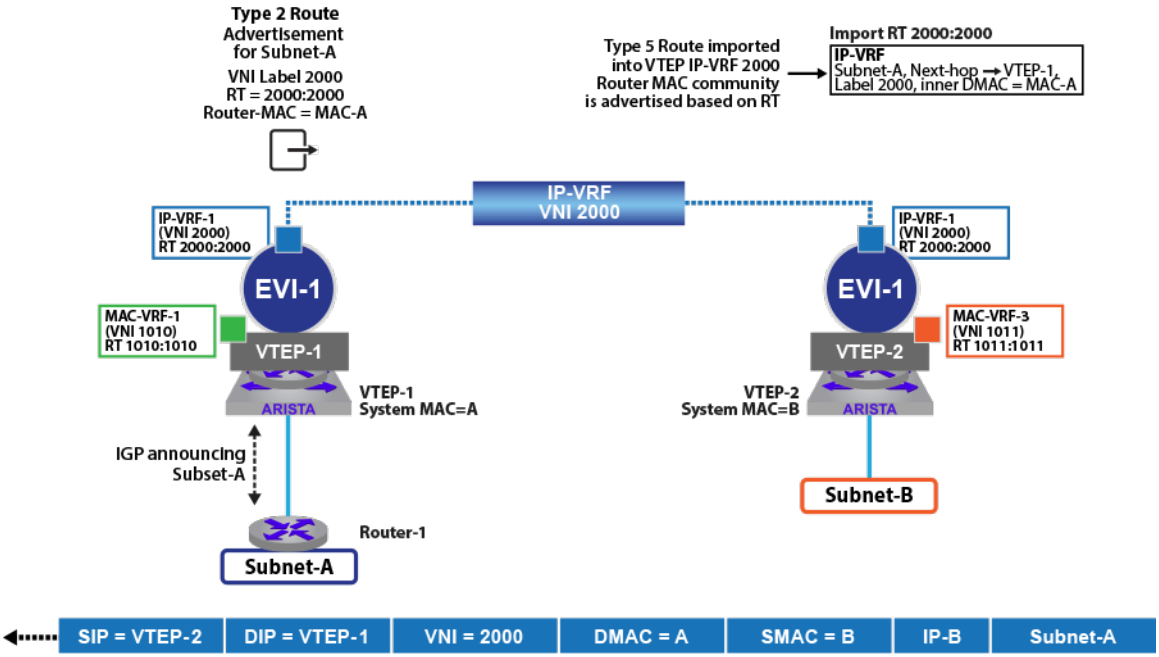

Figure 111: EVPN Route Type-5, Interface-less Update

As illustrated above, the IP prefix (***subnet-A***) residing behind the router (***Rtr-1***) is learned via an IGP in EVI-1 on VTEP-1. The prefix is announced and learned by the remote VTEPs residing in the same EVI, via the type-5 route announcement. The type-5 route, is advertised along with the prefix, with a route-target (***2000:2000***) and a VNI label (***2000***) equal to the IP-VRF which interconnects the VTEPs in the EVI, the router-mac extended community of the route is used to define the inner DMAC (equal to system MAC of ***VTEP-1***) for any VXLAN frame destined to advertised IP prefix.

From a forwarding perspective, host residing on ***subnet-B*** communicating with a host on ***subnet-A***, will send traffic to their default gateway which is the IRB interface on ***VTEP-2*** in ***VLAN 11/VNI 1011***. ***VTEP-2*** performs a route lookup for the destination ***subnet-A***), which has been learned in the IP-VRF with a next-hop of ***VTEP-1*** and VNI label of ***2000***. The packet is thus VXLAN encapsulated with VNI label of ***2000*** an inner DMAC of A (***VTEP-1*** system/router MAC), and routed to ***VTEP-1***, which is the next-hop for the prefix. Receiving the frame, ***VTEP-1*** de-encapsulates the packet, with an inner DMAC of the VTEPs router MAC, it performs a local route lookup for the destination ***subnet-A***), which has been learned with a next-hop of ***rtr-1***. The frame is forwarded directly to ***rtr-1***, which subsequently routes the packet to the local host on subnet-A. The format of the type-5 route in interface-less mode is illustrated in figure below.

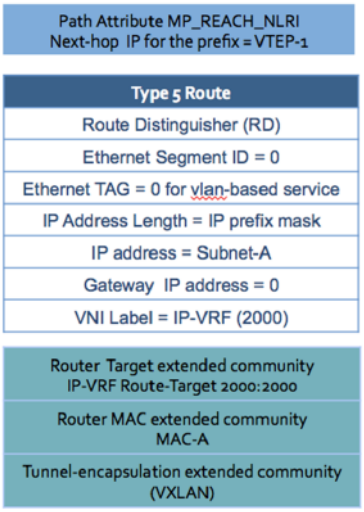

Figure 112: EVPN Type-5 Route Format for Interface-less Mode

In this model, the VTEPs forming the EVI are interconnected via an IP-VRF, meaning there is no IRB interface (MAC and IP) created for the interconnection on each of the VTEPs, hence the term “interface-less”. With no IRB interface the gateway IP address within the type-5 route is set to ***0***, traffic is routed to the prefix based on the next-hop of the route (VTEP IP) as well as MAC address conveyed within the Router MAC extended community, which represents the inner destination MAC of the VXLAN encapsulated frame.

18.6 BGP PIC Edge for EVPN VXLAN Routes for Remote VTEP Failures

When a remote VTEP goes down, this would require action by the IGP and BGP to recompute a new best path traffic destined to affected BGP prefixes originally reachable by the problematic VTEP. Currently, the BGP PIC is restricted to locally identifiable failures such as link failures.

To overcome such VTEP failure issues the above feature introduces support for EVPN learned VTEPs to improve convergence times in these scenarios by tying the liveness detection provided by the BFD sessions into existing BGP PIC support for software fast-failover. Without this feature, until the underlay route providing reachability to the problematic VTEP is removed from the FIB the overlay route could still forward traffic towards this VTEP. Once the underlay route is eventually removed the adjacency would be updated in place to avoid per-prefix updates so that any overlay routes containing the path to this VTEP would be corrected. However with this feature, upon detecting that a BFD session to a remote VTEP has gone down the hardware forwarding agents will update the affected adjacencies before the corresponding underlay route has been removed from the FIB which can improve convergence times.

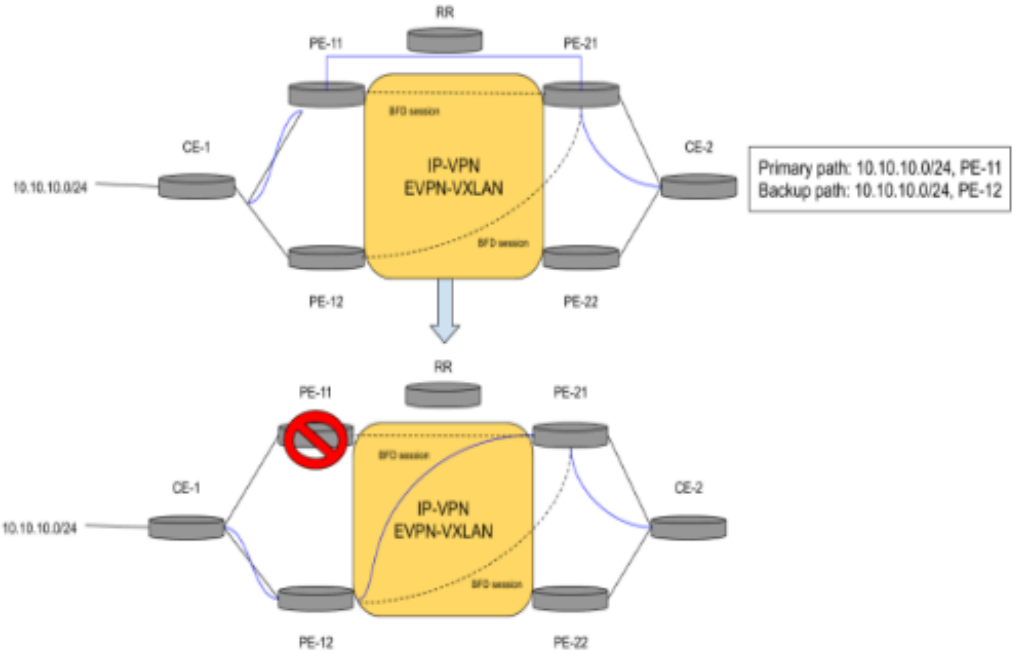

Figure 113: BGP PIC Edge for VXLAN

The above diagram outlines a scenario in which ***CE-2*** is sending traffic bound for ***10.10.10.0/24*** via ***PE-12*** to ***PE-11*** to ***CE-1***. ***PE-11*** goes down, however we have BFD sessions from ***PE-21*** to the remote VTEPs of ***PE-11*** and ***PE-12*** and therefore detect that it goes down and quickly update the forwarding to send the traffic along the pre-computed backup path via ***PE-12*** to ***CE-1***.

18.6.1 Configuring BGP PIC Edge for EVPN VXLAN Routes for Remote VTEP Failures

Use the **`bfd vtep evpn`** command to configure the BGP PIC Edge for EVPN VXLAN routes for remote VTEPs. This command is configured under the VXLAN Tunnel Interface (VTI).

```
switch# config
switch(config)# interface Vxlan1
switch(config-if-Vx1)# bfd vtep evpn interval <interval> min-rx <min-rx>
 multiplier <multiplier>
```

This configuration uses the specified timer values to initiate BFD sessions for all VTEPs learned through EVPN VXLAN for this VTI.

- interval – Transmit rate in milliseconds
- min-rx – Expected minimum incoming rate in milliseconds
- multiplier – BFD multiplier

Example

```
switch(config-if-Vx1)# bfd vtep evpn interval 100 min-rx 100 multiplier 3
```

In this example (assuming symmetric configuration on other PE devices) any BFD for VXLAN session initiated on the VTI would have a detect time of ***300ms*** (interval of 100ms multiplied by 3).

To utilize these BFD sessions, there must also be an alternate path traffic can take in the event that the session goes down. This would include other paths in an ECMP group or a backup path.

As mentioned, by default the above configuration will initiate BFD sessions for all VTEPs learned through EVPN VXLAN for the VTI.

```
switch# config
switch(config)# interface Vxlan1
switch(config-if-Vx1)# bfd vtep evpn prefix-list <PREFIX-LIST>
```

This command uses a supplied prefix list to filter and select the candidate VTEPs. By default, an empty prefix list will act as a deny-all and not initiate BFD sessions with any learned VTEPs.

18.6.2 Show Commands

The existing **show interface <VTI>** command is used to view whether BFD is enabled on the VTI and to see the timers used for any of the BFD sessions or any prefix-list configured for filtering BFD sessions.

```
switch# show interface Vxlan1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback0 and is active with 10.1.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning is disabled
  VNI mapping to VLANs
  Static VLAN to VNI mapping is
  Dynamic VLAN to VNI mapping for 'evpn' is
    [4092, 30000]     [4093, 20000]
  Dynamic VLAN to VNI mapping for 'vccbfd' is
    [4091, 0]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
        Use 'show vxlan vni' for details.
  Static VRF to VNI mapping is
   [vrf0, 20000]
  MLAG Shared Router MAC is 0000.0000.0000
  BFD is enabled with transmit interval 50, receive interval 50,
 multiplier 3, VTEP prefix list pl-example
```

The existing **show bfd peers** command is used to view the state of the BFD for VXLAN sessions.

```
switch# show bfd peers
VRF name: default
-----------------
DstAddr    MyDisc       YourDisc    Interface/Transport    Type        LastUp           LastDown
 LastDiag       State
-------- ----------  ------------ ---------------------- ---------  --------------  ------------
 -------------- -----------
10.1.1.2   1965370229   3607849318                 NA       VXLAN    01/12/21 10:45          NA       No
 Diagnostic       Up
10.1.1.3   1355343148   2407539267                 NA       VXLAN    01/12/21 10:45          NA       No
 Diagnostic       Up
```

The **show ip route <VRF>** command can be used to determine which prefixes are eligible for fast-failover.

```
switch# show ip route vrf example-vrf

VRF: example-vrf
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked,
```

```
       RC - Route Cache Route

Gateway of last resort is not set

 C        20.0.2.0/24 is directly connected, Ethernet14/1
 B E      99.99.0.0/24 [200/0] via VTEP 10.1.1.2 VNI 30000 router-mac fc:bd:67:3d:21:fd
                               via VTEP 10.1.1.3 VNI 30000 router-mac ba:ed:43:3f:ca:8e backup
```

In the above example there is a prefix with the primary path using a VXLAN tunnel to VTEP ***10.1.1.2*** and has a backup VXLAN tunnel to VTEP ***10.1.1.3***. Both paths are monitored via BFD.

In other use cases the prefix may have multiple paths with ECMP in which one or multiple of the paths are VXLAN tunnels to remote VTEPs monitored by these BFD for VXLAN sessions.

```
switch# show ip route vrf example-vrf

VRF: example-vrf
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked,
       RC - Route Cache Route

Gateway of last resort is not set

 C        20.0.2.0/24 is directly connected, Ethernet14/1
 B E      99.99.0.0/24 [200/0] via VTEP 10.1.1.2 VNI 30000 router-mac fc:bd:67:3d:24:fe
                               via VTEP 10.1.1.3 VNI 30000 router-mac ba:ed:43:3f:ca:8e
```

MLAG

This feature is applicable only to the scenario when remote prefix is known via two different MLAG VTEP pairs.

Prior to ***4.26.0F*** this feature is only supported on the primary switch of an MLAG pair due to use of Shared VTEP IP within MLAG pair as VXLAN tunnel source/destination. If BFD for VXLAN packets are received on the secondary MLAG switch, they will be forwarded to the primary MLAG switch for processing. Because only the primary MLAG switch will have BFD state for remote VTEPs, if a BFD session to a remote VTEP goes down only the primary MLAG switch will perform the fast-failover while the secondary MLAG switch will retain current behavior. Therefore it is not recommended to use this feature in conjunction with MLAG.

As of ***4.26.0F***, the primary MLAG switch will sync its BFD for VXLAN state to the secondary MLAG switch to allow the secondary to failover to an alternate path as well. To view the synced state, a new show command has been added.

```
switch# show bfd peers protocol vxlan mlag primary
Remote VTEPS for Vxlan1 on MLAG primary:
VTEP         BFD Status
-----------  ----------
10.1.1.2       up
10.1.1.3       up
```

However, because this state is synced across devices, the secondary MLAG switch will not be as performant in reacting to the BFD state transitions as the primary MLAG switch which is natively responding to the BFD session.

Another exception is the multi-VTEP MLAG feature, which allows BFD for VXLAN to run on the secondary MLAG switch. When running with multi-VTEP MLAG both the primary and secondary switches will run independent BFD sessions to remote VTEPs and react to BFD state transitions separately. Each switch will use the local VTEP IP of the VTI as the source IP address for the BFD sessions, which must differ from the MLAG VTEP IP.

In summary, it is not recommended to use MLAG with this feature unless configured with the multi-VTEP IP feature referenced above.

18.6.3 Troubleshooting

- Ensure that BFD configuration is present on the relevant VTI and that the VTI status shows BFD as being enabled using the mentioned **show interface <VTI>** command.
- As mentioned in the prior section, BFD state transitions are Syslogged and will display if a BFD session to a remote VTEP goes down.
- Upon fast-failover to a separate path, **show ip route** will still display FIB state that may display the original path. To view the post failover prefix state, **show ip hardware ale vrf <VRF> <prefix>** can be used instead.

18.6.4 Limitations

- Support is limited to EVPN VXLAN.
- IPv6 VXLAN underlay with this feature is not supported.

18.7 VXLAN DSCP Mapping

VXLAN DSCP Mapping allows selecting Differentiated Services Code Point DSCP and Traffic Class TC values for packets at VTEPs (VXLAN Tunnel Endpoint) along VXLAN encapsulation and decapsulation directions respectively.

An incoming packet from an edge port is encapsulated with a new IP and VXLAN header before being sent out to a remote VTEP via a core facing port for encapsulation direction.When this is enabled, the DSCP field of the outgoing packet is set as the value of the DSCP of the incoming packet at the edge port.

An incoming VXLAN packet on a core port is decapsulated and forwarded out via an edge port for decapsulation direction. When this is enabled, the TC value is derived from the value of the DSCP of the incoming VXLAN encapsulated packet at the core port. This is applicable for both VXLAN Bridging and Routing.

Platform Compatibility

The following platforms support VXLAN DSCP mapping:

- DCS-7050SX3-48YC12
- DCS-7050CX3M-32S
- DCS-7050CX3-32S

Configuration

The following command enables the propagation of the DSCP field from the incoming packet to the VXLAN encapsulated packet.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan qos dscp propagation encapsulation
```

The following command enables the assignment of the TC value during decapsulation of a VXLAN packet.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan qos dscp to traffic-class decapsulation
```

Show Commands

The **`show vxlan qos`** command shows the VXLAN DSCP and TC configuration.

```
switch# show vxlan qos
VXLAN ECN Propagation is Disabled.
Outer header DSCP is derived from Inner DSCP.
Traffic Class is derived from Outer DSCP.
```

Limitation

The core ports must be in DSCP Trust mode in order to derive TC on the outer DSCP field of the incoming VXLAN packet.

18.8 EVPN IGP Cost for VTEP Reachability

In EVPN deployment with VXLAN underlay when an EVPN type-5 prefix is imported into an IP VRF, the IGP cost of the underlay VTEP reachability is not considered as part of BGP bestpath selection post import. Therefore, if such a prefix is reachable via more than one VTEPs, the IGP metric step in the BGP best-path selection algorithm will not filter out any paths irrespective of the underlay's IGP metric for the VTEP reachability. If ECMP is enabled in the overlay and multiple paths are found to be otherwise equivalent, such paths would form ECMP regardless of the IGP metric. This is the default behavior.

However, the above mentioned behavior can be overridden by the following configuration command **`encapsulation vxlan layer-3 set next-hop igp-cost`** under ***config-route-bgp-af*** mode for **`address-family evpn`** as shown.

```
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# [no | default] encapsulation vxlan layer-3
 set next-hop igp-cost
```

The **`encapsulation vxlan layer-3 set next-hop igp-cost`** command will cause the underlay IGP metric for the VTEP reachability to be considered for BGP best path selection in the IP VRF that is importing the EVPN route. An IGP protocol such as OSPF, ISIS or static configuration could be the source of such a metric value.

Note: This feature is available only with the multi-agent routing protocol model.

18.8.1 Configuration Example

Let us consider a topology of four routers ***leaf1***, ***leaf2***, ***leaf3*** and ***rtr1*** as shown in the figure.

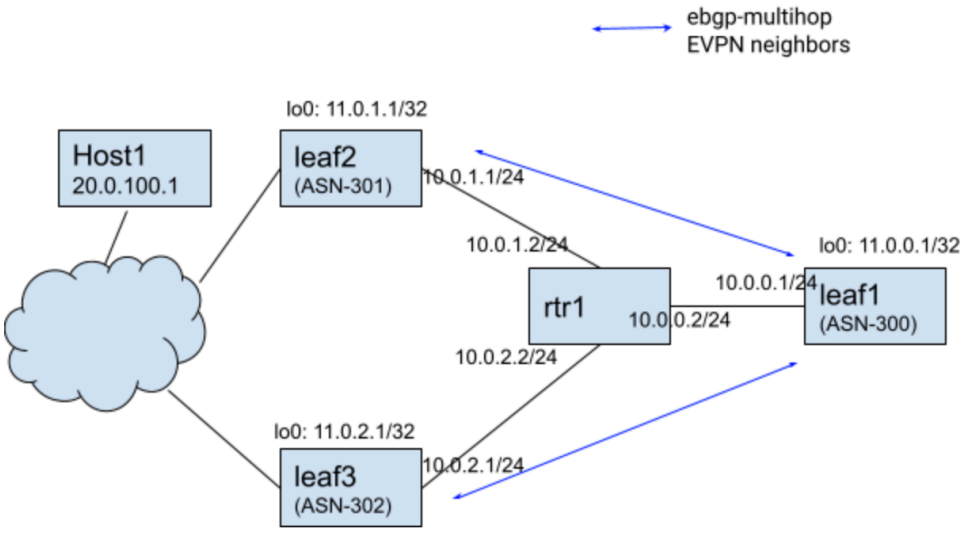

Figure 114: EVPN IGP Cost for VTEP

There could be IGP running among the four routers, but for simplicity let's have static routes with IGP metric on ***leaf1*** to ***lo0*** of border ***leaf2*** and ***leaf3*** (and vice-versa for reverse reachability on the respective routers, though that configuration not shown here):

```
leaf1#
ip route 11.0.1.1/32 10.0.0.2 metric 340
ip route 11.0.2.1/32 10.0.0.2 metric 350
```

Following are the IP routes in the default VRF on leaf1.

```
leaf1# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked,
       RC - Route Cache Route

Gateway of last resort:
 S        0.0.0.0/0 [1/0] via 10.0.0.2, Ethernet2

 C        10.0.0.0/24 is directly connected, Ethernet2
 C        11.0.0.1/32 is directly connected, Loopback0
 S        11.0.1.1/32 [1/340] via 10.0.0.2, Ethernet2
 S        11.0.2.1/32 [1/350] via 10.0.0.2, Ethernet2
```

Following are eBGP-multihop EVPN neighbor pairs with VXLAN as underlay:

leaf1 (ASN-300) # ***leaf2*** (ASN-301)

leaf1 (ASN-300) # ***leaf3*** (ASN-302)

Consider an example where a prefix ***20.0.100.1/32*** is reachable behind two VTEPs ***leaf2*** and ***leaf3*** as learnt on leaf1 via eBGP EVPN Type-5 routes.

Following EVPN paths will show for ***20.0.100.1/32*** on ***leaf1***:

```
leaf1(config)# show bgp evpn detail

```

18.8.2 Show Commands

By default, since the underlay IGP cost for the VTEP reachability is not used for best path selection in the imported EVPN Type-5 routes either of the two paths could be selected as the best path. If ECMP is configured in the importing VRF then the two paths will form ECMP. Following example shows an ECMP that is allowed in the importing VRF vrf1.

```
switch1# show ip route vrf vrf1

VRF: vrf1
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked,
       RC - Route Cache Route

 B E      20.0.100.1/32 [200/0] via VTEP 11.0.1.1 VNI 20000 router-mac
 00:00:78:02:00:00
                                via VTEP 11.0.2.1 VNI 20000 router-mac
 00:00:78:03:00:00

switch1# show ip bgp 20.0.100.1/32 vrf vrf1
BGP routing table information for VRF vrf1
```

```
Router identifier 11.0.0.1, local AS number 300
BGP routing table entry for 20.0.100.1/32
 Paths: 2 available
  302
    11.0.2.1 from 10.0.2.1 (0.0.3.1), imported EVPN route, RD 11.0.2.1:0

18.9 EVPN VXLAN Single-Gateway Centralized Routing

In a traditional EVPN VXLAN centralized anycast gateway deployment, multiple L3 VTEPs serve the role of the centralized anycast gateway. In order for the hosts to have a consistant ARP binding for any of the individual centralized gateway VTEPs, each VTEP operating as a centralized gateway is configured with a virtual router MAC (VARP MAC), and a virtual VTEP IP (VARP VTEP IP), that is shared between all of the L3 VTEPs operating as centralized gateways. Each centralized gateway VTEP also advertises an EVPN type-3 route for both its primary VTEP IP and VARP VTEP IP, so both IPs end up in the overlay floodset.

The traditional configuration works fine, but in the specific case of a network with only a single L3 VTEP centralized gateway (or single MLAG pair operating as the L3 VTEP centralized gateway), this leads to unnecessary BUM traffic.When both the physical VTEP IP and the VARP IP end up in the overlay floodset, BUM traffic is duplicated to the centralized gateway, which can overhead workloads that have a lot of broadcast or multicast traffic. There is only a single centralized gateway, so it is not necessary to have a VARP VTEP IP to provide a stable ARP binding for the gateway.

The EVPN VXLAN Single-Gateway Centralized Routing feature enables a single L3 VTEP (or single MLAG pair) operating as an anycast gateway to not configure a VARP VTEP IP, thereby eliminating the duplicate BUM traffic caused by the VARP VTEP IP being in the overlay floodset. It accomplishes this with two changes:

- A change to the default ARP behavior when a host ARPs for the MAC address associated with a virtual IP address (SVI IP).

  Previously, ARPing for a virtual IP returned different MAC address bindings, depending on whether or not a VARP VTEP IP was configured. If a VARP VTEP IP was configured, the ARP request returns the configured VARP MAC. If one was not, the ARP request returns the switch router MAC. This feature changes the behavior to always respond with the configured VARP MAC to an ARP request for a virtual IP. This closes an exception to the rule that virtual IPs are always associated with the VARP MAC.
- A new EVPN MAC VRF configuration command that generates an EVPN type-2 route for the VARP MAC with a nexthop of the physical VTEP IP.

In a traditional EVPN centralized anycast gateway development, the presence of a configured VARP VTEP IP advertises an EVPN type-2 route for the VARP MAC with a nexthop of the VARP VTEP IP. This allows TOR switches to learn the ARP binding of the centralized anycast gateway (presumably, their default gateway). With this feature, no VARP VTEP IP is configured, so an alternative method is required to advertise the appropriate EVPN route. This feature adds a new EVPN MAC VRF configuration command, **`redistribute router-mac next-hop vtep primary`** ,which when configured on a MAC VRF advertises an EVPN type-2 route for the VARP MAC with a nexthop of the primary VTEP IP. This allows TOR switches to learn the ARP binding of the centralized anycast gateway the same way they would in a traditional centralized anycast gateway deployment.

18.9.1 Configuration

On the multi-homing PEs, you must configure the Ethernet Segment (ES) to the CE. In addition, the configuration needed for asymmetric IRB or symmetric IRB must be configured on the local and the remote PEs.

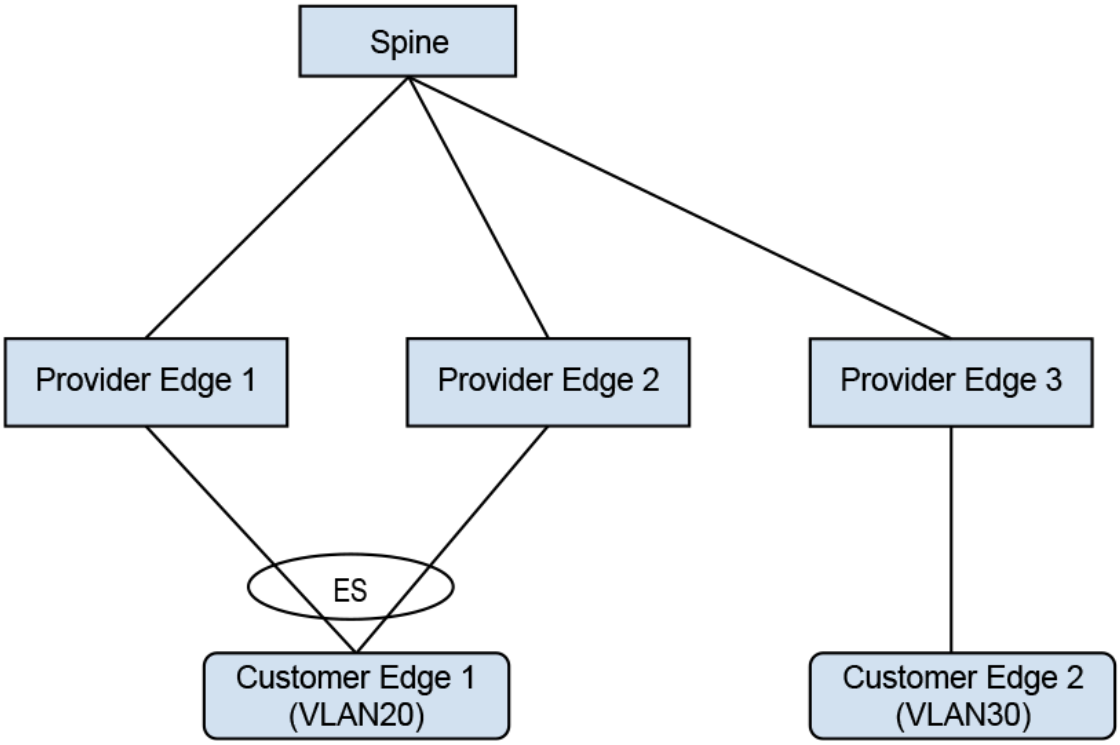

Figure 115: Asymmetric IRB with IPv4

In the example, ***CE1*** is a multi-homed CE in ***VLAN20***. ***CE2*** is a remote CE in ***VLAN30***. Asymmetric IRB is configured for inter-VLAN traffic.

Configuration on ***PE1***:

```
switch(config)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
switch(config-evpn-es)# lacp system-id 1234.5678.0123
!
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport mode trunk
switch(config-if-Et1)# channel-group 100 mode on
!
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 10.255.0.0/32
!
switch(config)# interface Vlan20
switch(config-if-Vl20)# ip address virtual 20.0.20.1/24
!
switch(config)# interface Vlan30
switch(config-if-Vl30)# ip address virtual 20.0.30.1/24
!
switch(config)# interface Vxlan1
```

```
switch(config=if-Vx1)# vxlan source-interface Loopback0
switch(config=if-Vx1)# vxlan udp-port 4789
switch(config=if-Vx1)# vxlan vlan 20 vni 10020
switch(config=if-Vx1)# vxlan vlan 30 vni 10030
!
switch(config)# ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config)# router bgp 300
switch(config-router-bgp)# router-id 0.0.0.1
switch(config-router-bgp)# neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp)# neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp)# neighbor 10.0.0.1 send-community extended
switch(config-router-bgp)# neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp)# redistribute static
   !
switch(config-router-bgp)# vlan 20
switch(config-macvrf-20)# rd 10.255.0.0:20
switch(config-macvrf-20)# route-target both 64500:10020
switch(config-macvrf-20)# redistribute learned
   !
switch(config-router-bgp)# vlan 30
switch(config-macvrf-30)# rd 10.255.0.0:30
switch(config-macvrf-30)# route-target both 64500:10030
switch(config-macvrf-30)# redistribute learned
   !
switch(config-macvrf-30)# address-family evpn
switch(config-router-bgp-af)# neighbor 10.0.0.1 activate
```

The Ethernet segment to the multi-homed CE is configured on the port channel interface Port-Channel ***100***. ***SVI 20*** and ***SVI 30*** along with VARP IP are configured for inter-subnet routing. A VARP MAC is configured globally on ***PE1***. The configuration on ***PE2*** is similar to the configuration shown above. On ***PE3***, ***SVI 20*** and ***SVI 30*** are configured along with VARP IP and VARP MAC.

Symmetric IRB with IPv4 example:

Configuration on ***PE1***:

```
!
switch(config)# vrf instance red
switch(config-vrf-red)# rd 10.255.0.0:0
!
switch(config-vrf-red)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
switch(config-evpn-es)# lacp system-id 1234.5678.0123
!
switch(config-if-Po100)# interface Ethernet6/6/1
switch(config-if-Et6/6/1)# switchport mode trunk
switch(config-if-Et6/6/1)# channel-group 100 mode on
!
switch(config-if-Et6/6/1)# interface Loopback0
switch(config-if-Lo0)# ip address 10.255.0.0/32
!
switch(config-if-Lo0)# interface Vlan20
switch(config-if-Vl20)# vrf red
switch(config-if-Vl20)# ip address virtual 20.0.20.1/24
!
switch(config-if-Vl20)# interface Vxlan1
switch(config-if-Vx1)# vxlan source-interface Loopback0
```

```
switch(config-if-Vx1)# vxlan udp-port 4789
switch(config-if-Vx1)# vxlan vlan 10 vni 10010
switch(config-if-Vx1)# vxlan vlan 20 vni 10020
switch(config-if-Vx1)# vxlan vrf red vni 20000
!
switch(config-if-Vx1)# ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config)# router bgp 300
switch(config-router-bgp)# router-id 0.0.0.1
switch(config-router-bgp)# maximum-paths 2
switch(config-router-bgp)# neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp)# neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp)# neighbor 10.0.0.1 send-community extended
switch(config-router-bgp)# neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp)# redistribute static
!
switch(config-router-bgp)# vlan 20
switch(config-macvrf-20)# rd 10.255.0.0:20
switch(config-macvrf-20)# route-target both 64500:10020
switch(config-macvrf-20)# redistribute learned
!
switch(config-macvrf-20)# address-family evpn
switch(config-router-bgp-af)# neighbor 10.0.0.1 activate
!
switch(config-router-bgp-af)# vrf red
switch(config-router-bgp-vrf-red)# rd 10.255.0.0:0
switch(config-router-bgp-vrf-red)# route-target import evpn 64500:20000
switch(config-router-bgp-vrf-red)# route-target export evpn 64500:20000
switch(config-router-bgp-vrf-red)# router-id 10.255.0.0
!
```

The Ethernet segment to the multi-homed ***CE1*** is configured on the port channel interface Port-Channel ***100***. ***SVI 20*** along with VARP IP and VARP MAC is configured. Also, IP VRF is configured which is needed for symmetric IRB. The configuration on ***PE2*** is similar. On ***PE3***, IP VRF and ***SVI 30*** are configured for symmetric IRB.

VXLAN example

A netwok with 2 VRFs, ***red*** and ***blue*** has VLANs ***10*** and ***20*** in ***red*** and VLANs ***30*** and ***40*** in ***blue***. The spines in these act as a route reflectors. Multicast groups are used to encapsulate traffic arriving in a VRF such that it is delivered to VTEPs that have that VRF provisioned.

```
interface Loopback0
   ip address 10.0.0.20/32
!
vlan 10
vlan 20
vlan 30
vlan 40
!
interface Ethernet1
   switchport access vlan 10
!
interface Ethernet2
   switchport access vlan 20
!
interface Ethernet3
   switchport access vlan 30
!
interface Ethernet4
   switchport access vlan 40
!
```

```
interface Vlan10
   vrf red
   ip address virtual 192.168.1.0/24
   ip igmp
   pim ipv4 local-interface loopback0
!

   vxlan vlan 40 flood group 226.1.1.3
   vxlan vrf red multicast group 225.1.1.1
   vxlan vrf blue multicast group 226.1.1.1
!
```

18.9.2 Show Commands

The following examples are based on the sample topology and configuration in the previous sections.

On the remote VTEP, to display the EVPN routes to the multi-homed CE (***20.0.20.2***):

```
switch# show bgp evpn route-type mac-ip 20.0.20.2
BGP routing table information for VRF default
Router identifier 0.0.3.1, local AS number 302
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
 head,
                    e - ECMP S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop

          Network                Next Hop              Metric  LocPref Weight  Path
 * >     RD: 10.255.0.0:20 mac-ip 0000.0101.0000 20.0.20.2
                                 10.255.0.0            -       100     0       303 300 i
 * >     RD: 10.255.0.1:20 mac-ip 0000.0101.0000 20.0.20.2
                                 10.255.0.1            -       100     0       303 301 i
```

As shown above, there are two EVPN MAC-IP routes for the multi-homed CE.

On the remote PE, to display the installed routes to the multi-homed CE:

```
switch# show ip route vrf red 20.0.20.2/32
```

```
VRF: red
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

 B E      20.0.20.2/32 [200/0] via VTEP 10.255.0.0 VNI 20000 router-mac 00:00:78:01:00:00
                               via VTEP 10.255.0.1 VNI 20000 router-mac 00:00:78:04:00:00
```

Two routes to the multi-homed CE are installed from the two EVPN MAC-IP routes and they form L3 ECMP.

On the remote PE, to check the details of the two routes in BGP RIB:

```
switch# show ip bgp 20.0.20.2/32 vrf red
BGP routing table information for VRF red
Router identifier 10.255.0.2, local AS number 302
BGP routing table entry for 20.0.20.2/32
 Paths: 2 available
  303 300
    10.255.0.0 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.0:20
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
      valid, external, ECMP head, ECMP, best, ECMP contributor
      Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
      TunnelEncap:tunnelTypeVxlan EvpnMacMobility:1 EvpnRouterMac:00:00:78:01:00:00
      Remote VNI: 20000
      Rx SAFI: Unicast
  303 301
    10.255.0.1 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.1:20
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
      valid, external, ECMP, ECMP contributor
      Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
      TunnelEncap:tunnelTypeVxlan EvpnMacMobility:1 EvpnRouterMac:00:00:78:04:00:00
      EvpnNdFlags:pflag
      Remote VNI: 20000
      Rx SAFI: Unicast
```

The second route has **EvpnNdFlags:pflag** to indicate that this is a proxy MAC-IP route.

This command shows information about the SBD instance that is created when **evpn multicast** is configured under an IP VRF:

```
switch# show bgp evpn instance sbd red
EVPN instance: SBD red
  Route distinguisher: 100:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN
vtep2#show bgp evpn instance sbd blue
EVPN instance: SBD red
  Route distinguisher: 200:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN
```

The OISM supported capability is set in IMET routes for the SBD when **evpn multicast** is configured for a VRF. The IGMP proxy flag is not set in IMET routes for VLANs in the VRF unless**redistribute igmp** is configured in a VLAN:

```
switch# show bgp evpn route-type imet next-hop 10.0.0.10 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for imet 10.0.0.10, Route Distinguisher: 10:1

 * >     RD: 200:1 spmsi (S, G): (*, *) originating IP: 10.0.0.40
                                 10.0.0.40             -       100     0       i
```

18.9.3 Limitations

The following limitations are included in the EVPN VXLAN all-active multi-homing integrated routing and bridging feature:

- L2 loop-free protocols, such as Spanning Tree Protocol (STP) are not supported between PE-CE with EVPN VXLAN All-Active Multi-homing. Users must ensure their topology is loop-free. STP must be disabled for the Multihomed VLANs on PEs and CEs.
- A limit of two multi-homing destinations are installed at one time for any particular MAC address. Any other valid destinations are ignored in the context of switching unicast traffic until one of the active destinations is removed. The multi-homing PEs themselves operate normally regardless of the number of PEs on the ethernet segment; this limitation only affects the selection of a destination for unicast traffic.
- VXLAN GPE is not currently supported, so packets cannot be flagged as having been broadcast. As a result, unicast packets that are known at the sender and unknown at the receiver are dropped if the receiving PE is not a designated forwarder. Similarly, unicast packets that are unknown at the sender and known at the receiver are duplicated at the receiving CE. This state automatically resolves itself as the BGP network distributes the appropriate type 1 auto-discovery and type 2 MAC/IP advertisement EVPN routes.
- Fast mass withdrawal is not supported, so there may be a delay if an interface harboring a large number of MAC addresses goes down.

18.9.4 Flood Traffic Filtering with EVPN

VXLAN fabric managed by EVPN does not always flood with broadcast, multicast or unknown MAC traffic. Sometimes ARP request broadcast and ND multicast traffic flood the VXLAN fabric as well. There may be other cases where flooding ARP plus other traffic is allowed but not all broadcast traffic into the fabric.

Most of the ARPs are learnt through EVPN and for some cases where the ARP is not learnt through EVPN, it is acceptable to flood such ARP requests. However, it is requested to rate limit the ARP flooding going into the VXLAN fabric.

Configuration

The default command disables flooding of different kinds of traffic into the VXLAN fabric in order to restrict only ARP and ND traffic flooding.

```
switch(config-rtr-l2-vpn)# flooding default disabled
```

The following command enables flooding of ARP packets into the VXLAN fabric again.

```
switch(config-rtr-l2-vpn)# arp flooding
```

The above command starts flooding ARP traffic into the VXLAN fabric while all other traffic including ND traffic is prevented from getting flooded into the fabric. The following command enables flooding of ND traffic.

```
switch(config-rtr-l2-vpn)# nd flooding
```

Note: These commands are in effect only when EVPN is enabled. ARP & ND flooding are enabled by default.

Show Commands

The **`show vxlan counters software`** command shows the number of ARP & ND packets prevented from getting flooded into the VXLAN fabric.

```
switch# show vxlan counters software
. . . . . .
Tx pkts after IPv6 encapsulation                    :  0
SW pkts forwarded to remote VTEPs via HW HER        :  4
SW pkts forwarding to remote VTEPs via HW HER failed :  0
Packets suppressed from getting flooded             :  0
```

18.10 Inter-VRF Local Route Leaking

Inter-VRF local route leaking allows the leaking of routes from one VRF (the source VRF) to another VRF (the destination VRF) on the same router. Inter-VRF routes can exist in any VRF (including the default VRF) on the system. Routes can be leaked using the following methods:

- Inter-VRF Local Route Leaking using BGP VPN
- Inter-VRF Local Route Leaking using VRF-leak Agent

18.10.1 Inter-VRF Local Route Leaking using BGP VPN

Inter-VRF local route leaking allows the user to export and import routes from one VRF to another on the same device. This is implemented by exporting routes from a VRF to the local VPN table using route target extended community list and then importing the same route target extended community lists from the local VPN table into the target VRF. VRF route leaking is supported on VPN-IPv4, VPN-IPv6, and EVPN types.

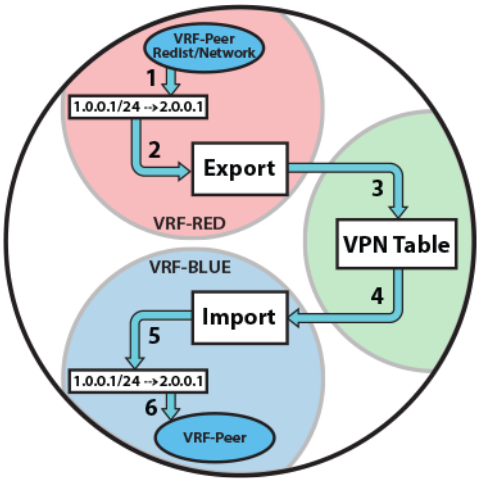

Figure 116: Inter-VRF Local Route Leaking using Local VPN Table

Accessing Shared Resources Across VPNs

To access shared resources across VPNs, all the routes from the shared services VRF must be leaked into each of the VPN VRFs and customer routes must be leaked into the shared services VRF for return traffic. Accessing shared resources allows one to export the route target of the shared services VRF into all customer VRFs, and allows the shared services VRF to import route targets from customers A and B. The figure below shows how to provide customers, corresponding to multiple VPN domains, access to services like DHCP available in the shared VRF.

Route leaking across the VRFs is supported on VPN-IPv4, VPN-IPv6, and EVPN.

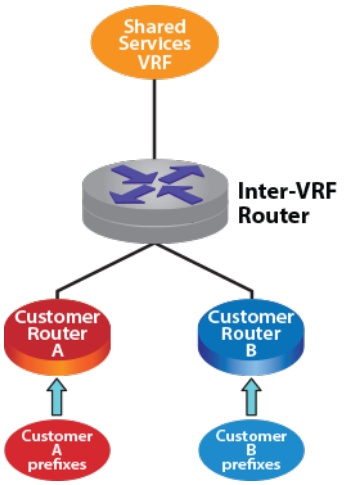

Figure 117: Accessing Shared Resources Across VPNs

18.10.1.1 Configuring Inter-VRF Local Route Leaking

Inter-VRF local route leaking is configured using VPN-IPv4, VPN-IPv6, and EVPN. Prefixes can be exported and imported using any of the configured VPN types. Ensure that the same VPN type that is exported is used while importing.

Leaking unicast IPv4 or IPv6 prefixes is supported and achieved by exporting prefixes locally to the VPN table and importing locally from the VPN table into the target VRF on the same device as shown in the figure titled **Inter-VRF Local Route Leaking using Local VPN Table** using the **`route-target`** command.

Exporting or importing the routes to or from the EVPN table is accomplished with the following two methods:

- Using VXLAN for encapsulation
- Using MPLS for encapsulation

Using VXLAN for Encapsulation

To use VXLAN encapsulation type, ensure that VRF to VNI mapping is present and the interface status for the VXLAN interface is up. This is the default encapsulation type for EVPN.

Example

The configuration for VXLAN encapsulation type is as follows:

```
switch(config)# router bgp 65001
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# neighbor default encapsulation vxlan next-
hop-self source-interface Loopback0
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile vxlan-routing
switch(config-hw-tcam)# interface Vxlan1
switch(config-hw-tcam-if-Vx1)# vxlan source-interface Loopback0
switch(config-hw-tcam-if-Vx1)# vxlan udp-port 4789
switch(config-hw-tcam-if-Vx1)# vxlan vrf vrf-blue vni 20001
switch(config-hw-tcam-if-Vx1)# vxlan vrf vrf-red vni 10001
```

Using MPLS for Encapsulation

To use MPLS encapsulation type to export to the EVPN table, MPLS needs to be enabled globally on the device and the encapsulation method needs to be changed from default type, that is VXLAN to MPLS under the EVPN address-family sub-mode.

Example

```
switch(config)# router bgp 65001
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# neighbor default encapsulation mpls next-
hop-self source-interface Loopback0
```

18.10.1.2 Route-Distinguisher

Route-Distinguisher (RD) is used to uniquely identify routes from a particular VRF. Route distinguisher is configured for every VRF from which routes are exported from or imported into.

The following commands are used to configure route distinguisher for a VRF.

```
Switch(config-router-bgp)# vrf vrf-services
switch(config-router-bgp-vrf-vrf-services)# rd 1.0.0.1:1

switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2.0.0.1:2
```

18.10.1.3 Exporting Routes from a VRF

Use the **route-target export** command to export routes from a VRF to the local VPN or EVPN table using the route target extended community list.

Examples

- These commands export routes from ***vrf-red*** to the local VPN table.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv4
 10:10
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv6
 10:20
```

- These commands export routes from ***vrf-red*** to the EVPN table.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn 10:1
```

18.10.1.4 Importing Routes into a VRF

Use the **route-target import** command to import the exported routes from the local VPN or EVPN table to the target VRF using the route target extended community list.

Examples

- These commands import routes from the VPN table to ***vrf-blue***.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2:2
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4
 10:10
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6
 10:20
```

- These commands import routes from the EVPN table to ***vrf-blue***.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2:2
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn 10:1
```

18.10.1.5 Exporting and Importing Routes using Route Map

To manage VRF route leaking, control the prefixes that are exported and imported with route-map export or import commands. The route map is effective only if the VRF paths or the VPN paths are already candidates for export or import. It is mandatory to have the route-target export or import command configured first. Setting BGP attributes using route maps is effective only on the export end.

Note: Prefixes that are leaked are not re-exported to the VPN table from the target VRF.

Examples

- These commands export routes from ***vrf-red*** to the local VPN table.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv4
 10:10
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv6
 10:20
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv4
 route-map EXPORT_V4_ROUTES_T0_VPN_TABLE
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv6
 route-map EXPORT_V6_ROUTES_T0_VPN_TABLE
```

- These commands export routes to from ***vrf-red*** to the EVPN table.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn 10:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn route-
map EXPORT_ROUTES_T0_EVPN_TABLE
```

- These commands import routes from the VPN table to ***vrf-blue***.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
```

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 1:1
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4
 10:10
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6
 10:20
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4
 route-map IMPORT_V4_ROUTES_VPN_TABLE
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6
 route-map IMPORT_V6_ROUTES_VPN_TABLE
```

- These commands import routes from the EVPN table to ***vrf-blue***.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2:2
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn route-
map IMPORT_ROUTES_FROM_EVPN_TABLE
```

18.10.2 Inter-VRF Local Route Leaking using VRF-leak Agent

Inter-VRF local route leaking allows the leaking of routes from one VRF to another using route map as a VRF-leak agent. VRFs are leaked based on the preferences assigned to each VRF.

18.10.2.1 Configuring Route Maps

To leak routes from one VRF to another using a route map, use the **`router general`** command to enter Router-General Configuration Mode, then enter the VRF submode for the destination VRF, and use the **`leak routes`** command to specify the source VRF and the route map to be used. Routes in the source VRF that match the policy in the route map will then be considered for leaking into the configuration-mode VRF. If two or more policies specify leaking the same prefix to the same destination VRF, then the route with a higher (post-set-clause) distance and preference is chosen.

Example

These commands configure a route map to leak routes from ***VRF1*** to ***VRF2*** using route map ***RM1***.

```
switch(config)# router general
switch(config-router-general)# vrf VRF2
switch(config-router-general-vrf-VRF2)# leak routes source-vrf VRF1
 subscribe-policy RM1
switch(config-router-general-vrf-VRF2)#
```

18.11 Static Inter-VRF Route

The Static Inter-VRF Route feature adds support for static inter-VRF routes. This enables the configuration of routes to destinations in one ingress VRF with an ability to specify a next-hop in a different egress VRF through a static configuration.

You can configure static inter-VRF routes in default and non-default VRFs. A different egress VRF is achieved by “tagging” the **next-hop** or **forwarding via** with a reference to an egress VRF (different from the source VRF) in which that next-hop should be evaluated. Static inter-VRF routes with ECMP next-hop sets in the same egress VRF or heterogenous egress VRFs can be specified.

The Static Inter-VRF Route feature is independent and complementary to other mechanisms that can be used to setup local inter-VRF routes. The other supported mechanisms in EOS and the broader use-cases they support are documented here:

- Local Route leaking using BGP VPN
- Local Route leaking using EOS RouteLeak Agent

18.11.1 Configuration

The configuration to setup static-Inter VRF routes in an ingress (source) VRF to forward IP traffic to a different egress (target) VRF can be done in the following modes:

- This command creates a static route in one ingress VRF that points to a next-hop in a different egress VRF.

  ip|ipv6 route [vrf ***vrf-name destination-prefix*** [egress-vrf***egress-next-hop vrf-name***] ***next-hop***

18.11.2 Show Commands

Use the **show ip route vrf** to display the egress VRF name if it is different from the source VRF.

Example

```
switch# show ip route vrf vrf1

VRF: vrf1
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E -
 eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control
 Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

Gateway of last resort is not set

 S        1.0.1.0/24 [1/0] via 1.0.0.2, Vlan2180 (egress VRF
 default)
 S        1.0.7.0/24 [1/0] via 1.0.6.2, Vlan2507 (egress VRF
 vrf3)
```

18.11.3 Limitations

- For bidirectional traffic to work correctly between a pair of VRFs, static inter-VRF routes in both VRFs must be configured.
- Static Inter-VRF routing is supported in the multi-agent routing protocol mode only.

18.12 VCS to EVPN Hitless Migration

VCS to EVPN Hitless Migration enables support for migrating from only using VCS as the control plane to only using EVPN as a control plane in a hitless manner with respect to L2 reachability information.

18.12.1 Configuration

On the multi-homing PEs, you must configure the Ethernet Segment (ES) to the CE. In addition, the configuration needed for asymmetric IRB or symmetric IRB must be configured on the local and the remote PEs.

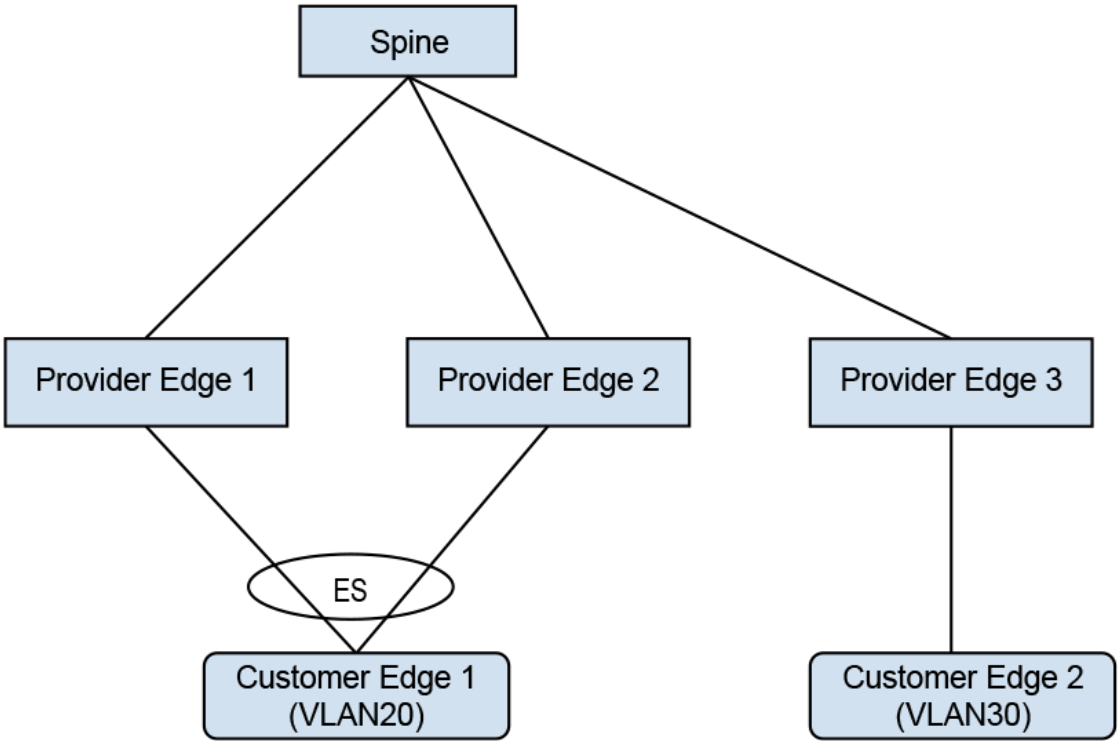

Figure 118: Asymmetric IRB with IPv4

In the example, ***CE1*** is a multi-homed CE in ***VLAN20***. ***CE2*** is a remote CE in ***VLAN30***. Asymmetric IRB is configured for inter-VLAN traffic.

Configuration on ***PE1***:

```
switch(config)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
switch(config-evpn-es)# lacp system-id 1234.5678.0123
!
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport mode trunk
switch(config-if-Et1)# channel-group 100 mode on
!
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 10.255.0.0/32
!
switch(config)# interface Vlan20
switch(config-if-Vl20)# ip address virtual 20.0.20.1/24
!
switch(config)# interface Vlan30
switch(config-if-Vl30)# ip address virtual 20.0.30.1/24
!
switch(config)# interface Vxlan1
```

```
switch(config=if-Vx1)# vxlan source-interface Loopback0
switch(config=if-Vx1)# vxlan udp-port 4789
switch(config=if-Vx1)# vxlan vlan 20 vni 10020
switch(config=if-Vx1)# vxlan vlan 30 vni 10030
!
switch(config)# ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config)# router bgp 300
switch(config-router-bgp)# router-id 0.0.0.1
switch(config-router-bgp)# neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp)# neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp)# neighbor 10.0.0.1 send-community extended
switch(config-router-bgp)# neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp)# redistribute static
   !
switch(config-router-bgp)# vlan 20
switch(config-macvrf-20)# rd 10.255.0.0:20
switch(config-macvrf-20)# route-target both 64500:10020
switch(config-macvrf-20)# redistribute learned
   !
switch(config-router-bgp)# vlan 30
switch(config-macvrf-30)# rd 10.255.0.0:30
switch(config-macvrf-30)# route-target both 64500:10030
switch(config-macvrf-30)# redistribute learned
   !
switch(config-macvrf-30)# address-family evpn
switch(config-router-bgp-af)# neighbor 10.0.0.1 activate
```

The Ethernet segment to the multi-homed CE is configured on the port channel interface Port-Channel ***100***. ***SVI 20*** and ***SVI 30*** along with VARP IP are configured for inter-subnet routing. A VARP MAC is configured globally on ***PE1***. The configuration on ***PE2*** is similar to the configuration shown above. On ***PE3***, ***SVI 20*** and ***SVI 30*** are configured along with VARP IP and VARP MAC.

Symmetric IRB with IPv4 example:

Configuration on ***PE1***:

```
!
switch(config)# vrf instance red
switch(config-vrf-red)# rd 10.255.0.0:0
!
switch(config-vrf-red)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
switch(config-evpn-es)# lacp system-id 1234.5678.0123
!
switch(config-if-Po100)# interface Ethernet6/6/1
switch(config-if-Et6/6/1)# switchport mode trunk
switch(config-if-Et6/6/1)# channel-group 100 mode on
!
switch(config-if-Et6/6/1)# interface Loopback0
switch(config-if-Lo0)# ip address 10.255.0.0/32
!
switch(config-if-Lo0)# interface Vlan20
switch(config-if-Vl20)# vrf red
switch(config-if-Vl20)# ip address virtual 20.0.20.1/24
!
switch(config-if-Vl20)# interface Vxlan1
switch(config-if-Vx1)# vxlan source-interface Loopback0
```

```
switch(config-if-Vx1)# vxlan udp-port 4789
switch(config-if-Vx1)# vxlan vlan 10 vni 10010
switch(config-if-Vx1)# vxlan vlan 20 vni 10020
switch(config-if-Vx1)# vxlan vrf red vni 20000
!
switch(config-if-Vx1)# ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config)# router bgp 300
switch(config-router-bgp)# router-id 0.0.0.1
switch(config-router-bgp)# maximum-paths 2
switch(config-router-bgp)# neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp)# neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp)# neighbor 10.0.0.1 send-community extended
switch(config-router-bgp)# neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp)# redistribute static
!
switch(config-router-bgp)# vlan 20
switch(config-macvrf-20)# rd 10.255.0.0:20
switch(config-macvrf-20)# route-target both 64500:10020
switch(config-macvrf-20)# redistribute learned
!
switch(config-macvrf-20)# address-family evpn
switch(config-router-bgp-af)# neighbor 10.0.0.1 activate
!
switch(config-router-bgp-af)# vrf red
switch(config-router-bgp-vrf-red)# rd 10.255.0.0:0
switch(config-router-bgp-vrf-red)# route-target import evpn 64500:20000
switch(config-router-bgp-vrf-red)# route-target export evpn 64500:20000
switch(config-router-bgp-vrf-red)# router-id 10.255.0.0
!
```

The Ethernet segment to the multi-homed ***CE1*** is configured on the port channel interface Port-Channel ***100***. ***SVI 20*** along with VARP IP and VARP MAC is configured. Also, IP VRF is configured which is needed for symmetric IRB. The configuration on ***PE2*** is similar. On ***PE3***, IP VRF and ***SVI 30*** are configured for symmetric IRB.

VXLAN example

A netwok with 2 VRFs, ***red*** and ***blue*** has VLANs ***10*** and ***20*** in ***red*** and VLANs ***30*** and ***40*** in ***blue***. The spines in these act as a route reflectors. Multicast groups are used to encapsulate traffic arriving in a VRF such that it is delivered to VTEPs that have that VRF provisioned.

```
interface Loopback0
   ip address 10.0.0.20/32
!
vlan 10
vlan 20
vlan 30
vlan 40
!
interface Ethernet1
   switchport access vlan 10
!
interface Ethernet2
   switchport access vlan 20
!
interface Ethernet3
   switchport access vlan 30
!
interface Ethernet4
   switchport access vlan 40
!
```

```
interface Vlan10
   vrf red
   ip address virtual 192.168.1.0/24
   ip igmp
   pim ipv4 local-interface loopback0
!
interface Vlan20
   vrf red
   ip address 192.168.2.0/24
   ip igmp
!
interface Vlan30
   vrf blue
   ip address 192.168.1.0/24
   ip igmp
!
interface Vlan40
   vrf blue
   ip address 192.168.2.0/24
   ip igmp
!
interface Vxlan1
   vxlan source-interface Loopback0
   vxlan vlan 10 vni 10
   vxlan vlan 20 vni 20
   vxlan vlan 30 vni 30
   vxlan vlan 40 vni 40
   vxlan vrf red vni 100
   vxlan vrf blue vni 200
   vxlan vlan 10 flood group 225.1.1.2
   vxlan vlan 20 flood group 225.1.1.3
   vxlan vlan 30 flood group 226.1.1.2
   vxlan vlan 40 flood group 226.1.1.3
   vxlan vrf red multicast group 225.1.1.1
   vxlan vrf blue multicast group 226.1.1.1
!
```

18.12.2 Show Commands

The following examples are based on the sample topology and configuration in the previous sections.

On the remote VTEP, to display the EVPN routes to the multi-homed CE (***20.0.20.2***):

```
switch# show bgp evpn route-type mac-ip 20.0.20.2
BGP routing table information for VRF default
Router identifier 0.0.3.1, local AS number 302
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
 head,
                    e - ECMP S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop

          Network                Next Hop              Metric  LocPref Weight  Path
 * >     RD: 10.255.0.0:20 mac-ip 0000.0101.0000 20.0.20.2
                                 10.255.0.0            -       100     0       303 300 i
 * >     RD: 10.255.0.1:20 mac-ip 0000.0101.0000 20.0.20.2
                                 10.255.0.1            -       100     0       303 301 i
```

As shown above, there are two EVPN MAC-IP routes for the multi-homed CE.

On the remote PE, to display the installed routes to the multi-homed CE:

```
switch# show ip route vrf red 20.0.20.2/32
```

```
VRF: red
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

 B E      20.0.20.2/32 [200/0] via VTEP 10.255.0.0 VNI 20000 router-mac 00:00:78:01:00:00
                               via VTEP 10.255.0.1 VNI 20000 router-mac 00:00:78:04:00:00
```

Two routes to the multi-homed CE are installed from the two EVPN MAC-IP routes and they form L3 ECMP.

On the remote PE, to check the details of the two routes in BGP RIB:

```
switch# show ip bgp 20.0.20.2/32 vrf red
BGP routing table information for VRF red
Router identifier 10.255.0.2, local AS number 302
BGP routing table entry for 20.0.20.2/32
 Paths: 2 available
  303 300
    10.255.0.0 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.0:20
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
      valid, external, ECMP head, ECMP, best, ECMP contributor
      Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
      TunnelEncap:tunnelTypeVxlan EvpnMacMobility:1 EvpnRouterMac:00:00:78:01:00:00
      Remote VNI: 20000
      Rx SAFI: Unicast
  303 301
    10.255.0.1 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.1:20
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
      valid, external, ECMP, ECMP contributor
      Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
      TunnelEncap:tunnelTypeVxlan EvpnMacMobility:1 EvpnRouterMac:00:00:78:04:00:00
      EvpnNdFlags:pflag
      Remote VNI: 20000
      Rx SAFI: Unicast
```

The second route has **EvpnNdFlags:pflag** to indicate that this is a proxy MAC-IP route.

This command shows information about the SBD instance that is created when **evpn multicast** is configured under an IP VRF:

```
switch# show bgp evpn instance sbd red
EVPN instance: SBD red
  Route distinguisher: 100:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN
vtep2#show bgp evpn instance sbd blue
EVPN instance: SBD red
  Route distinguisher: 200:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN
```

The OISM supported capability is set in IMET routes for the SBD when **evpn multicast** is configured for a VRF. The IGMP proxy flag is not set in IMET routes for VLANs in the VRF unless**redistribute igmp** is configured in a VLAN:

```
switch# show bgp evpn route-type imet next-hop 10.0.0.10 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for imet 10.0.0.10, Route Distinguisher: 10:1
 Paths: 1 available
  Local
    10.0.0.10 from 10.0.0.1 (0.0.1.1)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:10:1 TunnelEncap:tunnelTypeVxlan
      VNI: 10
```

```
      PMSI Tunnel: PIM-SSM Tree, MPLS Label: 10, Leaf Information Required: false,
      Tunnel ID: 10.0.0.10, 225.1.1.2
BGP routing table information for VRF default

BGP routing table entry for imet 10.0.0.10, Route Distinguisher: 100:1
 Paths: 1 available
  Local
    10.0.0.10 from 10.0.0.1 (0.0.1.1)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:100:1 TunnelEncap:tunnelTypeVxlan Multicast
      Flags: IGMP proxy, OISM-supported, SBD
      VNI: 100
      PMSI Tunnel: Ingress Replication, MPLS Label: 100, Leaf Information Required: false,
      Tunnel ID: 10.0.0.10
```

This command shows information about the single SMET route for the group with the RD of ***VRF red***:

```
switch# show bgp evpn route-type smet multicast 228.1.1.1
BGP routing table information for VRF default
Router identifier 0.0.1.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop
          Network                Next Hop              Metric  LocPref Weight  Path
 * >     RD: 100:1 smet (S, G): (*, 228.1.1.1) originating IP: 10.0.0.10
                                 10.0.0.10             -       100     0       i
 * >     RD: 100:1 smet (S, G): (*, 228.1.1.1) originating IP: 10.0.0.20
                                 -                     -       -       0       i

                                 -                     -       -       0       i
 * >     RD: 100:1 spmsi (S, G): (*, *) originating IP: 10.0.0.30
                                 10.0.0.30             -       100     0       i
```

```
 * >     RD: 200:1 spmsi (S, G): (*, *) originating IP: 10.0.0.30
                                  10.0.0.30             -       100     0       i
 * >     RD: 200:1 spmsi (S, G): (*, *) originating IP: 10.0.0.40
                                  10.0.0.40             -       100     0       i
```

18.12.3 Limitations

The following limitations are included in the EVPN VXLAN all-active multi-homing integrated routing and bridging feature:

- L2 loop-free protocols, such as Spanning Tree Protocol (STP) are not supported between PE-CE with EVPN VXLAN All-Active Multi-homing. Users must ensure their topology is loop-free. STP must be disabled for the Multihomed VLANs on PEs and CEs.
- A limit of two multi-homing destinations are installed at one time for any particular MAC address. Any other valid destinations are ignored in the context of switching unicast traffic until one of the active destinations is removed. The multi-homing PEs themselves operate normally regardless of the number of PEs on the ethernet segment; this limitation only affects the selection of a destination for unicast traffic.
- VXLAN GPE is not currently supported, so packets cannot be flagged as having been broadcast. As a result, unicast packets that are known at the sender and unknown at the receiver are dropped if the receiving PE is not a designated forwarder. Similarly, unicast packets that are unknown at the sender and known at the receiver are duplicated at the receiving CE. This state automatically resolves itself as the BGP network distributes the appropriate type 1 auto-discovery and type 2 MAC/IP advertisement EVPN routes.
- Fast mass withdrawal is not supported, so there may be a delay if an interface harboring a large number of MAC addresses goes down.

18.13 Configuring EVPN

18.13.1 Configuring BGP-EVPN and VCS on CVX

18.13.1.1 Configuring BGP-EVPN

Configuring VNI Bundle

A VNI-aware-bundle represents a MAC-VRF that contains Layer 2 route entries from all VXLAN Network Identifiers (VNI) available across multiple DCs. Use the **`vni-aware-bundle`** command available on CVX to create a MAC-VRF.

Note: This command is not available on switches.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#
```

Configuring RD and RT in VNI Bundle

Use the **`rd`** (Router-BGP VRF and VNI Configuration Modes) command to add a Route Distinguisher (RD) for uniquely identifying Layer 2 routes for the VNI bundle. Use the **`route-target`** command to configure a well-known extended community that is attached to the routes exported by BGP-EVPN; and to import routes with the specified well-known extended community into the MAC-VRF that corresponds to the VNI bundle.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# rd 530:12
cvx(config-macvrf-bundle1)# route-target both 530:12
```

Enabling Redistribution of Bridging Information

After the VNI aware bundle is created, use the **redistribute service vxlan** command to redistribute the Layer 2 bridging information received from VCS.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# redistribute service vxlan
```

Disabling Next-Hop Resolution in BGP-EVPN

When BGP-EVPN module receives a route from its BGP peer, it generally tries to resolve the next-hop indicated in the route. However in the DCI topology, the routes coming from a CVX in another DC contains next-hops (VTEP addresses) that may not be reachable from the CVX receiving the route. Use the **next-hop resolution disabled** command to disable the next-hop resolution on routes received from BGP-EVPN peers.

Note: CVX is a part of the control plane and it is only connected to the VTEPs in its own DC. It does not have IP connectivity to the VTEPs in a different DC.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# address-family evpn
cvx(config-router-bgp-af)# next-hop resolution disabled
```

18.13.1.2 Configuring VCS

Enabling Redistribution of BGP-EVPN Routes

Use the **redistribute bgp evpn vxlan** command to redistribute BGP-EVPN routes to VCS, which, in turn advertises them to all VTEPs within the DC.

Example

```
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service vxlan
cvx(config-cvx-vxlan)# no shutdown
cvx(config-cvx-vxlan)# redistribute bgp evpn vxlan
```

18.13.2 EVPN MPLS Virtual Private Wire Service (VPWS)

Traffic to / from a given Attachment Circuit (AC) without any MAC lookup / learning can be forwarded using EVPN MPLS VPWS, which uses BGP for signalling. Port based and VLAN based services are supported.

Configuring EVPN MPLS VPWS

Configure the patch panel to specify the connection of the ACs to the VPWS service instances, and then the VPWS service instance, which is part of BGP. Finally, configure the individual participating ACs.

Patch Panel Configuration

The following configures the local AC as ***Ethernet2*** interface and the remote VPWS service instance as evi-1 and pseudowire pw1.

```
patch panel
            patch port
                connector 1 interface Ethernet2
                connector 2 pseudowire bgp vpws evi-1 pseudowire pw1
```

The following configures the local AC as ***Ethernet3.1*** subinterface and the remote VPWS service instance as ***evi-1*** and pseudowire ***pw2***.

```
patch panel
             patch subintf
                 connector 1 interface Ethernet3.1
                 connector 2 pseudowire bgp vpws evi-1 pseudowire pw2
```

Note: Connector ID is optional.

VPWS Service Instance Configuration

The following configures the VPWS service instance with the BGP ***vpws*** sub mode. This defines an EVPN instance under which any number of VPWS service instances can be configured. The BGP configuration itself can also define multiple EVPN instances under multiple **vpws** blocks, each with a unique name and Route-Distinguisher (RD) value. Only the **mpls control-word** and **mtu *value*** configuration items are optional; the rest are required for proper operation.

```
router bgp 1
   neighbor 10.0.0.1 remote-as 1
   neighbor 10.0.0.1 send-community extended
   neighbor 10.0.0.1 maximum-routes 12000
   !
   vpws evi-1
      rd 10.2.2.2:2
      route-target import export evpn 0.0.0.0:1
      mpls control-word
      !
      pseudowire pw1
         evpn vpws id local 2001 remote 1001
      !
      pseudowire pw2
         evpn vpws id local 2002 remote 1002
   !
   address-family evpn
      neighbor default encapsulation mpls next-hop-self source-interface
 Loopback0
      neighbor 10.0.0.1 activate
```

Note: It is strongly recommended that 'mpls control-word' is always enabled, when possible, to avoid any potential mis-forwarding where the PWE frames may be incorrectly interpreted as having an IP, as opposed to Ethernet, payload.

Attachment Circuit Configuration (double-tagged L3 subinterfaces)

The following configures the AC in Port mode.

```
interface Ethernet2
   no switchport
```

Note: Use Ethernet or Port-channel interface for Port mode.

The following configures the AC in VLAN mode.

```
interface Ethernet3
   no switchport
interface Ethernet3.1
   encapsulation dot1q vlan 1
```

Note: Use subinterfaces for VLAN mode.

The following configures the AC in Flexible Encapsulation mode. The **client** after 'network' preserves the corresponding client encapsulation specification.

```
interface Ethernet3
   no switchport
interface Ethernet3.1
   encapsulation vlan
   client dot1q 11 network client
```

Flexible Encapsulation EVPN MPLS VPWS

Flexible encapsulation enables the following actions for tags.

- Remove incoming encapsulation tag(s) and forward
- Preserve incoming encapsulation tag(s) and forward
- Replace one or two tags when forwarding in encapsulation and decapsulation directions

The table below explains the encapsulation and decapsulation behaviors for the various FlexEncap options. Applying a Flexible Encapsulation with a ***network*** specification to a subinterface creates a bidirectional mapping table that is applied to the sub-interface. The mapping embodied in this table is applied from ***client*** to ***network*** in the encap direction, and ***network*** to ***client*** in the decap direction.

Example	Behavior
client dot1q 10	**From Client:** match VLAN ID 10, consume and forward **To Client:** add VLAN ID 10 before transmit
client dot1q 10 inner 20	**From Client:** match VLAN IDs 10, 20 consume and forward **To Client:** add VLAN ID 10, 20 before transmit
client dot1q 10 network client	**From Client:** match VLAN ID 10 and retain it. **From Network:** match vlan=10, retain.
client dot1q outer 10 inner 20 network client	**From Client:** match VLAN IDs 10, 20 and retain both. **From Network:** match vlan=10,20, retain both.

client dot1q 10 network dot1q 100	
client dot1q 10 network dot1q 100	**From Client:** match VLAN ID 10, consume. Before forwarding, write vlan=100. **From Network:** match vlan=100, consume. Before transmit, write vlan=10.
client dot1q outer 10 inner 20 network dot1q outer 100 inner 200	**From Client:** match VLAN IDs 10, 20, and consume them. Before forwarding, write vlan=100,200. **From Network:** match vlan=100, 200, consume. Before transmit, write vlan=10, 20.

The following configures FlexEncap on a subinterface as a local connector and LDP pseudowire as remote connector.

- Packets received on ***Ethernet3/1*** with outermost 802.1q VLAN tag of ***1000*** get mapped to sub-interface ***Ethernet3/1.1000***.
- The tag of ***1000*** is preserved and forwarded to pseudowire ***PW1***.
- Packets terminating on ***PW1*** get forwarded to ***Et3/1.1000*** and get transmitted out with VLAN tag of ***1000***.

```
interface Ethernet3/1.1000
   encapsulation vlan
      client dot1q 1000 network client
patch panel
   patch patch-1
      connector 1 interface Ethernet3/1.1000
      connector 2 pseudowire ldp PW1
```

Displaying EVPN MPLS VPWS Configuration

This command shows both the client encapsulation and network encapsulation configured on sub-interfaces.

```
switch(config-if-Et3/1.1003)# show interfaces encapsulation vlan
Interface                 Status       Client Encapsulation      Network
 Encapsulation
------------------------- ------------ --------------------------
-------------------------
Ethernet3/1.1000       active       dot1q outer 1000
Ethernet3/1.1001       active       dot1q outer 1001             client
Ethernet3/1.1002       active       dot1q outer 1002 inner 102
Ethernet3/1.1003       active       dot1q outer 1003 inner 103   client
Ethernet3/1.1004       active       dot1q outer 1004             dot1q
 2004
Ethernet3/1.1005       active       dot1q outer 1005 inner 104   dot1q
 outer 2005 inner 204
```

This command shows output of a patch with sub-interface as the local connector and VPWS as the remote connector.

```
switch(config-if-Et3/1.1003)# show patch panel PP_1000

Patch   Connector                              Status

```

Tag Matching Semantics

The matching rules are applied on a 'longest matching tag sequence' basis when rules are configured for multiple subinterfaces of a parent port. Considering the following rules on the same parent, the receive (encap) and transmit (decap) rule application is shown in the following tables.

Rule 1:

```
interface Ethernet 10.1
  encapsulation vlan
    client dot1q 11 network client
```

Rule 2:

```
interface Ethernet 10.2
  encapsulation vlan
    client dot1q 11 inner 20 network client
```

The receive (encap) matching behavior is as follows.

Received Packet	**Matching Rule**
outer=11, inner=20	Rule #2
single tag with 11	Rule #1
double tag with 11, not 20	Rule #1

The transmit (decap) matching behavior is as follows.

Forwarded Packet	**Matching Rule**
outer=11, inner=20	Rule #2
single tag with 11	Rule #1
double tag with 11, not 20	Rule #1

18.14 Sharing Equivalence Class entry across multiple VRF

This enables the sharing of the same Forwarding Equivalence Class (FEC) entry across multiple VRF's and achieves higher scale in VPN deployments by making optimal use of hardware resources. The VPN path routes are imported to multiple VRF for MPLS VPN address family in BGP, individual FEC entry in the hardware table is used for each VRF.

The following configuration in router BGP mode at BGP instance level allows sharing FEC, when the VPN path is imported to multiple VRFs.

bgp fec skip in-place update

The following configures disable FEC and restores default configuration.

[no| default] bgp fec skip in-place update

Note: Changing the configuration in a production system may increase FEC usage.

The following example displays BGP VPN-IPv4 routes for prefix ***20.0.1.0/24***, which is imported to four VRFs.

```
switch# show bgp vpn-ipv4 20.0.1.0/24 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for IPv4 prefix 20.0.1.0/24, Route Distinguisher:
 11.0.1.1:0
 Paths: 1 available
  301
    11.0.1.1 from 10.0.0.2 (0.0.1.1)
      Origin IGP, metric -, localpref 100, weight 0, valid, external,
 best
      Extended Community: Route-Target-AS:300:0 Route-Target-AS:301:0
      MPLS label: 116507
```

This route was using 4 FEC entries for each VRF before the change.

```
switch# show platform jericho ip route 20.0.1.0/24
Tunnel Type: M(mpls), G(gre), MoG(mpls-over-gre),
             vxlan-o(vxlan outer-rewrite info), vxlan-i(vxlan inner-rewrite info)
* - Routes in LEM
D - ECMP is divergent across switching chips
 ------------------------------------------------------------------------------------------------------------
-
|                                Routing Table                                                |
 |
|-------------------------------------------------------------------------------------------------------------

```

18.15 Sample Configurations

18.15.1 EVPN VXLAN IRB Sample Configuration

In the topology below, we are connecting a Layer 2 site with a Layer 3 site using Layer 3 EVPN (type-5 route). Right side leaves are MLAG leaves and have SVI 10 in VRF-Blue. A number of directly connected hosts are simulated behind the right side leaf. The left side leaves are individual leaves that connect with a remote switch in **`vrf`** VRF-Blue to learn Layer 3 routes using BGP. The left side leaves are configured as two independent Layer 3 only VTEPs.

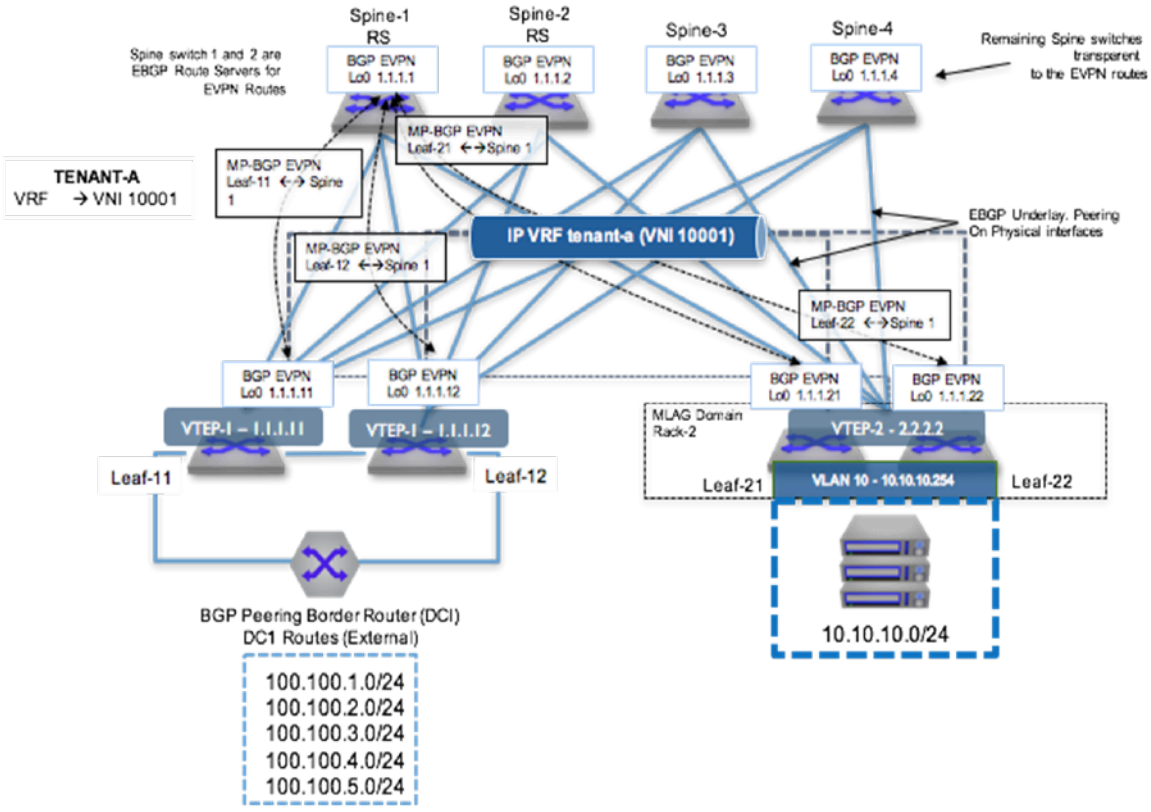

Figure 119: Layer 3 EVPN Configuration

To provide VXLAN routing and bridging between the two MLAG domains, each leaf switch is EVPN peering with the four spine switches via a loopback interface.

eBGP Underlay Configuration: Leaf-11

Underlay configuration is straightforward and all neighbors are eBGP. Since all leaves share the same AS number, the **`allowas-in`** command was added in the leaf.

```
interface Ethernet1
   description Spine-1-et1/1
   mtu 9214
   no switchport
   ip address 172.168.1.1/31

interface Ethernet8/1
   description ck428-et8/1
   speed forced 40gfull
   no switchport
   ip address 172.168.1.10/31

interface Loopback0
   ip address 1.1.1.11/32

ip prefix-list loopback
   seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
   match ip address prefix-list loopback

router bgp 65004
neighbor SPINE peer-group
   neighbor SPINE remote-as 65001
   neighbor SPINE allowas-in 1
   neighbor SPINE soft-reconfiguration inbound all
   neighbor SPINE send-community
   neighbor 172.168.1.0 peer-group SPINE
   neighbor 172.168.1.11 remote-as 65003
   redistribute connected route-map loopback
```

eBGP Underlay Configuration: Spine-1

```
interface Ethernet1/1
   description Leaf-11-et1
   mtu 9214
   no switchport
   ip address 172.168.1.0/31

interface Loopback0
   ip address 1.1.1.1/32
!
ip prefix-list loopback
   seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
   match ip address prefix-list loopback
!
router bgp 65001
   neighbor 172.168.1.1 remote-as 65004
   redistribute connected route-map loopback
```

VRF Configuration: Leaf-11

VRF-Blue is configured on all the left leaves. The left leaves have pure Layer 3 interfaces and the right side has ***SVI 10***.

```
vrf instance VRF-Blue

ip routing vrf VRF-Blue

interface Ethernet36
   no switchport
   vrf VRF-Blue
   ip address 172.168.1.9/31

router bgp 65004
     vrf VRF-Blue
           neighbor 172.168.1.8 remote-as 65005
```

VRF Configuration: Leaf-21

```
vlan 10

vrf instance VRF-Blue

ip routing vrf VRF-Blue

interface Vlan10
   vrf VRF-Blue
   ip address virtual 10.10.10.1/24

ip virtual-router mac-address 00:aa:aa:aa:aa:aa

interface Port-Channel3
   switchport mode trunk
   mlag 3
```

VXLAN Configuration: Leaf-11

Make sure all VTEPs have unique loopback0 addresses to represent unique VTEP identifiers. For every VNI that EVPN receives, a dynamic VLAN is allocated, so it is a good practice to keep the same VNI.

```
interface Vxlan1
   vxlan source-interface Loopback0
   vxlan udp-port 4789
   vxlan vrf VRF-Blue vni 10001
```

VXLAN Configuration: Leaf-21

```
interface Vxlan1
   vxlan source-interface Loopback0
   vxlan udp-port 4789
   vxlan vrf VRF-Blue vni 10001
```

EVPN Configuration: Leaf-11

Leaf establishes the EVPN neighborship with all four spines for redundancy. EVPN neighborship is on the loopback address and the **multihop** keyword is used. Make sure to disable the IPv4 address family for EVPN neighbors.

Since the spine is acting like a route-reflector for EVPN routes, make sure to configure the next-hop-unchanged.

```
router bgp 65004
   neighbor SPINE_EVPN peer-group
   neighbor SPINE_EVPN remote-as 65001
   neighbor SPINE_EVPN update-source Loopback0
   neighbor SPINE_EVPN ebgp-multihop 3
   neighbor SPINE_EVPN send-community extended
   neighbor SPINE_EVPN maximum-routes 12000
   neighbor 1.1.1.1 peer-group SPINE_EVPN
   !
   address-family evpn
      neighbor SPINE_EVPN activate
   !
   address-family ipv4
      no neighbor SPINE_EVPN activate
```

EVPN Configuration: Leaf-21

```
router bgp 65002
   neighbor SPINE_EVPN peer-group
   neighbor SPINE_EVPN remote-as 65001

Advertise VRF Routes in EVPN: Leaf-11

By configuring VRF under **`router-bgp`**, you are advertising routes from that VRF into EVPN using the RD/RT. The remote end can install the route by importing the RT.

Leaf-11 has routes in ***VRF-Blue*** learned through eBGP with the neighbor down south. Since the routes are already in BGP VRF table, we do not want to configure the **`redistribute`** command.

```
router bgp 65004
   neighbor SPINE_EVPN peer-group
   neighbor SPINE_EVPN remote-as 65001
   neighbor SPINE_EVPN update-source Loopback0
   neighbor SPINE_EVPN ebgp-multihop 3
   neighbor SPINE_EVPN send-community extended
   neighbor SPINE_EVPN maximum-routes 12000
   neighbor 1.1.1.1 peer-group SPINE_EVPN
   !
   address-family evpn
      neighbor SPINE_EVPN activate
   !
   address-family ipv4
      no neighbor SPINE_EVPN activate
```

Advertise VRF Routes in EVPN: Leaf-21

On the other hand ***Leaf-21*** wants to export the connected SVI into EVPN and therefore require **`redistribute connected`** command.

```
router bgp 65002
   neighbor SPINE_EVPN peer-group
   neighbor SPINE_EVPN remote-as 65001
   neighbor SPINE_EVPN update-source Loopback0
   neighbor SPINE_EVPN allowas-in 1
   neighbor SPINE_EVPN ebgp-multihop 3
   neighbor SPINE_EVPN send-community extended
   neighbor SPINE_EVPN maximum-routes 12000
   neighbor 1.1.1.1 peer-group SPINE_EVPN
   !
   address-family evpn
      neighbor SPINE_EVPN activate
   !
   address-family ipv4
      no neighbor SPINE_EVPN activate
```

18.15.2 Multi-Tenant EVPN VXLAN IRB Sample Configuration

The following configuration example shows a deployment using both symmetric and asymmetric IRB with VLAN-based and VLAN-aware bundle services; and eBGP overlay and underlay.

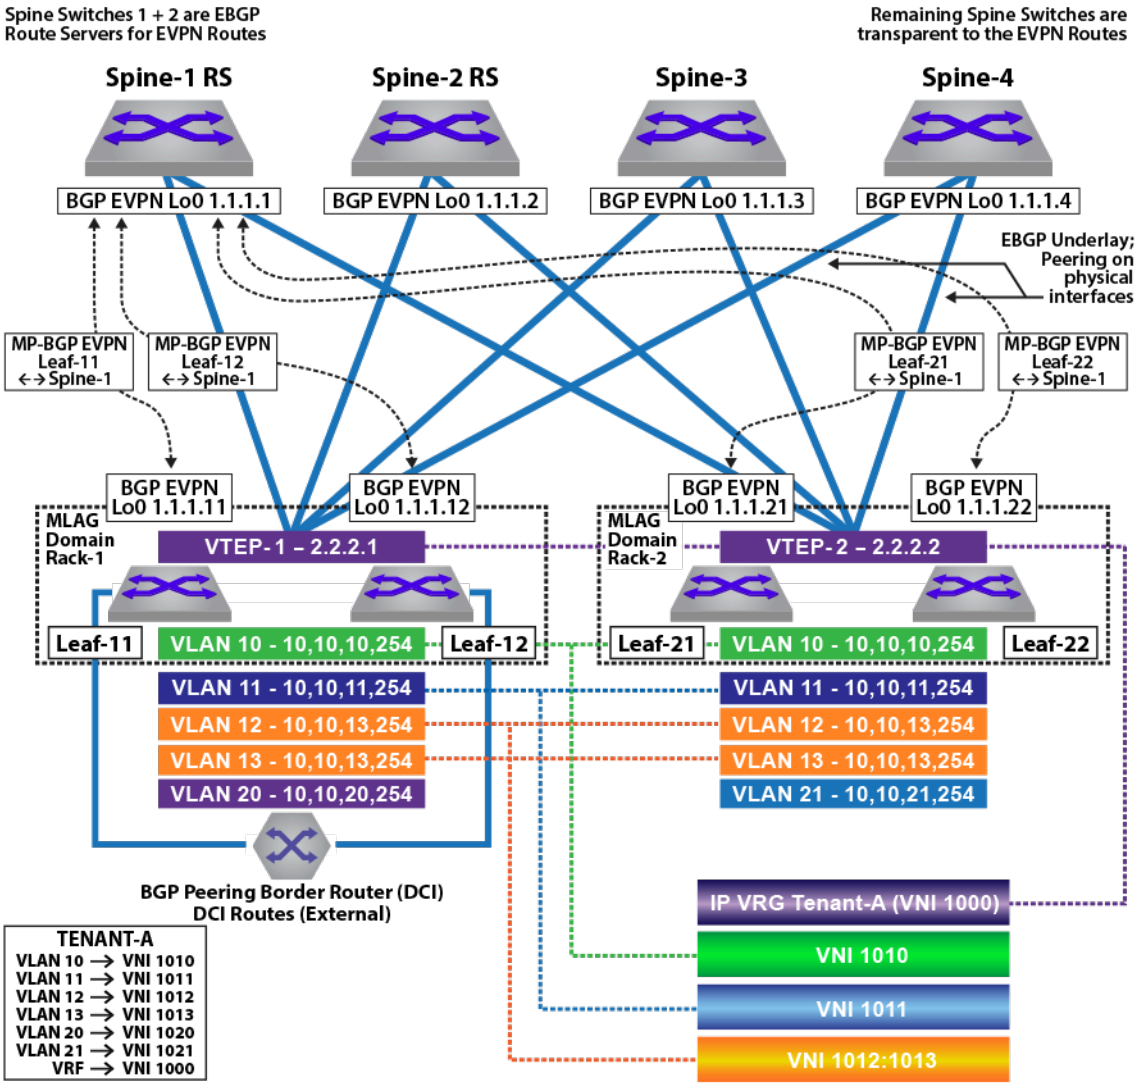

Figure 120: Tenant-A: Symmetric IRB

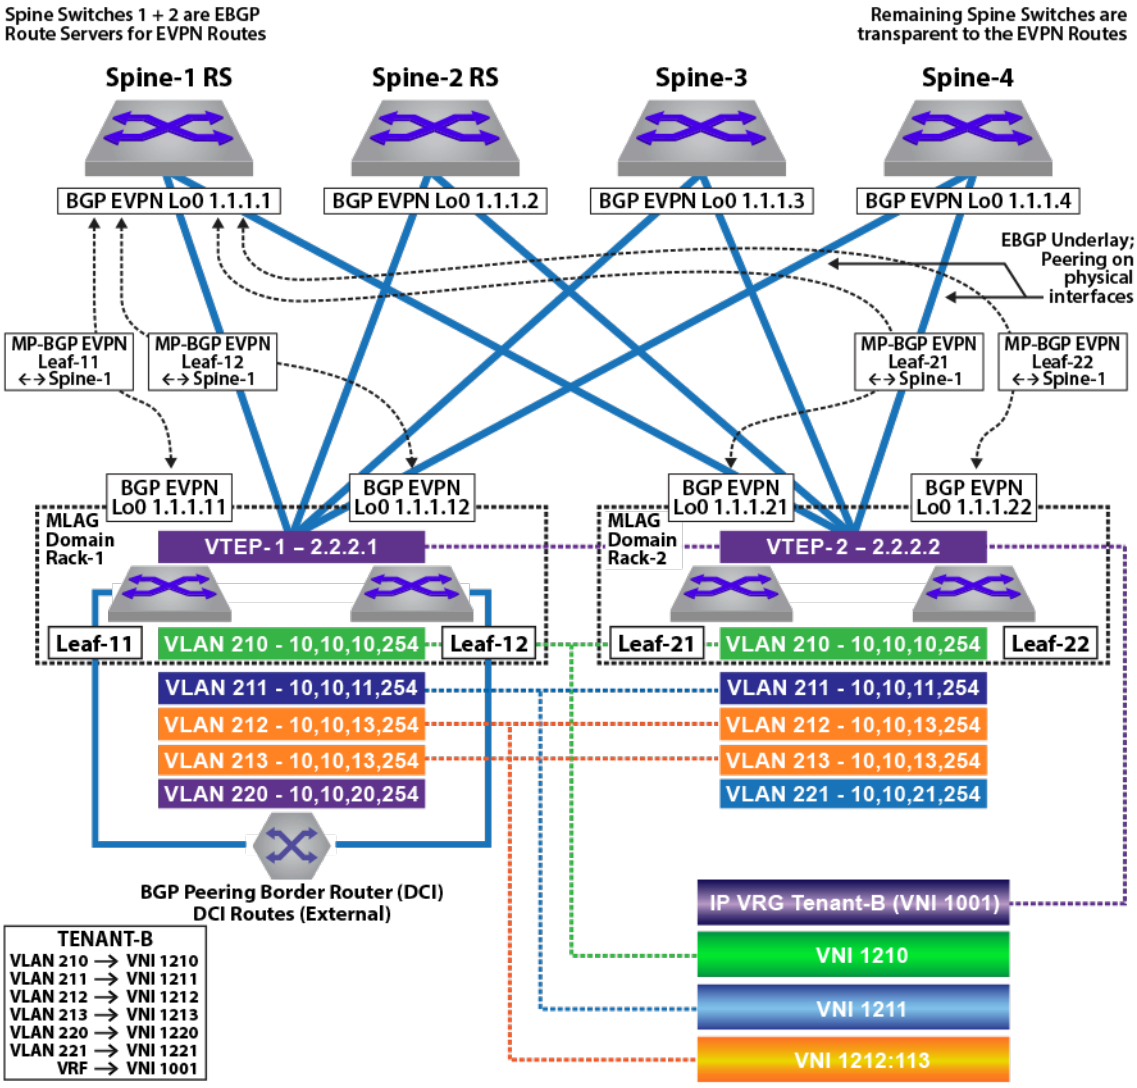

Figure 121: Tenant-B: Asymmetric IRB

In the symmetric and asymmetric IRB configurations illustrated in the figures above, for ***Tenant-A***, four subnets are stretched across the two MLAG domains with two subnets (***VLAN 10***, ***10.10.10.0/24*** and ***VLAN 11***, ***10.10.11.0/24***) configured as a VLAN-based service, and two other subnets (***VLAN 12***,***10.10.12.0/24*** and ***VLAN 13***, ***10.10.13.0/24***) as a VLAN-aware bundle service.

For ***Tenant-B***, four subnets are stretched across the two MLAG domains with two subnets (***VLAN 210***, ***10.10.10.0/24*** and ***VLAN 211***,***10.10.11.0/24***) configured as a VLAN-based service, and two other subnets (***VLAN 212***,***10.10.12.0/24*** and ***VLAN 213***,***10.10.13.0/24***) as a VLAN-aware bundle service.

In addition each MLAG domain has a single local subnet (***Rack-1*** subnet ***10.10.20.0/24*** and ***Rack-2*** subnet ***10.10.21.0/24***) for the tenant. To provide direct distributed routing, each leaf switch is configured with the same virtual IP address for the four stretched subnets. For the local-only subnets, the virtual IP address is configured in both physical leaf switches of the relevant MLAG domain.

For each MLAG domain, a logical VTEP is created with the same shared loopback address. For ***Rack-1***, the logical VTEP IP is ***2.2.2.1*** and for the ***Rack-2***, the logical VTEP IP is ***2.2.2.2***. Directly connected to each leaf switch is a host, which is a member of one of the two IP subnets. To provide Layer 2 connectivity across the racks, VXLAN bridging is enabled by mapping VLAN to VNIs as detailed in the diagram.

To provide IP connectivity across all subnets both stretched and directly connected, an IP-VRF is shared between the two MLAG domains for the tenant. This is used as a transit network for announcing and forwarding the locally attached subnets. Each leaf switch is EVPN peering with the four spine switches via a loopback interface on the leaf and again on the spine switches. To provide external connectivity, ***Leaf-11*** and ***Leaf-12*** are eBGP peering via the tenants' VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and IP prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (***Leaf-21*** and ***Leaf-22***) re-advertise the prefixes into the tenant's VRF via a type-5 route advertisement, with a next-hop equal to the advertising VTEP.

18.15.2.3 VLAN and Distributed IP Address Configuration: Leaf-11 and Leaf-21

VLAN and interface configuration for ***VLAN 10*** (virtual IP address ***10.10.10.254***) and ***VLAN 11*** (virtual IP address ***10.10.11.254***), along with SVIs ***12***, ***13***, and ***20***, are similarly configured. To provide multi-tenancy, the two tenant VLANs are placed in a dedicated VRF, named ***Tenant-A***. A further five tenant VLANs are configured and assigned to VRF ***Tenant-B***.

The other VLANs are for peering, MLAG, and a unique VLAN SVI. These VLANs do not use virtual IP addresses.

The tenants' stretched subnets (***Tenant-A***: VLANs ***10***,***11***,***12***, and ***13***; ***Tenant-B***: VLANs ***210***, ***211***, ***211***, ***212***, and ***213***) are mapped to unique overlay VXLAN VNIs. The tenants' IP-VRF (***Tenant-A*** and ***Tenant-B***) is associated with a VNI using the **`vxlan vrf`** command under the VXLAN interface. In the forwarding model for symmetric IRB, this VNI will be used as the transit VNI for routing to subnets which are not locally configured on the VTEP.

As a standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain, ***Rack-1*** (***Leaf-11*** + ***Leaf-12***) has a shared logical VTEP IP of ***2.2.2.1*** and ***Rack-2*** (***Leaf-21*** + ***Leaf-22***) has a shared logical VTEP IP of ***2.2.2.2***.

!
```

18.15.2.4 VXLAN Interface Configuration: Leaf-11 and Leaf-21

The tenants' VLANs are mapped to unique overlay VXLAN VNIs. ***VLAN 10*** is mapped to ***VNI 1010*** on both MLAG domains, and ***VLAN 11*** is mapped to ***VNI 1011***. As standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain ***Rack-1*** (***Leaf-11*** + ***Leaf-12***) has a shared logical VTEP IP of ***2.2.2.1*** and ***Rack-2*** (***Leaf-21*** + ***Leaf-22***) has a shared logical VTEP IP of ***2.2.2.2***. Also configured is the VRF-to-VXLAN mapping for ***Tenant-A***.

Leaf-11 VXLAN Interface Configuration

```
!
interface Loopback1
   ip address 2.2.2.1/32
!
interface Vxlan1
   vxlan source-interface Loopback1
   vxlan udp-port 4789
   vxlan vlan 10 vni 1010
   vxlan vlan 11 vni 1011
   vxlan vlan 12 vni 1012
   vxlan vlan 13 vni 1013
   vxlan vlan 20 vni 1020
   vxlan vlan 210 vni 1210
   vxlan vlan 211 vni 1211
   vxlan vlan 212 vni 1212
   vxlan vlan 213 vni 1213
   vxlan vlan 220 vni 1220
   vxlan vrf tenant-a vni 1000
```

```
   vxlan vrf tenant-b vni 1001
```

Leaf-21 VXLAN Interface Configuration

```
!
interface Loopback1
   ip address 2.2.2.2/32
!
interface Vxlan1
   vxlan source-interface Loopback1
   vxlan udp-port 4789
   vxlan vlan 10 vni 1010
   vxlan vlan 11 vni 1011
   vxlan vlan 12 vni 1012
   vxlan vlan 13 vni 1013
   vxlan vlan 21 vni 1021
   vxlan vlan 210 vni 1210
   vxlan vlan 211 vni 1211
   vxlan vlan 212 vni 1212
   vxlan vlan 213 vni 1213
   vxlan vlan 221 vni 1221
   vxlan vrf tenant-a vni 1000
   vxlan vrf tenant-b vni 1001
```

Note: This configuration uses VXLAN routing. For single-chip T2 and TH platforms, recirculation must be enabled. For R-Series platforms, the following configuration commands must be added:

`hardware tcam`

`system profile vxlan-routing`

Refer to diagrams for VLAN and SVI assignment to tenant; ***Leaf-11*** also has peering out to the border router in addition to the connected SVIs.

18.15.2.5 eBGP Underlay Configuration on the Leaf Switches

The leaf switches for the underlay network peer with each spine on the physical interface. For EVPN route advertisement, the BGP EVPN session is between loopback addresses.

In this case, the underlay is all eBGP, and peering is on the physical interfaces. The MLAG leaves also peer with each other in the underlay to retain BGP EVPN connectivity (loopback reachability) in the very unlikely case that all spine links are down. This is a failover configuration that can be implemented if there is ever the chance a leaf could be “core isolated.” The configuration can be viewed on each leaf using the command **`show running-configuration section bgp`**.

The examples below show the underlay configuration on all four leaf switches, and also on two of the spine switches as an example of the underlay configuration on the spine.

The configuration uses the following peer groups:

SPINE configuration inherited for underlay (eBGP) peering to the spines

SPINE_EVPN overlay eBGP peering between spine and leaf, using loopbacks

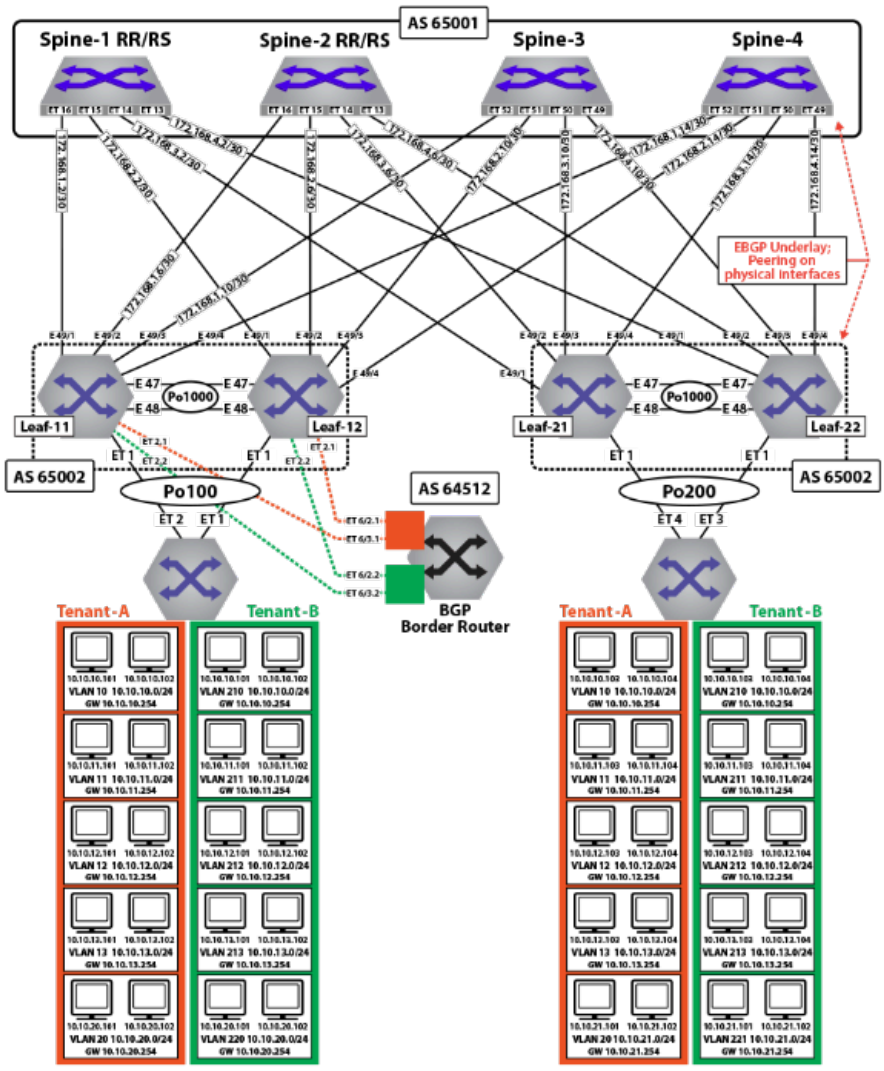

Figure 122: Physical Underlay Topology

18.15.2.7 eBGP Overlay on Leaf Switches

The MAC VRFs and IP VRF for the tenants' subnets are created in the BGP router context with unique Route-Distinguishers (RD) and Route-Targets (RT) attached to each MAC-VRF and IP-VRF. The RDs provide support for overlapping MAC and IP addresses across tenants, while the RTs allow control of the routes imported and exported between MAC VRFs.

To ensure all routes are correctly imported between VTEPs sharing the same Layer-2 domain, the import and export RTs are equal across the two MLAG domains. The **`redistribute learned`** statement under each MAC VRF ensures any locally learned MACs in the VLAN are automatically announced as type-2 routes.

The IP VRF (***Tenant-A***) is created on all leaf switches which have subnets attached to the tenant's VRF with the same route target ensuring that routes are correctly imported and exported between VTEPs in the VRF. On ***Leaf-21*** and ***Leaf-22***, to import the external routes an eBGP session with the BGP peering router is created under the IP VRF (***Tenant-A***) context, and a peering from each to the other is created on the overlay.

Note: All MAC VRFs are unique, and each has its own RT, matched by the other leaves in the DC. The "tenants" as such are defined at layer 3 by assigning SVIs to the appropriate VRF. To view this assignment, use the **`show ip route vrf <tenant> connected`** command. Note below that VLANs ***12-13*** and ***212-213*** (shown in bold) are configured as a bundle-aware EVPN service. Also note the peering from ***Leaf-11*** to the BGP border router in each tenant VRF.

18.15.2.8 eBGP Overlay on Spine Switches

The EVPN BGP configuration on the spine switches is summarised in the examples below. Note that only the EVPN BGP sessions are listed for two spine switches; the BGP underlay configuration is not included.

EVPN BGP Overlay Configuration: Spine-1

```
!
router bgp 65001
   router-id 1.1.1.1
   distance bgp 20 200 200
   maximum-paths 8 ecmp 16
   neighbor LEAF_EVPN peer-group
   neighbor LEAF_EVPN remote-as 65002
   neighbor LEAF_EVPN update-source Loopback0
   neighbor LEAF_EVPN ebgp-multihop 5
   neighbor LEAF_EVPN send-community extended
   neighbor LEAF_EVPN next-hop-unchanged
   neighbor LEAF_EVPN maximum-routes 12000
   neighbor 1.1.1.11 peer-group LEAF_EVPN
   neighbor 1.1.1.12 peer-group LEAF_EVPN
   neighbor 1.1.1.21 peer-group LEAF_EVPN
   neighbor 1.1.1.22 peer-group LEAF_EVPN
   !
   address-family evpn
      neighbor LEAF_EVPN activate
   !
   address-family ipv4
      no neighbor LEAF_EVPN activate
!
   address-family ipv6
      no neighbor LEAF_EVPN activate
!
```

EVPN BGP Overlay Configuration: Spine-2

```
!
router bgp 65001
   router-id 1.1.1.2
   distance bgp 20 200 200
   maximum-paths 8 ecmp 16
   neighbor LEAF_EVPN peer-group
   neighbor LEAF_EVPN remote-as 65002
   neighbor LEAF_EVPN update-source Loopback0
   neighbor LEAF_EVPN ebgp-multihop 5
   neighbor LEAF_EVPN send-community extended
   neighbor LEAF_EVPN next-hop-unchanged
   neighbor LEAF_EVPN maximum-routes 12000
   neighbor 1.1.1.11 peer-group LEAF_EVPN
   neighbor 1.1.1.12 peer-group LEAF_EVPN
   neighbor 1.1.1.21 peer-group LEAF_EVPN
   neighbor 1.1.1.21 peer-group LEAF_EVPN

!
   address-family ipv6
```

```
      no neighbor LEAF_EVPN activate
!
```

18.15.2.9 Symmetric IRB Configuration (Tenant-A)

In symmetric IRB, the host routes are generated by advertising type-2 routes with both the MAC VRF VNI and the routing (or VRF) VNI. On ***Leaf-11***, the MAC VRFs for ***Tenant-A*** are left in their default configuration (i.e., redistributing host routes). The example below shows the configuration for the MAC VRF.

MAC VRF Configuration for Tenant-A: Leaf-11

The **`redistribute learned`** commands below cause type-2 routes to be advertised with two labels: in ***VLAN 10***, ***1010*** and ***1000***; in ***VLAN 11***, 1011 and ***1000***; in ***VLAN 21***, ***1021*** and ***1000***.

```
vlan 10
      rd 1.1.1.11:1010
      route-target both 1010:1010
      redistribute learned
!
   vlan 11
      rd 1.1.1.11:1011
      route-target both 1011:1011
      redistribute learned
!
   vlan 21
      rd 1.1.1.11:1021
      route-target both 1021:1021
      redistribute learned
   !
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with two labels. For example, on switches ***Leaf-21*** and ***Leaf-22***, any MAC-IP binding locally learned on subnets ***10.10.10.0/24***, ***10.10.11.0/24***, or ***10.10.21.0/24*** will be advertised as type-2 routes with two labels (the MAC VRF of ***1010***, ***1011***, or ***1021*** and the IP VRF of ***1000***) and two route targets equal to the relevant MAC VRF for the host and IP VRF for the tenant (***1000:1000***). The remote leaf switches (***Leaf-11*** and ***Leaf-12***), will now learn the host route in the IP VRF.

In addition to advertising the type-2 routes with dual labels, the switch will still advertise type-5 routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned. With both a layer-2 route and layer-3 host route for Server-3 learned on the MAC VRF(***1010***) and the IP VRF (***1000***) on ***Leaf-11***, traffic ingressing on ***Leaf-11*** from the local subnet ***10.10.10.103*** (i.e., ***VLAN 10***) will be VXLAN bridged based on the MAC VRF entry. Traffic ingressing from outside the subnet (i.e., ***VLAN 11***, ***12***, ***13***, or ***20***) will be routed to the host via the IP VRF host route.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

The type-5 routes are advertised with the IP VRF Route Distinguisher and the VNI label, signifying that the forwarding path for the prefix would be the IP VRF. The imported routes from the eBGP peering with the BGP border router in ***Leaf-11*** and ***Leaf-12*** are imported by both switches respectively and redistributed via type-5 advertisements to ***Leaf-21*** and ***Leaf-22***.

18.15.2.10 Asymmetric IRB Configuration (Tenant-B)

In asymmetric IRB, the host routes are generated by advertising type-2 routes with just the MAC VRF VNI. On leaf 11, the MAC VRFs for ***Tenant-B*** are configured with no redistribute host route within the MAC VRF configuration. The example below shows the configuration for the MAC VRF.

MAC VRF Configuration for Tenant-B: Leaf-11

The **`no redistribute host-route`** commands below cause type-2 routes to be advertised with a single label: in ***VLAN 210***, ***1110***; in ***VLAN 211***, ***1211***; in ***VLAN 220***, ***1220***; and in the VLAN-aware bundle (***Tenant-B-VLAN-212-213***), ***1212*** and ***1213***.

```
vlan 210
      rd 1.1.1.11:1210
      route-target both 1210:1210
      redistribute learned
      no redistribute host-route
   !
   vlan 211
      rd 1.1.1.11:1211
      route-target both 1211:1211
      redistribute learned
      no redistribute host-route
   !
   vlan 220
      rd 1.1.1.11:1220
      route-target both 1220:1220
      redistribute learned
      no redistribute host-route
!
     vlan-aware-bundle Tenant-B-VLAN-212-213
      rd 1.1.1.11:21213
      route-target both 212:213
      redistribute learned
      no redistribute host-route
      vlan 212-213
   !
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with a single label. For example, on ***Leaf-11*** and ***Leaf-12***, any MAC-IP binding locally learned on subnets ***10.10.10.0/24***, ***10.10.11.0/24***, or ***10.10.21.0/24*** will be advertised as type-2 routes with a single label, the MAC VRF (***1210***, ***1211***, ***1220***, ***1212***, ***1213***, or ***21111***). The IP VRF (***1001***) still advertises the type-5 prefix routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

18.15.3 EVPN MPLS Sample Configuration

This section describes configuring and verifying BGP VPN which has steps similar to the EVPN VXLAN demonstration. Here, we examine BGP EVPN layer 3 VPN over LDP, Segment Routing (ISIS-SR), and BGP-SR transport LSPs. This highlights the difference between the transport and the VPN overlay service.

18.15.3.1 Layer 3 VPN Over ISIS-SR

The following figures illustrate the overview of combined control and data planes.

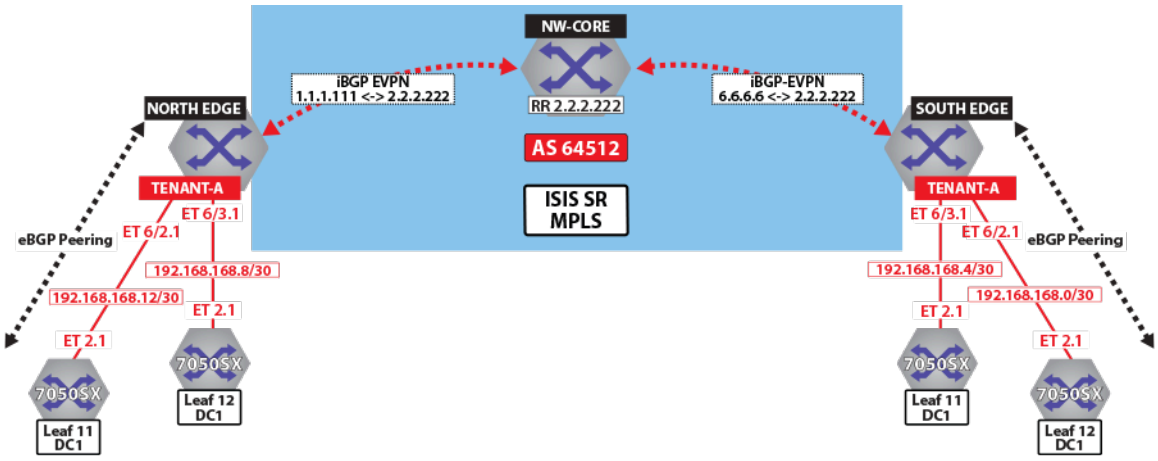

Figure 123: Control Plane Tenant-A Over ISIS-SR

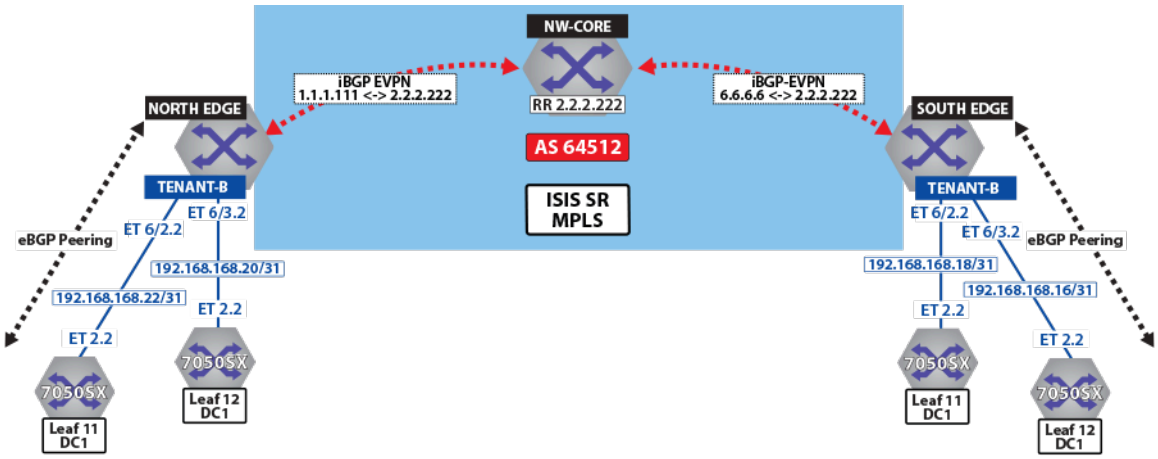

Figure 124: Control Plane Tenant-B over ISIS-SR

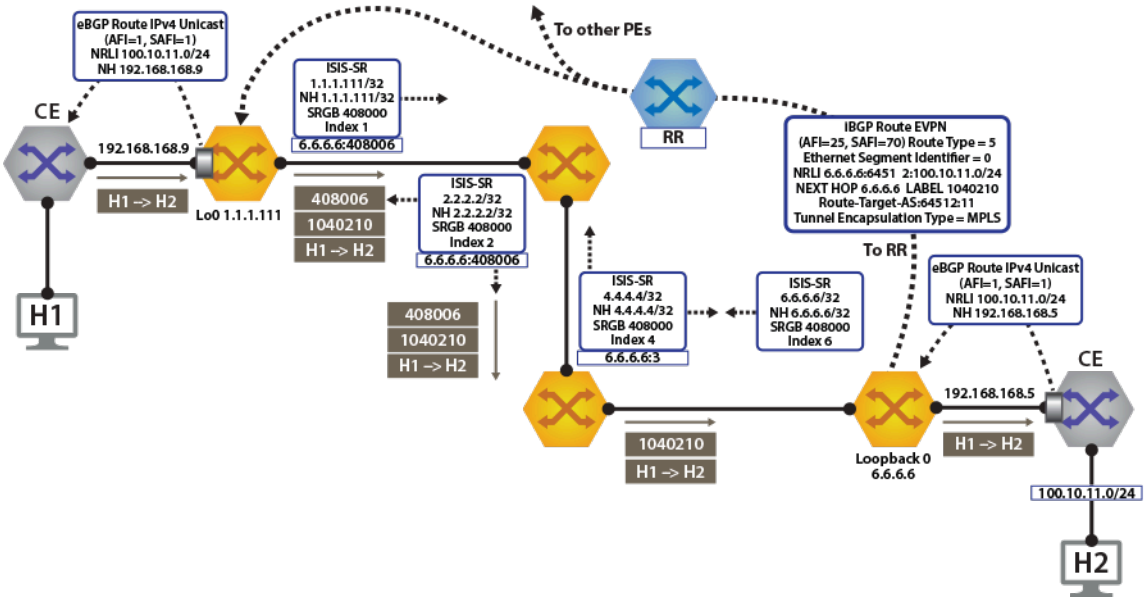

Figure 125: Control Plane & Forwarding Tenant-A Over ISIS-SR

The North Edge router has an eBGP peering session out to ***Leaf-11*** and ***Leaf-12*** in ***DC1***, while the South Edge router has peerings to ***Leaf-11*** and***Leaf-12*** in ***DC2***. Tenant-a has few additional local interfaces used for testing.

Example

The **`show ip route vrf tenant-a connected`** command displays the interfaces assigned to the tenant-a of North Edge router.

```
north-edge# show ip route vrf tenant-a connected

VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

 C      192.168.168.8/30 is directly connected, Ethernet6/3.1
 C      192.168.168.12/30 is directly connected, Ethernet6/2.1
```

Activating EVPN

In all scenarios, the EVPN must be activated under BGP and neighbors configured to exchange Layer 2 VPN/EVPN NLRI.The tenant's VRF (tenant-a and tenant-b) is associated with a dynamically assigned label by BGP.

An activated EVPN provides the following functionalities:

- Enables the multi-agent routing protocol model, which is required for EVPN support.
- Sets the local autonomous system number to 64512 and configures IBGP neighbors that are activated for the Layer 2 VPN/EVPN address family.
- Sets the EVPN encapsulation type to MPLS.
- Specifies that Loopback0 will be used as the next-hop for all advertised EVPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

Example

The **`service routing protocols model multi-agent`** command activates EVPN on the north edge router.

```
service routing protocols model multi-agent

router bgp 64512
   router-id 1.1.1.111
   maximum-paths 128 ecmp 128
   neighbor 2.2.2.222 remote-as 64512
   neighbor 2.2.2.222 update-source Loopback0
   neighbor 2.2.2.222 bfd
   neighbor 2.2.2.222 send-community extended
   !
   address-family evpn
     neighbor default encapsulation mpls next-hop-self source-interface
 Loopback0
       neighbor default graceful-restart
       neighbor 2.2.2.222 activate
   !
```

Layer 3 Overlay Configuration

Distribution of layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, IP routing must be enabled in the VRF.

The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise EVPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRF's IPv4 table into EVPN consists of both the RD and the original IP prefix.

The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received EVPN type-5 routes carrying at least one RT matching the VRFs configuration are imported into the VRF. The route target directives are configured under the IPv4 or IPv6 address- family.

Example

The **`vrf tenant-a`** and **`vrf tenant-a`** commands define overlay VRFs (***tenant-a*** and ***tenant-b***) on the VTEP of North Edge router and enables IPv4 routing within them.

```
vrf tenant-a
      rd 1.1.1.1:64512
      route-target import evpn 64512:11
      route-target export evpn 64512:11
      router-id 1.1.1.111
      neighbor 192.168.168.10 remote-as 65002
      neighbor 192.168.168.10 local-as 64512 no-prepend replace-as
      neighbor 192.168.168.10 default-originate
      neighbor 192.168.168.10 maximum-routes 12000
      neighbor 192.168.168.14 remote-as 65002
      neighbor 192.168.168.14 local-as 64512 no-prepend replace-as
      neighbor 192.168.168.14 default-originate
      neighbor 192.168.168.14 maximum-routes 12000
      redistribute connected
      redistribute static
   !
   vrf tenant-b
      rd 1.1.1.1:64513
      route-target import evpn 64513:11
      route-target export evpn 64513:11
      router-id 1.1.1.111
      neighbor 192.168.168.20 remote-as 65002
      neighbor 192.168.168.20 local-as 64513 no-prepend replace-as
      neighbor 192.168.168.20 maximum-routes 12000
      neighbor 192.168.168.22 remote-as 65002
      neighbor 192.168.168.22 local-as 64513 no-prepend replace-as
      neighbor 192.168.168.22 maximum-routes 12000
      redistribute connected
      redistribute static
   !
```

Verifying BGP EVPN Layer 3 VPN

Show commands are executed in the North Edge router to view routes to the South Edge router. Execute the same commands in the South Edge router to view vice-versa routes.

Examples

- The **`show bgp evpn summary`** command displays the status of EVPN peers in North Edge router.

```
north-edge# show bgp evpn summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
```

```
  Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State
PfxRcd PfxAcc
  2.2.2.222        4  64512            195       127    0    0 01:13:31 Estab  78     78
```

- The **`show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6`** command displays all BGP EVPN ip prefix routes received from the South Edge router (***6.6.6.6***). Not all are advertised via the ***RR 2.2.2.222***.

Note: Each entry in the table represents a BGP path. The path specific information includes Route-Distinguisher and IP prefix. Paths are either received from EVPN peers or exported from local VRFs.

```
north-edge# show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E -
 ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence

```

Note: EVPN routes are received from router ***2.2.2.222*** C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being ***6.6.6.6***.

- The **`show ip route vrf tenant-b`** command displays the BGP table for VRF in ***tenant-b*** containing imported EVPN routes.

```
north-edge# show ip route vrf tenant-b

VRF: tenant-b
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

```

Note: If we look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, whilst the transport label for ***NH 6.6.6.6*** is the same. The only difference seen in ***tenant-b***, aside from the different VPN label, is that there are no host-routes in ***tenant-b*** because within each DC ***tenant-b*** is running in asymmetric mode, therefore no host routes are generated/installed in the IP VRF.

18.15.3.2 Layer 3 EVPN Over LDP

The following figures illustrate an overview of the combines control and data planes.

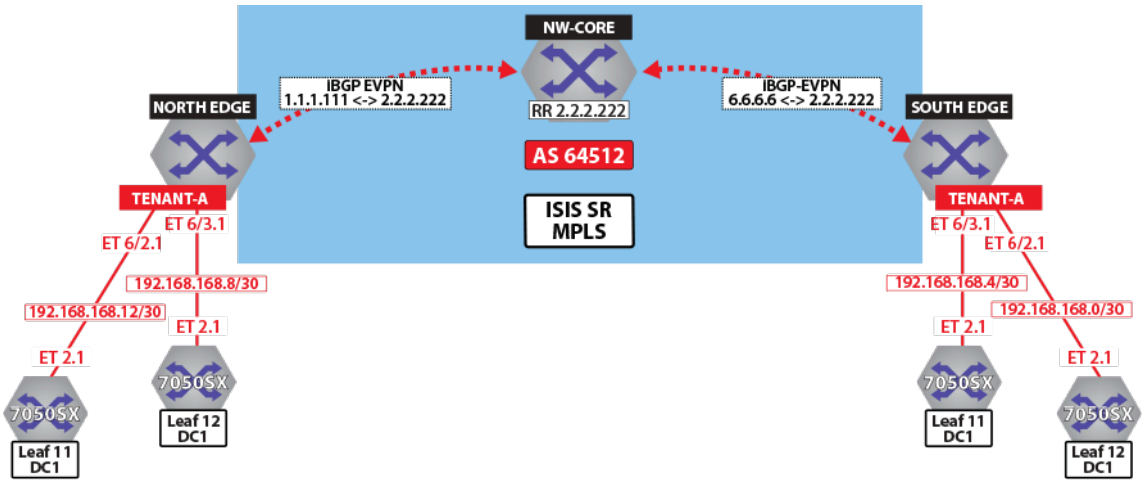

Figure 126: Control Plane Tenant-A Over LDP

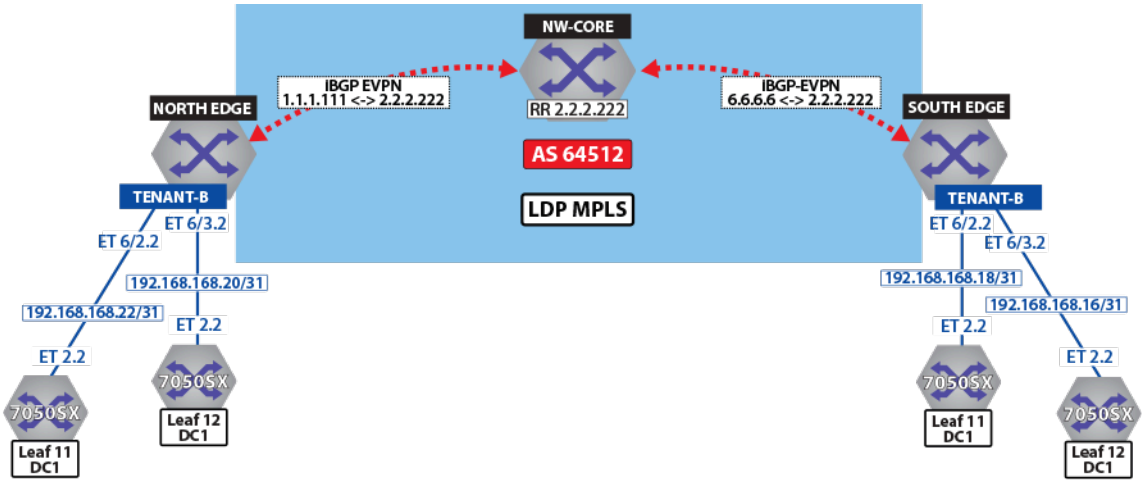

Figure 127: Control Plane Tenant-B over LDP

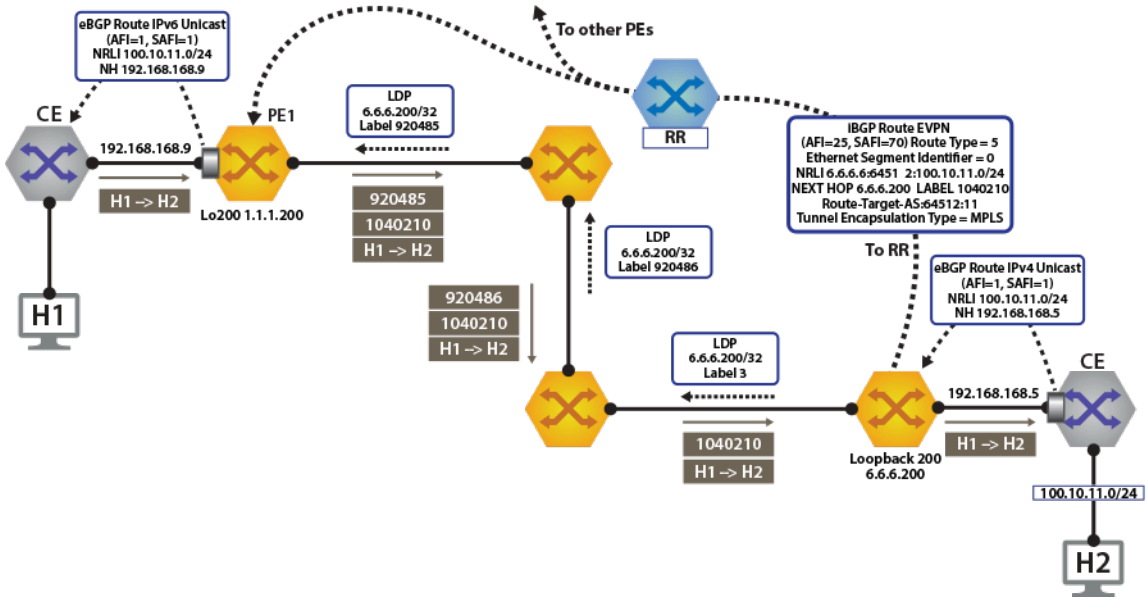

Figure 128: Control Plane & Forwarding Tenant-A Over LDP

To switch to using the MPLS LDP transport, we simply need to change the next-hop advertised for EVPN routes. As illustrated above, the next hop needs to be set to loopback ***200*** to use the LDP LSP.

This is simply achieved by configuring the next-hop for EVPN routes on both North Edge and South Edge routes. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to ***6.6.6.200*** for ***tenant-a*** and ***tenant-b***.

```
router bgp 64512
   !
   address-family evpn
     neighbor default encapsulation mpls next-hop-self source-interface
 Loopback200
```

Once this is configured, we can check the BGP updates and the routes in the VRF.

```
north-edge# show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64512
 Paths: 1 available
  65006
    6.6.6.200 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64512:11 TunnelEncap:tunnelTypeMpls
      MPLS label: 958810
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64513
 Paths: 1 available
  65006
    6.6.6.200 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64513:11 TunnelEncap:tunnelTypeMpls
      MPLS label: 953372
```

Note: Again, we have the same route in tenant-a and tenant-b in DC2. Therefore, the two other routes with ***RD 6.6.6.6:64513*** and ***RT 64513:11***. The VPN label has not changed, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

Finally, let us look at the routes in the VRF ***tenant-a***.

```
north-edge# show ip route vrf tenant-a

VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS ----level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort:
 B I    0.0.0.0/0 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                          via 192.168.58.12, Ethernet1/1, label 904097
                          via 192.168.59.12, Ethernet2/1, label 904098

 B E    10.10.10.103/32 [200/0] via 192.168.168.14, Ethernet6/2.1
                                  via 192.168.168.10, Ethernet6/3.1
 B E    10.10.10.104/32 [200/0] via 192.168.168.14, Ethernet6/2.1

                                 via 192.168.168.10, Ethernet6/3.1
 B I    100.10.10.103/32 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                    via 192.168.58.12, Ethernet1/1, label 904097
                                    via 192.168.59.12, Ethernet2/1, label 904098

 B I    192.168.168.4/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                    via 192.168.58.12, Ethernet1/1, label 904097
                                    via 192.168.59.12, Ethernet2/1, label 904098
 C      192.168.168.8/30 is directly connected, Ethernet6/3.1
 C      192.168.168.12/30 is directly connected, Ethernet6/2.1
 B I    223.255.254.248/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
```

```
                                       via 192.168.58.12, Ethernet1/1, label 904097
                                       via 192.168.59.12, Ethernet2/1, label 904098
 B I    223.255.254.252/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                       via 192.168.58.12, Ethernet1/1, label 904097
                                       via 192.168.59.12, Ethernet2/1, label 904098
 B E    223.255.255.248/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                   via 192.168.168.10, Ethernet6/3.1
 B E    223.255.255.252/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                   via 192.168.168.10, Ethernet6/3.1
```

Note: As can be seen from the highlighted route above the label stack, the route has the same VPN route ***958810***, but the transport labels are now ***904097*** and ***904098*** on top (this is the ECMP label path to reach ***NH 6.6.6.200***).

As a comparison, let us look at the routes for ***tenant-b***.

```
north-edge# show ip route vrf tenant-b

VRF: tenant-b
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort:

                                       via 192.168.58.12, Ethernet1/1, label 904097
                                       via 192.168.59.12, Ethernet2/1, label 904098
 B E    223.255.255.248/30 [200/0] via 192.168.168.22, Ethernet6/2.2
                                   via 192.168.168.20, Ethernet6/3.2
 B E    223.255.255.252/30 [200/0] via 192.168.168.22, Ethernet6/2.2
```

Note: The only difference apart from the missing host routes (no host-route inject for this tenant), is the VPN label.

18.15.3.3 Layer 3 EVPN Over BGP-SR

The following figures illustrate an overview of the combined control and data planes.

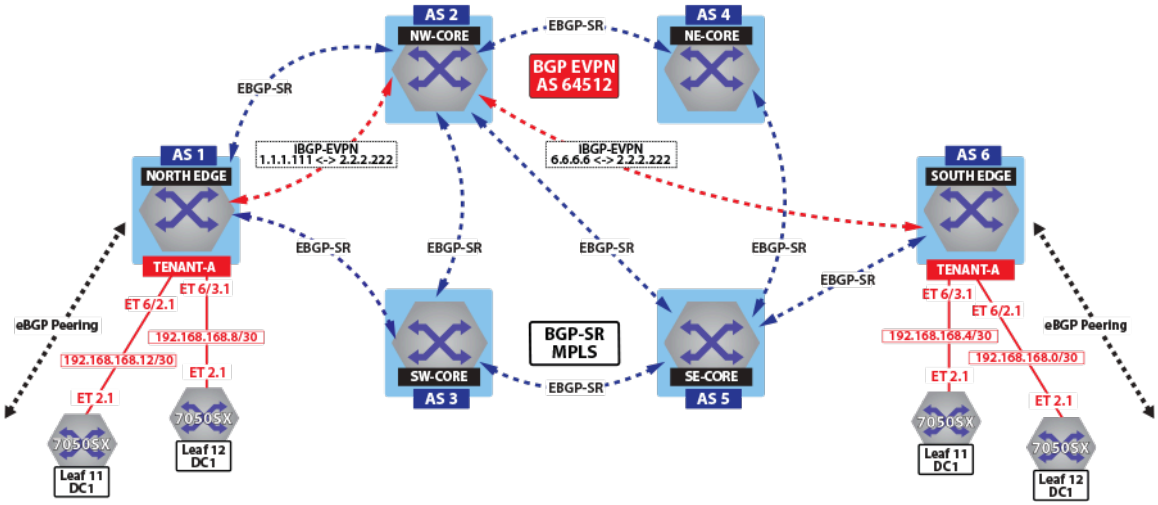

Figure 129: Control Plane Tenant-A Over BGP-SR

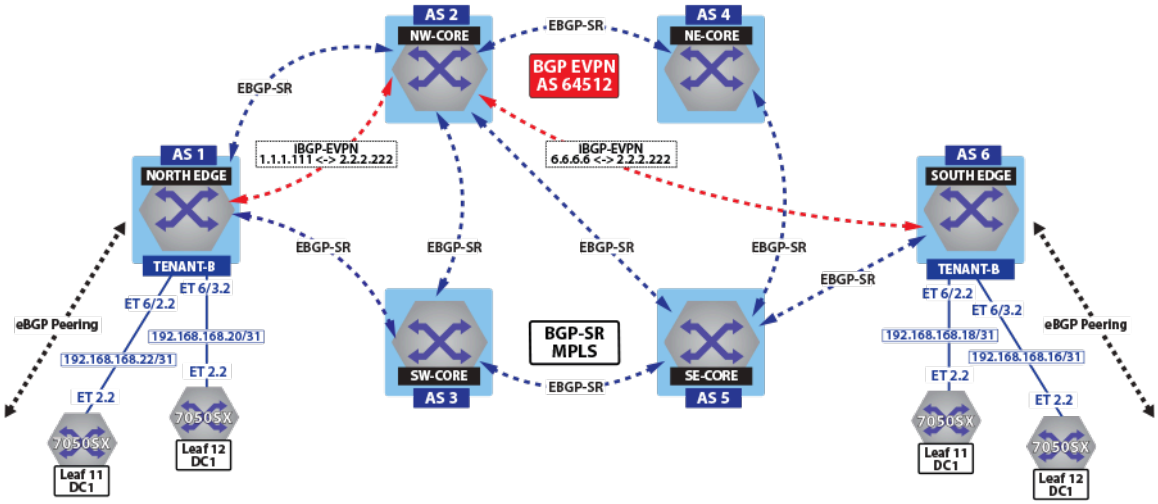

Figure 130: Control Plane Tenant-B Over BGP-SR

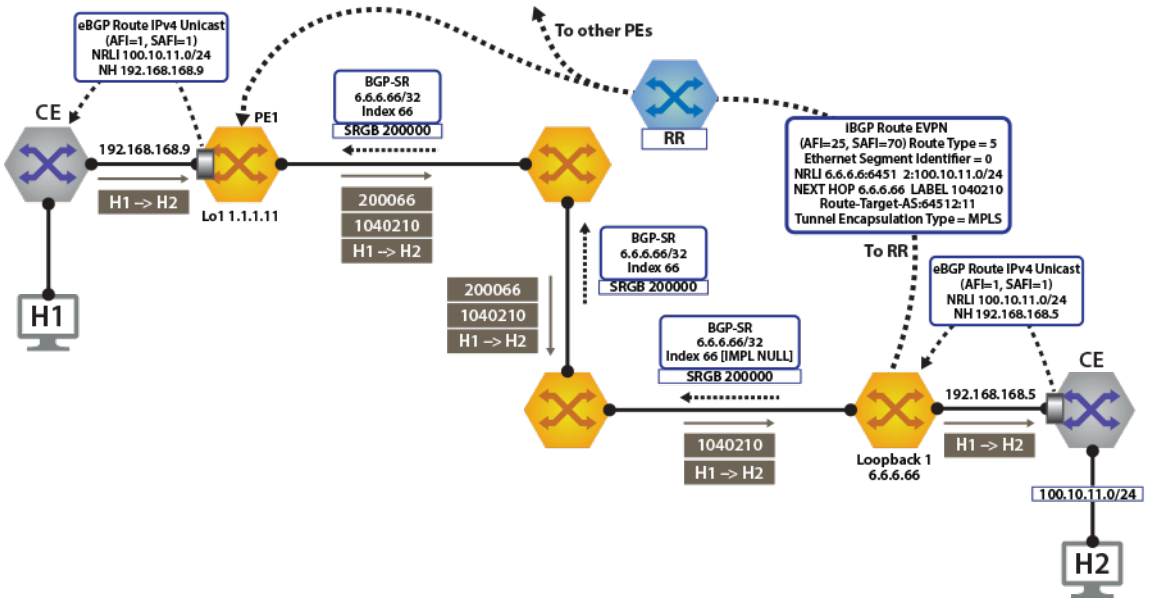

Figure 131: Control Plane & Forwarding Tenant-A Over BGP-SR

To switch to using the MPLS BGP-SR transport, we simply need to change the next-hop advertised for the EVPN routes. As shown in Control Plane ***tenant-b*** Over BGP-SR, the next hop needs to be set to ***loopback 1*** for using the BGP-SR LSP. This is achieved by configuring the next-hop for the EVPN routes.

```
router bgp 64512
   !
   address-family evpn
     neighbor default encapsulation mpls next-hop-self source-interface
 Loopback1
```

Once the next-hop for the EVPN routes are configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to ***6.6.6.66*** for ***tenant-a*** and ***tenant-b***.

```
North Edge.17:52:30# show bgp evpn route-type ip-prefix 100.10.11.0/24

Note: Again, we have the same route in tenant-a and tenant-b in DC2. Therefore, the two other routes with ***RD 6.6.6.6:64513*** and ***RT 64513:11***. The VPN label has not changed, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

Finally, let us look at the routes in the VRF ***tenant-a***.

```
North Edge.17:55:01# show ip route vrf tenant-a

 label 200066
```

```
                                        via 192.168.59.12, Ethernet2/1,
 label 200066
 B E    223.255.255.248/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                   via 192.168.168.10, Ethernet6/3.1
 B E    223.255.255.252/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                   via 192.168.168.10, Ethernet6/3.1
```

As can be seen from the highlighted route above the label stack, the route are the transport labels ***958810*** and ***200066*** on top (this is the ECMP label path to reach ***NH 6.6.6.66***), with the ***tenant-a*** VPN label ***958810*** next in the stack, identifying the route as belonging to ***tenant-a***.

As a comparison, let us look at the routes for ***tenant-b***. As seen in the output, the VPN label assigned to ***tenant-b*** is ***953372***.

```
north-edge# show bgp evpn route-type ip-prefix 100.10.11.0/24 detail

      MPLS label: 953372
north-edge#
```

If we now look at the routes in the VRF for ***tenant-b***, we see that the VPN label has now changed, while the transport label (for ***NH 6.6.6.66*** is the same). The only difference seen in ***tenant-b***, aside from the different VPN label, is that there are no host-routes in ***tenant-b*** because within each DC ***tenant-b*** is running in asymmetric mode; therefore, no host routes are generated/installed in the IP VRF.

```

```

18.15.4 EVPN VxLAN IPv6 Overlay

The EVPN VXLAN L3 Gateway using EVPN IRB supports routing traffic from one IPv6 host to another IPv6 host on a stretched VXLAN VLAN on platforms that support ND Proxy and ND suppression. The **`ipv6 address virtual`** command enables the use of one MAC address for all SVI instead of one per SVI. Both EVPN IRB and VXLAN tunnel interface are required for the feature to work. The VXLAN must be configured with a VNI or the VRF for the VLAN must be configured with a VRF/VNI mapping.

Configuring for Overlay

The following configures the switches for global IPv6 unicast routing and IPv6 unicast routing for each VRF.

```
switch(config)# ipv6 unicast-routing
switch(config)# ipv6 unicast-routing vrf tenant-c
```

The following configures the switches with a virtual MAC address, which is used for mapping all virtual router IP addresses. For VARP configs, the address is receive-only; the switch never sends packets

with this address as the source. For **ip address virtual**, the address is also used as the source for ARP packets.

```
Switch(config)# ipv6 virtual-router mac-address <mac>
```

The following shows the switch with IPv6 configured where one SVI uses one physical IP address.

```
switch# show run int vlan 501
interface Vlan501
      vrf forwarding tenant-c
      ipv6 enable
ipv6 address 2004:220::1:2/112
ipv6 virtual-router address 2004:220::1:10
```

The following shows configuration for the switch such that all SVI use the virtual MAC address and only one physical IP address.

```
switch# show run int vlan 501
interface Vlan501
      vrf forwarding tenant-c
      ipv6 enable
ipv6 address virtual 2004:220::1:10/112
```

Limitations

Any topology that requires a VXLAN Virtual VTEP address configuration is not supported.

Example Configurations

VRF-TO-VNI MAP and VLAN-TO-VNI MAP

Under ***Vxlan1*** interface:

```
switch(config)#
interface vxlan1
   vxlan vrf tenant-c vni 4001
   vxlan vlan 501 vni 10501
```

MAC-VRF

Under BGP router configuration mode:

```
switch(config)#
Router bgp 65000
vlan 501
      rd 20.1.1.1:10501
      route-target both 1:10501
      redistribute learned
```

IPv6 VRF BGP

```
switch(config)#
router bgp 65000
vrf tenant-c
   rd 2.0.0.1:4001
   router-target import evpn 4001:4001
   router-target export evpn 4001:4001

! configure IPv4 router ID under the BGP VRF configuration
! for activating V6-only VRF
!
router-id 4.0.0.1
```

The selective installation configuration is the same for ARP and IPv6 ND.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)#arp ?
 proxy              Proxy ARP
 selective-install  Install ARP entries for remote hosts on demand
switch(config-rtr-l2-vpn)#arp selective-install
```

The following disables the ND proxy reply to an NS for the specified target IPv6 address(es).

```
switch(config)#
ipv6 prefix-list list-test
seq 10 deny 2000:0:0:69::19/64
! do not perform ND proxy on 2000:0:0:69::19/64

switch(config)# router l2-vpnswitch(config-rtr-l2-vpn)#nd proxy prefix-
list list-test
```

The following restores the proxy behavior.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# no nd proxy prefix-list list-test
```

The following disables router solicitation packets sent by a host from getting flooded to all VTEPs.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# nd rs flooding disabled
```

The following restores the default behavior.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# no nd rs flooding disabled
```

The following disables Duplicate-Address-Detection (DAD) multicast packets from getting flooded to all VTEPs when there is no matching IP to MAC binding found in EVPN published IP to MAC bindings. When there is a match found, a DAD frame is flooded to all VTEPs (instead of doing a proxy reply) to confirm that host liveliness.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# nd dad flooding disabled
```

The following restores the default behavior.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# no nd dad flooding disabled
```

The following disables Neighbor Advertisement (NA) multicast packets from the SVI configured as a virtual router from getting flooded to all VTEPs.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# virtual-router neighbor advertisement flooding
 disabled
```

The following restores the default behavior.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# no virtual-router neighbor advertisement
 flooding disabled
```

The following disables Gratuitous ARP multicast packets from the SVI configured as a virtual router from getting flooded to all VTEPs.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# virtual-router arp advertisement flooding
 disabled
```

The following restores the default behavior.

```
switch(config)# router l2-vpn
switch(config-rtr-l2-vpn)# no virtual-router arp advertisement flooding
 disabled
```

Checking the Status of the Switches

IPv6 Local Host

The following displays the ND bindings for a given VRF. The output shows that the local host ***002c.0100.0001*** has an IPv6 link local address ***fe80::22c:1ff:fe00:1*** and a global IPv6 address ***2004:220::1:50***. The host is connected to the MLAG port-channel ***20***.

```
switch# show ipv6 neighbors vrf tenant-c vlan 501 | i 002c.0100.0001
2004:220::1:50          N/A 002c.0100.0001   REACH Vl501, Port-Channel20
fe80::22c:1ff:fe00:1    N/A 002c.0100.0001   REACH Vl501, Port-Channel20
```

EVPN IRB redistributes all the local hosts in ***VLAN 501***. The MAC address of the host is advertised as EVPN Type 2 MAC-only route advertisement. The global IPv6 to MAC binding is advertised using MAC-IP route.

Note: By default, the IPv6 link local binding is not advertised by EVPN.

The following displays the two MAC-only routes and two MAC-IP routes. In both cases, one route is locally originated and the second one advertised by the MLAG peer with the same VTEP IP *10.0.0.1*.

```
switch# show bgp evpn route-type mac-ip 002c.0100.0001

IPv6 Link Local Redistribution

The following configures **`link-local redistribution`** command under BGP router MAC-VRF configuration mode to redistribute IPv6 link local binding.

```
vlan 501
rd 20.1.1.1:10501
route-target both 1:10501
redistribute learned
redistribute link-local ipv6
```

When this is configured, NS from a local host for a link local target will get proxy-replied by the ingress VTEP if the binding is published to EVPN by a remote VTEP. The NS in that case will not get replicated to other VTEPs.

IPv6 Remote Host

The following displays the MAC-only and MAC-IP routes for remote host ***002d.0100.0001***. These two routes originated from VTEP ***10.0.0.2***.

```
switch# show bgp evpn route-type mac-ip 002d.0100.0001 detail
BGP routing table information for VRF default
Router identifier 1.0.1.1, local AS number 65000

BGP routing table entry for mac-ip 002d.0100.0001, Route Distinguisher:
 20.1.1.3:10501
 Paths: 1 available
  65002 65004
    10.0.0.2 from 1.0.1.111 (1.0.1.111)
      Origin IGP, metric -, localpref 100, weight 0, valid, external,
 best
      Extended Community: Route-Target-AS:1:10501 TunnelEncap:t
unnelTypeVxlan
      VNI: 10501 ESI: 0000:0000:0000:0000:0000

BGP routing table entry for mac-ip 002d.0100.0001 2004:220::1:151, Route
 Distinguisher: 20.1.1.3:10501

```

18.15.5 IP VPNs Sample Configuration

Here, we examine BGP EVPN layer 3 VPN over an LDP, ISIS-SR, and BGP-SR transport LSPs. This highlights the separation between the transport and the VPN overlay service.

The following figures illustrate the sample VPN Physical Topology.

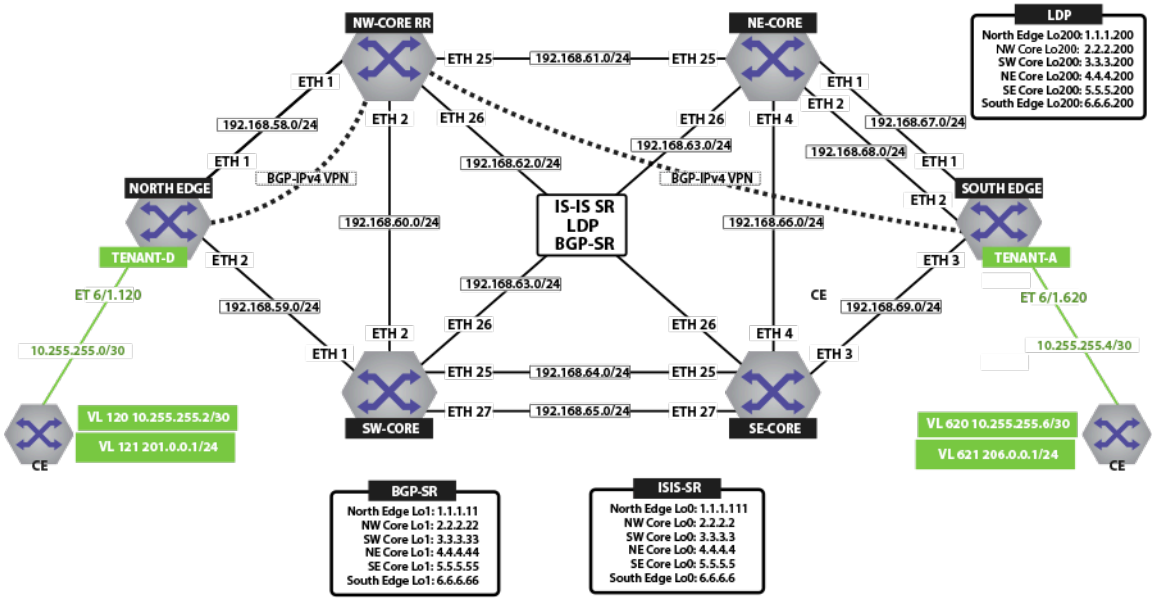

Figure 132: IPv4 VPN Physical Topology

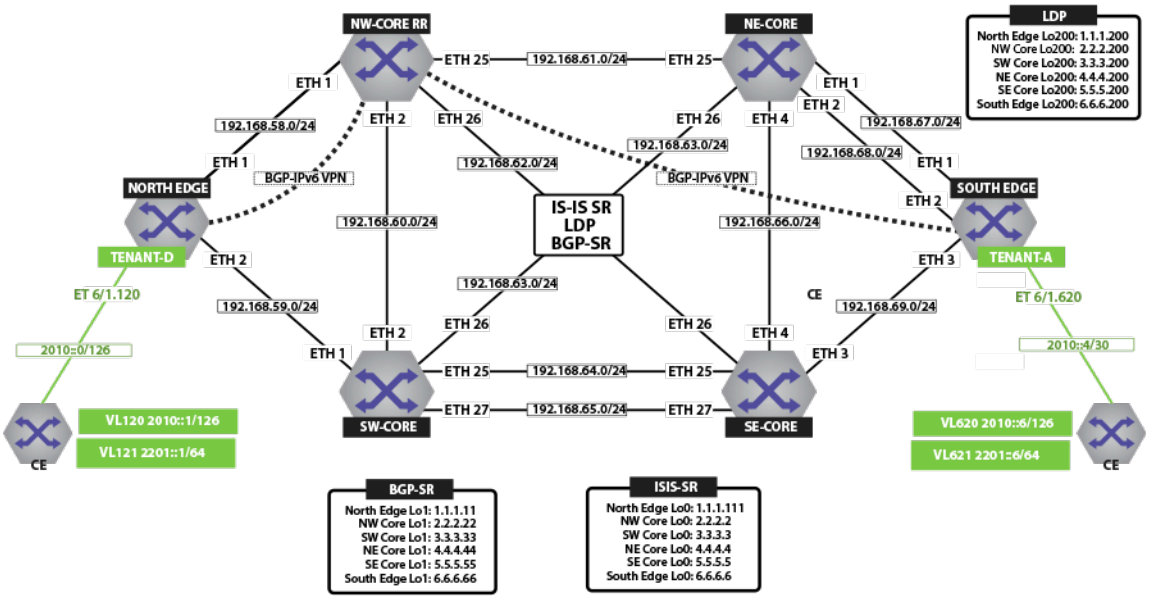

Figure 133: IPv6 VPN Physical Topology

18.15.5.1 IP VPN over ISIS-SR

The figure below illustrates an overview of the combined control and data planes.

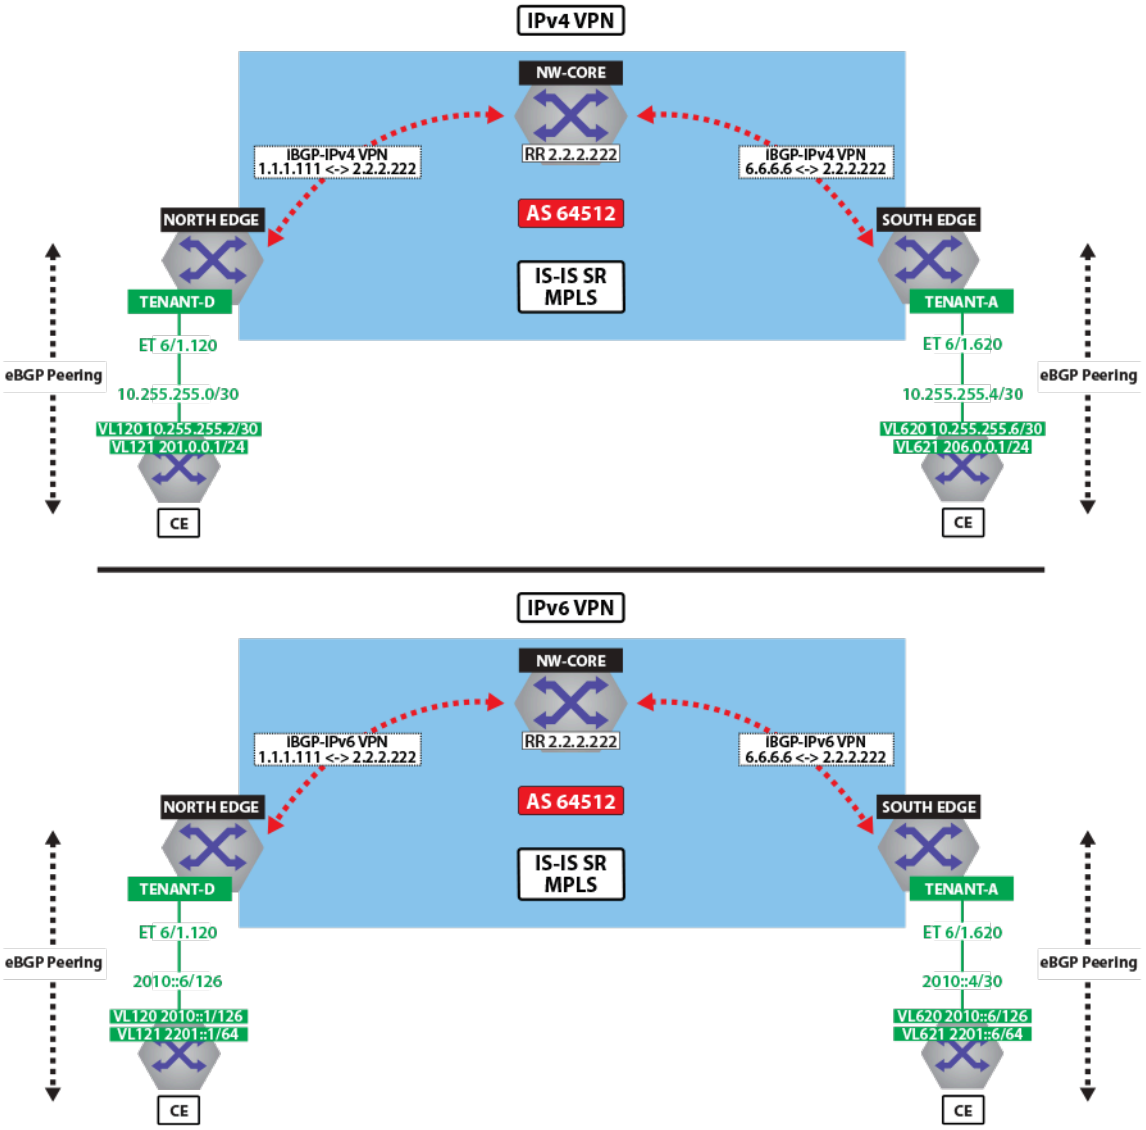

Figure 134: IPv4 VPN and IPv6 VPN Over ISIS-SR MPLS

The next two figures illustrate the forwarding path and control plane for both IP traffic over ISIS MPLS segment routing.

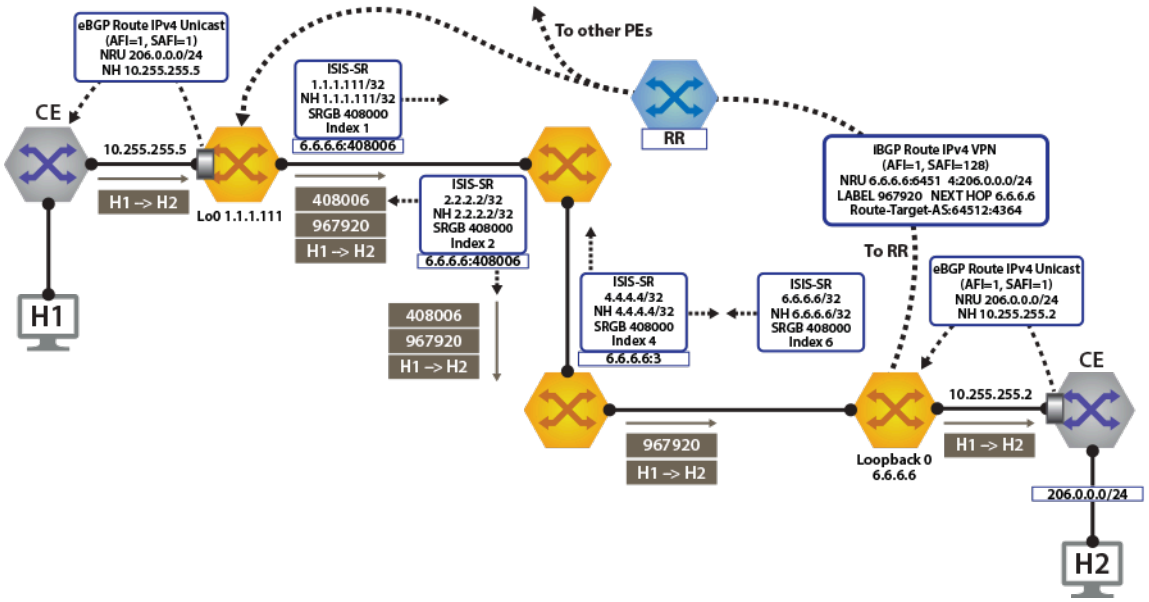

Figure 135: IPv4 VPN Forwarding Over ISIS-SR MPLS

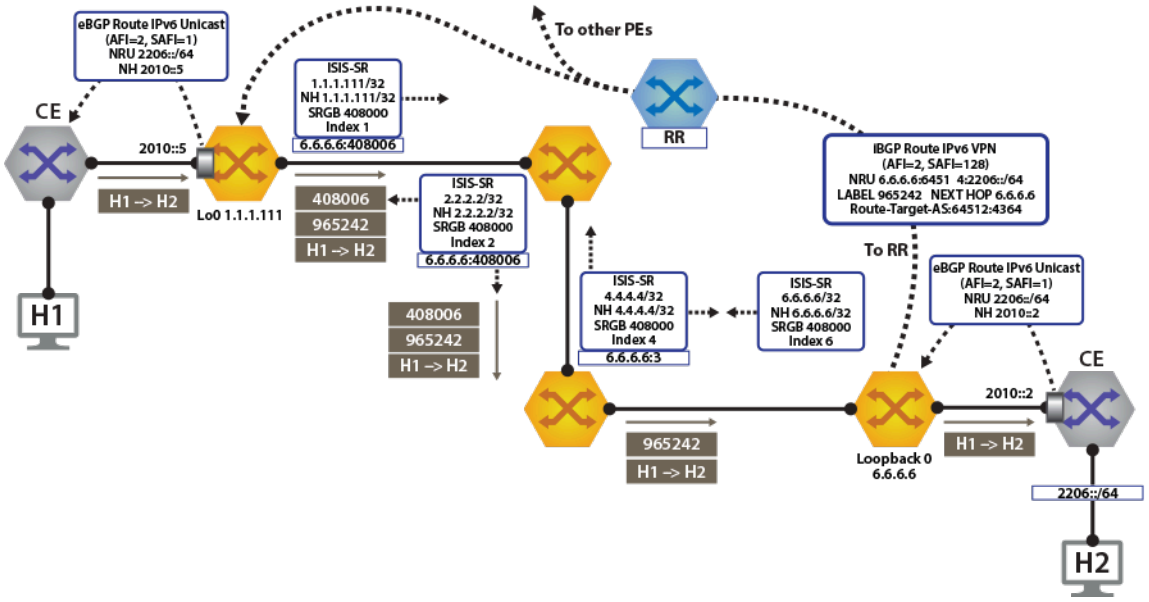

Figure 136: IPv6 VPN Forwarding Over ISIS-SR MPLS

View IPv4 and IPv6 Routes in the VRF

Both North Edge and South Edge routers have an eBGP peering session out to the CE; and learning routes from CE and remote PE.

- The **`show ip route vrf tenant-d`** command displays IPv4 Routes in the VRF of North Edge.

```
north-edge# show ip route vrf tenant-d

VRF: tenant-d
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
```

```
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort is not set

 B I    10.255.255.0/30 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index
 6, label 967920
                                    via 192.168.58.12, Ethernet1/1,
 label 408006
 C      10.255.255.4/30 is directly connected, Ethernet6/1.120
 B E    201.0.0.0/24 [200/0] via 10.255.255.6, Ethernet6/1.120
 B I    206.0.0.0/24 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6,

 B    2206::/64 [200/0]
       via 2010::2, Ethernet6/1.620
```

Activating IP VPN

In all scenarios, the IP VPN must be activated under BGP and neighbors configured to exchange the IP VPN NLRIs.The tenant's VRF (tenant-d) is associated with a dynamically assigned label by BGP.

North Edge

```
service routing protocols model multi-agent

router bgp 64512
   router-id 1.1.1.111
   maximum-paths 128 ecmp 128
   neighbor 2.2.2.222 remote-as 64512
   neighbor 2.2.2.222 update-source Loopback0
   neighbor 2.2.2.222 bfd
   neighbor 2.2.2.222 send-community extended
   neighbor 2.2.2.222 maximum-routes 12000
   !
   address-family vpn-ipv4
      neighbor 2.2.2.222 activate
      neighbor default encapsulation mpls next-hop-self source-interface
 Loopback0
   !
   address-family vpn-ipv6
      neighbor 2.2.2.222 activate
      neighbor default encapsulation mpls next-hop-self source-interface
 Loopback0
   !
```

South Edge

```
service routing protocols model multi-agent

router bgp 64512
   router-id 6.6.6.6
   maximum-paths 128 ecmp 128
   neighbor 2.2.2.222 remote-as 64512
   neighbor 2.2.2.222 update-source Loopback0
   neighbor 2.2.2.222 bfd
   neighbor 2.2.2.222 send-community extended
   neighbor 2.2.2.222 maximum-routes 12000
   !
   address-family vpn-ipv4
      neighbor 2.2.2.222 activate
      neighbor default encapsulation mpls next-hop-self source-interface
 Loopback0
   !
   address-family vpn-ipv6
      neighbor 2.2.2.222 activate
      neighbor default encapsulation mpls next-hop-self source-interface
 Loopback0
   !
```

The configuration above provides the following:

- It enables the multi-agent routing protocol model, which is required for BGP VPN support.
- It sets the local autonomous system number to ***64512*** and configured the route-reflector for both IPv4 VPN and IPv6 VPN capabilities.
- It sets the IP VPN encapsulation type to MPLS (default).
- It specifies that ***Loopback0*** will be used as the next-hop for all advertised VPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

Layer 3 Overlay Configuration

Distribution of Layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, either IPv4 or IPv6 routing must be enabled in the VRF.

- Configure IP VRF in the North Edge router.

```
vrf instance tenant-d
ip routing vrf tenant-d
ipv6 unicast-routing vrf tenant-d
!
router bgp 64512
    vrf tenant-d
      rd 1.1.1.1:64514
      route-target import vpn-ipv4 64512:4364
      route-target import vpn-ipv6 64512:4364
      route-target export vpn-ipv4 64512:4364
      route-target export vpn-ipv6 64512:4364
      neighbor 10.255.255.6 remote-as 65011
      neighbor 10.255.255.6 maximum-routes 12000
      neighbor 2010::6 remote-as 65011
      neighbor 2010::6 maximum-routes 12000
      !
      address-family ipv6
         neighbor 2010::6 activate
      redistribute connected
      !
```

- Configure IP VRF in the South Edge router.

```
vrf instance tenant-d
ip routing vrf tenant-d
ipv6 unicast-routing vrf tenant-d
!
router bgp 64512
   vrf tenant-d
      rd 6.6.6.6:64514
      route-target import vpn-ipv4 64512:4364
      route-target import vpn-ipv6 64512:4364
      route-target export vpn-ipv4 64512:4364
      route-target export vpn-ipv6 64512:4364
      neighbor 10.255.255.2 remote-as 65010
      neighbor 10.255.255.2 maximum-routes 12000
      neighbor 2010::2 remote-as 65010
      neighbor 2010::2 maximum-routes 12000
      !
      address-family ipv6
         neighbor 2010::2 activate
       redistribute connected
      !
```

These IP VRF configurations provide the following functionalities:

- It defines overlay VRFs (tenant-d) on the PE and enables IP unicast routing.
- The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise VPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRFs IPv4 table into VPN consists of both the RD and the original IP prefix.
- The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received VPN routes carrying at least one RT matching the VRFs configuration are imported into the VRF.

Verifying IP VPNs over ISIS-SR

- The **`show bgp vpn-ipv4 summary`** command displays the status of the VPN IP peers in the North Edge router with the BGP VPN enabled.

```
north-edge# show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
  Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down
 State
PfxRcd PfxAcc
  2.2.2.222        4  64512            172        45    0    0 00:17:16
 Estab  2      2
north-edge#  show bgp vpn-ipv6 summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
  Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down
 State
PfxRcd PfxAcc
  2.2.2.222        4  64512            172        45    0    0 00:17:20
 Estab  2      2
```

- The **`show bgp vpn-ipv4`** command displays routes sent and received through IP VPN.

```
north-edge# show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
```

```
Route status codes: s - suppressed, * - valid, > - active, # - not
 installed, E - ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete

```

Note: Each entry in the table represents a BGP path. The path specific information includes the Route-Distinguisher and the IP prefix. Paths are either received from VPN peers or exported from local VRFs.

- The **`show bgp vpn-ipv4 206.0.0.0/24 detail`** and **`show bgp vpn-ipv6 2206::/64 detail`** commands display detailed view of the IP prefix route for ***206.0.0.0/24*** and ***2206.::/64*** of the North Edge router.

```
north-edge# show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route
 Distinguisher: 6.6.6.6:64514
 Paths: 1 available
```

```
  65010
    6.6.6.6 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal,
 best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 967920

north-edge# show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv6 prefix 2206::/64, Route Distinguisher:
 6.6.6.6:64514
 Paths: 1 available
  65010
    6.6.6.6 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal,
 best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 965242
```

Note: The output includes the RD and IP prefix identifying the route. As seen in the output, the IPv4 VPN route is received from ***2.2.2.222*** because it is set-up to be a route-reflector, but the next hop is ***6.6.6.6***. Both are advertised with tenant VPN label ***967920*** and ***965242*** and an RT.

- The **`show ip bgp vrf tenant-d`** command displays the BGP table for the VRF containing the imported EVPN routes.

```
north-edge# show ip bgp vrf tenant-d
BGP routing table information for VRF tenant-d
Router identifier 1.1.1.1, local AS number 64512

 2.2.2.222
```

Note: Each entry in the table represent a BGP path that is either locally redistributed and received into the VRF or imported from the IPv4 VPN table. VPN routes are received from router *2.2.2.222* C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being *6.6.6.6*.

Finally, let us look at the routes in the VRF tenant-d.

```
VRF: tenant-d
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort is not set
```

```
B I    10.255.255.0/30 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6,
label 967920
                                    via 192.168.58.12, Ethernet1/1, label
408006
C      10.255.255.4/30 is directly connected, Ethernet6/1.120
B E    201.0.0.0/24 [200/0] via 10.255.255.6, Ethernet6/1.120
B I    206.0.0.0/24 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6,
label 967920
                                  via 192.168.58.12, Ethernet1/1, label
408006
```

Note: As displayed in the highlighted route above the label stack, the route is the transport label 408006 on top (this is the label to reach ***NH 6.6.6.6***), with the ***tenant-a*** VPN label ***967920*** next in the stack, identifying the route as belonging to ***tenant-d***.

A check of the Tunnel FIB confirms that ***408006*** is the ISIS-SR LSP.

```

18.15.5.2 IP VPNs Over LDP

The following figures illustrate an overview of the combined control and data planes.

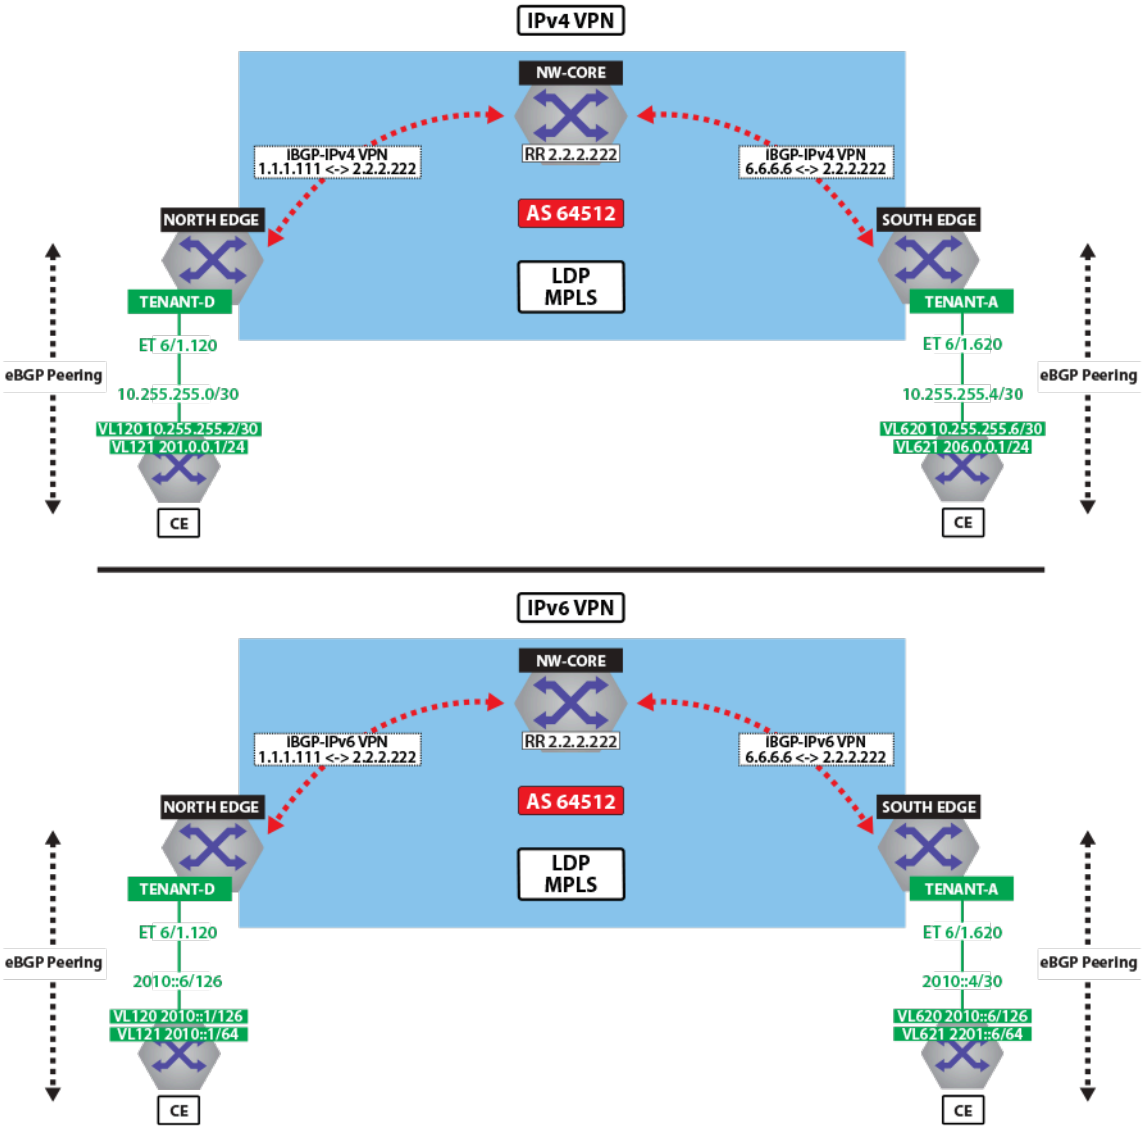

Figure 137: IPv4 VPN and IPv6 VPN Over LDP MPLS

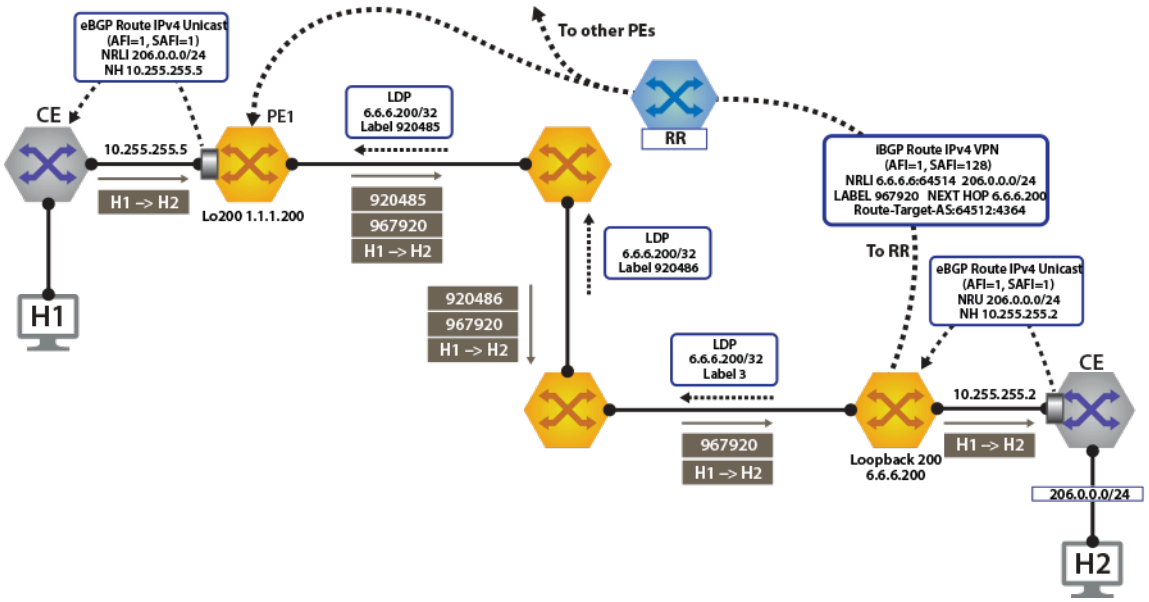

Figure 138: IPv4 VPN Forwarding Over LDP MPLS

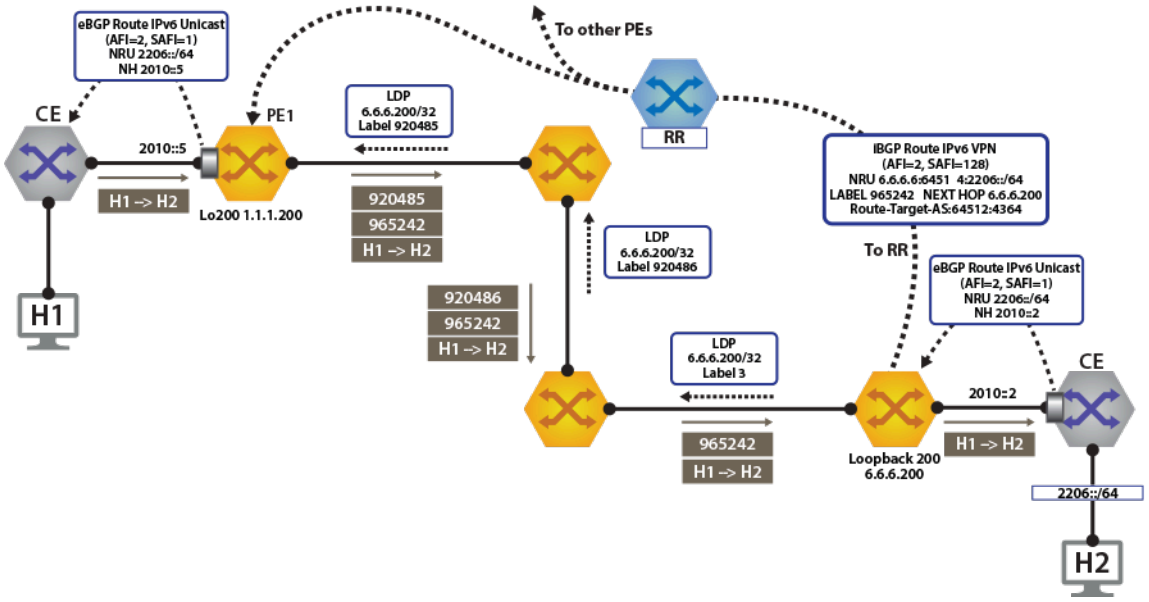

Figure 139: IPv6 VPN Forwarding Over LDP MPLS

To switch to using the MPLS LDP transport, we just need to change the next-hop we advertised for the VPN routes. As shown above, the next hop needs to be set to ***loopback 200*** for using the LDP LSP.

This is achieved by configuring the next-hop for the EVPN routes on both north and south edge routers.

```
router bgp 64512
   !
   address-family evpn
     neighbor default encapsulation mpls next-hop-self source-interface
 Loopback200
```

Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. We now have the NH set to ***6.6.6.200*** for ***tenant-d***.

```
north-edge# show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512

M - Martian, DP - Dynamic Policy Route

 B    2010::/126 [200/0]
       via 6.6.6.6/32, IS-IS SR tunnel index 6, label 965242
          via 192.168.58.12, Ethernet1/1, label 408006
 C    2010::4/126 [0/0]
       via Ethernet6/1.120, directly connected
 B    2201::/64 [200/0]
       via 2010::6, Ethernet6/1.120
 B    2206::/64 [200/0]
       via 6.6.6.6/32, IS-IS SR tunnel index 6, label 965242
          via 192.168.58.12, Ethernet1/1, label 408006
```

Note: As seen from the highlighted route above the label stack, the route are the transport label ***904097*** on top (this is the label path to reach ***NH 6.6.6.200***), with the ***tenant-d*** VPN label ***967920*** next in the stack, and identifying the route as belonging to ***tenant-a***.

A capture of the dataplane on North-Edge matching on the LDP transport label confirms the encapsulated traffic on the wire. ***904097:976920:[Source IP Address][Destination IP Address]***.

18.15.5.3 IP VPNs Over BGP-SR

The following figures illustrate an overview of the combined control and data planes.

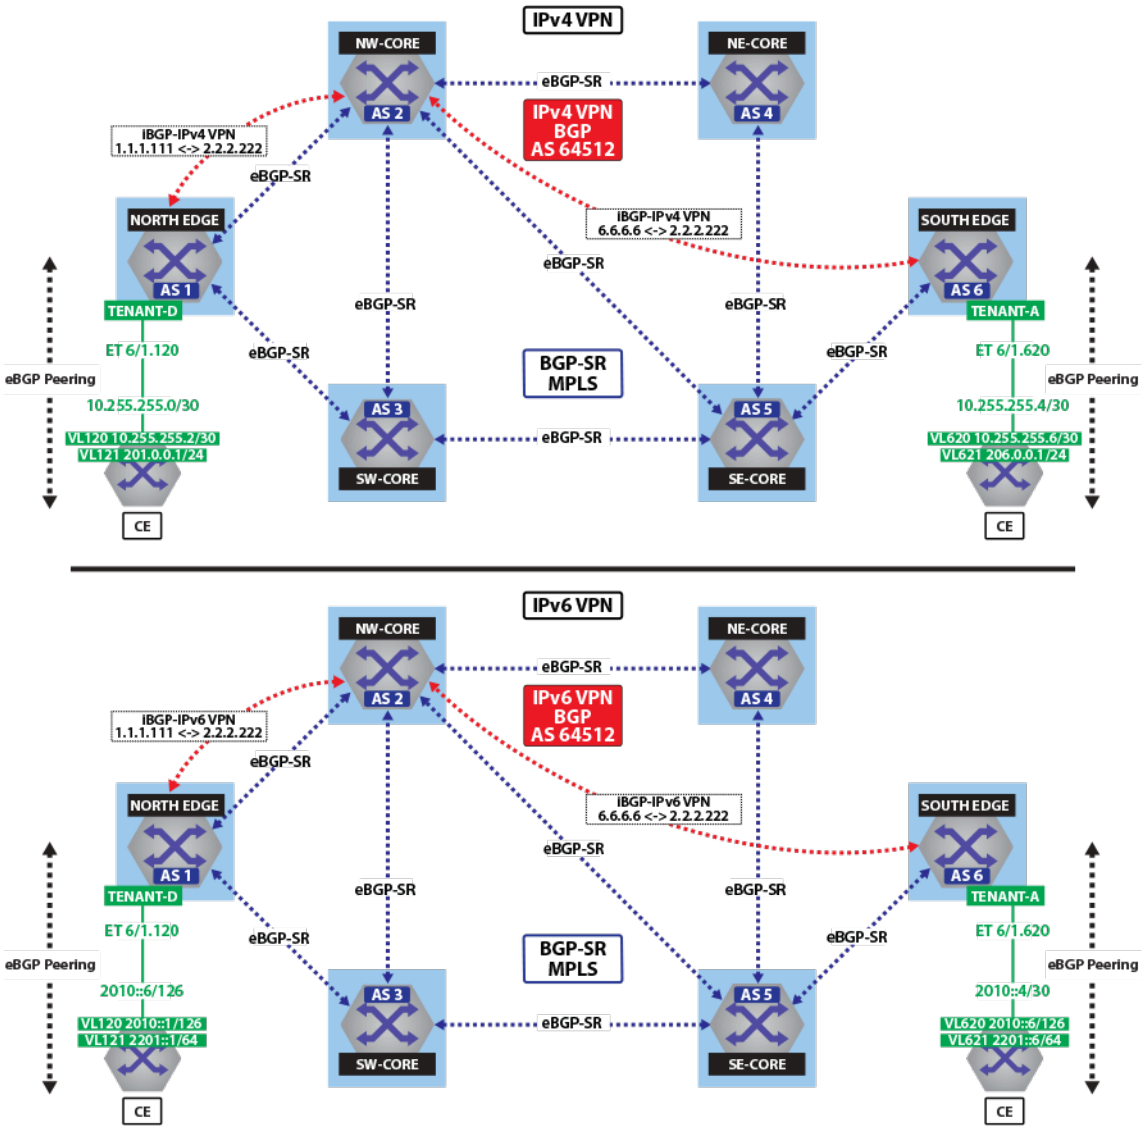

Figure 140: IPv4 VPN and IPv6 VPN Over BGP-SR MPLS

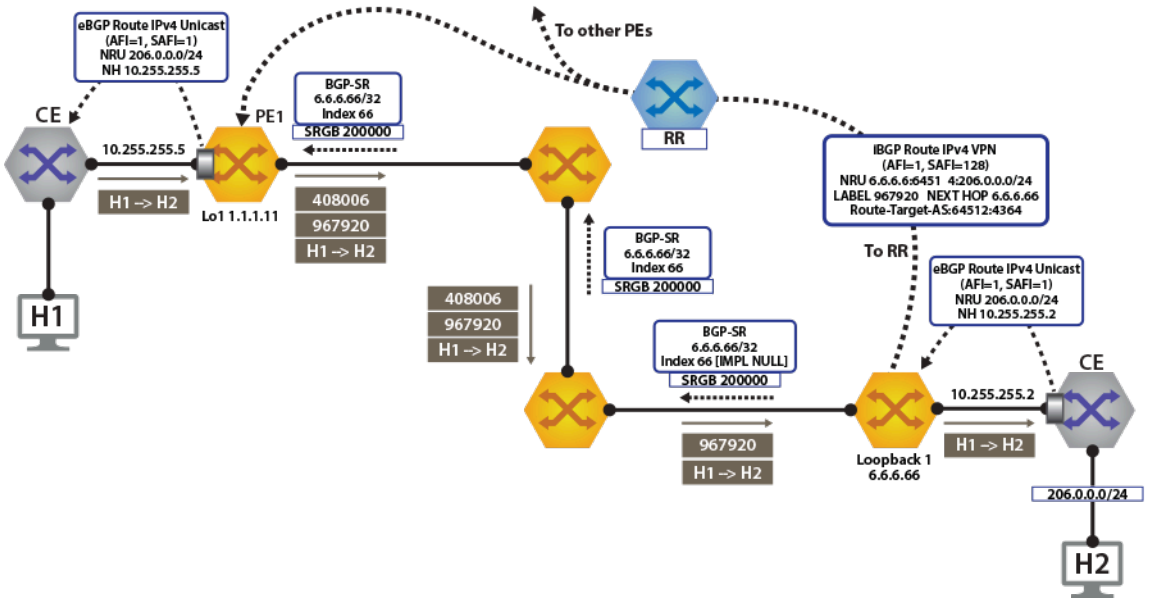

Figure 141: IPv4 VPN Forwarding Over BGP-SR MPLS

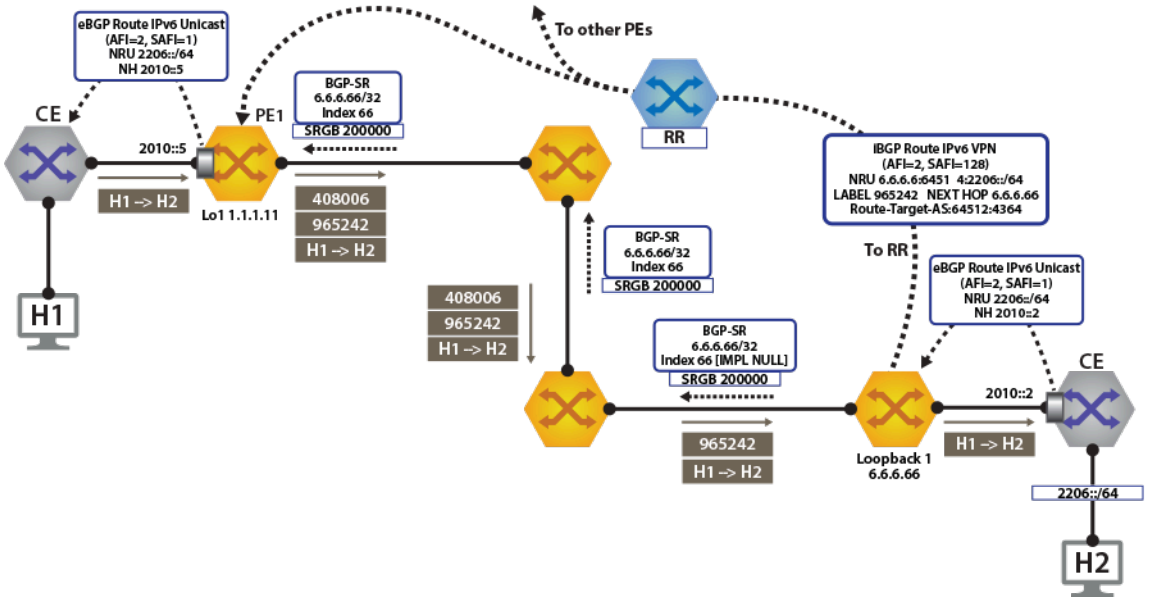

Figure 142: IPv6 VPN Forwarding Over BGP-SR MPLS

To switch to using the MPLS BGP-SR transport, we just need to change the next-hop we advertised for the VPN routes. As shown above, the next hop needs to be set to ***loopback 1*** for using the BGP-SR LSP.

This is achieved by configuring the next-hop for EVPN routes.

```
router bgp 64512
   !
   address-family evpn
     neighbor default encapsulation mpls next-hop-self source-interface
 Loopback1
```

Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to ***6.6.6.66*** for ***tenant-d***.

```

Note: The VPN label has not changed from the ISIS-SR case above (***967920*** and ***965242***), reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to ***6.6.6.66*** for ***tenant-d***.

```
north-edge# show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route Distinguisher: 6.6.6.6:64514
 Paths: 1 available
  65010
    6.6.6.66 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 967920
north-edge#
north-edge# show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv6 prefix 2206::/64, Route Distinguisher: 6.6.6.6:64514
 Paths: 1 available
  65010
    6.6.6.66 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 965242
north-edge#
```

Note: The VPN label has not changed from the ISIS-SR case above (***967920*** and ***965242***), reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

As displayed in the highlighted route above the label stack, the route are the transport label ***200066*** on top (this is the label path to reach ***NH 6.6.6.66***), with the ***tenant-d*** VPN label ***967920*** next in the stack, and identifying the route as belonging to ***tenant-a***.

```

18.16 EVPN and VCS Commands

Global Configuration Mode

- router general

Router BGP Configuration Mode

- next-hop resolution disabled
- redistribute service vxlan
- route-target
- route-target export
- route-target import
- route-target route-map
- vlan (VLAN-AWARE-Bundle configuration mode)
- vni-aware-bundle

Router BGP Address-Family Configuration Mode

- encapsulation vxlan layer-3 set next-hop igp-cost

Router General Configuration Mode

- leak routes

VCS Commands

- redistribute bgp evpn vxlan

EVPN VXLAN Commands

- bfd vtep evpn
- redistribute router-mac next-hop vtep primary

Display Commands

- show bgp evpn
- show ip bgp vrf
- show ip route vrf
- show ipv6 bgp vrf
- show ipv6 route vrf
- show l2rib input all
- show l2Rib input vxlan-control-service
- show l2rib output
- show service vxlan address-table
- show vrf leak flapping
- show vxlan control-plane

18.16.1 bfd vtep evpn

The **bfd vtep evpn** command to configure the BGP PIC Edge for EVPN VXLAN routes for remote VTEPs. This command is configured under the VXLAN Tunnel Interface (VTI).

The **no bfd vtep evpn** command removes bfd vtep evpn configuration from the ***running-config***.

Command Mode

VXLAN Tunnel Interface (VTI) Mode

Command Syntax

bfd vtep evpn interval ***interval-milliseconds*** min-rx ***min-rx-milliseconds*** multiplier ***multiplier-range***

no bfd vtep evpn interval ***interval-milliseconds*** min-rx ***min-rx-milliseconds*** multiplier ***multiplier-range***

Parameters

- **interval** Set transmit rate in milliseconds.
  - ***interval-milliseconds*** Rate in milliseconds. Value ranges from ***50*** to ***60000*** milliseconds.
- **min-rx** Set expected minimum incoming rate in milliseconds.
  - ***min-rx-milliseconds*** Rate in milliseconds. Value ranges from ***50*** to ***60000*** milliseconds.
- ***multiplier*** Sets the BFD multiplier.
  - ***multiplier-range*** The value ranges from ***3*** to ***50***.

Example

In this example (assuming symmetric configuration on other PE devices) any BFD for VXLAN session initiated on the VTI would have a detect time of ***300ms*** (interval of 100ms multiplied by 3).

```
switch(config-if-Vx1)# bfd vtep evpn interval 100 min-rx 100 multiplier 3
```

18.16.2 encapsulation vxlan layer-3 set next-hop igp-cost

The **encapsulation vxlan layer-3 set next-hop igp-cost** command configure the underlay IGP metric for the VTEP reachability to be considered for BGP best path selection in the IP VRF that is importing the EVPN route.

The **no encapsulation vxlan layer-3 set next-hop igp-cost** or **default encapsulation vxlan layer-3 set next-hop igp-cost** command removes all the IGP cost for VTEP running configurations on the switch.

Command Mode

BGP Address-Family Configuration

Command Syntax

encapsulation vxlan layer-3 set next-hop igp-cost

no encapsulation vxlan layer-3 set next-hop igp-cost

default encapsulation vxlan layer-3 set next-hop igp-cost

Examples

- The following command configures the IGP cost for VTEP feature on the switch :

```
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# [no | default] encapsulation vxlan
 layer-3 set next-hop igp-cost
```

18.16.3 leak routes

The **leak routes** command configures an inter-VRF route-leaking policy to allow routes to be leaked from one VRF to another using a route map.

The **no leak routes** and **default leak routes** commands removing the specified route-leaking policy from ***running-config***.

Command Mode

Router General Configuration

Command Syntax

leak routes source-vrf *source_name* **subscribe-policy** ***route_map***

no leak routes source-vrf ***source_name***

default leak routes source-vrf ***source_name***

Example

- These commands configure routes to be leaked from VRF ***VRF1*** to VRF ***VRF2*** according to the policy described in route-map ***RM1***.

```
switch(config)# router general
switch(config-router-general)# vrf VRF2
switch(config-router-general-vrf-VRF2)# leak routes source-vrf VRF1
 subscribe-policy RM1
switch(config-router-general-vrf-VRF2)# exit
switch(config-router-general)# exit
switch(config)#
```

18.16.4 next-hop resolution disabled

The **next-hop resolution disabled** command disables the next-hop resolution in routes received from BGP-EVPN peers.

The **no next-hop resolution disabled** and the **default next-hop resolution disabled** commands enable the next-hop resolution in routes received from BGP-EVPN peers.

Command Mode

Router-BGP Address-Family Configuration

Command Syntax

next-hop resolution disabled

Example

This command disables the next-hop resolution in routes received from BGP-EVPN peers.

```
switch(config)# router bgp 65002
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# next-hop resolution disabled
switch(config-router-bgp-af)#
```

18.16.5 redistribute bgp evpn vxlan

The **redistribute bgp evpn vxlan** command enables BGP-EVPN routes to be redistributed to VCS which in turn advertises them to all VTEPs within the DC.

The **no redistribute bgp evpn vxlan** and the **default redistribute bgp evpn vxlan** commands disable the redistribution of BGP-EVPN routes to VCS.

Command Mode

CVX-VXLAN Configuration

Command Syntax

redistribute bgp evpn vxlan

Example

This command enables redistribution of BGP-EVPN routes to VCS.

```
switch(config)# cvx
switch(config-cvx)# no shutdown
switch(config-cvx)# service vxlan
switch(config-cvx-vxlan)# no shutdown
switch(config-cvx-vxlan)# redistribute bgp evpn vxlan
```

18.16.6 redistribute router-mac next-hop vtep primary

Use the **redistribute router-mac next-hop vtep primary** command in the MAC VRF configuration mode to advertise an EVPN type-2 route for the VARP MAC with a nexthop of the primary VTEP IP.

Configuration Mode

MAC VRF

Command Syntax

redistribute router-mac next-hop vtep primary

Parameters

- **router-mac** Router Ethernet address.
- **next-hop** Cnfigure the advertised next-hop.
- **vtep** Associate next-hop with a VTEP.
- **primary** Use the primary VTEP IP.

Example

The following example uses the command **redistribute router-mac next-hop vtep primary** in the MAC VRF configuration.

```
switch(config)# router bgp 65003
switch(config-router-bgp-65003)# neighbor 223.255.255.1 remote-as 65001
switch(config-router-bgp-65003)# neighbor 223.255.255.2 remote-as 65002
switch(config-router-bgp-65003)# neighbor 223.255.255.4 remote-as 65003

switch(config)# vlan 100
switch(config-vlan-100)# rd 1:100
switch(config-vlan-100-rd-100)# route-target both 1:100
switch(config-vlan-100-rd-100)# redistribute learned
switch(config-vlan-100-rd-100)# redistribute router-mac next-hop vtep
 primary

switch(config)# vlan 200
switch(config-vlan-200)# rd 1:200
switch(config-vlan-100-rd-200)# route-target both 1:200
switch(config-vlan-100-rd-200)# redistribute learned
switch(config-vlan-100-rd-200)# redistribute router-mac next-hop vtep
 primary
```

18.16.7 redistribute service vxlan

The **redistribute service vxlan** command enables BGP to redistribute the Layer 2 bridging information received from VCS.

The **no redistribute service vxlan** and the **default redistribute service vxlan** commands disable the redistribution of the bridging information received from VCS.

Command Mode

Router-BGP VNI Configuration

Command Syntax

redistribute service vxlan

Example

This command enables redistribution of the Layer 2 bridging information received from VCS.

```
switch(config)# router bgp 100
switch(config-router-bgp)# vni-aware-bundle bundle1
switch(config-macvrf-bundle1)# redistribute service vxlan
```

18.16.8 route-target

The **route-target** command configures a well-known extended community that is used by BGP-EVPN to export routes from or import routes into MAC-VRF.

The **no route-target** and **default route-target** commands delete the route-target configuration.

Command Mode

Router-BGP VNI Configuration

Syntax

route-target {export | import | both} rt

no route-target

default route-target

Parameters

- **export** configures a well-known extended community that is attached to the routes exported by BGP-EVPN.
- **import** configures a well known extended community that identifies the received routes that need to be imported into the MAC-VRF specified by the VNI bundle.
- **both** configures the same extended community for import and export of routes.
- **rt** route-target extended community.

This command configures a well-known extended community for import and export of routes.

```
switch(config)# router bgp 100
switch(config-router-bgp)# vni-aware-bundle bundle1
switch(config-macvrf-bundle1)# route-target both 503:12
switch(config-macvrf-bundle1)#
```

18.16.9 route-target export

The **route-target export** command allows the user to export routes from a VRF to the local VPN table using the route target extended community list.

The **no route-target export** and **default route-target export** commands remove the routes from the VPN table.

Command Mode

Router-BGP VNI Configuration

Syntax

route-target export [***evpn*** | ***vpn-ipv4*** | ***vpn-ipv6***] ***RT***

no route-target export

default route-target export

Parameters

- ***evpn*** EVPN address family.
- ***vpn-ipv4*** MPLS L3 VPN IPv4 unicast address family.
- ***vpn-ipv6*** MPLS L3 VPN IPv6 unicast address family.
- ***RT*** route-target extended community.

Examples

- These commands export routes from ***vrf-red*** to the VPN table.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv4
 10:10
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv6
 10:20
```

- These commands export routes from ***vrf-red*** to the EVPN table.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn 10:1
```

18.16.10 route-target import

The **route-target import** command allows the user to import route target extended community lists from the local VPN table to the target VRF.

The **no route-target import** and **default route-target import** commands remove the routes from the VPN table.

Command Mode

Router-BGP VNI Configuration

Syntax

route-target import [***evpn*** | ***vpn-ipv4*** | ***vpn-ipv6***] ***RT***

no route-target import

default route-target import

Parameters

- ***evpn*** EVPN address family.
- ***vpn-ipv4*** MPLS L3 VPN IPv4 unicast address family.
- ***vpn-ipv6*** MPLS L3 VPN IPv6 unicast address family.
- ***RT*** route-target extended community.

Examples

- These commands import routes from the VPN table to ***vrf-blue***.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2:2
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4
 10:10
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6
 10:20
```

- These commands import routes from the EVPN table to ***vrf-blue***.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2:2
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn 10:1
```

18.16.11 route-target route-map

The **route-target route-map** command allows the user to export and import route target extended community lists from one VRF to another using route maps.

The **no route-target route-map** and **default route-target route-map** commands remove the routes from the VPN table.

Command Mode

Router-BGP VNI Configuration

Syntax

route-target {import | export} [***evpn*** | ***vpn-ipv4*** | ***vpn-ipv6***] **route-map** ***RM***

no route-target route-map

default route-target route-map

Parameters

- ***evpn*** EVPN address family.
- ***vpn-ipv4*** MPLS L3 VPN IPv4 unicast address family.
- ***vpn-ipv6*** MPLS L3 VPN IPv6 unicast address family.
- ***RM*** route-map extended community.

Examples

- These commands export routes from ***vrf-red*** to the VPN table.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv4
 10:10
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv6
 10:20
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv4
 route-map EXPORT_V4_ROUTES_T0_VPN_TABLE
switch(config-router-bgp-vrf-vrf-red)# route-target export vpn-ipv6
 route-map EXPORT_V6_ROUTES_T0_VPN_TABLE
```

- These commands export routes from ***vrf-red*** to the EVPN table.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn 10:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn route-
map EXPORT_ROUTES_T0_EVPN_TABLE
```

- These commands import routes from the VPN table to ***vrf-blue***.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 1:1
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4
 10:10
```

```
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6
 10:20
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4
 route-map IMPORT_V4_ROUTES_VPN_TABLE
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6
 route-map IMPORT_V6_ROUTES_VPN_TABLE
```

- These commands import routes from the EVPN table to ***vrf-blue***.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2:2
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn route-
map IMPORT_ROUTES_FROM_EVPN_TABLE
```

18.16.12 router general

The **router general** command places the switch in Router-General Configuration Mode for the configuration of protocol-independent routing.

The **no router general** and **default router general** commands remove all protocol-independent routing configuration from ***running-config***.

Command Mode

Global Configuration

Command Syntax

router general

no router general

default router general

Example

- These commands place the switch in Router-General Configuration Mode and display the commands available there.

```
switch(config)# router general
switch(config-router-general)# ?
  command            Configuration command
  control-functions  Routing control functions configuration
  hardware           Configure hardware-specific parameters
  next-hops          Next hop configuration
  rib                Routing table
  route              Route commands
  route-map          Route-map source configuration
  router-id          Configure a general router ID for all routing
 processes
  segment-routing    Segment Routing configuration
  software           Software configuration
  vrf                Enter VRF sub-mode

switch(config-router-general)#
```

18.16.13 show bgp evpn

The **show bgp evpn** command displays information about the BGP-EVPN routes of the switch.

Command Mode

Global Configuration

Command Syntax

show bgp evpn [community | detail | esi esid | extcommunity | host-flap | instance | large-community ***AS:nn:nn*** | next-hop | rt | admin:local-assignment | route-type | summary | vni ***vni_num***]

Parameters

- ***no parameters*** displays all routes of the switch.
- **community** displays routes filtered by the specified community. Options include:
  - **GSHUT** well known GSHUT community.
  - ***aa:nn*** AS and network number, separated by colon. The value ranges from ***1*** to ***4294967295***.
  - **internet** advertises route to the Internet community.
  - **local-as** advertises route only to local peers.
  - **no-advertise** does not advertise the route to any peer.
  - **no-export** advertises route only within the BGP-EVPN AS boundary.
  - ***comm_num*** community number. Values range from ***1*** to ***4294967040***.
- **detail** displays detailed information of routes.
- **esi esid** displays routes filtered by the specified Ethernet Segment Identifier (ESI).
- **extcommunity** displays routes that match with BGP or VPN extended community list. Options include:
  - **esi-label esid** displays routes filtered by the specified value of ESI label. The value ranges from ***0*** to ***16777215***.
  - **mac-mobility** displays routes filtered by the specified MAC mobility.
  - **rt** displays routes filtered by the specified route target.
  - **tunnel-encap vxlan** displays routes filtered by the VXLAN tunnel encapsulation.
  - **router-mac *H.H.H*** displays routes filtered by the specified router MAC address.
- **host-flap** displays routes that contains MAC addresses that are blacklisted due to duplication.
- **instance** displays routes with EVPN instances.
- **large-community *AS:nn:nn*** displays routes filtered by the specified large community.
- **next-hop** displays routes filtered by next-hop IPv4 or IPv6 addresses of remote VTEP.
- **rd admin:local-assignment** displays routes filtered by the specified Route Distinguisher (RD).
- **route-type** displays routes filtered by NLRI route type.
- **summary** displays summary of routes.
- **vni *vni_num*** displays routes filtered by the specified VXLAN Network Identifier (VNI). Value ranges from ***1*** to ***4294967294***.

Examples

- This command displays BGP-EVPN routes filtered by the ***VNI 3011***.

```
switch(config-router-bgp-af)# show bgp evpn vni 3011
BGP routing table information for VRF default
Router identifier 2.0.2.2, local AS number 65002
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP

18.16.14 show ip bgp vrf

The **show ip bgp vrf** command displays the type of VPN from the imported route. It shows an indication that the IPv4 route has been leaked and source VRF information is displayed.

Command Mode

Global Configuration

Command Syntax

show ip bgp vrf {***vrf_name*** | all | default}

Parameters

- ***vrf_name*** name of the VRF.
- **all** displays summary of all VRFs.
- **default** default virtual routing and forwarding instance.

Example

This command displays the leaked and source VRF information.

```
switch(config)# show ip bgp 13.0.0.0/24 vrf vrf-blue
BGP routing table information for VRF vrf-blue
Router identifier 5.0.0.2, local AS number 65001
BGP routing table entry for 130.110.61.0/24
   4.0.0.3 from 4.0.0.3 (52.0.0.1), imported EVPN route, RD 400:1
      Origin IGP, metric -, localpref 100, weight 0, valid, external,best
      Extended Community: Route-Target-AS:4000:1 TunnelEncap:t
unnelTypeVxlan
EvpnRouterMac:74:83:ef:0b:70:f3
      Leaked from VRF vrf-red
```

18.16.15 show ip route vrf

The **show ip route vrf** command displays leaked prefixes with the label **L** in the output that indicates that the IPv4 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

Command Mode

Global Configuration

Command Syntax

show ip route vrf {***vrf_name*** | all}

Parameters

- ***vrf_name*** name of the VRF.
- **all** displays summary of all VRFs.

Example

These commands display the OSPF or OSPFV3 leaked routes as **redistribute ospf** and **redistribute ospfv3** are configured on the source VRF ***vrf-red***.

```
switch(config)# show ip route vrf vrf-blue
VRF: vrf-blue
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked
Gateway of last resort is not set
C       5.0.0.2/31 is directly connected, Ethernet14
B L  57.0.0.3/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  45.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  52.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  120.0.0.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  130.0.0.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  130.0.1.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  130.0.2.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L  130.0.3.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
```

18.16.16 show ipv6 bgp vrf

The **show ipv6 bgp vrf** command displays the type of VPN from the imported route. It shows an indication that the IPv6 route has been leaked and source VRF information is displayed.

Command Mode

Global Configuration

Command Syntax

show ipv6 bgp vrf {***vrf_name*** | all | default}

Parameters

- ***vrf_name*** name of the VRF.
- **all** displays summary of all VRFs.
- **default** default virtual routing and forwarding instance.

Example

This command displays the leaked and source VRF information.

```
switch(config)# show ipv6 bgp 2001:10:1:0::102/64 vrf default
BGP routing table information for VRF default
Router identifier 218.218.218.218, local AS number 34
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup, L -
labeled-unicast
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

         Network                Next Hop              Metric  LocPref Weight  Path
 * >     2000:0:14:120::/64     2001:db8:1111:9000::  -       100     109     i

 *       2000:0:14:120::/64     2001:db8:203:1010::2  -       100     0       i
```

18.16.17 show ipv6 route vrf

The **show ipv6 route vrf** command displays leaked prefixes with the label **L** in the output that indicates that the IPv6 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

Command Mode

Global Configuration

Command Syntax

show ipv6 route vrf{***vrf_name*** | all}

Parameters

- ***vrf_name*** name of the VRF.
- **all** displays summary of all VRFs.

Example

These commands display the OSPF or OSPFV3 leaked routes as **redistribute ospf** and **redistribute ospfv3** are configured on the source VRF ***vrf-red***.

```
switch(config)# show ipv6 route vrf vrf-blue
VRF: vrf-blue
Displaying 802 of 802 IPv6 routing table entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R -
 RIP, A B - BGP Aggregate,
I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP, NG - Nexthop Group

```

18.16.18 show l2rib input all

Use the **`show l2rib input all`** command to display the Layer 2 RIB input tables migration process.

Command Mode

EXEC

Command Syntax

`show l2rib input all` [detail | floodset [vlan | vtep] | interface [Ethernet | Port-Channel] | mac ***H.H.H*** | vlan ***vlan_id*** | vtep [***A.B.C.D*** | ***A:B:C:D:E:F:G:H***]

Parameters

- **detail** Displays a more comprehensive output.
- **floodset** Displays L2Rib floodset from input source.
  - **vlan** Filter by VLAN ID.
  - **vtep** Filter by VTEP.
- **interface** Filter by destination interface.
  - **Ethernet** Ethernet interface.
  - **Port-Channel** Link Aggregation Group (LAG).
- **mac *H.H.H*** Filter by MAC address.
- **vlan *vlan_id*** Filter by VLAN ID.
- **vtep** Filter by VTEP.
  - ***A.B.C.D*** IP address of VTEP.
  - ***A:B:C:D:E:F:G:H*** IP address of VTEP.

18.16.19 show l2Rib input vxlan-control-service

Use the **`show l2Rib input vxlan-control-service`** to display the migration processes for the VXLAN control service.

Command Mode

EXEC

Command Syntax

`show l2Rib input vxlan-control-service` [detail | floodset [vlan | vtep] interface [Ethernet | Port-Channel]| mac ***H.H.H*** | vlan ***vlan_id*** | vtep [***A.B.C.D*** | ***A:B:C:D:E:F:G:H***]]

Parameters

- **detail** Displays a more comprehensive output.
- **floodset** Displays L2Rib floodset from input source.
  - **vlan** Filter by VLAN ID.
  - **vtep** Filter by VTEP.
- **interface** Filter by destination interface.
  - **Ethernet** Ethernet interface.
  - **Port-Channel** Link Aggregation Group (LAG).
- **mac** Filter by MAC address.
  - ***H.H.H*** Ethernet address.
- **vlan *vlan_id*** Filter by VLAN ID.
- **vtep** Filter by VTEP.
  - ***A.B.C.D*** IP address of VTEP.
  - ***A:B:C:D:E:F:G:H*** IP address of VTEP.

18.16.20 show l2rib output

Use the **`show l2rib output`** command to display the the Layer 2 RIB utput tables migration process.

Command Mode

EXEC

Command Syntax

`show l2rib output` [detail | floodset [vlan | vtep] | mac H.H.H | vlan ***vlan_id*** | vtep [***A.B.C.D*** | ***A:B:C:D:E:F:G***]

Parameters

- **detail** Displays a more comprehensive output.
- **floodset** Displays L2Rib floodset from input source.
  - **vlan** Filter by VLAN ID.
  - **vtep** Filter by VTEP.
- **interface** Filter by destination interface.
  - **Ethernet** Ethernet interface.
  - **Port-Channel** Link Aggregation Group (LAG).
- **mac *H.H.H*** Filter by MAC address.
- **vlan *vlan_id*** Filter by VLAN ID.
- **vtep** Filter by VTEP.
  - ***A.B.C.D*** IP address of VTEP.
  - ***A:B:C:D:E:F:G:H*** IP address of VTEP.

18.16.21 show service vxlan address-table

The **show service vxlan address-table** command displays route entries in the MAC forwarding table that are added through the CVX.

Command Mode

CVX Global Configuration

Command Syntax

show service vxlan address-table {advertised | received}[***address H.H.H*** | evpn | hsc | mss | switch [***Word*** | all] | vni ***vnid*** | vtep ***A.B.C.D***]

Parameters

- **advertised** displays the advertised route entries in the MAC forwarding table.
- **received** displays the received route entries in the MAC forwarding table.
- **address *H.H.H*** displays route entries that are filtered by the specified MAC addresses.
- **evpn** displays route entries filtered by BGP-EVPN.
- **hsc** displays route entries filtered by Hardware Switch Controller (HSC).
- **mss** displays route entries filtered by Macro Segmentation Service (MSS).
- **switch** displays route entries that are filtered by the specified switch or all switches. Options include:
  - ***Word*** Hostname, IP address or ID of the switch.
  - **all** all switches.
- **vni *vnid*** displays route entries filtered by the specified VXLAN Network Identifier (VNI). Value ranges from ***1*** to ***4294967294***.
- **vtep *A.B.C.D*** displays route entries filtered by the specified IP address of the remote Virtual Tunnel End Point (VTEP).

Examples

- This command displays the route entries in MAC forwarding table advertised to BGP-EVPN peers.

```
cvx# show service vxlan address-table advertised evpn

         Advertised Mac Address Table
-------------------------------------------------------------
VNI          Mac Address    VTEP         Moves
----------- ----------------- --------------- -----
1000         02:01:62:01:00:00 10.0.0.1         1
Total Mac Addresses for this criterion: 1

         Advertised Flood Table
-----------------------------------------------
VNI         Mac Address       VTEP(s)
---------- ----------------- ------------------------------
1000        00:00:00:00:00:00  10.0.0.1     10.0.0.2
Total Mac Addresses for this criterion: 1
cvx#
```

- This command displays the route entries in MAC forwarding table received from BGP-EVPN peers.

```
switch# show service vxlan address-table received evpn

      Received Mac Address Table
-------------------------------------------------------------
Source      VNI      Mac Address        VTEP       Moves
----------- -------- ----------------- ----------- -----

Total Mac Addresses for this criterion: 2
switch#
```

18.16.22 show vrf leak flapping

The **show vrf leak flapping** command displays the flapping prefixes of the routes leaked from one VRF to another VRF. Routes that are detected as “flapping” are blocked considering the future leaking policy execution.

Command Mode

EXEC

Command Syntax

show vrf leak flapping

Parameters

- **destination** displays flapping prefixes destined to a VRF.
- **prefix** displays flapping routes for a prefix.
- **source** displays flapping prefixes sourced from a VRF.
- **vrf** displays flapping prefixes associated with a VRF.

Example

This command displays the flapping prefixes of the leaked routes.

```
switch# show vrf leak flapping

  Age       Source VRF       Destination VRF       Prefix            Created At
-------- ---------------- --------------------- ----------------- -------------
  141       VRF1             VRF2                  10.0.2.0/24    3357281.40992
```

18.16.23 show vxlan control-plane

To enable the user to quickly view which control planes and sources are importing reachability information into which VLANs, use the following show command:

Command Mode

EXEC

`show vxlan control-plane` [export vlan [***$*** | ***vlan_id***]|import vlan [***$*** | ***vlan_id***]][vlan [***$*** | ***vlan_id***]

Parameters

- **export** Restricts output to VLANs exporting to a control plane.
  - **vlan** Specifies specific VLANs to display control plane information.
    - ***$*** List end.
    - ***vlan_id*** VLAN ID. Range ***1-4094***.
- **import** Restricts output to VLANs importing from a control plane.
  - ***$*** List end.
  - ***vlan_id*** VLAN ID. Range ***1-4094***.
- **vlan** Specifies specific VLANs to display control plane information.
  - ***$*** List end.
  - ***vlan_id*** VLAN ID. Range ***1-4094***.

18.16.24 vlan (VLAN-AWARE-Bundle configuration mode)

The **vlan add/ remove** command configures the VLAN range string in a VLAN-AWARE-BUNDLE. When the add and remove options are not used, the currently configured range is replaced by the new one . The add and remove options update the currently configured range-aware bundles by adding or removing the provided VLAN range from the currently configured range respectively.

Command Mode

VLAN-AWARE-BUNDLE Configuration

Command Syntax

vlan [add | remove] ***range***

Parameters

range is the range specified.

Example

These commands take an existing vlan-aware-bundle configuration, ***corporate_100***, and modify it with the add and remove options.

```
(Existing configuration for corporate_100)
vlan-aware-bundle corporate_100
  rd 1.1.1.1:100
  route-target both 100:100
  vlan 1-10

switch(config-vlan-aware-bundle)#vlan add 1000

(Modified configuration for corporate_100)
vlan-aware-bundle corporate_100
  rd 1.1.1.1:100
  route-target both 100:100
  vlan 1-10, 1000

switch(config-vlan-aware-bundle)#vlan remove 5

(Updated configuration for corporate_100)
vlan-aware-bundle corporate_100
  rd 1.1.1.1:100
  route-target both 100:100
  vlan 1-4, 6-10, 1000
```

18.16.25 vni-aware-bundle

The **vni-aware-bundle** command configures a BGP MAC-VRF containing Layer 2 routes from a group of VXLAN Network Identifiers (VNI).

Command Mode

Router BGP Configuration

Command Syntax

vni-aware-bundle ***vni_bundle_name***

Parameter

vni_bundle_name VNI bundle name.

Example

This command configures MAC-VRF BGP to support VNI bundle1.

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#
```

Chapter 19

Multiprotocol Label Switching (MPLS)

Tunneling protocols encapsulate packets of a different protocol as the payload of a larger frame for delivery within networks utilizing the encapsulating protocol. Tunneling facilitates the delivery of payload over an incompatible delivery network and creates a secure path through an untrusted network. Protocols that this chapter describes include MPLS, Decap Groups, and Nexthop Groups.

Sections in this chapter include:

19.1 MPLS

These sections describe the Arista MPLS implementation:

19.1.1 MPLS Description

19.1.1.1 MPLS Overview

Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes. The labels identify virtual links (paths) between distant nodes rather than endpoints. MPLS is scalable and protocol-independent. Data packets are assigned labels, which are used to determine packet forwarding destinations without examining the packet.

Arista switches utilize MPLS to improve efficiency and control from servers through data centers and to the WAN. The MPLS implementation supports static MPLS tunneling that is manually configured on each switch or established over a network by an SDN controller. The configuration is specified by a set of rules that filter packets based on matching criteria. Each rule applies MPLS-related actions to packets that match the rule's criteria. Each rule includes a metric that the switch uses to select an action when multiple rules match a packet.

19.1.1.2 MPLS Implementation

MPLS static rule parameters contain the following:

- A 20-bit value that is compared to the top header label of each MPLS packet. Other rule parameters may be applied to packets whose top label match this value.
- A nexthop location that specifies the packet’s next destination (IPv4 or IPv6) and the interface through which the switch forwards the packet.

- An MPLS label stack management action that is performed on filtered packets:
  - **pop-payload**: removes the top label from stack; this terminates an Label-Switched Path (LSP).
  - **swap-label**: replaces top label with a specified new label; this passes a packet along an LSP.
- A rule metric that the switch uses to select a rule when multiple rules match an MPLS packet.

Packets that do not match any MPLS rules are dropped.

19.1.1.3 MPLSoGRE Filtered Mirroring

In MPLS over Generic Routing Encapsulation (MPLSoGRE) filtered mirroring, IPv4 over MPLS over GRE (IPv4oMPLSoGRE) and IPv6 over MPLS over GRE (IPv6oMPLSoGRE) packets that enter a GRE tunnel endpoint on which MPLS lookup is performed, are selected for mirroring based on the destination IP address field in the inner IPv4 or IPv6 header.

Note: These packets are not selected for mirroring if they are forwarded based on either the L2 or outer L3 header destination address.

the image below shows the header format of the packets that are selected for mirroring.

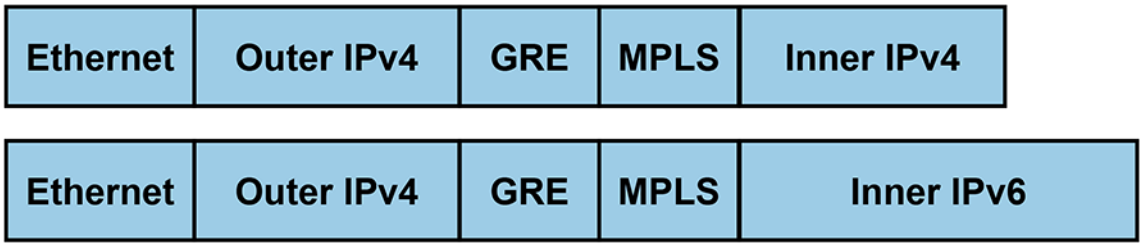

Figure 143: Header Format of Packets

When mirroring to a GRE tunnel, the payload of the outgoing GRE packet contains the payload of the incoming source packet starting from the MPLS header. L2 and outer L3 headers are stripped from the mirror copy. When the MPLS lookup fails, the packet is still eligible for mirroring based on the selection criteria defined in the ACL.

19.1.1.4 Mixed TTL/DSCP in MPLS Tunnel Termination

A Label Edge Router (LER) decapsulating an MPLS packet may choose to source the TTL and DSCP fields from either the MPLS header or the original inner IPv4 header. However, some applications need the TTL field value from the MPLS header, while retaining the DSCP from the original IPv4 header. Mixed TTL/DSCP in MPLS Tunnel Termination enables tunnel termination to select this specific mix of two modes.

This section contains the following topics:

- Configuration
- Packet Support for IPv6

19.1.1.4.1 Configuration

Mixed TTL/DSCP in MPLS tunnel termination is intended to be used with MPLS VRF decapsulation. Therefore, a static VRF-to-MPLS-label map is expected to be provided, similar to the following:

```
switch(config)# mpls ip
switch(config)# mpls static vrf-label mpls-label vrf vrf-name
switch(config)# ip routing vrf vrf-name
```

TTL=uniform and DSCP=pipe options have been added to the existing **mpls tunnel termination** command:

```
switch(config)# mpls tunnel termination model ttl uniform dscp pipe
```

Also, a new TCAM profile packet type has been introduced:

```
switch(config)# packet mpls ipv4 forwarding routed decap
```

Configuration occurs under the “qos ip” feature section of a user defined TCAM profile:

```
switch(config)# hardware tcam
# May use any profile that provides "qos ip"
switch(config-tcam)# profile name copy default
switch(config-tcam-profile-name)# feature qos ip
switch(config-tcam-profile-name-feature-qos-ip)# packet mpls ipv4
 forwarding routed decap

switch(config-tcam)# system profile name
```

19.1.1.4.1.1Packet Support for IPv6

RFE 391109 brings mixed TTL/DSCP support for IPv6 over MPLS packets as well. The TCAM profile configuration is similar to the above IPv4 configuration:

```
switch(config)# hardware tcam
   # May use any profile that provides "qos ipv6"
switch(config-tcam)# profile name copy default
switch(config-tcam-profile-name)# feature qos ipv6
switch(config-tcam-profile-name-ipv4)# packet mpls ipv6 forwarding routed
 decap
switch(config-tcam)# system profile name
```

19.1.1.5 Support for MPLS Packets in IP ACLs

Ingress and egress IPv4 and IPv6 access-lists do not automatically match the inner IP header when processing IP over MPLS traffic.

Support is now avaiable to allow matching of the inner IP header in an access-list by adding the proper packet types to the corresponding TCAM features.

19.1.1.6 DSCP-to-TC Maps for MPLS Traffic to L3 VRFs

MPLS-labeled traffic, both IPv4 and IPv6, can be decapsulated and routed using a specific VRF, either the default or a named VRF. The MPLS label can be statically assigned to a specific VRF, or dynamically through L3 EVPN MPLS. In this configuration, a traffic class (TC) label based on a packet's ingress DSCP is added to the decapsulated MPLS packet if it is directed to a specific VRF. This is an MPLS tunneling technique called Short Pipe Mode.

The mapping of DSCP labels to TC is steered by a QoS map. Up to 10 custom maps can be applied. Such a map will only use hardware resources when attached to at least one VRF. When a map is first created, the DSCP-to-TC map is copied from the global map; subsequent changes to the global map do not have any effect on custom maps.

19.1.2 MPLS Configuration

MPLS routing is enabled through the **mpls ip** command.

This command enables MPLS routing.

```
switch(config)# mpls ip
switch(config)# show running-config mpls ip
!

end
switch(config)#
```

MPLS rules are created by the **mpls static** command. MPLS static rules identify a set of MPLS packets by a common top label and defines the method of handling these packets.

These commands create an MPLS rule that matches packets with a top label value of ***3400*** and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address ***10.14.4.4*** through ***interface ethernet 3/3/3***. This rule has a metric value of ***100***.

```
switch(config)# mpls static top-label 3400 ethernet 3/3/3
 10.14.4.4 pop payload-type ipv4
switch(config)# show running-config

!
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-
type ipv4
!

end
switch(config)#
```

These commands create a backup rule that forwards the packet through ***interface ethernet 4/3***. This rule's metric value of ***150*** assigns it backup status prior to the first rule.

```
switch(config)# mpls static top-label 3400 ethernet 4/3 10.14.4.4
 pop payload-type ipv4 metric 150
switch(config)# show running-config

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type
 ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-
type ipv4
!

end
switch(config)#
```

These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```
switch(config)# mpls static top-label 4400 10.15.46.45 pop
 payload-type ipv4
switch(config)# show running-config
```

```
!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type
 ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-
type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

end
switch(config)#
```

This command configures a static tunnel for the tunnel endpoint ***64.0.0.1*** and pushes a label ***11111*** to it.

```
switch(config)# mpls static STATIC 64.0.0.1/32 54.0.0.1 Port-
Channel7 label-stack 11111
```

This example shows MPLS swap route configuration. The following CLI swaps a packet with MPLS top label ***3400*** to ***5600*** for forwarding to ***10.14.4.4***.

```
switch(config)# mpls static top-label 3400 10.14.4.4 swap 5600
switch(config)#
```

This example shows MPLS next-hop groups configuration for MPLS. The following CLI shows the specification of a next hop group called ***TestGrp1*** with two entries.

```
switch(config)# nexthop-group TestGrp1 type MPLS
switch(config-nexthop-group-TestGrp1)# size 2
switch(config-nexthop-group-TestGrp1)# entry 0 push label-stack
 70 nexthop 10.20.30.5
switch(config-nexthop-group-TestGrp1)# entry 1 push label-stack
 71 nexthop 10.20.30.6
switch(config-nexthop-group-TestGrp1)# exit
switch(config)#
```

The label-stack keyword can take only one label. Tunnel-source and ttl config commands do not apply to MPLS NexthopGroups and are disabled. The nexthop entry is recursively resolved when the specified entry is a remote nexthop. The show command indicates the resolved, directly-attached nexthop.

The switch's MPLS static rule configuration for specified routes and rules is displayed by **`show mpls route`**.

This command displays the MPLS rule configuration.

```
switch> show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
```

```
switch>
```

Statistics about the configuration and implementation of MPLS rules are displayed by the **show mpls route summary** command.

This command displays a summary of MPLS rule implementation.

```
switch> show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

The **show mpls lfib route** command displays the Label Forward Information Base of the switch.

```
switch(config)# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 1 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
          M - MPLS via, P - Pseudowire via,

 NG - Nexthop Group Static Route, V - VXLAN Control Service

Gateway of last resort is not set
C 192.0.2.0/24 is directly connected, Ethernet1/1
 S 3.3.3.0/24 [1/0] via 192.0.2.2, Ethernet1/1 label 200
 S 10.80.0.0/13 [1/0] via 172.24.0.1, Management1
 S 10.95.0.0/20 [1/0] via 172.24.0.1, Management1
 C 172.24.0.0/18 is directly connected, Management1
 S 172.16.0.0/12 [1/0] via 172.24.0.1, Management1
switch(config)#
```

The MPLS push routes are of type static so the **`show ip route static`** command also displays the output for an MPLS Nexthop Group assuming there is a route pointing to the NexthopGroup and the entries in the NexthopGroup are resolved. The output for **`show nexthop-group TestGrp1`** for the test group configured earlier is shown below.

```
switch(config)# show nexthop-group TestGrp1
TestGrp1
  Id 2
  Type MPLS
  Size 2
  Entries
   0 push label-stack 70 nexthop 10.20.30.5
   Tunnel destination directly connected, Ethernet2
   52:14:a3:a6:50:e8, Ethernet2
   1 push label-stack 71 nexthop 10.20.30.6
   Tunnel destination directly connected, Ethernet2
   52:14:a3:a6:50:e8, Ethernet2
switch(config)#
```

19.1.2.1 LSP Ping/Traceroute for MPLS Nexthop Group Tunnels

The **`ping/traceroute mpls tunnel nexthop-group`** command checks the liveness of Nexthop Group tunnel endpoint for an MPLS Nexthop Group.

The following displays the output for the **`ping`** command where the endpoint is specified.

```
switch(config)# rtrmpls1
switch(config-rtrmpls1)# ping mpls tunnel nexthop-group 100.0.116.1/32
LSP ping to nexthop-group tunnel 100.0.116.1/32

```

19.1.2.2 Egress IPv4/IPv6 over MPLS ACLs

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (such as if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.

Examples

- This command disables egress ACLs for MPLS top-label ***12000*** on the egress interface ***120.1.1.1*** nexthop address.

  ```
  switch(config)# no mpls static top-label 12000 120.1.1.1 pop
   payload-type ipv6
  switch(config)#
  ```

- This command enables egress ACLs for MPLS top-label ***12000*** on the egress interface ***120.1.1.1*** nexthop address.

  ```
  switch(config)# mpls static top-label 12000 120.1.1.1 pop
   payload-type ipv6
  switch(config)#
  ```

19.1.2.3 Configuring MPLSoGRE Filtered Mirroring

The filtered mirroring of terminated MPLSoGRE packets is configured by creating an IPv4 access-list, and then attaching the IPv4 access-list to a monitor session source where a tunnel decap group has

been configured. This IPv4 access-list has rules that match to either inner IPv4 or IPv6 destination addresses.

Enabling the TC-Counters TCAM Profile

The following limitations are applicable to MPLSoGRE filtered mirroring in tc-counters TCAM profile:

- Security ACLs are not enforced on IPv4oMPLSoGRE and IPv6oMPLSoGRE terminated packets.
- The rules of a mirroring-ACL are set to match either inner IPv4 or inner IPv6 header fields, but not both.

The ACLs containing rules to match both inner IPv4 and inner IPv6 header fields are not applicable to a single source interface in multiple mirroring sessions. In other words, all ACLs applied to a shared source interface must contain either inner IPv4 rules or inner IPv6 rules.

The commands below switch to the tc-counters TCAM profile in the running configuration.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile tc-counters
switch(config-hw-tcam)# exit
```

Defining Two IPv4 Access-Lists

The ip access-list command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that

subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending till the end of the session.

The permit (Role) command configures one access-list to match the inner IPv4 address, and the other access-list to match the inner IPv6 address.

```
switch(config)# ip access-list dIPv4
switch(config)# 10 permit ip any any inner ip any host 5.5.5.5
switch(config)# exit

switch(config)# ip access-list dIPv6
switch(config)# 10 permit ip any any inner ipv6 any host 55::55
switch(config)# exit
```

Attaching Access-Lists

The monitor session source and monitor session destination commands allow to attach two access-lists to two different monitor session sources.

```
switch(config)# monitor session sess1 source et1 rx ip access-group dIPv4
switch(config)# monitor session sess1 destination tunnel mode gre source 1.1.1.1 destination
 2.2.2.2
switch(config)# monitor session sess2 source et2 rx ip access-group dIPv6
switch(config)# monitor session sess2 destination tunnel mode gre source 3.3.3.3 destination
 4.4.4.4
switch(config)# show monitor session

Session sess1
-------------------------

Source Ports:

  Rx Only:     Et1(IP ACL: dIPv4)

Destination Ports:

        status    source    dest      TTL   DSCP  proto    VRF      fwd-drop
Gre1 :  active    1.1.1.1   2.2.2.2   128   0     0x88be   default  no
```

```
Session sess2
-------------------------

Source Ports:

  Rx Only:     Et2(IP ACL: dIPv6), Et5(IP ACL: dIPv6)

Destination Ports:

        status   source    dest     TTL   DSCP  proto    VRF        fwd-drop
Gre2 :  active   3.3.3.3   4.4.4.4  128   0     0x88be   default    no

switch(config)#
```

19.1.2.4 Configurations to Support IP ACLs for MPLS Packets

19.1.2.4.1 Ingress IP Access-List Support

To facilitate inner IP header matching, there are two TCAM profile packet types:

```
packet mpls ipv4 forwarding bridged
packet mpls ipv4 forwarding mpls
```

The ingress inner IP header matching creates a user-defined profile with these new packet types. Although MAC access-lists do not match on the inner IP header, you must add this packet type in order to generate a lookup for MPLS packets (if using MAC ACLs).

```
hardware tcam
   #May use any profile that provides ACL features
   profile <name> copy default
      feature acl port ip
         packet mpls ipv4 forwarding bridged
         packet mpls ipv4 forwarding mpls
      feature acl port ipv6
         packet mpls ipv6 forwarding bridged
         packet mpls ipv6 forwarding mpls
      feature acl port mac
         packet mpls ipv4 forwarding bridged
         packet mpls ipv4 forwarding mpls
         packet mpls ipv6 forwarding bridged
         packet mpls ipv6 forwarding mpls
   system profile <name>
```

Starting in Release ***EOS 4.23.1***, ingress on inner IP header matching in MPLS packets is also supported on PBR ACLs. In order to enable this, the following must be configured in a user-defined TCAM profile:

```
hardware tcam
   #May use any profile that provides ACL features
   profile <name> copy default
      feature pbr ip
         packet mpls ipv4 forwarding mpls
      feature pbr ipv6
         packet mpls ipv6 forwarding mpls
```

19.1.2.4.2 Egress IPv4/IPv6 over MPLS ACLs

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (such as if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS

labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.

Examples

- This command disables egress ACLs for MPLS top-label ***12000*** on the egress interface ***120.1.1.1*** nexthop address.

```
switch(config)# no mpls static top-label 12000 120.1.1.1 pop
 payload-type ipv6
switch(config)#
```

- This command enables egress ACLs for MPLS top-label ***12000*** on the egress interface ***120.1.1.1*** nexthop address.

```
switch(config)# mpls static top-label 12000 120.1.1.1 pop
 payload-type ipv6
switch(config)#
```

19.1.2.4.3 MPLS Pop Terminated Packets

To enable the use of these qualifiers on MPLS-terminated packets by last label pop, this feature must be applied to the current TCAM profile, as illustrated below:

```
feature acl port ip egress mpls-tunnelled-match
```

No functionality is lost, however, this feature is not enabled by default on all system profiles. Some TCAM profiles may also use the resources required by this feature. Verification is required to ensure the current user-defined TCAM profile supports this feature.

```
hardware tcam
   #May use any profile that provides ACL features
   profile <name> copy <some-system-profile>
      feature acl port ip egress mpls-tunnelled-match
   system profile <name>
```

19.1.2.4.4 MPLS VRF-Decapsulated Packets

To enable the use of these new qualifiers on MPLS-terminated packets by last label VRF-label mapping, the packet type **`mpls ipv4 forwarding routed decap`** must be applied to at least one feature in the TCAM profile. For example:

```
hardware tcam
   profile <name> copy default
      feature qos ip
         packet mpls ipv4 forwarding routed decap
   system profile <name>
```

19.1.2.5 Supporting Traffic Policy on Interfaces

Access Control Lists (ACL) configures the action for packets which are going through the packet processor pipeline based on different fields of packets. Usually TCAM is used to match packets with multiple entries matching the list of IP addresses. TCAM is also a limited resource, so traffic-policy performs transformation of the fields of the packet, that summarize them in terms of the relevant rules this field matches by using command **`interface traffic-policy`**.

Custom TCAM Profile

The following commands enable custom TCAM profile to support traffic policy.

```
hardware tcam
   profile traffic-policy
      feature acl port mac
         sequence 55
         key size limit 160
         key field dst-mac ether-type src-mac
         action count drop
         packet ipv4 forwarding bridged
         packet ipv4 forwarding routed
         packet ipv4 forwarding routed multicast
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet ipv4 non-vxlan forwarding routed decap
         packet ipv4 vxlan forwarding bridged decap
         packet ipv6 forwarding bridged
         packet ipv6 forwarding routed
         packet ipv6 forwarding routed decap
         packet ipv6 forwarding routed multicast
         packet ipv6 ipv6 forwarding routed decap
         packet mpls forwarding bridged decap
         packet mpls ipv4 forwarding mpls
         packet mpls ipv6 forwarding mpls
         packet mpls non-ip forwarding mpls
         packet non-ip forwarding bridged
      feature forwarding-destination mpls
         sequence 100
      feature mirror ip
         sequence 80
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops l4-
src-port src-ip tcp-control
         action count mirror set-policer
         packet ipv4 forwarding bridged
         packet ipv4 forwarding routed
         packet ipv4 forwarding routed multicast
         packet ipv4 non-vxlan forwarding routed decap
      feature mpls
         sequence 5
         key size limit 160
         action drop redirect set-ecn
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet mpls ipv4 forwarding mpls
         packet mpls ipv6 forwarding mpls
         packet mpls non-ip forwarding mpls
      feature pbr ip
         sequence 60
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops-18b
 l4-src-port src-ip tcp-control
         action count redirect

         key field dst-ipv6-label hop-limit icmp-type-code ipv6-length
 ipv6-next-header ipv6-traffic-class l4-dst-port
         l4-src-port src-ipv6-label tcp-control
         action count drop log set-dscp set-tc
         packet ipv6 forwarding routed
      feature tunnel vxlan
         sequence 50
         key size limit 160
         packet ipv4 vxlan eth ipv4 forwarding routed decap
         packet ipv4 vxlan forwarding bridged decap
```

19.2 BGP/MPLS L3 VPN

Border Gateway Protocol/ Multiprotocol Label Switching (BGP/MPLS) L3 Virtual rivate Network (VPN) allows a Service Provider (SP) or an Enterprise to provide the service of interconnecting geographically dispersed customer sites. This type of service can be provided to multiple customers over the common network backbone infrastructure of the Service Provider, while:

- Maintaining privacy of each customer.
- Allowing for overlapping IP addresses among customers.
- Having constrained route distribution – such as, only those routers in the Service Provider's network that need the customer routes, have them.

Achieve the above through the extensions to BGP as defined in ***RFC 4364*** for IPv4 and ***RFC 4659*** for IPv6, and the use of VPN Routing and Forwarding Tables (VRFs), Route Distinguishers (RDs), and Route Targets (RTs).

BGP/MPLS L3 VPN is available when configuring BGP in the multi-agent routing protocol model.

19.2.1 Operation

A Virtual Private Network, or VPN, is a set of geographically dispersed sites attached to the Service Provider's (SP) backbone, with IP interconnectivity amongst the sites. Using this scenario, the customer can obtain "VPN service" from the SP. The SP will provide a VPN service to multiple customers, using this common backbone network infrastructure. The sample VPN topology diagram below illustrates three sites where a customer is being interconnected over the SP backbone network.

At each site, the Customer Edge router (CE) attaches to the Provider's Edge router (PE). The CE can attach to more than one PE, and in these cases the CE is said to be "multi-homed". The routers in the SP core network, those which do not attach to any CE, are referred to as "P" routers. The "P" routers do not need to know about the customer routes.

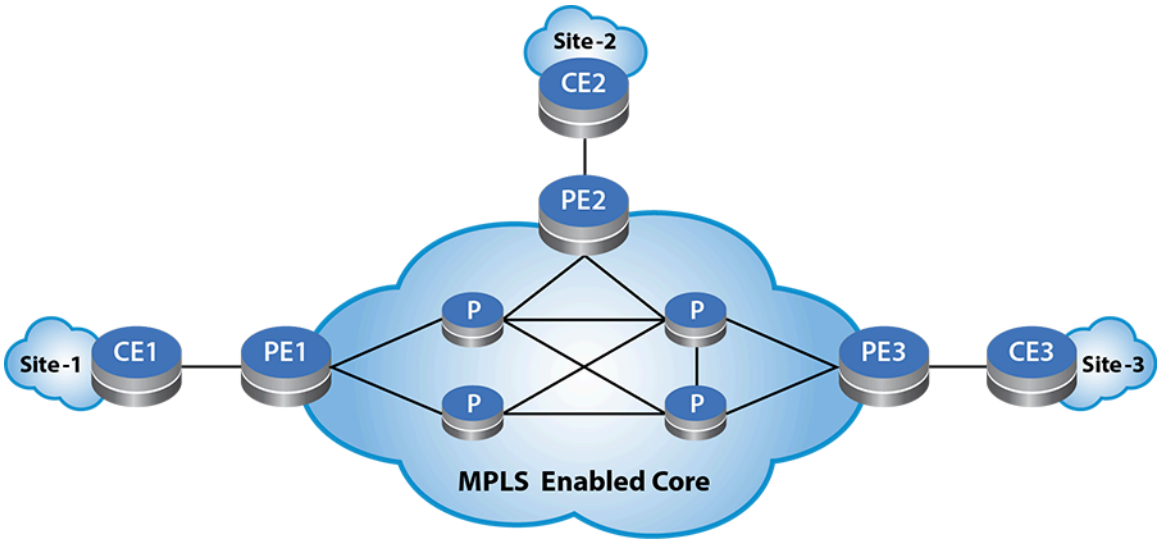

Figure 144: MPLS Enabled Core Schematic

The CE attaches to PE in a VRF. The routes learned from the CE are programmed in the corresponding VRF and the PE then distributes the routes to other PEs as "VPN routes" using MP-BGP. This is done by using two new BGP address families, VPN-IPv4 (AFI=1, SAFI=128) and VPN-IPv6 (AFI=2, SAFI=128).

On the PEs, corresponding to the VPN, VRFs configure with the RD and one or more import and export RTs. The RD attaches to the customer route to create a VPN route. By picking a unique RD for each VRF and attaching it to the customer route, the VPN route is unique. This allows for customers with overlapping IP addresses to be managed by the Service Provider. This unique VPN route is advertised to other PEs along with the configured export RT and the VPN label. The PE router allocates a VPN label per VRF and address family. The PE router programs its Label FIB (LFIB) with this label information. When the PE router receives an incoming MPLS packet with the VPN label as the topmost label, it pops the label and does an IP lookup in the associated VRF. The PE router also maintains a mapping of import RTs to the corresponding VRFs. This mapping is used later when deciding into which VRFs a received VPN route should be imported into.

The PE learns customer routes from the CE through the PE-CE routing protocol, which could be Static routing, EBGP, OSPF, or ISIS. The PE will install those customer routes in the associated VRF, with the CE as the nexthop. The customer routes in the VRF are exported into the BGP VPN table as VPN routes, along with the VPN label and the configured export RTs as BGP path attributes. These VPN routes are then advertised to other PEs which have been activated for the VPN address-families (VPN-IPv4/VPN-IPv6). The PE then sets itself as the nexthop while advertising the VPN routes. The PE which receives those VPN routes strips out the RD and import them as IPv4 or IPv6 routes into the VRFs. The list of VRFs into which the route is imported is determined based on the mapping of import RTs to VRFs. These routes will be programmed into the FIB along with the VPN label and the remote PE as the nexthop. Once these routes are installed in the VRF, the CE connected to that VRF will learn those routes (based on the PE-CE routing protocol) and make it available it in the customer network that it is attached to. This way the geographically dispersed customer sites learn of each other's networks and IP reachability is established between the them.

19.2.1.1 Forwarding

In the Service Provider's core network there should be MPLS LSPs between the PEs. That is, the connection to the VPN next-hop should be over an MPLS tunnel. The MPLS LSPs in the core could be setup using RSVP-TE or LDP in conjunction with OSPF/ISIS or ISIS-SR.

When the PE receives an IP packet from the CE destined to the remote site, it does an IP lookup in the VRF to which the CE is connected. This lookup provides the VPN label to be used and the nexthop, which would be the remote-PE. The VPN label is imposed on the IP packet and the resulting MPLS packet is then tunneled through the MPLS LSP to the remote PE. As result of penultimate hop popping, the MPLS packet arrives at the remote PE with the VPN label as the topmost label. The label lookup results in the VPN label being popped and an IP lookup will be done in the associated VRF. Note that the PE would have programmed this label action when it allocated the label to start with. That IP lookup will result in the IP packet being forwarded out to the CE.

19.2.2 Configuration

Configuring BGP/MPLS L3 VPN involves enabling the SP core for MPLS and then configuring the PEs with the required BGP configuration.

It is assumed that the SP core network is enabled for MPLS. This involves configuring an IGP (OSPF/ISIS) followed by a label distribution protocol such as LDP, RSVP-TE or ISIS-SR. Typically, loopback interfaces are configured on all the PE and the P routers and the IGPs exchange reachability to those loopback interfaces. And then the MPLS Label Distribution Protocol will set up MPLS LSPs/tunnels between all those loopbacks.

This section includes the following topics:

- LDP Hello Redundancy
- Enabling BGP to Exchange the Routing Tables with the Peer
- Configuring the VRF Information
- Configuring the Route Distinguisher
- Configuring Route Targets
- Configuring Import / Export Route-maps
- VPN Next-hop

Enabling MPLS and LDP on the PE involves the following steps:

1. Configure terminal.

```
switch# configure terminal
```

2. Enter the ***Loopback0*** interface config mode.

```
switch(config)# interface Loopback0
```

3. Enter destination IP address.

```
switch(config)# ip address 11.0.0.1/32
```

4. Enable MPLS routing.

```
switch(config)# mpls ip
```

5. Configure MPLS LDP.

```
switch(config)# mpls ldp
```

6. Configure the router ID interface.

```
switch(config-mpls-ldp)# router-id interface Loopback0
```

7. Configure for no shutdown

```
switch(config-mpls-ldp)# no shutdown
```

Example:

```
switch# configure terminal
switch(config)# interface Loopback0
switch(config-if)# ip address 11.0.0.1/32
switch(config)# mpls ip
switch(config)# mpls ldp
switch(config-mpls-ldp)# router-id interface Loopback0
switch(config-mpls-ldp)# no shutdown
```

19.2.2.1 LDP Hello Redundancy

LDP Hello Redundancy establishes a redundant target Hello adjacency for each neighbor discovered through the Basic Discovery Mechanism using the LDP Extended Discovery mechanism. For the mechanism to work, the following must be true:

- Devices must have a loopback interface configured to serve as the transport address interface, which must be routable through all interfaces on the device.
- Devices must be reachable via a redundant path through other devices on the network.
- Both devices must have Hello Redundancy configured or the targeted Hello messages will be ignored.

After a Hello adjacency is established using LDP Basic Discovery, devices with Hello Redundancy will start sending Targeted Hello messages to the Transport Address found in the received Link Hello message of Basic Discovery. The Targeted Hello adjacency can support the session established between peers even when all Link Hello adjacencies have timed out. The FEC label bindings between two peers with no Link Hello adjacency will not be active because the Interior Gateway Protocol will not use the other peer as the next hop. Maintaining the FEC label bindings and the session between the two peers can save significant time when the Link Hello adjacency is reestablished.

The **`neighbor hello-redundancy`** command configures Hello Redundancy on all platforms under the LDP configuration mode. If a Link Hello adjacency is restored within 600 seconds of being lost, the Target Hello adjacency and the session associated with it will be dropped. The timeout can be configured using the ***duration*** option of the command. An infinite value for the ***duration*** disables the timeout.

Configuration for LDP Hello Redundancy

The following example is applicable to all platforms.

These commands enable Targeted Hello redundancy with a duration of 300 seconds.

```
switch(config-mpls-ldp)# neighbor hello-redundancy
switch(config-mpls-ldp)# neighbor hello-redundancy duration 300
```

Either of the following commands in the example below disable Hello Redundancy.

```
switch(config-mpls-ldp)# neighbor hello-redundancy none
switch(config-mpls-ldp)# default neighbor hello-redundancy
```

The following command shows the Targeted Hello adjacencies established.

```
switch(config)# show mpls ldp discovery detail
LDP MD5 Password Not Set
Local LDP Identifier: 2.2.2.2:0
Discovery Sources:
   Interfaces:

            Hold time: 45 sec; Proposed local/peer: 45/45 sec; Expires
 in: 35.89 sec
            Target configuration source: Hello Redundancy
```

19.2.2.2 Enabling BGP to Exchange the Routing Tables with the Peer

Enabling the send-community extended knob on the neighbor. This essentially enables BGP to exchange the RTs with the peer.

- Activating the peer (the remote PE) under the **`address-family VPN-IPv4`** and **`address-family VPN-IPv6`** modes enables BGP to negotiate the MPLS L3 VPN address families.
- Specify the address for the VPN next-hop using the command, **`neighbor default encapsulation mpls next-hop-self source-interface Loopback0.`**

In the preceding configuration example, the system uses the address ***11.0.0.1*** from interface ***Loopback0*** as the nexthop in the VPN route advertisements.

19.2.2.3 Configuring the VRF Information

First, the VRF must be configured in the ***global*** mode and IPv4 and IPv6 routing must be enabled in the VRF. After that, under the ***router bgp*** mode, we need to configure the VRF and provide the information related to RD and import and export RTs.

1. Configure terminal.

```
switch# configure terminal
```

2. Enable IP routing.

```
switch(config)# ip routing
```

3. Enable IP routing for the VRF.

```
switch(config)# ip routing vrf vrf1
```

4. Enable IPv6 routing for the VRF.

```
switch(config)# ipv6 unicast-routing vrf vrf1
```

```
switch# configure terminal
switch(config)# ip routing
switch(config)# ip routing vrf vrf1
switch(config)# ipv6 unicast-routing vrf vrf1
```

The VRF configuration under router BGP mode is shown below.

```
switch(config-router-bgp-vrf-vrf1)# show active
router bgp 300
  vrf vrf1
    rd 11.0.0.1:0
    route-target import vpn-ipv6 300:0
    route-target import vpn-ipv4 300:0
    route-target import vpn-ipv4 300:0
    route-target import vpn-ipv4 300:0
    route-target export vpn-ipv6 300:0
    route-target export vpn-ipv4 300:0
    redistribute connected
    redistribute static
switch(config-router-bgp-vrf-vrf1)#
```

19.2.2.4 Configuring the Route Distinguisher

The Route Distinguisher (RD) is structured such that it can be easily configured and managed. It is configured by specifying two fields separated by a colon, as in administrative-subfield: assigned-number-subfield.

The administrative subfield could contain either an IP address, as shown in the example (the PEs loopback address), or the AS number. The assigned-number-subfield can be any number which is determined by the SP. The primary requirement of the RD is that it must be unique per VRF. It is possible to have overlapping address space between VRFs, the intent of the RD is to ensure that a VPN route can be uniquely identified as it is received by a remote PE. However, the identification of which VRF(s) the received VPN route should be imported into is handled by the import RTs configured on the remote PE.

19.2.2.5 Configuring Route Targets

Next is the import and export Route Target configuration. The RTs are structured similar to the RDs. They too are made up of administrative-subfield: **assigned-number-subfield**. In the example shown, the AS number has been used as the administrative subfield. And the value ***0*** has been used for the assigned number subfield. It is the RT that plays an important role in identifying the VPN.

- Received VPN routes with the import RT as path attributes will be imported into the VRF will have RTs has extended-community BGP path attributes. They will be imported into VRFs which import RT configuration for RTs in the received VPN route.
- And while advertising the routes from the VRF as VPN routes, the export RT will be attached to the route as an extended-community BGP attribute.

1. In the example, the connected and static routes in the VRF are redistributed into BGP. And these routes will be exported as VPN routes.
2. It is also possible to have a BGP session with the CE. In that case, routes received over that session are exported as VPN routes. And imported routes are advertised to the CE.

19.2.2.6 Configuring Import / Export Route-maps

The routes that are imported into a VRF can be further controlled by applying an import route-map. And the routes that are exported from the VRF can be controlled by applying an export route-map.

Complete the following steps:

1. Configure terminal.

```
switch# configure terminal
```

2. Configure BGP. In this example, BGP is configured AS ***4274781899.***

```
switch(config)# router bgp 4274781899
```

3. Configure the VRF under router bgp mode.

```
switch(config-router-bgp)# vrf vrf1
```

4. Select the BGP route distinguisher. In this example, ***36351:268450419*** is selected.

```
switch(config-router-bgp-vrf-vrf1)# rd 36351:268450419
```

5. Configure the import route-target VPN-IPv4, unicast address family. In this example, ***36351:1001*** is selected.

```
switch(config-router-bgp-vrf-vrf1)# route-target import vpn-ipv4
 36351:1001
```

6. Configure another import route-target for VPN-IPv4 unicast address family. In this example, ***36351:268450419*** is selected.

```
switch(config-router-bgp-vrf-vrf1)# route-target import vpn-ipv4
 36351:268450419
```

7. Configure the export route-target for VPN-IPv4 unicast address family. In this example, ***36351:268450419*** is selected.

```
switch(config-router-bgp-vrf-vrf1)# route-target export vpn-ipv4
 36351:268450419
```

8. Configure the import route-map. In this example, the import router-map name is **BGP-IMPORT-VRF-SERVICES**.

```
switch(config-router-bgp-vrf-vrf1)# route-target import vpn-ipv4 route-
map BGP-IMPORT-VRF-SERVICES
```

9. Configure the export route-map. In this example, the export route-map name is **BGP-EXPORT-VRF-VRF1**.

```
switch(config-router-bgp-vrf-vrf1)# route-target export vpn-ipv4 route-
map BGP-EXPORT-VRF-VRF1
```

10. Optionally, redistribute connected routes in the VRF into BGP, with the associated route-map **BGP-ANNOUNCE-CONNECTED**.

```
switch(config-router-bgp-vrf-vrf1)# redistribute connected route-map
 BGP-ANNOUNCE-CONNECTED
```

11. Optionally, redistribute static routes in the vrf into BGP, with associated route-map **BGP-ANNOUNCE-STATIC**.

```
switch(config-router-bgp-vrf-vrf1)# redistribute static route-map BGP-
ANNOUNCE-STATIC
```

12. The import and export route-maps should be separately configured. The configuration snippet below shows the configuration of the same route-map **BGP-IMPORT-VRF-SERVICES**.

```
switch(config-router-bgp-vrf-vrf1)# route-map BGP-IMPORT-VRF-SERVICES
 permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)# match extcommunity
 SERVICES
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)# match ip address
 prefix-list SERVICES
```

Example:

```
switch# configure terminal
switch(config)# router bgp 4274781899
switch(config-router-bgp)# vrf vrf1
switch(config-router-bgp-vrf-vrf1)# rd 36351:268450419
switch(config-router-bgp-vrf-vrf1)# route-target import vpn-ipv4
 36351:1001
switch(config-router-bgp-vrf-vrf1)# route-target import vpn-ipv4
 36351:268450419
switch(config-router-bgp-vrf-vrf1)# route-target export vpn-ipv4
 36351:268450419
switch(config-router-bgp-vrf-vrf1)# route-target import vpn-ipv4
 route-map BGP-IMPORT-VRF-SERVICES
switch(config-router-bgp-vrf-vrf1)# route-target export vpn-ipv4
 route-map BGP-EXPORT-VRF-VRF1
switch(config-router-bgp-vrf-vrf1)# redistribute connected route-
map BGP-ANNOUNCE-CONNECTED
switch(config-router-bgp-vrf-vrf1)# redistribute static route-map
 BGP-ANNOUNCE-STATIC
switch(config-router-bgp-vrf-vrf1)# route-map BGP-IMPORT-VRF-
SERVICES permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)# match
 extcommunity SERVICES
```

```
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)# match ip
 address prefix-list SERVICES
```

19.2.2.7 VPN Next-hop

By default, the system uses the source address of the BGP session as the nexthop in the VPN advertisements. This source address is determined by the system while establishing the TCP session between the PEs. If the SP want to use a different address as the VPN next-hop, then an interface with that address must be specified under the BGP address-family VPN-IPv4 or address-family VPN-IPv6 configuration modes. For example,

```
switch(config-router-bgp)# address-family vpn-ipv4
switch(config-router-bgp-af)# neighbor 10.0.0.2 activate
switch(config-router-bgp-af)# neighbor default encapsulation mpls next-
hop-self source-interface Loopback0

switch(config-router-bgp)# address-family vpn-ipv6
switch(config-router-bgp-af)# neighbor 10.0.0.2 activate
switch(config-router-bgp-af)# neighbor default encapsulation mpls next-
hop-self source-interface Loopback0
```

In the previous example, the interface ***Loopback 0*** has been specified. The system picks the VPN next-hop address from the interface based on the following rules:

- For VPN-IPv4, the IPv4 address from the interface is picked.
- For VPN-IPv6,
  - For an IPv4 peer,
    - Pick the IPv4 address from the interface.
    - If the interface does not have a IPv4 address, pick the IPv6 address.
  - For an IPv6 peer,
    - Pick the IPv6 address from the interface.
    - If the interface does not have an IPv6 address, pick the IPv4 address.

For VPN-IPv6, when an IPv4 address is picked as the next-hop, it is encoded as a IPv4-mapped IPv6 address in the VPN route advertisement. This is as per ***RFC 4659***.

19.2.3 Show Commands

Use the **`show bgp instance vrf vrf1`** command to show the BGP instance status for a specific VRF to verify the route-targets and import/export route-maps being used. The command also displays the locally allocated MPLS label that the system has allocated for IPv4 and IPv6.

```
switch# show bgp instance vrf vrf1
BGP instance information for VRF vrf1
BGP Local AS: 4274781899, Router ID: 169.254.156.10
Total peers:                        0
 Static peers:          0
 Dynamic peers:         0
 Disabled peers:        0
 Established peers:     0
Four Octet ASN mode enabled
Graceful restart helper mode disabled
Graceful restart mode disabled
Graceful restart timer timeout: 00:05:00
End of rib timer timeout: 00:05:00
```

```
Attributes of the reflected routes are not preserved
UCMP mode: disabled
Peer mac resolution timeout: 00:00:00
BGP IPv4 Listen Port Status: listening on port 179
BGP IPv6 Listen Port Status: listening on port 179
BGP Convergence information:
   BGP has converged:   yes,   Time taken to converge: 00:00:31
   Outstanding EORs:    0,     Outstanding Keepalives: 0
   Convergence timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence based update synchronization is disabled
BGP Convergence slow-peer timeout: 00:01:30
Address-family IPv4 Unicast:
 Redistributed routes into BGP:
   Static
   Connected
 Route Distinguisher: 36351:268450419
  Route targets to import:

    IPv6 Unicast:          0         0
  Configured maximum total number of routes is 12000
  Inbound updates dropped by reason:
    AS path loop detection: 0
    Malformed MPBGP routes: 0
    Originator ID matches local router ID: 0
    Nexthop matches local IP address: 0
Local AS is 300, local router ID 0.0.0.1
Local TCP address is 10.0.0.1, local port is 179
Remote TCP address is 10.0.0.2, remote port is 47400
```

Use the **`show bgp vpn-ipv4 summary`** command to show the status of VPN-IPv4 peers. While the examples below are with respect to VPN-IPv4, the same set of commands are applicable to VPN-IPv6.

```
switch# show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 300
Neighbor Status Codes: m - Under maintenance
Neighbor  V AS  MsgRcvd MsgSent InQ OutQ Up/Down State  PfxRcd PfxAcc
10.0.0.2  4 300 3379    60      0   0    1d23h   Estab  1      1
```

Use the **`show bgp vpn-ipv4`** command to show how the VPN-IPv4 routes sent and received.

```
switch# show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not
 installed, E -
ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
```

```
AS Path Attributes:Or-ID - Originator ID,C-LST - Cluster List,LL Nexthop-
Link
Local Nexthop
         Network             Next Hop         Metric  LocPref Weight Path
 * >     RD: 11.0.0.1:0 IPv4 prefix 20.0.0.0/24
                             -                -       -       0      i
 * >     RD: 11.0.1.1:0 IPv4 prefix 20.0.1.0/24
             11.0.1.1        -                100     0              i
```

Each entry in the output represent a VPN path in the VPN table. For each VPN path, the RD and actual prefix along with the nexthop information is shown. Paths in the VPN table are either received from other VPN-IPv4 peers (other PEs) or exported from local VRFs.

In the above output, ***20.0.0.0/24*** is a local route that has been exported. Notice that it has been prepended with the RD ***11.0.0.1:0*** to make it a VPN-IPv4 route. And the prefix of ***20.0.1.0/24*** has been received from another PE. It has the RD of ***11.0.1.1:0*** with a nexthop of ***11.0.1.1***. Looking at each of those prefixes in detail:

20.0.0.0/24 is a local route from one of the VRFs that has been exported. Notice that along with the prefix, the RD, the export RT and the MPLS label information is displayed. In this case, the MPLS label is a locally allocated label.

```
switch# show bgp vpn-ipv4 20.0.1.0/24
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for IPv4 prefix 20.0.1.0/24, Route Distinguisher
:
11.0.1.1:0
 Paths: 1 available
  Local
    11.0.1.1 from 10.0.0.2 (0.0.1.1)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal,
 best
      Extended Community: Route-Target-AS:300:0
      MPLS label: 100123
```

20.0.1.0/24 is a prefix that has been received from the VPN-IPv4 peer, ***10.0.0.2***. The next-hop in this case is ***11.0.1.1***. This VPN route is imported into a VRF based on the import RT configuration matching the RT received in the VPN route (***300:0***).

Note: Route-Distinguishers for the non-default VRFs must be configured under the **router bgp** mode. Route-Distinguisher configured under the VRF definition mode are ignored.

The route is installed in the VRF only when the VPN next-hop is reachable through an MPLS tunnel. The presence of such an MPLS tunnel can be verified using the **`show tunnel fib`** command. The output below shows that there is an MPLS tunnel setup by LDP to the VPN nexthop ***11.0.1.1***.

```
switch# show tunnel fib
Type 'LDP', index 1, endpoint 11.0.1.1/32, forwarding None
   via 10.0.0.2, 'Ethernet6'
      label stack 3
```

Use the **`show ip bgp vrf vrf1`** command to show the BGP table for the VRF which contains the imported VPN-IPv4 route.

```
switch# show ip bgp vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
Route status codes:s-suppressed,*-valid,>-active,#-not installed, E-ECMP
 head,e-ECMP
       S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unica
st
```

```
       % - Pending BGP convergence
Origin codes: i-IGP, e-EGP, ?-incomplete
AS Path Attributes: Or-ID-Originator ID, C-LST-Cluster List, LL Nexthop-
Link Local Nexthop

         Network          Next Hop       Metric  LocPref Weight Path
 * >     20.0.0.0/24      -              -       -       0      i
 * >     20.0.1.0/24      11.0.1.1       -       100     0      i
```

Each entry in the table represents a path either locally redistributed/received into the VRF (from a BGP peer) or imported from the VPN table.

Use the **`show ip bgp 20.0.1.0/24 vrf vrf1`** command for a more detailed view of the imported IP prefix ***20.0.1.0/24***:

```
switch# show ip bgp 20.0.1.0/24 vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
BGP routing table entry for 20.0.1.0/24
 Paths: 1 available
  Local
    11.0.1.1 from 10.0.0.2 (0.0.1.1), imported VPN-IPv4 route, RD
 11.0.1.1:0
      Origin IGP, metric -, localpref 100, weight 0, valid, internal,
 best
      Extended Community: Route-Target-AS:300:0
      Remote MPLS label: 100123
```

Use the **`show ip route vrf vrf1`** command to view the prefix installed in route table of the VRF:

```
switch# show ip route vrf vrf1
VRF: vrf1
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route
Gateway of last resort is not set
 C     20.0.0.0/24 is directly connected, Ethernet5
 B I   20.0.1.0/24 [200/0] via 11.0.1.1/32,LDP tunnel index 1,label
 100123
                           via 10.0.0.2,Ethernet3,label imp-null(3)
```

The output displays both the VPN label, as well as the underlay tunnel (LDP) information.

19.2.4 Limitations

- While configuring a BGP Route-Reflector for the VPN-IPv4/VPN-IPv6 address families, the route-reflector must have transport MPLS LSPs to reach the PE nexthop addresses. Even though the route-reflector may not be in the data path and does not use the transport LSPs to forward traffic, the LSPs are required in order for the BGP nexthops to be considered as reachable valid candidates in the bestpath computation.
- When configuring eBGP peers, which receive routes over an eBGP session and re-advertise the same to a different eBGP peer, next-hop-unchanged knob must be configured, so that the original nexthop is retained.
- With iBGP route-reflector topology, next-hop-self knob must not be configured.

- Even with directly connected PEs, the VPN nexthops should be the loopback on the directly connected PEs with an MPLS tunnel between them.
  - For a VPN route to be installed in the VRF, the VPN nexthop must resolve over a MPLS tunnel.
- With OSPF as the PE-CE protocol, ***RFC 4576***, setting of the DN bit in the LSA, is not supported.
- Internal BGP (iBGP) as the PE-CE protocol, ***RFC 6368***, is not supported.

19.3 EVPN MPLS Shared ESI Label

In a multihomed EVPN MPLS configuration, BUM packets sent from a Non-Designated Forwarder (Non-DF) PE to a Designated Forwarder (DF) PE must carry the ESI label advertised by the egress DF PE. When the egress DF PE receives a packet with the ESI label that it has advertised, it does not forward the packet on the Ethernet Segment (ES) corresponding to that ESI label. This avoids sending the packet back to the same ES from which the BUM packet originated.

However, when a DF election is triggered, a PE may change its role from being Non-DF to DF. Since the DF election is run on each PE distributively, some PE(s) may not have updated their view of the new DF PE and add no ESI label in the BUM packet. In such a case, the BUM packets in transit may get sent back to the same ES where they originated. To overcome this, ESI labels are included to Non-DF PEs as well. This shared ESI label provides a mechanism to achieve sending ESI label to Non-DF PEs on platforms which cannot support sending different ESI labels to its multihomed peers.

19.3.1 Configuring EVPN MPLS Shared ESI Label

An Ethernet-Segment (ES) must be configured with a shared-index to allocate an ESI label value based on the shared-index configuration.

Example

```
switch(config)# interface Ethernet4
switch(config-if-Et1)# switchport access vlan 1000
switch(config-if-Et1)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0022:2222:2222:2222:2222
switch(config-evpn-es)# mpls shared index 100
switch(config-evpn-es)# route-target import 00:02:00:02:00:02
```

- If all PEs which are provisioned with the same ES carry the same shared-index value, then they will allocate the same ESI label value for that ethernet-segment.
- Having this configuration consistent on all PEs will enable the hardware to encapsulate the ESI label on all BUM packets towards its multi-homed peers. This is essential to implement split-horizon filtering during DF role change events.
- The shared index value is used as an offset into the reserved **`l2evpn ethernet-segment`** range where the label value is derived as follows:
  - ESI label = label-range base value + shared-index value – 1

The ESI labels are allocated from **`l2evpn ethernet-segment`** label range which has a **default configuration** as shown below.

```
switch#show running-config all
mpls label range bgp-sr 900000 65536
mpls label range dynamic 100000 262144
mpls label range isis-sr 900000 65536
mpls label range l2evpn 1036288 12288
mpls label range l2evpn ethernet-segment 1031072 1024
mpls label range srlb 965536 65536
mpls label range static 16 99984
```

19.3.2 EVPN MPLS Shared ESI Label Show Commands

The following show command displays the operational state on whether the ESI label is shared amongst all the PEs in that Ethernet-Segment:

Example

```
switch# show bgp evpn instance
EVPN instance: VLAN 1000
  Route distinguisher: 100.0.0.1:1000
  Route target import: Route-Target-AS:64500:1000
  Route target export: Route-Target-AS:64500:1000
  Service interface: VLAN-based
  Local IP address: 100.0.0.1
  Encapsulation type: MPLS
  Label allocation mode: per-instance
  MAC route label: 1040210
  IMET route label: 1042201
  AD route label: 1040210
  Local ethernet segment:
    ESI: 0022:2222:2222:2222:2222
      Interface: Ethernet4
      Mode: all-active
      State: up
      ESI label: 1031171
      Shared ESI label: on
      ES-Import RT: 00:02:00:02:00:02
      Designated forwarder: 100.0.0.1
      Non-Designated forwarder: 100.0.0.2
```

- Shared ESI label state for an ES is **ON** when the following conditions are satisfied.
  - ES is configured with shared-index i.e, **`mpls shared index <value>`**.
  - All PEs in that ES carry the same ESI label.
- **`l2evpn shared ethernet-segment`** label range space can be looked up using the command below:

```
switch# show mpls label ranges
Start     End       Size      Usage
-----------------------------------------------
0         15        16        reserved
16        99999     99984     static mpls
100000    116383    16384     ldp (dynamic)
116384    132767    16384     bgp (dynamic)
132768    362143    229376    free (dynamic)
362144    899999    537856    unassigned
900000    965535    65536     isis-sr
900000    965535    65536     bgp-sr
965536    1031071   65536     srlb
1031072   1032095   1024      l2evpn shared ethernet-segment
1032096   1036287   4192      unassigned
1036288   1048575   12288     l2evpn
```

19.3.3 Limitations

When the PE switch is multihomed to more than six PEs and each one of those PEs have an ethernet segment in shared ESI configuration, the PE switch may not be able to push the ESI label into the MPLS label stack of BUM packets ingressing on every ethernet segment. In such a case, the syslog **`EVPN-3-MPLS_SHARED_ESI_HW_RESOURCE_FULL`** is emitted.

19.4 RSVP-TE LSR

RSVP-TE applies the Resource Reservation Protocol (RSVP) for Traffic Engineering (TE), that is, to distribute MPLS labels for steering traffic and reserving bandwidth.

The EOS implementation supports:

- RSVP-TE core protocol (***RFC 2205***, ***RFC 3209***), transit role
- Hello messages (***RFC 3209***)
- Refresh overhead reduction (***RFC 2961***)
- Cryptographic authentication (***RFC 2747***)
- Fast Reroute: facility backup, link-protection/NHOP (***RFC 4090***)
- LSP Ping/Traceroute (***RFC 4379***)
- Fast Reroute node-protection (Starting in ***EOS Release 4.22.1F***)
- Bandwidth management (Starting in ***EOS Release 4.22.1F***)
- SRLG for Fast Reroute (Starting in ***EOS Release 4.23.1F***)
- MTU signaling (Starting in ***EOS Release 4.23.1F***)
- Soft preemption (Starting in ***EOS Release 4.23.1F***)
- Support for OSPFv2 as the IGP (Starting in ***EOS Release 4.24.2F***)
- Support for LDP entropy label (Starting in ***EOS Release 4.26.0F, RFC 6790***)

19.4.1 RSVP-TE LSR Configuration

There is a dedicated configuration sub-mode for RSVP:

```
(config)# mpls rsvp
(config-mpls-rsvp)#
```

19.4.1.1 Enabling RSVP-TE

Enable RSVP-TE globally by issuing **`no shutdown`** in the configuration sub-mode. This is the only mandatory setting for RSVP-TE to work. This also globally enables MPLS.

```
(config-mpls-rsvp)# no shutdown
```

To disable RSVP-TE, use the **`shutdown`** command, which is the default.

```
(config-mpls-rsvp)# shutdown
```

There is no per-interface knob to enable and disable RSVP. However, you can only enable RSVP on interfaces that MPLS is also enabled.

19.4.1.2 State Refresh Parameter

You can configure the state refresh interval. It describes parameter R in seconds, leading to a state refresh (Path and Resv messages) every ***0.5*R*** to ***1.5*R*** seconds (randomly chosen). The default value is ***30*** seconds.

```
(config-mpls-rsvp)# refresh interval 30
```

19.4.1.3 Hello Messages

To configure the Hello message interval (seconds) and timeout multiplier (integer), refer to the following example.

In this example, hello messages are sent to all known neighbors every ***10*** seconds. If no hello responses are received from a neighbor for 4*10=40 seconds, communication is considered to be lost and the neighbor is reset.

```
(config-mpls-rsvp)# hello interval 10 multiplier 4
```

The default of ***10*** seconds with multiplier ***4*** can be reset with:

```
(config-mpls-rsvp)# default hello interval
```

To explicitly disable Hello messages, use the following command:

```
(config-mpls-rsvp)# no hello interval
```

19.4.1.4 Refresh Overhead Reduction

Setting the refresh method to **bundled** enables the Refresh Overhead Reduction (***RFC 2961***) that supports the sending of message IDs and refreshing state with refresh messages.

```
(config-mpls-rsvp)# refresh method bundled
```

This is also the default setting. To turn off refresh overhead reduction, use **explicit**.

```
(config-mpls-rsvp)# refresh method explicit
```

19.4.1.5 Cryptographic Authentication Extension

Cryptographic Authentication (***RFC 2747***) is enabled by setting the **authentication type** to **md5** and configuring an active password.

```
(config-mpls-rsvp)# authentication type md5
```

The default is **none**, which disables cryptographic authentication.

Authentication secrets are configured with an index. One of the indices should be chosen as the actively used password:

```
(config-mpls-rsvp)# authentication index 1 password s3cr3t
(config-mpls-rsvp)# authentication index 1 active
```

The **active** password is used to authenticate outgoing messages. All configured passwords are accepted for authentication of incoming packets, which allows smooth key rollover.

Password obfuscation is available:

```
(config-mpls-rsvp)# authentication index 1 password 7 07092E43
```

The size of the sequence number reorder window can be changed to accommodate a larger number of out-of-order packets. A value of *N* means that a packet is accepted if all earlier received packets with a higher sequence number are within the preceding *N-1* packets.

```
(config-mpls-rsvp)# authentication sequence-number window 5
```

The default value is ***5***. A value of ***1*** effectively turns off support for packet reordering.

19.4.1.6 Fast Reroute Extension

Support for Fast ReRoute (FRR) link protection/NHOP (***RFC 4090***) is enabled by setting the Fast Reroute mode to **link-protection**.

```
(config-mpls-rsvp)# fast-reroute mode link-protection
```

To turn off FRR, change the mode to the default setting **none**.

```
(config-mpls-rsvp)# fast-reroute mode none
```

This setting only applies to Point of Local Repair (PLR) behavior, for example, the router is the upstream node relative to a to-be-protected link over which an LSP is routed. Merge Point (MP) behavior is always enabled and not affected by this setting.

Support for Node Protection is present starting in ***EOS Release 4.22.1F***, so the above CLI also accepts an additional mode **node-protection**.

You can change the revertive behavior of the FRR from the **global** revertive mode to the **local** revertive mode. In the **global** revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is dead keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the **local** revertive mode, the LSR switches back to using the primary link after recovery.

```
(config-mpls-rsvp)# fast-reroute reversion local
```

The default for reversion is **global**.

```
(config-mpls-rsvp)# fast-reroute reversion global
```

19.4.1.7 Shared Risk Link Group

Starting in ***EOS Release 4.23.1F***, there is an additional config command to configure SRLG mode.

`srlg` [strict]

`no srlg` [strict]

`default srlg` [strict]

This command specifies if link SRLGs of a primary LSP are to be considered as constraints while creating a fast-reroute bypass tunnel with either link or node protection. When **`srlg`** is specified with the **strict** keyword, then if a path for a bypass tunnel excluding SRLGs of the next-hop interface of primary LSP can not be found, RSVP does not setup the bypass tunnel. When **`srlg`** is specified without a **strict** keyword, then a bypass tunnel is setup with as many links as possible that exclude the SRLGs of the next-hop interface of primary LSP and where such links are not available, links that have the least number of SRLGs which are to be excluded are used.

When this CLI is not configured, the behavior remains the same as before, which is to turn off SRLG processing. Therefore, the **`no`** and **`default`** versions of the command take you back to the default of SRLG processing being turned off.

The SRLGs of an interface can be configured using the following traffic-engineering CLI as below:

```
(config)# interface Et1
(config-if-Et1)# traffic-engineering srlg 100

(config)# interface Et2
(config-if-Et2)# traffic-engineering srlg 200
```

Note: Although a large number of SRLGs can be configured on an interface (ranging from ***0*** to ***2^32 -1***), CSPF only takes into account a maximum of ***16*** SRLGs for finding a path with SRLG constraints.

19.4.1.8 CSPF Configuration Command

RSVP-TE uses CSPF to compute the FRR backup path. CSPF can be throttled to avoid frequent path changes when there are frequent network events. The following CLI command is used under the **`router traffic-engineering`** mode to specify how frequently CSPF is to run after a network event by specifying the initial wait interval, back-off interval, and maximum wait interval for CSPF.

`cspf delay` [initial *n* back-off ***n***] max ***n***

All three values are in milliseconds and default to ***100***, ***200***, and ***1000*** milliseconds, respectively.

19.4.1.9 Traffic-engineering Configuration Commands

For CSPF to compute the FRR backup path to a particular destination, enable traffic-engineering on all the IGP enabled interfaces, and enable globally the traffic engineering extensions. For IS-IS, enable under ***router isis*** mode, and for OSPFv2, enable under ***router ospf***. This is required for the IGP to start exchanging TE-related attributes with peers and build its topology database.

Also, CSPF needs some notion of router ID to uniquely identify a router, so that it can find a path to it. CSPF also uses self router-id as a source for running SPF. So a router-id is required to be configured under ***router traffic-engineering*** mode for CSPF to function properly.

19.4.1.10 MTU Signaling

Starting in ***EOS Release 4.23.1F***, MTU along a path can be signaled using RSVP.

Example

`mtu signaling`

`no mtu signaling`

`default mtu signaling`

RSVP can discover the lowest MTU used along an LSP by evaluating and updating, at each hop, the composed MTU, stored in the General Parameters fragment of an AdSpec object in RSVP Path messages.

At each RSVP hop, when MTU signaling is enabled, the value is updated by taking the minimum between the downstream interface for an LSP and the composed MTU value from the incoming Path message.

When the feature is disabled, the composed MTU is not updated.

19.4.1.11 Soft Preemption

Starting in ***EOS Release 4.23.1F***, soft preemption is supported, which enables deferred failure of RSVP-TE LSPs on link oversubscription. A preemption timer value can be used to configure a delay on a transit router to support LSPs signaled with soft preemption enabled by the headend (***RFC 5712***).

`preemption method` [hard | soft] timer *t*

`no preemption method` [hard | soft] timer *t*

`default preemption method` [hard | soft] timer *t*

The default preemption method is soft preemption with a timer value of ***30*** seconds.

In this example, the preemption method is soft preemption with a timer value of ***10*** seconds.

```
(config-mpls-rsvp)# preemption method soft timer 10
```

Setting the preemption method to hard preemption results in a timer value of ***0*** seconds and disables the feature.

```
(config-mpls-rsvp)# preemption method hard
```

Sample Configuration

```
switch(config)# ip routing
!
switch(config)# mpls ip
!
switch(config)# interface Ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ip address 10.0.0.1/24
switch(config-if-Et1)# isis enable isis
switch(config-if-Et1)# traffic-engineering
switch(config-if-Et1)# traffic-engineering bandwidth 100 percent
switch(config-if-Et1)# traffic-engineering metric 5
!
switch(config)# router traffic-engineering
switch(config-te)# router-id ipv4 0.1.1.1
!
switch(config)# router isis isis
switch(config-router-isis)# net 49.0000.0000.0000.1111.00
switch(config-router-isis)# is-type level-2
   !
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af)# maximum-paths 32
   !
switch(config-router-isis-af-te)# traffic-engineering
switch(config-router-isis-af-te)# no shutdown
switch(config-router-isis-af-te)# is-type level-2
!
switch(config)# mpls rsvp
switch(config-mpls-rsvp)# no shutdown
!
```

The following displays the overall state of RSVP.

```
switch> show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
   Mode: none
   Hierarchical FECs: enabled
Cryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
   Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
   Operational: 1
   Ingress/Transit/Egress: 0/1/0
```

```
   Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2
```

The following displays the RSVP neighbors.

```
switch> show mpls rsvp neighbor
Neighbor 10.0.1.1
   Upstream for
      Session #1 LSP #1
   Downstream for
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: 1 seconds ago
   Last hello sent: 1 seconds ago
   Bypass tunnel: not requested
Neighbor 10.0.2.2
   Upstream for
   Downstream for
   Session #1 LSP #1
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: -
   Last hello sent: 31 seconds ago
   Bypass tunnel: not requested
```

The following displays a summary of RSVP neighbors by IP address.

```
switch> show mpls rsvp neighbor summary
Neighbor                                Role    Sessions LSPs
======================================= ========== ======== ========
10.0.1.1                                Upstream   1     1
10.0.2.2                                Downstream 1     1
```

The following displays RSVP sessions.

```
switch> show mpls rsvp session
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        Type: primary
        Source address: 0.1.1.1
        LSP ID: 1
        LSP uptime: 00:02:38
        Session name: Session1
        Local label: 100000
        Downstream label: 100000
        Upstream neighbor: 10.0.1.1
           Last refresh received: 17 seconds ago
           Last refresh sent: 10 seconds ago
        Downstream neighbor: 10.0.2.2
           Last refresh received: 7 seconds ago
           Last refresh sent: 9 seconds ago
        Bypass tunnel: not requested
```

The following displays a summary of RSVP sessions.

```
switch> show mpls rsvp session summary

```

19.4.1.12 Path Specifications

Path specifications can be **explicit** and **dynamic** depending on Constrained Shortest Path First (CSPF) search procedure to find a path in the network topology.

Explicit Path Specifications

The operator provides all hops in the path explicitly. The given path is used directly as the Explicit Route Object (ERO) in RSVP Path messages. All hops are implicitly **strict** hops. Explicit loose hops are not supported. The submode to configure explicit paths is entered by specifying the name.

```
switch(config-te-rsvp)# path MyPath explicit
switch(config-te-rsvp-path-expl-MyPath)#
```

Each hop is specified explicitly in order.

```
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.12.2
(config-te-rsvp-path-expl-MyPath)# hop 10.0.34.4
```

Adding hops with **before** and **after** create a unique internal ordering in **`show running-config`**.

```
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.23.3 before 10.0.34.4
```

```
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.45.5 after 10.0.34.4
```

no hop command removes the hop.

```
switch(config-te-rsvp-path-expl-MyPath)# no hop 10.0.12.2
```

show active command retrieves the currently active configuration. The pending configuration that becomes active upon exiting the submode is retrieved with **show pending** command; the difference between these two can be retrieved with **show diff** command.

```
switch(config-te-rsvp-path-expl-MyPath)# show active
router traffic-engineering
   rsvp
      path MyPath explicit
         hop 10.0.23.3
         hop 10.0.34.4
         hop 10.0.45.5
(config-te-rsvp-path-expl-MyPath)# show pending
   hop 10.0.23.3
   hop 10.0.44.4
   hop 10.0.45.5
(config-te-rsvp-path-expl-MyPath)# show diff
 hop 10.0.23.3
-hop 10.0.34.4
+hop 10.0.44.4
 hop 10.0.45.5
(config-te-rsvp-path-expl-MyPath)#
```

exit command keeps the changes in the submode.

```
switch(config-te-rsvp-path-expl-MyPath)# exit
switch(config-te-rsvp)#
```

abort command discards the changes in the submode.

```
switch(config-te-rsvp-path-expl-MyPath)# abort
switch(config-te-rsvp)#
```

Dynamic Path Specifications

In a dynamic path specification, the operator provides constraints with which a CSPF procedure finds a path in the network topology. The CSPF result is a list of strict hops which forms the ERO.

The submode to configure dynamic paths is entered by specifying the name with **dynamic**.

```
switch(config-te-rsvp)# path MyPath dynamic
switch(config-te-rsvp-path-dyn-MyPath)#
```

Exclude hop constraints specify that CSPF must not choose the specified address on the path. Note that other interfaces on the same node may be used.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.56.6 exclude
```

Include hop constraints specify these hops included in the computed path in a certain order. A hop can be loose which allows other hops to be filled by the CSPF procedure. The keywords **before** and **after** work in the submode for explicit paths.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.23.3
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.45.5 loose
```

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.12.2 before 10.0.23.3
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.67.7 loose after
 10.0.45.5
```

19.4.1.13 Tunnel Specifications

Tunnel specification has its own sub-mode.

```
switch(config-te-rsvp)# tunnel MyTunnel
switch(config-te-rsvp-tunnel-MyTunnel)#
```

Each tunnel has a tunnel destination IP.

```
switch(config-te-rsvp-tunnel-MyTunnel)# destination ip 10.2.2.2
```

A tunnel specifies for path for its LSP(s). It configures the **primary** LSP.

```
switch(config-te-rsvp-tunnel-MyTunnel)# path MyPath
```

A **secondary** LSP is configured, when the **primary** LSP is not available. Only one secondary path can be configured per tunnel.

```
switch(config-te-rsvp-tunnel-MyTunnel)#path MyOtherPath secondary pre-
signaled
```

A tunnel reserves bandwidth along the path. The bandwidth can be configured explicitly.

```
switch(config-te-rsvp-tunnel-myTunnel)# bandwidth 10 mbps
```

Auto bandwidth specifies the minimum and maximum bandwidth used for the tunnel and adjusts bandwidth with an **adjustment period** based on the observed traffic going over the tunnel. The adjustment period is specified in seconds.

```
switch(config-te-rsvp-tunnel-myTunnel)# bandwidth auto min 1 mbps max 5
 mbps adjustment-period 60
```

Setup and hold priorities from ***0*** to ***7*** can be configured for the tunnel, where ***0*** is ***most preferred*** and ***7*** the ***least preferred***.

```
switch(config-te-rsvp-tunnel-myTunnel)# priority setup 5 hold 3
```

By default, a tunnel is not enabled.

```
switch(config-te-rsvp-tunnel-myTunnel)# no shutdown
```

Changes in the sub-mode only take effect when the sub-mode is exited normally for **`show active`**, **`show pending`** and **`show diff`** commands.

```
switch(config-te-rsvp-tunnel-myTunnel)# exit
switch(config-te-rsvp)#
```

Changes are discarded when sub-mode is aborted.

```
switch(config-te-rsvp-tunnel-myTunnel)# abort
switch(config-te-rsvp)#
```

Periodic tunnel optimization is configured globally as well as individually for a specific tunnel. For global periodic tunnel optimization, the optimization interval is configured in ***config-te-rsvp*** mode, and this configuration automatically gets applied to all the RSVP tunnels.

```
switch(config-te-rsvp)# optimization interval 3600 seconds
switch(config-te-rsvp)#
```

The optimization interval can also be individually configured on a tunnel by entering the command in ***tunnel*** sub-mode. The optimization interval configured in the ***tunnel*** sub-mode overrides the optimization interval configured globally.

```
switch(config-te-rsvp)# tunnel myTunnel
switch(config-te-rsvp-tunnel-myTunnel)# optimization interval 3600
 seconds
```

Optimization can also be disabled on a specific tunnel. Optimization is enabled for all the tunnels with a common interval but a specific tunnel has optimization disabled.

```
switch(config-te-rsvp)# optimization interval 3600 seconds
switch(config-te-rsvp)# tunnel myTunnel
switch(config-te-rsvp-tunnel-myTunnel)# optimization disabled
```

alias IPv4 and IPv6 endpoints per tunnel allow these additional next hops to resolve using the existing tunnel. The command allows a maximum of ***15*** alias endpoints to be configured per tunnel.

```
switch(config-te-rsvp-tunnel-myTunnel)# alias endpoint 5.5.5.5
switch(config-te-rsvp-tunnel-myTunnel)# alias endpoint 2001::10
```

The **`split-tunnel`** command allows splitting the bandwidth for a tunnel between multiple sessions. With this enabled, RSVP automatically creates multiple LSPs with smaller bandwidth reservations for a single tunnel.

```
switch(config-te-rsvp-tunnel-myTunnel)# split-tunnel quantum 10 kbps
switch(config-te-rsvp-tunnel-myTunnel)# split-tunnel quantum 10 kbps sub-
tunnels limit 20
```

IGP Shortcut in IS-IS

IGP shortcuts enable traffic to get forwarded along paths computed to take advantage of traffic-engineered paths setup using RSVP using a modified SPF algorithm. This enables operators to take advantage of TE capabilities of RSVP tunnels which traverse over links satisfying bandwidth, latency or fast reroute considerations.

IGP shortcuts are enabled on a RSVP Label Edge Router (LER) selectively on specific RSVP tunnels. When IGP shortcut is enabled, IP routes resolving over RSVP tunnels are installed in FIB. As a result all IP traffic including control plane traffic is forwarded through IGP shortcut tunnels. All protocols relying on FIB for nexthop resolution such as Static routes or BGP is also resolved over IGP shortcuts.

Configuring IGP Shortcut on RSVP Tunnel

On a RSVP LER, IGP shortcut is enabled individually on each RSVP tunnel that is intended for them. No configuration changes are needed on any of the RSVP Label Switch Routers.

```
switch(config)# router traffic-engineering
switch(config-te)# rsvp
switch(config-te-rsvp)# tunnel R3b
switch(config-te-rsvp-tunnel-T1)# igp shortcut
switch(config-te-rsvp-tunnel-T1)# exit
```

IGP shortcuts is enabled by default in IS-IS, following command disables this under the IS-IS ***address-family ipv4*** mode.

```
switch# conf terminal
switch(config)# router isis inst1
switch(config-router-isis)# address-family ipv4
switch(config-router-isis-af)# igp shortcut disabled
```

Limitations

- IGP shortcut is only supported for IPv4.
- IGP shortcuts can only be computed over RSVP tunnels'
- IS-IS must be enabled on the loopback interface whose primary IP address is used as the RSVP tunnel end point.
- This is only available in the multi-agent routing protocol model.
- TI-LFA protection is not enabled for Segment Routing destinations reachable via IGP shortcuts.

Show Commands

The **`show traffic-engineering rsvp tunnel`** command gives the information about the paths for its LSP(s).

```
switch# show traffic-engineering rsvp tunnel
Tunnel TestTunnel
   Source: 10.1.1.1
   Destination: 10.4.4.4
   State: up
   Bandwidth: 0.0 bps, mode explicit
   LSPs: 2
   Active path: primary
   Primary path: Path1to4
      State: up, in use
      Path (dynamic):
         10.0.12.2
         10.0.23.3
         10.0.34.4
   Secondary path: Path1to4detour
      State: up
      Path (explicit):
         10.0.16.6
         10.0.67.7
         10.0.37.3
         10.0.34.4
```

The **`show traffic-engineering rsvp tunnel lsp`** command gives the details of the paths for its LSP(s).

```
switch(config)# show traffic-engineering rsvp tunnel lsp
Tunnel TestTunnel
   Source: 10.1.1.1
   Destination: 10.4.4.4
   State: up
   Bandwidth: 0.0 bps, mode explicit
   LSPs: 2
   Active path: primary
   LSP 1:
      Path specification: Path1to4, primary
      CSPF Path ID: 10001
      Bandwidth: 0.0 bps
      State: up, in use
```

```
      Path (dynamic):
         10.0.12.2
         10.0.23.3
         10.0.34.4
   LSP 2:
      Path specification: Path1to4detour, secondary
      Bandwidth: 0.0 bps
      State: up
      Path (explicit):
         10.0.16.6
         10.0.67.7
         10.0.37.3
         10.0.34.4
```

The **show traffic-engineering rsvp tunnel detail** command gives the details of the tunnel.

```
switch# show traffic-engineering rsvp tunnel detail
Tunnel TestTunnel
   Source: 10.1.1.1
   Destination: 10.4.4.4
   Additional endpoints:
      5.5.5.5
      2001::10
   State: up
   Bandwidth: 0.0 bps, mode explicit
      Setup priority: 7
      Hold priority: 0
   MTU signaling: disabled
Periodic optimization: disabled
   Session #4
   Tunnel index: 1
   LSPs: 2
LDP tunneling: enabled
   IGP shortcut: enabled
   Active path: primary
   Primary path: Path1to4
      State: up, in use
      CSPF Path ID: 10001
      Path (dynamic):
         10.0.12.2
         10.0.23.3
         10.0.34.4
   Secondary path: Path1to4detour
      State: up
      Path (explicit):
         10.0.16.6
         10.0.67.7
         10.0.37.3
         10.0.34.4
```

The **show traffic-engineering rsvp tunnel history** command gives the history for the paths.

```
switch# show traffic-engineering rsvp tunnel history
Tunnel TestTunnel
Mon 2020-07-13 07:04:44 CSPF query on primary path
Mon 2020-07-13 07:04:44 State change: down
Mon 2020-07-13 07:04:44 LSP #1 added
Mon 2020-07-13 07:04:44 CSPF reply for primary path, path found
Mon 2020-07-13 07:04:44 LSP #2 added
Mon 2020-07-13 07:04:46 State change: up using primary path
```

```
LSP #1
Mon 2020-07-13 07:04:44 LSP created
Mon 2020-07-13 07:04:44 State change: establishing
Mon 2020-07-13 07:04:46 State change: up
LSP #2
Mon 2020-07-13 07:04:44 LSP created
Mon 2020-07-13 07:04:44 State change: establishing
Mon 2020-07-13 07:04:47 State change: up
```

The **show isis summary** command shows the status of IGP shortcut configuration if IGP shortcut is enabled for IS-IS.

```
switch# show isis summary
IS-IS Instance: inst1 VRF: default
  Instance ID: 0
  System ID: 1111.1111.1001, administratively enabled
  Router ID: IPv4: 1.0.5.1
  Multi Topology disabled, not attached
  IPv4 Preference: Level 1: 115, Level 2: 115
  IPv6 Preference: Level 1: 115, Level 2: 115
  IS-Type: Level 2, Number active interfaces: 3
  Routes IPv4 only
  LSP size maximum: Level 1: 1492, Level 2: 1492
  …
  Shortcut SPF for IGP: Enabled
  …
```

The **show isis network topology** command verifies the best path details computed after IS-IS SPF. RSVP tunnel details are shown if the destination is reachable through a IGP shortcut.

```
switch# show isis network topology
IS-IS Instance: inst1 VRF: default
 IS-IS paths to level-2 routers

19.4.1.14 Show Commands

19.4.1.14.1 RSVP Show Commands

Use the **show mpls rsvp** command to display the overall state of the RSVP.

```
switch> show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
   Mode: none
   Hierarchical FECs: enabled
Cryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
   Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
```

```
   Operational: 1
   Ingress/Transit/Egress: 0/1/0
   Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2
```

Use the **show mpls rsvp neighbor** command to display RSVP neighbors.

```
switch> show mpls rsvp neighbor
Neighbor 10.0.1.1
   Upstream for
      Session #1 LSP #1
   Downstream for
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: 1 seconds ago
   Last hello sent: 1 seconds ago
   Bypass tunnel: not requested
Neighbor 10.0.2.2
   Upstream for
   Downstream for
   Session #1 LSP #1
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: -
   Last hello sent: 31 seconds ago
   Bypass tunnel: not requested
```

Use the **show mpls rsvp neighbor summary** command to display neighbors filtered by IP address.

```
switch> show mpls rsvp neighbor summary
Neighbor             Role       Sessions LSPs
==================== ========== ======== ========
10.0.1.1             Upstream   1     1
10.0.2.2             Downstream 1     1
```

or use the **show mpls rsvp session** command.

```
switch> show mpls rsvp session
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        Type: primary
        Source address: 0.1.1.1
        LSP ID: 1
        LSP uptime: 00:02:38
        Session name: Session1
        Local label: 100000
        Downstream label: 100000
        Upstream neighbor: 10.0.1.1
           Last refresh received: 17 seconds ago
           Last refresh sent: 10 seconds ago
        Downstream neighbor: 10.0.2.2
           Last refresh received: 7 seconds ago
           Last refresh sent: 9 seconds ago
        Bypass tunnel: not requested
```

Session #ID and LSP #ID are internal values that are locally significant. Use these to filter sessions in the **show mpls rsvp session summary** command and in LSP ping and traceroute commands (see below). Sessions can further be filtered by name, destination, router role (transit/ingress/egress), and state.

```
switch> show mpls rsvp session summary
Session  Destination        LSP      Name         Role    Bypass State
======== ================== ======== ============ ======= ======
 =========
1        0.4.4.4             1        Session1    transit n/req  up
```

Beginning with ***EOS Release 4.23.1F***, use the **show mpls rsvp session detail** command to display detailed information of RSVP sessions.

```
switch> show mpls rsvp session detail
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        [...]
        MTU Signaling: enabled
           Received Path MTU: 1800 bytes
           Sent Path MTU: 1500 bytes
  [...]
```

Use the **show mpls rsvp counters** command to display RSVP message counters by interface.

```
switch> show mpls rsvp counters
Received Messages:

Interface  Path  PathTear  PathErr  Resv  ResvTear  ResvErr  Srefresh

19.4.1.14.2 CSPF Show Commands

RSVP-TE uses CSPF to compute the FRR backup path. Starting from ***EOS Release 4.23.1F***, if **srlg** is configured in RSVPconfig to exclude SRLG, then details about the SRLG related constraint attributes are also shown as in the following show commands.

Use the **show traffic-engineering cspf path** command to display all the paths computed by CSPF. In the following example, path ***20.0.0.1*** is selected for display.

```
switch> show traffic-engineering cspf path 20.0.0.1 20.0.0.1

Destination     Constraint                          Path
20.0.0.1        exclude Ethernet1                   0.1.1.1
                exclude SRLG of Ethernet1           0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
                exclude Ethernet2                   0.1.1.1
                                                    0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
```

Using the **show traffic-engineering cspf path detail** command, path ***20.0.0.1*** is displayed in detail.

```
switch> show traffic-engineering cspf path 20.0.0.1 detail

Destination: 20.0.0.1
   Path Constraint: exclude Ethernet1
                    exclude SRLG of Ethernet1: orange-link (500),
                       green-link (400), 100, red-link (200), 600
   Request Sequence number: 1
   Response Sequence number: 1

   0.1.1.2
   0.2.2.2
   3.3.3.2

      Path Constraint: exclude Ethernet2
      Request Sequence number: 2
      Response Sequence number: 2
      Number of times path updated: 3
      Last updated: 00:00:38
      Reoptimize: Always
      Path:
   0.1.1.1
   0.1.1.2
   0.2.2.2
   3.3.3.2
```

19.4.1.14.2.1 Displaying the Traffic-engineering Database

You can display the topology used for CSPF computations by using the **show traffic-engineering database** command. Starting from ***EOS Release 4.23.1F***, the SRLG group details of a neighbor are shown if it is advertised.

Beginning with ***EOS Release 4.24.2F***, information for the OSPFv2 topology, if configured, displays.

```
switch# show traffic-engineering database

```

19.4.1.15 Limitations

RSVP-TE LSR contains the following limitations:

- Supports only IPv4.
- Supports only the default VRF.
- Supports only strict EROs with host hops (***/32***).
- Supports only transit role functionality.
- Traffic Engineering links with secondary IP addresses are not supported.
- The maximum number of supported RSVP sessions and LSPs is ***5000***.
- For FRR, the maximum number of supported LSPs per interface is ***2000***.
- Changing the RSVP FRR mode while a bypass tunnel is already in use can bring down both primary and bypass tunnels which cause traffic loss.

- Changing the RSVP SRLG mode while a bypass tunnel is already in use could bring down both primary and bypass tunnels which cause traffic loss.
- The maximum number of IS-IS/OSPFv2 routers supported by CSPF on a single broadcast network is ***30***.
- The maximum number of IS-IS/OSPFv2 adjacencies supported by CSPF for a single router is ***500***.
- CSPF only takes into account a maximum of ***16*** SRLGs per TE link, when excluding SRLGs while computing a path.

19.5 RSVP-TE LER

RSVP-TE, the Resource Reservation Protocol (RSVP) for Traffic Engineering (TE), is used to distribute MPLS labels for steering traffic and reserving bandwidth. The Label Edge Router (LER) feature implements the headend functionality, such as, RSVP-TE tunnels can originate at an LER which is used to steer traffic into the tunnel.

To Configure RSVP-TE LER

To configure RSVP-TE LER, use the traffic-engineering mode to configure the **`rsvp`** command.

Example

```
switch(config)# router traffic-engineering
switch(config-te)# rsvp
switch(config-te-rsvp)
```

In the RSVP-TE submode, the configuration has three components.

- Global configuration
- Path specifications
- Tunnel specifications

Global Configuration

In global configuration, all settings apply to all configured tunnels. Path specifications describe a set of constraints for paths. These are referenced from tunnel specifications to describe which path each tunnel can take.

Path Specifications

Path specifications are **explicit** and **dynamic** which differ in whether they involve a Constrained Shortest Path First (CSPF) search procedure to find a path in the network topology known to the headend. A path specification of a certain name is only either **explicit** or **dynamic**, such as, they share a namespace.

Explicit Path Specifications

In an explicit path specification, the operator provides all hops in the path explicitly. The given path is used directly as the Explicit Route Object (ERO) in RSVP Path messages. All hops are implicitly strict hops. Explicit loose hops are not supported.

Example

The submode to configure explicit paths is entered by specifying the name and the **explicit** keyword.

```
switch(config-te-rsvp)# path MyPath explicit
switch(config-te-rsvp-path-expl-MyPath)#
```

To explicitly specify the order of each hop, use the RSVP-TE explicit path configuration mode. In this example, hop 10.0.12.2. then hop 10.0.34.4 is specied.

Example

```
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.12.2
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.34.4
```

Adding hops with **before** and **after** keywords creates a unique internal ordering which will be represented in a canonical form using neither before nor after in the **`show running-config`**.

Example

Using the keyword **before**, the configuration places hop ***10.0.23.3*** before ***10.0.34.4***. Then, using the keyword **after** the configuration places hop ***10.0.45.5*** after ***10.0.34.4***.

```
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.23.3 before 10.0.34.4
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.45.5 after 10.0.34.4
```

When it is no longer necessary to have a hop order use the **`no hop`** command.

Example

Use the **`no hop 10.0.12.2`** command when removing hops.

```
switch(config-te-rsvp-path-expl-MyPath)# no hop 10.0.12.2
```

The **`show active`** command explains what is currently happening with the configuration

Example

The currently active configuration is retrieved with the **`show active`** command.

```
switch(config-te-rsvp-path-expl-MyPath)# show active
router traffic-engineering
   rsvp
      path MyPath explicit
         hop 10.0.23.3
         hop 10.0.34.4
         hop 10.0.45.5
```

The **`show pending`** command explains what happens when exiting the submode.

Example

The pending configuration that becomes active upon exiting the submode is retrieved with the **`show pending`** command.

```
switch(config-te-rsvp-path-expl-MyPath)# show pending
   hop 10.0.23.3
   hop 10.0.44.4
   hop 10.0.45.5
```

The **`show diff`** command displays the differences between the **`show active`** and **`show pending`** commands.

Example

The difference between these two commands is that they are retrieved with the **`show diff`** command.

```
switch(config-te-rsvp-path-expl-MyPath)# show diff
 hop 10.0.23.3
-hop 10.0.34.4
+hop 10.0.44.4
```

```
 hop 10.0.45.5
switch(config-te-rsvp-path-expl-MyPath)#
```

When you want to keep all your saved changes, use the **exit** command.

Example

The change in the submode only takes effect when the submode is exited normally.

```
switch(config-te-rsvp-path-expl-MyPath)# exit
switch(config-te-rsvp)#
```

when you do not want to save any changes, use the **abort** command.

Example

Changes are discarded when the submode is aborted.

```
switch(config-te-rsvp-path-expl-MyPath)# abort
switch(config-te-rsvp)#
```

Dynamic Path Specifications

In a dynamic path specification, the operator provides constraints with which a Constained Shortest Path First (CSPF) procedure finds a path in the network topology. Effectively, the path specification serves as a template to get instantiated together with other tunnel constraints (like bandwidth requirements). The CSPF result is a list of strict hops which form the ERO.

Example

The submode to configure dynamic paths is entered by specifying the name of the path, in this example MyPath, and use the **dynamic** keyword.

```
switch(config-te-rsvp)# path MyPath dynamic
switch(config-te-rsvp-path-dyn-MyPath)#
```

Exclude hop constraints specifies that CSPF must not choose the selected address on the path. Each excluding hops expresses that neither end of a link in the path may have the specified address. Note that other interfaces on the same node may be used.

Example

This example excludes hop ***10.0.56.6***.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.56.6 exclude
```

Include hop constraints are supported and specify that these hops have to be included in the computed path in a certain order. By default, a hop is strict, meaning that in the computed path it has to appear directly after the previously specified hop. when a hop is loose it allows other hops to be filled by the CSPF procedure. The keywords before and after work as in the submode for explicit paths.

Example

In the following example hop ***10.0.23.3*** must be included in the path.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.23.3
```

In the following example hop ***10.0.45.5*** loose shows the hop does not have to be in any paticular order.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.45.5 loose
```

The following example shows hop ***10.0.12.2*** comes before ***10.0.23.3***.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.12.2 before 10.0.23.3
```

The following example shows hop ***10.0.67.7*** comes loose after ***10.0.45.5***.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.67.7 loose after
 10.0.45.5
```

Administrative group constraints are specified to restrict CSPF path computation to links that match a set of admin groups. Their IDs are globally significant and the specification contains lists and ranges of admin groups to include or exclude. In particular, every chosen link for a dynamic path must be in all of the admin groups specified in the ***include all*** range, must be in one of the admin groups specified in the ***include any*** range, and must not be in any of those in the ***exclude*** range. The admin group range starts at ***0*** and ends at ***31***. On the wire, the admin-group of ***0*** is translated to ***0x1***, ***1*** is translated to ***0x2***.

Example

In this example include ***1*** and anything inbetween ***2-4***, and exclude ***7*** and ***9***.

```
switch(config-te-rsvp-path-dyn-MyPath)# administrative-group include all
 1 include any 2-4 exclude 7,9
```

Administrative group constraints are specified using a name as an alias mapped to a numerical value. The mapping is configured under the global TE mode.

These names are directly used to configure administrative group constraints in addition to the existing numerical format. The admin group constraints for the dynamic path are configured using the following RSVP LER CLI.

Example

In this example the administartive-group includes all blue and anything between ***2-4*** red, and excludes ***7*** green.

```
switch(config-te-rsvp-path-dyn-MyPath)# administrative-group include all
 blue include any 2-4,red exclude green,7
```

The list of administrative groups is provided as a comma-separated input without spaces.

The submode for dynamic paths has the same commit/abort semantics and show commands as the submode for explicit paths.

Local Interface

Use the **`local-interface Loopback`** command to derive the source IP address for RSVP-TE tunnels. This is a mandatory setting.

Example

```
switch(config-te-rsvp)# local-interface Loopback 0
```

A few settings are taken from the global ***mpls rsvp*** configuration like Fast-Reroute (FRR) mode and soft preemption. The SRLG setting from the global ***mpls rsvp*** configuration is also used to specify if the secondary path of a tunnel is set up by excluding SRLGs of all the links in the primary path as additional constraints, therefore allowing the secondary path to be disjoint from the primary path.

Tunnel Specifications

A tunnel needs a specification of which tunnel to go to.

Example

In this example, MyTunnel is the name of the submode tunnel to use.

```
switch(config-te-rsvp)# tunnel MyTunnel
switch(config-te-rsvp-tunnel-MyTunnel)#
```

Basic Tunnel Configuration

Each tunnel must have a tunnel destination IP.

Example

The this example the selected destination IP is ***10.2.2.2***.

```
switch(config-te-rsvp-tunnel-MyTunnel)# destination ip 10.2.2.2
```

Adding Path Specifications

A tunnel needs to specify along the path in which its LSPs are established. Therefore, a path specification is referenced by its name and configures the **primary** LSP.

Example

The specified name for the path is ***MyPath***.

```
switch(config-te-rsvp-tunnel-MyTunnel)# path MyPath
```

A secondary LSP is specified which provides a fallback in case the primary LSP is not available. The secondary LSP is either established on-demand cold standby once the primary is not available or pre-signaled hot standby regardless. Configuring a secondary path is optional.

Example

To configure the secondary path, in this example, the name ***MyOtherPath*** is selected as a seconday path and is configured to be pre-signaled.

```
switch(config-te-rsvp-tunnel-MyTunnel)# path MyOtherPath secondary pre-
signaled
```

Only one secondary path can be configured, per tunnel.

Bandwidth Specification

Use the **bandwidth** command to reserve bandwidth along the path. The bandwidth is explicitly configured.

Example

In this example, a bandwidth of ***10*** mbps is selected as the reserve bandwidth for the ***myTunnel*** tunnel path.

```
switch(config-te-rsvp-tunnel-myTunnel)# bandwidth 10 mbps
```

Available units are bps, kbps, mbps, and gbps. By default, no bandwidth reservation is signaled, such as a bandwidth of***0*** bps.

An alternative to **explicit** bandwidth configuration is to use the **autobandwidth** feature which specifies the minimum and maximum bandwidth to be used for the tunnel and otherwise adjusts bandwidth with an **adjustment period** based on the observed traffic going over the tunnel. The adjustment period is an optional parameter measured in seconds. The default adjustment period is ***0*** . A special value

meaning that the algorithm decides when to adjust bandwidth based on statistical measurements (the actual adjustment cannot happen more frequently than the sampling, which occurs every ***30*** seconds).

Example

In this example the bandwidth is set to auto with a minimum of ***1*** mbps and a maximum of ***5*** mbps, and has an adjustment-period of ***60*** seconds.

```
switch(config-te-rsvp-tunnel-myTunnel)# bandwidth auto min 1 mbps max 5
 mbps adjustment-period 60
```

The adjustment period is specified in seconds.

Tunnel Priorities

Setup and hold priorities from ***0*** to ***7*** are configured for the tunnel, where ***0*** means most preferred, and ***7*** means least preferred.

Example

In this example, the setup priority is configured of ***5*** and the hold priority is configured of ***3***.

```
switch(config-te-rsvp-tunnel-myTunnel)# priority setup 5 hold 3
```

The CLI does not impose restrictions on the priority values. Therefore, hold priority should be more preferred than setup priority to avoid cycles where an LSP is continuously established and immediately preempted.

Enabling The Tunnel

By default, a tunnel is not enabled, so it needs to be explicitly enabled.

Example

Use the **`no shutdown`** command to explicitly enable the tunnel.

```
switch(config-te-rsvp-tunnel-MyTunnel)# no shutdown
```

As for path specifications, the submode provides **`show active`**, **`show pending`** and **`show diff`** commands. It has abort/commit semantics.

When you want to keep all your saved changes, use the **`exit`** command.

Example

The change in the submode only takes effect when the submode is exited normally.

```
switch(config-te-rsvp-tunnel-MyTunnel)# exit
switch(config-te-rsvp)#
```

when you do not want to save any changes, use the **`abort`** command.

Example

Changes are discarded if the submode is aborted.

```
switch(config-te-rsvp-tunnel-MyTunnel)# abort
switch(config-te-rsvp)#
```

19.6 LDP Pseudowire

LDP pseudowire provides support for emulating Ethernet connections over a Multiprotocol Label Switching (MPLS) network, and controlled using the extension of the MPLS Label Distribution Protocol (LDP) specified in RFC4447.

The **patch panel** command allows "patching" a local interface “connector” to an LDP pseudowire “connector”, terminating on the local switch. The LDP pseudowire itself is defined under the **pseudowires** configuration mode, under the ***mpls ldp*** configuration mode.

LDP pseudowire also supports locally patching traffic between two interfaces and is configured under the **patch panel** command.

19.6.1 Configuring LDP Pseudowire

19.6.1.1 Local-Remote Patch Configuration

To configure an LDP pseudowire, complete the following task.

1. Enter the pseudowire configuration section under the ***mpls ldp*** configuration section, and specify an LDP pseudowire name using the **pseudowire** command. In this example, the selected LDP pseudowire name is ***ldppw***.

```
switch(config)# mpls ldp
switch(config-mpls-ldp)# pseudowire
switch(config-mpls-ldp-pw)# pseudowire ldppw
```

2. Once an LDP pseudowire has been configured, configure the neighbor IP address, pseudowire ID, and pseudowire MTU using the **neighbor**, **pseudowire-id**, and **mtu** configuration commands.

```
switch(config-mpls-ldp-pw-ldppw)# neighbor 1.2.3.4
switch(config-mpls-ldp-pw-ldppw)# pseudowire-id 1
switch(config-mpls-ldp-pw-ldppw)# mtu 9000
```

3. To configure a cross-connection between two connectors, configure a pseudowire patch by specifying a patch name in the **patch panel** configuration section.

```
switch(config)# patch panel
switch(config-patch)# patch example
```

4. After entering a ***patch*** configuration mode, configure a type 4 LDP pseudowire by specifying a VLAN tagged interface connector and an LDP pseudowire connector using the **connector** command.

```
switch(config-patch-example)# connector interface ethernet1 dot1q vlan
 100
switch(config-patch-example)# connector pseudowire ldp ldppw
```

5. After entering a ***patch*** configuration mode, configure a type 5 LDP pseudowire by specifying an interface connector and an LDP pseudowire connector using the **connector** command.

```
switch(config-patch-example)# connector interface ethernet1
switch(config-patch-example)# connector pseudowire ldp ldppw
```

Note: IP routing must be enabled and the interface used for the local connector must be routed.

```
switch(config)# ip routing
switch(config)# interface ethernet1
```

```
switch(config-if-Et1)# no switchport
```

19.6.1.2 Local-Local Patch Configuration

The patch can also consist of two interface connectors or two VLAN tagged interface connectors to configure local stitching.

```
switch(config-patch)# patch example
switch(config-patch-example)# connector conn1 ethernet1
switch(config-patch-example)# connector conn2 ethernet2
switch(config-patch)# patch example2
switch(config-patch-example2)# connector conn1 ethernet1 dot1q vlan 100
switch(config-patch-example2)# connector conn2 ethernet2 dot1q vlan 200
```

Note: IP routing must be enabled and both interfaces used for the local connectors must be routed.

```
switch(config)# ip routing
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config)# interface ethernet2
switch(config-if-Et2)# no switchport
```

19.6.1.3 Additional Patch Configuration Commands

The **shutdown** configuration command can be used to disable a pseudowire patch.

Example

```
switch(config-patch-example)# shutdown
```

19.6.1.4 Forwarding Behavior For Layer 2 Control Packets

There are differences in forwarding behavior for reserved MACs between the Ethernet Tagged Mode and the Ethernet Raw Mode. Some Layer 2 control packets are terminated and consumed at the Provider Edge, while others are encapsulated and forwarded on the pseudowire. Below is a list of the common Layer 2 control packets, and a summary of their forwarding behavior.

	Ethernet Tagged Mode (type 4)	**Ethernet Raw Mode (type 5)**
STP	When STP is enabled, STP packets are terminated. Otherwise, they are forwarded.	Forwarded
LLDP	Terminated	Forwarded
LACP	Terminated	Terminated
MACsec	Not supported	Forwarded

In addition, custom Layer 2 Control Packet forwarding behavior for type 5 pseudowire can be configured using the Layer 2 Protocol Forwarding functionality.

19.6.2 LDP Pseudowire Limitations

When a subinterface has been configured with the same VLAN tag as a pseudowire connector on the same parent interface, or vice versa, only the first configured feature will be active.

When a port-based connector is used for a pseudowire or local cross-connect patch, dot1q-tagged packets will have the outer tag incorrectly removed on ingress/encap if any one of several other features are configured on the switch (on any interface) including Layer 2 subinterfaces, Dot1q Tunnel, VLAN Mapping, and VXLAN. The only workaround is to unconfigure these other features.

When a VLAN-based connector (or subinterface with dot1q encapsulation) is used for a pseudowire or local cross-connect patch, tagged packets will have incorrect tags after forwarding if any one of several other features are configured on the switch (on any interface) including Layer 2 subinterfaces, Dot1q Tunnel, VLAN Mapping, and VXLAN. The only workaround is to unconfigure these other features.

19.6.3 LDP Pseudowire Show Commands

Use the **`show patch panel`** command to display the overall status of the configured pseudowire patches.

Example

```
switch# show patch panel
Patch     Connector                                Status
--------- ---------------------------------------- ----------
example   1: Ethernet3                             Up
          2: Port-Channel2
example2  1: Ethernet1 802.1Q VLAN 100             Up
          2: LDP neighbor 1.1.1.1 PW ID 1111
example3  1: LDP neighbor 4.4.4.4 PW ID 1040       Up
          2: Ethernet2
```

Use the **`show patch panel detail`** command to display the detailed status of the configured pseudowire patches.

Example

```
switch# show patch panel detail
PW Fault Legend:
   ET-IN - Ethernet receive fault
   ET-OUT - Ethernet transmit fault
   TUN-IN - Tunnel receive fault
   TUN-OUT - Tunnel transmit fault
   NF - Pseudowire not forwarding (other reason)
Patch: example, Status: Up
   Connector 1: Ethernet3
      Status: Up
   Connector 2: Port-Channel2
      Status: Up
Patch: example2, Status: Up
   Connector 1: Ethernet1 802.1Q VLAN 100
      Status: Up
   Connector 2: LDP neighbor 1.1.1.1 PW ID 1111
      Status: Up
      Local MPLS label: 100032, Group ID: 0
         MTU: 9000, 802.1Q VLAN request sent: -
      Neighbor MPLS label: 900000, Group ID: 0x0
         MTU: 9000, 802.1Q VLAN request received: -
```

```
      PW type: 4 (tagged), Control word: N
      Tunnel type: LDP, Tunnel index: 198
Patch: example3, Status: Up
   Connector 1: LDP neighbor 4.4.4.4 PW ID 1040
      Status: Up
      Local MPLS label: 100002, Group ID: 0x0
         MTU: 1500, 802.1Q VLAN request sent: -
      Neighbor MPLS label: 400000, Group ID: 0x0
         MTU: 9213, 802.1Q VLAN request received: -
      PW type: 5 (raw), Control word: N
      Tunnel type: LDP, Tunnel index: 2
   Connector 2: Ethernet2
      Status: Up
```

Use the **`show patch panel forwarding`** command to display the forwarding information for configured pseudowire connectors.

Example

```
switch# show patch panel forwarding
Legend:
   Type - Pseudowire type: 4 (tagged)
                           5 (raw)

100032   Et1 802.1Q VLAN 100    LDP       4    Up     example2
```

19.7 LDP Entropy Label

If a network device uses deep packet inspection for load balancing, it is recommended to use entropy label in LDP to improve load balancing in MPLS networks by providing sufficient entropy in the label stack itself.

19.7.1 Configuring LDP Entropy Label

Use the **`entropy-label`** command to enable the MPLS LDP entropy labelling on the switch. Use the **no** form of the command to disable the MPLS LDP entropy labelling. By default, the entropy label knob is disabled.

```
switch(config)# mpls ldp
switch(config-mpls-ldp)# entropy-label
```

```
switch(config-mpls-ldp)# exit
```

19.7.2 Show Commands

The **show running-config all** command displays the Entropy Label Signaling status.

```
switch# show running-config all
!
mpls ldp
   ...
   no entropy-label
   ...
!
```

The **show mpls ldp bindings detail** command displays whether the ELC is advertised or not for a given FEC for both local/remote bindings.

```
switch# show mpls ldp bindings 1.1.1.1/32 detail
1.1.1.1/32
     Local binding:    Label: imp-null, ELC: False
          Uptime:   1:51:14
          Advertised to: 2.2.2.2:0, 3.3.3.3:0
     Remote binding: Peer ID: 2.2.2.2:0, Label: 100001, ELC: True
          Uptime:   1:51:57
     Remote binding: Peer ID: 3.3.3.3:0, Label: 100002, ELC: True
          Uptime:   1:52:05
```

Following debug commands are modified to incorporate Entropy label and Entropy label indicator information in label stack for debugging on ingress router.

```
switch> show platform fap fec <idx>
Tunnel Type: Mpop(mpls pop), Mpush(mpls push), Mswap(mpls swap),
             MoG(mpls-over-gre), T(IPv4 tunnels GRE/VXLAN)

 ',
```

19.7.3 Limitations

- When the Transit LSR is acting as a PHP hop for a given LDP tunnel with entropy label pushed onto it by an Ingress LSR, only the LDP tunnel label will be popped at PHP whenever the Egress LSR has signaled implicit-null in LDP.
- Egress LSR should be capable of handling ELI as top label in the label stack like [ELI, EL, VPN, Payload].

19.8 MPLS Commands

MPLS Commands

- **MPLS Commands**
  - entropy-label
  - mpls ip
  - mpls shared index
  - mpls static
  - mpls static vrf-label
  - mpls tunnel termination
  - mpls tunnel termination (vrf qos map)
  - show mpls route
  - show mpls route summary
  - show mpls tunnel termination qos maps
  - vrf (MPLS tunnel termination)
- **RSVP-TE LSR**
  - authentication
  - cspf delay
  - fast-reroute
  - fast-reroute reversion
  - hello interval
  - ping mpls rsvp session
  - preemption method
  - refresh method
  - shutdown
  - srlg
- **RSVP-TE LSR Show Commands**
  - show mpls rsvp
  - show mpls rsvp counters
  - show mpls rsvp neighbor
  - show mpls rsvp session
  - show mpls rsvp session detail
  - show mpls rsvp session summary
  - show traffic-engineering cspf path
  - show traffic-engineering database

19.8.1 authentication

Use the **authentication** command to enable cryptographic authentication. The **no** form and the **default** form of the command removes crytographic authentication.

Command Mode

MPLS RSVP sub-mode (mpls-rsvp)

Command Syntax

authentication [index ***1-4294967295*** [active | password]|[sequence-number window ***1-255***]|[type [md5 | none]]]

no authentication [index ***1-4294967295*** [active | password]|[sequence-number window ***1-255***]| [type [md5 | none]]]

default authentication [index ***1-4294967295*** [active | password]|[sequence-number window ***1-255***]|[type [md5 | none]]]

Parameters

- **index** ***1-4294967295*** Password index.
  - **active** Use index as the active password.
  - **password** password.
- **sequence-number** Index in the sequesnce.
  - **window** ***1-255*** Reorder window size. The default value is ***5***. A value of ***1*** turns off support for packet reordering.
- **type** Authentication mechanism.
  - **md5** MD5 hash.
  - **none** No authentication mechanism. Disables cryptographic authentication.

Examples

- Cryptographic Authentication (***RFC 2747***) is enabled by setting the **authentication type** to **md5** and configuring an active password.

```
(config-mpls-rsvp)# authentication type md5
```

- Authentication secrets are configured with an index. One of the indices should be chosen as the actively used password:

```
(config-mpls-rsvp)# authentication index 1 password s3cr3t
(config-mpls-rsvp)# authentication index 1 active
```

  The **active** password is used to authenticate outgoing messages. All configured passwords are accepted for authentication of incoming packets, which allows smooth key rollover.
- Password obfuscation is available:

```
(config-mpls-rsvp)# authentication index 1 password 7 07092E43
```

- The size of the sequence number reorder window can be changed to accommodate a larger number of out-of-order packets. A value of *N* means that a packet is accepted if all earlier received packets with a higher sequence number are within the preceding *N-1* packets.

```
(config-mpls-rsvp)# authentication sequence-number window 5
```

  The default value is ***5***. A value of ***1*** effectively turns off support for packet reordering.

19.8.2 cspf delay

RSVP-TE uses CSPF to compute the FRR backup path. CSPF can be throttled to avoid frequent path changes when there are frequent network events. Use the **`cspf delay`** command to specify how frequently CSPF is to run after a network event by specifying the initial wait interval, back-off interval, and maximum wait interval for CSPF. The **`no`** form and the **`default`** form of the command removes the CSPF delay.

Command Mode

Router traffic engineering mode

Command Syntax

`cspf delay` [initial *n* back-off ***n***] max ***n***

`no cspf delay` [initial *n* back-off ***n***] max ***n***

`default cspf delay` [initial *n* back-off ***n***] max ***n***

Parameters

- **initial** Specify initial wait interval for CSPF.
  - ***n*** Time in milliseconds. ***1-300000***.
    - **back-off** specify back-off interval for CSPF.
      - ***n*** Time in milliseconds. ***1-300000***.
- **max** Specify maximum wait interval for CSPF.
  - ***n*** Time in milliseconds. ***1-300000***.

19.8.3 entropy-label

The **entropy-label** command enables the MPLS LDP Entropy Label.

The **no entropy-label** command removes the MPLS LDP Entropy Label configurations from the ***running-config***.

Command Mode

MPLS LDP Configuration Mode

Command Syntax

entropy-label

no entropy-label

Example

This command enables the MPLS LDP Entropy Label.

```
switch(config)# mpls ldp
switch(config-mpls-ldp)# entropy-label
switch(config-mpls-ldp)# exit
```

19.8.4 fast-reroute

Use the **`fast-reroute`** command to support Fast Reroute (FRR) link protection/NHOP (***RFC 4090***). You can enable FRR protection by setting the Fast Reroute mode to **link-protection**.

Command Mode

MPLS RSVP sub-mode (mpls-rsvp)

Command Syntax

`fast-reroute` [mode [link-protection | node-protection | none]|[reversion [global | local]]

Parameters

- **mode** Fast reroute mode.
  - **link-protection** Protects against failure of the next link.
  - **node-protection** protects against failure of the next node.
  - **none** Disables fast reroute.
- **reversion** Select reversion behavior.
  - **global** Global revertive repair (default).
  - **local** Local revertive repair.

Examples

- Support for Fast ReRoute (FRR) link protection/NHOP (***RFC 4090***) is enabled by setting the Fast Reroute mode to **link-protection**.

```
(config-mpls-rsvp)# fast-reroute mode link-protection
```

- To turn off FRR, change the mode to the default setting **none**.

```
(config-mpls-rsvp)# fast-reroute mode none
```

- You can change the revertive behavior of the FRR from the **global** revertive mode to the **local** revertive mode. In the **global** revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is d keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the **local** revertive mode, the LSR switches back to using the primary link after recovery

```
(config-mpls-rsvp)# fast-reroute reversion local
```

- The default for reversion is **global**.

```
(config-mpls-rsvp)# fast-reroute reversion global
```

19.8.5 fast-reroute reversion

You can change the revertive behavior of the FRR from the **global** revertive mode to the **local** revertive mode. In the **global** revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is dead keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the **local** revertive mode, the LSR switches back to using the primary link after recovery.

The default for reversion is **global**.

Command Mode

Configuration sub-mode for RSVP

Command syntax

`fast-reroute reversion` [global | local]

Parameters

- **global** Global revertive repair.
- **local** Local revertive repair.

Examples

- Setting the fast-reroute reversion to local:

```
(config-mpls-rsvp)# fast-reroute reversion local
```

- The default for reversion is **global**.

```
(config-mpls-rsvp)# fast-reroute reversion global
```

19.8.6 hello interval

The **hello interval** command sets the time between the hello packets. The **no** form of the command explicitly disables the Hello messages, while the **default** form of the command resets to the default setting of 10 seconds with a multiplier of 4.

Command Mode

Configuration sub-mode for RSVP.

Command Syntax

hello interval [interval [***sec***]] [multiplier [***num***]]

no hello interval [interval [***sec***]][multiplier [***num***]]

default hello interval [interval [***sec***]][multiplier [***num***]]

Parameters

- **interval *sec*** The interval in units of seconds.
  - **multiplier *num*** The number of missed hellos after which the neighbor is expired.

Examples

- In this example, hello messages are sent to all known neighbors every ***10*** seconds. If no hello responses are received from a neighbor for 4*10=40 seconds, communication is considered to be lost and the neighbor is reset.

```
(config-mpls-rsvp)# hello interval 10 multiplier 4
```

- In this example, the default of ***10*** seconds with multiplier ***4*** is reset.

```
(config-mpls-rsvp)# default hello interval
```

- in this example, the command to explicitly disables the Hello messages.

```
(config-mpls-rsvp)# no hello interval
```

19.8.7 mpls ip

The **mpls ip** command enables MPLS routing. Multiprotocol Label Switching (MPLS) is a networking process that avoids complex lookups in a routing table by replacing complete network addresses with short path labels for directing data packets to network nodes. MPLS data paths are serviced through a tunnel encapsulation data structure that adds four-byte label headers to packets.

The **no mpls ip** and **default mpls ip** commands disable MPLS routing by removing the **mpls ip** command from ***running-config***. When MPLS routing is disabled, routed MPLS packets are dropped and all MPLS routes and adjacencies are removed. MPLS routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

mpls ip

no mpls ip

default mpls ip

Examples

- This command enables MPLS routing. Previous commands enabled IP routing and configured MPLS static routes.

```
switch(config)# mpls ip
switch(config)# show running-config

! Command: show running-config

!
ip routing
!
mpls ip
!
mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

!
end
switch(config)#
```

- This command disables MPLS routing.

```
switch(config)# no mpls ip
switch(config)# show running-config

! Command: show running-config
                 <-------OUTPUT OMITTED FROM EXAMPLE-------->
!
ip routing
!
mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

!
end
switch(config)#
```

19.8.8 mpls shared index

The **mpls shared index** command configures an Ethernet-Segment (ES) shared-index to allocate an ESI label value based on the shared-index configuration.

The **no mpls shared index** command removes mpls shared index configuration from the ***running-config***.

Command Mode

EVPN Ethernet-Segment Mode

Command Syntax

mpls shared index ***index-value***

no mpls shared index ***index-value***

Parameter

- ***index-value*** Label index value. Value ranges from ***1*** to ***1024***.

Example

- These commands place the switch on Ethernet-Segment (ES) configuration mode and configure an MPLS shared index value of ***100***.

```
switch(config)# interface Ethernet4
switch(config-if-Et1)# switchport access vlan 1000
switch(config-if-Et1)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0022:2222:2222:2222:2222
switch(config-evpn-es)# mpls shared index 100
switch(config-evpn-es)# route-target import 00:02:00:02:00:02
```

19.8.9 mpls static

The **mpls static** command creates an MPLS rule that specifies the method of handling of inbound MPLS traffic. Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes.

Static rules specify these parameters:

- **MPLS filter:** The top-label parameter specifies the 20-bit value that the MPLS packet's top header label must match to be handled by the rule.
- **Nexthop location:** Specifies the destination nexthop address (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- **MPLS action:** Specifies the MPLS label stack management action performed on the packet:
  - **pop-payload:** removes the top label from stack; this terminates an LSP (label-switched path).
  - **swap-label:** replaces top label with a specified new label; this passes a packet along an LSP.
- **Rule priority:** Specifies the rule to be used when an MPLS packet matches multiple rules.

The **no mpls static** and **default mpls static** commands delete the specified MPLS rule from ***running-config***.

- Commands that include only a top label tag remove all MPLS rules with the matching top label.
- Commands with no **PRIORITY** parameter remove all matching routes of every metric value.

Command Mode

Global Configuration

Command Syntax

mpls static top-label ***top_tag***[**bgp peer** [***peer IP***]] [**DEST_INTF**] **NEXTHOP_ADDR ACTION** [**PRIORITY**]

no mpls static top-label ***top_tag***

no mpls static top-label ***top_tag*** [**DEST_INTF**] **NEXTHOP_ADDR ACTION** [**PRIORITY**]

default mpls static top-label ***top_tag***

default mpls static top-label ***top_tag*** [**DEST_INTF**] **NEXTHOP_ADDR ACTION** [**PRIORITY**]

Parameters

- ***top_tag*** Top header's label field contents. Value ranges from ***0*** to ***1048575*** (20 bits).
- BGP peer ***peer IP*** The BGP peer identifier.
- **DEST_INTF** Specifies interface through which ***NEXTHOP_ADDR*** is accessed. Options include:
  - ***no parameter*** Any interface.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- ***NEXTHOP_ADDR*** Nexthop address for MPLS for filtered MPLS packets. Options include:
  - ***ipv4_addr*** IPv4 address.
  - ***ipv6_addr*** IPv6 address.
- **ACTION** MPLS header stack management action performed on packet. Options include:
  - **pop payload-type ipv4** Removes top layer from stack. Payload is handled as IPv4 packet.
  - **pop payload-type ipv6** Removes top layer from stack. Payload is handled as IPv6 packet.
  - **swap-label *0*** to ***1048575*** Replaces header label with specified label value (20 bits).

- **PRIORITY** Specifies rule priority when multiple rules match a packet. Options include:
  - ***no parameter*** Assigns a metric value of 100 to the rule.
  - **metric *1*** to ***255*** Lower values denote higher priority. Value ranges from ***1*** to ***255***.

The **`mpls static`** command does not support push label actions.

Examples

- These commands create an MPLS rule that matches packets with a top label value of ***3400*** and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address ***10.14.4.4*** through Ethernet interface ***3/3/3***. This rule has a metric value of ***100***.

```
switch(config)# mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop
 payload-type ipv4
switch(config)# show running-config

!
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
 ipv4
!

end
switch(config)#
```

- These commands create a backup rule that forwards the packet through Ethernet interface ***4/3***. This rule's metric value of ***150*** assigns it backup status prior to the first rule.

```
switch(config)# mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop
 payload-type ipv4 metric 150
switch(config)# show running-config

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
 ipv4
!

                     <-------OUTPUT OMITTED FROM EXAMPLE-------->
end
switch(config)#
```

- These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```
switch(config)# mpls static top-label 4400 10.15.46.45 pop payload-type
 ipv4
switch(config)# show running-config

                      <-------OUTPUT OMITTED FROM EXAMPLE-------->

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
 ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

end
switch(config)#
```

- This command uses the BGP peer option to designate the nexthop..

```
switch(config)#mpls static top-label 1001 100.1.1.1 bgp peer pop
 payload-type ipv4
```

- When the ***peer IP*** is not specified, the next-hop is considered as the peer.

```
switch(config)# mpls static top-label 1002 100.1.1.2 bgp peer 100.1.1.1
 pop payload-type ipv4
switch(config)# mpls static top-label 1002 100.1.1.3 bgp peer 100.1.1.1
 pop payload-type ipv4
```

- Multiple nexthops can be associated with the same BGP peer by explicitly specifying the BGP peer IP. This is useful in the case of third-party nexthops.

```
switch(config)# mpls static top-label 1000 nexthop-group mygroup bgp
 peer 100.1.1.1 pop payload-type ipv4
```

19.8.10 mpls static vrf-label

Use the **mpls static vrf-label** command to configure a static VRF label route. The **no** and **default** versions of the command removes the configuration.

Command Mode

Global configuration mode

Command Syntax

mpls static vrf-label ***mpls-label*** [vrf ***vrf-name***]

no mpls static vrf-label ***mpls-label*** [vrf ***vrf-name***]

default mpls static vrf-label ***mpls-label*** [vrf ***vrf-name***]

Parameters

- ***mpls-label*** Value of the MPLS label.
- **vrf** ***vrf-name*** VRF instance name.

Example

```
switch(config)# mpls static vrf-label 100 vrf default
switch(config)# mpls static vrf-label 200 vrf v1
```

19.8.11 mpls tunnel termination

Command Mode

Global configuration mode

Command Syntax

mpls tunnel termination [model [php model][ttl [[pipe | uniform] dscp]| pipe | uniform]

no mpls tunnel termination [model [php model][ttl [[pipe | uniform] dscp]| pipe | uniform]

default mpls tunnel termination [model [php model][ttl [[pipe | uniform] dscp]| pipe | uniform]

Parameters

- **model** Tunnel termination TTL and DSCP model.
- **php** Penultimate hop popping configuration.
- **ttl** Model for TTL.
- **pipe** Preserve the inner value.
- **uniform** Propagate value from outer header.
- **dscp** mode for DSCP.

Example

```
switch(config)# mpls tunnel termination model ttl uniform dscp pipe
```

19.8.12 mpls tunnel termination (vrf qos map)

The **mpls tunnel termination (vrf qos map)** command changes configuration mode to allow the attachment of DSCP-to-traffic-class maps to specific VRFs. This is a group change command, so no changes are made to the running config until the **exit** command is issued.

MPLS tunnel termination mode has one subcommand, **vrf**. **vrf** is also a group change command, with the subcommand **qos map dscp to traffic-class**.

Command Mode

Global Configuration

Command Syntax

mpls tunnel termination

Subcommands

vrf

Example

These commands enter MPLS Tunnel Termination Configuration mode and attach the DSCP-to-traffic-class map ***map1*** to the VRFs ***newVRF1*** and ***newVRF2***.

```
switch(config)#mpls tunnel termination
switch(config-mpls-tunnel-termination)#vrf newVRF1
switch(config-mpls-tunnel-termination-vrf-newVRF1)#qos map dscp to
 traffic-class map1
switch(config-mpls-tunnel-termination-vrf-newVRF1)#exit
switch(config-mpls-tunnel-termination)#vrf newVRF2
switch(config-mpls-tunnel-termination-vrf-newVRF2)#qos map dscp to
 traffic-class map1
switch(config-mpls-tunnel-termination-vrf-newVRF2)#exit
switch(config-mpls-tunnel-termination)#exit
switch(config)#exit
```

19.8.13 ping mpls rsvp session

LSP Ping allows the user to check if the remote endpoint of an RSVP session is reachable through the LSP. Running ping on an RSVP LSP creates an LSP Ping Request packet with the label programmed by RSVP and that packet will follow the MPLS path until it reaches the end of the tunnel. If the node that receives this Request is the intended destination, it replies with an RSVP Ping Reply through normal IP routing. When the source receives the Reply it indicates that there are no apparent data plane failures and that the endpoint of that LSP is reachable.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

`ping mpls rsvp session` [id ***num*** | name ***word***] [lsp | pad-reply | repeat | source | standard | tos | tos]

Parameters

- **id** Specifies the session by ID
  - ***num*** RSVP session ID.
    - **lsp** Specifies LSP
    - **pad-reply** Indicates that the reply should copy the pad TLV.
    - **repeat** Specifies repeat count.
    - **source** Specifies source address.
    - **standard** Sets the standard to comply with.
    - **tos** Specifies ToS value.
    - **tos** Specifies MPLS traffic class field.
- **name** Specifies session by name.
  - ***word*** RSVP session name.
    - **lsp** Specifies LSP
    - **pad-reply** Indicates that the reply should copy the pad TLV.
    - **repeat** Specifies repeat count.
    - **source** Specifies source address.
    - **standard** Sets the standard to comply with.
    - **tos** Specifies ToS value.
    - **traffic-class** Specifies MPLS traffic class field.

Examples

- A user can invoke the ping utility for a specific LSP by using the session and LSP IDs displayed in the CLI show commands.

```
switch# ping mpls rsvp session id 1 lsp 1 repeat 3
LSP ping to RSVP session #1 LSP #1
   timeout is 5000ms, interval is 1000ms
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=1, time=53.294ms, success: egress ok
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=2, time=75.329ms, success: egress ok
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=3, time=85.574ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lspping statistics ---
Via 10.0.12.2, Ethernet1, label 100000
   3 packets transmitted, 3 received, 0% packet loss, time 2272ms
   3 received from 10.0.34.4, rtt min/max/avg 53.294/85.574/71.399 ms
```

- For the **`ping mpls rsvp session`** command, the argument **lsp** is optional. If unspecified, the utility pings all LSPs within that session.

```
switch# ping mpls rsvp session id 1 repeat 2
LSP ping to RSVP session #1
   timeout is 5000ms, interval is 1000ms
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=1, time=60.28ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=1, time=81.701ms, success: egress ok
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=2, time=52.807ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=2, time=62.814ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lspping statistics ---
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 52.807/60.280/56.544 ms

LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 62.814/81.701/72.257 ms
```

- Similarly, the session can be specified by name and the utility pings all the LSPs within that session.

```
switch# ping mpls rsvp session name Session1to4 repeat 2
LSP ping to session Session1to4
   timeout is 5000ms, interval is 1000ms
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=1, time=63.314ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=1, time=75.639ms, success: egress ok
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=2, time=60.875ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=2, time=77.135ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lspping statistics ---
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 60.875/63.314/62.094 ms

LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 75.639/77.135/76.387 ms
```

19.8.14 preemption method

The **preemption method** command enables deferred failure of RSVP-TE LSPs on link oversubscription. Use a preemption timer value to configure a delay on a transit router to support LSPs signaled with soft preemption enabled by the headend (***RFC 5712***).

The default preemption method is soft preemption with a timer value of 30 seconds.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

preemption method [hard | soft] timer ***t***

no preemption method [hard | soft] timer ***t***

default preemption method [hard | soft] timer ***t***

Parameters

- **hard** Hard preemption.
- **soft** Soft preemption.
  - **timer** Time limit for LSP teardown.
    - ***t 1-65535*** Timer value in units of seconds.

Examples

- In this example, the preemption method is soft preemption with a timer value of ***10*** seconds.

```
(config-mpls-rsvp)# preemption method soft timer 10
```

- Setting the preemption method to hard preemption results in a timer value of ***0*** seconds and disables the feature.

```
(config-mpls-rsvp)# preemption method hard
```

19.8.15 refresh method

Using the **refresh method** command with the **bundled** keyword enables the Refresh Overhead Reduction that supports the sending of message IDs and refreshing state with refresh messages.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

refresh method [bundled | explicit]

Parameters

- **bundled** Refresh states using message identifiers lists. This is the default setting.
- **explicit** Send each message individually.

Examples

- Use the **bundled** keyword to enable the Refresh Overhead Reduction.

```
(config-mpls-rsvp)# refresh method bundled
```

- To turn off refresh overhead reduction, use the **explicit** keyword.

```
(config-mpls-rsvp)# refresh method explicit
```

19.8.16 show mpls route summary

The **show mpls route summary** command displays statistics about the configuration and implementation of MPLS rules.

Command Mode

EXEC

Command Syntax

show mpls route summary

Example

This command displays a summary of MPLS rule implementation.

```
switch> show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

19.8.17 show mpls route

The **show mpls config route** command displays the switch's MPLS static rule configuration for the specified routes and rules.

Command Mode

EXEC

Command Syntax

show mpls [**INFO_LEVEL**] **route** [***header_label***]

Parameters

- **INFO_LEVEL** Specifies the filters that are used to select the routes to display. Options include:
  - ***no parameter*** Displays routes published by the forwarding agent.
  - **config** Displays all configured routes.
  - **lfib** Displays routes stored to the Label Forwarding Information Base (LFIB).
- ***header_label*** Filters routes by MPLS top header label. Options include:
  - ***no parameter*** Displays routes for all header values.
- ***0*** to ***1048575*** Specifies header for which command displays information.

Examples

- This command displays the MPLS rule configuration.

```
switch# show mpls config route
Codes: S - Static MPLS Route, IA - IS-IS SR Adjacency Segment,
       IP - IS-IS SR Prefix Segment, L - LDP,
       I>L - IS-IS SR Segment to LDP, L>I - LDP to IS-IS SR Segment, R
 - RSVP

In-Label Out-Label Metric Payload NextHop   Egress-ACL Status Monitored

-------- --------- ------ ------- --------- ---------- ------
 --------------
1000     pop       100    ipv4    100.0.0.1 apply      up

1001     pop       100    ipv4    20.0.0.2  apply      down

1002     pop       100    ipv4    100.0.0.2 apply      down
 100.0.0.2(Bgp)
1003     pop       100    ipv4    20.0.0.2  apply      down
 100.0.0.2(Bgp)
1004     pop       100    ipv4    20.0.0.2  apply      up
 20.0.0.2(Bgp)
1005     pop       100    ipv4    30.0.0.3  apply      up
 200.0.0.3(Bgp)
```

The status could be down if either of the following is true

1. Nexthop is not resolved (**show ip route** ***nexthop*** - shows no route).
2. The monitored BGP session is down (**show ip bgp summary** - shows the peer is not in established state).

- The following example shows that the first route is down because the BGP peer session is down.

```
switch# show mpls config route
Codes: S - Static MPLS Route, IA - IS-IS SR Adjacency Segment,
       IP - IS-IS SR Prefix Segment, L - LDP,
       I>L - IS-IS SR Segment to LDP, L>I - LDP to IS-IS SR Segment, R
 - RSVP
```

```
In-Label Out-Label Metric Payload NextHop  Egress-ACL Status Monitored

-------- --------- ------ ------- -------- ---------- ------
 -------------
88886    pop       100    ipv4    14.0.0.4 apply      down
 14.0.0.4(BGP)
88887    pop       100    ipv4    15.0.0.5 apply      down
```

- The following example shows the status of label ***88886*** is down because the BGP peer session to ***14.0.0.4*** is down, but route exists for ***14.0.0.4***.

```
switch# show ip bgp summary
BGP summary information for VRF default
Router identifier 3.0.1.3, local AS number 3000
Neighbor Status Codes: m - Under maintenance
  Neighbor V AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State
 PfxRcd PfxAcc

       G  - gRIBI, RC - Route Cache Route

 S        14.0.0.4/32 [1/0] via 2.0.1.4, Ethernet2
```

19.8.18 show mpls rsvp

Use the **show mpls rsvp** to display the overall state of the RSVP.

Command Mode

EXEC

Command Syntax

show mpls rsvp [bandwidth | counters | ip | ipv6 | neighbor | session]

Parameters

- **bandwidth** Displays RSVP bandwidth information.
- **counters** Displays RSVP message counters.
- **ip** Displays details related to IPv4.
- **ipv6** Displays details related to IPv6.
- **neighbor** Displays RSVP neighbors.
- **session** Displays RSVP session information.

Example

```
switch> show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
   Mode: none
   Hierarchical FECs: enabled
Cryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
   Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
   Operational: 1
   Ingress/Transit/Egress: 0/1/0
   Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2
```

19.8.19 show mpls rsvp counters

Use the **show mpls rsvp counters** command to display RSVP message counters, per interface.

Command Mode

EXEC

Command Syntax

show mpls rsvp counters [[interface [Ethernet |Fabric | Loopback | Management | Port-Channel | Switch | Tunnel | Vlan | Vxlan]]| ipv4 ***interface*** | ipv6 ***interface***

Parameters

- **interface** Filter by interface.
  - **Ethernet** Hardware Ethernet interface.
  - **Fabric** Fabric interfaces.
  - **Loopback** Hardware interface used for looping packets.
  - **Management** Management interface.
  - **Port-Channel** Lag interface.
  - **Switch** Switch interface.
  - **Tunnel** Tunnel interface.
  - **Vlan** Logical interface into a VLAN.
  - **Vxlan** VXLAN tunnel interface.
- **ipv4** Filter by IPv4.
  - ***interface*** Filter by interface.
- **ipv6** Filter by IPv6.
  - ***interface*** Filter by interface.

Example

```
switch> show mpls rsvp counters
Received Messages:

Interface  Path  PathTear  PathErr  Resv  ResvTear  ResvErr  Srefresh  Other  Errors
---------  ----  --------  -------  ----  --------  -------  --------  -----  ------
Ethernet1  5     0         0        0     0         0        8         51     1
Ethernet2  0     0         0        14    0         0        0         0      0

Sent Messages:

Interface  Path  PathTear  PathErr  Resv  ResvTear  ResvErr  Srefresh  Other  Errors
---------  ----  --------  -------  ----  --------  -------  --------  -----  ------
Ethernet1  0     0         0        4     0         0        9         49     0
Ethernet2  13    0         0        0     0         0        0         4      0
```

19.8.20 show mpls rsvp neighbor

Use the **show mpls rsvp neighbor** command to display a summary of all RSVP neighbors, or the list of active LSPs for a specific neighbor.

Command Mode

EXEC

Command Syntax

show mpls rsvp neighbor [***A.B.C.D*** | ***A:B:C:D:E:F:G:H*** | summary]

Parameters

- ***A.B.C.D*** IP (v4 or v6) address of neighbor.
- ***A:B:C:D:E:F:G:H*** IP (v4 or v6) address of neighbor.
- **summary** Displays summarized information.

Examples

- Use the **show mpls rsvp neighbor** command to display a summary of all RSVP neighbors.

```
switch> show mpls rsvp neighbor
Neighbor 10.0.1.1
   Upstream for
      Session #1 LSP #1
   Downstream for
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: 1 seconds ago
   Last hello sent: 1 seconds ago
   Bypass tunnel: not requested
Neighbor 10.0.2.2
   Upstream for
   Downstream for
   Session #1 LSP #1
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: -
   Last hello sent: 31 seconds ago
   Bypass tunnel: not requested
```

- Use the **show mpls rsvp neighbor summary** command to display summarized information.

```
switch> show mpls rsvp neighbor summary
Neighbor             Role       Sessions LSPs
==================== ========== ======== ========
10.0.1.1             Upstream   1     1
10.0.2.2             Downstream 1     1
```

19.8.21 show mpls rsvp session detail

Use the **show mpls rsvp session detail** to display the detailed information of RSVP sessions.

Command Mode

EXEC

Command Syntax

show mpls rsvp session detail

Example

```
switch> show mpls rsvp session detail
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        [...]
        MTU Signaling: enabled
           Received Path MTU: 1800 bytes
           Sent Path MTU: 1500 bytes
  [...]
```

19.8.22 show mpls rsvp session summary

Use the **show mpls rsvp session summary** command to filter sessions in the show command and in LSP ping and traceroute commands. Sessions can further be filtered by name, destination, router role (transit/ingress/egress), and state.

Command Mode

EXEC

Command Syntax

show mpls rsvp session summary

Example

```
switch> show mpls rsvp session summary
Session  Destination         LSP      Name          Role    Bypass State
======== ================== ======== ============ ======= ======
 =========
1        0.4.4.4             1        Session1    transit n/req  up
```

19.8.23 show mpls rsvp session

Use the **show mpls rsvp session** command to list the current RSVP sessions filtered by IP address.

Command Mode

EXEC

Command Syntax

show mpls rsvp session

Example

```
switch> show mpls rsvp session
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        Type: primary
        Source address: 0.1.1.1
        LSP ID: 1
        LSP uptime: 00:02:38
        Session name: Session1
        Local label: 100000
        Downstream label: 100000
        Upstream neighbor: 10.0.1.1
           Last refresh received: 17 seconds ago
           Last refresh sent: 10 seconds ago
        Downstream neighbor: 10.0.2.2
           Last refresh received: 7 seconds ago
           Last refresh sent: 9 seconds ago
        Bypass tunnel: not requested
```

19.8.24 show mpls tunnel termination qos maps

The **show mpls tunnel termination qos maps** command shows the DSCP to TC map associated with each VRF, or with a specified VRF.

Command Mode

Privileged EXEC mode

Command Syntax

show mpls tunnel termination qos maps [**vrf** ***vrf_name***]

Parameters

- ***vrf_name*** The VRF whose DSCP to TC map association is to be shown. If this parameter is omitted, all DSCP to TC maps associated with a VRF are shown.

Examples

This command shows the DSCP to TC maps associated with VRFs.

```
switch#show mpls tunnel termination qos maps
VRF newVRF1 DSCP to TC map: map1
VRF newVRF2 DSCP to TC map: map1
switch#
```

This command shows the DSCP to TC map associated with VRF ***newVRF2***.

```
switch#show mpls tunnel termination qos maps vrf newVRF2
VRF newVRF2 DSCP to TC map: map1
switch#
```

19.8.25 show traffic-engineering cspf path

Use the **show traffic-engineering cspf path** command to display all the paths conuted by CSPF.

Command Mode

EXEC

Command Syntax

show traffic-engineering cspf path [***destination-IP***]detail]

Parameters

- ***A.B.C.D*** CSPF path to this destination IP address.
- **detail** Show detailed path information.

Examples

- In this example, the CSPF destination path ***20.0.0.1*** is selected to display.

```
switch> show traffic-engineering cspf path 20.0.0.1

Destination     Constraint                          Path
20.0.0.1        exclude Ethernet1                   0.1.1.1
                exclude SRLG of Ethernet1           0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
                exclude Ethernet2                   0.1.1.1
                                                    0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
```

- In this example, the CSPF destination path ***20.0.0.1*** is selected to display detailed information.

```
switch> show traffic-engineering cspf path 20.0.0.1 detail

Destination: 20.0.0.1
   Path Constraint: exclude Ethernet1
                    exclude SRLG of Ethernet1: orange-link (500),
                       green-link (400), 100, red-link (200), 600
   Request Sequence number: 1
   Response Sequence number: 1
   Number of times path updated: 2
   Last updated: 00:01:58
   Reoptimize: Always
   Path:
   0.1.1.1
   0.1.1.2
   0.2.2.2
   3.3.3.2

   Path Constraint: exclude Ethernet2
   Request Sequence number: 2
   Response Sequence number: 2
   Number of times path updated: 3
   Last updated: 00:00:38
   Reoptimize: Always
   Path:
   0.1.1.1
   0.1.1.2
   0.2.2.2
   3.3.3.2
```

19.8.26 show traffic-engineering database

Use the **show traffic-engineering database** to display the topology used for CSPF computations. Starting from ***EOS Release 4.23.1F***, the SRLG group details of a neighbor are shown if it is advertised.

Command Mode

EXEC

Command Syntax

show traffic-engineering database

Special Considerations

- Beginning with ***EOS Release 4.23.1F***, the SRLG group details of a neighbor are shown if it is advertised.
- Beginning with ***EOS Release 4.24.2F***, information for the OSPFv2 topology is displayed if configured.

Example

```
switch# show traffic-engineering database

TE Router-ID: 1.0.0.2
  Source: IS-IS Level-1 IPv4 Topology Database

              Group: green-link (150)
```

19.8.27 shutdown

The **shutdown** command disables the RSVP-TE protocol instance or the RSVP-related functions for the interface. The RSVP-TE configuration information associated with the interface is retained.

RSVP-TE is enabled globally by issuing **no shutdown** in the configuration sub-mode. This is the only mandatory setting for RSVP-TE to work. There is no per-interface knob to enable or disable RSVP. However, RSVP is only enabled on interfaces on which MPLS is enabled.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

shutdown

no shutdown

Examples

- You can enable RSVP-TE globally by issuing the **no shutdown** command.

```
(config-mpls-rsvp)# no shutdown
```

- Similarly, it is disabled with the **shutdown** command, which is the default.

```
(config-mpls-rsvp)# shutdown
```

19.8.28 srlg

The **srlg** command specifies if link SRLGs of a primary LSP are to be considered as constraints while creating a fast-reroute bypass tunnel with either link or node protection. When the **srlg** command is specified with **strict** keyword, then when a path for a bypass tunnel excluding SRLGs of next-hop interface of primary LSP can not be found, RSVP does not setup the bypass tunnel. When the **srlg** command is specified without the **strict** keyword, then a bypass tunnel is setup with as many links as possible that exclude the SRLGs of next-hop interface of primary LSP and where such links are not available, links that have the least number of SRLGs which are to be excluded are used.

When this CLI is not configured, the behavior remains the same as before, which is to turn off SRLG processing. Therefore, the **no** and **default** versions of the command takes you back to the default of SRLG processing being turned off.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

srlg strict

no srlg strict

default srlg strict

Parameters

strict Applies strict SRLG constraints.

Example

The SRLGs of an interface can be configured using the following traffic-engineering CLIs.

```
switch(config)# interface Et1
switch(config-if-Et1)# traffic-engineering srlg 100

switch(config)# interface Et2
switch(config-if-Et2)# traffic-engineering srlg 200
```

19.8.29 vrf (MPLS tunnel termination)

The **vrf (MPLS tunnel termination)** command places the switch in MPLS Tunnel Termination VRF Configuration mode. There is one command available in this mode: **qos map dscp (MPLS tunnel termination VRF)**.

Command Mode

MPLS Tunnel Termination Configuration mode

Command Syntax

vrf ***vrf_name***

Parameter

- ***vrf_name*** The name of the VRF to configure. This does not create a VRF. The VRF must be created with the **vrf** command in Configuration mode.

Example

These commands place the switch in MPLS Tunnel Termination VRF Configuration mode for VRF ***newVRF1***.

```
switch(config)#mpls tunnel configuration
switch(config-mpls-tunnel-configuration)#vrf newVRF1
switch(config-mpls-tunnel-configuration-vrf-newVRF1)#
```

Chapter 20

Visibility and Monitoring Services

The Visability and Monitors Services chapter contains the following sections:

20.1 Test Access Point Aggregation

This section describes Test Access Point (TAP) aggregation and the data structures that it requires. Topics in this section include:

20.1.1 TAP Aggregation Introduction

Ethernet-based switches are commonly deployed in dedicated networks to support Test Access Point (TAP) and mirror port traffic toward one or more analysis applications. Ports configured to mirror data can simultaneously switch traffic to its primary destination while directing a copy of that traffic to analysis or test devices. TAP ports are typically part of a dedicated environment that allows for the aggregation of data streams from multiple sources that can be directed to multiple destinations.

Arista switches support port mirroring and TAP aggregation and the data structures required by these functions.

20.1.2 TAP Aggregation Description

These sections describe TAP aggregation, timestamps, and keyframes:

20.1.2.1 TAP Aggregation

Test Access Point (TAP) aggregation is the accumulation of data streams and the subsequent dispersal of these streams to devices and applications that analyze, test, verify, parse, detect, or store data. TAP aggregation requires an environment free from switching operations. Arista switches operate in one of two device modes:

- **Switching mode**: the switch performs normal switching and routing operations. Data mirroring is supported in switching mode. Tap aggregation is not available in switching mode.
- **TAP aggregation mode**: The switch is a data-monitoring device and does not provide normal switching and routing services. Data mirroring is not available in tap aggregation mode.

  Access control lists, port channels, LAGs, QoS, and VLANs function normally in both modes.

Ethernet and port channel interfaces are configured as **TAP** and **tool** ports to support tap aggregation.

- **TAP ports**: a tap port is an interface that receives a data stream that two network ports exchange.

  TAP ports prohibit egress traffic. MAC learning is disabled. All control plane interaction is prevented. Traps for inbound traffic are disabled. Tap ports are in STP forwarding mode.

- **Tool ports**: A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to devices that process the monitored data streams.

  Tool ports prohibit ingress traffic. MAC learning is disabled. All control plane interaction is prevented. Tool ports are in STP forwarding mode.

TAP and tool ports are configured with the **`switchport mode`** command. These ports are active when the switch is in tap aggregation mode and error-disabled when the switch is in switching mode.

TAP and tool ports are designated through switchport mode commands and act similar to trunk ports, in that they can allow access to VLANs specified through allowed-VLAN lists. Tap ports also specify a native VLAN for handling untagged frames.

Access, trunk, and dot1q-tunnel mode ports are active when the switch is in switching mode and error-disabled when the switch is in tap aggregation mode.

TAP and tool mode ports are active when the switch is in TAP aggregation mode and error-disabled when the switch is in switching mode.

TAP aggregation groups are data structures that map a set of TAP ports to a set of tool ports. Both TAP and tool ports may belong to multiple TAP aggregation groups, and a TAP aggregation group may contain multiple TAP and tool ports.

20.1.2.2 Timestamps and Keyframes

FM6000 platform switches support packet timestamping of packets sent from any port at line rate. Timestamps are used to correlate network events and in performance analysis. Keyframes provide information to assist in the interpretation of timestamps.

The switch contains two 64-bit counters to maintain ASIC time and UTC time. ASIC time is based on an internal 350 MHz counter. UTC is absolute time that is maintained by a precision oscillator and synchronized through PTP.

Timestamps are derived from the least significant 31 bits of ASIC time. Based on the 350 MHz counter period and 31-bit resolution, timestamp values repeat every 6.135 seconds.

Keyframes are periodically inserted into the data stream to provide context for interpreting timestamps. Keyframes contain the 64-bit value of the ASIC time counter, the corresponding 64-bit value of the UTC time counter, and the elapsed time since the last PTP synchronization of the UTC counter. Inserting one keyframe every second into the data stream assures that the timestamp value in each egress packet can be associated with values of the complete 64-bit ASIC time counter and the corresponding UTC counter.

20.1.2.2.1 Timestamps

Timestamps are based on a frame's ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Timestamping is configured on the egress port where the timestamp is applied to the frame.

A timestamp consists of the least significant 31 bits of the ASIC time counter. The most significant bit of the least significant byte is a 0 pad, resulting in a 32-bit timestamp with 31 bits of data. The keyframe mechanism provides recovery of the most significant 33 bits of the ASIC counters and a map to UTC time. Applications use this mechanism to determine the absolute time of the frame timestamp.

The switch supports three timestamp modes, which are configurable on individual Ethernet ports. The modes differ in the management of the egress frame's 32-bit frame check sequence (FCS):

- **Disabled**: timestamping is disabled.
- **FCS Replacement Mode**: the original FCS is discarded, and the ingress timestamp is appended to frame data, followed by a new FCS that is based on the appended timestamp. The result is a valid Ethernet frame, but the headers of all nested protocols are not updated to reflect the timestamp.

- **FCS Appending Mode**: the original FCS is discarded and replaced by the ingress timestamp. The size of the original frame is maintained without any latency impact, but the FCS is not valid.

20.1.2.2.2 Keyframes

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. Keyframes have valid L2 and L3 headers. Keyframes contain these header fields:

- MAC fields (12 bytes):
  - Source MAC address is the address of the egress interface transmitting the keyframe.
  - Destination MAC address is configured through a CLI command.
- IP Header (20 bytes):
  - Source IP address is configured through CLI; default is management interface IP address.
  - Destination IP address is configured through a CLI command.
  - TTL is set to ***64***.
  - TOS is set to ***0***.
  - Protocol field is set to ***253***.
  - IP header's ID field is set to ***0***.

Keyframes contain these payload fields:

- **ASIC time**: (64 bits) ASIC time counter. (***2.857*** ns resolution).
- **UTC time**:(64 bits) Unix time that corresponds to ASIC time (ns).
- **Last sync time**: (64 bits) ASIC time of most recent PTP synchronization.
- **Keyframe time**: (64 bits) ASIC time of the keyframe's egress (ns).
- **Egress interface drops**: (64 bits) Number of dropped frames on keyframe's egress interface.
- **Device ID**: (16 bits) device ID (user defined).
- **Egress interface**: (16 bits) Keyframe's egress switchport.
- **FCS type (8 bits)**: Timestamping mode configured on keyframe's egress port.
  - ***0***: timestamping disabled.
  - ***1***: timestamp is appended to payload; new FCS is added to the frame.
  - ***2***: timestamp overwrites the existing FCS.
- **Reserved (8 bits)**: reserved for future use.
- **Skew numerator/skew denominator**: form a ratio indicating the ASIC clock skew. If the ratio is greater than ***1***, the clock is skewed fast; if the ratio is less than ***1***, the clock is skewed slow.

Last sync time equals ***0*** when there was no previous synchronization or the time since the last synchronization is greater than ***8*** hours.

The 31-bit frame timestamp provides high-resolution timing, rolling over about every ***6.135*** seconds (31 bits at 2.857ns per tick). To obtain the full ASIC time and to correlate the timestamp to an absolute UTC time, the switch sends keyframes. Each keyframe contains the current ASIC time and UTC time; hence an application can compute the high order bits of the ASIC time (for precise, relative timing) from the ASIC to UTC time mapping, and then determine absolute time.

ASIC to UTC time conversion is not quite immediate, so the UTC time in the frame will not be the current time. A keyframe timestamp is provided for this purpose. The frame also includes the timestamping mode (FCS type) so applications can dynamically determine the timestamp's byte offset. Each field is shown in the following table.

Table 72: Keyframe Payload

0 7	8 15	16 31

ASIC time		
UTC time		
Last sync time		
Skew numerator		
Skew denominator		
Keyframe timestamp		
Drop count		
Device ID		Egress interface
FCS type	Reserved	

20.1.3 TAP Aggregation Extra MPLS Pop (4 to 6 Labels)

Available starting with ***EOS Release 4.23.1F*** extra MPLS pop for TAP Aggregation allows you to remove four to six MPLS labels from a packet. Previously, only one to three labels were able to be popped.

When configured, popping four to six MPLS labels will work in all the cases where popping one to three MPLS labels works. MPLS pop for ***1*** to ***3*** labels can be found here: https://www.arista.com/en/support/toi/eos-4-15-0f/13620-tap-aggregation-mpls-pop.

20.1.3.1 TAP Aggregation Extra MPLS Pop Configuration

MPLS pop is configurable per tap port as follows to pop one to three labels:

```
(config-if-Et1/1)# switchport tap mpls pop all
```

However, MPLS pop for four to six labels requires a user defined TAP Aggregation profile based on off of tap-aggregation-extended. This profile must have one action and three fields configured under the tapagg port feature, such as the following:

```
(config)# hardware tcam
(config-hw-tcam)# profile foo copy tap-aggregation-extended
(config-profile-foo)# feature tapagg port
(config-profile-foo-feature-tapagg-port)# action set-fwd-header
(config-profile-foo-feature-tapagg-port)# key field mpls-label1-l
ower-24b mpls-label2-lower-24b mpls-label3-lower-24b
(config-profile-foo-feature-tapagg-port)# tap aggregation
Saving new profile 'foo'
(config-tap-agg)# mode exclusive profile foo
```

With the above profile changes, four to six MLPS label pop is additionally supported when the MPLS pop feature is configured on a tap port.

To check if a profile is installed correctly, use the **show hardware tcam profile** command.

```
(config-tap-agg)# show hardware tcam profile
```

Upon successful installation of a TAP Aggregation profile, you should see a display similar to the following:

```
Configuration            Status
FixedSystem          foo*                    foo
* configuration overridden by TapAgg
```

20.1.3.1.1 Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments

The Point of Local Repair (PLR) switches to the TI-LFA backup path on link failure or BFD neighbor failure but switches back to the post-convergence path once the PLR computes SPF and updates its LFIB. This sequence of events can lead to micro-loops in the topology if the PLR converges faster than other routers along the post-convergence path. So a configuration option is provided to apply a delay, after which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

To configure a convergence delay only to LFIB routes that are being protected, the following command is used either in the router IS-IS mode or the router IS-IS address-family sub-mode. A default of 10 seconds is used when using the command without an explicitly specified delay.

```
switch(config-router-isis-af)# timers local-convergence-delay
 [<delay_in_milliseconds>] protected-prefixes
```

20.1.3.2 Limitations

20.1.3.2.1 IP Steering

IP steering does not work for MPLS packets with four or more labels. Currently, you must work around this limitation with a configuration similar to the Configuration for IP Steering. This workaround does not work when MPLS pop is not enabled.

20.1.3.2.2 Configuration for IP Steering

When MPLS pop is enabled, you can enable IP steering for for to six MPLS labels by adding an extra port into the configuration as a tap-tool port.

For example, you want to perform IP steering from interface ***Ethernet1*** to a set of interfaces and also want MPLS labels to be popped. Add a new interface ***Ethernet2***, which will not receive any external traffic, as a tap-tool port with traffic loopback. Then configure ***Ethernet1*** to forward to ***Ethernet2*** as its default interface. The commands would look similar to the following:

```
(config-if-Et2)# swi mode tap-tool
(config-if-Et2)# traffic-loopback source system device phy
(config-if-Et2)# int et1
(config-if-Et1)# swi tap default interface et2
```

All of ***Ethernet1***'s old tool ports should be disabled and become ***Ethernet2***'s tool ports. Then, all IP steering configuration that was originally meant to be between ***ET1*** and its old tool ports should be configured with ***Ethernet2*** in place of ***Ethernet1***. Finally, configure MPLS pop on ***Ethernet1***.

20.1.3.3 TAP Aggregation Extra MPLS POP (4 to 6 Labels) Commands

show hardware tcam profile

20.1.4 TAP Aggregation Configuration

These sections describe TAP aggregation configuration tasks:

- Enabling Tap Aggregation Mode
- Tap Aggregation Mixed Mode
- Tap Port Configuration
- Tool Port Configuration
- Per-linecard TCAM Profile Configuration
- Two-Way Ports for Tap Aggregation
- Tap Aggregation QoS Handling on Tap Ports
- Identity VLAN Tagging
- Tap Aggregation Group Configuration

20.1.4.1 Enabling Tap Aggregation Mode

The switch supports switching mode and TAP aggregation mode. In switching mode, normal switching and routing functions are supported while TAP aggregation functions are disabled. In TAP aggregation mode, TAP aggregation functions are enabled while normal switching and routing functions are disabled. By default, the switch is in switching mode.

A ports switchport status depends on its switchport mode and the switch's TAP aggregation mode.

- **Tap aggregation mode enabled**: TAP and tool ports are enabled. Switching ports are errdisabled.
- **Tap aggregation mode disabled**: TAP and tool ports are errdisabled. Switching ports are enabled.

To enable the switch to carry out TAP aggregation, first enter TAP aggregation configuration mode using the **`tap aggregation`** command, then set the mode to **exclusive**.

Note: The switch can also perform TAP aggregation in **mixed** mode. See Mixed Mode Configuration.

Example

These commands enter TAP aggregation configuration mode, then place the switch in TAP aggregation **exclusive** mode.

```
switch(config)# tap aggregation
switch(config-tap-agg)# mode exclusive
switch(config-tap-agg)# show active
tap aggregation
   mode exclusive
switch(config-tap-agg)#
```

To return the switch to switching mode, remove the **`mode`** command from ***running-config***.

Examples

- These commands enter TAP aggregation configuration mode, then place the switch in switching mode.

```
switch(config)# tap aggregation
switch(config-tap-agg)# no mode
switch(config-tap-agg)# show active
switch(config-tap-agg)#
```

- These commands enter switching mode and remove all TAP aggregation configuration mode statements.

```
switch(config)# no tap aggregation
switch(config)#
```

20.1.4.2 TAP Aggregation Mixed Mode

On a modular switch, the user can configure TAP Aggregation on some linecards and leave other linecards to operate normally. This is referred to as TAP aggregation mixed mode.

- Mixed Mode Platform Compatibility
- Mixed Mode Configuration

20.1.4.2.1 Mixed Mode Platform Compatibility

The following platforms support TAP Aggregation Mixed Mode.

- DCS-7500R
- DCS-7500R2

20.1.4.2.2 Mixed Mode Configuration

Complete the following steps to configure ***Linecard 3*** as a TAP aggregation linecard in mixed mode.

1. Enable the switch for configuration.

```
switch> configure terminal
```

2. Enable TAP aggregation.

```
switch(config)# tap aggregation
```

3. Enable TAP aggregation mixed mode, selecting the targeted linecard module using the TAP aggregation default.

```
switch(config-tap-agg)# mode mixed module linecard 3 tap-aggregation-
default
```

Note: Changing modes may affect available functionality. Unsupported configuration elements will be ignored.

The profile selection in mixed mode is the same as in exclusive mode. The user can configure multiple linecards for TAP aggregation in mixed mode.

The user can check TAP Aggregation Mixed Mode status by executing the following show commands:

```
switch(config)# show running-config section tap
tap aggregation
   mode mixed module linecard 3 profile tap-aggregation-default
```

```
switch(config)#show hardware tcam profile
                     Configuration        Status
Linecard4            default              default
Linecard3            default              tap-aggregation-default
Linecard6            default              default
switch(config)#
```

20.1.4.3 TAP Port Configuration

TAP ports function when the switch is in TAP aggregation mode. TAP ports receive traffic for replication to one or more tool ports. In TAP aggregation mode, TAP ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

TAP mode ports are configured through switchport mode commands. TAP mode command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tap port configuration steps.

- Configuring an Interface as a TAP Mode Port
- TAP Port Allowed VLAN List Configuration
- TAP Port Native VLAN
- TAP Port Packet Truncation

Configuring an Interface as a Tap Mode Port

Ethernet and port-channel interfaces are configured as TAP ports with the **`switchport mode`** command.

Example

These commands configure interface ethernet ***41*** through ***43*** as TAP mode ports.

```
switch(config)# interface ethernet 41-43
switch(config-if-Et41-43)# switchport mode tap
switch(config-if-Et41-43)# show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            1        1    0
 ---
Et42      tap            tap            1        1    0
 ---
Et43      tap            tap            1        1    0
 ---
switch(config-if-Et41-43)#
```

TAP Port Allowed VLAN List Configuration

By default, TAP mode interfaces handle tagged traffic for all VLANs. The **`switchport tap allowed vlan`** command creates or modifies the set of VLANs for which a TAP port handles tagged traffic.

Example

These commands create TAP-mode allowed VLAN lists for interface ethernet ***41*** through ***43***.

```
switch(config)# interface ethernet 41
switch(config-if-Et41)# switchport tap allowed vlan 401-410
switch(config-if-Et41)# interface ethernet 42
switch(config-if-Et42)# switchport tap allowed vlan 411-420
switch(config-if-Et41)# interface ethernet 41-42
switch(config-if-Et41-42)# show active
interface Ethernet41
   switchport mode tap
   switchport tap allowed vlan 401-410
interface Ethernet42
   switchport mode tap
   switchport tap allowed vlan 411-420
switch(config-if-Et41-42)#
```

TAP Port Native VLAN

Tap mode Interfaces associate untagged frames with the tap mode native VLAN. The **`switchport tap native vlan`** command specifies the TAP-mode native VLAN for the configuration-mode interface. The default TAP-mode native VLAN for all interfaces is ***vlan 41***.

Example

These commands assign ***vlan 400*** as the TAP-mode native VLAN for ***interface ethernet 41***.

```
switch(config)# interface ethernet 41
switch(config-if-Et41)# switchport tap native vlan 400
switch(config-if-Et41)# show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
 ---
Et42      tap            tap            1        1    0
 ---
Et43      tap            tap            1        1    0
 ---
switch(config-if-Et41)#
```

TAP Port Packet Truncation

TAP ports can be configured to truncate inbound packets. The **`switchport tap truncation`** command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. By default, TAP ports do not truncate packets.

Examples

- These commands configure ***interface ethernet 41*** to truncate packets to ***150*** bytes.

```
switch(config)# interface ethernet 41
switch(config-if-Et41)# switchport tap truncation 150
switch(config-if-Et41)# show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id
 Truncation Default
          Mode                          Vlan     Vlan
   Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    150
   ---
Et42      tap            tap            1        1    0
   ---
Et43      tap            tap            1        1    0
   ---
switch(config-if-Et41)#
```

- These commands configure ***interface ethernet 41*** to send complete packets for replication.

```
switch(config-if-Et41)# no switchport tap truncation
switch(config-if-Et41)# show interface ethernet 41 tap
Port      Configured     Status         Native   Id
 Truncation Default
          Mode                          Vlan     Vlan
   Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
   ---
switch(config-if-Et41)#
```

20.1.4.4 Tool Port Configuration

Tool ports replicate traffic received by TAP ports. Tool ports are mapped to the TAP ports through TAP aggregation groups. A tool port may belong to multiple aggregation groups and an aggregation group may contain multiple tool ports.

Tool ports function when the switch is in TAP aggregation mode. In this switch mode, tool ports are in STP forwarding state and ingress traffic is prohibited. MAC learning, control plane interaction, and traps for inbound traffic are disabled. All control plane interaction is prevented and L2 agents do not send PDUs to tool-mode interfaces. When the switch is in switching mode, tool ports are error-disabled.

Tool-mode ports are configured through switchport commands. Tool-mode command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tool port configuration steps.

- Configuring an Interface as a Tool-mode Port
- Tool Port Allowed VLAN List Configuration
- Tool Port Packet Truncation

Configuring an Interface as a Tool-mode Port

Ethernet and port channel interfaces are configured as tool ports with the **`switchport mode`** command.

Example

These commands configure port-channel interfaces ***101*** through ***103*** as tool-mode ports and display the result.

```
switch(config)# interface port-channel 101-103
switch(config-if-Po101-103)# switchport mode tool
switch(config-if-Po101-103)# show interface port-channel 101-103
 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag
 Mode
------------------------------------------------------------
-----------
Po101     tool           tool           All                 Off
 ---
Po102     tool           tool           All                 Off
 ---
Po103     tool           tool           All                 Off
 ---
switch(config-if-Po101-103)#
```

Tool Port Allowed VLAN List Configuration

By default, tool mode interfaces handle tagged traffic for all VLANs. The **`switchport tool allowed vlan`** command creates or modifies the set of VLANs for which a tool port handles tagged traffic.

Example

These commands create tool mode allowed VLAN lists for port-channel interfaces 101 through 103.

```
switch(config)# interface port-channel 101-103
switch(config-if-Po101-103)# switchport tool allowed vlan
 1010-1020
switch(config-if-Po101-103)# interface port-channel 101
switch(config-if-Po101)# switchport tool allowed vlan add
 1001-1009
switch(config-if-Po103)# interface port-channel 102
switch(config-if-Po102)# switchport tool allowed vlan remove
 1016-1020
switch(config-if-Po102)# interface port-channel 103
switch(config-if-Po103)# switchport tool allowed vlan add
 1021-1030
switch(config-if-Po103)# show interface port-channel 101-103 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag
 Mode
------------------------------------------------------------
-----------
Po101     tool           tool           1001-1020           Off
 ---
Po102     tool           tool           1010-1015           Off
 ---
```

```
Po103     tool           tool           1010-1030           Off
 ---
switch(config-if-Po103)#
```

Tool Port Packet Truncation

Tool ports can be configured to truncate outbound packets. The **switchport tool truncation** command configures the configuration-mode interface, as a tool port, to truncate outbound packets to ***160*** bytes. By default, tool ports do not truncate packets.

Tool port packet truncation is supported only on the 7150 series platform.

Examples

- These commands configure ***interface ethernet 41***, as a tool port, to truncate packets on egress to ***160*** bytes.

```
switch(config)# interface ethernet 41
switch(config-if-Et41)# switchport mode tool
switch(config-if-Et41)# switchport tool truncation 160
switch(config-if-Et41)#
```

- These commands configure ***interface ethernet 41*** to send complete packets.

```
switch(config-if-Et41)# no switchport tool truncation
switch(config-if-Et41)#
```

20.1.4.5 Per-linecard TCAM Profile Configuration

This feature gives the ability to specify different profiles for different linecards in mixed mode.

To enable the TAP aggregation mode and configure a TCAM profile for a linecard set, complete the following steps:

1. Enable the switch for configuration.

```
switch> configure terminal
```

2. Enable TAP aggregation mode.

```
switch(config)# tap aggregation
```

3. Configure the TCAM profile for a linecard set.

```
switch(config-tap-agg)# mode mixed module linecard 3,4 profile tap-
aggregation-default
switch(config-tap-agg)# mode mixed module linecard 5,6 profile tap-
aggregation-extended
switch(config-tap-agg)#
```

To disable TAP aggregation on a linecard set, complete the following steps:

1. Enable the switch for configuration.

```
switch> configure terminal
```

2. Enable TAP aggregation mode.

```
switch(config)# tap aggregation
```

3. Disable TAP aggregation for a linecard set.

```
switch(config-tap-agg)# no mode mixed module linecard 3,4
switch(config-tap-agg)#
```

Note: If a TAP is a port-channel, its members must all come from linecards using the same profile.

20.1.4.6 Two-Way Ports for TAP Aggregation

While in TAP aggregation mode, there is support for traffic only in one direction through either TAP ports that receive packets from mirroring, or through optical TAP or tool ports that send out packets to customer devices. Two-way ports for TAP aggregation allow bidirectional transmit and receive capability on a single port in TAP aggregation mode. Using the TAP-tool switchport mode enables both TAP and tool configurations simultaneously on an interface.

- Two-Way Ports Platform Compatibility
- Two-Way Ports Configuration

20.1.4.6.1 Two-Way Ports Platform Compatibility

The following platforms support two-way ports for TAP aggregation.

- DCS-7280R
- DCS-7280R2
- DCS-7500R
- DCS-7500R2

20.1.4.6.2 Two-Way Ports Configuration

To enable a two-way port, use the **tap-tool** option of the **`switchport mode`** command.

Example

The following commands configure ***interface ethernet 4/1*** as a two-way port, allowing it to function as both a TAP and a tool port.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# switchport mode tap-tool
switch(config-if-Et4/1)#
```

Additional configurations for TAP and tool functionality on the interface remain the same. Once the user enables the TAP-tool switchport mode on the interface, they can use the existing TAP and tool mode commands to enable their respective configurations.

Arista recommends using this feature with unidirectional send-receive enabled on the interface, which allows the receiver and transmitter for the interface to operate independently. If one goes down, the other remains active. To enable unidirectional send-receive on an interface, use the **`unidirectional send-receive`** command.

Example

These commands enable unidirectional send-receive on ***interface ethernet 4/1***.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# unidirectional send-receive
switch(config-if-Et4/1)#
```

20.1.4.7 TAP Aggregation QoS Handling on TAP Ports

Before EOS 4.20.5F, QoS behavior was not enforced for TAP aggregation ports, meaning that QoS behavior for packets passing through the device was not changed.

- QoS Handling Platform Compatibility
- QoS Handling Configuration
- Displaying QoS Handling Status

20.1.4.7.1 QoS Handling Platform Compatibility

The following platforms support QoS handling on TAP ports.

- DCS-7280E
- DCS-7280R
- DCS-7500E
- DCS-7500R
- DCS-7280R2

Note: QoS is not available on TAP aggregation ports on the DCS-7150.

20.1.4.7.2 QoS Handling Configuration

Trust Mode of TAP Ports

TAP ports are in QoS **untrusted** mode by default. This means that the QoS marking of an incoming packet is not trusted when determining the QoS attributes of the packet. Therefore, the default QoS handling takes place. Consider the default CoS to traffic class mapping in the following example.

```
switch(config)# show qos maps
[...]
 Cos-tc map:
   cos:  0  1  2  3  4  5  6  7
   ----------------------------
   tc:   1  0  2  3  4  5  6  7
[...]
```

The Class of Service (CoS) field of incoming packets is ignored and is assumed to be zero. In this example, all packets are assigned to traffic class 1 when using the above mapping.

To override the default trust mode behavior on a TAP port, use the **`qos trust`** command.

Example

The following commands override the default trust mode behavior on ***Ethernet port 1***, configuring it to use Class of Service (CoS) trust mode instead so that incoming packets will be placed in their CoS-marked classes.

```
switch(config-if-Et1)# qos trust cos
```

```
switch(config-if-Et1)#
```

Class of Service Rewrite of TAP Ports

By default, TAP ports do not override the existing Class of Service (CoS) field of incoming packets. In other words, the CoS marking of steered packets is not changed in any way.

However, the CoS field of added tags may change according to the traffic class to CoS mapping. For example, the identity tag added by TAP ports may have the CoS value from the global traffic class to CoS mapping. Consider the following mapping:

```
switch(config)# show qos maps
[...]
   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ---------------------------
     cos:  1  7  2  3  4  5  6  0
[...]
```

Using this mapping, the added tag CoS field of packets assigned to ***traffic class 1*** may be set to ***7***.

20.1.4.7.3 Displaying QoS Handling Status

Use the **show qos maps** command to see the active QoS mappings.

Example

This command displays the QoS maps that are configured on the switch.

```
switch# show qos maps
Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8
   Cos Rewrite:  Disabled
   Dscp Rewrite:  Disabled

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ---------------------------
     tc:   1  0  2  3  4  5  6  7

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ---------------------------------------
      0 :     1  1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
      2 :     2  2  2  2  3  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  5  5  5  5  5  5  5  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ---------------------------
     cos:  1  0  2  3  4  5  6  7

   Tc-dscp map:
     tc:    0  1  2  3  4  5  6  7
     ----------------------------
```

```
     dscp:  8  0 16 24 32 40 48 56

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     --------------------------------
     tx-queue:   0  1  2  3  4  5  6  7

switch#
```

20.1.4.8 Identity VLAN Tagging

By default, tool port output packets are identical to the replicated packets they receive from the tap ports to which they are associated. Identity tagging modifies packets sent by tool ports by adding a dot1q VLAN tag that identifies the originating TAP port. Each TAP port is associated with an identity number. Tool ports that are configured to add an identity tag append the originating TAP port's identity number in the outer layer (or s-VLAN) tag.

The following sections describe identity VLAN tagging on TAP and tool ports.

- Tap Port Identity Value Configuration
- Tool Port Identity Tag Configuration

Tap Port Identity Value Configuration

The **`switchport tap identity`** command configures the TAP port identity value for the configuration-mode interface. The default identity value for all TAP ports is ***1***.

Example

These commands configure ***1042*** as the identity value for ***interface ethernet 42*** and display the result.

```
switch(config)# interface ethernet 42
switch(config-if-Et42)# switchport tap identity 1042
switch(config-if-Et42)# show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
 ---
Et42      tap            tap            1        1042 0
 ---
Et43      tap            tap            1        1    0
 ---
switch(config-if-Et42)#
```

Tool Port Identity Tag Configuration

The **`switchport tool identity`** command configures the configuration-mode interface to include a tier-1 VLAN tag (dot1q) in packets it transmits. The VLAN number on the dot1q tag is the identity value configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

Example

These commands configure ***port channel 102*** to include the identity tag in packets it transmits.

```
switch(config)# interface port-channel 102
switch(config-if-Po102)# switchport tool identity dot1q
switch(config-if-Po102)# show interface port-channel 101-103 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag
 Mode
-------------------------------------------------------------
-----------
Po101     tool           tool           1001-1020           Off
 ---
Po102     tool           tool           1010-1015           On
 ---
Po103     tool           tool           1010-1030           Off
 ---
switch(config-if-Po102)#
```

20.1.4.9 TAP Aggregation Group Configuration

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A tool port replicates packets it receives from TAP ports that are in the aggregation groups to which it belongs. A TAP port can be configured to send data to multiple TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. TAP aggregation groups may contain multiple TAP ports and multiple tool ports.

The following sections describe the configuration of TAP aggregation groups:

- Assigning a Tool Port to a TAP Aggregation Group
- Assigning TAP Ports to a TAP Aggregation Group
- Viewing TAP Aggregation Group Assignments
- LAGs in Tool Groups

Assigning a Tool Port to a TAP Aggregation Group

Tool ports are assigned to a TAP aggregation group through the **`switchport tool group`** command. Each command either creates a list or alters the existing list of groups to which a tool port belongs.

Examples

- These commands assign ***port-channel interface 101*** to TAP aggregation groups **analyze1**, ***analyze2***, and ***analyze3***.

```
switch(config)# interface port-channel 101
switch(config-if-Po101)# switchport tool group set analyze1
 analyze2 analyze3
switch(config-if-Po101)# show active
interface Port-Channel101
   switchport mode tool
   switchport tap identity 2101
   switchport tool allowed vlan 1001-1020
   switchport tap default group tag-9
```

```
   switchport tool group set analyze3 analyze1 analyze2
switch(config-if-Po101)#
```

- These commands remove **analyze-1** from ***port channel 101***'s TAP aggregation group list.

```
switch(config-if-Po101)# switchport tool group remove analyze1
switch(config-if-Po101)# show active
interface Port-Channel101
   switchport mode tool
   switchport tap identity 2101
   switchport tool allowed vlan 1001-1020
   switchport tap default group tag-9
   switchport tool group set analyze3 analyze2
switch(config-if-Po101)#
```

Assigning TAP Ports to a TAP Aggregation Group

TAP ports are assigned to a TAP aggregation group using the **switchport tap default group** command.

Note: A TAP port has multiple default groups.

Multiple ports can be added to a group simultaneously by entering the command in group interface configuration mode for all of the ports to be included.

Example

These commands assign ***interface ethernet 41-42*** to TAP aggregation group ***analyze2*** and assign ***interface ethernet 43*** to TAP aggregation group ***analyze3***.

```
switch(config)# interface ethernet 41-42
switch(config-if-Et41-42)# switchport tap default group analyze2
switch(config-if-Et41-42)# interface ethernet 43
switch(config-if-Et43)# switchport tap default group analyze2
switch(config-if-Et43)# show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
 analyze2
Et42      tap            tap            1        1042 0
 analyze2
Et43      tap            tap            1        1    0
 analyze3
switch(config-if-Et43)#
```

Default TAP Aggregation Groups

A TAP port has multiple default groups. When traffic entering a TAP port does not match any filtering or traffic-steering rules for TAP aggregation groups configured on that port, it is sent to all default groups.

Example

These commands assign ***interface ethernet 43*** to TAP aggregation groups **analyze2** and **analyze3**. Because it is listed first, **analyze2** is configured as the default group for the interface.

```
switch(config)# interface ethernet 43
switch(config-if-Et43)# switchport tap default group analyze2
 group analyze3
switch(config-if-Et43)#
```

Viewing TAP Aggregation Group Assignments

TAP aggregation group membership is displayed by **`show tap aggregation groups`**. Options allow the display of individual groups or of all configured groups. The command displays active tool and TAP ports by default, and provides an option to display configured ports that are not active.

Example

This command displays the contents of all configured TAP aggregation groups.

```
switch# show tap aggregation groups
Group Name                              Tool Members
------------------------------------------------------------
analyze2                                Po101, Po102
analyze3                                Po101, Po103

Group Name                              Tap Members
------------------------------------------------------------
analyze2                                Et41, Et42
analyze3                                Et43
switch#
```

LAGs in Tool Groups

Link Aggregation Groups (LAGs) can be included in tool groups for load balancing. A tool group can contain both LAGs and regular ports. Each member of a tool group receives one copy of the traffic destined to the group. Traffic is replicated to tool group members using multicast replication. The traffic replicated to LAGs is then load balanced to their members as per load-balance policies configured on the system.

If a tool group has no more than ***60*** members with at least one hardware LAG, then the replication mode of the tool group is set to **ingress-only**. Otherwise, the replication mode of the tool group is set to the configured system default multicast replication mode. See **`platform sand multicast replication default`** for more information on configuration of the system default replication mode.

Example

The following command changes the system-wide default multicast replication mode to **ingress**.

```
switch(config)# platform sand multicast replication default
 ingress
```

```
switch(config)#
```

20.1.5 TAP Aggregation Traffic Steering

Traffic steering is a TAP aggregation process that uses class maps and policy maps to direct data streams at tool ports that are not otherwise associated to the ingress TAP port. A policy map is a data structure that filters data streams upon which identity VLAN tagging or TAP aggregation group assignment is implemented.

TAP-aggregation class maps and policy maps are similar to QoS and control-plane maps. However, policy maps and their components are not interchangeable among function types.

20.1.5.1 TAP Aggregation Policies

A policy map filters data packets by using classes and match rules. Each class contains an eponymous class map and a traffic resolution command. Each match rule contains packet content descriptors and a traffic resolution parameter.

- A class map uses ACLs that identify packets that comprise a specified data stream.
- Packet content descriptors specify packet field values that are compared to inbound packets.
- A traffic resolution command or parameter specifies data handling methods for filtered traffic.

Each data packet entering an entity to which a policy map is assigned is managed as defined by the traffic resolution command of the highest priority class or rule that matches the packet.

Class maps are user-created and can be edited or deleted. They filter traffic with IPv4 ACLs and are listed in ***running-config***. TAP aggregation traffic resolution commands do one the following:

- specify a TAP aggregation group to direct the packet.
- specify a VLAN number for identity tagging the packet.

TAP aggregation policy maps do not define an implicit **deny** statement. Packets that do not match a policy map class or rule are replicated and sent out tool ports specified by the default aggregation group assigned to the ingress TAP port. If no default group is selected, these packets are dropped.

20.1.5.2 Configuring TAP Aggregation Traffic Policies

TAP aggregation traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port-channel interfaces.

Creating Class Maps

A class map is an ordered list of IPv4 Access Control Lists (ACLs). Each ACL is assigned a sequence number that specifies its priority in the class map. TAP aggregation class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class maps are created and modified in class-map configuration mode, which is entered using the **`class-map type tapagg`**. The **match (class-map (tapagg))** command inserts a specified ACL into the class map, assigning it a sequence number that denotes its placement.

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **`show active`** command displays the saved version of class map. The **`exit`** command returns the switch to ***global*** configuration mode and saves pending class-map changes. The **`abort`** command returns the switch to global configuration mode and discards pending changes.

Examples

- This command creates a TAP aggregation class map named ***t-class_1*** and places the switch in the ***class-map*** configuration mode.

```
switch(config)# class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```

- These commands add two IPv4 ACLs (***tacl-1*** and ***tacl-2***) to the ***t-class_1*** class map. The commands use the default method of assigning sequence numbers to the ACLs.

```
switch(config-cmap-t-class_1)# match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

- These commands exit class-map configuration mode, store pending changes to ***running-config***, then display the class map.

```
switch(config-cmap-t-class_1)# exit
switch(config)# class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)# show active
class-map type tapagg match-any t-class_1
10 match ip access-group tacl-1
20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

Creating Policy Maps

Policy maps are created and modified in ***policy-map*** configuration mode. A policy map is an ordered list of classes and match rules. Policy maps are edited by adding or removing map elements. Data packets are managed by commands of the highest priority class or rule that matches the packet.

Classes

Each class contains a class map, a set command, and a sequence number:

- The **class map** identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode.
- The **`set`** command specifies the replication method for filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The **sequence number** specifies the class's priority within the policy map. Lower sequence numbers denote higher priority.

Matching Rules

Each rule contains a filter list, an action, and a sequence number:

- The **filter list** identifies a data stream by using a set of packet field values.
- The action, (**SET_VALUE** parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The **sequence number** specifies the rule's priority within the policy map. Lower sequence numbers denote higher priority.

Policy-map and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **`exit`** command or discarded with the **`abort`** command. The **`show active`** and **`show pending`** commands display the saved and modified policy map versions respectively.

The **`class (policy-map (tapagg))`** command enters policy-map configuration mode.

Example

This command creates the TAP aggregation policy map named ***t-policy_1*** and places the switch in ***policy-map*** configuration mode.

```
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```

The **`class (policy-map (tapagg))`** command adds a class to the configuration mode policy map and places the switch in ***policy-map-class*** configuration mode for adding a traffic resolution command to the class. The **`set (policy-map-class (tapagg))`** command specifies the data replication method for traffic filtered by the associated class map in the *configuration-mode* policy map. The **`set`** command performs one of the following replication actions for filtered data packets.

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

Examples

- These commands add the ***t-class_1*** class map to the ***t-policy_1*** policy map, associate a set statement with the class, then save the policy map by exiting the modes. Packets filtered by the class map are identity tagged with ***VLAN 444*** and replicated as specified by the ***t-grp*** aggregation group.

  ```
  switch(config-pmap-t-policy_1)# class t-class_1
  switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group
  t-grp id-tag 444
  switch(config-pmap-c-t-policy_1-t-class_1)# exit
  switch(config-pmap-t-policy_1)# exit
  switch(config)# policy-map type tapagg t-policy_1
  switch(config-pmap-t-policy_1)# show active
  policy-map type tapagg t-policy_1
  10 class t-class_1
  set aggregation-group t-group id-tag 444
  switch(config-pmap-t-policy_1)#
  ```

  The **match (policy-map (tapagg))** command adds a match rule to the configuration-mode TAP aggregation policy map.
- This command enters policy-map configuration mode for ***t-policy_1***, then creates a match rule for the policy map that filters OSPF packets and replicates them as specified by ***t-grp*** TAP aggregation group.

  ```
  switch(config-pmap-t-policy_1)# match ip ospf any any set
  aggregation-group t-grp
  switch(config-pmap-t-policy_1)#
  ```

Applying Policy Maps to an Interface

The **service-policy type tapagg (Interface mode)** command applies a specified policy map to the configuration-mode interface.

Example

These commands apply the ***t-policy_1*** policy map to ***interface ethernet 17***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# service-policy type tapagg input tpolicy_1
switch(config-if-Et17)#
```

Stripping VLAN Tags

The traffic-steering policies in tap aggregation mode allows steering traffic from tap ports to tool ports using **set (policy-map-class (tapagg))** command, while the 'set id-tag' tags the traffic with the specified VLAN ID in the dot1q format. The **class (policy-map (tapagg))** command allows removing VLAN tags from the steered traffic. It supports all traffic types that the traffic steering policies support such as IPv4, IPv6, and MAC.

A tap port is an interface that receives a data stream where two network ports exchange.

A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to the devices that process monitored data streams.

Example

These commands place the switch in policy-map-class to add the ***t-class_1*** class map to the ***t-policy_1*** policy map. The first, second, or both of the two outer-most VLAN tags are stripped.

```
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# class t-class_1
switch(config-pmap-t-policy_1t-class_1)# set aggregation-group t-group
 remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group t-group
 id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)# set id-tag 10 remove dot1q
 outer 1
switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group t-
group
switch(config-pmap-c-t-policy_1-t-class_1)# set id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group t-group
 id-tag 10 remove dot1q outer 1-2
```

20.1.5.3 Traffic Steering to Match Inner Header Fields

This feature allows matching the inner header fields (either IPv4 or IPv6 inner fields) of encapsulated traffic.

The following convention is adopted when describing an encapsulated traffic: ***<inner-protocol>-over-<outer-protocol>***. For example, the IPv4-over-IPv6 packet indicates that the inner fields belong to IPv4 protocol and the outer fields belong to IPv6 protocol.

Supported Packet Types and Inner Header Fields

The types of traffic for which inner header field matching is supported are:

1. IP-over-IP traffic
2. IP-over-GRE traffic, with the following packet format supported:
   - [Eth | IPv4 or IPv6 | GRE | Inner IPv4 or IPv6]
   - [Eth | IPv4 | GRE | Inner Eth | Inner IPv4], which will be referred to as L2-GRE packet
3. IP-over-GTP traffic (only in DCS-7280R3 and DCS-7500R3 series), with the following packet format supported
   - [Eth | IPv4 | GTP | Inner IPv4 or IPv6]
   - [Eth | IPv6 | GTP | Inner IPv4 or IPv6]

The following inner header fields are supported:

- inner source IP address
- inner destination IP address
- inner TCP/UDP protocol
- inner source port number

- inner destination port number.

20.1.5.3.1 Configuring Traffic Steering to Match Inner Header Fields

To enable traffic steering with an ACL rule that matches the inner IP addresses, a user-defined TCAM profile must be configured for each type of IP protocol to which the inner IP addresses belong. For example, to match the inner IPv4 addresses of an IPv4 packet (i.e. IPv4-over-IPv4 traffic) or the inner IPv4 addresses of an IPv6 packet (i.e. IPv4-over-IPv6 traffic), one user-defined TCAM profile must be configured. A different user-defined TCAM profile is needed if matching the inner IPv6 addresses of an IPv4 packet or the inner IPv6 addresses of an IPv6 packet is desired.

The following commands show how to configure different TCAM profiles needed to enable support for matching inner IP headers, depending on the desired inner IP version, and inner IP header fields to be matched. These TCAM profiles are referred to as user-defined TCAM profiles and created based on the existing TCAM profile tap-aggregation-extended.

TCAM Profile to Match Inner IPv4 Header Fields

Match inner IPv4 addresses only.

The following commands configure the TCAM profile for matching only the inner source and destination IP addresses of IPv4 traffic based on the existing TCAM profile **tap-aggregation-extended**.

Example

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile tap-aggregation-user-inner-ip4 copy tap-
aggregation-extended
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# no key field src-ip dst-ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# key field inner-src-ip-high inner-src-ip-low inner-dst-ip-
high inner-dst-ip-low
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# feature tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)# no key field src-ipv6 src-ipv6-high dst-ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)# key field inner-src-ip-high inner-src-ip-low inner-dst-ip-
high inner-dst-ip-low
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)# exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# exit
```

Match inner IPv4 addresses, inner TCP/UDP protocol and inner port numbers for IP-over-IP and IP-over-GRE traffic.

In addition to matching inner IPv4 addresses, the previous user-defined TCAM profile can also be configured to match the inner TCP/UDP protocol and their corresponding port numbers. The commands to configure these inner fields are shown below.

Note that, due to hardware limitation, the feature “tapagg mac” is disabled in this TCAM profile to make room for matching additional inner header fields.

Example

```
switch(config-hw-tcam)# profile tap-aggregation-user-inner-ip4
```

```
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# no feature
 tapagg mac
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# no key field outer-vlan-id inner-vlan-id l4-src-port l4-dst-
port udf-16b-1 udf-16b-2 udf-16b-3 udf-16b-4 udf-32b-1 udf-32b-2
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# key field inner-ip-protocol inner-l4-src-port inner-l4-dst-
port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# feature tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)# no key field l4-src-port l4-dst-port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)# key field inner-ip-protocol inner-l4-src-port inner-l4-dst-
port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)# exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# exit
```

Match inner IPv4 addresses, inner TCP/UDP protocol and inner port numbers for L2-GRE packets.

The same user-defined TCAM profile can be updated to support traffic steering that matches on inner header fields for L2-GRE packets, simply by adding a new packet type.

Example

```
switch(config-hw-tcam)# profile tap-aggregation-user-inner-ip4
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# packet ipv4 eth ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# feature
 tapagg port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-port)# packet ipv4 eth ipv4 forwarding bridged
```

Match inner IPv4 addresses, inner TCP/UDP protocol and inner port numbers for IP-over-GTP packets.

We can re-use the same user-defined TCAM profile and update it to support traffic steering that matches on inner header fields for IP-over-GTP packets, simply by adding a new packet type.

Example

```
switch(config-hw-tcam)# profile tap-aggregation-user-inner-ip4
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# no packet ipv4 eth ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)# packet ipv4 gtpv1 ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# feature
 tapagg port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-port)# no packet ipv4 eth ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-port)# packet ipv4 gtpv1 ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)# feature
 tapagg ipv6
```

```
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-port)# packet ipv6 gtpv1 ipv4 forwarding bridged
```

Match inner and outer IPv4 addresses.

If matching a combination of inner and outer IP header fields is desired, the user-defined TCAM profile must be updated to include the desired fields. For example, instead of matching both inner source and inner destination IPv4 addresses as illustrated by this TCAM profile, if users would like to match outer source IPv4 address and inner destination IPv4 address only (and ignoring outer destination and inner source IPv4 addresses). The following commands show how to configure a TCAM profile for such filtering.

Example

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile tap-aggregation-user-outer-inner-ip4 copy
 tap-aggregation-extended
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-i
p4)# feature tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4-
feature-tapagg-ip)# no key field dst-ip
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4-
feature-tapagg-ip)# key field inner-src-ip-high inner-src-ip-low
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4-
feature-tapagg-ip)# exit
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4)# exit
```

TCAM Profile to Match Inner IPv6 Header Fields

Match inner IPv6 addresses only.

These commands are to configure a TCAM profile that can match inner IP addresses of IPv6 traffic are as follows:

Example

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile tap-aggregation-user-inner-ip6 copy tap-
aggregation-extended
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)# no key field dst-ip src-ip udf-16b-1  udf-16b-2 udf-16b-3
 udf-16b-4 udf-32b-1 udf-32b-2 outer-vlan-id inner-vlan-id l4-src-port
 l4-dst-port l4-ops
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)# key field inner-src-ipv6-high-high-32b inner-src-ipv6-high-
low-32b inner-src-ipv6-low-high-32b inner-src-ipv6-low-low-32b
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)# key field inner-dst-ipv6-high-high-32b inner-dst-ipv6-high-
low-32b inner-dst-ipv6-low-high-32b inner-dst-ipv6-low-low-32b
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)# exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# feature
 tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)# no key field src-ipv6 src-ipv6-high dst-ipv6 l4-dst-port
 l4-src-port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)# key field inner-src-ipv6-high-high-32b inner-src-ipv6-high-
low-32b inner-src-ipv6-low-high-32b inner-src-ipv6-low-low-32b
```

```
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)# key field inner-dst-ipv6-high-high-32b inner-dst-ipv6-high-
low-32b inner-dst-ipv6-low-high-32b inner-dst-ipv6-low-low-32b
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)# exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# exit
```

Match inner IPv6 addresses, inner TCP/UDP protocol and inner port numbers.

In addition to matching inner IPv6 addresses, the previous user-defined TCAM profile can also be configured to match the inner TCP/UDP protocol and their corresponding port numbers. The commands to configure these inner fields are shown below.

Note that, due to hardware limitation, the feature **tapagg mac** is disabled in this TCAM profile to make room for matching additional inner header fields.

Example

```
switch(config-hw-tcam)# profile tap-aggregation-user-inner-ip6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# no feature
 tapagg mac
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)# key field inner-ipv6-next-header inner-l4-src-port inner-l4-
dst-port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)# feature tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)# key field inner-ipv6-next-header inner-l4-src-port inner-
l4-dst-port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)# exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# exit
```

Match inner IPv6 addresses, inner TCP/UDP protocol and inner port numbers for IP-over-GTP packets.

We can re-use the same user-defined TCAM profile and update it to support traffic steering that matches on inner header fields for IP-over-GTP packets, simply by adding a new packet type.

```
switch(config-hw-tcam)# profile tap-aggregation-user-inner-ip6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)# packet ipv4 gtpv1 ipv6 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# feature
 tapagg port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-port)# packet ipv4 gtpv1 ipv6 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)# feature
 tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-port)# packet ipv6 gtpv1 ipv6 forwarding bridged
```

Apply TCAM Profile

To apply the newly-defined TCAM profile use **tap-aggregation-user-inner-ip4** or **tap-aggregation-user-inner-ip6** command.

```
switch(config)# tap aggregation
```

```
switch(config-tap-agg)# mode exclusive profile tap-aggregation-user-inner
-ip4
```

For modular systems

```
switch(config)# tap aggregation
switch(config-tap-agg)# mode mixed module Linecard <linecard number>
 profile tap-aggregation-user-inner-ip4
```

Set-Up ACL Rules for Matching Inner Header Fields

In order to apply traffic steering for particular packets based on their inner header fields, ACL rules that can filter such traffic must be created, as shown in the example.

1. ACL rule for filtering an IPv4-over-IPv4 traffic based on the inner addresses.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit ip any any inner ip host 1.2.3.4 host
 5.6.7.8
```

2. ACL rule for filtering an IPv4-over-IPv4 traffic based on the outer source and inner destination addresses.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit ip host 1.2.3.4 any inner ip host any
 host 5.6.7.8
```

3. ACL rule for filtering an IPv6-over-IPv4 traffic based on the inner addresses.

```
switch(config)# ip access-list acl2
switch(config-acl-acl2)# permit ip any any inner ipv6 host 1001::abcd
 host 2002::cafe
```

4. ACL rule for filtering an IPv4-over-IPv6 traffic based on the inner addresses, inner TCP/UDP protocol, and inner TCP/UDP ports.

```
switch(config)# ipv6 access-list acl3
switch(config-ipv6-acl-acl3)# permit ipv6 any any inner ip tcp host
 10.11.12.13 eq 9999 host 20.22.24.26 eq 8888
```

5. ACL rule for filtering an IPv6-over-GRE(IPv4) traffic based on the inner addresses, inner TCP/UDP protocol, and inner TCP/UDP ports.

```
switch(config)# ip access-list acl4
switch(config-acl-acl4)# permit gre any any inner ipv6 udp host
 2019::baba eq 9999 host 1986::deca eq 8888
```

6. ACL rule for filtering an IPv4-over-GTP traffic based on the inner addresses.

```
switch(config)# ip access-list acl5
switch(config-acl-acl5)# permit gtp any any version 1 protocol gtp-u
 inner ip host 1.2.3.4 host 5.6.7.8
```

20.1.5.3.2 Limitations

- Only IP (IPv4 and IPv6), GRE and GTP outer protocols are supported.
  - Other outer protocols are not supported.
- Only IP (IPv4 and IPv6), TCP and UDP inner protocols are supported.

    - Other inner protocols are not supported.
- To configure support for matching inner IPv4 addresses (for either IPv4 or IPv6 outer packets), a custom user-defined TCAM profile is required. A different user-defined TCAM profile is needed if matching inner IPv6 addresses is desired.
- The total size of fields to match must not exceed the TCAM key size limitation (which is ***320*** bit if tap-aggregation-extended system profile is used as the base profile, or ***160*** bit for tap-aggregation-default system profile). For example, it is not possible to create a user-defined TCAM profile that matches both outer and inner source/destination address pairs for an IPv6-over-IPv6 packet. This is because each IPv6 address is ***128*** bit, requiring at least ***512*** bit to match all ***4*** addresses, and the TCAM key size is limited to ***320*** bit.

20.1.6 TAP Aggregation GUI

The switch provides a Graphical User Interface (GUI) for creating and viewing a TAP aggregation configuration and displaying LANZ traffic statistics.

All commands available on the GUI are accessible through the CLI. The TAP aggregation configuration created through either the CLI or the GUI can be viewed and modified through either medium.

This section provides a brief description of the TAP aggregation GUI.

20.1.6.1 Accessing the TAP Aggregation GUI

The URL for the TAP aggregation GUI is: **`//hostname/apps/TapAgg/index.html`** where the hostname is the switch's configured hostname. The **`TAP Aggregation GUI Initial Panel`** displays the initial TAP aggregation GUI panel for the switch with the hostname ***ro402***.

The TAP aggregation panel contains two sections:

- The **configuration section** displays the TAP aggregation configuration, including the TAP interfaces, tool interfaces, and aggregation groups. Links are displayed to indicate interface group membership.
- The **component section** displays information and control buttons for the active configuration entity. When an entity is not selected, the section displays information for the switch (device).

The configuration section displays TAP aggregation components only when the switch is in TAP aggregation mode. To enter TAP aggregation mode, click the TAP Aggregation icon in the component section for the device. The icon is a toggle mechanism; clicking it again disables TAP aggregation mode.

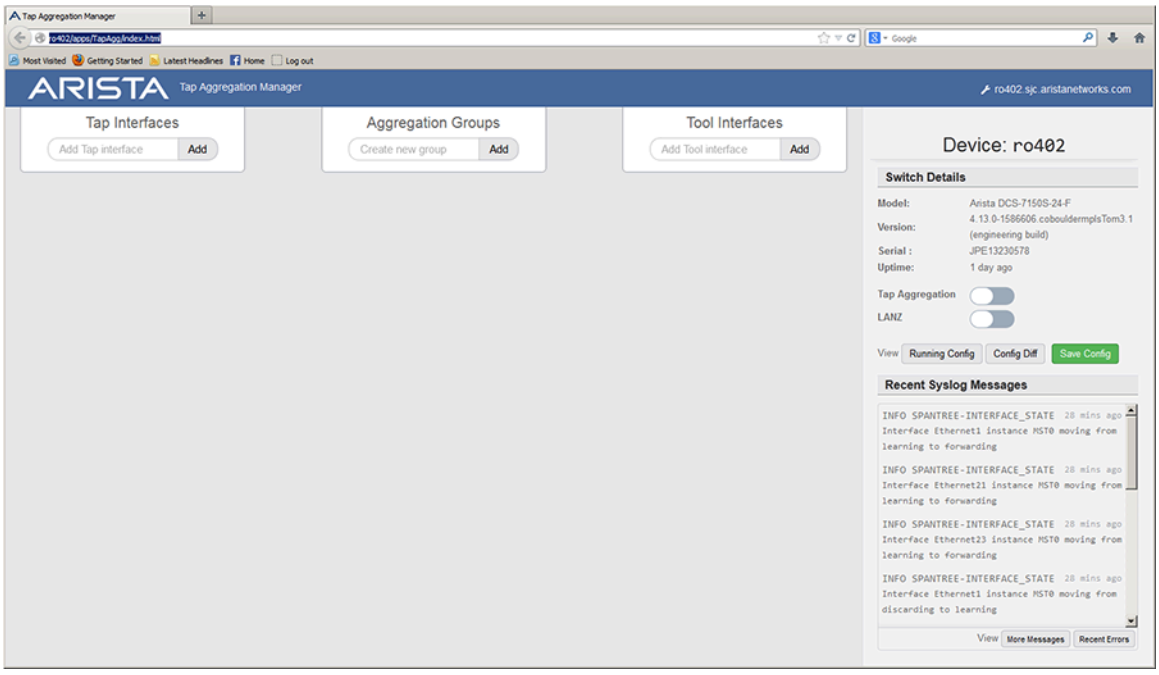

Figure 145: TAP Aggregation GUI Initial Panel

20.1.6.2 Viewing TAP Aggregation Component Details

TAP Aggregation GUI Panel with TAP Aggregation Mode Enabled displays the TAP aggregation panel when the switch is in TAP aggregation mode. The configuration section indicates that the TAP aggregation configuration consists of three tool interfaces, one TAP interface, and four aggregation groups. ***Ethernet port 10*** is the active component; configuration control and traffic information for this interface is available in the component section.

The active component is changed by clicking on the desired component in the configuration section. To display device (switch) information, click on any configuration section outside of any component.

20.1.6.3 Modifying a TAP Aggregation Configuration

The TAP aggregation configuration can be modified only when the switch is in TAP aggregation mode, (see Accessing the TAP Aggregation GUI). The following is a partial list of configuration tasks that are available from the GUI:

- **adding a TAP or tool interface**: begin typing the interface name in the desired add-interface data entry area to access a drop-down list of available interfaces. Select the desired interface and press the **Add** button.
- **removing an interface from the configuration**: select the desired interface in the configuration section and click the deconfigure button in that interface's component section.
- **adding an aggregation group**: type the desired name of the new group in the data entry area and press the **Add** button. The TAP aggregation group name can consist of alphanumeric characters and specific special characters (**- _ [ ] { } :**) only.
- **adding an interface to an aggregation group**: select the desired interface in the configuration section, then press the icon of the group in the group membership area of the interface's component section.

Group icons are toggle buttons; clicking the icon of a group to which the interface belongs removes that interface from the group.

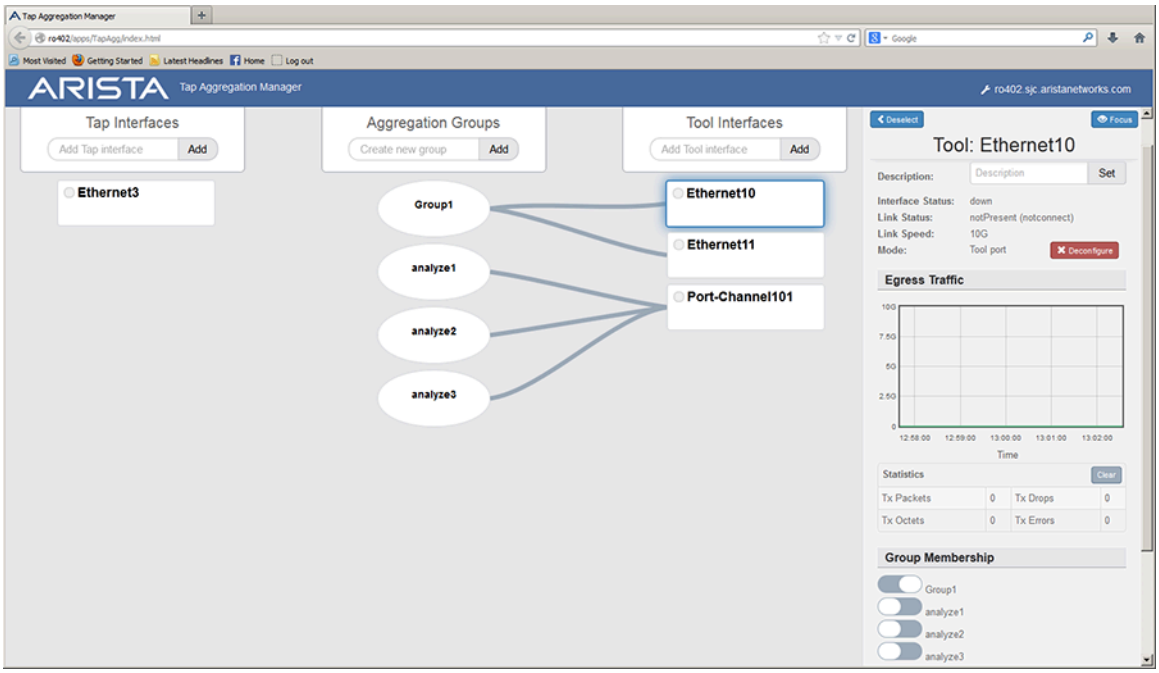

Figure 146: TAP Aggregation GUI Panel with TAP Aggregation Mode Enabled

20.1.7 TAP Aggregation Keyframe and Timestamp Configuration

This section contains the following topics:

20.1.7.1 TAP Aggregation Keyframe Generation

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. The switch supports a maximum of ten keyframes, which are distinguished by their name label. Each keyframe can egress from every Ethernet port.

Keyframe generation is enabled by the **`platform fm6000 keyframe`** command. Command options specify ports that transmit keyframes along with the destination MAC address and IP address in the keyframe's header. Other keyframe commands specify the transmission rate and the frame's source:

- the **`platform fm6000 keyframe rate`** command configures the keyframe's transmission rate.
- the **`platform fm6000 keyframe source`** command configures the source IP address that is placed in each keyframe's header. The management interface IP address is the default source address.

  The source MAC address is the MAC address of the egress interface transmitting the keyframe
- the **`platform fm6000 keyframe device`** command configures the 16-bit number that keyframes list as the device ID in their payload.
- the **`platform fm6000 keyframe fields skew`** command enables the inclusion of clock skew fields in the keyframe.
- the **`show platform fm6000 keyframe`** command displays keyframe configuration information.

Examples

- This command enables the generation of a keyframe named ***key-1*** and configures it to egress from interfaces ethernet ***11*** through ***15*** with a source IP address of ***10.21.1.4*** and a MAC address of ***10.4E21.9F11***.

```
switch(config)# platform fm6000 keyframe key-1 interface
 ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#
```

- This command configures the generation rate for the keyframe of ***10*** frames per second on each of the five interfaces that it is configured to egress.

```
switch(config)# platform fm6000 keyframe key-1 rate 10
switch(config)#
```

- This command enables the generation of a keyframe named ***key-1*** and configures ***100*** as the value that is placed in the keyframe's device ID field.

```
switch(config)# platform fm6000 keyframe key-1 device 100
switch(config)#
```

- This command enables the inclusion of clock skew fields in the keyframe named ***key-1***.

```
switch(config)# platform fm6000 keyframe key-1 fields skew
switch(config)#
```

- This command displays configuration information for keyframe ***key-1***.

```
switch(config)# show platform fm6000 keyframe

Keyframe key-1
------------------------
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13,
 Ethernet14, Ethernet15
Source IP: 172.22.30.142
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 100
Rate: 10 packet(s) per second

switch(config)#
```

20.1.7.2 Enabling Timestamp Insertion on an Interface

Timestamps are based on a frame's ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Time-stamping is configured on the egress port where the timestamp is applied to the frame.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware when the packet arrived at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The **`mac timestamp`** command enables time-stamping on the configuration-mode interface. The switch supports two timestamp modes, which differ in managing the egress frame's 32-bit Frame Check Sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new

FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.

- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

Examples

- These commands enable timestamping in **before-fcs** mode on ***interface ethernet 44***.

```
switch(config)# interface ethernet 44
switch(config-if-Et44)# mac timestamp before-fcs
switch(config-if-Et44)# show active
interface Ethernet44
   mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on ***interface ethernet 44***.

```
switch(config-if-Et44)# no mac timestamp
switch(config-if-Et44)# show active
interface Ethernet44
switch(config-if-Et44)#
```

20.1.8 TapAgg GRE Tunnel Termination

The TapAgg GRE Tunnel Termination feature terminates the GRE packets on a TapAgg switch by stripping the GRE header and then letting the decapped packets go through the normal TapAgg path. With this feature, we can use an L3 GRE tunnel to transit tapped traffic to the TapAgg switch over an L3 network. That would widely extend the available use cases for TapAgg.

- Support IPv4 GRE tunnel interfaces only.
- Support the following GRE types: IPoGRE, L2GRE, GREenSPAN, ERSPAN Type I, ERSPAN Type II, and GREenTAP.
- Do packet forwarding/steering on the decapped packets. Not routing.
- Packets can be forwarded to a set of tool ports.
- Have a command to configure for not stripping the GRE header, so that the TapAgg side may use the information present in the GRE metadata.

20.1.8.1 Configuring TapAgg GRE Tunnel Termination

The TapAgg GRE Tunnel Termination is allowed to be configured in the following two modes:

- TapAgg Exclusive Mode
- TapAgg Mixed Mode

20.1.8.1.1 TapAgg Exclusive Mode

In Tapagg Exclusive mode, GRE tunnel termination is enabled on a selected tap ports through CLI. When traffic comes into those tap ports, the matched GRE packets is decapped and forwarded to the tap port's default forwarding destinations or the steering destinations if it matches the policy ACLs applied.

Adding the TCAM Feature

Tap tunnel termination on tapAgg exclusive mode is supported by built-in profiles **tap-aggregation-default** and **tap-aggregation-extended**. Custom profiles can support tap tunnel termination with the configuration of the tapagg tunnel termination feature through the following steps:

```
switch# configure
switch(config)# hardware tcam
switch(config-tcam)# profile tap-aggregation-gre copy tap-aggregation-
profile
switch(config-tcam-profile-tap-aggregation-gre)# feature tapagg tunnel
 termination copy system-feature-source-profile
switch(config-tcam-feature-tapagg-tunnel-termination)# exit
switch(config-tcam-profile-tap-aggregation-gre)# exit
Saving new profile 'tap-aggregation-gre'
switch(config-tcam)# exit
switch(config)#
```

To check if a TCAM profile has the feature, use the following command:

```
switch(config)# show hardware tcam profile tap-aggregation-gre
Features enabled in TCAM profile tap-aggregation-gre:
 mpls
 acl port ipv6
 tapagg port
 tapagg mac
 tapagg ip
 tapagg ipv6
 tapagg tunnel termination
 acl port ip
 tunnel vxlan
 acl port mac
 forwarding-destination mpls
```

Change Hardware Forwarding Profile

On DCS-7280R3, DCS-7500R3 and DCS-7800R3 systems, the hardware forwarding profile needs to be set to **system-profile-tap-aggregation** on all linecards.

Enable GRE Termination on a Tap Port

Use **switchport tap encapsulation gre [tunnel destination <dst IP address> [source <src IP address>]] strip** to enable GRE termination on a tap port. The command allows specification of tunnel endpoints, to support termination on a specific tunnel.

```
switch(config-if-Et7/1)# switchport tap encapsulation gre destination
 <dst-ip> source <src-ip> strip
```

Without the specification of tunnel endpoints, it will terminate GRE packets for all tunnels. If only the destination endpoint is specified, then any GRE packet that matches this destination is terminated.

Example

In this example the following configuration tap port ***et7/1*** will strip GRE packets for all GRE tunnels and forward the decapped packets to tool group ***tool1***.

```
switch(config-if-Et7/1)# switchport mode tap
switch(config-if-Et7/1)# switchport tap default group tool1
switch(config-if-Et7/1)# switchport tap encapsulation gre strip
```

GRE Termination into Traffic Steering

If the matched GRE packet also hits the policy map that is applied on the tap port, after stripping the GRE header, the packets are forwarded to the steering destination configured for the policy map. In the example below, a policy map named ‘pm’ is applied on the tap port which has gre strip enabled on it. Then the GRE packets with an outer destination IP ***dst-ip*** and source IP ***src-ip***, matching the permit rule in the policy map, is forwarded to the tool group ***tool2*** aftering stripping the GRE header.

Note: The ACLs are applied on the original GRE packet, and not the one after the GRE header is stripped.

```
switch(config)# show policy-map type tapagg
Service policy pm
  Configured on:
  Applied on:
  10: Class-map: cm (match-any)
    Match: 10 IP Access List testAcl
        10 permit ip host 1.1.1.1 host 2.2.2.2

    Configured actions: set group tool2

switch(config-if-Et7/1)#show active
interface Ethernet7/1
   service-policy type tapagg input pm
   switchport mode tap
   switchport tap encapsulation gre strip
   switchport tap default group tool1
```

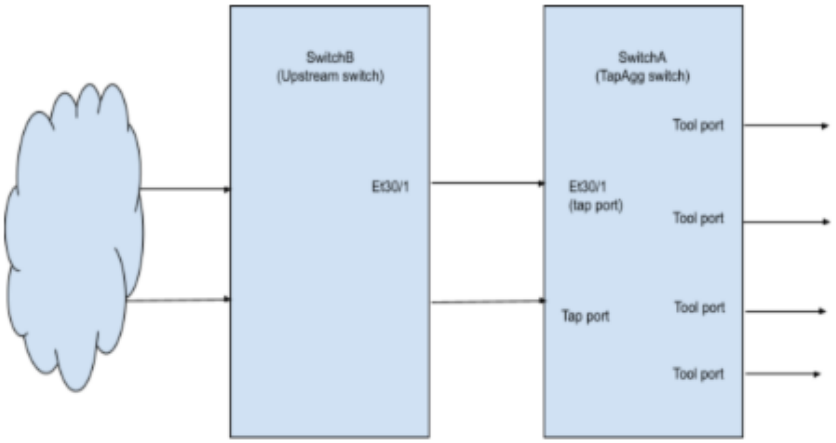
GRE Termination with Ingress/Egress Truncation

When there is truncation enabled, either on the tap port that has GRE termination configured or on the tool port that is configured to egress out the decapped packets, the GRE header is stripped from the truncated packets. In other words, the GRE header stripping occurs after truncation. That means the size of the egress packet will be less than the original expectation. For example, if we have configured to truncate packets to a size of ***178*** bytes, after enabling GRE termination, the egress out packet for a GREenSpan will have a size of ***136***. It is ***178*** minus ***42*** (the total bytes stripped for GREenSpan).

Configuring the Upstream Switch

In TapAgg exclusive mode, the routing protocols are not running so TapAgg Switch will rely on its upstream switch which has routing protocol enabled to forward the GRE packets to it. Tap ports which are selected to receive the GRE packets should be connected to the upstream switch. The upstream switch needs to configure a static route to forward the GRE packets to the link.

Example



If TapAgg switch A is connected to the upstream ***Switch B*** through the link between ***A-et30/1*** and ***B-et30/1*** then the static route for forwarding GRE packets with Destination IP address ***40.1.1.2*** terminated on TapAgg ***Switch A*** can be configured with the following commands:

```
switchB(config-if-Et30/1)# show active
interface Ethernet30/1
   speed forced 100gfull
   no switchport
   ip address 10.10.10.1/24
SwitchB(config-if-Et30/1)#ip route 40.1.1.2/32 ethernet 30/1
```

The static route should be present in the output of the **`show ip route`** command.

```
switchB# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,

       RC - Route Cache Route

Gateway of last resort is not set

 C        10.10.10.0/24 is directly connected, Ethernet30/1
 S        10.80.0.0/13 [1/0] via 10.240.25.1, Management1
 S        10.95.0.0/16 [1/0] via 10.240.25.1, Management1
 C        10.240.25.0/25 is directly connected, Management1
 S        10.240.0.0/15 [1/0] via 10.240.25.1, Management1
 S        10.242.0.0/15 [1/0] via 10.240.25.1, Management1
 S        40.1.1.2/32 is directly connected, Ethernet30/1
 S        172.16.0.0/12 [1/0] via 10.240.25.1, Management1
```

Setup static ARP entry for the route. ***44:4c:a8:be:35:e9*** is the MAC address of ***A-et30/1***. Note that any unicast MAC address can be used for static ARP entry.

```
switchB(config)# arp 40.1.1.2 44:4c:a8:be:35:e9 arpa
```

Use the following command to check ARP entries.

```
switchB# show arp
Address                  HWtype  HWaddress           Flags Mask
  Iface
10.240.25.1              ether   28:99:3a:67:7f:93   C
  ma1
40.1.1.2                 ether   44:4c:a8:be:35:e9   CM
  et30_1
```

With the above configurations, the upstream ***Switch B*** can forward the GRE packets to TapAgg ***Switch A***.

20.1.8.1.2 TapAgg Mixed Mode

For a modular system, such as the DCS-7500R or DCS-7500R2, routed ports on a non-TapAgg linecard is used to receive GRE packets. In order to use the tap tunnel termination feature, **dbTapTunnelTermination** must be added to the TCAM profile for the non-TapAgg linecards.

Adding the TCAM Feature

For example, if the current system profile is profile **default**, we can use the following commands to create a new profile **`default-with-tap-gre`**, which is copied from the current system profile, and add the new feature that we need.

```
switch(config)# hardware tcam
switch(config-tcam)# profile default-with-tap-gre copy default
switch(config-tcam-profile-default-with-tap-gre)# feature tapagg tunnel
 termination copy system-feature-source-profile
switch(config-tcam-feature-tapagg-tunnel-termination)# exit
switch(config-tcam-profile-default-with-tap-gre)# exit
Saving new profile 'default-with-tap-gre'
switch(config-tcam)# exit
```

Use the following command to apply the new TCAM profile.

```
switch(config)# hardware tcam
switch(config-tcam)# system profile default-with-tap-gre
```

Configure TapAgg mixed mode. In the below example, we configure TapAgg mixed mode and leave the linecard ***6*** in normal mode.

```
switch(config)# tap agg
switch(config-tap-agg)# mode mixed module linecard 3,4,5
! Changing modes may affect available functionality. Unsupported
 configuration elements will be ignored.
switch(config)#show hardware tcam profile
                    Configuration            Status
Linecard3           tap-aggregation-default* tap-aggregation-default
Linecard4           tap-aggregation-default* tap-aggregation-default
Linecard5           tap-aggregation-default* tap-aggregation-default
Linecard6           default-with-tap-gre     default-with-tap-gre
* configuration overridden by TapAgg
```

There could be some cases where we need to remove some features from the TCAM profile in order to have room to fit the feature **tapagg tunnel termination** in. This kind of 'tradeoff' is needed when we want this feature to be with a specific user-defined tcam profile.

Below is an example of solving that problem.

```
switch(config)# tap agg
switch(config-tap-agg)# mode mixed module linecard 3,4,5
! Changing modes may affect available functionality. Unsupported
 configuration elements will be ignored.
switch(config)#show hardware tcam profile
                    Configuration            Status
Linecard3           tap-aggregation-default* tap-aggregation-default
Linecard4           tap-aggregation-default* tap-aggregation-default
Linecard5           tap-aggregation-default* tap-aggregation-default
Linecard6           default-with-tap-gre     ERROR
* configuration overridden by TapAgg

switch(config)# hardware tcam
switch(config-tcam)# profile default-with-tap-gre
switch(config-tcam-profile-default-with-tap-gre)# no feature mirror ip
switch(config-tcam-profile-default-with-tap-gre)# no feature pbr ip
switch(config-tcam-profile-default-with-tap-gre)# exit
switch(config-tcam)# show hardware tcam profile
                    Configuration            Status
Linecard3           tap-aggregation-default* tap-aggregation-default
Linecard4           tap-aggregation-default* tap-aggregation-default
Linecard5           tap-aggregation-default* tap-aggregation-default
Linecard6           default-with-tap-gre     default-with-tap-gre
* configuration overridden by TapAgg
```

Change Hardware Forwarding Profile

On DCS-7280R3, DCS-7500R3 and DCS-7800R3 systems, the hardware forwarding profile needs to be set to system-profile-tap-aggregation on all tap agg linecards. Detailed instructions on how to set it can be found in the Resources section.

Configure GRE Tunnel Interface

Configure the GRE tunnel interface that we want the packets it received to be terminated and redirected.

In the below example, the GRE packets for this tunnel interface should have destination IP address ***40.1.1.1*** and source IP address ***40.1.1.2***.

```
switch(config)# interface tunnel 1
switch(config-if-Tu1)# tunnel mode gre
switch(config-if-Tu1)# tunnel source 40.1.1.1
switch(config-if-Tu1)# tunnel destination 40.1.1.2
```

For a tunnel interface, if **tunnel source** is configured but **tunnel destination** is not, then any GRE packet with destination IP address matching the tunnel source will be stripped and redirected. In the example below, the GRE packet with destination IP ***40.1.1.1*** is what we are interested in.

```
switch(config-if-Tu1)# show active
   tunnel mode gre
   tunnel source 40.1.1.1
   tap default group gr1
   tap default interface Ethernet3/1
```

If neither **tunnel source** nor **tunnel destination** is configured, then the GRE packets for any endpoints will be stripped and redirected.

```
switch(config-if-Tu1)# show active
   tunnel mode gre
   tap default group gr1
   tap default interface Ethernet3/1
```

Use the **tap default group** and **tap default interface** commands to configure the redirecting destination. In the example below, the GRE packets sent to ***interface tunnel 1*** will be redirected to tool group gr1 and tool ***interface et3/1*** after stripping the GRE header. (In current version, the target interfaces must be tool ports on TapAgg linecards. A non tool port putting in this command will not take effect.)

```
switch(config)# interface tunnel 1
switch(config-if-Tu1)# tap default group gr1
switch(config-if-Tu1)# tap default interface ethernet 3/1
switch(config-if-Tu1)#
```

If we want to redirect the packets but do not want to strip the GRE header, command **tap encapsulation gre preserve** can be configured for that purpose, not stripping the GRE header.

```
switch(config)# interface tunnel 1
switch(config-if-Tu1)# tap encapsulation gre preserve
switch(config-if-Tu1)#
```

The show command below is used to check the tunnel interface status. In TapAgg mixed mode, routing protocols can run on non-TapAgg linecards, and any routed port in non-TapAgg linecards can be used to receive the GRE packets. For Tap tunnel termination feature, the status of the tunnel interface doesn't have to be **connected**, but there must be some routes to help the GRE packets find the way to the routed ports on this switch.

```
switch(config)# show interfaces tunnel 1
Tunnel1 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 2801.0102.0800
  Tunnel source 40.1.1.2, destination 40.1.1.1
  Tunnel protocol/transport GRE/IP
  Hardware forwarding enabled
  Tunnel transport MTU 1476 bytes (default)
  Up 35 minutes, 57 seconds
```

Enable Tap Tunnel Termination on TapAgg Linecards in Mixed Mode

If you do want to enable GRE Termination on a specific tap port in TapAgg mixed mode, follow the **TapAgg exclusive mode** section and refer to configuring TCAM profile and GRE termination for the TapAgg linecard.

20.1.9 Tap Aggregation Hardware Forwarding Profile

In order to enable the MPLS Pop and 802.1br-E/VN Tag Stripping features, the hardware forwarding profile needs to be set. Setting the hardware forwarding profile will not affect the functionality of any other features that are supported while in Tap Aggregation mode. However, changing the forwarding profile does interrupt forwarding for a short period of time while the new configuration is applied.

20.1.9.1 Configuring Tap Aggregation Hardware Forwarding Profile

- The default hardware forwarding profile can be set globally with the **hardware forwarding system profile** command:

```
switch(config)# hardware forwarding system profile system-profile-tap-aggregation
```

- When not in Tap Aggregation mode the default hardware forwarding profile should be returned to the default system profile with the same command:

```
switch(config)# hardware forwarding system profile system-profile-default
```

- For a modular system the system default profile can also be overridden on a per line card basis with the command:

```
switch(config)# hardware forwarding module Linecard3 profile system-profile-tap-aggregation
```

Note: If this command is used to set the hardware forwarding profile of a specific line card then changing the system default profile with the **hardware forwarding system profile** command will not affect that line card until the line card specific configuration is removed.

20.1.9.2 Show Commands

The following show command is available to see the hardware forwarding profile configuration:

```
(config)# show hardware forwarding profile
Linecard          Configured Profile
----------------- ----------------------------
FixedSystem       system-profile-tap-aggregation

System default profile: system-profile-tap-aggregation
```

For a modular system, this example shows the system default profile, configured by **hardware forwarding system profile**, is set to **system-profile-default**. While the configuration for line cards ***4*** and ***5*** has been overridden and is set to **system-profile-tap-aggregation**.

```
(config)# show hardware forwarding profile
Linecard        Configured Profile
--------------- ----------------------------
Linecard3       system-profile-default
Linecard4       system-profile-tap-aggregation
Linecard5       system-profile-tap-aggregation

System default profile: system-profile-default
```

20.1.9.3 Limitations

Changing the hardware forwarding profile on the system or on a specific line card will interrupt forwarding on that system or line card for a short period of time.

20.1.10 TAP Aggregation MPLS Pop

The MPLS pop supports tools that do not parse MPLS labels and therefore need the switch to remove (pop) the MPLS header. The MPLS pop supports both IPv4 and IPv6 over MPLS.

20.1.10.1 Configuring MPLS Pop

- On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R MPLS pop is configurable at the tap port using the switchport command:

```
switch(config-if-Et1)# [no] switchport tap mpls pop all
```

- On DCS-7280R3, DCS-7500R3, and DCS7800R3 MPLS pop is configurable at the tool port using the switchport command. As the commands suggest, all MPLS labels will be popped.

```
switch(config-if-Et1)# [no] switchport tool mpls pop all
```

- On DCS-7280R3, DCS-7500R3, and DCS7800R3 the hardware forwarding profile must also be set before MPLS pop can be used. This is done globally by the command:

```
switch(config)# hardware forwarding system profile system-profile-tap-aggregation
```

- The system profile can also be overridden on a per line card basis with the command:

```
switch(config)# hardware forwarding module Linecard3 profile system-profile-tap-aggregation
```

20.1.10.2 Limitations

R/R2 series MPLS pop has the following limitations:

- New L2 Header on Egress
  - Always inserts a tap port Identity VLAN ID, even if not configured. Default Identity VID is *1*.
  - Destination / source MAC addresses are not configurable.
- Tool Port / Egress VLAN Filtering
  - Because the incoming L2 header is discarded, the tool port does not have access to the original VLAN ID.
  - Tap ports can still filter on VLAN ID.
- ACL-Based Tap Aggregation
  - Matching IP headers contained inside an MPLS header is only supported since ***EOS-4.20.5F***.

On both R/R2 series and R3 series some Tap Aggregation features do not work when forwarding MPLS-encapsulated traffic:

- Non-IP over MPLS
  - If the incoming L3 header is not recognized as IPv4 or IPv6 the MPLS pop feature is bypassed and the packet is not stripped.

20.1.11 TAP Aggregation 802.1br EVN Tag Stripping

802.1br-E/VN Tag Stripping feature for Tap Aggregation mode strips IEEE 802.1BR E-Tag and Cisco VN-Tag headers from all tagged packets received on tap interface before delivering them out of tool interfaces. Untagged packets are unaffected. The 802.1br EVN Tag Stripping may be useful for third-party tools and/or packet analyzers which cannot parse these headers.

20.1.11.1 Configuring 802.1br-E/VN Tag Stripping

By default, Arista switches do not strip BR-E/VN tags from ingress packets.

On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R the BR-E/VN tag stripping is globally configured for Tap Aggregation. This means that packet ingressing any tap port will have their BR-E/VN tags

stripped if the BR-E/VN tag stripping is enabled. The BR-E/VN tag stripping allows a choice of stripping both or either of the tags.

- To enable BR E-Tag stripping add the following configuration:

```
switch(config)# tap aggregation
switch(config-tap-agg)# [no] encapsulation dot1br strip
```

- To enable VN-TAG stripping add the following configuration:

```
switch(config)# tap aggregation
switch(config-tap-agg)# [no] encapsulation vn-tag strip
```

On DCS-7280R3, DCS-7500R3and DCS7800R3, BR-E/VN tag stripping is configured at the tool port level. When enabled on a tool port, only packets egressing this tool port will have their BR-E/VN tags stripped. The BR-E/VN tag stripping allows a choice of stripping both or either of the tags.

- To activate BR E-Tag stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)# [no] switchport tool encapsulation dot1br strip
```

- To activate VN-TAG stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)# [no] switchport tool encapsulation vn-tag strip
```

On DCS-7280R3, DCS-7500R3, and DCS7800R3 the hardware forwarding profile must also be set before BR-E/VN tag stripping is used. This is done globally by the command:

```
switch(config)# hardware forwarding system profile system-profile-tap-
aggregation
```

The system profile can also be overridden on a per line card basis with the command:

```
switch(config)# hardware forwarding module Linecard3 profile system-
profile-tap-aggregation
```

20.1.11.2 Show Commands

The tap or tool ports with BR-E/VN tag stripping configured is verified with the following show commands.

- On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R:

```
switch(config)# show interfaces tap tunnel
  Port        Configured         Status       Port            Allowed Vlans       Native
 Truncation
              Mode                            Identity                            Vlan       Size
---------- ------------------ ------------ --------------- ------------------- -------------
 -----------
  Et1/1       tap                tap          0               All                 1          0

   Port        VN Tag Action       BR Tag Action       VxLAN Action    MPLS Action
---------- ------------------- ------------------- ------------------ -----------
   Et1/1       strip               none                none            none
```

- On DCS-7280R3, DCS-7500R3, and DCS7800R3:

```
switch(config)# show interface tool tunnel
   Port         Configured         Status       Id Tag       Allowed Vlans    Timestamp
                Mode                                                         Mode
------------ ------------------ ------------ ------------ ------------------- -----------
   Et1/1        tool               tool         Off          100              None
```

```
   Port         VN Tag Action       BR Tag Action    MPLS Action
------------ ------------------- ------------------- -----------
   Et1/1        strip               none             none
```

20.1.11.3 Feature Interactions

On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R the following Tap aggregation features are supported with BR-E/VN tagged packets when tag stripping is enabled. Some or all of these features may not work for BR-E/VN tagged packets when tag stripping is not configured.

- MAC, IPv4, IPv6 Traffic Steering
- Tap identity tagging
- MPLS Termination
- Ingress VLAN Membership Filtering
- Egress VLAN Membership Filtering

On DCS-7280R3, DCS-7500R3, and DCS7800R3 the following Tap aggregation features are supported with BR-E/VN tagged packets when tag stripping is enabled.

- MAC, IPv4, IPv6 Traffic Steering
- Tap identity tagging

20.1.11.4 Limitations

The following lists feature limitations on DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R when BR-E/VN tag stripping is enabled with tagged packets:

- IPv4/IPv6 traffic steering on VLAN IDs is not supported.
- IPv6 traffic steering is not supported on packets with two or more accompanying 802.1Q tags
- Ingress VLAN membership filtering is scale limited. Only ***4096*** entries, used for whitelisting or allowing specific port-VLAN pairs, are supported. The default case of allowing all VLANs does not consume any of these entries. For example, a tap interface configured to allow ***4093*** VLANs will consume all but three entries.
- Ingress VLAN membership filtering on Tap interface LAGs for BR-E/VN tagged packets is not supported. To use Ingress VLAN membership for BR-E/VN tagged packets on a LAG Tap interface the Ingress VLAN membership configuration must be configured on each physical interface of the LAG.
- Time stamping and BR-E/VN tag stripping cannot be configured on the same tool interfaces. Time stamping, if configured, will take precedence over BR-E/VN tag stripping.
- 802.1Q Tag Stripping does not support BR-E/VN tagged packets.

The following lists feature limitations on DCS-7280R3, DCS-7500R3, and DCS7800R3 when BR-E/VN tag stripping is enabled with tagged packets:

- IPv4/IPv6/MAC traffic steering on VLAN IDs is not supported.
- MPLS pop and BR-E/VN tag stripping can not be used simultaneously on a tool port. If MPLS pop and BR-E/VN tag stripping are both configured on the same tool port, MPLS pop will take precedence and BR-E/VN tags will not be stripped.
- Ingress and Egress VLAN Membership filtering of BR-E/VN tagged packets is not supported in ***EOS-4.25.2F***.
- 802.1Q Tag Stripping does not support BR-E/VN tagged packets.

20.1.12 TAP Aggregation Commands

Global Configuration Commands

- hardware forwarding system-profile-tap-aggregation
- platform fm6000 keyframe
- platform fm6000 keyframe device
- platform fm6000 keyframe fields skew
- platform fm6000 keyframe rate
- platform fm6000 keyframe source
- platform sand multicast replication default
- platform sand multicast replication ingress maximum
- tap aggregation

Interface Configuration Commands

- mac timestamp
- switchport mpls pop all
- switchport tap allowed vlan
- switchport tap default group
- switchport tap identity
- switchport tap native vlan
- switchport tap truncation
- switchport tool allowed vlan
- switchport tool encapsulation
- switchport tool group
- switchport tool identity
- switchport tool truncation

Tap Aggregation Configuration Mode

- encapsulation
- mode (tap-agg configuration mode)
- mode exclusive no-errdisable (tap-agg configuration mode)

Tap Aggregation Traffic Steering

- class (policy-map (tapagg))
- class-map type tapagg
- match (class-map (tapagg))
- match (policy-map (tapagg))
- policy-map type tapagg
- resequence (class-map (tapagg))
- resequence (policy-map (tapagg))
- service-policy type tapagg (Interface mode)
- set (policy-map-class (tapagg))

Display Commands EXEC Mode

- show hardware tcam profile
- show interfaces tap
- show interfaces tool
- show platform fm6000 keyframe

- show platform sand mcast capacity
- show tap aggregation groups

20.1.12.1 class (policy-map (tapagg))

The **`class (policy-map (tapagg))`** command places the switch in the ***policy-map-class*** (TAPagg) configuration mode, which is a group-change mode that defines a TAP aggregation class by associating the class's eponymous class-map to a **`set`** statement. Upon exiting the policy-map-class mode, the class is placed in the policy-map as specified by an assigned sequence number.

A policy map is an ordered list of classes and match rules. Each class contains a class map, a **`set`** command, and a sequence number:

- The class map identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode. Data packets are managed by commands of the highest priority class or rule that matches the packet.
- **`set`** commands specify the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- Sequence numbers specify the class's priority within the policy map. Lower sequence numbers denote higher priority.

The **`exit`** command returns the switch to policy-map configuration mode. However, saving policymap-class changes also requires an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to ***running-config*** and returns the switch to global configuration mode. The **`abort`** command discards pending changes and returns the switch to global configuration mode.

The **`no class`** and **`default class`** commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from ***running-config***.

Command Mode

Policy-Map (tapagg) Configuration accessed through **`class (policy-map (tapagg))`**

Command Syntax

[**SEQ_NUM**] **`class`** ***class_name***

`default` [**SEQ_NUM**] **`class`** ***class_name***

`no` [**SEQ_NUM**] **`class`** ***class_name***

Parameters

- **SEQ_NUM** priority of the class within the policy map. Lower numbers denote higher priority.
  - ***no parameter*** number is derived by adding 10 to number of the map's last class or rule.
  - ***1 to 4294967295*** number assigned to class.
- ***class_name*** name of the class.

Guidelines

When a class is not associated with a set (policy-map-class (tapagg)) command, the filtered traffic is managed as specified by the TAP port's default aggregation group.

Commands Available in Policy-map-class (tapagg) Configuration Mode

- set (policy-map-class (tapagg)) assigns VLAN identity tag or tap aggregation group to class.
- **`exit`** returns the switch to parent policy map configuration mode.
- **`abort`** discards pending class map changes, then returns the switch to global configuration mode.

Related Commands

- class (policy-map (tapagg)) places the switch in the ***policy-map*** (tapagg) configuration mode.
- match (policy-map (tapagg)) assigns a match rule to a TAP aggregation policy map.

Examples

- These commands place the switch in ***policy-map-class*** and add the ***t-class_1*** class map to the ***tpolicy_1*** policy map. Packets filtered by the class map are identity tagged with ***VLAN 444***.

```
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)# set id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)# exit
switch(config-pmap-t-policy_1)# exit
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# show active
policy-map type tapagg t-policy_1
10 class t-class_1
set id-tag 444
switch(config-pmap-t-policy_1)#
```

- These commands place the switch in policy-map-class to add the ***t-class_1*** class map to the ***t-policy_1*** policy map. The first, second, or both of the two outer-most VLAN tags are stripped.

```
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# class t-class_1
switch(config-pmap-t-policy_1t-class_1)# set aggregation-group t-group
 remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group t-
group id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)# set id-tag 10 remove dot1q
 outer 1
switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group t-
group
switch(config-pmap-c-t-policy_1-t-class_1)# set id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group t-
group id-tag 10 remove dot1q outer 1-2
```

20.1.12.2 class-map type tapagg

The **class-map type tapagg** command places the switch in class-map (tapagg) configuration mode, which is a group change mode that modifies a tapagg class map. A tapagg class map is a data structure that uses Access Control Lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise the stream. Tapagg policy maps use class maps to specify traffic that is managed by policy map criteria.

The **exit** command saves pending class map changes to ***running-config***, then returns the switch to the ***global*** configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type tapagg** and **default class-map type tapagg** commands delete the specified class map by removing the corresponding class-map type qos command and its associated configuration.

Command Mode

Global Configuration

Command Syntax

class-map type tapagg match-any ***class_name***

no class-map type tapagg match-any ***class_name***

default class-map type tapagg match-any ***class_name***

Parameters

class_name name of class map.

Commands Available in Class-Map (tapagg) Configuration Mode

- match (class-map (tapagg))
- resequence (class-map (tapagg))

Related Commands

class (policy-map (tapagg))

Example

This command creates a TAP aggregation class map named ***t-class_1*** and places the switch in the ***class-map*** configuration mode.

```
switch(config)# class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```

20.1.12.3 encapsulation

The **encapsulation** command is configured under Tap Aggregation mode to enable the 802.1br-E/VN Tag Stripping the packets ingressing any tap port on DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R.

The **no encapsulation** or **default encapsulation** commands disable the 802.1br-E/VN Tag Stripping configuration from the **running-config**.

Command Mode

Tap Aggregation Configuration Mode

Command Syntax

encapsulation {dot1br | vn-tag} strip

no encapsulation {dot1br | vn-tag} strip

default encapsulation {dot1br | vn-tag} strip

Parameters

- **dot1br** strips the 802.1br-E headers.
- **vn-tag** strips the VN Tag headers.

Examples

- To enable BR E-Tag stripping add the following configuration:

```
switch(config)# tap aggregation
switch(config-tap-agg)# encapsulation dot1br strip
```

- To enable VN-TAG stripping add the following configuration:

```
switch(config)# tap aggregation
switch(config-tap-agg)# encapsulation vn-tag strip
```

20.1.12.4 hardware forwarding system-profile-tap-aggregation

The **hardware forwarding system-profile-tap-aggregation** command sets the global hardware forwarding system profile on a switch.

The **hardware forwarding system-profile-default** command returns the switch to the default system profile configurations when not in Tap Aggregation mode.

Command Mode

Global Configuration Mode

Command Syntax

hardware forwarding system profile [system-profile-default | system-profile-tap-aggregation | module]

default hardware forwarding system profile [system-profile-default | system-profile-tap-aggregation | module]

Parameters

- **system-profile-default** normal forwarding profile.
- **system-profile-tap-aggregation** tap aggregation features profile.
- **module** used to set the tap aggregation features profile on a modular system.

Examples

- This command configures the tap aggregation features profile.

```
switch(config)# hardware forwarding system profile system-profile-tap-aggregation
```

- This command returns the to the default system profile configurations when not in Tap Aggregation mode.

```
switch(config)# hardware forwarding system profile system-profile-default
```

- This command overrides the system default profile on a per line card basis for a modular system.

```
switch(config)# hardware forwarding module Linecard3 profile system-profile-tap-aggregation
```

20.1.12.5 mac timestamp

The **mac timestamp** command enables timestamping on the configuration mode interface.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware upon arriving at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The switch supports two timestamp modes, which differ in managing the egress frame's 32-bit Frame Check Sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

The **no mac timestamp** and **default mac timestamp** commands restore the default behavior of disabling timestamping on the configuration mode interface by removing the corresponding **mac timestamp** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mac timestamp TS_PROPERTY

Parameters

- **TS_PROPERTY** specifies the timestamp insertion mode. Options include:
  - **before-fcs** the ingress timestamp is appended to the frame and the FCS is recalculated.
  - **replace-fcs** the ingress timestamp replaces the original FCS.

Examples

- These commands enable timestamping in **before-fcs** mode on ***interface ethernet 44***.

```
switch(config)# interface ethernet 44
switch(config-if-Et44)# mac timestamp before-fcs
switch(config-if-Et44)# show active
interface Ethernet44
   mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on ***interface ethernet 44***.

```
switch(config-if-Et44)# no mac timestamp
switch(config-if-Et44)# show active
interface Ethernet44
switch(config-if-Et44)#
```

20.1.12.6 match (class-map (tapagg))

The **match** command adds an ACL to the configuration-mode class map and associates a sequence number to the ACL. A class map is an ordered list of ACLs that define a data stream; the sequence number specifies an ACL's priority within the list. A class map is used by policy maps to filter data packets. Tapagg class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class map (tapagg) configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the specified **match** statement from the configuration-mode class map by deleting the corresponding **match** command from ***running-config***.

Command Mode

Class-map (tagagg) Configuration accessed through **class-map type tapagg** command.

Command Syntax

[**SEQ_NUM**] **match ip access-group** ***list_name***

no SEQ_NUM] **match ip access-group** ***list_name***

default SEQ_NUM] **match ip access-group** ***list_name***

Parameters

- **SEQ_NUM** sequence number assigned to the ACL. Options include:
  - ***no parameter*** number is derived by adding 10 to the number of the map's last ACL.
  - **1 to *4294967295*** number assigned to ACL.
- ***list_name*** name of ACL assigned to class map.

Guidelines

match statements accept IPv4 ACLs.

Related Commands

- class-map type tapagg places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- class (policy-map (tapagg)) assigns a class map to a policy map.

Example

These commands add two IPv4 ACLs (***tacl-1*** and ***tacl-2***) to the ***t-class_1*** class map, save the command by exiting class-map mode, and re-enter the mode to display the added ACLs.

```
switch(config)# class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)# match ip access-group tacl-1
switch(config-cmap-t-class_1)# match ip access-group tacl-2
switch(config-cmap-t-class_1)# exit
switch(config)# class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)# show active
 class-map type tapagg match-any t-class_1
      10 match ip access-group tacl-1
      20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

20.1.12.7 match (policy-map (tapagg))

The **match** command adds a rule to the configuration-mode TAP aggregation policy map. A policy map is an ordered list of classes and rules. Each rule contains a filter list, an action, and a sequence number:

- The filter list identifies a data stream through a set of packet field values.
- The action, (**SET_VALUE** parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The sequence number specifies the rule's priority within the policy map.

The **no match** and **default match** commands remove the **match** rule from the configuration-mode policy by deleting the corresponding statement from ***running-config***.

Command Mode

Policy-Map (tapagg) Configuration accessed through class (policy-map (tapagg)).

Command Syntax

[**SEQ_NUM**] **match** [**VLAN_TAG**] **SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**PROTOCOL**] [**FLAGS**] [**MESSAGE**] [**fragments**] [**tracked**] [**DSCP_FILTER**] [**TTL_FILTER**] [**log**] **SET_VALUE**

no match [**VLAN_TAG**] **SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**PROTOCOL**][**FLAGS**][**MESSAGE**] [fragments][tracked] [**DSCP_FILTER**][**TTL_FILTER**] [log] **SET_VALUE**

default match [**VLAN_TAG**] **SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**PROTOCOL**][**FLAGS**] [**MESSAGE**][fragments] [tracked][**DSCP_FILTER**] [**TTL_FILTER**][log] **SET_VALUE**

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** priority of the rule within the policy map. Lower numbers denote higher priority.
  - ***no parameter*** number derived by adding 10 to number of the map's last class or rule.
  - ***1*** to ***4294967295*** number assigned to class.
- **VLAN_TAG** VLAN field filter. Options include:
  - ***no parameter*** packets are not filtered by VLAN field.
  - **vlan *1*** to ***4094 0*** to ***4095*** VLAN ID and mask.
  - **vlan inner *1*** to ***4094 0*** to ***4095*** VLAN ID and mask.
  - **vlan *1*** to ***4094 0*** to ***4095*** **inner *1*** to ***4094 0*** to ***4095*** VLAN ID and mask.
- **PROTOCOL** protocol field filter. Values include:
  - ***no parameter*** packets are not filtered by host name.
  - **ahp** authentication header protocol (51).
  - **icmp** internet control message protocol (1).
  - **igmp** internet group management protocol (2).
  - **ip** internet protocol IPv4 (4).
  - **ospf** open shortest path first (89).
  - **pim** protocol independent multicast (103).
  - **tcp** transmission control protocol (6).
  - **udp** user datagram protocol (17).
  - **vrrp** virtual router redundancy protocol (112).
  - ***protocol_num*** integer corresponding to an IP protocol. Values range from ***0*** to ***255***.

- **SOURCE_ADDR** and **DEST_ADDR** source and destination address filters. Options include:
  - ***network_addr*** subnet address (CIDR or address-mask).
  - **any** packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

  Source and destination subnet addresses support discontiguous masks.
- **SOURCE_PORT** and **DEST_PORT** source and destination port filters. Options include:
  - **any** all ports.
  - **eq *port-1 port-2*** ... ***port-n*** a list of ports. Maximum list size is ***10*** ports.
  - **neq *port-1 port-2*** ... ***port-n*** the set of all ports not listed. Maximum list size is ***10*** ports.
  - **gt *port*** the set of ports with larger numbers than the listed port.
  - **lt *port*** the set of ports with smaller numbers than the listed port.
  - **range *port_1 port_2*** the set of ports whose numbers are between the range.
- **fragments** filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** rule filters packet by its DSCP value. Values include:
  - ***no parameter*** rule does not use DSCP to filter packets.
  - **dscp *dscp_value*** packets match if DSCP field in packet is equal to ***dscp_value***.
- **TTL_FILTER** rule filters packet by its TTL (time-to-live) value. Values include:
  - ***no parameter*** rule does not use TTL field to filter packets.
  - **ttl eq *ttl_value*** packets match if ttle in packet is equal to ***ttl_value***.
  - **ttl gt *ttl_value*** packets match if ttl in packet is greater than ***ttl_value***.
  - **ttl lt *ttl_value*** packets match if ttl in packet is less than ***ttl_value***.
  - **ttl neq *ttl_value*** packets match if ttl in packet is not equal to ***ttl_value***.
- **log** triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **SET_VALUE** specifies the replication method for filtered packets.
  - **set aggregation group *agg_group*** peplication specified by aggregation group.
  - **set id-tag *1*** to ***4094*** packet is identity tagged with specified VLAN number.
  - **set aggregation group *agg_group*** id-tag ***1*** to ***4094*** assigns agg group and identity tag.

Related Commands

- policy-map type tapagg places the switch in the ***policy-map*** (tapagg) configuration mode.
- class (policy-map (tapagg)) assigns a class to the configuration-mode policy map.

Example

This command creates a match rule for the ***t-policy_1*** policy map that filters OSPF packets and replicates them as specified by the ***t-group*** tap aggregation group.

```
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# match ip ospf any any set aggregation-g
roup t-group
switch(config-pmap-t-policy_1)# exit
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# show active
```

```
 policy-map type tapagg t-policy_1
   10 match ip ospf any any set aggregation-group t-group
switch(config-pmap-t-policy_1)#
```

20.1.12.8 mode (tap-agg configuration mode)

The **mode** command configures the switch's TAP aggregation mode. The **mode exclusive** command enables TAP aggregation. When TAP aggregation is enabled, TAP and tool ports are enabled, switching mode is disabled, and switching ports are errdisabled. TAP aggregation is disabled by default.

The **no mode** and **default mode** commands disable TAP aggregation mode and enable switching mode by removing the **mode** command from ***running-config***.

Command Mode

TAP Aggregation Configuration

Command Syntax

mode exclusive

no mode exclusive

default mode exclusive

Parameters

exclusive TAP aggregation is enabled.

Related Command

tap aggregation places the switch in the ***TAP-aggregation*** configuration mode.

Examples

- These commands place the switch in ***tap aggregation*** configuration mode, enable TAP aggregation mode, and display the results.

```
switch(config)# tap aggregation
switch(config-tap-agg)# mode exclusive
switch(config-tap-agg)# show active
tap aggregation
   mode exclusive
switch(config-tap-agg)#
```

- These commands disable ***tap aggregation*** mode by removing the **mode** command from ***running-config***, then display the results.

```
switch(config)# tap aggregation
switch(config-tap-agg)# no mode
switch(config-tap-agg)# show active
switch(config-tap-agg)#
```

20.1.12.9 mode exclusive no-errdisable (tap-agg configuration mode)

The **mode exclusive no-errdisable** command configures the specified interface to remain enabled, regardless of its switchport mode, when TAP aggregation is enabled. This command is used primarily to configure a port to support PTP functions while the switch operates as a TAP aggregator.

Each command configures one Ethernet or port-channel interface. Subsequent **mode exclusive no-errdisable** commands add to the list of ports that remain enabled when TAP aggregation is enabled.

The **no mode exclusive no-errdisable** and **default mode exclusive no-errdisable** commands configure the specified interface to be error-disabled when programmed in access, trunk, or dot1q-tunnel switching mode (when TAP aggregation is enabled) by removing the corresponding **mode exclusive no-errdisable** command from ***running-config***.

Command Mode

TAP Aggregation Configuration

Command Syntax

mode exclusive no-errdisable **INT_NAME**

Parameters

INT_NAME interface type and number. Options include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **port-channel *p_num*** port-channel interface specified by ***p_num***.

Related Commands

- **tap aggregation** places the switch in ***TAP-aggregation*** configuration mode.
- **mode (tap-agg configuration mode)** configures the switch's TAP-aggregation mode.

Guidelines

In order for a TAP-aggregation switch to receive PTP traffic, the upstream device to which it is connected should be set to statically send PTP multicast traffic to the connected port on the switch.

Since IGMP snooping is disabled on TAP-aggregation switches and with no configuration to support sending upstream join messages in such a state, the messages are transmitted statically from the upstream device. Once the upstream messages are received, the port will move to the slave state and follow the standard PTP mechanism.

Example

These commands place the switch in TAP-aggregation configuration mode and place ***interface ethernet 21/3*** in no-errdisable mode.

```
switch(config)# tap aggregation
switch(config-tap-agg)# mode exclusive
switch(config-tap-agg)# mode exclusive no-errdisable ethernet 21/4
switch(config-tap-agg)#
```

20.1.12.10 platform fm6000 keyframe

The **platform fm6000 keyframe** command enables keyframe generation for data streams transmitted from specified ethernet interfaces. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with absolute UTC time and the switch's complete ASIC time counter.

The switch supports a maximum of ten keyframes. The keyframe name is the label that distinguishes different keyframes. Each keyframe can egress from every ethernet port. Command options specify the destination MAC address and IP address in the keyframe's header. Other keyframe commands specify the transmission rate and the frame's source.

The **no platform fm6000 keyframe and default platform fm6000 keyframe** commands disable generation of the specified keyframe by deleting the corresponding platform fm6000 keyframe command from ***running-config***. These command also remove all supporting **platform fm6000 keyframe** commands for the specified keyframe.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe ***kf_name*** interface ethernet ***e_range ipv4_addr mac_addr***

no platform fm6000 keyframe ***kf_name***

default platform fm6000 keyframe ***kf_name***

Parameters

- ***kf_name*** the keyframe's name.
- ***e_range*** Ethernet interface range over which the keyframe egresses. Valid formats include number, range, or comma-delimited list of numbers and ranges.
- ***ipv4_addr*** destination IPv4 address inserted into keyframes (dotted decimal notation).
- ***mac_addr*** destination MAC address inserted into keyframes (48-bit dotted hex notation).

Guidelines

Subsequent issuance of this command for a specified keyframe replaces the existing command in ***running-config***. Ethernet interfaces are inserted into an existing keyframe only by issuing the complete command that identifies all interfaces through which the keyframe is transmitted.

Example

This command enables the generation of a keyframe named ***key-1***. This keyframe egresses from Ethernet interfaces ***11*** through ***15*** and specifies a source IP address of ***10.21.1.4*** and a MAC address of ***10.4E21.9F11***.

```
switch(config)# platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4 10.4E21.9F11
switch(config)#
```

20.1.12.11 platform fm6000 keyframe device

The **platform fm6000 keyframe device** command configures the 16-bit number that the specified keyframe lists as the device ID in its payload. By default, the device value placed in the specified keyframes is ***0***.

The **no platform fm6000 keyframe device** and **default platform fm6000 keyframe device** commands restore the default device ID insertion value of ***0*** for the specified keyframe by removing the corresponding **platform fm6000 keyframe device** command from ***running-config***. The **no platform fm6000 keyframe and default platform fm6000 keyframe** command also removes the corresponding **platform fm6000 keyframe device** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe ***kf_name*** **device** ***device_id***

no platform fm6000 keyframe ***kf_name*** **device**

default platform fm6000 keyframe ***kf_name*** **device**

Parameters

- ***kf_name*** keyframe name.
- ***device_id*** value inserted in keyframe's device ID field. Values range from ***0*** to ***65535***. Default is ***0***.

Example

These commands enable the generation of a keyframe named ***key-1***, then configure ***100*** as the value that is placed in the keyframe's device ID field.

```
switch(config)# platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4 10.4E21.9F11
switch(config)# platform fm6000 keyframe key-1 device 100
switch(config)#
```

20.1.12.12 platform fm6000 keyframe fields skew

Keyframes may optionally include skew numerator and skew denominator fields. These skew fields form a ratio indicating the ASIC clock skew. If the ratio is greater than ***1***, the clock is skewed fast; if the ratio is less than ***1***, the clock is skewed slow. Clock skew fields are omitted by default.

The **platform fm6000 keyframe fields skew** command enables the inclusion of clock skew fields in the keyframe.

The **no platform fm6000 keyframe fields skew** and **default platform fm6000 keyframe fields skew** commands remove the clock skew fields from the keyframe.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe ***kf_name*** **fields skew**

Parameter

kf_name keyframe name.

Example

This command enables the inclusion of clock skew fields in the keyframe named ***key-1***.

```
switch(config)# platform fm6000 keyframe key-1 fields skew
switch(config)#
```

20.1.12.13 platform fm6000 keyframe rate

The **platform fm6000 keyframe rate** command specifies the transmission rate for the specified keyframe from each interface from which it is configured to egress. By default, one keyframe is sent per second.

The **no platform fm6000 keyframe rate** and **default platform fm6000 keyframe rate** commands restore the default transmission rate for the specified keyframe of one per second by removing the corresponding **platform fm6000 keyframe rate** command from ***running-config***. The **no platform fm6000 keyframe and default platform fm6000 keyframe** command also removes the corresponding **platform fm6000 keyframe rate** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe ***kf_name*** **rate** ***tx_rate***

Parameters

- ***kf_name*** the keyframe's name.
- ***tx_rate*** keyframe transmission rate (frames per second). Values range from ***1*** to ***100***. Default value is ***1***.

Example

These commands enable the generation of a keyframe named ***key-1***, then configure the generation rate for the keyframe of ***10*** frames per second on each of the five interfaces that it is configured to egress.

```
switch(config)# platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4 10.4E21.9F11
switch(config)# platform fm6000 keyframe key-1 rate 10
switch(config)#
```

20.1.12.14 platform fm6000 keyframe source

The **platform fm6000 keyframe source** command configures the source IP address that the specified keyframe lists in its IP header. By default, keyframes use the IP address of the management interface as their source address.

The **no platform fm6000 keyframe source** and **default platform fm6000 keyframe source** commands restore the management interface IP address as the specified keyframe's source IP address by removing the corresponding **platform fm6000 keyframe source** command from ***running-config***. The **no platform fm6000 keyframe and default platform fm6000 keyframe** command also removes the corresponding **platform fm6000 keyframe source** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe ***kf_name*** **source ip** ***ipv4_addr***

no platform fm6000 keyframe*kf_name* **source ip**

default platform fm6000 keyframe ***kf_name*** **source ip**

Parameters

- ***kf_name*** keyframe's name.
- ***ipv4_addr*** keyframe's source IPv4 address (dotted decimal notation).

Example

These commands enable the generation of a keyframe named ***key-1***, then sets the keyframe source IP address to ***10.1.1.101***.

```
switch(config)# platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4 10.4E21.9F11
switch(config)# platform fm6000 keyframe key-1 source 10.1.1.101
switch(config)#
```

20.1.12.15 platform sand multicast replication default

The **platform sand multicast replication default** command configures the default replication mode on Sand platform switches. The factory default replication mode differs in various scenarios as follows:

- The default replication mode on switches with fabric is **fabric-egress** mode.
- The default replication mode on switches with single Fabric Access Processor (FAP) systems is **ingress** mode.
- The default replication mode on switches without fabric barring single FAP systems is **ingress-egress** mode.
- If a tool group with less than ***60*** LAGs has at least one hardware LAG, then the default replication mode of the tool group is **ingress-only** mode. Else the default replication mode of the tool group is the one configured across all LAGs in the tool group.

The **default platform sand multicast replication default** and **no platform sand multicast replication default** commands revert the current state to the factory default behavior.

Command Mode

Global Configuration

Command Syntax

platform sand multicast replication default {fabric-egress | ingress}

no platform sand multicast replication default

default platform sand multicast replication default

Parameters

- **fabric-egress** configures the replication mode to use fabric-egress VoQ buffers.
- **ingress** configures the replication mode to use ingress VoQ buffers.

Guidelines

This command is supported on Sand platforms only.

Related Commands

- **platform sand multicast replication ingress maximum**
- **show platform sand mcast capacity**

Example

This command configures the default replication mode to ingress.

```
switch(config)# platform sand multicast replication default ingress
switch(config)#
```

20.1.12.16 platform sand multicast replication ingress maximum

The **platform sand multicast replication ingress maximum** command configures maximum members for ingress-only replication.

The **default platform sand multicast replication ingress maximum** command reverts the maximum members for ingress-only replication to the default value.

The **no platform sand multicast replication ingress maximum** command deletes the maximum member value for ingress-only replication.

Command Mode

Global Configuration

Command Syntax

platform sand multicast replication ingress maximum *max_value*

no platform sand multicast replication ingress maximum

default platform sand multicast replication ingress maximum

Parameters

max_value specifies the maximum number of members for ingress-only replication. Values range from ***1*** to ***64***. The default value is ***64***.

Note: ***max_value*** for a single FAP Jericho system ranges from ***1*** to ***4096***.

Guidelines

This command is supported on Sand platforms only.

Related Commands

- **platform sand multicast replication default**
- **show platform sand mcast capacity**

Example

This command specifies a maximum of ***63*** members for ingress-only replication.

```
switch(config)# platform sand multicast replication ingress maximum 63
switch(config)#
```

20.1.12.17 policy-map type tapagg

The **policy-map type tapagg** command places the switch in policy-map (tapagg) configuration mode, which is a group-change mode that modifies a TAP-aggregation policy map. A TAP-aggregation policy map is a data structure that consists of class maps and match statements that filter a specific data stream. Packets in that data stream are either managed as specified by a TAP aggregation group or modified to add a VLAN identity tag. Policy maps manage traffic when applied to an Ethernet or port-channel interface.

The **exit** command saves pending policy map changes to ***running-config*** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type tapagg** and **default policy-map type tapagg** commands delete the specified policy map by removing the corresponding **policy-map type tapagg** command and the associated policy map statements from ***running-config***.

Command Mode

Global Configuration

Command Syntax

policy-map type tapagg ***map_name***

no policy-map type tapagg ***map_name***

default policy-map type tapagg ***map_name***

Parameters

map_name name of policy map.

Commands Available in Policy-Map Configuration Mode

- class (policy-map (tapagg))
- match (policy-map (tapagg))

Related Commands

- class-map type tapagg
- service-policy type tapagg (Interface mode)

Example

This command creates the TAP-aggregation policy map named ***t-policy_1*** and places the switch in the ***policy-map*** configuration mode.

```
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```

20.1.12.18 resequence (class-map (tapagg))

The **resequence** command assigns sequence numbers to access control lists (ACLs) in the configuration mode TAP-aggregation class map. Sequence numbers denote an ACL's priority within the class map. Command parameters specify the number of the first ACL and the numeric interval between consecutive ACLs.

Maximum rule sequence number is ***4294967295***.

Command Mode

Class-map (tagagg) Configuration

accessed with the class-map type tapagg command

Command Syntax

resequence [***start_num*** [***inc_num***]]

Parameters

- ***start_num*** sequence number assigned to the first rule. Default is ***1***.
- ***inc_num*** numeric interval between consecutive rules. Default is ***1***.

Example

These commands display a policy map whose entities were entered with default sequence numbers, then renumber the contents.

```
switch(config-pmap-t-policy_1)# show active
 policy-map type tapagg t-policy_1
   10 match ip ospf any any set aggregation-group t-group
   20 class fred
      set aggregation-group t-group id-tag 444
   30 class t-class_2
      set id-tag 500
   40 class t-class_3
      set id-tag 600
   50 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)# resequence 100 20
switch(config-pmap-t-policy_1)# exit
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# show active
 policy-map type tapagg t-policy_1
   100 match ip ospf any any set aggregation-group t-group
   120 class fred
      set aggregation-group t-group id-tag 444
   140 class t-class_2
      set id-tag 500
   160 class t-class_3
      set id-tag 600
   180 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)#
```

20.1.12.19 resequence (policy-map (tapagg))

The **resequence** command assigns sequence numbers to classes and rules in the configuration mode TAP-aggregation policy map. Sequence numbers denote the priority of a class or rule within the policy map. Command parameters specify the number of the first policy map entity and the numeric interval between consecutive entities.

Maximum rule sequence number is ***4294967295***.

Command Mode

Policy-Map (tapagg) Configuration accessed with the class (policy-map (tapagg)) command

Command Syntax

resequence [***start_num*** [***inc_num***]]

Parameters

- ***start_num*** sequence number assigned to the first rule. Default is ***1***.
- ***inc_num*** numeric interval between consecutive rules. Default is ***1***.

Example

These commands display a policy map whose entities were entered with default sequence numbers, then use the **resequence** command to renumber the contents.

```
switch(config-pmap-t-policy_1)# show active
 policy-map type tapagg t-policy_1
   10 match ip ospf any any set aggregation-group t-group
   20 class fred
      set aggregation-group t-group id-tag 444
   30 class t-class_2
      set id-tag 500
   40 class t-class_3
      set id-tag 600
   50 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)# resequence 100 20
switch(config-pmap-t-policy_1)# exit
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# show active
 policy-map type tapagg t-policy_1
   100 match ip ospf any any set aggregation-group t-group
   120 class fred
      set aggregation-group t-group id-tag 444
   140 class t-class_2
      set id-tag 500
   160 class t-class_3
      set id-tag 600
   180 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)#
```

20.1.12.20 service-policy type tapagg (Interface mode)

The **service-policy type tapagg** command applies a specified TAP-aggregation policy map to the configuration-mode interface. A policy map is a data structure that identifies data traffic through class maps and match rules, then specifies the method of replicating the traffic. This command is active only when TAP aggregation mode is enabled on the switch.

The **no service-policy type tapagg** and **default service-policy type tapagg** commands remove the policy map assignment from the configuration mode interface by deleting the corresponding **service-policy tapagg** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

service-policy type tapagg input ***policymap_name***

Parameters

- **input** policy map applies to inbound packet streams. This is the only option.
- ***map_name*** name of policy map.

Guidelines

A policy map that is attached to a port-channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy-map implementation specified by its Ethernet interface configuration.

Related Commands

class (policy-map (tapagg)) places the switch into the ***policy-map*** configuration mode to create a policy map.

Example

These commands apply the ***t-policy_1*** policy map to ***interface ethernet 17***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# service-policy type tapagg input t-policy_1
switch(config-if-Et17)#
```

20.1.12.21 set (policy-map-class (tapagg))

The **set** command specifies the data replication method for traffic filtered by the associated class map in the configuration-mode policy map. The **set** command specifies one of these replication actions for filtered data packets:

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

The **no set** and **default set** commands remove the specified set command data action from the configuration-mode class by deleting the associated **set** command from ***running-config***.

Command Mode

Policy-map-class (tapagg) Configuration accessed using the class (policy-map (tapagg)) command

Command Syntax

set **SET_VALUE**

no set **SET_VALUE**

default set **SET_VALUE**

Parameters

SET_VALUE specifies the replication method for filtered packets. Options include:

- **aggregation group *agg_group*** replication specified by aggregation group.
- **id-tag *VLAN_number*** packet is identity tagged with specified VLAN number. VLAN numbers range from ***1*** to ***4094***.
- **aggregation group *agg_group* id-tag *VLAN_number*** assigns aggregation group and identity tag (VLAN number). VLAN numbers range from ***1*** to ***4094***.

Related Commands

- **policy-map type tapagg** places the switch in the ***policy-map*** (tapagg) configuration mode.
- class (policy-map (tapagg)) assigns a class to the ***policy-map*** configuration mode.
- **match (policy-map (tapagg))** assigns a rule to the ***policy-map*** configuration mode.

Guidelines

When a class is not associated with a **set** command, the filtered traffic is managed as specified by the TAP port's default aggregation group.

Example

These commands place the switch in policy-map-class to add the ***t-class_1*** class map to the ***t-policy_1*** policy map. Packets filtered by the class map are identity tagged with ***vlan 444*** and replicated as specified through the ***t-group*** aggregation group.

```
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)# set aggregation-group t-group
 id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)# exit
switch(config-pmap-t-policy_1)# exit
switch(config)# policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)# show active
 policy-map type tapagg t-policy_1
   10 class t-class_1
      set aggregation-group t-group id-tag 444
switch(config-pmap-t-policy_1)#
```

20.1.12.22 show hardware tcam profile

Use the **show hardware tcam profile** command to display The TCAM prifile by configuration and status.

Command Mode

EXEC

Command Syntax

show hardware tcam profile detail

Parameter

detail Displays TCAM profile details.

Example

```
(config-tap-agg)# show hardware tcam profile
                    Configuration            Status
FixedSystem         foo*                     foo
* configuration overridden by TapAgg
```

20.1.12.23 show interfaces tap

The **show interfaces tap** command displays TAP-port configuration information for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **tap** [**INFO_LEVEL**]

Parameters

- **INTERFACE** interface type and numbers. Options include:
  - ***no parameter*** all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **management *m_range*** management interface range specified by ***m_range***.
  - **port-channel *p_range*** port-channel interface range specified by ***p_range***.
  - Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** command displays table that summarizes TAP data.
  - **detail** command displays TAP data summary table and a list of ACLS applied to TAP ports.

Examples

- This command displays TAP-port configuration information for interface ethernet ***36*** through ***40***.

```
switch# show interface ethernet 31-35 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et31      tap            tap            301      31   0          tag_1
Et32      tap            tap            1        132  0          tag_1
Et33      tap            tap            303      233  0          tag_1
Et34      tap            tap            1        334  0          tag_3
Et35      tap            tap            1        345  0          tag_3
switch#
```

- This command displays detailed TAP-port configuration information for ***interface ethernet 17***.

```
switch# show interface ethernet 17 tap detail
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et31      tap            tap            301      31   0          tag_1

Port      ACLs Applied
-------------------------------------------------------------------
switch#
```

20.1.12.24 show interfaces tool

The **`show interfaces tool`** command displays tool port configuration information for the specified interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`tool`**

Parameters

INTERFACE interface type and numbers. Options include:

- ***no parameter*** all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** management interface range specified by ***m_range***.
- **port-channel *p_range*** port-channel interface range specified by ***p_range***.

  Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays tool port configuration information for interface ethernet ***36*** through ***40***.

```
switch# show interface ethernet 36-40 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag  Mode
-------------------------------------------------------------------------
Et36      tool           tool           201-205             Off  None
Et37      tool           tool           201-205             Off  None
Et38      tool           tool           201-205             Off  None
Et39      access         errdisabled    All                 Off  None
Et40      tool           tool           All                 On   None

switch#
```

20.1.12.25 show platform fm6000 keyframe

The **show platform fm6000 keyframe** command displays configured information for the specified keyframes. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with the absolute UTC time and the switch's complete ASIC time counter.

Command Mode

Privileged EXEC

Command Syntax

show platform fm6000 keyframe [**KEYFRAME_ID**]

Parameters

KEYFRAME_ID specifies keyframes that the command displays. Options include:

- ***no parameter*** command displays all configured keyframes.
- ***kf_name*** specifies a single keyframe to display information for.

Example

This command displays information concerning the three keyframes that the switch sends.

```
switch# show platform fm6000 keyframe
Keyframe key-2
------------------------
Egress Interface(s): Ethernet17, Ethernet18, Ethernet19, Ethernet20,
 Ethernet21
Source IP: 10.22.30.144
Destination IP: 10.21.1.14
Destination MAC: 00:09:00:09:00:09
Device ID: 0
Rate: 5 packet(s) per second

Keyframe key-1
------------------------
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13, Ethernet14,
 Ethernet15
Source IP: 10.22.30.146
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 0
Rate: 2 packet(s) per second

switch#
```

20.1.12.26 show platform sand mcast capacity

The **show platform sand mcast capacity** command displays the usage details of hardware resources on Sand platform switches.

Command Mode

EXEC

Command Syntax

show platform sand mcast capacity [threshold ***threshold_value***]

Parameters

threshold *threshold_value* displays the list of resources whose usage percentage is greater than or equal to the specified threshold value. Values range from ***0*** to ***100***. The default value is ***100***.

Guidelines

This command is supported on Sand platforms only.

Examples

This command displays the usage details of hardware resources on a Sand platform switch.

```
switch# show platform sand mcast capacity

Multicast Resources
-------------------
'*' - Applies to all Modules
'-' - Not applicable
                          TCAM Resources
------------------------------------------------------------------------

                  Linecard6-Jericho6/2.0        262143    10576       4.0

switch#
```

20.1.12.27 show tap aggregation groups

The **show tap aggregation groups** command displays the TAP and tool port members of the specified TAP aggregation groups.

Command Mode

EXEC

Command Syntax

show tap aggregation groups [**INFO_LEVEL**] [**GROUP_NAMES**]

Parameters

- **INFO_LEVEL** port information to display. Options include:
  - ***no parameter*** displays active TAP and tool ports.
  - **detail** displays all configured TAP and tool ports, including inactive ports.
- **GROUP_NAMES** TAP aggregation groups. Options include:
  - ***no parameter*** displays information for all TAP aggregation groups.
  - ***group_list*** displays information for the specified TAP aggregation group list.

    Valid ***group_list*** format is a space-delimited list of one or more TAP aggregation group names.

Example

This command displays the contents of all configured TAP aggregation groups.

```
switch# show tap aggregation groups
Group Name                          Tool Members
------------------------------------------------------
analyze2                            Po101, Po102
analyze3                            Po101, Po103

Group Name                          Tap Members
------------------------------------------------------
analyze2                            Et41, Et42
analyze3                            Et43
switch#
```

20.1.12.28 switchport mpls pop all

The **`switchport mpls pop all`** command configures the MPLS Pop on the switch.

- On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R MPLS pop is configurable at the tap port using the switchport command.
- On DCS-7280R3, DCS-7500R3, and DCS7800R3 MPLS pop is configurable at the tool port using the switchport command.
- On DCS-7280R3, DCS-7500R3, and DCS7800R3 the hardware forwarding profile must also be set before MPLS pop can be used.

The **`no switchport mpls pop all`** command removes the switchport configuration by modifying the corresponding statements in ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`switchport` [tool | tap] **`mpls pop all`**

`no switchport` [tool | tap] **`mpls pop all`**

Parameters

- **tool** Tool port configuration.
- **tap** Tap port configuration.

Example

This command configures the MPLS Pop at the Tap port on the switch.

```
switch(config-if-Et1)# [no] switchport tap mpls pop all
```

20.1.12.29 switchport tap allowed vlan

The **switchport tap allowed vlan** command creates or modifies the list of VLANs for which the configuration mode interface, in TAP mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The **no switchport tap allowed vlan** and **default switchport tap allowed vlan** commands restore the TAP mode default allowed VLAN setting of **all** by removing the corresponding **switchport tap allowed vlan** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap allowed vlan EDIT_ACTION

Parameters

EDIT_ACTION modifications to the VLAN list. Options include:

- ***v_range*** creates VLAN list from range of VLANs specified by ***v_range***.
- **add *v_range*** adds specified VLANs to current list.
- **all** VLAN list contains all VLANs.
- **except *v_range*** VLAN list contains all VLANs except those specified by ***v_range***.
- **none** VLAN list is empty (no VLANs).
- **remove *v_range*** removes VLANs specified by ***v_range*** from current list.

Example

These commands create the TAP mode allowed VLAN list of ***26-30*** for ***interface ethernet 20***.

```
switch(config)# interface ethernet 20
switch(config-if-Et20)# switchport tap allowed vlan 26-30
eswitch(config-if-Et20)# show active
interface Ethernet20
   switchport mode tap
   switchport tap allowed vlan 26-30
switch(config-if-Et20)#
```

20.1.12.30 switchport tool encapsulation

The **switchport tool encapsulation** command is configured under Ethernet Interface configuration mode. When enabled on a tool port, only packets egressing this tool port will have their BR-E/VN tags stripped on DCS-7280R3, DCS-7500R3and DCS7800R3.

The **no switchport tool encapsulation** or **default switchport tool encapsulation** commands disables the 802.1br-E/VN Tag Stripping from the **running-config**.

Command Mode

Interface-Ethernet Configuration Mode

Command Syntax

switchport tool encapsulation {dot1br | vn-tag} **strip**

no switchport tool encapsulation dot1br | vn-tag} **strip**

defualt switchport tool encapsulation dot1br | vn-tag} **strip**

Parameters

- **dot1br** strips the 802.1br-E headers.
- **vn-tag** strips the VN Tag headers.

Examples

- To activate BR E-Tag stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)# [no] switchport tool encapsulation dot1br strip
```

- To activate VN-TAG stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)# [no] switchport tool encapsulation vn-tag strip
```

20.1.12.31 switchport tap default group

The **switchport tap default group** command assigns the configuration-mode interface to the specified tool group as a TAP port member. TAP aggregation groups associate a set of TAP ports with a set of tool ports. Both TAP ports and tool ports may belong to multiple TAP aggregation groups.

The **no switchport tap default group** and **default switchport tap default group** commands remove the configuration-mode interface from the TAP aggregation group to which it is assigned by deleting the corresponding **switchport tap default group** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-port Channel Configuration

Command Syntax

switchport tap default group ***group_name***

no switchport tap default group

default switchport tap default group

Parameters

group_name tool group name.

Restriction

This command is available on FM6000 platform switches only.

Example

These commands assign ***port channel 101*** to TAPs aggregation group ***tag-1***.

```
switch(config)# interface port-channel 101
switch(config-if-Po101)# switchport tap default group tag-1
switch(config-if-Po101)# show interfaces port-channel 101 tap
Port      Configured     Status         Native   Id   Truncation Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Po101     access         notconnect     1        1    0          tag-1
switch(config)#
```

20.1.12.32 switchport tap identity

The **switchport tap identity** command associates a VLAN number to the configuration mode TAP interface. Tool ports that are configured to encapsulate packets with an dot1q-style tag enter the number specified by this command as the s-VLAN (tier 1) for packets received from this TAPs port. The default identity value is 1.

The **no switchport tap identity** and **default switchport tap identity** commands restore ***vlan 1*** as the configuration-mode ports's identity VLAN by removing the corresponding **switchport tap identity** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap identity ***port_id***

no switchport tap identity

default switchport tap identity

Parameter

port_id port's identity VLAN. Values range from ***1*** to ***4094***. Default is ***1***.

Related Commands

switchport tool identity configures a tool port to encapsulate packets received from TAP ports.

Restriction

This command is available only on FM6000 platform switches.

Example

These commands ***171*** as the identity value for ***interface ethernet 17***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# switchport tap identity 171
switch(config-if-Et17)# show active
interface Ethernet17
   switchport tap identity 171
switch(config-if-Et17)# show interfaces ethernet 17 tap

Port      Configured     Status         Native   Id   Truncation Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et17      access         connected      1        171   0
switch(config-if-Et17)#
```

20.1.12.33 switchport tap native vlan

The **switchport tap native vlan** command specifies the TAP-mode native VLAN for the configuration-mode interface. Interfaces in TAP mode associate untagged frames with the native VLAN. The default native VLAN for all interfaces is ***vlan 1***. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode.

The **no switchport tap native vlan** and **default switchport tap native vlan** commands restore ***vlan 1*** as the TAP-mode native VLAN to the configuration-mode interface by removing the corresponding **switchport tap native vlan** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap native vlan ***v_num***

no switchport tap native vlan

default switchport tap native vlan

Parameter

v_num TAP-mode native VLAN ID. Values range from 1 to 4094. Default is 1.

Restriction

This command is available only on FM6000 platform switches.

Example

These commands assign ***vlan 25*** as the TAP-mode native VLAN for ***interface ethernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# switchport tap native vlan 25
switch(config-if-Et7)# show interface ethernet 7 tap
Port      Configured     Status         Native   Id   Truncation Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et7       tool           connected      25       1     0          ---
switch(config-if-Et7)#
```

20.1.12.34 switchport tap truncation

The **switchport tap truncation** command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. This command is in effect when the port is in TAP mode and the switch is in TAP aggregation mode. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode. By default, TAP ports do not truncate inbound packets.

The **no switchport tap truncation** and **default switchport tap truncation** commands restore the default behavior of not truncating packets received by the configuration-mode interface by removing the corresponding **switchport tap truncation** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap truncation ***packet_size***

no switchport tap truncation

default switchport tap truncation

Parameter

packet_size size of truncated packets (bytes). Values range from ***100*** to ***9236***. Default value of ***0*** corresponds to not truncating packets.

Restriction

This command is available only on FM6000 platform switches.

Examples

- These commands configure ***interface ethernet 38*** to truncate packets to ***150*** bytes.

```
switch(config)# interface ethernet 38
switch(config-if-Et38)# switchport tap truncation 150
switch(config-if-Et38)# show interface ethernet 38 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et38      access         notconnect     1        1     150        ---
switch(config-if-Et38)#
```

- These commands configure ***interface ethernet 38*** to send complete packets to tool ports in its TAP aggregation group.

```
switch(config-if-Et38)# no switchport tap truncation
switch(config-if-Et38)# show interface ethernet 38 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et38      access         notconnect     1        1     0          ---
switch(config-if-Et38)#
```

20.1.12.35 switchport tool allowed vlan

The **switchport tool allowed vlan** command creates or modifies the list of VLANs for which the configuration-mode interface, in tool mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The **no switchport tool allowed vlan** and **default switchport tool allowed vlan** commands restore the tool mode default allowed VLAN setting of **all** by removing the corresponding **switchport tool allowed vlan** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tool allowed vlan EDIT_ACTION

Parameters

EDIT_ACTION modifications to the VLAN list. Options include:

- ***v_range*** creates VLAN list from ***v_range***.
- **add *v_range*** adds specified VLANs to current list.
- **all** VLAN list contains all VLANs.
- **except *v_range*** VLAN list contains all VLANs except those specified.
- **none** VLAN list is empty (no VLANs).
- **remove *v_range*** removes specified VLANs from current list.

  Valid ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

These commands create the tool mode allowed VLAN list of ***16-20*** for ***interface ethernet 38***.

```
switch(config)# interface ethernet 38
switch(config-if-Et38)# switchport tool allowed vlan 16-20
switch(config-if-Et38)# show interfaces ethernet 38 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag  Mode
--------------------------------------------------------------------------
Et38      access         notconnect     16-20               Off  None
switch(config-if-Et38)#
```

20.1.12.36 switchport tool group

The **switchport tool group** command modifies the configuration-mode interface's tool port membership in the specified TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. Command options for configuring a port's TAP aggregation group membership include:

- specifying the groups to which the port belongs (supersedes the port's previous group memberships).
- adding to the list of groups to which the port belongs.
- deleting from the list of groups to which the port belongs.

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A TAP port can belong to a maximum of one default TAP aggregation group.

The **no switchport tool default group** and **default switchport tool default group** commands remove the configuration-mode interface from all TAP aggregation groups to which it is assigned as a tool port by modifying the corresponding statements in ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tool group **EDIT_ACTION**

Parameters

EDIT_ACTION specifies changes to the list of groups to which the port belongs.

- **add *group_list*** specifies additional groups to which the port belongs.
- **remove *group_list*** removes interface as a tool port member from specified groups.
- **set *group_list*** specifies groups to which interface belongs as a tool port.

  Valid ***group_list*** format is a space-delimited list of one or more TAP aggregation group names.

Restriction

This command is available only on FM6000 platform switches.

Examples

- These commands associate ***interface ethernet 40*** with three TAP aggregation groups.

```
switch(config)# interface ethernet 40
switch(config-if-Et40)# switchport tool group set tag-1 tag-2 tag-3
switch(config-if-Et40)# show active
interface Ethernet40
   switchport tool group set tag-3 tag-2 tag-1
switch(config-if-Et40)#
```

- These commands add ***tag-7*** to the tap aggregation groups to which ***interface ethernet 40*** belongs.

```
switch(config-if-Et40)# switchport tool group add tag-7
switch(config-if-Et40)# show active
interface Ethernet40
   switchport tool group set tag-3 tag-7 tag-2 tag-1
switch(config-if-Et40)#
```

- These commands specify ***tag-9*** as the only group to which ***interface ethernet 40***belongs.

```
switch(config-if-Et40)# switchport tool group set tag-9
switch(config-if-Et40)# show active
```

```
interface Ethernet40
   switchport tool group set tag-9
switch(config-if-Et40)#
```

20.1.12.37 switchport tool identity

The **switchport tool identity** command configures the configuration-mode interface to add a tier-1 VLAN tag (dot1q) to packets it receives from TAP ports. The VLAN number on the dot1q tag is specified by the **switchport tap identity** command configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

The **no switchport tool identity** and **default switchport tool identity** commands restore the default VLAN handling method for the configuration-mode interface by removing the corresponding **switchport tool identity** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tool identity dot1q

no switchport tool identity dot1q

default switchport tool identity dot1q

Restriction

This command is available only on FM6000 platform switches.

Example

These commands configure ***interface ethernet 40*** to include a dot1q tag on egress packets.

```
switch(config)# interface ethernet 40
switch(config-if-Et40)# switchport tool identity dot1q
switch(config-if-Et40)# show active
interface Ethernet40
   switchport mode tool
   switchport tool identity dot1q
   switchport tool group set tag-9
switch(config-if-Et40)#
```

20.1.12.38 switchport tool truncation

The **`switchport tool truncation`** command configures the configuration-mode interface, as a tool port, to truncate outbound packets to ***160*** bytes. This command is in effect when the port is in tool mode and the switch is in TAP aggregation mode. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in tool mode. By default, tool ports do not truncate outbound packets.

The **`no switchport tool truncation`** and **`default switchport tool truncation`** commands restore the default behavior (not truncating packets that exit the configuration mode interface) by removing the corresponding **`switchport tool truncation`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

`switchport tool truncation` ***packet_size***

`no switchport tool truncation`

`default switchport tool truncation`

Parameters

packet_size size of truncated packets in bytes. The only permitted value is ***160***.

Examples

- These commands configure ***interface ethernet 38***, as a tool port, to truncate packets on egress to ***160*** bytes.

```
switch(config)# interface ethernet 38
switch(config-if-Et38)# switchport mode tool
switch(config-if-Et38)# switchport tool truncation 160
switch(config-if-Et38)#
```

- These commands configure ***interface ethernet 38*** to send complete packets.

```
switch(config)# interface ethernet 38
switch(config-if-Et38)# no switchport tool truncation
switch(config-if-Et38)#
```

20.1.12.39 tap aggregation

The **tap aggregation** command places the switch in TAP-aggregation configuration mode. The switch's TAP aggregation mode is enabled or disabled by the **mode** command in TAP-aggregation configuration mode.

When TAP aggregation mode is enabled, normal switching and routing operations are disabled. A port's switchport status depends on the switch's TAP aggregation mode and the port's switchport mode:

- **TAP aggregation mode enabled**: TAP and tool ports are enabled. Switching ports are errdisabled.
- **TAP aggregation mode disabled**: TAP and tool ports are errdisabled. Switching ports are enabled.

The **no tap aggregation** and **default tap aggregation** commands disable tap aggregation mode on the switch by removing all TAP-aggregation configuration mode commands from ***running-config***.

TAP-aggregation configuration mode is not a group-change mode; ***running-config*** is changed immediately upon entering commands. Exiting TAP-aggregation configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

tap aggregation

no tap aggregation

default tap aggregation

Commands Available in TAP-aggregation Configuration Mode

mode (tap-agg configuration mode)

Related Commands

switchport mode

Examples

- These commands place the switch in TAP-aggregation configuration mode and enable TAP aggregation.

```
switch(config)# tap aggregation
switch(config-tap-agg)# mode exclusive
switch(config-tap-agg)# show active
tap aggregation
 mode exclusive
switch(config-tap-agg)#
```

- This command disables TAP aggregation and removes all TAP-aggregation configuration mode commands from ***running-config***.

```
switch(config)# no tap aggregation
switch(config)#
```

20.2 Latency Analyzer (LANZ)

Arista Networks' Latency Analyzer (LANZ) is a family of EOS features that provide enhanced visibility into network dynamics, particularly in areas related to the delay packets experience through the network. The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho, Tomahawk and XP80 switch platforms.

This section describes the purpose, behavior, and configuration of LANZ features. Topics covered by this section include:

20.2.1 Introduction to LANZ

LANZ tracks interface congestion and queuing latency with real-time reporting. With LANZ application layer event export, external applications can predict impending congestion and latency. This enables the application layer to make traffic routing decisions with visibility into the network layer.

With LANZ, network operations teams and administrators have near real-time visibility into the network, enabling early detection of microbursts. LANZ continually monitors congestion, allowing for rapid detection of congestion and sending of application layer messages.

20.2.2 LANZ Overview

LANZ monitors output queue lengths to provide congestion information for individual interfaces. This allows for more detailed analysis of congestion events, and allows identification of potential latency problems before they arise. On some platforms, LANZ also monitors global buffer usage.

Output queues for each port are monitored, and information about queue congestion events can be accessed in the form of system log messages, reports, or streaming.

20.2.2.1 LANZ Monitoring Mechanism

LANZ provides congestion data by continuously monitoring each port's output queue lengths. When the length of an output queue exceeds the upper threshold for that port, LANZ generates an over-threshold event.

20.2.2.1.1 Notifying and Polling Modes

Notifying Mode

In Notifying Mode (available on all platforms), LANZ monitors congestions on all queues and generates Start, Update, and End events every five seconds or at user-configured intervals.

- **Start** event is generated when any queue on an interface exceeds the upper threshold.
- **Update** events are generated periodically while the congested queue remains above the lower threshold. The interval at which Update events are generated is configured using the queue-monitor length update-interval command.
- **End** event is generated when the congested queue drops below the lower threshold.

Polling Mode

Polling Mode is available only on Arad and Jericho switches. On these switches, LANZ can be configured to use Notifying Mode, but it operates in Polling Mode by default. In Polling Mode, LANZ polls the most congested queue in each ASIC and continues to report an over-threshold state every ***800*** microseconds until all queue lengths for the port pass below the lower threshold.

20.2.2.2 LANZ Logging

Over-threshold events generated by LANZ can be logged as system log messages. Log messages are generated for events on all ports, at a maximum rate of one message per second per interface. The interval between messages can be configured globally.

Log messages indicate the time of the event, the interface affected, the threshold set for that interface, and the actual number of entries in the port's queue.

20.2.2.3 LANZ Reporting

Detailed LANZ data can be viewed through the CLI or exported as a CSV-formatted report.

A circular FIFO event buffer is dynamically shared by all interfaces. When an interface begins generating LANZ over-threshold events it can fill all available buffer space. However, each interface is guaranteed sufficient resources for a minimum of ***500*** entries.

20.2.2.4 LANZ Streaming

On some platforms, external client applications can also receive congestion event information as a data stream. The switch can stream LANZ data to up to ***100*** clients via TCP through port ***50001***.

Streamed data is in Google protocol buffer format, and includes both over-threshold events and LANZ configuration information.

20.2.3 Configuring LANZ

LANZ is disabled by default and must be enabled to function. Upper and lower queue-length thresholds can be defined for individual interfaces.

These sections describe the basic LANZ configuration steps:

- Enabling and Disabling LANZ
- Specifying the LANZ Mode on Jericho and Arad Switches
- Configuring LANZ Congestion Thresholds
- Setting LANZ Traffic Sampling
- Logging LANZ Congestion Events
- Viewing LANZ Data
- Streaming LANZ Data

20.2.3.1 Enabling and Disabling LANZ

LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), allowing the switch to collect and display latency information. LANZ is disabled by default on all other switches. If LANZ is disabled, the **queue-monitor length (global configuration mode)** command enables LANZ with the current settings, or with the default settings if none have been configured.

When LANZ is enabled, the switch monitors queue lengths on all front-panel ports, and on CPU and fabric ports on selected platforms. Queue length data is available in the following forms:

- syslog data (see **queue-monitor length log**)
- CLI display or CSV-format output (see **show queue-monitor length**)
- data stream (see **queue-monitor streaming**)

To disable LANZ globally, enter the **no queue-monitor length** command in global configuration mode. Disabling LANZ globally also discards LANZ log data, but retains settings. To disable LANZ on an individual interface, enter the **no queue-monitor length** command in interface Ethernet configuration mode.

Examples

- This command enables LANZ on the switch.

```
switch(config)# queue-monitor length
switch(config)#
```

- This command disables LANZ on the switch.

```
switch(config)# no queue-monitor length
switch(config)#
```

- These commands disable LANZ on Ethernet interface 7.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# no queue-monitor length
switch(config-if-Et7)#
```

20.2.3.2 Specifying the LANZ Mode on Jericho and Arad Switches

On Jericho and Arad switches, LANZ operates by default in Polling Mode, which provides congestion data for the most congested queue per ASIC. They also support Notifying Mode (the LANZ mode used on all other switches), which generates Start, Update, and End events for all queues.

Notifying Mode is enabled using the queue-monitor length notifying command.

Examples

- This command enables Notifying Mode on a Jericho or Arad switch.

```
switch(config)# queue-monitor length notifying
```

- This command disables Notifying Mode on a Jericho or Arad switch, returning LANZ to the default Polling Mode.

```
switch(config)# no queue-monitor length notifying
```

20.2.3.3 Configuring LANZ Congestion Thresholds

When LANZ is enabled on the switch, it generates over-threshold events when queue lengths on any monitored interface exceed the upper threshold value and continues generating them until all the queue lengths on that interface drop back below the lower threshold.

20.2.3.3.1 Setting the Congestion Update Interval

The queue-monitor length update-interval command specifies the frequency with which congestion information is updated in microseconds.

- This command sets the time between congestion updates to ***10*** seconds.

```
switch(config)# queue-monitor length update-interval 10000000
switch(config)#
```

- This command resets the time between congestion updates to its default value of ***5*** seconds.

```
switch(config)# default queue-monitor length update-interval
switch(config)#
```

20.2.3.3.2 Congestion Thresholds on FM6000, Trident II, Trident 3, and Tomahawk Switches

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, and in 256-byte segments on Trident 3 switches. The default threshold values are ***512*** segments and ***256*** segments. To change the threshold values for a specific interface, use the queue-monitor length thresholds command.

FM6000 switches can also monitor global buffer usage. Global buffers are measured in 160-byte segments; the default threshold values are ***10940*** segments and ***4376*** segments. To enable global buffer monitoring, use the queue-monitor length global-buffer command. To change the threshold values for global buffer usage monitoring on the switch, use the queue-monitor length global-buffer thresholds command.

Examples

- These commands set the upper and lower queue-length thresholds on ***interface ethernet 5*** to ***300*** segments and ***200*** segments.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# queue-monitor length thresholds 300 200
switch(config-if-Et5)#
```

- These commands enable global buffer monitoring on the switch and set the upper and lower thresholds to ***9000*** segments and ***4000*** segments.

```
switch(config)# queue-monitor length global-buffer
switch(config)# queue-monitor length global-buffer thresholds 9000 4000
switch(config)#
```

20.2.3.3.3 Congestion Thresholds on Arad Switches

Queue lengths are measured in bytes. The top threshold value can be between ***2*** and ***52428800*** bytes (the default value is ***52428800*** bytes). To change the upper threshold value for a specific interface, use the queue-monitor length threshold (Arad/Jericho/Qumran) command.

Example

These commands set the upper queue-length threshold on ***interface ethernet 5*** to ***2614400*** bytes.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# queue-monitor length thresholds 2614400
switch(config-if-Et5)#
```

20.2.3.3.4 CPU Port Congestion Thresholds

CPU port queue lengths are also monitored on selected platforms. All CPU ports share common threshold values, which are configured using the queue-monitor length cpu thresholds command. Individual CPU port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)# queue-monitor length cpu thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for CPU port congestion to the default values of ***512*** and ***256***.

```
switch(config)# default queue-monitor length cpu thresholds
switch(config)#
```

20.2.3.3.5 Fabric Port Congestion Thresholds

Fabric port queue lengths are also monitored on selected platforms. All fabric ports share common threshold values, which are configured using the queue-monitor length fabric thresholds command. Individual fabric port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)# queue-monitor length fabric thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for fabric port congestion to the default values of ***512*** and ***256***.

```
switch(config)# default queue-monitor length fabric thresholds
switch(config)#
```

20.2.3.4 Setting LANZ Traffic Sampling

The switch can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination when a queue threshold is crossed by enabling LANZ mirroring through the queue-monitor length mirror command. The CPU or an egress interface mirror destination is then configured through the queue-monitor length mirror destination command. LANZ traffic sampling includes exporting congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection through the tcpdump queue-monitor command.

Examples

- This command enables LANZ traffic sampling.

```
switch(config)# queue-monitor length mirror
switch(config)#
```

- This command disables LANZ traffic sampling.

```
switch(config)# no queue-monitor length mirror
switch(config)#
```

- This command configures LANZ traffic sampling for a CPU interface mirror destination.

```
switch(config)# queue-monitor length mirror destination cpu
```

```
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports ***1*** through ***5***.

```
switch(config)# queue-monitor length mirror destination Ethernet 1-5
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports ***6***, ***10***, and ***12*** through ***14***.

```
switch(config)# queue-monitor length mirror destination Ethernet
 6,10,12-14
switch(config)#
```

- This command inspects traffic on the switch.

```
switch(config)# tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol
 decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535
 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

20.2.3.5 Logging LANZ Congestion Events

To generate syslog messages when queue lengths on an interface exceed its upper threshold, enable logging with the queue-monitor length log command. When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see queue-monitor length threshold (Arad/Jericho/Qumran) or queue-monitor length thresholds). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Queue length information is not included in log messages, but can be accessed by displaying LANZ data or exporting reports.

On FM6000 platforms, log messages can also be created whenever global buffer usage exceeds its upper threshold value (see queue-monitor length global-buffer thresholds). To enable global buffer monitoring, use the queue-monitor length global-buffer command. To log over-threshold events for the global buffer, use the queue-monitor length global-buffer log command.

Examples

- This command enables queue-length over-threshold logging with a minimum interval of ***10*** seconds between messages for a given interface.

```
switch(config)# queue-monitor length log 10
```

- This command disables queue-length over-threshold logging on the switch.

```
switch(config)# queue-monitor length log 0
```

- This is an example of a queue-length log message.

```
Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD:
 Interface
Ethernet6 queue length is over threshold of 512, current
 length is 1024.
```

- This command enables global buffer over-threshold logging on the switch with a minimum interval of ***60*** seconds between messages.

```
witch(config)# queue-monitor length global-buffer log 60
```

20.2.3.6 Viewing LANZ Data

LANZ status, and the data stored in the LANZ data buffer, can be viewed using the CLI. Output varies by switch platform, and can be limited to a specified number of records.

20.2.3.6.1 Viewing LANZ Data on Arad Platform Switches

When LANZ is enabled on an Arad platform switch, the **show queue-monitor length** command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the show queue-monitor length limit command.

Example

This command displays the last ***100*** records for Ethernet interfaces ***6*** through ***8***.

```
switch# show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                          Interface   Queue length (segments, 1 to 512 bytes)
------------------------------------------------------------------------------
0:00:07.43393 ago             Et6         1049
0:00:39.22856 ago             Et7         2039
1 day, 4:33:23.12345 ago      Et6         1077
```

To view the current LANZ configuration for the switch and for each interface, use the show queue-monitor length status command.

Example

This command displays LANZ configuration and status information.

```
switch(config)# show queue-monitor length status
Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Maximum queue length in bytes : 52428800
Port threshold in bytes:
Port     High threshold
Et3/1           5242880
Et3/2           5242880
Et3/3           5242880
Et3/4           5242880
Et3/5           5242880
```

20.2.3.6.2 Viewing LANZ Data on FM6000, Trident II, Trident 3, and Tomahawk Platform Switches

When LANZ is enabled on an FM6000, Trident II, Trident 3, or Tomahawk platform switch, the show queue-monitor length command displays a report of recent over-threshold events for a range of

interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last ***1000*** records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the show queue-monitor length limit command.

Example

This command displays the last ***100*** records for Ethernet interfaces ***6*** through ***8***.

```
switch# show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                         Interface   Queue length (segments, 1 to 512 bytes)
-------------------------------------------------------------------------------
0:00:07.43393 ago            Et6         1049
0:00:39.22856 ago            Et7         2039
1 day, 4:33:23.12345 ago     Et6         1077
```

To view the current LANZ configuration for the switch and for each interface, use the show queue-monitor length status command.

Example

This command displays LANZ configuration and status information.

```
switch(config)# show queue-monitor length status
queue-monitor length enabled
Global Buffer Monitoring
------------------------
Global buffer monitoring is enabled
Segment size in bytes :   160
Total buffers in segments : 36864
High threshold : 10940
Low threshold :  4376

Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Segment size in bytes :   480
Maximum queue length in segments :  3647
Port thresholds in segments:
Port     High threshold  Low threshold
Et1                 512            256
Et2                 512            256
Et3                 512            256
Et4                 512            256
Et5                 512            256
```

To view all available LANZ records, use the show queue-monitor length all command.

Example

This command displays all available LANZ records.

```
switch> show queue-monitor length all

switch>
```

On the FM6000, Trident II, Trident 3, and Tomahawk platforms, information is also available for the number of dropped packets (see show queue-monitor length drops) and transmission latency (see show queue-monitor length tx-latency); global buffer usage can also be viewed on FM6000 platforms (see show queue-monitor length global-buffer).

20.2.3.7 Streaming LANZ Data

To support analysis of latency conditions, the switch can be configured to stream LANZ congestion and configuration data. The switch streams LANZ data via TCP in Google protocol buffer format through port ***50001*** and through the management interface.

You must create a client application to receive the streaming data. By default, the switch will accept up to ***10*** client connections for streaming LANZ data. This limit can be configured up to a maximum of ***100***. Maximum connections can be configured when LANZ is disabled.

20.2.3.7.1 Enabling and Disabling LANZ Data Streaming

LANZ data streaming is disabled by default. To enable streaming, issue the **`no show queue-monitor streaming clients`** command in queue-monitor streaming configuration mode. To disable streaming, use the show queue-monitor streaming clients command.

When streaming is disabled, a message is sent to any connected clients and the connections are closed.

To ensure client access to LANZ data, add a rule to any relevant ACL permitting traffic destined for the LANZ port (***50001***) before initiating a client connection for streaming from a remote host. A static rule (sequence number ***130***) in the default control plane ACL permits LANZ traffic, but a similar rule must be added to any user-created ACL.

Examples

- These commands enable the streaming of LANZ data from the switch.

```
switch(config)# queue-monitor streaming
switch(config-qm-streaming)# no shutdown
switch(config-qm-streaming)#
```

- These commands disable LANZ data streaming.

```
switch(config)# queue-monitor streaming
switch(config-qm-streaming)# shutdown
switch(config-qm-streaming)#
```

20.2.3.7.2 Configuring Maximum Connections

By default, the switch will accept a maximum of ***10*** client connections for LANZ data streaming. This maximum can be configured using the max-connections command. If a client connects to the switch after the limit has been reached, an error message is sent and the connection is closed.

Example

This command sets the maximum number of client connections for LANZ data streaming to ***50***.

```
switch(config-qm-streaming)# max-connections 50
```

20.2.3.7.3 LANZ Streaming Messages

When streaming is enabled, LANZ sends a message whenever a congestion event or a configuration event occurs. The messages are streamed in Google protocol buffer format.

Configuration Messages

A configuration message is sent whenever a change is made to the LANZ configuration settings on the switch. The switch also sends a configuration message when a new client connection is established.

The configuration message includes the following information:

- **`timestamp`** time of change in configuration in tens of microseconds (UTC).
- **`lanzVersion`** LANZ feature version.
- **`numOfPorts`** number of ports in the switch.
- **`segmentSize`** segment size.
- **`maxQueueSize`** maximum queue size in segments.
- **`qLenInterval`** frequency of updates.
- **`intfName`** name of the port.
- **`switchId`** ID of the chip on a multi-chip system.
- **`portId`** ID of the port.
- **`internalPort`** “true” if it is an internal port.
- **`highThreshold`** higher threshold value.
- **`lowThreshold`** lower threshold value.

Congestion Messages

A congestion message is sent whenever LANZ generates an over-threshold event.

The congestion message includes the following information:

- **`timestamp`** time of congestion in micro-seconds (UTC).
- **`intfName`** name of the port.
- **`switchId`** ID of the chip on a multi-chip system.
- **`portId`** ID of the port.
- **`queueSize`** queue size in segments at time of congestion.

20.2.3.7.4 Creating the LANZ Client

For a client device to receive streaming data from the LANZ server, it must be running a client application designed to receive LANZ data. Client programs must be based on the Google protocol buffer schema file describing the structure of the congestion and configuration messages which LANZ streams.

Google Protocol Buffers

Google protocol buffers provide an efficient mechanism for serializing LANZ data for streaming. A protocol buffer package is needed in order to run a LANZ client.

The latest version of the Google protocol buffer source code is available at this address: http://code.google.com/p/protobuf/downloads/list

LANZ Message Schema

LANZ client applications must be designed based on the LANZ protocol buffer schema, which defines the format and contents of the streamed messages. The schema file is shown below, and is also available in the Extensions/LANZ directory on this page: https://www.arista.com/en/support/software-download

```
package LanzProtobuf;

message ConfigRecord {
required uint64 timestamp = 1; // Time of change in configuration in
micro-seconds (UTC)
required uint32 lanzVersion = 2; // LANZ feature version
required uint32 numOfPorts = 3; // Num of ports in the switch
required uint32 segmentSize = 4; // Segement size
required uint32 maxQueueSize = 5; // Maximum queue size in segments
optional uint32 qLenInterval = 10; // Frequency of update
message PortConfigRecord {
required string intfName = 1; // Name of the port
required uint32 switchId = 2; // Id of the chip on a multi-chip system
required uint32 portId = 3; // Id of the port
required bool internalPort = 4; // 'True' if it's an internal port
required uint32 highThreshold = 5; // Higher threshold
required uint32 lowThreshold = 6; // Lower threshold
}

repeated PortConfigRecord portConfigRecord = 6; // Lanz config details of
 each
port
}

message CongestionRecord {
required uint64 timestamp = 1; // Time of congestion in micro-seconds
(UTC)
required string intfName = 2; // Name of the port
required uint32 switchId = 3; // Id of the chip on a multi-chip system
required uint32 portId = 4; // Id of the port
required uint32 queueSize = 5; // Queue size in segments at time of
congestion
}

message ErrorRecord {
required uint64 timestamp = 1; // Time of event in micro-seconds (UTC)
required string errorMessage = 2; // Text message
}

message LanzRecord {
optional ConfigRecord configRecord = 1;
optional CongestionRecord congestionRecord = 2;
optional ErrorRecord errorRecord = 3;
}
```

Implementation Procedure

The following steps create and install a functional client to receive streamed LANZ data. This procedure assumes a functional Python programming environment.

1. Download the example client (lanz_client.py) from the Arista website. It is available in the Extensions/LANZ directory on this page: https://www.arista.com/en/support/software-download
2. Decompress the GPB archive to a directory.
3. Run the GPB C++ compilation and install. With default flags using GCC on *nix platforms, this will produce a binary called “protoc” in your /usr/local/bin directory.
4. From the archive root, **cd** to python, and run the following commands:

- **python setup.py build**
- **python setup.py test**

5. Next, use the protoc compiler to convert the Lanz.proto file into a Python program called Lanz_pb2.py, used by the client. The command to do so is:
   - **protoc --python_out=. Lanz.proto**
   - The **--python_out=.** flag drops the compiled Python program in the directory where you ran the command.
6. Run **lanz_client.py -h** to activate the LANZ client.

20.2.4 LANZ Commands

LANZ Commands: Global Configuration

- clear queue-monitor length statistics
- queue-monitor length (global configuration mode)
- queue-monitor length cpu thresholds
- queue-monitor length fabric thresholds
- queue-monitor length global-buffer
- queue-monitor length global-buffer log
- queue-monitor length global-buffer thresholds
- queue-monitor length log
- queue-monitor length mirror
- queue-monitor length mirror destination
- queue-monitor length notifying
- queue-monitor length update-interval
- queue-monitor streaming
- tcpdump queue-monitor

LANZ Commands: Interface Ethernet Configuration Mode

- queue-monitor length threshold (Arad/Jericho/Qumran)
- queue-monitor length thresholds

LANZ Commands: Queue-Monitor Streaming Configuration Mode

- max-connections
- shutdown (queue-monitor-streaming configuration)

LANZ Display Commands

- show queue-monitor length
- show queue-monitor length all
- show queue-monitor length cpu
- show queue-monitor length csv
- show queue-monitor length drops
- show queue-monitor length ethernet
- show queue-monitor length global-buffer
- show queue-monitor length limit
- show queue-monitor length statistics
- show queue-monitor length status
- show queue-monitor length tx-latency
- show queue-monitor streaming clients

20.2.4.1 clear queue-monitor length statistics

The **clear queue-monitor length statistics** command resets the occurrences of all over-threshold events on the switch including global buffer information (if supported).

Command Mode

Privileged EXEC

Command Syntax

clear queue-monitor length statistics

Example

This command resets all over-threshold events and global buffer information on an FM6000 switch.

```
switch# clear queue-monitor length statistics
switch#
```

20.2.4.2 max-connections

The max-connections command sets the maximum number of client connections the switch accepts for streaming LANZ data. The default maximum is 10 connections. To stream LANZ data, you must use the queue-monitor streaming command to enable LANZ data streaming.

Command Mode

Queue-Monitor-Streaming Configuration

Command Syntax

`max-connections` *connections*

Parameter

connections maximum number of simultaneous LANZ streaming client connections the switch will accept. Values range from ***1*** through ***100***.

Example

This command sets the maximum number of client connections the switch accepts for LANZ data streaming to ***50***.

```
switch(config-qm-streaming)# max-connections 50
switch(config-qm-streaming)#
```

20.2.4.3 queue-monitor length (global configuration mode)

The **queue-monitor length (global configuration mode)** command enables LANZ with the current settings, or with the default settings if LANZ has not yet been configured. LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), and disabled by default on all other switches.

When LANZ is enabled, the switch monitors queue lengths on all ports and generates over-threshold events when an output queue becomes congested. Over-threshold event data is available in the following forms:

- syslog data (see queue-monitor length log).
- CLI display or CSV-format output (see show queue-monitor length).
- data stream (see queue-monitor streaming).

The **no queue-monitor length** command entered in global configuration mode disables LANZ and discards LANZ log data, but retains settings. LANZ settings include:

- logging settings (see queue-monitor length log).
- queue length thresholds (see queue-monitor length threshold (Arad/Jericho/Qumran) or queue-monitor length thresholds).
- data streaming settings (see queue-monitor streaming).

To disable LANZ on an interface, use the **no queue-monitor length** command in interface configuration mode.

Command Mode

Global Configuration

Command Syntax

queue-monitor length

no queue-monitor length

default queue-monitor length

Examples

- This command enables LANZ on the switch.

```
switch(config)# queue-monitor length
switch(config)#
```

- This command disables LANZ on the switch and discards LANZ data but maintains configurations.

```
switch(config)# no queue-monitor length
switch(config)#
```

- This command disables LANZ on Ethernet interface 3/30.

```
switch(config)# interface ethernet 3/30
switch(config-if-Et3/30)# no queue-monitor length
switch(config-if-Et3/30)#
```

20.2.4.4 queue-monitor length cpu thresholds

The **queue-monitor length cpu thresholds** command sets the queue length threshold to define “congested” on all CPU ports for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on a CPU interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the queue-monitor length log command.) Different monitoring thresholds cannot be set for individual CPU ports.

The **no queue-monitor length cpu thresholds** and **default queue-monitor length cpu thresholds** commands reset thresholds to the default values (high: ***512*** segments; low: ***256*** segments).

Command Mode

Global Configuration

Command Syntax

queue-monitor length cpu thresholds [***upper_limit*** | ***lower_limit***]

no queue-monitor length cpu thresholds

default queue-monitor length cpu thresholds

Parameters

- ***upper_limit*** is the queue length in segments that triggers an over-threshold event. Values range from ***8*** to ***16382***. Default setting is ***512***. Segment size varies by platform.
- ***lower_limit*** When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than ***upper_limit***. Values range from ***1*** to ***16382***. Default setting is ***256***.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)# queue-monitor length cpu thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for CPU port congestion to the default values of ***512*** and ***256***.

```
switch(config)# default queue-monitor length cpu thresholds
switch(config)#
```

20.2.4.5 queue-monitor length fabric thresholds

The **queue-monitor length fabric thresholds** command sets the queue-monitor length thresholds to define “congested” on all fabric ports for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on a fabric interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the queue-monitor length log command.) Different monitoring thresholds cannot be set for individual fabric ports.

The **no queue-monitor length fabric thresholds** and **default queue-monitor length fabric thresholds** commands reset thresholds to the default values (high: *512* segments; low: *256* segments).

Command Mode

Global Configuration

Command Syntax

queue-monitor length fabric thresholds [***upper_limit*** | ***lower_limit***]

no queue-monitor length fabric thresholds

default queue-monitor length fabric thresholds

Parameters

- ***upper_limit*** is the queue length in segments that triggers an over-threshold event. Values range from ***8*** to ***16382***. Default setting is ***512***. Segment size varies by platform.
- ***lower_limit*** When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than ***upper_limit***. Values range from ***1*** to ***16382***. Default setting is ***256***.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)# queue-monitor length fabric thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for fabric port congestion to the default values of ***512*** and ***256***.

```
switch(config)# default queue-monitor length fabric thresholds
switch(config)#
```

20.2.4.6 queue-monitor length global-buffer log

The **queue-monitor length global-buffer log** command enables logging of global buffer over-threshold events. When logging is enabled, a log message is generated each time the contents of the global buffer exceed the upper threshold value set for the switch (see queue-monitor length global-buffer thresholds). Once the global buffer is over the threshold, additional messages are generated at a maximum rate of one per interval as long as the buffer value remains above the lower threshold for the switch.

Global buffer logging is disabled by default.

Log messages do not include buffer usage or congestion information. To view this information, use the show queue-monitor length global-buffer command.

The **no queue-monitor length global-buffer log** and **default queue-monitor length global-buffer log** commands disable global buffer logging by removing the corresponding **queue-monitor length global-buffer log** command from ***running-config***. The **queue-monitor length global-buffer log** command with an interval value of ***0*** also disables global buffer logging.

Command Mode

Global Configuration

Command Syntax

queue-monitor length global-buffer log interval

no queue-monitor length global-buffer log

default queue-monitor length global-buffer log

Parameters

interval minimum interval in seconds between logged messages.

- ***0*** global buffer logging is disabled on the switch (the default setting).
- ***1*** to ***65535*** minimum logging interval (in seconds).

Guidelines

This command is available on FM6000 platform switches.

Examples

- This command enables global buffer logging with a minimum interval of ***10*** seconds between messages.

```
switch(config)# queue-monitor length global-buffer log 10
```

- This command disables global buffer logging on the switch.

```
switch(config)# no queue-monitor length global-buffer log
```

20.2.4.7 queue-monitor length global-buffer thresholds

The queue-monitor length global-buffer thresholds command sets global buffer thresholds for the switch. An over-threshold event is generated when usage of the global buffer exceeds the upper threshold, and over-threshold events continue to be generated until usage drops below the lower threshold. (To log these events, use the queue-monitor length global-buffer log command.)

The no queue-monitor length global-buffer and default queue-monitor length global-buffer commands disable global buffer reporting.

The **no queue-monitor length global-buffer thresholds** and **default queue-monitor length global-buffer thresholds** commands erase custom global buffer threshold settings.

Command Mode

Global Configuration

Command Syntax

queue-monitor length global-buffer thresholds ***max_segments min_segments***

no queue-monitor length global-buffer log

default queue-monitor length global-buffer log

Parameters

- ***max_segments*** upper threshold in 160-byte segments. Value ranges from ***2*** to ***36864***. Default is ***10940***.
- ***min_segments*** lower threshold in 160-byte segments. Value ranges from ***1*** to ***36864***. Default is ***4376***.

Examples

- This command sets the upper and lower global buffer thresholds to ***9000*** segments and ***3000*** segments.

```
switch(config)# queue-monitor length global-buffer thresholds 9000 3000
switch(config)#
```

- This command resets the upper and lower global buffer thresholds to their default values.

```
switch(config)# no queue-monitor length global-buffer thresholds 9000
 3000
switch(config)#
```

20.2.4.8 queue-monitor length global-buffer

The **queue-monitor length global-buffer** command includes global buffer usage in LANZ reporting.

When global buffer reporting is enabled, over-threshold events are generated when global buffer usage exceeds the upper threshold. To set the threshold value, use the queue-monitor length global-buffer thresholds command. Usage data may be viewed using the show queue-monitor length global-buffer command. To view status and threshold information, use the show queue-monitor length status command.

Global buffer usage is measured in segments of ***160*** bytes.

The **no queue-monitor length global-buffer** and **default queue-monitor length global-buffer** commands disable global buffer usage reporting by removing the corresponding **queue-monitor length global-buffer** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

queue-monitor length global-buffer

no queue-monitor length global-buffer

default queue-monitor length global-buffer

Guidelines

This command is available on FM6000 platform switches.

Examples

- This command enables global buffer monitoring on the switch.

```
switch(config)# queue-monitor length global-buffer
switch(config)#
```

- This command disables global buffer monitoring on the switch.

```
switch(config)# no queue-monitor length global-buffer
switch(config)#
```

20.2.4.9 queue-monitor length log

The **queue-monitor length log** command enables logging of queue-length over-threshold events when LANZ is enabled on the switch (see queue-monitor length (global configuration mode)). When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see queue-monitor length threshold (Arad/Jericho/Qumran)). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Logging is disabled by default.

Log messages do not include queue length information. To view queue length information, use the show queue-monitor length command.

The queue-monitor length log command with an interval value of 0 disables event logging.

Command Mode

Global Configuration

Command Syntax

queue-monitor length log interval

Parameters

interval minimum interval in seconds between logged messages from a single interface.

- ***0*** queue-length logging is disabled on the switch (the default setting).
- ***1*** to ***65535*** minimum logging interval (in seconds).

Examples

- This command enables over-threshold logging with a minimum interval of ***10*** seconds between messages for a given interface.

```
switch(config)# queue-monitor length log 10
```

- This command disables queue-length over-threshold logging on the switch.

```
switch(config)# queue-monitor length log 0
```

- This is an example of a queue-length log message.

```
Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface
Ethernet6 queue length is over threshold of 512, current length is
 1024.
```

20.2.4.10 queue-monitor length mirror

The **queue-monitor length mirror** command enables LANZ mirroring. As a result, the switch is configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. To set the destination for the mirrored traffic, use the queue-monitor length mirror destination command.

Command Mode

Global Configuration

Command Syntax

queue-monitor length mirror

Examples

- This command enables LANZ traffic sampling.

```
switch(config)# queue-monitor length mirror
switch(config)#
```

- This command disables LANZ traffic sampling.

```
switch(config)# no queue-monitor length mirror
switch(config)#
```

20.2.4.11 queue-monitor length mirror destination

The **queue-monitor length mirror destination** command results in automatically sending traffic experiencing congestion to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. Before using this command, first enable LANZ mirroring through the command queue-monitor length mirror.

Command Mode

Global Configuration

Command Syntax

queue-monitor length mirror destination cpu | *ports*

Parameter

ports any combination of Ethernet ports ***1*** through ***24***.

Examples

- This command configures LANZ traffic sampling for a CPU interface mirror destination.

```
switch(config)# queue-monitor length mirror destination cpu
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports ***3***, ***11***, and ***15*** through ***20***.

```
switch(config)# queue-monitor length mirror destination Ethernet
 3,11,15-20
switch(config)#
```

20.2.4.12 queue-monitor length notifying

The **queue-monitor length notifying** command enables Notifying Mode on Arad and Jericho switches. By default, LANZ operates in Polling Mode on Arad and Jericho switches. On all other switches, LANZ operates only in Notifying Mode.

When Notifying Mode is enabled, the switch provides detailed congestion information including Start, Update, and End events, rather than only polling the most congested queue in each ASIC. Notifying Mode uses both upper and lower threshold values. Both can be set with the queue-monitor length thresholds command. While a queue is congested, the maximum queue size is updated every five seconds by default; this interval can be configured using the queue-monitor length update-interval command.

The **no queue-monitor length notifying** and **default queue-monitor length notifying** commands reset LANZ to the default Polling Mode.

Command Mode

Global Configuration

Command Syntax

queue-monitor length notifying

no queue-monitor length notifying

default queue-monitor length notifying

Guidelines

- Polling mode is available only on Arad and Jericho platform switches.
- On Jericho platforms, LANZ will revert to Polling Mode if there are not enough counter resources to operate in Notifying Mode.
- On Arad platforms, Notifying Mode is incompatible with SSO. Enabling SSO while Notifying Mode is enabled will cause LANZ to revert to Polling Mode.
- On Arad platforms, Notifying Mode is not available for CPU queues. Use Polling Mode when monitoring congestion on CPU queues on Arad switches.
- If the switch is rebooted while Notifying Mode is enabled, queue threshold values may be lost.

Examples

- This command enables Notifying Mode on an Arad or Jericho switch.

```
switch(config)# queue-monitor length notifying
switch(config)#
```

- This command disables Notifying Mode on an Arad or Jericho switch, returning LANZ to the default Polling Mode.

```
switch(config)# no queue-monitor length notifying
switch(config)#
```

20.2.4.13 queue-monitor length thresholds

The **queue-monitor length thresholds** command sets both upper and lower queue length thresholds to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the queue-monitor length log command.)

Entering the **no queue-monitor length** command in interface configuration mode disables LANZ on the interface. Entering either the **queue-monitor length** command or the **default queue-monitor length** command in interface configuration mode enables LANZ on the interface by removing the **no queue-monitor length** command from the configuration.

The **no queue-monitor length thresholds** and **default queue-monitor length thresholds** commands in interface configuration mode both erase custom queue length threshold settings for the interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

queue-monitor length thresholds ***upper_limit lower_limit***

no queue-monitor length

default queue-monitor length

Parameters

- ***upper_limit*** queue length in segments that triggers an over-threshold event. Must be higher than ***lower_limit***. The minimum value is *2*. The maximum is the largest number of segments which can be queued before packets are dropped, and varies based on factors including flow control state and private buffer settings. Default setting is ***512***.
- ***lower_limit*** lower queue length threshold in segments. When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than ***upper_limit***. Values range from ***1*** to ***4806***. Default setting is ***256***.

Guidelines

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, in 256-byte segments on Trident 3 switches, and in bytes on Arad and Jericho switches. Default thresholds vary by platform. Both upper and lower thresholds are configurable.

Examples

- These commands set the upper and lower queue-length thresholds on ***interface ethernet 5*** to ***300*** segments and ***200*** segments.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# queue-monitor length thresholds 300 200
switch(config-if-Et5)#
```

- These commands reset the upper and lower queue-length thresholds on ***interface ethernet 5*** to their default values.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# default queue-monitor length thresholds
switch(config-if-Et5)#
```

20.2.4.14 queue-monitor length threshold (Arad/Jericho/Qumran)

The **queue-monitor length threshold** command sets the upper queue-length threshold on Arad, Jericho, and Qumran platforms to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the queue-monitor length log command.)

Entering the **no queue-monitor length** command in interface configuration mode disables LANZ on the interface. Entering either the **queue-monitor length threshold** command or the **default queue-monitor length threshold** command enables LANZ on the interface by removing the **no queue-monitor length** command from the configuration.

The **no queue-monitor length threshold** and **default queue-monitor length threshold** commands erase custom queue length threshold settings for the interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

queue-monitor length threshold ***upper_limit***

no queue-monitor length

default queue-monitor length

Parameters

upper_limit is the queue length in bytes that triggers an over-threshold event. Values range from ***40962*** to ***52428800*** bytes. Default setting is ***52428800***.

Guidelines

On Arad, Jericho, and Qumran platforms, the queue length is measured in bytes. Only the upper threshold is configurable using this command, and it is set at a default value of ***52428800*** bytes. Both upper and lower thresholds can be set using the queue-monitor length thresholds command.

Examples

- These commands set the upper queue-length threshold on ***interface ethernet 3/30*** to ***40000000*** bytes.

```
switch(config)# interface ethernet 3/30
switch(config-if-Et3/30)# queue-monitor length threshold 40000000
switch(config-if-Et3/30)#
```

- These commands reset the upper queue-length threshold on ***interface ethernet 3/30*** to its default value of ***52428800*** bytes.

```
switch(config)# interface ethernet 3/30
switch(config-if-Et3/30)# default queue-monitor length threshold
switch(config-if-Et3/30)#
```

20.2.4.15 queue-monitor length update-interval

The **queue-monitor length update-interval** command sets the interval between congestion updates when LANZ is in Notifying Mode.

The **no queue-monitor length update-interval** and **default queue-monitor length update-interval** commands reset the update interval to its default value of ***5000000*** (***5*** seconds).

Command Mode

Global Configuration

Command Syntax

queue-monitor length update-interval ***interval***

no queue-monitor length

default queue-monitor length

Parameters

interval is the time in microseconds between congestion updates. Values range from ***80***-***10000000***; default setting is ***5000000*** (***5*** seconds).

Examples

- This command sets the time between congestion updates to ***10*** seconds.

```
switch(config)# queue-monitor length update-interval 10000000
switch(config)#
```

- This command resets the time between congestion updates to its default value of ***5*** seconds.

```
switch(config)# default queue-monitor length update-interval
switch(config)#
```

20.2.4.16 queue-monitor streaming

The **queue-monitor streaming** command places the switch in queue-monitor-streaming configuration mode. Queue-monitor-streaming configuration mode is not a group change mode; ***running-config*** is changed immediately upon command entry. The exit command does not affect ***running-config***.

To enable LANZ data streaming on the switch, use the **no show queue-monitor streaming clients** command.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

queue-monitor streaming

Commands Available in queue-monitor streaming Configuration Mode

- max-connections
- show queue-monitor streaming clients

Example

This command places the switch in the ***queue-monitor streaming*** configuration mode.

```
switch(config)# queue-monitor streaming
switch(config-qm-streaming)#
```

20.2.4.17 show queue-monitor length

The **show queue-monitor length** command displays a report of recent over-threshold events for all interfaces, limited to the last ***1000*** records, with the newest events listed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

To limit the output to a specified number of seconds and/or records, use the show queue-monitor length limit command.

Command Mode

EXEC

Command Syntax

show queue-monitor length

Examples

- This command displays the last ***1000*** LANZ records on an Arad or Jericho platform switch in Polling Mode.

```
switch> show queue-monitor length

switch>
```

20.2.4.18 show queue-monitor length all

The **show queue-monitor length all** command displays all available over-threshold event records on the switch including global buffer information, with the most recent events listed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length all

Guidelines

This command is available on FM6000 platform switches.

Example

This command displays all available LANZ records from the switch.

```
switch> show queue-monitor length all

20.2.4.20 show queue-monitor length csv

The **show queue-monitor length csv** command displays LANZ records in Comma-Separated Value (CSV) format with the oldest samples displayed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length csv

Example

This command displays LANZ records in CSV format.

```
switch> show queue-monitor length csv

20.2.4.21 show queue-monitor length drops

The **show queue-monitor length drops** command displays a report of cumulative transmission drop totals for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length [**INTERFACES**][**FACTOR**] **drops**

Parameters

- **INTERFACES** interface type and number for report. Values include:
  - ***no parameter*** displays information for all interfaces.
  - ***ethernet e-range*** e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - ***no parameter*** displays the last ***1000*** records.
  - **limit number samples** displays the last ***number*** records.
  - **limit number seconds** displays all records generated during the last ***number*** seconds. Value of number ranges from ***1*** to ***1000000***.

Guidelines

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

Examples

- This command displays the last ***10*** records of transmission drop data on an FM6000 switch.

```
switch> show queue-monitor length limit 10 samples drops

20.2.4.22 show queue-monitor length ethernet

The **show queue-monitor length ethernet** command displays a report of recent over-threshold events for a range of interfaces, with the newest events listed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length ethernet ***e-range***

Parameters

e-range the range of interfaces to be included in the report; formats include a number, number range, or comma-delimited list of numbers and ranges

Examples

- This command displays the last ***1000*** records for ***interface ethernet 9*** on an FM6000 platform switch.

```
switch> show queue-monitor length ethernet 9

switch>
```

Note: The non-sequential listing of ingress ports shown here is specific to Jericho switches; interfaces on Arad switches are always displayed sequentially.

20.2.4.23 show queue-monitor length global-buffer

The **show queue-monitor length global-buffer** command displays a report of recent high usage, low usage and update events for the global buffer. Newest events are listed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length global-buffer

Guidelines

This command is available on FM6000 platform switches.

Example

This command displays the global buffer event records for the switch.

```
switch> show queue-monitor length global buffer
Report generated at 2013-04-01 14:30:07
GH-High, GU-Update, GL-Low
Segment size = 160 bytes

switch>
```

20.2.4.24 show queue-monitor length limit

The **`show queue-monitor length limit`** command displays a report of recent over-threshold events for a range of interfaces or for all interfaces, limited by a specified number of records.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

`show queue-monitor length limit` [**INTERFACES**] ***number***

Parameters

- **INTERFACES** interface type and number for report. Values include:
  - ***no parameter*** displays information for all interfaces.
  - **ethernet *e-range*** e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- ***number*** number of records to display. Values range from ***1*** to ***1000000***.

Example

This command displays the last ***100*** records for interface ethernet ***6*** through ***8***.

```
switch># show queue-monitor length ethernet 6-8 limit 100 samples
Report generated at 2010-01-01 12:56:13
Time                        Interface   Queue length (segments, 1 to 512 bytes)

1 day, 4:33:23.12345 ago    Et6         1077
switch>
```

20.2.4.25 show queue-monitor length statistics

The **show queue-monitor length statistics** command displays LANZ statistics for all interfaces, showing the traffic class and number of recorded congestion events for each interface.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length statistics

Example

This command displays LANZ statistics for all interfaces on the switch.

```
switch> show queue-monitor length statistics

Report generated at 2016-02-09 22:59:56
Interface      Traffic Class  Count
-------------------------------------------------------------
Et29            11             1
```

20.2.4.26 show queue-monitor length status

The **show queue-monitor length status** command displays the current LANZ configuration for the switch and for each interface. On certain platforms, the status of global buffer monitoring and per-linecard LANZ mode are displayed.

Command Mode

EXEC Global Configuration

Command Syntax

show queue-monitor length status

Guidelines

On FM6000 platform switches, this command includes status information about global buffer monitoring.

On Arad and Jericho based linecards, if LANZ is globally enabled (using the queue-monitor length (global configuration mode) command), the command displays the monitoring mode per-linecard.

On Arad and Jericho switches, even when all linecards are configured in Notifying Mode (using the queue-monitor length notifying command), some linecards may still run LANZ in Polling Mode under the following circumstances:

- On Arad-based linecards, LANZ falls back to Polling Mode when SSO redundancy mode is configured on the card (here, the mode is shown as “polling due to SSO configured”).
    - On Jericho-based linecards, LANZ may run in Polling Mode when many features that use the switch’s statistic capabilities have been configured (here, the mode is shown as “polling due to counters exhausted”).

Examples

- This command displays the current LANZ configuration on an FM6000 device.

```
switch# show queue-monitor length status
queue-monitor length enabled
queue-monitor length packet sampling is disabled
queue-monitor length update interval in micro seconds:  5000000

```

20.2.4.27 show queue-monitor length tx-latency

The **show queue-monitor length tx-latency** command displays the latency data of recent LANZ events for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see queue-monitor length (global configuration mode)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length [**INTERFACES**][**FACTOR**] tx-latency

Parameters

- **INTERFACES** interface type and number for report. Values include:
  - ***no parameter*** displays information for all interfaces.
  - ***ethernet e-range*** e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - ***no parameter*** displays the last ***1000*** records.
  - **limit number samples** displays the last ***number*** records.
  - **limit number seconds** displays all records generated during the last ***number*** seconds. Value of number ranges from ***1*** to ***1000000***.

Guidelines

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

Example

This command displays transmission latency data for the last ***1000*** LANZ events on the switch.

```
switch> show queue-monitor length tx-latency

Report generated at 2017-03-10 15:40:02

switch>
```

20.2.4.28 show queue-monitor streaming clients

The **show queue-monitor streaming clients** command displays the number of presently connected clients through LANZ streaming, and also displays their host-names. Ensure that both LANZ and LANZ streaming are enabled in order to use this command.

Command Mode

EXEC

Command Syntax

show queue-monitor streaming clients

Example

This command displays the number of clients connected to LANZ streaming.

```
switch# show queue-monitor streaming clients
Number of clients connected: 3
--------------------------------
172.20.63.161:6565
172.24.17.58:42
172.38.54.142:333
```

20.2.4.29 shutdown (queue-monitor-streaming configuration)

The **shutdown** command disables the streaming of LANZ data to external clients. The **no shutdown** command enables LANZ data streaming. Streaming is disabled by default.

Command Mode

Queue-Monitor-Streaming Configuration

Command Syntax

shutdown

no shutdown

Example

These commands enable the streaming of LANZ data on the switch.

```
switch(config)# queue-monitor streaming
switch(config-qm-streaming)# no shutdown
switch(config-qm-streaming)#
```

20.2.4.30 tcpdump queue-monitor

The **tcpdump queue-monitor** command exports congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection.

Command Mode

Global Configuration

Command Syntax

tcpdump queue-monitor [file | filecount | filter | lookup-names | max-file-size | packet-count | size | verbose]

Parameters

- ***file*** output file.
  - **certificate:** certificate file.
    - **file:** standard file.
    - **flash:** flash file.
    - **sslkey:** sslkey file.
    - **usb1:** usb1 file.
- **filecount** specify the number of output files: ***1*** to ***100***.
- **filter** set the filtering expression to select which packets will be dumped.
- **lookup-names** enable reverse DNS lookups.
- **max-file-size** specify the maximum file size by entering *1* to ***100*** million bytes.
- **packet-count** specify ***1*** to ***10000*** packets to capture.
- **size** specify the maximum number of bytes to dump per packet with a size of ***1*** to ***65536*** bytes.
- **verbose** enable verbose mode.

Example

This command inspects traffic on the switch.

```
switch(config)# tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol
 decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

20.3 Sampled Flow Tracking

This chapter describes Arista's implementation of sampled flow tracking, including configuration instructions and command descriptions. Topics covered by this chapter include:

20.3.1 Sampled Flow Tracking Overview

Network administrators require access to flow information that passes through various network elements to analyze and monitor networks. Sampled flow tracking provides access to IP flow information by sampling traffic flows in ingress direction on the interfaces on which it is configured. The samples are then used to create flow records that are exported to the configured collectors in the Internet Protocol Flow Information Export (IPFIX) format.

Sampled flow tracking terminology:

- **Flow tracker**: It is a collection of interfaces that collect samples and create flow records. The flow tracker has one or more exporters.
- **Exporter**: It sends flow records to one or more collectors.
- **Collector**: It receives flow records from one or more exporters.
- **Data record**: It contains values of the parameters corresponding to a template record.
- **Template record**: It defines the structure and interpretation of fields in a data record. It is an ordered sequence of type and length pairs.
- **Options template record**: It is a type of template record that defines the structure and interpretation of fields in a data record, including how to scope the applicability of the data record.

Data records are created based on the following flow key fields: source IP address, destination IP address, IP protocol, source port, destination port, VRF, and VLAN. These records support IPv4 flow data record and IPv6 flow data record.

Sampled flow tracking supports the following options data records:

- **VRF record**: mapping of VRF ID to VRF name.
- **Interface record**: mapping of interface ID to interface name.
- **Flow key indicator record**: mapping of template ID to flow key indicator.
- **Flow tracker record**: contains information about configured flow tracker.

20.3.1.1 Sampled Flow Tracking Limitations

The limitations of Sampled flow tracking are:

- Sampled flow tracking is active only when sFlow is disabled on the device.
- Sampled flow tracking does not support export of IPFIX messages over ECMP paths.
- Sampled flow tracking route simulation is not supported for ECMP paths.

20.3.2 Configuring Sampled Flow Tracking

These sections describe sampled flow tracking configurations.

Configuring Sampled Flow Tracking

Use the **flow tracker sampled** command to enable sampled flow tracking on a tracker. Each tracker should have a minimum of one exporter configured.

Example

This command enables sampled flow tracking on an interface ***Eth1*** and the flow tracker ***ftr1***.

```
switch(config)# interface Eth1
switch(config-if-Et1)# flow tracker sampled ftr1
```

Use the **sample** command to enable the sample rate for a specific sampled flow tracker. The default sample rate is ***1048576***.

Example

These commands configure a sample rate of ***1024*** for the sampled flow tracker.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# sample 1024
```

20.3.2.1 Configuring the Sampled Flow Tracker

Use the **tracker** command to configure a sampled flow tracker for a device.

Example

This command configures a sampled flow tracker named ***ftr1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
```

Use the **record export on interval** command to configure the interval at which active flow records are exported. The default interval is ***300000*** milliseconds.

Example

These commands configure an active record interval of ***7000*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on interval
 7000
```

Use the **record export on inactive timeout** command to configure the interval at which timed-out inactive flow records are exported. The default interval is ***15000*** milliseconds.

These commands configure an inactive record interval of ***4000*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on inactive
 timeout 4000
```

20.3.2.2 Configuring Exporter for Sampled Flow Tracker

Use the **exporter** command to configure or unconfigure an exporter for a specific tracker.

Example

This command configures exporter ***exp1*** for the specific tracker ***ftr1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
```

Use the **collector** command to configure the collector for the specific exporter.

Example

These commands configure a collector for the IPv4 address ***192.0.2.0*** and collector port number ***10***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# collector 192.0.2.0 port 10
```

Use the **local interface** command to configure the local source interface for the specific exporter.

Example

These commands configure the local source ***interface Ethernet1*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
```

Use the **dscp** command to configure the DSCP value for the specific exporter. The default DSCP value is ***0***.

Example

These commands configure a DSCP value of ***10*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# dscp 10
```

Use the **format ipfix version** command to configure the IPFIX version and maximum packet size for the specific exporter. The default IPFIX version is ***10*** and the default maximum packet size is ***9152***.

Example

These commands configure an IPFIX version of ***10*** and a maximum packet size of ***854*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# format ipfix version 10 max-
packet-size 854
```

Use the **template interval** command to configure the interval at which templates are exported for the specific exporter. The default template interval is ***3600000*** milliseconds.

Example

This command configures the interval of ***3400000*** milliseconds for the exporter ***exp1***.

```
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
```

20.3.3 Hardware Flow Tracking with IPFIX Export

Hardware flow tracking uses match criteria to collect data from packets based on defined flow profiles. The data collected is sent to an external node called Collector using IPFIX flow export protocol. The flow tracking engine tracks up to 32K flows going through a given set of ports in a switch with IPFIX-capability. Flow tracking is configured on physical interfaces or LAG interfaces. The matching fields in the packet header are:

- IP source
- IP destination
- IP protocol
- IP protocol's source port
- IP protocol's destination port

The information collected is:

- Byte count (4 bytes)
- Packet count (4 bytes)
- New-learn timestamp
- Flow start timestamp
- Flow end timestamp

Configuring Hardware Flow-tracking

This file extract show a hardware flow-tracking configuration.

```
! Define a loopback interface to act as the local source interface for
! IPFIX export
int Loopback0
 ip address 1.2.3.4/32

@ Enable IP routing for IPFIX packet to be routed to the collector
ip routing

! The flow tracker definition
flow tracking hardware
   tracker myFtr
      record export on inactive timeout 60000
      record export on interval 30000
      !
      exporter myExporter
         local interface Loopback0
         template interval 5000
         collector 172.28.130.153
   no shutdown

! Flow tracked interface/port
int Ethernet48
 flow tracker hardware myFtr
 no shutdown
```

This command shows general information about hardware flow tracking.

```
switch# show flow tracking hardware
```

```
Flow Tracking Status
  Type: Hardware
  Running: yes
  Tracker: myFtr
    Active interval: 30000ms
    Inactive timeout: 60000ms
    Groups: IPv4, IPv6, VxlanIPv4, VxlanIPv6
    Exporter: myExpoter
      VRF: default
      Local interface: Loopback0 (1.2.3.4)
      Export format: IPFIX version 10, MTU 1500
      DSCP: 0
      Template interval: 5000ms
      Collectors:
        172.28.130.153 port 4739
    Active interfaces:
      Et48
```

This command shows hardware flow tracking **IPFIX** template.

20.3.4 Postcard Telemetry

The postcard telemetry gathers per flow telemetry information like path and per hop latency. The path, latency and congestion information for flows at different times help in troubleshooting and monitoring flows. Postcard telemetry samples flows at every switch, aggregates them and sends the samples to a collector with path and latency information using GRE encapsulation. For calculating latency information, switches in the network need to be in PTP sync.

The information collected is:

- Length of the truncated samples in bytes.
- 48-bit timestamp.
- SNMP OID values of Ingress and Egress ports.
- 16 bit IP payload checksum, uniquely identify the sample of the same packet from different switches at the collector.
- Sample Rate (Multiplier is 1K).
- Sample data, packet inclusive of L2 header, truncated to 256 bytes.

Configuring Postcard Telemetry for Collector

All switches have same configuration for postcard telemetry to give correct information to collector and it should enabled with PTP.

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)# no disabled
switch(config-tele-postcard-policy)# ingress collection gre source
 10.10.10.10 destination 172.16.1.1

switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# telemetry postcard policy profile default
```

The sample rates can be selected:

- 16384 Set sample rate to 1 in 16k packets
- 32768 Set sample rate to 1 in 32k packets
- 65536 Set sample rate to 1 in 64k packets

This example configures sample policy for matching two different flow sets.

Match Rule 1:

- Destination IP prefix ***10.1.1.0/24*** and Source IP prefix ***10.2.2.0/24***
- TCP source port number ***100*** and destination source port number ***200***

Match Rule 2:

- Destination IP prefix ***172.16.2.0/24***
- Source IP prefix ***172.16.3.0/24***

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)# sample policy mypolicy
switch(config-postcard-sample-policy-mypolicy)# match myrule1
 ipv4
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# destination prefix 10.1.1.0/24
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# source prefix 10.2.2.0/24
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# protocol tcp source port 100 destination port 200

switch(config-postcard-sample-policy-mypolicy)# match myrule2
 ipv4
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# destination prefix 172.16.2.0/24
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# source prefix 172.16.3.0/24

switch(config-postcard-sample-policy-mypolicy)# profile myprofile
switch(config-postcard-profile-myprofile)# ingress sample policy
 mypolicy

switch(config)# interface Ethernet2/1
switch(config-if-Et1/1)# telemetry postcard policy profile
 myprofile
```

These actions can be configured for any match rule, sample at specified rate, sampling all packets, or no sampling for the flow. The last option is the default.

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)# sample policy mypolicy
switch(config-postcard-sample-policy-mypolicy)# match myrule1
 ipv4
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# actions
switch(config-postcard-sample-policy-actions-mypolicy-
myrule1)# sample
```

Sampling can also be done based on user specified checksum value and mask in TCP/UDP header.

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)# ingress sample tcp-udp-check
sum value <val> mask <mask>
```

Show Commands

This shows sample rate and collector IP configuration.

```
switch# show monitor telemetry postcard policy
Enabled: true
Ingress collection sample rate: 16384
Ingress collection type: GRE
Ingress collection source: 10.10.10.10
Ingress collection destination: 172.16.1.1
```

This shows information about postcard telemetry sample policies.

```
switch# show monitor telemetry postcard sample policy
Sample policy default
Total number of rules configured: 1
match ipv4 ipv4-all-default:
        Actions: sample

Sample policy mypolicy
Total number of rules configured: 3
match ipv4 myrule1:
        Source: 10.2.2.0/24
        Destination: 10.1.1.0/24
        Protocol: tcp
                Source port: 100
                Destination port: 200
match ipv4 myrule2:
        Source: 172.16.2.0/24
        Destination: 172.16.2.0/24
match ipv4 ipv4-all-default:
```

This shows different profiles configured and interfaces on which profiles are configured and active.

```
switch# show monitor telemetry postcard policy profiles
Profiles
```

```
Name: default
Sample policy: default
Configured on: Et1/1
Active on: Et1/1

Name: myprofile
Sample policy: mypolicy
Configured on: Et2/1
Active on: Et2/1

switch# show monitor telemetry postcard policy profile myprofile
Profiles
Name: myprofile
Sample policy: mypolicy
Configured on: Et2/1
Active on: Et2/1
```

20.3.4.1 Configuring TCAM Profile for Postcard Telemetry

The postcard telemetry requires the system TCAM profile to have postcard telemetry enabled. This can be achieved by creating a user defined TCAM profile.

The system TCAM profile must have the **`telemetry postcard policy ipv4`** to support postcard telemetry for IPv4 packets. This is applicable for both copied or newly created TCAM profiles.

Creating the User Defined TCAM profile

This adds the postcard telemetry to the default profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile <profile name> copy default
switch(config-hw-tcam-profile-<profile>)# feature telemetry postcard
 policy ipv4 copy
switch(system-feature-source-profile) #
```

Postcard telemetry is supported for ipv4 bridged and routed packets.

```
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# packet ipv4
 forwarding bridged
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# packet ipv4
 forwarding routed
```

Key size is limited to 160. This is optional for feature copied from the ***system-feature-source-profile***.

```
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# key size
 limit 160
```

This removes the unused features to ensure that the TCAM DB for postcard telemetry gets allocated.

```
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# exit
switch(config-hw-tcam-profile-<profile>)# no feature mirror ip
switch(config-hw-tcam-profile-<profile>)#
```

Applying the User Defined TCAM Profile

This sets the profile as the system profile under the ***hardware tcam*** mode.

```
switch(config-hw-tcam)# system profile <profilename>
```

When the system TCAM profile is changed, it is expected for some of the agents to restart. This removes the unused features to ensure that the TCAM DB for postcard telemetry gets allocated.

Limitations

- Only IPv4 collector in default VRF is supported.
- Only IPv4 match rules are supported in sample policy.
- Postcard telemetry for VxLAN encapsulated packets is not supported.
- Postcard telemetry for PBR forwarded packets is not supported.
- Postcard telemetry for packets with IP options are not supported.
- Postcard telemetry for multi destination packets is not supported.
- Postcard telemetry for packets dropped or consumed by switch is not supported.
- DCS-7280 and DCS-7500 platforms can support at most 3 postcard policies.
- For INT to be enabled, all the other telemetry features must be in disabled state (e.g.: Sflow, Sampled flow tracking).

20.3.5 Inband Network Telemetry (INT) Support

The Inband Network Telemetry, eXport Data (INT-XD) gathers flow, queue, drop telemetry information like network path, hop latency, queue congestion, drop reasons and more which are used for network monitoring and troubleshooting.

The INT-XD supports:

- Flow telemetry report generates from flow events. Flow events include new flows, change in the attributes of flow like ingress/egress port or latency. Flow reports include information about the path that packets traverse as well as other telemetry metadata such as hop latency and queue occupancy.
- Drop reports provide visibility into the impact of packet drops on user traffic. Drop reports include information about the path that packets traversed as well as other telemetry metadata such as drop reason code and queue id.
- Queue congestion reports are generated from queue-related events, like packets exceeding the queue depth or latency. This provides visibility into the traffic causing and prolonging queue congestion.

Platform Compatibility

The following platforms support the INT-XD feature.

- DCS-7170-64C-F
- DCS-7170-64C-R
- DCS-7170-64C#
- DCS-7170-64C-M#
- DCS-7170-32C-F
- DCS-7170-32C-R
- DCS-7170-32C#
- DCS-7170-32C-M-F
- DCS-7170-32C-M-R
- DCS-7170-32C-M#
- DCS-7170-32CD-F
- DCS-7170-32CD-R
- DCS-7170-32CD#

Configuration

All switches have same configuration for INT-XD and postcard telemetry to give correct information to collector and they are supported only in default profile.

```
switch(config)# platform barefoot profile default
```

This command enters the postcard telemetry context to enable the feature.

```
switch(config)# monitor telemetry postcard int-xd
```

This command enables the postcard telemerty.

```
switch(config-tele-postcard-int-xd)# no disabled
```

This command enables flow report.

```
switch(config-tele-postcard-int-xd)# report flow
```

This command configures flow report refresh interval. By default it is set to 5 seconds.

```
switch(config-tele-postcard-int-xd)# report flow refresh-interval <value>
 seconds
```

This command enables drop report.

```
switch(config-tele-postcard-int-xd)# report drop
```

This command enables queue report.

```
switch(config-tele-postcard-int-xd)# report queue
```

This command configures queue depth threshold. By default it is set to 2 percent.

```
switch(config-tele-postcard-int-xd)# report queue depth 10 percent
```

This command configures switch hop latency threshold. By default it is set to 2048 ns.

```
switch(config-tele-postcard-int-xd)# report queue latency 1024
 nanoseconds
```

This command configures queue report suppression limits. Default value is 1000 reports/sec per queue.

```
switch(config-tele-postcard-int-xd)# report queue rate-limit 1000
 reports-per-second
```

This command configures unique id of a switch.

```
switch(config-tele-postcard-int-xd)# device id 25
```

This command exits the mode to commit the changes.

```
switch(config-tele-postcard-int-xd)# exit
```

Show Commands

This example shows the mapping between drop reason text and drop reason code.

```
switch(config)# show platform barefoot int drop codes
Code                      Reason
------  ------------------------------------------------
---------
     1    Ingress STP blocked
     2    Ingress invalid VLAN
```

This command shows the current sequence number of the INT-XD reports. Sequence number is incremented every time an INT-XD report is sent. It shows the sequence number in HEX format.

```
switch(config)# show platform barefoot registers seqNumber
```

Limitations

- Specific flow watchlist to filter flows is not supported in this release.
- A 5-tuple of outer header is used for tracking the flows.
- Collector reachability through overlay networks is not supported.
- Packets punted to the CPU are not exported to the collector.
- Collector reachability over non default vrf is not supported.
- Collector reachability via out of band management port is not supported.
- Only unicast packet tail drops are exported to collectors.
- INT reports are sent to a single collector reachable via IPv4.

20.3.6 Sampled Flow Tracking Configuration Examples

This section describes the command configurations required to configure sampled flow tracking.

20.3.6.1 Sampled Flow Tracking Basic Configuration

The following commands enable a basic configuration.

1. Enable configuration mode for the sampled flow tracking on a device.

```
switch(config)# flow tracking sampled
```

2. Configure a sampled flow tracker for a device.

```
switch(config-flow-tracking-sampled)# tracker ftr1
```

3. Configure an exporter for the specific tracker.

```
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
```

4. Configure the collector for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# collector 172.31.22.131
```

5. Configure the local source ***interface Ethernet1*** for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
```

6. Enable sampled flow tracking.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# no shutdown
```

7. Configure the ***interface Ethernet2*** for the specific exporter.

```
switch(config)# interface Ethernet2
```

8. Configure the sampled flow tracker on ***interface Ethernet2***.

```
switch(config)# interface Ethernet2
switch(config-if-Et2)# flow tracker sampled ftr1
```

20.3.7 Sampled Flow Tracking Commands

This section contains descriptions of Sampled flow tracking commands.

Configuration Commands

- collector
- dscp
- exporter
- flow tracking sampled
- format ipfix version
- local interface
- record export on inactive timeout
- record export on interval
- sample
- shutdown (sampled flow tracking)
- template interval
- tracker

Interface Configuration Command

- flow tracker sampled

Privileged EXEC Command

- clear flow tracking sampled counters

Sampled Flow Tracking Display Commands

- show flow tracking sampled
- show flow tracking sampled counters
- show flow tracking sampled flow-table
- show flow tracking sampled ipfix options-table
- show flow tracking sampled ipfix template

20.3.7.1 clear flow tracking sampled counters

The **clear flow tracking sampled counters** command clears the flow tracking counters for all trackers, a specified tracker, or a specified tracker and exporter.

Command Mode

Privileged EXEC

Command Syntax

clear flow tracking sampled counters [tracker ***tracker_name*** [exporter ***exporter_name***]]

Parameters

- **tracker *tracker_name*** Specifies the flow tracker.
- **exporter *exporter_name*** Specifies the exporter.

Example

This command clears the flow counters for the tracker ***ftr1*** and exporter ***exp1***.

```
switch# clear flow tracking sampled counters tracker ftr1 exporter exp1
switch#
```

20.3.7.2 collector

The **collector** command configures a collector to receive flow records from a specified exporter.

The **no collector** and **default collector** commands remove the configured collector from ***running-config***.

Command Mode

Sampled Flow Tracking Exporter Configuration

Command Syntax

collector {***ipv4_address*** | ***ipv6_address***} [port ***port_number***]

no collector {***ipv4_address*** | ***ipv6_address***} [port ***port_number***]

default collector {***ipv4_address*** | ***ipv6_address***} [port ***port_number***]

Parameters

- ***ipv4_address*** Specifies the IPv4 address of the collector.
- ***ipv6_address*** Specifies the IPv6 address of the collector.
- **port *port_number*** Specifies the port number for the collector. Values range from ***1*** to ***65535***. The default value is ***4739***.

Example

These commands configure a collector for the IPv4 address ***192.0.2.0*** and collector port number ***10***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# collector 192.0.2.0 port 10
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# exit
switch(config-ftr-sampled-tr-ftr1)# exit
switch(config-flow-tracking-sampled)# exit
switch(config)#
```

20.3.7.3 dscp

The **dscp** command configures the Differentiated Services Code Point (DSCP) value for a specific exporter.

The **no dscp** and **default dscp** commands reset the DSCP value to the default of 0.

Command Mode

Sampled Flow Tracking Exporter Configuration

Command Syntax

dscp ***dscp_value***

no dscp ***dscp_value***

default dscp ***dscp_value***

Parameters

dscp_value the DSCP value assigned to the exporter. Value ranges from ***0*** to ***63***. Default value is ***0***.

Example

These commands configure a DSCP value of ***10*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# dscp 10
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# exit
switch(config-ftr-sampled-tr-ftr1)# exit
switch(config-flow-tracking-sampled)# exit
switch(config)#
```

20.3.7.4 exporter

The **exporter** command places the switch in sampled flow tracking exporter configuration mode for the specified exporter and creates the exporter if it does not yet exist.

The **no exporter** and **default exporter** commands remove the specific exporter from ***running-config***.

Command Mode

Sampled Flow Tracking Tracker Configuration

Command Syntax

exporter ***exporter_name***

no exporter ***exporter_name***

default exporter ***exporter_name***

Parameters

exporter_name the name of the exporter.

Example

These commands create exporter ***exp1*** for the flow tracker ***ftr1*** and place the switch in configuration mode for that exporter.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#
```

20.3.7.5 flow tracker sampled

The **flow tracker sampled** command configures an interface to be part of a flow tracker. An interface can belong to only one flow tracker.

The **no flow tracker sampled** and **default flow tracker sampled** commands remove the specified interface from the specified tracker.

Command Mode

Interface-Ethernet Configuration

Command Syntax

flow tracker sampled ***tracker_name***

no flow tracker sampled ***tracker_name***

default flow tracker sampled ***tracker_name***

Parameters

tracker_name the name of the flow tracker to which the interface is to be added.

Example

This command configures ***interface ethernet 1*** to participate in the flow tracker ***ftr1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# flow tracker sampled ftr1
switch(config-if-Et1)#
```

20.3.7.6 flow tracking sampled

The **flow tracking sampled** command places the switch in sampled flow tracking configuration mode. Sampled flow tracking configuration mode is a group-change mode; changes made in a group-change mode are saved by exiting the mode.

The **no flow tracking sampled** and **default flow tracking sampled** commands remove all sampled flow tracking configuration from ***running-config***.

Command Mode

Global Configuration

Command Syntax

flow tracking sampled

no flow tracking sampled

default flow tracking sampled

Commands Available in Sampled Flow Tracking Configuration Mode

- **abort** exits mode without saving changes
- **exit** exits mode and saved changes
- **sample** configures sample parameters
- **shutdown (sampled flow tracking)** enables or disables sampled flow tracking
- **tracker** configures a flow tracker

Example

This command places the switch in the ***sampled flow tracking*** configuration mode.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)#
```

20.3.7.7 format ipfix version

The **`format ipfix version`** command configures the IPFIX version and maximum packet size for a specific exporter.

The **`no format ipfix version`** and **`default format ipfix version`** commands remove the previously configured IPFIX version and the maximum packet size value from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

`format ipfix version` ***ipfix_version*** [max-packet-size ***max-packet-size value***]

`no format ipfix version` ***ipfix_version*** [max-packet-size]

`default format ipfix version` ***ipfix_version*** [max-packet-size]

Parameters

- ***ipfix_version*** the IPFIX version. Default value is *10*.
- **max-packet-size** ***max-packet-size value*** the IPFIX maximum packet size. Value ranges from ***512*** to ***65472***. Default value is ***9152***.

Example

These commands configure an IPFIX version of ***10*** and a maximum packet size of ***854*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# format ipfix version 10 max-
packet-size 854
```

20.3.7.8 local interface

The **`local interface`** command configures the local source interface for the specific exporter.

The **`no local interface`** and **`default local interface`** commands remove the local interface for the specific exporter from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

`local interface` ***interface***

`no local interface`

`default local interface`

Parameters

interface Interface type and numbers. Options include:

- **Ethernet *eth_num*** displays the information of the specified Ethernet interface. The value ranges from ***1*** to ***64***.
- **Loopback *lb_num*** displays the information of the specified loop back interface. The value ranges from ***0*** to ***2100***.
- **Management *m_num*** displays the information of the specified Management interface. The management port number ranges from ***1*** to ***2***.
- **Port-Channel *pc_num*** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from ***1-1000*** and ***1-2000***, ***1-4094*** respectively.
- **Tunnel *t_num*** displays the information of the specified tunnel. The value ranges from ***0*** to ***255***.
- **Vlan *vlan_num*** displays the information of the specified VLAN interface. The value ranges from ***1*** to ***4094***.

Example

These commands configure the local source ***interface Ethernet1*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
```

20.3.7.9 record export on inactive timeout

The **record export on inactive timeout** command configures the interval at which inactive flow records time out and are exported for a flow tracker.

The **no record export on inactive timeout** and **default record export on inactive timeout** commands remove the timeout interval from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

record export on inactive timeout ***timeout_value***

no record export on inactive timeout

default record export on inactive timeout

Parameters

timeout_value the flow record inactive export timeout value in milliseconds. Value ranges from ***3000*** to ***900000***. The default value is ***15000*** milliseconds.

Example

These commands configure an inactive record interval of ***6000*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on inactive
 timeout 6000
```

20.3.7.10 record export on interval

The **`record export on interval`** command configures the interval at which active flow records are exported for a flow tracker.

The **`no record export on interval`** and **`default record export on interval`** commands remove the interval from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

`record export on interval` ***interval_value***

`no record export on interval`

`default record export on interval`

Parameters

interval_value the flow record export interval in milliseconds. Value ranges from ***5000*** to ***36000000***. The default value is ***300000*** milliseconds.

Example

- These commands configure an active record interval of ***9000*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on interval
 9000
```

20.3.7.11 sample

The **sample** command enables the sample rate for a specific sampled flow tracker.

The **no sample** and **default sample** commands remove the sample rate configured for a specific sampled flow tracker from ***running-config***.

Command Mode

Sampled Flow Configuration

Command Syntax

sample ***sample_rate***

no sample

default sample

Parameters

sample_rate the sample flow tracking rate to be assigned for a sampled flow tracker. Value ranges from ***1024*** to ***16777216***. Default value is ***1048576***.

Example

These commands configure a sample rate of ***2056*** for the sampled flow tracker.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# sample 2056
```

20.3.7.12 show flow tracking sampled

The **show flow tracking sampled tracker** command displays information about the status of a specific tracker and the status of a specified exporter within that tracker. If no tracker is specified in the command, then all information about all trackers is displayed.

Command Mode

EXEC

Command Syntax

show flow tracking sampled [tracker ***tracker_name*** [exporter ***exporter_name***]]

Parameters

- **tracker *tracker_name*** the specific flow tracker.
- **exporter *exporter_name*** the specific exporter within the tracker.

Example

This command displays the status information of the tracker ***ftr1*** and the exporter ***exp1***.

```
switch# show flow tracking sampled tracker ftr1 exporter exp1
Flow tracking status
 Type: Sampled
 Running: yes
 Sample rate: 1024
 Tracker: ftr1
 Active interval: 30000ms
 Inactive timeout: 120000ms
 Groups: IPv4, IPv6
 Exporter: exp1
 VRF: default
 Local interface: Management1 (172.30.150.179)
 Export format: IPFIX version 10, MTU 1500
 DSCP: 48
 Template interval: 3600000ms
 Collectors:
 172.31.22.131 port 4739
 Active interfaces:
 Et1
```

20.3.7.13 show flow tracking sampled counters

The **show flow tracking sampled counters** command displays information about the flow tracking counters of a specific tracker and the counters of a specified exporter within that tracker.

Command Mode

EXEC

Command Syntax

show flow tracking sampled counters [tracker ***tracker_name*** [exporter ***exporter_name***]]

Parameters

- **tracker *tracker_name*** the specific flow tracker.
- **exporter *exporter_name*** the specific exporter within the tracker.

Example

This command displays the flow tracking counter information of the tracker ***ftr1*** and the exporter ***exp1***.

```
switch# show flow tracking sampled counters tracker ftr1 exporter exp1
Tracker: ftr1
  1 flows, 22 RX packets
  Flows created: 1, expired: 0
  Group: IPv4
  1 flows, 22 RX packets
  Group: IPv6
  0 flows, 0 RX packets
  Exporter: exp1 (IPFIX)
  Collector: 172.31.24.133 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
  Collector: 172.31.22.131 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
```

20.3.7.14 show flow tracking sampled flow-table

The **show flow tracking sampled flow-table** command displays information about the active flows maintained in the EOS.

Command Mode

EXEC

Command Syntax

show flow tracking sampled flow-table [detail | dst-ip | dst-port | group | interface | protocol | src-ip | src-port | tracker | vlan | vrf]

Parameters

- **detail** displays detailed flow records.
- **dst-ip** displays flow records based on destination IPv4 or IPv6 address.
- **dst-port** displays flow records based on a specified destination port.
- **group** displays flow records based on IPv4 or IPv6 flow groups.
- **interface** displays flow records based on ingress interface.
- **protocol** displays flow records based on the flow IP protocol.
- **src-ip** displays flow records based on source IPv4 or IPv6 address.
- **src-port** displays flow records based on a specified source port.
- **tracker** displays flow records based on flow tracker.
- **vlan** displays flow records based on a specified flow VLAN ID.
- **vrf** displays flow records based on flow VRF.

Examples

- This command displays information about the active flows on the device.

```
switch# show flow tracking sampled flow-table
Tracker: ftr1, Flows: 1
 Group: IPv4, Flows: 1
 VRF  VLAN   Source        Destination   Protocol   Start Time            Pkts   Bytes
 ---- ------ ------------- ------------- ---------- --------------------- ------ ------
 red  42     10.10.1.1:0   10.20.1.2:0   UDP        2019-04-18 15:06:50    7      700
```

- This command displays detailed information about the active flows on the device.

```
switch# show flow tracking sampled flow-table detail
Tracker: ftr1, Flows: 1
  Group: IPv4, Flows: 1
  Flow: UDP 10.10.1.1:0 - 10.20.1.2:0, VRF: red, VLAN: 42
  Start time: 2019-04-18 15:06:50.268734, Last packet time: 2019-04-18
 15:07:03.607900
  Packets: 15, Bytes: 1500, TOS: 0, TCP flags: none
  Source MAC: 001c.73ee.bfe4, Destination MAC: 001c.7374.3b85
  Ingress Interface: 'Ethernet1', Egress VLAN: routed, Egress
 Interface: CPU
  Next hop: unknown, BGP next hop: unknown (AS unknown), Source AS:
 unknown
  Source prefix length: 24, Destination prefix length: 32
```

20.3.7.15 show flow tracking sampled ipfix options-table

The **show flow tracking sampled ipfix options-table** command displays information about the sampled IPFIX options table available.

Command Mode

EXEC

Command Syntax

show flow tracking sampled ipfix options-table tracker [flow-key | flow-tracker | interface | vrf]

Parameters

- **tracker** displays the output for a specific flow tracker.
- **flow-key** displays the flow keys options table.
- **flow-tracker** displays the flow tracker options table.
- **interface** displays the interface options table.
- **vrf** displays the VRF options table.

Example

This command displays the sampled IPFIX options table for the tracker ***ftr1***.

```
switch# show flow tracking sampled ipfix options-table
Tracker: ftr1
  Observation domain: ftr1, ID: 1
  Active interval: 30sec
  Inactive timeout: 120sec
  Selector algorithm: random(3)
  Sampling: 1/1024
  Flow tracking type: sampled(1)
  VRF Table, Template ID: 256, Scope: ingressVRFID
  VRF ID VRF Name
  -------------- --------
  0 default
  1 red
  16777215
  Interface Table, Template ID: 257, Scope: ingressInterface
  Interface ID Interface Name
  ------------------ ----------------
  0 unknown
  3013 Ethernet1
  3014 Ethernet2

  1073741823 CPU
  1073741824 discard
  1074029945 Ethernet3/36/1.1
  1074292089 Ethernet3/36/1.2
  2147483648 multicast
  Flow Keys Table, Template ID: 258, Scope: templateId
  Template ID Flow Key Indicator
  ---------------- ------------------
  261 0x7f
  262 0x7f
```

20.3.7.16 show flow tracking sampled ipfix template

The **show flow tracking sampled ipfix template** command displays information about the exported IPFIX data templates and options templates.

Command Mode

EXEC

Command Syntax

show flow tracking sampled ipfix template [data | options | tracker]

Parameters

- **data** displays the data templates.
- **options** displays the flow options template.
- **tracker** displays the flow tracker template.

Example

This command displays the sampled IPFIX options table for the tracker ***ftr1***.

```
switch# show flow tracking sampled ipfix template
Tracker: ftr1
  Data Template, Group: IPv4, Fields: 26, Template ID: 261
    ingressVRFID (234), 4 bytes
    vlanId (58), 2 bytes
    sourceIPv4Address (8), 4 bytes
    destinationIPv4Address (12), 4 bytes
    protocolIdentifier (4), 1 bytes
    sourceTransportPort (7), 2 bytes
    destinationTransportPort (11), 2 bytes
    sourceMacAddress (56), 6 bytes
    postDestinationMacAddress (57), 6 bytes
    octetDeltaCount (1), 8 bytes
    packetDeltaCount (2), 8 bytes
    flowStartMilliseconds (152), 8 bytes
    flowEndMilliseconds (153), 8 bytes
    flowEndReason (136), 1 bytes
    tcpControlBits (6), 2 bytes
    ingressInterfaceType (368), 4 bytes
    ingressInterface (10), 4 bytes
    postVlanId (59), 2 bytes
    egressInterface (14), 4 bytes
    ipClassOfService (5), 1 bytes
    bgpSourceAsNumber (16), 4 bytes
    bgpDestinationAsNumber (17), 4 bytes
    bgpNextHopIPv4Address (18), 4 bytes
    ipNextHopIPv4Address (15), 4 bytes
    sourceIPv4PrefixLength (9), 1 bytes
    destinationIPv4PrefixLength (13), 1 bytes

<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

20.3.7.17 shutdown (sampled flow tracking)

The **shutdown** command disables sampled flow tracking for the specific exporter.

The **no shutdown** command enables sampled flow tracking for the specific exporter.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Example

These commands enable sampled flow tracking for the specific exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# no shutdown
```

20.3.7.18 template interval

The **`template interval`** command configures the interval at which templates are exported for a specific exporter. The default template interval is ***3600000*** milliseconds.

The **`no template interval`** and **`default template interval`** commands reset the interval rate to the default.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

`template interval` ***interval***

`no template interval`

`default template interval`

Parameters

interval the interval rate in milliseconds. The value ranges between ***5000*** and ***3600000*** milliseconds. The default rate is ***3600000*** milliseconds.

Example

This command configures the interval of ***3400000*** milliseconds for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
```

20.3.7.19 tracker

The **tracker** command configures a sampled flow tracker for a device.

The **no tracker** and **default tracker** commands remove the sampled flow tracker from the ***running config***.

Command Mode

Sampled Flow Configuration

Command Syntax

tracker ***tracker_name***

no tracker ***tracker_name***

default tracker ***tracker_name***

Parameters

tracker_name the flow tracker name.

Example

These commands configure the sampled flow tracker ***ftr1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
```

20.4 sFlow

This chapter describes Arista's implementation of sFlow, including configuration instructions and command descriptions. Topics covered by this chapter include:

- sFlow Conceptual Overview
- sFlow Configuration Procedures
- sFlow Subinterfaces
- QinQ L3 Subinterfaces
- sFlow Commands

20.4.1 sFlow Conceptual Overview

20.4.1.1 sFlow Technology

sFlow is a multi-vendor sampling technology that continuously monitors application level traffic flow at wire speed simultaneously on all interfaces. sFlow provides gigabit speed quantitative traffic measurements without impacting network performance.

sFlow has the following network traffic monitoring characteristics:

- sFlow is a statistical sampling technology that is designed to be deployed on all ports within a network to provide end to end visibility.
- sFlow exports packet samples and topology meta data to a centralized collector application
- sFlow is scalable to operate on all switch ports simultaneously.
- sFlow is implemented on all devices, without requiring additional memory or CPU and does not impact dataplane forwarding
- sFlow is an industry standard (***RFC 3176***).

An sFlow configuration consists of:

- sFlow agents, embedded on network equipment, that monitor traffic and generate data.
- sFlow collectors that receive and analyze sFlow data.

Arista switches include an sFlow agent that monitors ingress data through all Ethernet interfaces.

20.4.1.1.1 sFlow Agents

The sFlow agent is a software process that runs as part of the network management software within an Arista switch. It combines interface counters and flow samples into sFlow datagrams that are sent to an sFlow collector. Packets typically include flow samples and state information of the forwarding/ routing table entries associated with each sample. Additional data can be gathered for entries originated by BGP.

The sFlow Agent performs minimal processing when packaging data into datagrams. Immediate data forwarding minimizes agent memory and CPU requirements.

20.4.1.1.2 sFlow Collector

An sFlow collector is a server that runs software that analyzes and reports network traffic. Collectors receive flow samples and counter samples respectively as sFlow datagrams from sFlow agents.

Arista switches reference a collectors IP address and UDP port as a configurable setting through a CLI command. Arista switches do not include sFlow collector software.

20.4.1.1.3 sFlow Data

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched flows and time-based sampling of network interface statistics.

- **Switched flow sampling**: A sample is taken by either copying the packet's header or extracting feature data from the packet.
- **Interface statistics sampling**: Counter sampling extracts statistics by periodically polling each data source on the device.

sFlow implements flow sampling and counter sampling as part of an integrated system. An sFlow datagram incorporates both sample types.

20.4.1.2 Arista sFlow Implementation

Arista switches provide a single sFlow agent instance that samples ingress traffic from all Ethernet and port channel interfaces. The switch provides two levels of settings for enabling sFlow:

- a global setting that enables packet sampling on the entire switch.
- interface settings that control sampling on individual interfaces when sFlow is globally enabled.

sFlow default settings include:

- **global**: sFlow and BGP sFlow export are globally disabled.
- **Ethernet and port channel interfaces**: sFlow is enabled on all interfaces when it is enabled globally. BGP sFlow export is likewise enabled on all interfaces when it is enabled globally.

The switch performs sFlow polling when sFlow is globally enabled. The CLI provides commands that globally disable sampling while counter polling remains enabled. Sample enabling is not controllable on individual interfaces.

The switch sends sFlow datagrams to the collector located at an IP address specified by a global configuration command. If the collector destination is not configured, the switch samples data without transmitting the resulting datagrams.

Although the CLI enforces the configured sampling rate limit, it may drop samples if it cannot handle the number of samples it receives over a specified period. Under normal operation, the maximum packet sample rate is one per 16384 packets. The CLI allows for higher sampling rates by using the **dangerous** keyword.

The switch can also be configured to allow the routing agent to export BGP information to the sFlow agent. When BGP sFlow export is enabled, sFlow will add BGP information to packets whose destination is a BGP route.

The following lists describe sFlows sampling behavior relative to different packet types:

- Packets that are sampled:
  - CPU
  - IP Options and MTU violations
  - Flooded packets
  - Multicast packets
- Packets that are not sampled:
  - LACP frames
  - LLDP frames
  - STP BPDUs
  - IGMP packets
  - PAUSE frames
  - PIM hello packets
  - CRC error frames

- Packets dropped by ACLs or due to VLAN violations

20.4.1.3 sFlow and Mirroring

The sFlow and Mirroring is supported using the same interface for both a mirroring session and sFlow at the same time. But when sFlow and mirroring is configured on the same interface, the TAP Aggregation is not supported. And when TAP Aggregation mode is enabled, the interface configured as a source for both a mirroring session and sFlow will only mirror packets, and sFlow samples are not produced.

The sFlow and Mirroring are supported on the following switch series:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, DCS-7500E, DCS-7050X, DCS-7060X, DCS-7250X, DCS-7260X, and DCS-7300X.

However, the following switches have a limitation:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, and DCS-7500E.

When a mirroring session and sFlow is configured on a same interface for the above devices, the following packet types are not sampled though they are sampled with only sFlow.

- STP BPDUs
- LACP frames
- LLDP frames
- OSPF packets
- PIM HELLO packets
- Packets dropped due to VLAN violations

20.4.1.4 Hardware Accelerated sFlow

The hardware-accelerated sFlow is supported on compatible platforms. Without hardware acceleration, all sFlow processing is done in software, so performance is dependent on the capabilities of the host CPU. Aggressive sampling rates also decrease the amount of processing time available for other EOS applications.

With hardware acceleration, all sFlow processing is done in hardware using specialized chips, called accelerators. These accelerators process sampled packets and send out sFlow datagrams similarly as the software agent. Involvement from the CPU is very little and the chips are dedicated to sFlow, performance is higher and the CPU has more availability for other tasks, even with high sampling rates.

The Hardware accelerated sFlow is supported on the following switch series:

DCS-7280R3, DCS-7280SR2A-48YC6, DCS-7280CR2-60, DCS-7280CR2A-60, DCS-7280CR2K-60, DCS-7280CR2-30, DCS-7280CR2A-30, DCS-7280SRAM-48C6, DCS-7280SR2K-48C6, DCS-7500R3, DCS-7500R2A-36CQ-LC, DCS-7500R2AK-36CQ-LC, DCS-7500R2AM-36CQ-LC, DCS-7500R2AK-48YCQ-LC. and DCS-7800R3

However, the following switches have a limitation:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, and DCS-7500E.

Before enabling hardware-accelerated sFlow, the following requirements must be fulfilled:

- sFlow must be running globally.
- Routing must be enabled in any VRF. This is required for sFlow datagrams to be routed to the collector(s).

The following command enables or disables hardware-accelerated sFlow in configuration mode.

```
switch(config)# [no|default] sflow hardware acceleration
```

The following command disables hardware-accelerated sFlow on a particular LineCard.

```
switch(config)# no sflow hardware acceleration module Linecard3
```

The following command revertshardware-accelerated sFlow on a particular LineCard.

```
switch(config)# sflow hardware acceleration module Linecard3
```

Example

The following example enables routing on the switch, activates sFlow, and enables hardware acceleration globally, but forces software sFlow on Linecard3.

```
switch(config)# ip routing
switch(config)# sflow run
switch(config)# sflow hardware acceleration
switch(config)# sflow source 10.10.10.1
switch(config)# sflow destination 10.10.10.2
switch(config)# sflow hardware acceleration sample 1024
switch(config)# no sflow hardware acceleration module Linecard3
```

Example

The following example is for IPv6 configuration. Hardware accelerated sFlow enables either IPv4 or IPv6 collectors. IPv6 configuration takes precedence over IPv4 configuration and IPv4 collectors will be disabled.

```
switch(config)# ipv6 unicast-routing
switch(config)# ip routing
switch(config)# sflow run
switch(config)# sflow hardware acceleration
switch(config)# sflow source-interface Ethernet1/1
switch(config)# sflow destination 10.10.10.2
switch(config)# sflow hardware acceleration sample 1024
switch(config)# no sflow hardware acceleration module Linecard3
```

Example

The command **show sflow hardware status** displays the current status of hardware acceleration for sFlow for fixed system.

```
switch(config)# show sflow hardware status
Status
——
Hardware Acceleration On: No
       - sFlow must be enabled
       - sFlow hardware acceleration must be enabled in the CLI
       - routing must be enabled in any VRF
Sample Rate: None
```

Example

The command **show sflow hardware status** displays the current status of hardware acceleration for sFlow for modular system.

```
switch(config)# show sflow hardware status
Status
——
Hardware Acceleration On: Yes
Sample Rate: 1048576
                          sFlow Mode
Module          Active                    Configured             Has sFlow
 accelerators
——————      ————————            ————————        ———————-
Linecard3       Software                  Hardware-accelerated        No
Linecard4       Software                  Hardware-accelerated        No
Linecard5       Hardware-accelerated      Hardware-accelerated        Yes
Linecard6       Hardware-accelerated      Hardware-accelerated        No
```

Example

The command **show sflow hardware counters** displays counters that are specific to sFlow acceleration.

```
switch(config)# show sflow hardware counters
———————
SflowAccelFpga7:0
———————
Incoming Packet Count :
Outgoing Sflow Datagram Count : 0
Outgoing Flow Sample Count : 0
Incoming Processed Packet Count : 0
Receive Packet Drop Count : 0
Packet Truncated Count : 0
Incoming Packet Error Count : 0
Outgoing Processed Datagram Count : 0
Sample Pool : 0
———————
SflowAccelFpga7:1
———————
Incoming Packet Count : 0
Outgoing Sflow Datagram Count : 0
Outgoing Flow Sample Count : 0
Incoming Processed Packet Count : 0
Receive Packet Drop Count : 0
Packet Truncated Count : 0
Incoming Packet Error Count : 0
Outgoing Processed Datagram Count : 0
Sample Pool : 0
———————
Total
———————
Incoming Packet Count : 0
Outgoing Sflow Datagram Count : 0
Outgoing Flow Sample Count : 0
Incoming Processed Packet Count : 0
Receive Packet Drop Count : 0
Packet Truncated Count : 0
Incoming Packet Error Count : 0
Outgoing Processed Datagram Count : 0
Sample Pool : 0
```

Example

The command **show sflow hardware accelerators** displays a list of all hardware accelerators currently present in the system.

```
switch(config)# show sflow hardware accelerators
Slice     sFlow Accelerator    Type    PCI Address    Direct
 Connections
_____________________________
Linecard7 SflowAccelFpga7:0   halo    0000:85:00.0     Jericho7/0
Linecard9 SflowAccelFpga9:0   halo    0000:a6:00.0     Jericho9/0
```

Example

The command **show sflow hardware mapping** displays hardware accelerator performs sFlow processing for each switch chip in the system. Hardware acceleration needs to be enabled and running, otherwise the output of the command will be empty.

```
switch(config)# show sflow hardware mapping
Chip          sFlow Accelerator       Direct Connection
_____________________
Jericho3/0    SflowAccelFpga7:0       False
Jericho3/1    SflowAccelFpga7:0       False
Jericho4/0    SflowAccelFpga9:0       False
Jericho4/1    SflowAccelFpga9:0       False
Jericho5/0    SflowAccelFpga7:0       False
Jericho5/1    SflowAccelFpga7:0       False
Jericho6/0    SflowAccelFpga9:0       False
Jericho6/1    SflowAccelFpga9:0       False
Jericho7/0    SflowAccelFpga7:0       True
Jericho9/0    SflowAccelFpga9:0       True
```

20.4.2 sFlow Configuration Procedures

Implementing sFlow on an Arista switch consists of configuring the following agent parameters:

1. Collector location address.
2. Agent source address.
3. Polling interval.
4. Sampling rate.

Optionally, sFlow can be configured to include output interface and traffic class information in samples using the sflow sample command, and to include BGP information in samples whose destination is a BGP route using the sflow extension bgp command.

After configuring the sFlow agent, sampling is initiated by globally enabling sFlow on the switch.

Platform-specific Considerations

When BGP sFlow export is enabled on Arad platform switches (DCS-7280E and DCS-7500E), BGP information can be added to some sFlow packets with ECMP destinations.

DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Configuring the Collector Location

The sflow destination command specifies the IP address and UDP port of an sFlow collector. The switch supports multiple collectors.

Example

This command configures the switch to send sFlow data to collectors at ***10.42.15.12***, port ***6100*** and ***10.52.12.2*** port ***6343*** (the default sFlow port).

```
switch(config)# sflow destination 10.42.15.12 6100
switch(config)# sflow destination 10.52.12.2
switch(config)#
```

Configuring the Agent Source Address

The sflow source command specifies the source address that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

This command configures ***10.2.9.21*** as the sFlow source address.

```
switch(config)# sflow source 10.2.9.21
switch(config)#
```

The **sflow source-interface** command can be alternatively used to specify the interface from which an IP address is derived that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

This command configures ***interface vlan 25*** as the sFlow source interface. The switch enters the IP address for ***vlan 25*** in the source field of sFlow datagrams.

```
switch(config)# sflow source-interface vlan 25
switch(config)#
```

running-config cannot simultaneously contain sflow source and sflow source-interface commands.

Configuring the Polling Interval

The sflow polling-interval command specifies the interval for sending counter data to the sFlow collector. The default interval is two seconds.

Example

This command configures the switch to send sFlow data every ***10*** seconds.

```
switch(config)# sflow polling-interval 10
switch(config)#
```

Configuring the Sampling Rate and Sample Contents

The sflow sample command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events. A rate of ***16384*** corresponds to an average sample of one per ***16384*** packets. The default rate is ***1048576***.

Example

This command configures the sFlow sampling rate as ***65536*** (one per ***65536*** packets).

```
switch(config)# sflow sample 65536
switch(config)#
```

The sflow sample command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

By default, samples include information about the output interface. To remove this information, use the [no] sflow sample output interface command.

Example

These commands configure sFlow to include traffic class information in samples but to exclude output interface data.

```
switch(config)# no sflow sample output interface
switch(config)# sflow sample rewrite dscp
switch(config)#
```

Enabling BGP sFlow Export

The sflow extension bgp command enables BGP sFlow export. When it is enabled, the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
  - AS numbers
  - AS system path to the destination
  - communities
  - local pref

On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export will also add the above BGP information to sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of ***0***.

On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as ***0***.

Note: A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol (BGP) chapter for details.

Example

These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```
switch(config)# router bgp 50
switch(config-router-bgp)# exit
switch(config)# sflow extension bgp
switch(config)#
```

Extended Switch and Router Information

By default, extended switch and router information is added to sFlow sample packets.

Extended switch information includes the following:

- source and destination VLANs and priorities

Extended router information includes the following:

- IP version and address of next-hop router
  - source and destination mask lengths

The **no** form of sflow extension switch and **no** form of sflow extension router commands prevent the addition of extended switch and router information to sFlow sample packets.

Example

These commands prevent extended switch and router information from being added to sFlow sample packets.

```
switch(config)# no sflow extension switch
switch(config)# no sflow extension router
switch(config)#
```

Enabling sFlow

The sflow run command globally enables sFlow on the switch. The sflow enable command controls sFlow operation on Ethernet and port channel interfaces when sFlow is globally enabled. The **sflow enable** command has no effect when sFlow is globally disabled.

Example

These commands enable sFlow on the switch, then disables sFlow on Ethernet interface 10.

```
switch(config)# sflow run
switch(config)# interface ethernet 10
switch(config-if-Et10)# no sflow enable
switch(config)#
```

20.4.3 sFlow Subinterfaces

The **sflow sample [input | output] subinterface** command configures ifIndex values for subinterfaces on input and output ports to be included in the flow sample. These values are in place of the default parent port ifIndex value. Enabling this feature changes all sFlow samples generated by the switch from the compact to the expanded format.

Configuring sFlow Subinterface

The following configures subinterfaces on the switch for sampling.

```
switch (config)# sflow run
switch (config-if-Et1)# sflow sample input subinterface
switch (config)# sflow sample output subinterface
```

The following file extract displays the output from a **show sflow detail** command.

```
switch# show sflow detail
...
Status
------
...
Sample Switch Extension: Yes
Sample Router Extension: Yes
Sample Tunnel IPv4 Egress Extension: No
Sample Input Subinterface: Yes
Sample Output Subinterface: Yes
Port Channel Output Interface Index: portchannel
```

```
Sample Encoding Format: expanded
...
```

Limitations

- The feature is supported only on some hardware platforms.
- Only L3 subinterfaces and QinQ L3 subinterfaces support the sFlow output subinterface.
- Tunneled packets such as GRE, MPLSoGRE, and IPinIP are not supported.

20.4.4 QinQ L3 Subinterfaces

QinQ L3 subinterfaces divide a single Ethernet or port-channel interface into multiple logical L3 interfaces based on a combination of two 802.1q tags (VLAN ID) in the incoming traffic. QinQ L3 subinterfaces are commonly used in the L2/L3 boundary device, but they are also used to isolate traffic with a combination of two 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

QinQ L3 subinterfaces are similar to regular L3 subinterfaces, with the only difference being the number of tags being used to isolate traffic. While L3 subinterfaces use a single 802.1q tag (VLAN ID) in the incoming traffic, QinQ L3 subinterfaces use a combination of two 802.1q tags outer, and inner, in the incoming traffic.

All restrictions that are applicable to L3 subinterfaces are also applicable to QinQ L3 subinterfaces including the following:

- PBR service policy.
- ACL logging.
- Tunneling features including VxLAN, MPLS EVPN, MPLS VPN, and Pseudowire.
- QinQ subinterfaces with Algomatch ACLs.
- QinQ subinterfaces with flex-route configuration with optimization for non-nibble aligned prefix length.
- QoS service policy on QinQ subinterfaces with TCAM profiles that have **`feature qos subintf ip/ipv6`**.
- On a routed port, a single tag L3 subinterface and a QinQ L3 subinterface with the same outer tag in the dot1q encapsulation configuration are not supported simultaneously.
- On a routed port ***Et1***, if ***Et1*** has a dot1q encapsulation of ***100***, and if ***Et1.2*** has a dot1q encapsulation of <***100,200*** outer tag ***100***, inner tag ***200***, then ***Et1.1*** and ***Et1.2*** are not supported simultaneously.

20.4.4.1 Configuring QinQ L3 Subinterfaces

The following commands assign packets ingressing on ***Ethernet interface 1/1*** (routed port) with two dot1q tags (VLAN ID) - outer tag ***100*** and inner tag ***200*** to ***Ethernet subinterface 1/1.1***, making ***Ethernet1/1.1*** a QinQ L3 subinterface.

1. Bring up the parent interface and ensure that it is configured as a routed port.

```
witch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# no switchport
switch(config-if-Et1/1)# no shutdown
```

2. Configure a VLAN on the subinterface. The encapsulation dot1q vlan command is also used for VLAN translation, but in this context it associates a VLAN with the subinterface.

```
switch(config-if-Et1/1)# interface Ethernet1/1.1
switch(config-if-Et1/1.1)# encapsulation dot1q vlan 100 inner 200
switch(config-if-Et1/1.1)#
```

3. Configure IPv4, and IPv6 ACL on QinQ subinterface.

```
switch(config)# interface ethernet1/1.1
switch(config-if-Et1/1.1)# ip access-group acl_1 in
switch(config-if-Et1/1.1)# ipv6 access-group acl_v6_1 in
```

4. Configure the subinterface counters to ingress and egress.

```
switch(config)# hardware counter feature subinterface in
switch(config)# hardware counter feature subinterface out
```

To confirm the status of the subinterfaces you can use the **show interface status sub-interfaces** command as shown in the following example.

```
switch(config)# show interface status sub-interfaces
Port       Name    Status       Vlan     Duplex Speed  Type
  Flags  Encapsulation
Et1.1              connect      routed   full   10G    dot1q-encapsu
lation        100,200
Et1.2              connect      routed   full   10G    dot1q-encapsu
lation        102
switch>
```

To confirm the status of the **show interface et1.1 counters** command, use the ingress and egress counters as shown in the following example.

```
switch(config)# show interface et1.1 counters
L3 Interface                   InOctets          InPkts
Et1.1                                 0               0
L3 Interface                  OutOctets         OutPkts
Et1.1                                 0               0
```

20.4.5 sFlow Commands

Global Configuration Commands

- sflow destination
- sflow extension bgp
- sflow extension router
- sflow extension switch
- sflow polling-interval
- sflow run
- sflow sample
- [no] sflow sample output interface
- sflow source
- sflow source-interface

Interface Configuration Commands

- sflow enable

Privileged EXEC Command

- clear sflow counters

sFlow Display Commands

- show sflow
- show sflow interfaces

20.4.5.1 clear sflow counters

The **clear sflow counters** command resets the global sFlow statistics, which includes the number of samples and sample pool. The hardware trigger count is not reset.

The show sflow command displays global sFlow statistics.

Command Mode

Privileged EXEC

Command Syntax

clear sflow counters

Example

This command resets the sFlow counters.

```
switch# clear sflow counters
switch#
```

20.4.5.2 [no] sflow sample output interface

By default, sFlow samples include information about the output interface of the sampled packet. The **no sflow sample output interface** command prevents sFlow from including that information.

Command Mode

Global Configuration

Command Syntax

no sflow sample output interface

Example

This command configures sFlow to not include output interface information in samples.

```
switch(config)# no sflow sample output interface
switch(config)#
```

20.4.5.3 sflow destination

The **sflow destination** command specifies an sFlow collector IP address and UDP port. The switch supports sFlow collector addresses through multiple sFlow destination commands in ***running-config***.

The **no sflow destination** and **default sflow destination** commands remove the specified sFlow collector IP address by deleting the corresponding **sflow destination** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

sflow destination ***dest_addr*** [**UDP_PORT**]

no sflow destination ***dest_addr*** [**UDP_PORT**]

default sflow destination ***dest_addr*** [**UDP_PORT**]

Parameters

- ***dest_addr*** sflow collectors IP address.
- **UDP_PORT** sFlow collectors data reception port. Options include:
  - ***no parameter*** port number ***6343*** (default).
  - ***port_num*** port number. Value ranges from ***0*** to ***65535***.

Example

This command configures the switch to send sFlow data to the collector located at ***10.42.15.12***; the collector receives the data through UDP port ***6100***.

```
switch(config)# sflow destination 10.42.15.12 6100
switch(config)#
```

20.4.5.4 sflow enable

The **sflow enable** command enables sFlow on the configuration mode interface when sFlow is globally enabled. By default, sFlow is enabled on all interfaces when sFlow is globally enabled (sflow run). The **sflow enable** command is required only when ***running-config*** contains a **no sflow enable** statement for the specified interface.

The **no sflow enable** command disables sFlow on the configuration mode interface. When sFlow is globally disabled, this command persists in ***running-config*** but has no effect on switch operation.

The **default sflow enable** command removes the corresponding **no sflow enable** command from ***running-config*** enabling sFlow capability on the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

sflow enable

no sflow enable

default sflow enable

Examples

- These commands enable sFlow on the switch and disable sFlow on ***interface ethernet 12***.

```
switch(config)# sflow run
switch(config)# interface ethernet 12
switch(config-if-Et12)# no sflow enable
switch(config-if-Et12)#
```

- This command removes the **no sflow enable** command for ***interface ethernet 12*** from ***running-config***, enabling sFlow on the interface whenever sFlow is globally enabled.

```
switch(config-if-Et12)# sflow enable
switch(config-if-Et12)#
```

20.4.5.5 sflow extension bgp

The **sflow extension bgp** command enables BGP export to sFlow. When enabled, this feature the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

next hop IP

- AS numbers
- AS system path to the destination
- communities
- local pref

The **no sflow extension bgp** and **default sflow extension bgp** commands disable BGP export to sFlow by deleting the corresponding **sflow extension bgp** command from ***running-config***.

Note: A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol chapter for details.

Command Mode

Global Configuration

Command Syntax

sflow extension bgp

no sflow extension bgp

default sflow extension bgp

Guidelines

BGP sFlow export behaves differently on different switch platforms as follows:

- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.
- On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export works for sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of ***0***.
- On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as ***0***.
- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Example

These commands configure a BGP instance in ***AS 50*** and enable BGP sFlow export globally.

```
switch(config)# router bgp 50
switch(config-router-bgp)# exit
switch(config)# sflow extension bgp
switch(config)#
```

20.4.5.6 sflow extension router

By default, the switch provides extended router information in sFlow packets, including the IP version and address of the next-hop router and source and destination mask lengths.

The **no** version of the **`sflow extension router`** command prevents this information from being included in sFlow packets.

The **`sflow extension router`** and **`default sflow extension router`** commands restore the default behavior by deleting the corresponding **`no sflow extension router`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`sflow extension router`

`no sflow extension router`

`default sflow extension router`

Example

This command prevents the switch from including extended router information in sFlow packets.

```
switch(config)# no sflow extension router
switch(config)#
```

20.4.5.7 sflow extension switch

By default, the switch provides extended switch information in sFlow packets, including source and destination VLANs and priorities.

The **no** version of the **`sflow extension switch`** command prevents this information from being included in sFlow packets.

The **`sflow extension switch`** and **`default sflow extension switch`** commands restore the default behavior by deleting the corresponding **`no sflow extension switch`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`sflow extension switch`

`no sflow extension switch`

`default sflow extension switch`

Example

This command prevents the switch from including extended switch information in sFlow packets.

```
switch(config)# no sflow extension switch
switch(config)#
```

20.4.5.8 sflow polling-interval

The **`sflow polling-interval`** command specifies the counters polling interval. The switch uses this interval to schedule a ports counter data transmissions to the sFlow collector.

The default interval is two seconds.

The **`no sflow polling-interval`** and **`default sflow polling-interval`** commands revert the polling interval to the default of two seconds by removing the **`sflow polling-interval`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`sflow polling-interval` ***interval_period***

`no sflow polling-interval`

`default sflow polling-interval`

Parameters

interval_period polling interval (seconds). Value ranges from ***0*** to ***3600*** (***60*** minutes). Default is ***2***.

Example

This command configures the switch to send sFlow counter data every ***10*** seconds.

```
switch(config)# sflow polling-interval 10
switch(config)#
```

20.4.5.9 sflow run

The **sflow run** command globally enables sFlow on the switch. The default sFlow global setting is ***disabled***. sFlow cannot be enabled on individual interfaces when it is globally disabled.

The sflow enable interface configuration command controls sFlow operation on individual Ethernet and port channel interfaces when sFlow is globally enabled. When sFlow is enabled globally, sFlow is also enabled on all interfaces by default.

The **no sflow run** and **default sflow run** commands globally disable sFlow on the switch.

Command Mode

Global Configuration

Command Syntax

sflow run

no sflow run

default sflow run

Examples

- This command enables sFlow on the switch.

```
switch(config)# sflow run
switch(config)#
```

- This command globally disables sFlow.

```
switch(config)# no sflow run
switch(config)#
```

20.4.5.10 sflow sample

The **sflow sample** command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events; the packet sampling rate defines the average number of ingress packets that pass through an interface for every packet that is sampled. A rate of ***16384*** corresponds to an average sample of one per ***16384*** packets. The switch may drop samples if it cannot handle the configured sample rate. Under normal operation, the maximum packet sample rate is one per ***16384*** packets. Higher sampling rates can be specified with the **dangerous** option.

By default, samples include information about the output interface. To remove this information, use the [no] sflow sample output interface command.

The **sflow sample** command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

The **no sflow sample** and **default sflow sample** commands reset the packet sampling rate to the default of ***1048576*** and remove output interface and traffic class information from samples by removing the **sflow sample** command from the configuration.

Command Mode

Global Configuration

Command Syntax

sflow sample TRUNCATE SAMPLE_RATE[rewrite dscp]

no sflow sample

default sflow sample

Parameters

SAMPLE_RATE size of the packet sample from which one packet is selected. Default sample size is 1048576 packets. Options include:

- ***recommended_rate*** Integer between ***16384*** and ***16777215***.
  - **dangerous *any_rate*** permits overriding the recommended range of sampling rates. The ***any_rate*** value range varies by platform:
    - **fm6000 *1*** to ***65535***.
    - **trident *1*** to ***16777216***.
- **rewrite dscp** configures sFlow to rewrite the DSCP field of sample packets to indicate the traffic class of the original packet.
- **TRUNCATE** sFlow sample truncation size between the range of ***128*** to ***512***. By default, the sFlow sample truncate size is set to ***128***. Note, this option is hidden.

Examples

- This command configures the sFlow sampling rate as ***65536*** (one per ***65536*** packets).

```
switch(config)# sflow sample 65536
switch(config)#
```

- This command configures the sFlow sampling rate as ***256*** (one per ***256*** packets).

```
switch(config)# sflow sample dangerous 256
switch(config)#
```

- This command configures sFlow to include traffic class information in samples.

```
switch(config)# sflow sample rewrite dscp
switch(config)#
```

20.4.5.11 sflow source

The **`sflow source`** command specifies the IP address used in the **Agent** address filed of the IPv4 sFlow datagram that the switch sends to the collector. This command cannot be used if ***running-config*** contains an sflow source-interface command.

The **`no sflow source`** and **`default sflow source`** commands remove the **`sflow source`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`sflow source` ***source_addr***

`no sflow source`

`default sflow source`

Parameter

source_addr source IP address (dotted decimal notation).

Example

This command configures ***10.2.9.21*** as the sFlow source address.

```
switch(config)# sflow source 10.2.9.21
switch(config)#
```

20.4.5.12 sflow source-interface

The **sflow source-interface** command specifies the source IP address that is set to the IP's of the specified interfaces that the switch sends to the collector. Both, the Agent address in the IPv4 sFlow datagram as well as the source IP address sent to the collector are specified in sFlow packet. This command cannot be used if ***running-config*** contains an sflow source command.

The **no sflow source-interface** and **default sflow source-interface** commands remove the **sflow source-interface** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

sflow source-interface **INT_NAME**

no sflow source-interface

default sflow source-interface

Parameters

INT_NAME Interface type and number. Options include:

- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by ***l_num***.
- **interface management *m_num*** Management interface specified by ***m_num***.
- **interface port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command configures the sFlow source address as the IP address assigned to the ***loopback 0*** interface.

```
switch(config)# sflow source-interface loopback 0
switch(config)#
```

20.4.5.13 show sflow

The **show sflow** command displays configured sFlow parameters, operational status, and statistics.

The show sflow interfaces command displays the interfaces where sFlow is enabled.

Command Mode

EXEC

Command Syntax

show sflow [detail]

Parameters

detail adds hardware sampling status and number of discarded samples to the information displayed.

Examples

- This command displays the base sFlow information.

```
switch# show sflow
! Displaying counters that may be stale
sFlow Configuration
-------------------
Destinations: None (default)
Source(s):
 0.0.0.0 ( default ) ( VRF: default )

20.4.5.14 show sflow interfaces

The **show sflow interfaces** command displays the interfaces where sFlow is enabled.

The show sflow command displays configured sFlow parameters, operational status, and statistics.

Command Mode

EXEC

Command Syntax

show sflow interfaces

Examples

- This command displays the show sflow interface message when sFlow is globally disabled.

```
switch# show sflow interfaces
sFlow Interface (s):
--------------------
sFlow is not running
```

- This command displays the show sflow interface message when sFlow is globally enabled and enabled on all interfaces.

```
switch(config)# sflow run
switch(config)# show sflow interfaces
Default sFlow configuration for an interface: Disable
sFlow Interface (s):
--------------------
Ethernet1  running(Counter)
Ethernet2  running(Counter)
Ethernet3  running(Flow,Counter)
Ethernet4  running(Flow,Counter)
Ethernet5  running(Flow,Counter)
```

20.5 SNMP

This chapter describes the Arista switch SNMP agent and contains these sections:

20.5.1 SNMP Introduction

Arista Networks switches support many standard SNMP MIBs, making it easier to integrate these platforms into existing network management infrastructures.

With only a few configurations, many public domain and commercially available network management tools can quickly manage Arista switches out of the box. Support of SNMP V2 groups and views and V3 security allow network managers to tune switch monitoring to match the administration policy of the IT organization.

20.5.2 SNMP Conceptual Overview

Simple Network Management Protocol (SNMP) is a protocol that provides a standardized framework and a common language to monitor and manage network devices.

20.5.2.1 SNMP Structure

The SNMP framework has three parts:

- **SNMP manager**: The SNMP manager controls and monitors network host activities and is typically part of a Network Management System (NMS).
- **SNMP agent**: The SNMP agent is the managed device component that manages and reports device information to the manager.
- **Management Information Base (MIB)**: The MIB stores network management information.

The agent and MIB reside on the switch. Enabling the SNMP agent requires the definition of the manager-agent relationship. The agent contains MIB variables whose values the manager can request or change. The agent gathers data from the MIB and responds to requests for information. For a list of supported MIBs, refer to the release notes for the specific EOS version.

This chapter discusses enabling the SNMP agent on an Arista switch and controlling notification transmissions from the agent. Information on using SNMP management systems is available in the appropriate documentation for the corresponding NMS application.

20.5.2.2 SNMP Notifications

SNMP notifications are messages, sent by the agent, informing of an event or a network condition. A ***trap*** is an unsolicited notification. An ***inform*** (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.

For a list of supported traps, refer to the release notes for the specific EOS version.

20.5.2.3 SNMP Versions

Arista switches support the following SNMP versions:

- **SNMPv1**: The Simple Network Management Protocol, defined in ***RFC 1157***. Security is based on community strings.

- **SNMPv2c**: Community-string based Administrative Framework for SNMPv2, defined in ***RFC 1901***, ***RFC 1905***, and ***RFC 1906***. Security is based on SNMPv1.
- **SNMPv3**: Version 3, as defined in ***RFC 2273*** to ***RFC 2275***.

20.5.2.4 SNMP Authentication and Encryption Methods

The following are the SNMP stronger Authentication and Encryption methods:

- **Authentication**
  - MD5
  - SHA-1
  - SHA-224
  - SHA-256
  - SHA-384
  - SHA-512
- **Encryption**
  - AES
  - DES
  - AES-192
  - AES-256

Note: Use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperability issues.

- When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
- When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

20.5.3 Configuring SNMP

This section describes the steps that configure the switch SNMP agent to communicate with an SNMP manager, including the following:

- Enabling and Disabling SNMP
- Enabling SNMP in a VRF
- Configuring Community Access Control
- Configuring SNMP Parameters
- Configuring the Agent to Send Notifications
- Extending the SNMP Agent Through Runtime Scripts
- SNMP IP Address ACL Support

20.5.3.1 Enabling and Disabling SNMP

SNMP is enabled globally by issuing any snmp-server community or snmp-server user command. The no snmp-server command disables SNMP agent operation by removing all non-default **`snmp-server`** commands from ***running-config***.

20.5.3.2 Enabling SNMP in a VRF

By default, SNMP is enabled only in the **default** VRF. The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled.

To enable or disable SNMP in a VRF, use the snmp-server vrf command.

20.5.3.3 Configuring Community Access Control

SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. A Network Management System (NMS) can access the switch only if its community string matches at least one of the switch's community strings.

The snmp-server community command configures the community string.

Example

This command adds the community string ***ab_1*** to provide read-only access to the switch agent.

```
switch(config)# snmp-server community ab_1 ro
switch(config)#
```

Community statements can reference views to limit MIB objects that are available to a manager. A view is a community string object that specifies a subset of MIB objects. The snmp-server view command configures the community string.

Examples

- These commands create a view that includes all objects in the ***system*** group except for those in ***system.2***.

  ```
  switch(config)# snmp-server view sys-view system include
  switch(config)# snmp-server view sys-view system.2 exclude
  switch(config)#
  ```

- This command adds the community string ***lab_1*** to provide read-only access to the switch agent for the previously defined view.

  ```
  switch(config)# snmp-server community lab_1 view sys-view
  switch(config)#
  ```

20.5.3.4 Configuring SNMP Parameters

This section describes these SNMP parameter configuration tasks:

- Configuring the Engine ID
- Configuring the Group
- Configuring the User
- Configuring the Host
- Enabling Link Trap Generation
- Specifying the Source Interface
- Configuring the Chassis-id String
- Configuring the Contact String
- Configuring the Location String

20.5.3.4.1 Configuring the Engine ID

The **`snmp-server engineID remote`** command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. Use the **`snmp-server engineID local`** command for the local engine.

A remote agent's engine ID must be configured before remote users for that agent are configured. User authentication and privacy digests are derived from the engine ID and user passwords. The configuration command fails if the remote engine ID is not configured first.

Note: When the remote engine ID is changed, all user passwords associated with the engine must be reconfigured.

Example

This command configures ***DC945798CAB4*** as the name of the remote SNMP engine located at ***12.23.104.25***, UDP ***port 162***

```
switch(config)# snmp-server engineID remote 10.23.104.25 udp-port
 DC945798CA
switch(config)#
```

20.5.3.4.2 Configuring the Group

An SNMP group grants specific levels of SNMP access to group users. The snmp-server group command configures a new SNMP group.

This command configures ***normal_one*** as an SNMPv3 group (authentication and encryption) that provides access to the ***all-items*** read view.

```
switch(config)# snmp-server group normal_one v3 priv read all-items
switch(config)#
```

20.5.3.4.3 Configuring the User

Members of SNMP groups are called ***users***. The snmp-server user command allows a new user to be added an SNMP group and configures that user's parameters. Remote users are configured by specifying the IP address or port number that accesses the user's SNMP agent.

Example

- This command configures the local SNMPv3 user ***tech-1*** as a member of the SNMP group ***tech-sup***.

  ```
  switch(config)# snmp-server user tech-1 tech-sup v3
  switch(config)#
  ```

- This command configures the remote SNMPv3 user ***tech-2*** as a member of the SNMP group ***tech-sup***. The remote user is on the agent located at ***13.1.1.4***.

  ```
  switch(config)# snmp-server user tech-2 tech-sup remote 13.1.1.4 v3
  switch(config)#
  ```

20.5.3.4.4 Configuring the Host

The snmp-server host command configures an SNMP host (to which SNMP traps will be sent). The **`snmp-server host`** command sets the community string if it was not previously configured.

Example

This command adds a v2c inform notification recipient at ***12.15.2.3*** using the community string ***comm-1***.

```
switch(config)# snmp-server host 12.15.2.3 informs version 2c comm-1
switch(config)#
```

20.5.3.4.5 Enabling Link Trap Generation

The snmp trap link-change command enables SNMP link trap generation on the configuration mode interface. SNMP link trap generation is enabled by default. If SNMP link trap generation was previously disabled, this command removes the corresponding **no snmp link-status** statement from the configuration. The show snmp notification command displays the SNMP link trap generation information.

Example

This command disables SNMP link trap generation on the ***interface ethernet 5***.

```
switch(config-if-Et5)# no snmp trap link-change
switch(config-if-Et5)#
```

20.5.3.4.6 Specifying the Source Interface

The snmp-server local-interface command specifies the interface from where an SNMP trap originates. The show snmp local-interface command displays the interface of the IP address for SNMP traps.

Example

This command configures the ***ethernet 1*** interface as the source of SNMP traps and informs.

```
switch(config)# snmp-server local-interface ethernet 1
switch(config)#
```

20.5.3.4.7 Configuring the Chassis-id String

The chassis ID string is typically set to the serial number of the switch. The SNMP manager uses this string to associate all data retrieved from the switch with a unique identifying label. Under normal operating conditions, editing the chassis ID string contents is unnecessary.

The snmp-server chassis-id command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The show snmp command displays the chassis ID.

Example

This command configures ***xyz-1234*** as the chassis-ID string, then displays the result.

```
switch(config)# snmp-server chassis-id xyz-1234
switch(config)# show snmp
Chassis: xyz-1234  <---chassis ID
8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
21 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to taccon.162
```

```
SNMP agent enabled
switch(config)#
```

20.5.3.4.8 Configuring the Contact String

The SNMP contact string is information text that typically displays the name of a person or organization associated with the SNMP agent.

The snmp-server contact command configures the system contact string. The contact string is displayed by the show snmp and show snmp v2-mib contact commands.

Example

These commands configure ***Bonnie H at 3-1470*** as the contact string.

```
switch(config)# snmp-server contact Bonnie H at 3-1470
switch(config)#
```

20.5.3.4.9 Configuring the Location String

The location string typically provides information about the physical location of the SNMP agent. The snmp-server location command configures the system location string. By default, the system location string is not set.

Example

These commands configure ***lab-25*** as the location string.

```
switch(config)# snmp-server location lab_25
switch(config)# show snmp v2-mib location
Location: lab_25
switch(config)#
```

20.5.3.5 Configuring the Agent to Send Notifications

The following tasks are mandatory when setting up the SNMP agent to send notifications:

1. Configure the remote engine ID.
2. Configure the group.
3. Configure the user.
4. Configure the host.
5. Enable link trap generation on the interfaces.

Configuring SNMP Parameters describes each of these tasks.

20.5.3.6 Extending the SNMP Agent Through Runtime Scripts

The switch supports the execution of user supplied scripts to service portions of the OID space.

Scripts run under one of two operational modes:

- **Normal mode** scripts run over an indefinite period to process subsequent objects after the initial request. Maintaining an executing script avoids startup and connection delay each time an object requires processing.
- **One-shot mode** scripts process a single object, then terminate execution; requires the **one-shot** keyword.

Startup and data collection overhead is required for each request. In both modes, the SNMP server is blocked from serving other requests when waiting for script responses.

The snmp-server extension command configures the execution of user-supplied scripts to service portions of the OID space. Use the **one-shot** keyword to specify one-shot execution.

Examples

- This command specifies the file ***normal-example.sh***, located in flash as the script file that services the specified OID space in normal mode.

```
switch(config)# snmp-server extension .1.3.6.1.4.1.8072.2 flash:normal-
example.sh
switch(config)#
```

- Contents of the script file:

```
#!/bin/bash
while read cmd; do
   case $cmd in
      PING)
      printf "PONG\n"      ;;
      get)
      read oid
      printf "$oid\n"
      printf "integer\n"
      printf "42\n"      ;;      *)
      printf "NONE\n"
      ;;    esac
done
```

- Testing the script:

```
switch(config)# show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
switch(config)#
```

- This command specifies the file ***one-shot-example.sh***, located in flash as the script file that services the specified OID space in one-shot mode, executing once and then exiting.

```
switch(config)# snmp-server extension .1.3.6.1.4.1.8072.2 flash:one-sho
t-example.sh one-shot
switch(config)#
```

- Contents of the script file:

```
#!/bin/bash
oid="$2"
printf "$oid\n"
printf "integer\n"
printf "42\n"
```

- Testing the script:

```
switch(config)# show snmp mib get .1.3.6.1.4.1.8072.2 NET-SNMP-EXAM
PLES-MIB::netSnmpExamples = INTEGER: 42
```

20.5.3.6.1 Normal Script Behavior

The first time the SNMP server requires a script result, it launches it with no arguments. The server communicates with the script through **stdin/stdout**. Before each request, the script is sent the string **PING\n** on **stdin**. The expected response from the script is printing **PONG\n** to **stdout**.

GET and GETNEXT Requests

For **GET** and **GETNEXT** requests, the script is passed two lines on **stdin**, the command (**get** or **getnext**) and the requested OID. The expected response from the script is the printing of three lines to **stdout**: the OID for the result varbind, the **TYPE**, and the **VALUE** itself.

Table 73: Extension Script Type and Encoding lists legal TYPE values and resulting VALUE encodings. If the command does not return an appropriate varbind, it should print **NONE\n** to **stdout** and continue running; this results in an SNMP **`noSuchName`** error or a **`noSuchInstance`** exception.

Table 73: Extension Script Type and Encoding

Type string	SNMP type	Encoding for script
integer	Integer32	integer
unsigned	Unsigned32	integer
gauge	Gauge32	integer
counter	Counter32	integer
counter64	Counter64	integer
timetick	TimeTicks	integer
ipaddress	IpAddress	a.b.c.d
objectid	ObjectID	1.3.6.1.42.99.2468
octet	OctetString	hexadecimal string
opaque	Opaque	hexadecimal string
string	OctetString	ascii string

SET Requests

For **SET** requests, script is passed three lines on stdin: the command (set), and the requested OID, and the **TYPE** and **VALUE**, both on the same line. If the assignment is successful, the expected script response is to print **DONE\n** to **stdout**. Indicated errors by writing one of the error strings described in **Set Request Error Strings** In each case, the command should continue running.

Table 74: Set Request Error Strings

authorization-error	no-access	too-big
bad-value	no-creation	undo-failed
commit-failed	no-such-name	wrong-type
gen-error	not-writable	wrong-length
inconsistent-name	read-only	wrong-encoding
inconsistent-value	resource-unavailable	wrong-value

20.5.3.6.2 One-Shot Script Behavior

The command should exit after it finishes processing a single object.

GET and GETNEXT

For each **GET** or **GETNEXT** request, the script is invoked once for each OID in the space that it serves. It receives two arguments: -g for **GET** or -n for **GETNEXT**, and the requested OID.

The expected script response is the response varbind as three separate lines printed to stdout: the result OID, the type, and the value.

If the command does not return an appropriate varbind, then the script should exit without producing any output. This results in an SNMP **noSuchName** error, or a **noSuchInstance** exception.

Possible reasons that a command would not return an appropriate varbind includes:

- The specified OID didn't correspond to a valid instance for a **GET** request.
- There were no following instances for a **GETNEXT**.

SET

A SET request results in the command being called with the arguments: -s, **OID**, **TYPE** and **VALUE**, where **TYPE** is a listed token. Normal Script Behavior indicates the type of the value passed as the third parameter.

When the assignment is successful, the script exits without producing any output. Errors are indicated by writing just the error name (Normal Script Behavior); the agent generates the appropriate error response.

20.5.3.7 SNMP IP Address ACL Support

SNMP IP address ACL support provides the ability to add access-lists to limit the source addresses that can be used to query the SNMP server. The access-lists are reachable on the switch through the access SNMP data (***port 161***). The access-lists contain standard **`permit`** and **`deny`** commands.

20.5.3.7.1 Configuration

Use the following command to add SNMP IP address ACL support:

`[no | default] snmp-server` **[[ipv4 access-list *IP4_ACL*] | [ipv6 access-list *IP6_ACL*]][vrf *VRF*]**

When the ***VRF*** is not specified, **`default`** is assumed.

20.5.3.7.2 Show Commands

Use the **`show snmp ipv4 access-list summary`** command to display an abreviated output of an IPv4 access-list.

Example

```
switch# show snmp ipv4 access-list summary
IPv4 ACL Permit169
 Total rules configured: 2
Configured on VRFs: red VRF

IPv4 ACL Permit168
Total rules configured: 2
Configured on VRFs: default VRF
Active on VRFs: default VRF
```

Use the **show snmp ipv4 access-list detail** command to display a detailed output of an IPv4 access-list.

Example

```
switch# show snmp ipv4 access-list detail
IP Access List Permit169
10 permit ip 192.169.199.0/24 any [match 7 packets, 0:19:56 ago]
20 deny ip any any [match 13 packets, 0:03:56 ago]
Total rules configured: 2
Configured on VRFs: red VRF

IP Access List Permit168
10 permit ip 192.168.199.0/24 any [match 7 packets, 0:27:00 ago]
20 deny ip any any [match 13 packets, 0:04:30 ago]
Total rules configured: 2
Configured on VRFs: default VRF
Active on VRFs: default VRF
```

Use the **show snmp ipv4 access-list IPv4ACL** command to display a configured access-list. In this example, the configured access-list is ***Permit169***.

Example

```
switch# show snmp ipv4 access-list Permit169
IP Access List Permit169
10 permit ip 192.169.199.0/24 any [match 7 packets, 0:20:12 ago]
20 deny ip any any [match 13 packets, 0:04:12 ago]
Total rules configured: 2
Configured on VRFs: red VRF
```

Use the **show snmp ipv4 access-list summary** command to display a summary of an active access-list.

Example

```
switch# show snmp ipv4 access-list summary
! Same ACL configured in multiple VRFs. Both VRFs are listed in
 both the configured
! and the active sessions
IPv4 ACL Permit169
Total rules configured: 2
Configured on VRFs: default VRF
         red VRF
Active on VRFs: default VRF
 red VRF
```

Use the **show snmp ip access-list summary** command to display a short output of the active access-lists.

Example

```
switch# show snmp ip access-list summary
IPv4 ACL Permit169
Total rules configured: 2
Configured on VRFs: default VRF
         red VRF
Active on VRFs: default VRF
```

20.5.4 SNMP Commands

Global Configuration Commands

- no snmp-server
- snmp-server chassis-id
- snmp-server community
- snmp-server contact
- snmp-server enable traps
- snmp-server engineID local
- snmp-server engineID remote
- snmp-server extension
- snmp-server group
- snmp-server host
- snmp-server local-interface
- snmp-server location
- snmp-server qosmib counter-interval
- snmp-server user
- snmp-server view
- snmp-server vrf

Interface Configuration Commands

- snmp trap link-change

Display Commands

- show snmp
- show snmp community
- show snmp engineID
- show snmp group
- show snmp local-interface
- show snmp mib
- show snmp notification
- show snmp notification | grep bridge
- show snmp notification host
- show snmp user
- show snmp v2-mib chassis
- show snmp v2-mib contact
- show snmp v2-mib location
- show snmp view

20.5.4.1 no snmp-server

The **no snmp-server** and **default snmp-server** commands disable Simple Network Management Protocol (SNMP) agent operation by removing all **snmp-server** commands from ***running-config***.

SNMP is enabled with any snmp-server community or snmp-server user command.

Command Mode

Global Configuration

Command Syntax

no snmp-server

default snmp-server

Example

This command disables SNMP agent operation on the switch.

```
switch(config)# no snmp-server
switch(config)#
```

20.5.4.2 show snmp

The **show snmp** command displays SNMP information including the SNMP counter status and the chassis ID string.

Command Mode

EXEC

Command Syntax

show snmp

Example

This command displays SNMP counter status, the chassis ID, the previously configured location string, logging status and destination, and the VRFs in which the SNMP agent is operating.

```
switch> show snmp
Chassis: JFL08320162
Location: 5470ga.dc
2329135 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    38132599 Number of requested variables
    0 Number of altered variables
    563934 Get-request PDUs
    148236 Get-next PDUs
    0 Set-request PDUs
2329437 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    2329135 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to 172.22.22.20.162
SNMP agent configured in VRFs: default
SNMP agent enabled in default VRF
switch>
```

20.5.4.3 show snmp community

The **show snmp community** command displays the Simple Network Management Protocol (SNMP) community access strings configured by the snmp-server community command.

Command Mode

EXEC

Command Syntax

show snmp community

Example

This command displays the list of community access strings configured on the switch.

```
switch> show snmp community
Community name: public
switch>
```

20.5.4.4 show snmp engineID

The **show snmp engineID** command displays the local SNMP engine information configured on the switch.

Command Mode

EXEC

Command Syntax

show snmp engineID

Example

This command displays the ID of the local SNMP engine.

```
switch> show snmp engineid
Local SNMP EngineID: f5717f001c730436d700
switch>
```

20.5.4.5 show snmp group

The **show snmp group** command shows the names of configured SNMP groups along with the security model, and view status of each group.

Command Mode

EXEC

Command Syntax

show snmp group [**GROUP_LIST**]

Parameters

GROUP_LIST the name of the group.

- ***no parameter*** displays information about all groups.
- ***group_name*** the name of the group.

Field Descriptions

- **groupname** name of the SNMP group.
- **security model** security model used by the group: ***v1***, ***v2c***, ***orv3***.
- **readview** string identifying the group's read view. Refer to the show snmp view comaand.
- **writeview** string identifying the group's write view.
- **notifyview** string identifying the group's notify view. This command displays the groups configured on the switch.

Example

```
switch> show snmp group
groupname : normal                              security model:v3 priv
readview  : all                                 writeview: <no writeview
 specified>
notifyview: <no notifyview specified>
switch>
```

20.5.4.6 show snmp local-interface

The **show snmp local-interface** command displays the interface whose IP address is the source address for SNMP traps.

Command Mode

EXEC

Command Syntax

show snmp local-interface

Example

This command displays the source interface for the SNMP notifications.

```
switch> show snmp local-interface
SNMP source interface: Ethernet1
switch>
```

20.5.4.7 show snmp mib

The **show snmp mib** command displays values associated with specified MIB object identifiers (OIDs) that are registered on the switch.

Command Mode

EXEC

Command Syntax

show snmp mib OBJECTS

Parameters

OBJECTS object identifiers for which the command returns data. Options include:

- **get *oid_1*** [***oid_2 ... oid_x***] values associated with each listed OID.
- **get-next *oid_1*** [***oid_2 ... oid_x***] values associated with subsequent OIDs relative to listed OIDs.
- **table *oid*** table associated with specified OID.
- **translate *oid*** object name associated with specified OID.
- **walk *oid*** objects below the specified subtree.

Example

- This command uses the get option to retrieve information about the ***sysORID.1 OID***.

```
switch# show snmp mib get sysORID.1
SNMPv2-MIB::sysORID[1] = OID: TCP-MIB::tcpMIB
```

- This command uses the get-next option to retrieve information about the OID that is after ***sysORID.8***.

```
switch# show snmp mib get-next sysORID.8
SNMPv2-MIB::sysORDescr[1] = STRING: The MIB module for managing TCP
implementations
```

20.5.4.8 show snmp notification

The **show snmp notification** command displays the SNMP trap generation information.

Command Mode

EXEC

Command Syntax

show snmp notification

Example

This command displays the SNMP traps configured on the switch.

```
switch> show snmp notification
  Type                         Name                                 Enabled
---------------------------- ------------------------------------ -------------
  entity                       entConfigChange                      Yes (default)
  entity                       entStateOperDisabled                 Yes (default)
  entity                       entStateOperEnabled                  Yes (default)
  lldp                         lldpRemTablesChange                  Yes (default)
  msdpBackwardTransition       msdpBackwardTransition               Yes
  msdpEstablished              msdpEstablished                      Yes
  snmp                         linkDown                             Yes
  snmp                         linkUp                               Yes
  snmpConfigManEvent           aristaConfigManEvent                 Yes (default)
  switchover                   aristaRedundancySwitchOverNotif      Yes
  test                         aristaTestNotification               Yes
switch>
```

20.5.4.9 show snmp notification host

The **show snmp notification host** command displays information for Simple Network Management Protocol notification. Details include IP address and port number of the Network Management System, notification type, and SNMP version.

Command Mode

EXEC

Command Syntax

show snmp notification host

Field Descriptions

- **Notification host** IP address of the host.
- **udp-port** port number.
- **type** notification type.
- **user** access type of the user.
- **security model** SNMP version used.
- **traps** details of the notification.

Example

This command displays the hosts configured on the switch.

```
switch> show snmp notification host
Notification host: 172.22.22.20    udp-port: 162   type: trap
user: public                       security model: v2c
switch>
```

20.5.4.10 show snmp notification | grep bridge

Use the **show snmp notification | grep bridge** command to display the enabled or disabled status of each trap type.

Command Mode

EXEC

Command Syntax

show snmp notification | grep bridge

Example

```
switch(config)# show snmp notification | grep bridge
bridge     arista-mac-age          Yes
bridge     arista-mac-learn        No
bridge     arista-mac-move         No (aristaMacMove default disabled)
```

20.5.4.11 show snmp user

The **show snmp user** command shows information about Simple Network Management Protocol (SNMP) users. Information that the command displays about each user includes their SNMP version, the engine ID of the host where they reside, and security information

Command Mode

EXEC

Command Syntax

show snmp user [**USER_LIST**]

Parameters

USER_LIST the name of the group.

- ***no parameter*** displays information about all users.
- ***user_name*** specifies name of displayed user.

Example

This command displays information about the users configured on the switch.

```
switch> show snmp user
User name: test
Security model: v3
Engine ID: f5717f001c73010e0900
Authentication protocol: SHA
Privacy protocol: AES-128
Group name: normal
switch>
```

20.5.4.12 show snmp v2-mib chassis

The **show snmp v2-mib chassis** command displays the Simple Network Management Protocol (SNMP) server serial number or the chassis ID string configured by the snmp-server chassis-id command.

Command Mode

EXEC

Command Syntax

show snmp v2-mib chassis

Example

This command displays the chassis ID string.

```
switch> show snmp v2-mib chassis
Chassis: JFL08320162
switch>
```

20.5.4.13 show snmp v2-mib contact

The **show snmp v2-mib contact** command displays the Simple Network Management Protocol (SNMP) system contact string configured by the snmp-server contact command. The command has no effect if a contact string was not previously configured.

Command Mode

EXEC

Command Syntax

show snmp v2-mib contact

Example

This command displays the contact string contents.

```
switch> show snmp v2-mib contact
Contact: John Smith
switch>
```

20.5.4.14 show snmp v2-mib location

The **show snmp v2-mib location** command displays the Simple Network Management Protocol (SNMP) system location string. The snmp-server location command configures system location details. The command has no effect if a location string was not previously configured.

Command Mode

EXEC

Command Syntax

show snmp v2-mib location

Example

This command displays the location string contents.

```
switch> show snmp v2-mib location
Location: santa clara
switch>
```

20.5.4.15 show snmp view

The **show snmp view** command displays the information of a Simple Network Management Protocol configuration and the associated MIB. SNMP views are configured with the snmp-server view command.

Command Mode

EXEC

Command Syntax

show snmp view [**VIEW_LIST**]

Parameters

VIEW_LIST the name of the view.

- ***no parameter*** displays information about all views.
- ***view_name*** the name of the view.

Field Descriptions

- **First column** view name.
- **Second column** name of the MIB object or family.
- **Third column** inclusion level of the specified family within the view.

Example

These commands configure an SNMP view, then displays that view.

```
switch(config)# snmp-server view sys-view system include
switch(config)# snmp-server view sys-view system.2 exclude
switch(config)# show snmp view
sys-view system - included
sys-view system.2 - excluded
```

20.5.4.16 snmp trap link-change

The **snmp trap link-change** command enables Simple Network Management Protocol (SNMP) link-status trap generation on the configuration mode interface. The generation of link-status traps is enabled by default. If SNMP link-trap generation was previously disabled, this command removes the corresponding **no snmp link-status** statement from the configuration to re-enable link-trap generation.

The **no snmp trap link-change** command disables SNMP link trap generation on the configuration mode interface.

The **snmp trap link-change** and **default snmp trap link-change** commands restore the default behavior by removing the **no snmp trap link-change** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration Interface-VXLAN Configuration

Command Syntax

snmp trap link-change

no snmp trap link-change

default snmp trap link-change

Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the **snmp-server vrf** command.

Example

This command disables SNMP link trap generation on the ***interface ethernet 5***.

```
switch(config-if-Et5)# no snmp trap link-change
switch(config-if-Et5)#
```

20.5.4.17 snmp-server chassis-id

The **snmp-server chassis-id** command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The show snmp command displays the chassis ID.

The **no snmp-server chassis-id** and **default snmp-server chassis-id** commands restore the default chassis ID string by removing the **snmp-server chassis-id** command from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server chassis-id ***id_text***

no snmp-server chassis-id

default snmp-server chassis-id

Parameters

id_text chassis ID string

Example

These commands configure ***xyz-1234*** as the chassis-id string, then display the result.

```
switch(config)# snmp-server chassis-id xyz-1234
switch(config)# show snmp
Chassis: xyz-1234<---chassis ID
8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
21 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to taccon.162
SNMP agent enabled
switch(config)#
```

20.5.4.18 snmp-server community

The **snmp-server community** command configures the community string. SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. The Network Management System (NMS) must define a community string that matches at least one of the switch community strings to access the switch.

The **no snmp-server community** and **default snmp-server community** commands remove the community access string from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server community ***string_text*** [**MIB_VIEW**][**ACCESS**][**ACL_NAMES**]

no snmp-server community ***string_text***

default snmp-server community ***string_text***

Parameters

- ***string_text*** community access string.
- **MIB_VIEW** community access availability. Options include:
  - ***no parameter*** community string allows access to all objects.
  - **view** ***view_name*** community string allows access only to objects in the ***view_name*** view.
- **ACCESS** community access availability. Options include:
  - ***no parameter*** read-only access (default setting).
  - **ro** read-only access.
  - **rw** read-write access.
- **ACL_NAMES** community access availability. Options include:
  - ***no parameter*** community string allows access to all objects.
  - ***list_v4*** IPv4 ACL list.
  - **ipv6** ***list_v6*** IPv6 ACL list.
  - **ipv6** ***list_v6 list_v4*** IPv4 and IPv6 ACL list.

Example

This command adds the community string ***lab_1*** to provide read-only access to the switch agent.

```
switch(config)# snmp-server community lab_1 ro
switch(config)#
```

20.5.4.19 snmp-server contact

The **snmp-server contact** command configures the system contact string. The contact is displayed by the show snmp and show snmp v2-mib contact commands.

The **no snmp-server contact** and **default snmp-server contact** commands remove the **snmp-server contact** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server contact ***contact_string***

no snmp-server contact

default snmp-server contact

Parameters

contact_string system contact string.

Example

These commands configure *Bonnie H* as the contact string, then display the result.

```
switch(config)# snmp-server contact Bonnie H
switch(config)# show snmp
Chassis: xyz-1234
Contact: Bonnie H.
8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
24 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to taccon.162
SNMP agent enabled
switch(config)#
```

20.5.4.20 snmp-server enable traps

The **snmp-server enable traps** command enables Simple Network Management Protocol (SNMP) traps. The same command also enables SNMP inform requests. To specify the recipient for notifications, use the snmp-server host command. Sending notifications requires the configuration of at least one host using the snmp-server host command.

The **snmp-server enable traps** and **no snmp-server enable traps** commands, without a trap-type parameter, specify the default notification setting for all trap types. These commands, when specifying a trap type, control notification generation for the specified trap type. The **default snmp-server enable traps** command resets notification generation to the default setting for the specified trap type.

Command Mode

Global Configuration

Command Syntax

snmp-server enable traps [***trap_type***]

no snmp-server enable traps [***trap_type***]

default snmp-server enable trap [***trap_type***]

Parameters

trap_type controls the generation of informs or traps for the specified trap type:

- ***no parameter*** controls notifications for traps not covered by specific commands.
- **entity** controls entity modification notifications.
- **lldp** controls LLDP notifications.
- **msdpBackwardTransition** controls msdpBackwardTransition notifications.
- **msdpEstablished** controls msdpEstablished notifications.
- **snmp** controls SNMP-v2 notifications.
- **switchover** controls switchover notifications.
- **snmpConfigManEvent** controls snmpConfigManEvent notifications.
- **test** controls test trap notifications.

Examples

- These commands enables notification generation for all trap types except entity traps.

```
switch(config)# snmp-server enable traps
switch(config)# no snmp-server enable traps entity
switch(config)#
```

- This command enables notification generation for all five entity traps, regardless of the default setting.

```
switch(config)# snmp-server enable traps entity
switch(config)#
```

- This command resets the entity trap notification generation to follow the default setting.

```
switch(config)# default snmp-server enable traps entity
switch(config)#
```

20.5.4.21 snmp-server engineID local

The **snmp-server engineID local** command configures the name for the local Simple Network Management Protocol (SNMP) engine. The default SNMP engineID is generated by the switch and is used when an engineID is not configured with this command. The show snmp engineID command displays the default or configured engine ID.

SNMPv3 authenticates users through security digests (MD5 or SHA) that are based on user passwords and the local engine ID. Passwords entered on the CLI are similarly converted, then compared to the user's security digest to authenticate the user.

Note: Changing the local engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The **no snmp-server engineID** and **default snmp-server engineID** commands restore the default engineID by removing the **snmp-server engineID** command from the ***running-config***

Command Mode

Global Configuration

Command Syntax

snmp-server engineID local ***engine_hex***

no snmp-server engineID local

default snmp-server engineID

Parameter

engine_hex the switch name for the local SNMP engine (hex string).

The string must consist of at least ten characters with a maximum of ***64*** characters.

Example

This command configures ***DC945798CAB4*** as the name of the local SNMP engine.

```
switch(config)# snmp-server engineID local DC945798CAB4
switch(config)#
```

20.5.4.22 snmp-server engineID remote

The **`snmp-server engineID remote`** command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. The switch generates a default engineID; use the show snmp engineID command to view the configured or default engineID.

An SNMPv3 inform requires a remote engine ID to compute the security digest that authenticates and encrypts data transmitted to remote users. SNMPv3 authenticates users with MD5 or SHA through the engine ID and user passwords. CLI passwords are similarly authenticated.

Note: Changing the engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The **`no snmp-server engineID remote`** and **`default snmp-server engineID remote`** commands remove the **`snmp-server engineID remote`** command from the configuration.

Command Mode

Global Configuration

Command Syntax

`snmp-server engineID remote` ***engine_addr*** [**PORT**] ***engine_hex***

`no snmp-server engineID remote` ***engine_addr*** [**PORT**]

`default snmp-server engineID remote` ***engine_addr*** [**PORT**]

Parameters

- ***engine_addr*** location of remote engine (IP address or host name).
- **PORT** udp port location of the remote engine. Options include:
  - ***no parameter*** port number ***161*** (default).
  - **udp-port** ***port_num*** port number. Ranges from *0* to ***65535***.
- ***engine_hex*** the switch's name for the remote SNMP engine (hex string).

  The string must have at least ten characters and can contain a maximum of ***64*** characters.

Example

This command configures ***DC945798CA*** as the engineID of the remote SNMP engine located at ***10.23.10.25***, UDP ***port 162***.

```
switch(config)# snmp-server engineID remote 10.23.10.25 udp-port 162
 DC945798CA
switch(config)#
```

20.5.4.23 snmp-server extension

The **snmp-server extension** command configures the execution of user supplied scripts to service portions of the OID space.

The **no snmp-server extension** and **default snmp-server extension** commands deletes the **snmp-server extension** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server extension ***OID_space*** **FILE_PATH** [**DURATION**]

Parameters

- ***OID_space*** OID branch serviced by the script, in numerical format.
- **FILE_PATH** path and name of the script file. Options include:
  - **file:** file is located in the switch file directory.
  - **flash:** file is located in flash memory.
- **DURATION** the execution scope of the script.
  - ***no parameter*** script runs after initial request to process subsequent requests.
  - **one-shot** script processes a single object (runs once), then terminates.

Example

This command specifies the file example.sh, located in flash, as the script file that services the listed OID space.

```
switch(config)# snmp-server extension .1.3.6.1.4.1.8072.2 flash:example
.sh
```

20.5.4.24 snmp-server group

The **snmp-server group** command configures a new Simple Network Management Protocol (SNMP) group or modifies an existing group. An SNMP group is a data structure that user statements reference to map SNMP users to SNMP contexts and views, providing a common access policy to the specified users.

An SNMP context is a collection of management information items accessible by an SNMP entity. Each item of may exist in multiple contexts. Each SNMP entity can access multiple contexts. A context is identified by the EngineID of the hosting device and a context name.

The **no snmp-server group** and **default snmp-server group** commands delete the specified group by removing the corresponding **snmp-server group** command from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server group ***group_name*** **VERSION** [**CNTX**][**READ**][**WRITE**][**NOTIFY**]

no snmp-server group ***group_name*** **VERSION**

default snmp-server group ***group_name*** **VERSION**

Parameters

- ***group_name*** the name of the group.
- **VERSION** the security model utilized by the group.
  - **v1** SNMPv1. Uses a community string match for authentication.
  - **v2c** SNMPv2c. Uses a community string match for authentication.
  - **v3 no auth** SNMPv3. Uses a username match for authentication.
  - **v3 auth** SNMPv3. HMAC-MD5 or HMAC-SHA authentication.
  - **v3 priv** SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- **CNTX** associates the SNMP group to an SNMP context.
  - ***no parameter*** command does not associate group with an SNMP context.
  - **context** ***context_name*** associates group with context specified by ***context_name***.
- **READ** specifies read view for SNMP group.
  - ***no parameter*** command does not specify read view.
  - **read** ***read_name*** read view specified by ***read_name*** (string maximum 64 characters).
- **WRITE** specifies write view for SNMP group.
  - ***no parameter*** command does not specify write view.
  - **write** ***write_name*** write view specified by ***write_name*** (string maximum 64 characters).
- **NOTIFY** specifies notify view for SNMP group.
  - ***no parameter*** command does not specify notify view.
  - **notify** ***notify_name*** notify view specified by ***notify_name*** (string maximum 64 characters).

Example

This command configures ***normal_one*** as SNMP version 3 group (authentication and encryption) that provides access to the **all-items read view**.

```
switch(config)# snmp-server group normal_one v3 priv read all-items
switch(config)#
```

20.5.4.25 snmp-server host

The **snmp-server host** command configures an SNMP host (to which SNMP traps will be sent) and sets the community string if it was not previously configured. The host is denoted by host location and community string. The command also specifies the type of SNMP notifications that are sent: a trap is an unsolicited notification; an inform is a trap that includes a request for a confirmation that the message is received

The configuration can contain multiple statements to the same host location with different community strings. For instance, a configuration can simultaneously contain all of the following:

- **snmp-server host host-1 version 2c comm-1**
- **snmp-server host host-1 informs version 2c comm-2**
- **snmp-server host host-1 version 2c comm-3 udp-port 666**
- **snmp-server host host-1 version 3 auth comm-3**

The **no snmp-server host** and **default snmp-server host** commands remove the specified host by deleting the corresponding **snmp-server host** statement from the configuration. When removing a statement, the host (address and port) and community string must be specified.

Command Mode

Global Configuration

Command Syntax

snmp-server host ***host_id*** [**VRF_INST**][**MESSAGE**][**VERSION**] ***comm_str*** [**PORT**]

no snmp-server host ***host_id*** [**VRF_INST**][**MESSAGE**][**VERSION**] ***comm_str*** [**PORT**]

default snmp-server host ***host_id*** [**VRF_INST**][**MESSAGE**][**VERSION**] ***comm_str*** [**PORT**]

Parameters

- ***host_id*** hostname or IP address of the SNMP host.
- **VRF_INST** specifies the VRF instance being modified.
  - ***no parameter*** changes are made to the default VRF.
  - **vrf *vrf_name*** changes are made to the specified user-defined VRF.
- **MESSAGE** message type that is sent to the host.
  - ***no parameter*** sends SNMP traps to host (default).
  - **informs** sends SNMP informs to host.
  - **traps** sends SNMP traps to host.
- **VERSION** SNMP version. Options include:
  - ***no parameter*** SNMPv2c (default).
  - **version 1** SNMPv1; option not available with informs.
  - **version 2c** SNMPv2c.
  - **version 3 noauth** SNMPv3; enables user-name match authentication.
  - **version 3 auth** SNMPv3; enables MD5 and SHA packet authentication.
  - **version 3 priv** SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- ***comm_str*** community string to be sent with the notification as a password.

  Arista recommends setting this string separately before issuing the **snmp-server host** command. To set the community string separately, use the snmp-server community command.
- **PORT** port number of the host.
  - ***no parameter*** socket number set to ***162*** (default).
  - **udp-port *p-name*** socket number specified by ***p-name***.

Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the snmp-server vrf command.

Example

This command adds a **version 2c** inform notification recipient.

```
switch(config)# snmp-server host 10.15.2.3 informs version 2c comm-1
switch(config)#
```

20.5.4.26 snmp-server local-interface

The **snmp-server local-interface** command specifies the interface where SNMP originates informs and traps.

The **no snmp-server local-interface** and **default snmp-server local-interface** commands remove the inform or trap source assignment by removing the **snmp-server local-interface** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server local-interface INTERFACE

no snmp-server local-interface

default snmp-server local-interface

Parameters

INTERFACE Interface type and number. Values include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vrf *vrf_name*** The VRF in which SNMP is enabled. The keyword **default** specifies the default VRF.

Example

This command configures ***interface ethernet 1*** as the source of SNMP traps and informs.

```
switch(config)# snmp-server local-interface ethernet 1
switch(config)#
```

20.5.4.27 snmp-server location

The **snmp-server location** command configures the system location string. By default, no system location string is set.

The **no snmp-server location** and **default snmp-server location** commands delete the location string by removing the **snmp-server location** command from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server location ***node_locate***

no snmp-server location

default snmp-server location

Parameters

node_locate system location information (string).

Example

These commands configure ***lab-east*** as the location string.

```
switch(config)# snmp-server location lab_east
switch(config)#
```

20.5.4.28 snmp-server qosmib counter-interval

The **snmp-server qosmib counter-interval** command configures the interval (in seconds) after which the QoS counters are updated periodically. By default the counter updates are disabled.

Command Mode

Global Configuration

Command Syntax

snmp-server qosmib counter-interval ***timer_interval***

no snmp-server qosmib counter-interval

default snmp-server qosmib counter-interval

Parameter

timer_interval Update interval for refreshing QoS counters (in seconds) between (***10***-***600***).

Example

The following command configures a interval of ***50*** seconds after which the QoS counters are updated periodically.

```
switch(config)# snmp-server qosmib counter-interval 50
```

20.5.4.29 snmp-server user

The **`snmp-server user`** command adds a user to a Simple Network Management Protocol (SNMP) group or modifies an existing user's parameters.

To configure a user, the IP address or port number of the device where the user's remote SNMP agent resides must be specified. A user's authentication come from the engine ID and the user's password. Remote user configuration commands fail if the remote engine ID is not configured first.

The **`no snmp-server user`** and **`default snmp-server user`** commands remove the user from an SNMP group by removing the user command from ***running-config***.

Note: Use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperability issues.

- When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
- When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

Command Mode

Global Configuration

Command Syntax

`snmp-server user` ***user_name group_name*** [**AGENT**] **VERSION** [**ENGINE**][**SECURITY**]

`no snmp-server user` ***user_name group_name*** [**AGENT**] **VERSION**

`default snmp-server user` ***user_name group_name*** [**AGENT**] **VERSION**

Parameters

- ***user_name*** name of user.
- ***group_name*** name of group to which user is being added.
- **AGENT** Options include:
  - ***no parameter*** local SNMP agent.
  - **remote *addr*** [**udp-port *p_num***] remote SNMP agent location.
- ***addr*** denotes the IP address; ***p_num*** denotes the udp port socket (default port is ***162***).
- **VERSION** SNMP version; options include:
  - **v1** SNMPv1.
  - **v2c** SNMPv2c.
  - **v3** SNMPv3.
- **ENGINE** engine ID used to localize passwords. Available only if **VERSION** is **v3**.
  - ***no parameter*** Passwords localized by SNMP copy specified by ***agent***.
  - **localized *engineID*** octet string of engineID.
- **SECURITY** Specifies authentication and encryption levels. Available only if **VERSION** is **v3**. Encryption is available only when authentication is configured.
  - ***no parameter*** no authentication or encryption.
  - **auth *a_meth a_pass*** [**priv *e_meth e_pass***] authentication parameters.
  - ***a_meth*** authentication method: options are **md5** (HMAC-MD5-96) and **sha** (HMAC-SHA-96).
  - ***a-pass*** authentication string for users receiving packets.
  - ***e-meth*** encryption method: Options are **aes** (AES-128) and **des** (CBC-DES).
  - ***e-pass*** encryption string for the users sending packets.

Example

This command configures the remote SNMP user ***tech-1*** to the ***tech-sup*** SNMP group.

```
switch(config)# snmp-server user tech-1 tech-sup remote 10.1.1.2 v3
```

20.5.4.30 snmp-server view

The **snmp-server view** command defines a view.

An SNMP view defines a subset of objects from an MIB. Every SNMP access group specifies views, each associated with read or write access rights, to allow or limit the group's access to MIB objects.

The **no snmp-server view** command deletes a view entry by removing the corresponding **snmp-server view** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server view *view_name* [*family_name*] INCLUSION

no snmp-server view *view_name* [***family_name***]

default snmp-server view *view_name* [***family_name***]

Parameters

- ***view_name*** Label for the view record that the command updates. Other commands reference the view with this label.
- ***family_name*** name of the MIB object or family.

  MIB objects and MIB subtrees can be identified by name or by the numbers representing the position of the object or subtree in the MIB hierarchy.
- **INCLUSION** inclusion level of the specified family within the view. Options include:
  - **include** view includes the specified subtree.
  - **exclude** view excludes the specified subtree.

Example

These commands create a view named **sys-view** that includes all objects in the **system subtree** except for those in ***system.2***.

```
switch(config)# snmp-server view sys-view system include
switch(config)# snmp-server view sys-view system.2 exclude
```

20.5.4.31 snmp-server vrf

The **snmp-server vrf** command enables SNMP in the specified VRF. By default, SNMP is enabled only in **default** VRF.

- User-defined VRFs: The **no snmp-server vrf** command disables SNMP in the specified VRF by removing the corresponding **snmp-server vrf** command from the ***running-config***.
- Default VRF: The **no snmp-server vrf** command disables SNMP in the VRF by adding a **no snmp-server vrf default** statement to the ***running-config*.**

Command Mode

Global Configuration

Command Syntax

snmp-server vrf ***vrf_name***

no snmp-server vrf ***vrf_name***

default snmp-server vrf ***vrf_name***

Parameters

vrf_name The VRF in which SNMP is enabled. The keyword **default** specifies the default VRF.

Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the **snmp-server vrf** command.

Example

These commands disable SNMP in the default VRF, then enable it in the user-defined VRFs named ***magenta*** and ***columbia***.

```
switch(config)# no snmp-server vrf default
switch(config)# snmp-server vrf magenta
switch(config)# snmp-server vrf columbia
switch(config)#
```

20.6 VM Tracer

This chapter describes VM Tracer configuration and usage and contains these sections:

20.6.1 VM Tracer Introduction

VM Tracer is a switch feature that determines the network configuration and requirements of connected VMware hypervisors. The switch uses VMware's SOAP XML API to discover VMware host server components, including:

- instantiated VMs with their network configuration (VLANs and distributed/virtual Switches).
- server hardware IPMI data which can be shown to the network manager.

VM Tracer also supports adaptive auto-segmentation, which automatically provisions and prunes VLANs from server-switched ports as VMs are instantiated and moved within the data center.

20.6.2 VM Tracer Description

Cloud operating systems manage large virtualized computing infrastructures, including software and hardware. Cloud operating systems consist of virtual machines and hypervisors:

- A Virtual Machine (VM) is a software implementation of a computer that operates as running on dedicated physical hardware. Multiple VMs share physical machine resources from a single physical device. Each VM is controlled by its operating system.
- A hypervisor, also called a Virtual Machine Manager (VMM), is software that manages multiple operating systems running concurrently on a physical device.

VM Tracer tracks activity of VMs that are controlled by hypervisors connected to the switch's Ethernet or LAG ports. VM Tracer supports vSphere versions 6.0– 7.0. The vSphere features include Distributed Virtual Switches (DVS) and VM movement among VMware servers (VMotion).

vSphere components include:

- ESX and ESXi: hypervisors that run on VMware host server hardware.
- vCenter: centralized tool that manages multiple servers running VMware hypervisors.
- NSX for vSphere® (NSX-V): network virtualization platform delivering networking and security.

Monitoring VLAN based configurations requires vCenter access. Monitoring VXLAN based configurations requires access to vCenter and NSX-V. The following sections describe topologies that monitor these networks:

20.6.2.1 Monitoring VLAN Based Configurations

vCenter manages ESX hosts and VMs through a central database. VM Tracer identifies interfaces connected to a specified ESX host and sends discovery packets (CDP or LLDP) on interfaces where VM Tracer is enabled. The ESX host updates the vCenter when it receives a discovery packet. VM Tracer reads this data from the vCenter through a SOAP XML API to associate the ESX host to the connected switch ports. The network topology of this configuration is displayed below.

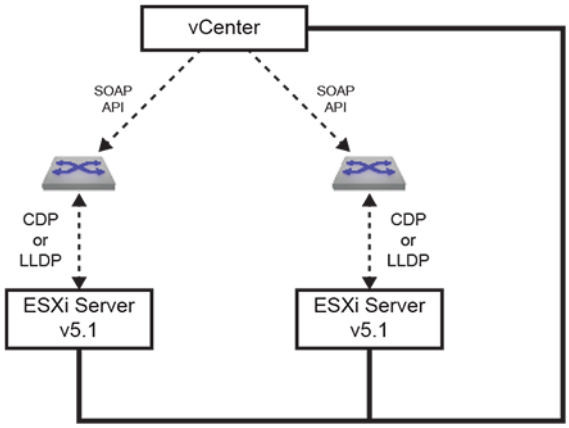

Figure 147: VM Tracer Topology – Monitoring VLAN Based Configurations

VM Tracer connects to a maximum of four vCenters through a SOAP (Simple Object Access Protocol) API to discover VMs in the data centers that the vCenters manage. VM Tracer maintains a list of VMs in the data center and gathers network related information about each VM, including the number of Vnics (virtual network interface card), the MAC address of each Vnic, the switch to which it connects, and the host on which it resides. VM Tracer also identifies the host NICs connected to the switch through the bridge MAC address and the interface port name. VM Tracer then searches for VMs on this host and connected to the vswitch or dvswitch whose uplink is mapped to the connected NIC.

For each connected interface, VM Tracer creates a VM Table that lists its active VMs, sorted by Vnic MAC address. Each VM entry includes its name, Vnic name, VLAN, switch name, datacenter name, and portgroup. An entry is deleted when the corresponding VM is removed, moved to a different host, or its Vnic is no longer part of the vswitch or dvswitch. An entry is added when a VM is created or moved to a host connected to the interface. VM Tracer monitors vCenter for VM management updates. If an interface goes down, all VM entries for that interface are removed from the VM Table.

20.6.2.2 Monitoring VXLAN Based Configurations

Monitoring VXLAN based configurations require access to the NSX for vSphere® (NSX-V), in addition to the configuration described in Monitoring VLAN Based Configurations. Each VM Tracer session can communicate with one NSX-V through a REST interface over XML and gathers VXLAN information by polling it on a 30 second polling cycle. VXLAN data that the switch receives from the NSX-V includes:

- VNI range.
- VXLAN segment.
- Multicast address range.
- network scope.

The network scope specifies the virtual address space the VXLAN segments span and is defined by the server group (cluster) collections within the segments, which in turn contain a collection of distributed virtual switches (DVS) from ESX hosts within the clusters.

VM Tracer uses this information to build a network model. Communications with NSX-V requires a single polling thread that detects network connectivity and constantly updates the local data model.

The network topology of this configuration is displayed below.

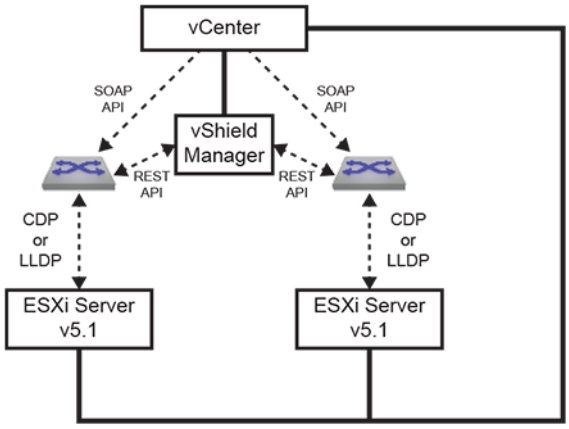

Figure 148: VM Tracer Topology – Monitoring VXLAN Based Configurations

20.6.3 VM Tracer Configuration Procedures

The following sections describe the session configuration process, configuring the NSX-V connection for VXLAN based configurations, and the procedure for enabling VM Tracer on individual interfaces. The switch defines the ***vmtracer*** configuration mode and VMtracer mode:

- ***vmtracer*** configuration mode is a command mode for configuring VM Tracer monitoring sessions.
- VMtracer mode is defines an interface state where discovery packets are sent to attached vSwitches.

20.6.3.1 Configuring vCenter Monitoring Sessions

A VM Tracer session connects the switch to a vCenter server for downloading data about VMs and vSwitches managed by ESX hosts connected to the switch's ports. The switch supports four VM Tracer sessions.

The switch is placed in the ***vmtracer*** configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The **`vmtracer session`** command places the switch in the ***vmtracer*** configuration mode for a specified session. The command either creates a new session or loads an existing session for editing.

Example

This command enters the ***vmtracer*** configuration mode for the ***system_1*** session.

```
switch(config)# vmtracer session system_1
switch(vmtracer-system_1)#
```

In vmtracer configuration mode, the **`url (vmtracer mode)`**, **`username (vmtracer mode)`**, and **`password (vmtracer mode)`** commands specify the location and the account information that authenticates the switch. The URL parameter must reference a fully formed secure URL.

Example

These commands specify the IANA url along with the username and password that allow the switch to access the location.

```
switch(vmtracer-system_1)# url https://example.com/sdk
switch(vmtracer-system_1)# username a-switch_01
switch(vmtracer-system_1)# password abcde
switch(vmtracer-system_1)#
```

Default session settings allow auto-segmentation, or the dynamic allocation and pruning of VLANs when a VM managed by the ESX host connected to the switch is created, deleted, or moved to a different host. The **autovlan disable** command prevents auto-segmentation, regardless of VM activity. The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

Examples

- This command disables auto-segmentation.

```
switch(vmtracer-system_1)# autovlan disable
switch(vmtracer-system_1)#
```

- These commands enable auto-segmentation and limit the list of allowed VLANs to VLAN ***1-2000***.

```
switch(vmtracer-system_1)# no autovlan disable
switch(vmtracer-system_1)# allow-vlan 1-2000
switch(vmtracer-system_1)#
```

The **exit** command returns the switch to the ***global*** configuration mode and enables the VM Tracer session. The ***vmtracer*** configuration mode can be re-entered for this session to edit session parameters.

Example

This command exits vmtracer configuration mode.

```
switch(vmtracer-system_1)# exit
switch(config)#
```

The **no vmtracer session** command disables the session and removes it from ***running-config***.

Example

This command disables and deletes the ***system_1*** VM Tracer session.

```
switch(config)# no vmtracer session system_1
switch(config)#
```

20.6.3.2 Configuring vShield Monitoring Sessions

To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). The ***vmtracer-vxlan*** configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session.

The switch is placed in the ***vmtracer*** configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The **vxlan (vmtracer mode)** command is executed from the ***vmtracer*** mode for a specified session and places the switch in the ***vmtracer-vxlan*** configuration mode for that session. Each VM Tracer session can be associated with one vShield instance.

Example

These commands create the vShield instance for the VMTracer session named ***vnet-1***.

```
switch(config)# vmtracer session vnet-1
switch(config-vmtracer-vnet-1)# vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

In the ***vmtracer-vxlan*** configuration mode, the **url (vmtracer-vxlan mode)**, **username (vmtracer-vxlan mode)**, and **password (vmtracer-vxlan mode)** commands specify

the vShield server's location and the account information that authenticates the switch to the vShield server. The url parameter must reference a fully formed secure url, such as **https://vcshield.democorp.com/sdk**.

Example

These commands specify the vShield's URL along with the username and password that allow the switch to access the vShield server.

```
switch(config-vmtracer-vnet-1-vxlan)# url https://vshieldserver.comp
any1.org/sdk
switch(config-vmtracer-vnet-1-vxlan)# username a-shield_01
switch(config-vmtracer-vnet-1-vxlan)# password home
switch(config-vmtracer-vnet-1-vxlan)#
```

20.6.3.3 Enabling VMtracer Mode

VMtracer mode is an interface setting that enables interfaces to send discovery packets to the connected vSwitch. The **vmtracer** command enables VMtracer mode on the configuration mode interface.

Examples

- These commands enable VMtracer mode on the ***interface Ethernet3***.

  ```
  switch(config)# interface Ethernet3
  switch(config-if-Et3)# vmtracer vmware-esx
  switch(config-if-Et3)#
  ```

  The **no vmtracer** command disables vmtracer mode on the configuration mode interface.
- This command disables vmtracer mode on the ***interface ethernet 3***.

  ```
  switch(config-if-Et3)# no vmtracer vmware-esx
  switch(config-if-Et3)#
  ```

20.6.3.4 Displaying VM Tracer Data

20.6.3.4.1 Displaying Session Status

The **show vmtracer session** command displays information about the specified session.

Without the **detail** parameter, the command displays connection parameters and status for the vCenter associated to the specified session.

Example

This command displays connection parameters for the vCenter associated with the system_1 session.

```
switch# show vmtracer session system_1
    vCenter URL https://vmware-vcenter1/sdk
    username arista
    password arista
    Session Status Disconnected
```

With the **detail** parameter, the command displays connection status and data concerning messages the vCenter previously received from ESX hosts connected to the switch.

Example

This command displays connection parameters and message details for the vCenter associated with the ***system_1*** session.

```
switch# show vmtracer session system_1 detail
    vCenter URL https://vmware-vcenter1/sdk
    username arista
    sessionState Connected
    lastStateChange 19 days, 23:03:59 ago
    lastMsgSent CheckForUpdatesMsg
    timeOfLastMsg 19 days, 23:14:09 ago
    resonseTimeForLastMsg 0.0
    numSuccessfulMsg 43183
    lastSuccessfulMsg CheckForUpdatesMsg
    lastSuccessfulMsgTime 19 days, 23:14:19 ago
    numFailedMsg 1076
    lastFailedMsg CheckForUpdatesMsg
    lastFailedMsgTime 19 days, 23:14:09 ago
    lastErrorCode Error -1 fault: SOAP-ENV:Client [no subcode]
    "End of file or no input: Operation interrupted or timed out after
 600s send
or     600s receive delay"
    Detail: [no detail]
    CheckForUpdates:
```

20.6.3.4.2 Displaying VM Interfaces

The show vmtracer interface command displays the VM interfaces (Vnics) that are active on switch interfaces where vmtracer mode is enabled. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

This command displays the Vnics connected to all VM Tracer-enabled interfaces.

```
switch# show vmtracer interface

Ethernet8 : example.com
    VM Name VM Adapter VLAN Status
    esx3.aristanetworks.com vmk0 0 Up/Down
    vspheremanagement Network adapter 1 0 Up/Down

Ethernet15 : example.om
    VM Name VM Adapter VLAN Status
    Openview Network adapter 1 123 Up/Down
    VmTracerVm Network adapter 1 123 Down/Down

Ethernet23 : example.com
    VM Name VM Adapter VLAN Status

Ethernet24 : example.com
    VM Name VM Adapter VLAN Status
```

20.6.3.4.3 Displaying VMs

The **show vmtracer vm** command displays VM interfaces (Vnics) accessible to the VM Tracer-enabled interfaces. For each active listed VM, the command displays its name, adapter, and the connected hypervisor.

- This command displays the VMs connected to all VM Tracer-enabled interfaces.

```
switch# show vmtracer vm
    VM Name VM Adapter Interface VLAN
```

```
    Openview Network adapter 1 Et15 123
    vspheremanagement Network adapter 1 Et8 0
    VmTracerVm Network adapter 1 Et15 123
    example.com vmk0 Et8 0
```

- This command displays connection data for the VMs connected to all VM Tracer-enabled interfaces.

```
switch# show vmtracer vm detail
VM Name Openview
   intf : Et15
   vnic : Network adapter 1
   mac : 00:0c:29:ae:7e:90
   portgroup : dvPortGroup
   vlan : 123
   switch : vds
   host : example.com
```

20.6.4 VM Tracer Commands

Global Configuration Commands

- vmtracer session

Interface Configuration (Ethernet and Port Channel) Commands

- vmtracer

VMTracer Configuration Commands

- allowed-vlan
- autovlan disable
- password (vmtracer mode)
- source-interface
- url (vmtracer mode)
- username (vmtracer mode)
- vrf (vmtracer mode)
- vxlan (vmtracer mode)

VMTracer-VXLAN Configuration Commands

- password (vmtracer-vxlan mode)
- url (vmtracer-vxlan mode)
- username (vmtracer-vxlan mode)

VM Tracer Display Commands

- show vmtracer all
- show vmtracer interface
- show vmtracer session
- show vmtracer session vcenter
- show vmtracer session vsm
- show vmtracer vm
- show vmtracer vm detail
- show vmtracer vnic counters
- show vmtracer vxlan segment
- show vmtracer vxlan vm

20.6.4.1 allowed-vlan

The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved from the hypervisor connected to the session specified by the vmtracer mode. By default, all VLANs are allowed.

Command Mode

Vmtracer Configuration

Command Syntax

allowed-vlan [**VLAN_LIST**]

no allowed-vlan

default allowed-vlan vlan

Parameters

VLAN_LIST The VLAN list or the edit actions to the current VLAN list. Valid ***v_range*** formats include number, or number range.

- ***v_range*** The list consists of the ***v_range*** VLANs.
- **add *v_range*** The ***v_range*** VLANs are added to the current VLAN list.
- **all** The list consists of all VLANs (***1-4094***).
- **except *v_range*** The list consists of all VLANs except for those specified by ***v_range***.
- **none** The list of VLANs is empty.
- **remove *v_range*** The ***v_range*** VLANs are removed from the current VLAN list.

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Examples

- This command sets the list of allowed VLANs to ***1*** through ***2000***.

```
switch(vmtracer-system_1)# allow-vlan 1-2000
switch(vmtracer-system_1)#
```

- This command adds VLANs to ***2501*** through ***3000***.

```
switch(vmtracer-system_1)# allow-vlan add 2051-3000
switch(vmtracer-system_1)#
```

20.6.4.2 autovlan disable

Default VM Tracer session settings enable auto provisioning, which allows the dynamic assignment and pruning of VLANs when a VM attached to the ESX connected to the switch is created, deleted, or moved to a different ESX host. The autovlan setting controls auto provisioning.

The **autovlan disable** command disables auto provisioning, which prevents the creation or deletion of VLANs regardless of VM activity. The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

The **no autovlan disable** command enables the creation and deletion of VLANs caused by VM activity. This is the default setting.

Command Mode

Vmtracer Configuration

Command Syntax

autovlan disable

no autovlan disable

default autovlan disable

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Example

This command disables dynamic VLAN creation or pruning within the configuration mode VM Tracer session.

```
switch(vmtracer-system_1)# autovlan disable
switch(vmtracer-system_1)#
```

20.6.4.3 password (vmtracer mode)

The **password** command specifies the token that authorizes the username to the vCenter associated with the VM Tracer mode session.

Command Mode

Vmtracer Configuration

Command Syntax

password [**ENCRYPTION**] [*password*]

Parameters

- **ENCRYPTION** encryption level of the password.
  - ***no parameter*** password is a clear-text string.
  - ***0*** the password is a clear-text string. Equivalent to ***no parameter***.
  - **7** the password is an encrypted string.
- ***password*** text that authenticates the username.
  - ***password*** is a clear-text string if **ENCRYPTION** specifies clear text.
  - ***password*** is an encrypted string if **ENCRYPTION** specifies an encrypted string.

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Example

This command configures **abode** as the clear-text string that authorizes the username ***a-switch_01*** located at **example.com/sdk**.

```
switch(vmtracer-system_1)# url https://example.com/sdk
switch(vmtracer-system_1)# username a-switch_01
switch(vmtracer-system_1)# password abcde
switch(vmtracer-system_1)#
```

20.6.4.4 password (vmtracer-vxlan mode)

The **password** command specifies the token that authorizes the username on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this account to access NSX-V information.

The **password** statement is replaced in ***running-config*** for the configuration mode interface by a subsequent **password** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in vmtracer configuration mode.

Command Mode

Vmtracer-vxlan Configuration

Command Syntax

password [**ENCRYPTION**] ***password***

Parameters

- **ENCRYPTION** encryption level of the password.
  - ***no parameter*** password is a clear-text string.
  - ***0*** the is a clear-text string. Equivalent to ***no parameter***.
  - ***7*** the password is an encrypted string.
- ***password*** text that autorizes the username.
  - ***password*** is a clear-text string if **ENCRYPTION** specifies clear text.
  - ***password*** is an encrypted string if **ENCRYPTION** specifies an encrypted string.

Related Commands

vxlan (vmtracer mode) places the switch in the ***vmtracer-vxlan*** configuration mode.

Example

- This command configures ***5678*** as the clear-text string that authorizes the username **admin** to the NSX-V located at **https://example.com/sdk**.

```
switch(config)# vmtracer session vnet-1
switch(config-vmtracer-vnet-1)# vxlan
switch(config-vmtracer-vnet-1-vxlan)# url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)# username admin
switch(config-vmtracer-vnet-1-vxlan)# password 5678
switch(config-vmtracer-vnet-1-vxlan)# exit
switch(config-vmtracer-vnet-1)# show active
vmtracer session vnet-1
   allowed-vlan 1-4094
   vxlan
      url https://example.com/sdk
      username admin
      password 7 s2Xq4GSBlYU=
switch(config-vmtracer-vnet-1)#
```

20.6.4.5 show vmtracer all

The **`show vmtracer all`** command displays VM Tracer data for all switches with the vSphere scope.

Command Mode

EXEC

Command Syntax

`show vmtracer all`

Example

This command displays data for both switches in the vSphere scope.

```
switch> show vmtracer all
Switch : a109(10.10.30.109)
Ethernet49     : 10.102.28.3/10G
   VM Name             VM Adapter          VLAN      Status    State
   ABCD                Network adapter 2   native    Up/--     --

Switch : a164(10.10.30.(172.22.30.164)
Ethernet49     : 10.102.28.3/10G Storage Network/dvUplink1
   VM Name             VM Adapter          VLAN      Status    State
   WXYZ                Network adapter 2   native    Up/--     --
switch>
```

20.6.4.6 show vmtracer interface

The **show vmtracer interface** command displays the VM interfaces (Vnics) that are active on the VM Tracer enabled interface. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

Command Mode

EXEC

Command Syntax

show vmtracer interface [**INT_NAME**] [**INFO_LEVEL**]

Parameters

- **INT_NAME** the interfaces to be configured. Values include:
  - ***no parameter*** command returns information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range.
  - **port-channel *p_range*** Port Channel interface range.

    Valid ***e_range*** and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** specifies information that the command returns.
  - ***no parameter*** connection parameters and status for VM associated to specified sessions.
  - **detail** connection status and data concerning messages the VM.
  - **host** name of the connected host.

Examples

- This command displays the Vnics connected to all VM Tracer enabled interfaces.

```
switch > show vmtracer interface

Ethernet8 : example.com
    VM Name                     VM Adapter          VLAN     Status
    esx3.aristanetworks.com     vmk0                0        Up/Down
    vspheremanagement           Network adapter 1   0        Up/Down

Ethernet15 : example.com
    VM Name                     VM Adapter          VLAN      Status
    Openview                    Network adapter 1   123       Up/Down
    VmTracerVm                  Network adapter 1   123       Down/Down

Ethernet23 : example.com
    VM Name                     VM Adapter          VLAN       Status
switch>
```

- This command displays the Vnics connected to the ***interface Ethernet8***.

```
switch> show vmtracer interface Ethernet8

Ethernet8 : example.com
    VM Name                     VM Adapter          VLAN      Status
    example.com                 vmk0                0         Up/Down
    vspheremanagement           Network adapter 1   0         Up/Down
switch>
```

20.6.4.7 show vmtracer session

The **`show vmtracer session`** command displays vCenter and vShield connection information for a specified VM Tracer session.

Command Mode

EXEC

Command Syntax

`show vmtracer session` [**SESSION_LIST**]

Parameters

SESSION_LIST VM Tracer sessions for which the command returns information.

- ***no parameter*** all configured VM Tracer sessions.
- ***session_name*** name of one VM Tracer session.

Example

This command displays connection parameters associated to the ***abcde*** session.

```
switch> show vmtracer session abcde
Session abcde
vCenter URL       https://example.com/sdk
username                      Administrator
autovlan                      enabled
allowed-vlans     1-4094
sessionState      Connected
VShield URL       https:/vmware-vshield5.1.xyz.abcde.com
username                  admin
sessionState      Connected

switch>
```

20.6.4.8 show vmtracer session vcenter

The **show vmtracer session vcenter** command displays vCenter information for a specified VM Tracer session.

Command Mode

EXEC

Command Syntax

show vmtracer session ***session_name*** **vcenter** [**INFO_LEVEL**]

Parameters

- ***session_name*** VM Tracer sessions for which the command returns information.
- **INFO_LEVEL** specifies information that the command returns.
  - ***no parameter*** displays connection and status information for the specified vCenter.
  - **detail** displays connection, status, and history information for the specified vCenter.

Examples

- This command displays connection parameters for the vCenter associated to the abcde session.

```
switch> show vmtracer session abcde vcenter

Session           abcde
vCenter URL       https://vmware-vcenter5.1/sdk
username          Administrator
autovlan          enabled
allowed-vlans     1-4094
sessionState      Connected
switch>
```

- This command displays connection parameters and history details from the vCenter associated to the abcde session.

```
switch> show vmtracer session abcde vcenter detail

Session                         abcde
vCenter URL                     https://vmware-vcenter5.1/sdk
username                        Administrator
autovlan                        enabled
allowed-vlans                   1-4094
SessionState                    Connected
lastStateChange                 2:46:50 ago
lastMsgSent                     Query network hint message
timeOfLastMsg                   0:00:20 ago
responseTimeForLastMsg          0.000102301000479
numSuccessfulMsg                998
lastSuccessfulMsg               Query network hint message
lastSuccessfulMsgTime           0:00:20 ago
numFailedMsg                    0
lastFailedMsg                   --
lastFailedMsgTime               never
lastErrorCode                   --
switch>
```

20.6.4.9 show vmtracer session vsm

The **show vmtracer session vsm** command displays NSX-V information for a specified VM Tracer session.

Command Mode

EXEC

Command Syntax

show vmtracer session ***session_name*** vsm [**INFO_LEVEL**]

Parameters

- ***session_name*** VM Tracer sessions for which the command returns information.
- **INFO_LEVEL** specifies information that the command returns.
  - ***no parameter*** connection and status information for the specified NSX-V.
  - **detail** connection, status, and history information for the specified NSX-V.

Examples

- This command displays connection parameters for the NSX-V associated to the ***abcde*** session.

```
switch> show vmtracer session abcde vsm

Session           abcde
VShield URL       https://example.com/sdk
username          admin
sessionState      Connected
switch>
```

- This command displays connection parameters and history details from the vShield Manager associated to the ***abcde*** session.

```
switch> show vmtracer session abcde vsm detail

Session                         abcde
VShield URL                     https://vmware-vshield5.1/
username                        admin
SessionState                    Connected

switch>
```

20.6.4.10 show vmtracer vm

The **show vmtracer vm** command displays VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces. For each active VM, the command displays the name of the VM, its adapter, and the hypervisor to which it connects.

Command Mode

EXEC

Command Syntax

show vmtracer [**INT_NAME**] vm [**VM_LIST**]

Parameters

- **INT_NAME** the interfaces name Values include:
  - ***no parameter*** command returns information for all interfaces.
  - **interface ethernet *e_range*** Ethernet interface range.
  - **interface port-channel *p_range*** Port Channel interface range.

    Valid ***e_range*** and ***p_range*** formats include a number, number range, or comma-delimited list of numbers and ranges.
- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - ***no parameter*** command returns information for all present VMs.
  - ***vm_name*** command returns information only for specified VM.

Related Commands

The **show vmtracer vm detail** command displays connection information for one or more specified VMs.

Example

This command displays the VMs connected to all VM Tracer enabled interfaces.

```
switch> show vmtracer vm
VM Name              Esx Host          Interface  VLAN     Status

vCenter1             172.22.28.8       Po45       native   Down/Down
vCenter2             172.22.28.8       Po45       native   Up/Up
vCenter3             172.22.28.8       Po45       11       Down/Down
vCenter4             172.22.28.8       Po45       native   Down/Down
VMKernel                               Po43       native   Up/Up
demo vcenter 5 clone                   Po43       native   Up/Up
switch>
```

20.6.4.11 show vmtracer vm detail

The **show vmtracer vm detail** command displays connection data for VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces.

Command Mode

EXEC

Command Syntax

show vmtracer vm [**VM_LIST**] **detail**

Parameters

VM_LIST The virtual machines for which the command displays information. Options include:

- ***no parameter*** command returns information for all present VMs.
- ***vm_name*** command returns information only for specified VM.

Examples

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch# show vmtracer vm vmcenter1
VM Name  vCenter1 Server App
  Interface   :     Po45
  vNIC        :     Network adapter 1
  MAC         :     00:31:22:8e:b8:41
  Portgroup   :     VM Network
  VLAN        :     native
  Switch      :     Switch2
  Status      :     Down/Down
  Host        :     10.22.18.28
  Data Center :     vcenter-5
switch>
```

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch> show vmtracer vm detail
VM Name  vCenter1 Server App
  Interface   :     Po45
  vNIC        :     Network adapter 1
  MAC         :     00:31:22:8e:b8:41
  Portgroup   :     VM Network
  VLAN        :     native
  Switch      :     Switch2
  Status      :     Down/Down
  Host        :     10.22.18.28
  Data Center :     vcenter-5

VM Name  vCenter2 Server App
  Interface   :     Po45
  vNIC        :     vmk0
  MAC         :     00:33:23:3c:e1:4e
  Portgroup   :     Management Network
  VLAN        :     native

switch>
```

20.6.4.12 show vmtracer vnic counters

The **`show vmtracer interface vnic counters`** command displays input and output packet counts for VM interfaces (Vnics) that are active on the specified interface or VM.

Command Mode

EXEC

Command Syntax

`show vmtracer` [**ENTITY**] **`vnic counters`**

Parameters

ENTITY the virtual machine or interface over which statistics are gathered and displayed.

- ***no parameter*** command returns information for all active VMs.
- **interface ethernet *e_range*** Ethernet interface range.
- **interface port-channel *p_range*** Port Channel interface range.
- **vm *vm_name*** command returns information for specified VM.

  Valid ***e_range*** and ***p_range*** formats include a number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the Vnics connected to ***interface ethernet 24***.

```
switch> show vmtracer interface ethernet 24 vnic counters
Physical Intf: Ethernet24
Host: 10.17.28.8/site1/dvUplink1
VM Name         vNic                  Input Pkt/Byte/%          Output Pkt/Byte/%
vCenter1        Network adapter 2     2550/   187175/  0.6      6/         360/  0.0
vCenter2        Network adapter 2     418615/ 30678024/ 99.4    1904439/ 1145654613/100.0
Summary                               421165/ 30865199/100.0    1904445/ 1145654973/100.0
switch>
```

20.6.4.13 show vmtracer vxlan segment

The **show vmtracer vxlan segment** command displays information about the VXLAN segments that are managed by the connected NSX for vSphere® (NSX-V).

Command Mode

EXEC

Command Syntax

show vmtracer segment **ENTITY**

Parameters

ENTITY specifies the information that the command displays. Options include:

- ***no parameter*** displays information for VXLAN segments.
- **pool** displays resource pools available to segments.
- **pool *pool_name*** displays connection information about the specified pool.
- **range** displays the VNI range of the managed segments.

Examples

- This command displays the VXLAN segments managed by the NSX-V.

```
switch> show vmtracer vxlan segment
Name                  VNI     Multicast IP     Network Scope
------------------------------------------------------------
Eng Wire              5002    237.0.0.1        abcde
HR Wire               5000    237.0.0.2        abcde

switch>
```

- This command displays the resource pools available to the VXLANs.

```
switch> show vmtracer vxlan segment pool
Name                   Description                      Segments
-----------------------------------------------------------------
--------
abcde                  Spans Cluster 1 and Cluster 2   Eng Wire, HR
 Wire

switch>
```

- This command displays connection and packet information for the ***abcde*** pool.

```
switch> show vmtracer vxlan segment pool abcde
Name:          abcde
Description:   Spans Cluster 1 and Cluster 2
Segments:      Eng Wire, HR Wire

Vxlan Segment  Cluster   Host                VTEP IP           DVS       VLAN  MTU
Eng Wire       Cluster2  test2.example.com   10.168.200.1/24  dvs-test2  200   1600
Eng Wire       Cluster1  test2.example.com   10.168.100.1/24  dvs-test1  100   1600
HR Wire        Cluster1  test2.example.com   10.168.100.1/24  dvs-test1  100   1600
HR Wire        Cluster2  test2.example.com   10.168.200.1/24  dvs-test2  200   1600
switch>
```

- This command displays the VNI range of the VXLAN segments.

```
switch> show vmtracer vxlan segment range

VNI Range             Multicast IP Range
-----------------------------------------
5000 - 5024           237.0.0.1 - 237.0.0.117
```

```
Name                  VNI     Multicast IP     Network Scope
-------------------------------------------------------------
HR Wire               5002    237.0.0.1        abcde

Eng Wire              5000    237.0.0.2        abcde
switch>
```

20.6.4.14 show vmtracer vxlan vm

The **show vmtracer vxlan vm** command displays the VXLAN segments, their VTEP IP numbers, and their VM endpoints that are managed by the connected NSX for vSphere® (NSX-V).

Command Mode

EXEC

Command Syntax

show vmtracer vxlan vm

Example

This command displays the VM endpoints of the VXLAN segments managed by the NSX-V.

```
switch> show vmtracer vxlan vm
Vxlan Segment       VTEP IP            VLAN  VMs
Eng Wire            192.168.200.1/24   200   Eng VM3, Eng VM2
Eng Wire            192.168.100.1/24   100   Eng VM1
HR Wire             192.168.100.1/24   100   HR VM2, HR VM1
HR Wire             192.168.200.1/24   200   --
switch>
```

20.6.4.15 source-interface

The **source-interface** command allows you to connect to a remote vCenter endpoint by using the primary address of the interface as the source IP address. If the interface is not specified, the source IP address is determined by the routing table.

The **no source-interface** and **default source-interface** commands restore default behavior by removing the **source-interface** command from the ***running-config***.

Command Mode

Vmtracer Configuration

Command Syntax

source-interface [**INTERFACE_NAME**]

no source-interface

default source-interface

Parameters

INTERFACE_NAME specifies the interface for which the information is displayed. Options include:

- **Ethernet *e_num*** specifies the Ethernet interface number.
- **Loopback *l_num*** specifies the loopback interface number. Value ranges from ***0*** to ***2100***.
- **Management *m_num*** specifies the management interface number. The values are ***1*** or ***2***.
- **Port-Channel** {***lag_num*** | ***lag_num.sub_num***} specifies the port-channel interface number. Value of interface ranges from ***1*** to ***2000***. Value of sub-interface ranges from ***1*** to ***4094***.
- **Tunnel *tunnel_num*** specifies the tunnel interface number. Value ranges from ***1*** to ***255***.
- **UnconnectedEthernet *port_num*** specifies the unconnected Ethernet port number. Value ranges from ***1*** to ***8***.
- **VLAN *vlan_num*** specifies the VLAN interface number. Value ranges from ***1*** to ***4094***.

Related Commands

The **vmtracer session** command places the switch in the ***vmtracer*** configuration mode.

Examples

- This command configures VM Tracer to use ***interface Ethernet 17*** to derive the source address for session packets.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# source-interface Ethernet 17
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface Loopback 0*** for VM Tracer session.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# source-interface Loopback 0
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface management 1*** for VM Tracer session.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# source-interface management 1
switch(config-vmtracer-session-system_1)#
```

- This command configures ***port-channel 10*** for VM Tracer session.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# source-interface port-channel
 10
```

```
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface tunnel 25*** for VM Tracer session.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# source-interface tunnel 25
switch(config-vmtracer-session-system_1)#
```

- This command configures unconnected ***interface Ethernet 1*** for VM Tracer session.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# source-interface unconnected
 Ethernet 1
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface vlan 25*** for VM Tracer session.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# source-interface vlan 25
switch(config-vmtracer-session-system_1)#
```

20.6.4.16 url (vmtracer mode)

The **`url`** command specifies the vCenter server location that is monitored by the session being edited by the current vmtracer mode. The command must reference a fully formed secure url.

Command Mode

Vmtracer Configuration

Command Syntax

`url` ***url_name***

Parameter

url_name location of the vCenter server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

Related Commands

The **`vmtracer session`** command places the switch in the ***vmtracer*** configuration mode.

Example

This command specifies the location of the vCenter monitored by the ***system_1*** VM Tracer session.

```
switch(vmtracer-system_1)# url https://example.com/sdk
switch(vmtracer-system_1)#
```

20.6.4.17 url (vmtracer-vxlan mode)

The **url** command specifies the NSX for vSphere® (NSX-V) server location that is monitored for VXLAN information by the configuration mode VM Tracer session. The command must reference a fully formed secure URL.

The **url** statement is replaced in running-config for the configuration mode session by a subsequent **url** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in ***vmtracer*** configuration mode.

Command Mode

Vmtracer-vxlan Configuration

Command Syntax

url ***url_name***

Parameters

url_name location of the NSX-V server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

Related Commands

The **vxlan (vmtracer mode)** command places the switch in the ***vmtracer-vxlan*** configuration mode.

Example

This command configures the location of the NSX-V monitored by the ***vnet-1*** VM Tracer session.

```
switch(config)# vmtracer session vnet-1
switch(config-vmtracer-vnet-1)# vxlan
switch(config-vmtracer-vnet-1-vxlan)# url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)# exit
switch(config-vmtracer-vnet-1)# show active
vmtracer session vnet-1
   allowed-vlan 1-4094
   vxlan
      url https://example.com/sdk
switch(config-vmtracer-vnet-1)#
```

20.6.4.18 username (vmtracer mode)

The **username** command identifies the switch's account name on the vCenter server. The switch uses this user name to access vCenter information.

Command Mode

Vmtracer Configuration

Command Syntax

username ***name_string***

Parameters

name_string vCenter account user name. Parameter must match the user name configured on the vCenter.

Related Commands

The **vmtracer session** command places the switch in the ***vmtracer*** configuration mode.

Example

This command configures the user name for the vCenter associated with the ***system_1*** session. The session uses this user name to log into the vCenter server.

```
switch(vmtracer-system_1)# username a-switch_01
switch(vmtracer-system_1)#
```

20.6.4.19 username (vmtracer-vxlan mode)

The **username** command identifies the switch's account name on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this user name to access NSX-V information.

The **username** statement is replaced in ***running-config*** for the configuration mode interface by a subsequent **username** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in the ***vmtracer*** configuration mode.

Command Mode

Vmtracer-vxlan Configuration

Command Syntax

username ***name_string***

Parameters

name_string NSX-V account user name. Parameter must match a user name configured on the NSX-V.

Related Commands

The **vxlan (vmtracer mode)** command places the switch in the ***vmtracer-vxlan*** configuration mode.

Example

This command configures the user name of admin for the NSX-V located at the URL specified by the URL command.

```
switch(config)# vmtracer session vnet-1
switch(config-vmtracer-vnet-1)# vxlan
switch(config-vmtracer-vnet-1-vxlan)# url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)# username admin
switch(config-vmtracer-vnet-1-vxlan)# exit
switch(config-vmtracer-vnet-1)# show active
vmtracer session vnet-1
   allowed-vlan 1-4094
   vxlan
      url https://example.com/sdk
      username admin
switch(config-vmtracer-vnet-1)#
```

20.6.4.20 vmtracer

The **vmtracer** command enables vmtracer mode on the configuration mode interface. Interfaces with vmtracer mode enabled send discovery packets to the connected vSwitch.

The **no vmtracer** and **default vmtracer** commands disable vmtracer mode on the configuration mode interface by removing the corresponding **vmtracer** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration Interface-Port-channel Configuration

Command Syntax

vmtracer HOST_TYPE

no vmtracer HOST_TYPE

default vmtracer HOST_TYPE

Parameters

HOST_TYPE the type of hypervisor that controls the vSwitch to which the interface connects.

- **vmware-esx** ESX or ESXI hypervisor (VMware).

Examples

- These commands enable the ***vmtracer*** mode on the ***interface Ethernet 3***.

```
switch(config)# interface Ethernet 3
switch(config-if-Et3)# vmtracer vmware-esx
switch(config-if-Et3)#
```

- This command disables the ***vmtracer*** mode on the ***interface Ethernet 3***.

```
switch(config-if-Et3)# no vmtracer vmware-esx
switch(config-if-Et3)#
```

20.6.4.21 vmtracer session

The **`vmtracer session`** command places the switch in the ***vmtracer*** mode for the specified session. The command creates a new session or loads an existing session for editing.

A VM Tracer session connects the switch to a vCenter server at a specified location, then downloads data about VMs and vSwitches managed by ESX hosts connected to switch ports. The switch supports a maximum of four VM Tracer sessions.

VM Tracer session parameters are configured in the ***vmtracer*** mode. Parameters configured in the ***vmtracer*** mode include the vCenter location and dynamic VLAN usage.

The **`no vmtracer session`** and **`default vmtracer session`** commands disable the session and remove its configuration from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`vmtracer session` ***name***

`no vmtracer session` ***name***

`default vmtracer session` ***name***

Parameters

name The label assigned to the VM Tracer session.

Commands Available in vmtracer Configuration Mode

- allowed-vlan
- autovlan disable
- password (vmtracer mode)
- url (vmtracer mode)
- username (vmtracer mode)
- vxlan (vmtracer mode)

Examples

- This command enters vmtracer mode for the ***system_1*** session.

```
switch(config)# vmtracer session system_1
switch(vmtracer-system_1)#
```

- This command disables the ***system_1*** VM Tracer session. The ***system_1*** session and all of its parameters are removed from ***running-config***.

```
switch(config)#no vmtracer session system_1
switch(config)#
```

20.6.4.22 vrf (vmtracer mode)

The **vrf** command allows the switch to communicate with a vCenter server by enabling VmTracer configuration mode. By default, VmTracer is enabled only in the **default vrf** command.

Command Mode

Vmtracer Configuration

Command Syntax

vrf ***vrf_name***

Parameters

vrf_name specifies information of the corresponding VRF.

Example

These commands place the VRF ***vrf1*** in the ***vmtracer*** configuration mode.

```
switch(config)# vmtracer session system_1
switch(config-vmtracer-session-system_1)# vrf vrf1
switch(config-vmtracer-session-system_1)#
```

20.6.4.23 vxlan (vmtracer mode)

The **vxlan** command places the switch in the ***vmtracer-vxlan*** configuration mode. To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). The ***vmtracer-vxlan*** configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode ***vmtracer*** session. Each VM Tracer session can be associated with one NSX-V instance.

The **no vxlan** and **default interface vxlan** commands delete the NSX-V instance from the configuration mode ***vmtracer*** session by removing all of the ***vmtracer-vxlan*** mode commands from ***running-config***.

Command Mode

Vmtracer Configuration

Command Syntax

vxlan

no vxlan

default vxlan

Related Commands

The **vmtracer session** command places the switch in the ***vmtracer*** configuration mode.

Commands Available in vmtracer-vxlan Configuration Mode

- password (vmtracer mode)
- url (vmtracer mode)
- username (vmtracer mode)

Example

These commands create the vShield instance for the VMTracer session named ***vnet-1***.

```
switch(config)# vmtracer session vnet-1
switch(config-vmtracer-vnet-1)# vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

20.7 MapReduce Tracer

This section describes Arista's implementation of MapReduce Tracer, including configuration instructions and command descriptions. Topics covered by this section include:

- MapReduce Tracer Introduction
- MapReduce Tracer Configuration
- Displaying MapReduce Tracer Results
- MapReduce Tracer Commands

20.7.1 MapReduce Tracer Introduction

MapReduce Tracer is a network tool that monitors Hadoop nodes that are directly connected to Arista switches. MapReduce Tracer requires the following:

- Hadoop clusters are deployed with a L3 design.
- The top of rack switch is the default gateway to all attached TaskTracker nodes.
- JobTracker RPC ports do not require authentication.
- Nodes cannot simultaneously belong to multiple Hadoop clusters.
- All TaskTrackers within a cluster are accessed through a common HTTP access port.
- The switch's DNS or static host configuration facilitates TaskTracker name resolution.

Map Reduce Tracer supports these Hadoop releases:

- Apache 0.20.205
- Apache 1.2.1
- Cloudera 3u6
- Cloudera 4.1.3
- Cloudera 4.3.0
- HortonWorks 1.3
- Cloudera 4.5.0

These sections briefly describe Hadoop, Hadoop data structures, and MapReduce Tracer.

20.7.1.1 Hadoop Description

Apache Hadoop is an open-source, Java-based software framework that supports large dataset storage and processing in a distributed computational environment. Hadoop is licensed under Apache License 2.0 and developed through a global community.

Hadoop facilitates application execution on systems composed of thousands of nodes utilizing petabytes of data. Its distributed file system facilitates rapid data transfer among nodes and supports continued operations when individual nodes fail or become inaccessible.

Hadoop Distributed File System (HDFS) is a distributed file-system that stores data on the commodity machines to provide high aggregate bandwidth across the cluster.

20.7.1.2 Hadoop Cluster Structure

A cluster is a group of servers that function as a single system to provide high availability through load balancing and parallel processing. A Hadoop cluster is a type of computational cluster designed for storing and analyzing large amounts of unstructured data in a distributed computing environment.

Typical Hadoop clusters include one master and multiple worker nodes. The master node consists of a TaskTracker, JobTracker, NameNode and DataNode. Worker nodes include a TaskTracker and DataNode.

20.7.1.3 Map Reduce

MapReduce is an algorithm that Hadoop implements to process large datasets by distributing parallel tasks to nodes within a cluster. The MapReduce program includes a Map procedure that filters data and a Reduce procedure that processes the data.

MapReduce manages task and data distribution to cluster nodes such that tasks are executed in parallel, and data transfers between cluster components support redundancy and fault tolerance.

The MapReduce engine consists of one JobTracker and multiple TaskTrackers – all nodes within the Hadoop cluster. The JobTracker receives MapReduce jobs from a client application and manages the completion of these jobs by submitting tasks to available TaskTracker nodes. If a TaskTracker fails to perform the assigned task, the JobTracker reschedules that part of the job to another node.

20.7.1.4 MapReduce Tracer Function

MapReduce Tracer is a feature that tracks and interacts with Hadoop nodes directly connected to Arista switches in a cluster. It communicates with a JobTracker to obtain a list of all nodes in a cluster and then queries JobTracker and TaskTrackers on these nodes for information regarding the jobs they are running and progress of those jobs. This creates a map of TaskTrackers with kinds of jobs they are running. Commands are available to display this data in tables through the CLI and EAPI.

MapReduce Tracer monitors only nodes that connect directly to the switch in L3 networks. Directly connected nodes use the top-of-rack switch as their default gateway and the switch learns ARP entries for these nodes. The list of nodes provided by JobTracker is filtered by tracking ARP entries to remove nodes that are not directly accessible.

MapReduce Tracer creates a database of nodes from the filtered list. After the database is created, the switch queries the JobTracker and TaskTrackers to obtain the following:

- The number of monitored Hadoop nodes.
- The list of monitored nodes, including their IP addresses.
- Jobs that the TaskTrackers are running.
- JobTracker and TaskTracker statistics.

MapReduce Tracer can simultaneously monitor multiple clusters. This means the directly connected TaskTracker nodes can belong to different clusters. A maximum of five clusters are supported per switch.

20.7.2 MapReduce Tracer Configuration

The ***MapReduce Tracer*** configuration commands are structured into two configuration levels:

- The ***monitor-hadoop*** configuration mode is a child of ***global*** configuration mode and controls the ***global MapReduce Tracer*** settings.
- The ***monitor-hadoop-cluster*** configuration mode is a child of the ***monitor-hadoop*** configuration mode and defines polling configurations that monitor individual Hadoop clusters.

These sections describe MapReduce Tracer configuration processes:

- MapReduce Tracer Global Configuration
- Hadoop Cluster Access Configuration
- MapReduce Tracer Example

MapReduce Tracer functions after it is enabled globally. Each polling configuration can be individually enabled after the feature is enabled globally.

20.7.2.1 MapReduce Tracer Global Configuration

MapReduce Tracer global parameters are configured in the ***monitor-hadoop*** configuration mode. Tasks performed from this mode include specifying connection parameters to Hadoop clusters and globally enabling MapReduce Tracer.

Entering the Monitor-Hadoop Configuration Mode

Monitor-hadoop configuration mode is entered using the monitor hadoop command. Monitor-hadoop configuration mode is not a group change mode; statements are immediately stored in ***running-config*** when they are entered through the CLI. The **exit** command returns the switch to global configuration mode.

Examples

- These commands place the switch in the ***monitor-hadoop*** configuration mode.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)#
```

- This command exits the ***monitor-hadoop*** mode.

```
switch(config-monitor-hadoop)# exit
switch(config)#
```

- This command deletes all previously configured ***monitor-hadoop*** configuration mode commands.

```
switch(config)# no monitor hadoop
switch(config)#
```

Globally Enabling MapReduce Tracer

MapReduce Tracer is globally enabled by the **no** version of the shutdown (Monitor-Hadoop) command. MapReduce Tracer is globally disabled by default.

Example

These commands globally enable MapReduce Tracer.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# no shutdown
switch(config-monitor-hadoop)# show active
 monitor hadoop
   no shutdown
switch(config-monitor-hadoop)#
```

Creating a Cluster Monitor

A cluster monitor is created by entering the ***monitor-hadoop-cluster*** mode with the cluster (Monitor Hadoop) command. Each monitor is labeled with a cluster ID and probes one Hadoop cluster. When the command specifies a monitor with a previously defined cluster ID, subsequent commands edit that monitor's parameters. A monitor with a new cluster ID is created by a command that specifies a nonexistent cluster ID.

Example

These commands enter the **monitor-hadoop-cluster** mode to edit a cluster monitor. The monitor's cluster-id is ***CL2***.

```
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)#
```

20.7.2.2 Hadoop Cluster Access Configuration

Cluster monitors are configured in the ***monitor-hadoop-cluster*** configuration mode. Each monitor corresponds to a hadoop cluster through these configurable parameters:

- JobTracker access parameters (address, port number, and username)
- TaskTracker access port
- Polling interval
- Cluster description
- Enabled setting

The minimum explicit configuration includes JobTracker address and username; default values are defined for all other parameters. By default, cluster monitors are disabled.

The cluster (Monitor Hadoop) command places the switch in the ***monitor-hadoop-cluster*** mode for the specified monitor, where a cluster's connection parameters are specified. The ***monitor-hadoop-cluster*** mode is not a group change mode.

A cluster monitor is enabled by using the **no** version of the shutdown (Monitor-Hadoop) command when MapReduce Tracer is globally enabled.

20.7.2.2.1 JobTracker Configuration

A cluster's JobTracker is located on the master node and schedules work to the cluster's TaskTracker nodes. The jobtracker (Monitor Hadoop Cluster) command specifies connection parameters to the monitored cluster.

JobTracker parameters include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is ***8021***. Location and username parameters do not have default values and must be explicitly configured.

Example

For the ***CL2*** monitor, these commands configure connection parameters to a JobTracker node at ***10.4.4.4*** with the username ***account1***. The default RPC port (***8021***) is implicitly specified.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# jobtracker host 10.4.4.4
 username account1
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
      jobtracker host 10.4.4.4 user account1
```

```
switch(config-monitor-hadoop-CL2)#
```

20.7.2.2.2 TaskTracker Configuration

The tasktracker (Monitor Hadoop Cluster) command specifies the HTTP port that access TaskTrackers of the Hadoop cluster probed by the configuration mode monitor. The switch compiles a list of the cluster's TaskTracker addresses by periodically polling the cluster's JobTracker.

The default TaskTracker HTTP port is ***50060***.

Examples

- For the ***CL2*** monitor, these commands configure a TaskTracker access port of ***51000***.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
  cluster CL2
    tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP access port address of ***50060***.

```
switch(config-monitor-hadoop-CL2)# no tasktracker http-port
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)# show active all
monitor hadoop
  cluster CL2
    jobtracker rpc-port 8021
    tasktracker http-port 50060
    interval 10
    shutdown
switch(config-monitor-hadoop-CL2)#
```

20.7.2.2.3 Polling Interval Configuration

When the monitor configuration is complete, the switch polls the cluster's JobTracker to maintain the list of active TaskTracker nodes associated with the monitored cluster and compile Hadoop job statistics. The interval (Monitor Hadoop Cluster) command specifies the interval between polls to the JobTracker of the monitored cluster. The default interval is ***10*** seconds.

Example

This command sets the JobTracker polling interval to ***25*** seconds for the cluster monitored by the ***CL2*** MapReduce Tracer configuration.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# interval 25
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
```

```
      interval 25
switch(config-monitor-hadoop-CL2)#
```

20.7.2.3 MapReduce Tracer Example

The commands in this section create monitors that probe two Hadoop clusters, enables each monitor individually, then enables MapReduce Tracer globally. Monitor parameters for the clusters include:

- Cluster ID: ***CL_1***
  - Jobtracker: IP address: ***10.15.2.2***; RPC port: ***8021***; username: ***xyz1***
  - TaskTracker: HTTP address ***54000***
  - JobTracker polling interval: ***10*** seconds (default)
- Cluster ID: ***CL_2***
  - Jobtracker: IP address: ***10.21.5.2***; RPC port: ***9521***; username: ***qrst4***
  - TaskTracker: HTTP address ***50060*** (default)
  - JobTracker polling interval: ***5*** seconds

Example

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL_1

switch(config-monitor-hadoop-CL_1)# jobtracker host 10.15.2.2
 username xyz1
switch(config-monitor-hadoop-CL_1)# tasktracker http-port 54000
switch(config-monitor-hadoop-CL_1)# no shutdown
switch(config-monitor-hadoop-CL_1)# exit

switch(config-monitor-hadoop)# cluster CL_2
switch(config-monitor-hadoop-CL_2)# jobtracker host 10.21.5.2
 rpc-port 9521
switch(config-monitor-hadoop-CL_2)# interval 5
switch(config-monitor-hadoop-CL_2)# no shutdown
switch(config-monitor-hadoop-CL_2)# exit

switch(config-monitor-hadoop)# no shutdown
switch(config-monitor-hadoop)# show active
 monitor hadoop
   no shutdown
   cluster CL_1
      jobtracker host 10.15.2.2 user xyz1
      tasktracker http-port 54000
      no shutdown
   !
   cluster CL_2
      jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
      interval 5
      no shutdown

switch(config-monitor-hadoop)# show active all
 monitor hadoop
   no shutdown
   cluster CL_1
      jobtracker host 10.15.2.2 rpc-port 8021 user xyz1
      tasktracker http-port 54000
      interval 10
      no shutdown
```

```
   !
   cluster CL_2
      jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
      tasktracker http-port 50060
      interval 5
      no shutdown
switch(config-monitor-hadoop)# exit
switch(config)#
```

20.7.3 Displaying MapReduce Tracer Results

MapReduce Tracer display commands provide information about the configuration and activity on the monitored clusters.

This section contains the following topics:

- MapReduce Tracer Status
- Cluster Configuration and Connections
- Job Lists
- Job Data
- TaskTracker Lists
- TaskTracker Connection and Activity
- Data Bursts
- Low-memory Mode

20.7.3.1 MapReduce Tracer Status

MapReduce Tracer status is accessed through show monitor hadoop status. Status information includes the enabled status and the number of monitored clusters, TaskTrackers, and locally running jobs.

Example

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch> show monitor hadoop status

Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                          : Enabled
  Operational status                    : Enabled
  Number of clusters configured         : 3
  Number of local TaskTrackers          : 4
  Number of jobs running locally        : 4

switch>
```

20.7.3.2 Cluster Configuration and Connections

The following cluster configuration and connection information is available through these commands:

- show monitor hadoop cluster all: Configuration and connection data for all monitored clusters.
- show monitor hadoop cluster status: Configuration and connection data for a specified cluster.

- show monitor hadoop tasktracker status: Connection and activity information for TaskTrackers in a specified cluster, on a specified node, or accessed through a specified interface.

Example

This command displays configuration and connection data for the ***Cluster0*** cluster.

```
switch> show monitor hadoop cluster Cluster0 status

Last updated: 2013-10-06 18:14:23
Cluster status for cluster:  Cluster0
  Admin status                 : Enabled
  JobTracker host              : host0
  JobTracker RPC port          : 9000
  JobTracker user              : user0
  JobTracker polling interval  : 100 seconds
  TaskTracker HTTP port        : 8800
  Operational status           : Enabled
  Active TaskTrackers          : 31
  Blacklisted TaskTrackers     : 1
  Decommissioned TaskTrackers  : 1
  Tracker expiry interval      : 20.0
  Map slots (used/total)       : 10/100
  Reduce slots (used/total)    : 11/110
  JobTracker heap size         : 1.04GB (max: 2.08GB)

switch>
```

20.7.3.3 Job Lists

The following commands display rosters of currently running job or jobs that previously ran:

- show monitor hadoop: Jobs running on all monitored Hadoop clusters.
- show monitor hadoop cluster counters: Jobs running on a specified cluster and byte counter data.
- show monitor hadoop cluster history: Jobs that previously ran on a specified cluster.
  - clear monitor hadoop job-history: Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared.
- show monitor hadoop cluster jobs: Jobs running on a specified cluster.
- show monitor hadoop history: Jobs that ran on all configured clusters is accessed through.
  - clear monitor hadoop job-history: Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared.
- show monitor hadoop tasktracker counters: Jobs running on a specified TaskTracker and byte counter data.

Examples

- This command displays the jobs that are running on all monitored clusters.

```
switch> show monitor hadoop

Last updated: 2013-10-06 18:14:23
Currently running jobs: 4
JobId   Job Name         Cluster   Maps(#/%)  Reduces(#/%)  Start Time
------- ---------------- --------- ---------- ------------- -------------------
1       ReallyAVeryLon\  Cluster0  2/12.34%   0/13.45%      2013-10-06 17:56:03
        gNameForAJob1
2       ShortName2       Cluster0  2/24.68%   0/26.90%      2013-10-06 17:37:43
510001  ReallyAVeryLon\  Cluster1  2/12.34%   0/13.45%      2013-10-06 17:56:03

         gNameForAJob1

switch>
```

20.7.3.4 Job Data

The following commands display information about jobs that are running or previously ran on monitored clusters. Available data include job identifiers, JobTracker ID, start time, stop time, data consumption, and progress statistics.

- show monitor hadoop cluster history jobs: Data consumption, start and stop times, and JobTracker ID for a specific job.
- show monitor hadoop cluster jobs <job number>: Data consumption, start and stop times, priority, JobTracker ID, and progress statistics for a specified job.
- show monitor hadoop cluster jobs counter: HDFS (Hadoop Distributed File System) data consumption and and shuffle byte counters for a specified job.
- show monitor hadoop counters: Data through and start time for jobs running on all monitored clusters.
- show monitor hadoop tasktracker jobs: Progress statistics and start times are available for jobs running on specified TaskTracker.
- show monitor hadoop tasktracker running-tasks: Job progress and byte counts of jobs running on a specified Hadoop cluster .
- show monitor hadoop tasktracker running-tasks cluster job task: Progress statistics, HDFS data consumption, start time, and progress information for the specified task of a running job.
- show monitor hadoop tasktracker counters: Data consumption and start times for jobs running on a specified TaskTracker.

Examples

- This command displays information about ***job 1*** that ran on cluster ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 history job 1

Job history data for job: HistoryJob1
  Cluster                  : Cluster0
  Job Id                   : 1
  JT Id                    : 201310110013
  User                     : HistoryUser1
  Job start time           : 2013-10-06 17:57:43
  Job end time             : 2013-10-08 00:31:03

Per Interface job counters:
Interface       TaskTracker         Bytes In       Bytes Out
--------------- ------------------- -------------- ---------
Ethernet7       TaskTracker2        26.08GB        13.04GB

switch>
```

- This command displays information about ***job 1*** that is running on cluster ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 jobs 1

Last updated: 2013-10-06 18:14:23
Information for job: ReallyAVeryLongNameForAJob1 running on
 cluster: Cluster0
  Cluster                  : Cluster0

switch>
```

20.7.3.5 TaskTracker Lists

These commands display lists of TaskTrackers that are active on monitored clusters:

- show monitor hadoop cluster tasktracker: TaskTrackers on a specified cluster.
- show monitor hadoop tasktracker all: TaskTrackers on all monitored clusters.

Example

This command displays the TaskTrackers on the ***Cluster0*** cluster.

```
switch> show monitor hadoop cluster Cluster0 tasktracker

Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node          IP Address  Interface      Maps   Reduces
------------- ----------- -------------- ------ -------
TaskTracker1  10.100.0.1   Ethernet7      4      0
TaskTracker2  10.100.0.2   Port-Channel7  4      0

switch>
```

20.7.3.6 TaskTracker Connection and Activity

The following TaskTracker connection and activity data is available through these commands:

- show monitor hadoop tasktracker status: Connection and activity information for TaskTrackers on a specified cluster or accessed through a specified interface.
- show monitor hadoop tasktracker all counters: Data consumption for TaskTrackers connected to monitored clusters.

Example

This command displays connection and activity data for TaskTracker on the ***TaskTracker1*** node.

```
switch> show monitor hadoop tasktracker host TaskTracker1 status

Last updated: 2013-10-06 18:14:23
  TaskTracker         : TaskTracker1
  IP Address          : 10.100.0.1
  Interface           : Ethernet7
  State               : active
  Running jobs        : 2
  Running tasks       : 4
  Map Tasks           : 4
  Reduce Tasks        : 0
  Total bytes read    : 2.08GB
  Total bytes written : 4.24MB

switch>
```

20.7.3.7 Data Bursts

The show monitor hadoop traffic burst command displays the largest data bursts for jobs running on a specified cluster or accessed through a specified node or interface. A data burst is the data consumed during a polling interval.

Example

This command displays traffic burst data for all running jobs that are accessible through ***port channel interface 7***.

```
switch> show monitor hadoop traffic burst interface Port-Channel 7
```

```
Last updated: 2013-10-06 18:14:23
Bursts on Interface: 'Port-Channel7' in cluster: Cluster0
Top 2 input bursts:
JobId       Job Name              Burst     Time
----------- --------------------- ----------- -------------------
 1           ShortName             3.07GB    2013-10-06 17:57:43
 2           ReallyAVeryLon\       6.15GB    2013-10-06 17:41:03
             gNameForAJob

Top 2 output bursts:
JobId       Job Name              Burst     Time
----------- --------------------- ----------- -------------------
 1           ShortName             4.10GB    2013-10-06 17:55:13
 2           ReallyAVeryLon\       8.20GB    2013-10-06 17:36:03
             gNameForAJob
```

20.7.3.8 Low-memory Mode

Switch behavior can be improved using the **`memory exhaustion`** command when the switch gets low on available memory. This low-memory or Out-of-Memory (OOM) state is caused by a number of individual or a combination of factors including the one listed below:

- Memory leaks in EOS or customer user processes.
- Process leaks to too many processes or scripts running at one time.
- Over configuration of the system requiring more memory than available.
- Large number of temporary (tmpfs) files such as logs.
- Large number of CLI sessions.
- Any event or agents that can consume more memory than available in the system.

Once the low-memory state is reached, the system uses the **oom_score**, which depends on the value of the **oom_score_adj** parameter to kill processes to free up available memory. The value for the parameter ranges from ***-1000*** (will not be shut down) to ***1000*** (will be shut down first) during an OOM state. Non-essential agents are assigned **oom_score_adj** values of ***900*** or greater.

When enabled, the system implements the following:

- Non-essential agents shut down by Linux are not restarted.
- CLI is restarted, and a message: "Restarting CLI due to memory exhaustion on the system" is sent to all login sessions in the switch.
- CLI Scheduler is disabled.

The system requires manual intervention through **`reset system memory exhaustion`** command to exit the mode and restart the agents that were shut down.

Configuring Low-memory Mode

The following examples are applicable to all platforms.

Example

These commands configure the low-memory mode.

```
switch(config)# monitor system
switch(config-monitor-system)# memory exhaustion
switch(config-monitor-system-memory)# action agent non-critical
 hold-down
```

Example

The following command disables low-memory mode in ***config-monitor-system-memory***.

```
switch(config-monitor-system-memory)# no action agent non-
critical hold-down
```

The following command exits low-memory mode after an OOM event has occurred and agents have been shut down. The command restarts the agents being held down and reenables the CLI scheduler.

```
switch(config-monitor)# reset system memory exhaustion
```

The **show monitor system** command shows the state of the system with the following information:

- If the feature is enabled.
- If the system is in low-memory mode (featured enabled and system experiencing OOM).
- How many times the system entered low-memory mode.
- Last time the system entered low-memory mode (if applicable).
- Last time the system exited low-memory mode (if applicable).

Example

```
switch# show monitor system
```

The following output is for a system where the feature is disabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: False
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion:
```

The following output is for a system where the feature is enabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 0
```

The following output is for a system where the feature is enabled and the system enters the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: True
Number of times system entered Memory Exhaustion: 1
Last time entered in Memory Exhaustion: 0:00:07 ago
```

The following output is for a system where the feature is enabled and the system enters the low-memory mode once, and has exited the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 1
Last time entered in Memory Exhaustion: 0:01:00 ago
```

```
Last time exited from Memory Exhaustion: 0:00:05 ago
```

Configuring oom_score_adj for a daemon agent

To configure the ***oom_score_adj*** of any configured daemon, use the following command:

```
switch(config-daemon-<daemon_name>)# oom score adjustment <score>
```

Note: Similar to change the daemon heartbeat value, the new ***oom_score_adj*** value for the daemon is in effect after restarting the daemon by using **shutdown** command followed by a **no shutdown** command.

```
switch(config)# daemon daemonName
switch(config-daemon-daemonName)# oom score adjustment -200
switch(config-daemon-daemonName)# shutdown
switch(config-daemon-daemonName)# no shutdown
```

20.7.4 MapReduce Tracer Commands

Global Configuration Commands

- monitor hadoop

Clear Hadoop Monitor Commands

- clear monitor hadoop burst-counters
- clear monitor hadoop job-history

Display Commands

- show agent oom scores
- show monitor hadoop
- show monitor hadoop cluster all
- show monitor hadoop cluster counters
- show monitor hadoop cluster history
- show monitor hadoop cluster history jobs
- show monitor hadoop cluster jobs
- show monitor hadoop cluster jobs <job number>
- show monitor hadoop cluster jobs counter
- show monitor hadoop cluster status
- show monitor hadoop cluster tasktracker
- show monitor hadoop counters
- show monitor hadoop history
- show monitor hadoop status
- show monitor hadoop tasktracker all
- show monitor hadoop tasktracker all counters
- show monitor hadoop tasktracker counters
- show monitor hadoop tasktracker jobs
- show monitor hadoop tasktracker running-tasks
- show monitor hadoop tasktracker running-tasks cluster job task
- show monitor hadoop tasktracker status
- show monitor hadoop traffic burst
- show monitor system

Hadoop Commands

- cluster (Monitor Hadoop)
- shutdown (Monitor-Hadoop)

Hadoop-Cluster Commands

- description (Monitor Hadoop Cluster)
- interval (Monitor Hadoop Cluster)
- jobtracker (Monitor Hadoop Cluster)
- shutdown (Monitor Hadoop Cluster)
- tasktracker (Monitor Hadoop Cluster)

20.7.4.1 clear monitor hadoop burst-counters

The **clear monitor hadoop burst-counters** command resets MapReduce Tracer burst counters for all jobs running on specified clusters.

Command Mode

Privileged EXEC

Command Syntax

clear monitor hadoop burst-counters [**CLUSTERS**]

Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - ***no parameter*** All clusters.
  - **cluster *c_name*** Cluster name.

Example

This command clears the burst counters for all jobs running on ***CL2*** cluster.

```
switch# clear monitor hadoop burst-counters cluster CL2
Cleared burst counters
switch#
```

20.7.4.2 clear monitor hadoop job-history

The **clear monitor hadoop job-history** command resets the job history database for all specified clusters.

Command Mode

Privileged EXEC

Command Syntax

clear monitor hadoop job-history [**CLUSTERS**]

Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - ***no parameter*** All clusters.
  - **cluster *c_name*** Cluster name.

Example

This command clears the job history on the ***CL2*** cluster.

```
switch# clear monitor hadoop job-history cluster CL2
Cleared job history
switch#
```

20.7.4.3 cluster (Monitor Hadoop)

The **`cluster`** command is a monitor-hadoop command that places the switch in the ***monitor-hadoop-cluster mode*** for configuring and enabling a MapReduce Tracer monitor for a Hadoop cluster. The command either accesses an existing monitor configuration or creates a monitor.

The ***monitor-hadoop-cluster*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***monitor-hadoop-cluster*** mode does not affect ***running-config***. The **`exit`** command returns the switch to the ***monitor-hadoop*** configuration mode.

The configuration mode monitor is enabled by the **no** version of the shutdown (Monitor Hadoop Cluster). Enabling a monitor also requires that MapReduce Tracer is globally enabled (shutdown (Monitor Hadoop Cluster).

The **`no cluster`** and **`default cluster`** commands remove the specified Hadoop cluster configuration from ***running-config***.

Command Mode

Monitor-hadoop Configuration

Command Syntax

`cluster` ***cluster_name***

`no cluster` ***cluster_name***

`default cluster` ***cluster_name***

Parameters

cluster_name Hadoop cluster name.

Related Command

The monitor hadoop command places the switch in the ***monitor-hadoop*** configuration mode.

Commands Available in Monitor-hadoop-cluster Configuration Mode

- description (Monitor Hadoop Cluster)
- interval (Monitor Hadoop Cluster)
- jobtracker (Monitor Hadoop Cluster)
- shutdown (Monitor Hadoop Cluster)
- tasktracker (Monitor Hadoop Cluster)

Examples

- These commands create the CL2 monitor and enters the ***monitor-hadoop-cluster*** mode for the monitor.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)#
```

- These commands exit the ***monitor-hadoop-cluster*** mode.

```
switch(config-monitor-hadoop-CL2)# exit
switch(config-monitor-hadoop)# show active
 monitor hadoop
   cluster CL2
switch(config-monitor-hadoop)#
```

- These commands remove the CL2 monitor.

```
switch(config-monitor-hadoop)# no cluster CL2
switch(config-monitor-hadoop)# show active
switch(config-monitor-hadoop)#
```

20.7.4.4 description (Monitor Hadoop Cluster)

The **description** command adds a text string to the configuration mode MapReduce Tracer cluster monitor. The string has no functional impact on the monitor.

The **no description** and **default description** commands remove the text string from the configuration mode monitor by removing the corresponding **description** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

description ***label_text***

no description

default description

Parameters

label_text Character string assigned to the monitor configuration.

Related Commands

The cluster (Monitor Hadoop) command places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Example

These commands add description text to the ***CL2*** monitor.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# description First Cluster
monitor hadoop
   cluster CL2
      description First Cluster
      jobtracker host 10.3.3.3 user JANE
switch(config-monitor-hadoop-CL2)#
```

20.7.4.5 interval (Monitor Hadoop Cluster)

The **interval** command specifies the polling interval between queries to the Hadoop cluster JobTracker specifed by configuration mode statements. The switch polls a cluster's JobTracker to update its list of active TaskTracker nodes and the statistics of jobs running in the cluster. This command controls the frequency of these polls. The default interval is ***10*** seconds.

The **no interval** and **default interval** commands restore the default interval of ***10*** seconds by removing the **interval** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

interval ***period***

no interval

default interval

Parameters

period Interval (seconds) between JobTracker polls. Value ranges from ***1*** to ***600***. Default is ***10***.

Related Commands

The cluster (Monitor Hadoop) command places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Example

This command sets the JobTracker polling interval to ***25*** seconds for the ***CL2*** cluster configuration.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# interval 25
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
      interval 25
switch(config-monitor-hadoop-CL2)#
```

20.7.4.6 jobtracker (Monitor Hadoop Cluster)

The **jobtracker** command specifies JobTracker access parameters for the cluster monitored by configuration mode monitor statements. A cluster's JobTracker is located on the master node and schedules work to the cluster's TaskTracker nodes.

Parameters required to communicate with a JobTracker include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is ***8021***. Location and username parameters do not have default values and must be explicity configured. A JobTracker command that specifies a partial parameter list modifies the existing corresponding **jobtracker** statement in ***running-config***.

The **no jobtracker** and **default jobtracker** commands perform the following:

- removes the **jobtracker** statement from ***running config*** when it lists all command parameters.
- modifies the existing **jobtracker** statement when it lists a subset of command parameters.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

jobtracker [**LOCATION**][**PORT**][**USER**]

no jobtracker[**LOCATION**][**PORT**][**USER**]

default jobtracker [**LOCATION**][**][USER**]

All parameters may be placed in any order.

Parameters

- **LOCATION** Address or hostname of JobTracker node. Options include:
  - ***no parameter*** Location remains undefined or unchanged from a previous configuration.
  - **host *ipv4_addr*** IPv4 address of master (JobTracker) node.
  - **host *hostname*** Hostname of master (JobTracker) node.
- **PORT** JobTracker RPC port number. Default value is ***8021***. Options include:
  - ***no parameter*** Port number remains unchanged from previous configuration.
  - **rdp-port *port_num*** Port number of master (JobTracker) node. Value ranges from ***1*** to ***65535***.
- **USER** Username that accesses JobTracker node. Options include:
  - ***no parameter*** Username remains undefined or unchanged from previous configuration.
  - **username *name_string*** JobTracker username.

Related Command

The cluster (Monitor Hadoop) command places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Examples

- For the CL2 cluster configuration, these commands establish a connection to the JobTracker node at ***10.4.4.4*** with the username ***account1***. The default RPC port (***8021***) is implicitly specified.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# jobtracker host 10.4.4.4 username
 account1
switch(config-monitor-hadoop-CL2)# show active

monitor hadoop
   cluster CL2
```

```
      jobtracker host 10.4.4.4 user account1

switch(config-monitor-hadoop-CL2)#
```

- These commands modify the JobTracker configuration to specify an RPC port of ***9000***.

```
switch(config-monitor-hadoop-CL2)# jobtracker rpc-port 9000
switch(config-monitor-hadoop-CL2)# show active

monitor hadoop
   cluster CL2
      jobtracker host 10.4.4.4 rpc-port 9000 user account1

switch(config-monitor-hadoop-CL2)#
```

20.7.4.7 monitor hadoop

The **`monitor hadoop`** command places the switch in the ***monitor-hadoop*** configuration mode for configuring MapReduce Tracer monitors. A MapReduce Tracer monitor interacts with Hadoop cluster nodes that are directly attached to the switch. Tasks that the switch can perform through this interaction include:

- compile a list of nodes in the cluster.
- compile a list of jobs the nodes are running.
- download progress of the running jobs.

The ***monitor-hadoop*** configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. Exiting the ***monitor-hadoop*** configuration mode does not affect the ***running-config***. The **`exit`** command returns the switch to the ***global*** configuration mode. MapReduce Tracer is enabled in the ***monitor-hadoop*** mode through the **no** version of the shutdown (Monitor Hadoop Cluster) command.

The **`no monitor hadoop`** and **`default monitor hadoop`** commands delete previously configured **`monitor hadoop mode`** configuration commands.

Command Mode

Global Configuration

Command Syntax

`monitor hadoop`

`no monitor hadoop`

`default monitor hadoop`

Commands Available in Monitor-hadoop Configuration Mode

- cluster (Monitor Hadoop)
- shutdown (Monitor Hadoop Cluster)

Examples

- These commands place the switch in the ***monitor-hadoop*** configuration mode.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)#
```

- This command exits ythe *monitor-hadoop* mode.

```
switch(config-monitor-hadoop)# exit
switch(config)#
```

- This command deletes all previously configured ***monitor-hadoop*** configuration mode commands.

```
switch(config)# no monitor hadoop
switch(config)#
```

20.7.4.8 show agent oom scores

The **show agent oom scores** command displays information for each agent if specified.

Command Mode

EXEC

Command Syntax

show agent [agentName] ***oom scores***

Parameters

- **Display Values**
  - **Agent name** Name(s) of agent(s) - processes.
  - **RssAnon** Size of the resident anonymous memory for the given process.
  - **VmSize** Current total virtual memory size for the process.
  - **Max VmSize** Peak value of total virtual memory for the process.
  - **oom_score** Parameter used in determining which process to hold down.
  - **oom_score_adj** Parameter used to adjust ***oom_score*.**

Example

This command displays the information for SNMP and Sysdb.

```
switch# show agent Snmp Sysdb oom scores
Agent Name  RssAnon  VmSize  Max VmSize  oom_score oom_score_adj

---------- --------- ------- ----------  --------- ------------
Snmp          34.8MB  536.1MB   541.9MB      911          900
Sysdb         102.3MB 597.5MB   597.5MB      0           -500
```

20.7.4.9 show monitor hadoop

The **show monitor hadoop** command displays a list of jobs that are running on all monitored Hadoop clusters.

Command Mode

EXEC

Command Syntax

show monitor hadoop

Example

This command displays the jobs that are running on all monitored clusters.

```
switch> show monitor hadoop

Last updated: 2013-10-06 18:14:23
Currently running jobs: 4
JobId  Job Name         Cluster   Maps(#/%)  Reduces(#/%)  Start Time
-----  ---------------- --------- ---------- ------------- -------------------
1      ReallyAVeryLon\  Cluster0  2/12.34%   0/13.45%      2013-10-06 17:56:03
       gNameForAJob1
2      ShortName2       Cluster0  2/24.68%   0/26.90%      2013-10-06 17:37:43
510001 ReallyAVeryLon\  Cluster1  2/12.34%   0/13.45%      2013-10-06 17:56:03
       gNameForAJob11
510002 ShortName12      Cluster1  2/24.68%   0/26.90%      2013-10-06 17:37:43

switch>
```

20.7.4.10 show monitor hadoop cluster all

The **show monitor hadoop cluster all** command displays configuration and connection information for all monitored Hadoop clusters.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster all

Example

This command displays configuration and connection data for all connected Hadoop clusters.

```
switch> show monitor hadoop cluster all

Total number of clusters configured: 3
  Cluster                      : Cluster0
  Admin status                 : Enabled
  JobTracker host              : host0
  JobTracker RPC port          : 9000
  JobTracker user              : user0
  JobTracker polling interval : 100 seconds
  TaskTracker HTTP port        : 8800
  Operational status           : Enabled
  Active TaskTrackers          : 31
  Blacklisted TaskTrackers     : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval      : 20.0
  Map slots (used/total)       : 10/100
  Reduce slots (used/total)    : 11/110

```

20.7.4.11 show monitor hadoop cluster counters

The **show monitor hadoop cluster counters** command displays a list of jobs running on the specified Hadoop cluster and data consumption associated with these jobs.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster ***c_name*** counters

Parameters

c_name Cluster name.

Example

This command displays jobs running on cluster ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 counters

Last updated: 2013-10-06 18:14:23
Counters for currently running jobs on cluster: Cluster0
JobId   Job Name          User Bytes In Bytes   Out Start  Time
------- ----------------- ---------- ---------- ---------- -------------------
2       ShortName2        JobUser2   37.36GB    76.29MB     2013-10-06 17:37:43
1       ReallyAVeryLon\   JobUser1   37.36GB    76.29MB     2013-10-06 17:56:03
        gNameForAJob1

switch>
```

20.7.4.12 show monitor hadoop cluster history

The **show monitor hadoop cluster history** command displays all jobs that ran on the specified cluster. The list includes all jobs that ran since the switch was reloaded, the job history was cleared (clear monitor hadoop job-history), or MapReduce Tracer was enabled.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster ***c_name*** history

Parameters

c_name Cluster name.

Example

This command displays the jobs that were ran on the cluster named ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 history

Jobs history on cluster: Cluster0
JobId    Job Name           Start Time    End Time       Bytes In     Bytes Out
-------- ------------------ ------------- -------------- ------------ ---------
2        AReallyBigHist\    2013-10-06    2013-10-09     26.08GB      13.04GB
         oricalJobName      17:41:03      06:47:43
2        AReallyBigHist\    2013-10-06    2013-10-09     26.08GB      13.04GB

1        HistoryJob1        2013-10-06    2013-10-08     26.08GB      13.04GB
                            17:57:43      00:31:03

switch>
```

20.7.4.13 show monitor hadoop cluster history jobs

The **show monitor hadoop cluster history jobs** command displays data about the specified job. Hadoop jobs are identified by job number and the cluster that ran the job.

Data that the command returns include job identifiers, JobTracker ID, start and stop times, and data consumption.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster ***c_name*** history jobs ***job_number***

Parameters

- ***c_name*** Cluster name.
- ***job_number*** Job number. Value ranges from ***0*** to ***2147483647***.

Example

This command displays information about ***job 1*** that ran on cluster ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 history job 1

Job history data for job: HistoryJob1
  Cluster               : Cluster0
  Job Id                : 1
  JT Id                 : 201310110013
  User                  : HistoryUser1
  Job start time        : 2013-10-06 17:57:43
  Job end time          : 2013-10-08 00:31:03

Per Interface job counters:
Interface       TaskTracker        Bytes In       Bytes Out
--------------- ------------------ -------------- ---------
Ethernet7       TaskTracker2       26.08GB        13.04GB

switch>
```

20.7.4.14 show monitor hadoop cluster jobs

The **show monitor hadoop cluster jobs** command displays a list of jobs that are running on the specified cluster.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster ***c_name*** jobs

Parameters

c_name Cluster name.

Example

This command displays the list of jobs running on cluster ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 jobs

Last updated: 2013-10-06 18:14:23
Currently running jobs on cluster: Cluster0
JobId    Job Name           User        Maps    Reduces     Start Time
-------- ------------------ ----------- ------- ----------- -------------------
2        ShortName2         JobUser2    2       0           2013-10-06 17:37:43
1        ReallyAVeryLon\    JobUser1    2       0           2013-10-06 17:56:03
         gNameForAJob1

switch>
```

20.7.4.15 show monitor hadoop cluster jobs counter

The **show monitor hadoop cluster jobs counter** command displays data consumption and progress statistics for the specified job.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* [jobs *job_number*] counter

Parameters

- ***c_name*** Cluster name.
- ***job_number*** Job number. Value ranges from ***0*** to ***2147483647***.

Example

This command displays byte counters for the job named ***1*** that is running on the cluster named ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 jobs 1 counters

Last updated: 2013-10-06 18:14:23

```

20.7.4.16 show monitor hadoop cluster jobs <job number>

The **show monitor hadoop cluster jobs*job number*** command displays information about the specified job. Hadoop jobs are identified by job ID and the cluster that is running the job.

Data that the command returns include time of update, job identifiers, start times, data consumption, and completion progress.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* [jobs *job_number*]

Parameters

- ***c_name*** Cluster name.
- ***job_number*** Job number. Value ranges from ***0*** to ***2147483647***.

Example

This command displays information about ***job 1*** that is running on cluster ***Cluster0***.

```
switch> show monitor hadoop cluster Cluster0 jobs 1

Last updated: 2013-10-06 18:14:23

```

20.7.4.17 show monitor hadoop cluster status

The **show monitor hadoop cluster status** command displays configuration and connection information for the specified cluster.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster ***c_name*** status

Parameters

c_name Cluster name.

Example

This command displays configuration and connection data for the ***Cluster0*** cluster.

```
switch> show monitor hadoop cluster Cluster0 status

Last updated: 2013-10-06 18:14:23
Cluster status for cluster: Cluster0
  Admin status                  : Enabled
  JobTracker host               : host0

switch>
```

20.7.4.18 show monitor hadoop cluster tasktracker

The **show monitor hadoop cluster tasktracker** command displays a list of TaskTrackers in the specified cluster. The IP address and access interface is included in the table.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster ***c_name*** tasktracker

Parameters

c_name Cluster name.

Example

This command displays the TaskTrackers on the ***Cluster0*** cluster.

```
switch> show monitor hadoop cluster Cluster0 tasktracker

Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node          IP Address   Interface      Maps   Reduces
------------- ------------ -------------- ------ -------
TaskTracker1   10.100.0.1   Ethernet7      4      0
TaskTracker2   10.100.0.2   Port-Channel7  4      0

switch>
```

20.7.4.19 show monitor hadoop counters

The **show monitor hadoop counters** command displays byte counter data for all jobs running on clusters for which MapReduce Tracer is configured.

Command Mode

EXEC

Command Syntax

show monitor hadoop counters

Example

This command displays byte counter data for all jobs running on clusters that the switch is accessing through MapReduce Tracer.

```
switch> show monitor hadoop counters

Last updated: 2013-10-06 18:14:23
Counters for running jobs:
JobId   Job Name          Cluster    Bytes In   Bytes Out   Start Time
------- ----------------- ---------- ---------- ----------- -------------------

switch>
```

20.7.4.21 show monitor hadoop status

The **show monitor hadoop status** command displays system status for MapReduce Tracer.

Command Mode

EXEC

Command Syntax

show monitor hadoop status

Example

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch> show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                   : Enabled
  Operational status             : Enabled
  Number of clusters configured  : 3
  Number of local TaskTrackers   : 4
  Number of jobs running locally : 4

switch>
```

20.7.4.22 show monitor hadoop tasktracker all

The **show monitor hadoop tasktracker all** command displays a list of TaskTrackers that are on all monitored Hadoop clusters.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker all

Example

This command displays the TaskTrackers of all monitored clusters that are connected to the switch.

```
switch> show monitor hadoop tasktracker all

Last updated: 2013-10-06 18:14:23
All local TaskTrackers:
Node              Cluster      IP Address     Interface          Maps     Reduces
----------------- ------------ -------------- ------------------ -------- -------
TaskTracker1      Cluster0     10.100.0.1      Ethernet7          4        0

TaskTracker4     10.100.0.4     Port-Channel8     8.30GB          16.95MB

switch>
```

20.7.4.24 show monitor hadoop tasktracker counters

The **show monitor hadoop tasktracker counters** command displays a list of jobs running on the specified TaskTracker and output from byte counters associated with these jobs.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker NODES counters

Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.

Examples

- • This command displays the jobs running on the TaskTracker on the ***TaskTracker1*** node.

```
switch> show monitor hadoop tasktracker host TaskTracker1 counters

Last updated: 2013-10-06 18:14:23

20.7.4.25 show monitor hadoop tasktracker jobs

The **show monitor hadoop tasktracker jobs** command displays data about the jobs that are running on TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster parameter filters results to include data only from the cluster polled by the specified monitor.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker NODES jobs [**CLUSTERS**]

Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.
- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - ***no parameter*** TaskTracker on specified **NODE** can be in any cluster.
  - **cluster *c_name*** TaskCluster on specified **NODE** must be in named cluster.

Examples

- This command displays data for jobs running on ***TaskTracker1***.

```
switch> show monitor hadoop tasktracker host TaskTracker1 jobs

Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker1

20.7.4.26 show monitor hadoop tasktracker running-tasks

The **show monitor hadoop tasktracker running-tasks** command displays progress and byte counts of tasks executed by TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster-ID parameter filters results to include data only from the specified cluster.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker **NODES** **running-tasks** [**CLUSTERS**][**JOBS**]

Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.
- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - ***no parameter*** TaskTracker on specified **NODE** can be in any cluster.
  - **cluster *c_name*** TaskCluster on specified **NODE** must be in named cluster.
- **JOBS** Job list. Options include:
  - ***no parameter*** all jobs.
  - **job *0*** to ***2147483647*** Specifies number of single job.

Examples

- This command displays data for tasks running on TaskTracker named ***TaskTracker1***.

```
switch> show monitor hadoop tasktracker host TaskTracker1 running-tasks

Last updated: 2013-10-06 18:14:23

20.7.4.27 show monitor hadoop tasktracker running-tasks cluster job task

The **show monitor hadoop tasktracker running-tasks cluster job task** command displays detailed data for the specified task.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker NODE [running-tasks cluster ***name***][job ***jnum***][task ***tnum***]

Parameters

- **NODE** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.
- ***name*** Cluster name.
- ***jnum*** Job number. Value ranges from ***0*** to ***2147483647***.
- ***tnum*** Task number. Value ranges from ***0*** to ***2147483647***.

Examples

- This command displays data for ***task 1*** of ***job 1*** on ***TaskTracker1*** of ***Cluster0***.

```
switch> show monitor hadoop tasktracker host TaskTracker1 running-tasks
 cluster Cluster0 job 1 task 1

20.7.4.28 show monitor hadoop tasktracker status

The **show monitor hadoop tasktracker status** command displays connection and activity information for the TaskTracker on the specified clusters or accessed through the specified interface. The following command formats display the listed TaskTracker information:

- **show monitor hadoop cluster *c_name* tasktracker status**: TaskTrackers on specified cluster.
- **show monitor hadoop tasktracker *node* status**: TaskTrackers on specified nodes or interfaces.
- **show monitor hadoop tasktracker all status**: all connected TaskTrackers.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* tasktracker **status**

show monitor hadoop tasktracker NODES status

show monitor hadoop tasktracker all **status**

Parameters

- *c_name* Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.

Examples

- This command displays connection and activity information for all TaskTrackers connected through Ethernet interfaces ***7*** and ***8***.

```
switch> show monitor hadoop tasktracker interface Ethernet7,8 status

20.7.4.29 show monitor hadoop traffic burst

The **show monitor hadoop traffic burst** command displays the largest data bursts for specified Hadoop cluster jobs. A data burst is the data consumed during a polling interval. The command displays input and output burst:

- Input bursts include bytes written to the host.
- Output bursts include bytes written by the host.

Command Mode

EXEC

Command Syntax

show monitor hadoop [**CLUSTERS**] **traffic burst** [**NODE**]

Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - ***no parameter*** All clusters.
  - **cluster *c_name*** Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.

Examples

- This command displays traffic burst data for all running jobs.

```
switch> show monitor hadoop traffic burst

20.7.4.30 show monitor system

The **show monitor system** command displays information about the memory usage status of the system including when low-memory situations have led to Out-Of-Memory (OOM) events.

Command Mode

EXEC

Command Syntax

show monitor system

Examples

- The following output is for a system where the feature is disabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: False
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 0
```

- The following output is for a system where the feature is enabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 0
```

- The following output is for a system where the feature is enabled and the system enters the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: True
Number of times system entered Memory Exhaustion: 1
Last time entered in Memory Exhaustion: 0:00:07 ago
```

- The following output is for a system where the feature is enabled and the system enters the low-memory mode once, and has exited the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Last time entered in Memory Exhaustion: 0:01:00 ago
Last time exited from Memory Exhaustion: 0:00:05 ago
```

20.7.4.31 shutdown (Monitor-Hadoop)

The **shutdown** command globally disables MapReduce Tracer on the switch. Enabling MapReduce Tracer for an individual cluster requires the feature to be globally enabled through this command and enabled for the individual cluster thorough the shutdown (Monitor Hadoop Cluster) command. By default, MapReduce Tracer is globally disabled.

The **no shutdown** command globally enables MapReduce Tracer. The **shutdown** and **default shutdown** commands globally disable MapReduce Tracer by removing the corresponding **no shutdown** command from ***running-config***.

Command Mode

Monitor-hadoop Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Commands

The monitor hadoop command places the switch in the ***monitor-hadoop*** configuration mode.

Examples

- These commands globally enable MapReduce Tracer.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# no shutdown
switch(config-monitor-hadoop)# show active
 monitor hadoop
   no shutdown
switch(config-monitor-hadoop)#
```

- This command globally disables MapReduce Tracer.

```
switch(config-monitor-hadoop)# shutdown
switch(config-monitor-hadoop)# show active
switch(config-monitor-hadoop)#
```

20.7.4.32 shutdown (Monitor Hadoop Cluster)

The **shutdown** command disables MapReduce Tracer for the configuration mode cluster. Globally disabling MapReduce Tracer (show monitor hadoop) also disables the function on the individual cluster. Enabling MapReduce Tracer for the cluster requires the function to be enabled globally and for the individual cluster.

The **no shutdown** command configures the MapReduce Tracer setting as **enabled** for the configuration mode cluster. The **shutdown** and **default shutdown** commands disable MapReduce Tracer for the cluster by removing the corresponding **no shutdown** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Commands

The cluster (Monitor Hadoop) command places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Examples

- These commands globally enable MapReduce Tracer, then enables it for the ***CL2*** cluster.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# no shutdown
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# no shutdown
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
      no shutdown
switch(config-monitor-hadoop-CL2)# exit
switch(config-monitor-hadoop)# show active
 monitor hadoop
   no shutdown
   cluster CL2
      no shutdown
switch(config-monitor-hadoop)#
```

- These commands disable MapReduce Tracer for the ***CL2*** cluster. MapReduce Tracer remains globally enabled.

```
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# shutdown
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)# exit
switch(config-monitor-hadoop)# show active
 monitor hadoop
   no shutdown
   cluster CL2
switch(config-monitor-hadoop)#
```

20.7.4.33 tasktracker (Monitor Hadoop Cluster)

The **tasktracker** command specifies the HTTP port for accessing TaskTrackers of the Hadoop cluster monitored through configuration mode statements. The switch compiles a list of the cluster's TaskTracker addresses by periodically polling the cluster's JobTracker (jobtracker (Monitor Hadoop Cluster)). The default TaskTracker HTTP port is ***50060***.

The **no tasktracker** and **default tasktracker** commands restore the configuration mode TaskTracker HTTP port to ***50060*** by removing the corresponding **tasktracker** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

tasktracker http-port ***port_number***

no tasktracker http-port

default tasktracker http-port

Parameters

port_num TaskTracker HTTP port number. Value ranges from ***1*** to ***65535***. Default value is ***50060***.

Related Command

The **cluster (Monitor Hadoop)** command places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Examples

- These commands specify a TaskTracker HTTP port address of ***51000***.

```
switch(config)# monitor hadoop
switch(config-monitor-hadoop)# cluster CL2
switch(config-monitor-hadoop-CL2)# tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
      tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP port address of ***50060***.

```
switch(config-monitor-hadoop-CL2)# no tasktracker http-port
switch(config-monitor-hadoop-CL2)# show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)# show active all
monitor hadoop
   cluster CL2
      jobtracker rpc-port 8021
      tasktracker http-port 50060
      interval 10
      shutdown
switch(config-monitor-hadoop-CL2)#
```

20.8 Transceiver Performance Monitoring

20.8.1 Transceiver Performance Monitoring Overview

The Transceiver Performance Monitoring and Enhanced Diagnostics enables viewing of the Digital Optical Monitoring (DOM) parameters for the optics that support enhanced diagnostics using the CLI. The show commands are used to view the instantaneous values for various PAM4 parameters like Signal-To-Noise Ratio, Residual Inter Symbol Interference, PAM4 Level Transition Parameters, etc. that such optics support.

With Performance Monitoring feature EOS collects and maintains certain performance statistics over a user-defined time period. EOS stores data for two intervals, the current interval and the most recently completed interval. When the current interval completes, the data is saved as the previous interval so a new current interval may be started. The old previous interval data is discarded.

20.8.2 Configuring Transceiver Performance Monitoring

The Digital Optical Monitoring (DOM) is always enabled on all interfaces and can't be disabled via any configuration command.

The Performance Monitoring is disabled on all interfaces by default. The **performance-monitoring transceiver default** configuration command is used to enable Performance Monitoring on all interfaces across the system.

```
switch(config)# performance-monitoring transceiver default
```

The Performance Monitoring can also be enabled on a per interface basis using the **performance-monitoring transceiver** configuration command.

```
switch(config)# interface Ethernet8/1
switch(config-if-Et8/1)# performance-monitoring transceiver
```

The Performance Monitoring period can be configured using the **performance-monitoring period <period>** configuration command.

```
switch(config)# performance-monitoring period 60s
```

The above command configures the performance monitoring period to ***60*** seconds across the system. This command supports configuring the performance monitoring period in units of either seconds, minutes, hours or days. For example, use performance-monitoring period ***30*** minutes to configure the period as ***30*** minutes, performance-monitoring period ***2*** hours to configure the period as ***2*** hours and so on. The default performance-monitoring period is ***15*** minutes.

Use the **no** form of these commands to revert configuration.

20.8.3 Transceiver Performance Monitoring Limitations

100GBASE-FR, 100GBASE-LR and 100GBASE-DR do not have thresholds of enhanced Digital Optical Monitoring (DOM) parameters, so these parameters and their thresholds will not be displayed in the output of CLI command **`show interfaces transceiver dom thresholds`**.

```
switch# show interfaces Ethernet8/1 transceiver dom thresholds
Ch: Channel, mA: milliamperes, dBm: decibels (milliwatts),
C: Celsius, V: Volts, NA or N/A: not applicable.

```

The Indicator column in the output above gives an indication of where the value lies with respect to its thresholds. Nothing is shown when the parameter is in the expected range between the Low Warn and High Warn thresholds. If the value is greater than or equal to the High Alarm or less than or equal to the Low Alarm, **`ALARM`** is shown. If the value is greater than or equal to the High Warn (but less than the High Alarm) or less than or equal to the Low Warn (but greater than the Low Alarm), **`WARN`** is shown.

- The **`show interfaces transceiver performance-monitoring`** command is used to display the performance monitoring statistics from the CLI. This command will display data only if the feature has been enabled using the configuration command performance-monitoring transceiver as described in the Configuration section.

```
switch# show interfaces Ethernet8/1 transceiver performance-monitoring

Performance Monitoring Period: 0:15:00

This indicates the length of one Performance Monitoring period. ***0:15:00*** specifies a period of ***15*** minutes, which is the default value for this parameter. The Performance Monitoring period can be configured using the **`performance-monitoring period`** configuration command as described in the Configuration section.

Started: 0:00:12 ago

This indicates the time the host started the performance monitoring interval.

Last Update: 0:00:02 ago

This indicates the last time the host read the diagnostic parameters from the module. The host samples values every six seconds.

Pre-FEC BER avg, Uncorrected BER avg

This is the average value so far in the indicated performance monitoring interval.

Pre-FEC BER min, Uncorrected BER min

This is the minimum value so far in the indicated performance monitoring interval.

Pre-FEC BER max, Uncorrected BER max

This is the maximum value so far in the indicated performance monitoring interval.

Pre-FEC BER high warn exceeded, Uncorrected BER high warn exceeded, Pre-FEC BER high alarm exceeded, Uncorrected BER high alarm exceeded

This is the number of times the host read a value which was greater than the indicated threshold. The host reads values and checks exceeded thresholds every six seconds. Please note that this provides only an indication of the actual exceeded count.

Temperature warn exceeded, Temperature alarm exceeded

This is the number of times the host read a value which was outside the range of the indicated threshold. The host reads values and checks exceeded thresholds every six seconds. Please note that this provides only an indication of the actual exceeded count.

- The **`show interfaces transceiver performance-monitoring thresholds`** command is used to display the performance monitoring statistics and their thresholds from the CLI. This command will display data only if the feature has been enabled using the configuration command performance-monitoring transceiver as described in the Configuration section.

20.8.5 Transceiver Performance Monitoring Commands

Global Configuration Commands

- performance-monitoring period
- performance-monitoring transceiver default

Interface Configuration Command

- performance-monitoring transceiver

Show Commands

- show interfaces transceiver dom
- show interfaces transceiver dom thresholds
- show interfaces transceiver performance-monitoring
- show interfaces transceiver performance-monitoring thresholds

20.8.5.1 performance-monitoring period

The **performance-monitoring period** command configures Performance Monitoring Period across the system.

The **no performance-monitoring period** command removes the Performance Monitoring Period configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

performance-monitoring period ***period***

no performance-monitoring period ***period***

Parameter

period performance monitoring period in units of either seconds, minutes, hours or days. The default performance-monitoring period is ***15*** minutes.

Example

This command configures the performance monitoring period to ***60*** seconds across the system.

```
switch(config)# performance-monitoring period 60s
```

20.8.5.2 performance-monitoring transceiver

The **`performance-monitoring transceiver`** command enable Performance Monitoring on per interface basis.

The **`no performance-monitoring transceiver`** command removes the Performance Monitoring configuration from the ***running-config***.

Command Mode

Interface Configuration Mode

Command Syntax

`performance-monitoring transceiver`

`no performance-monitoring transceiver`

Example

This command enables the Performance Monitoring on a per interface basis.

```
switch(config)# interface Ethernet8/1
switch(config-if-Et8/1)# performance-monitoring transceiver
```

20.8.5.3 performance-monitoring transceiver default

The **performance-monitoring transceiver default** command enable Performance Monitoring on all interfaces across the system.

The **no performance-monitoring transceiver default** command removes the Performance Monitoring configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

performance-monitoring transceiver default

no performance-monitoring transceiver default

Example

This command enables the Performance Monitoring on all interfaces across the system.

```
switch(config)# performance-monitoring transceiver default
```

20.8.5.4 show interfaces transceiver dom

The **show interfaces transceiver dom** command displays the Digital Optical Monitoring (DOM) parameters from the CLI. The displayed parameters are the most recently read, 'instantaneous' values.

Command Mode

Privileged EXEC

Command Syntax

show interfaces INTERFACE **transceiver dom**

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the Digital Optical Monitoring (DOM) parameters.

```
switch# show interfaces Ethernet8/1 transceiver dom
Ch: Channel, N/A: not applicable, TX: transmit, RX: receive
mA: milliamperes, dBm: decibels (milliwatts), C: Celsius, V: Volts

Ethernet8/1

                       2      0.00 GHz
Pre-FEC BER            -  1.53e-03
Uncorrected BER        -  0.00e+00
```

20.8.5.5 show interfaces transceiver dom thresholds

The **`show interfaces transceiver dom thresholds`** command displays the Digital Optical Monitoring (DOM) parameters and their thresholds from the CLI.

Command Mode

Privileged EXEC

Command Syntax

`show interfaces` **INTERFACE** **`transceiver dom thresholds`**

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the Digital Optical Monitoring (DOM) parameters and their thresholds.

```
switch# show interfaces Ethernet8/1 transceiver dom thresholds
Ch: Channel, mA: milliamperes, dBm: decibels (milliwatts),
C: Celsius, V: Volts, NA or N/A: not applicable.

```

Command Output

The Indicator column in the output above gives an indication of where the value lies with respect to its thresholds. Nothing is shown when the parameter is in the expected range between the Low Warn and High Warn thresholds. If the value is greater than or equal to the High Alarm or less than or equal to the Low Alarm, **`ALARM`** is shown. If the value is greater than or equal to the High Warn (but less than the High Alarm) or less than or equal to the Low Warn (but greater than the Low Alarm), **`WARN`** is shown.

20.8.5.6 show interfaces transceiver performance-monitoring

The **show interfaces transceiver performance-monitoring** command displays the performance monitoring statistics from the CLI. This command will display data only if the Performance Monitoring has been enabled using the configuration command **performance-monitoring transceiver**.

Command Mode

Privileged EXEC

Command Syntax

show interfaces **INTERFACE** **transceiver performance-monitoring**

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the performance monitoring statistics from the CLI.

```
switch# show interfaces Ethernet8/1 transceiver performance-monitoring
Ch: Channel, N/A: not applicable

Performance monitoring period : 0:15:00
Ethernet8/1
Parameter                                       Ch         Value

```

Command Output

Performance Monitoring Period: 0:15:00

This indicates the length of one Performance Monitoring period. ***0:15:00*** specifies a period of ***15*** minutes, which is the default value for this parameter. The Performance Monitoring period can be configured using the **`performance-monitoring period configuration`** command as described in the Configuration section.

Started: 0:00:12 ago

This indicates the time the host started the performance monitoring interval.

Last Update: 0:00:02 ago

This indicates the last time the host read the diagnostic parameters from the module. The host samples values every six seconds.

Pre-FEC BER avg, Uncorrected BER avg

This is the average value so far in the indicated performance monitoring interval.

Pre-FEC BER min, Uncorrected BER min

This is the minimum value so far in the indicated performance monitoring interval.

Pre-FEC BER max, Uncorrected BER max

This is the maximum value so far in the indicated performance monitoring interval.

Pre-FEC BER high warn exceeded, Uncorrected BER high warn exceeded, Pre-FEC BER high alarm exceeded, Uncorrected BER high alarm exceeded

This is the number of times the host read a value which was greater than the indicated threshold. The host reads values and checks exceeded thresholds every ***6*** seconds. Please note that this provides only an indication of the actual exceeded count.

Temperature warn exceeded, Temperature alarm exceeded

This is the number of times the host read a value which was outside the range of the indicated threshold. The host reads values and checks exceeded thresholds every six seconds. Note that this provides only an indication of the actual exceeded count.

20.8.5.7 show interfaces transceiver performance-monitoring thresholds

The **show interfaces transceiver performance-monitoring thresholds** command displays the performance monitoring statistics and their thresholds from the CLI.

Command Mode

Privileged EXEC

Command Syntax

show interfaces INTERFACE **transceiver performance-monitoring thresholds**

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the performance monitoring statistics and their thresholds from the CLI.

```
switch# show interfaces Ethernet8/1 transceiver performance-monitoring thresholds
Ch: Channel, N/A: not applicable

Performance monitoring period : 0:00:30

Ethernet8/1
                                                          High Alarm  High Warn   Low Warn  Low Alarm
Parameter                                  Ch        Value  Threshold  Threshold  Threshold  Threshold
 Indicator

```

20.9 AVA Sensor

AVA switch sensor also known as “monitor security awake” feature provides deep network analysis by doing deep packet inspection of some or all packets of traffic that's forwarded by the switch. It continuously monitors enterprise devices, users, and applications wherever they are, even as IP addresses change while maintaining a forensic record of past activities. This functionality can be enabled or disabled on the fly without impacting regular packet forwarding functionality.

AVA Switch Sensor Extension

AVA switch sensor extends EOS telemetry for network threat detection. The FlowWatcher agent RPMs along with other RPMs that enable AVA switch sensor functionality are released as part of the **`NDRSensor.swix`** extension. The **`NDRSensor.swix`** extension needs to be installed on the system running supported EOS version. After the extension is installed, it can be enabled using **`monitor security awake`** command as described in the Configuration section.

When **`monitor security awake`** is enabled, the FlowWatcher agent enables hardware flow tracking with filter based packet sampling, IP/IPv6 access lists and mirroring features to receive the first few packets of every new flow and flow volume using IPFIX. It connects to the AVA Nucleus using SSL. The EOS FlowWatcher agent processes the most interesting packets of all the flows that are forwarded by the switch. It does deep packet inspection (DPI) of the packets, computes flow volume using IPFIX data records and generates activity records. The generated activity records are then sent to AVA Nucleus using Kafka over a TLS session. The AVA Nucleus uses a combination of detection models to uncover malicious intent to provide NDR functionality.

Platform Compatibility

- CCS-720XP-96ZC2
- CCS-720XP-48Y6
- CCS-720XP-48ZC2
- CCS-720XP-24ZY4
- CCS-720XP-24Y6
- CCS-720DP-48ZS

20.9.1 NDR Sensor Extension Installation

If the switch already has the **`NDRSensor.swix`** installed, in order to upgrade EOS image or extension follow the steps to uninstall extension before proceeding to install new extension. After the switch is up with supported EOS.swi, copy and install the **`NDRSensor.swix`** extension.

```
switch# copy <source>/NDRSensor.swix extension:
switch# extension NDRSensor.swix
```

To show the status of extensions use the following command.

```
switch# show extensions
Name                                Version/Release      Status
 Extension
---------------------------------- -------------------- -----------
 ---------
```

```
NDRSensor.swix                        4.30.1F/316201\       A, NI, B    8
                                      29.4301F
```

Optionally, copy **NDRSensor.swix** to boot-extensions.

```
switch# copy installed-extensions boot-extensions
Copy completed successfully.
```

Refer to Managing EOS Extensions for additional details on managing extensions on EOS.

20.9.2 Configuration

20.9.2.1 SSL Profile Configuration

To configure an SSL profile for communication with the AVA Nucleus, use the following CLIs:

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile <profile-name>
switch(config-mgmt-sec-ssl-profile-awake-nucleus1)# certificate
 <certificate-name> key <key-name>
switch(config-mgmt-sec-ssl-profile-awake-nucleus1)# trust certificate
 system
```

The AVA Nucleus certificate can either be self-signed or signed by a third-party. For the self-signed case, the certificate needs to be copied onto the switch **certificate:** directory and configured using **trust certificate <certificate>** CLI under the SSL **profile** configuration. In case it's signed by a third-party, then the CA certificate of the third-party needs to be copied onto the switch **certificate:** directory and configured using **trust certificate <certificate>**. If the third-party is a common CA and present in the system-supplied list of trusted CAs (most cases), then the **trust certificate system** can be used, and no certificate needs to be copied over to the switch.

Refer to SSL certificate and key management for additional details on all SSL profile configuration parameters. For instructions on how to manage certificates on the switch using the CLI refer to: Working with certificates.

Generating SSL Key and Self-signed Certificate

Use these steps to setup senor and Nucleus SSL connection with self signed certificates. For complete details on EOS TLS security refer to EOS user manual control plane security section.

- To create an SSL key on the switch:

  ```
  switch# security pki key generate rsa 2048 <key-name>
  ```

- To show the SSL key generated:

  ```
  switch# show management security ssl key <key-name>
  ```

- To generate a self signed certificate on the switch use the following CLI.

  ```
  switch# security pki certificate generate self-signed <certificate-
  name> key <key-name> generate rsa 2048 [parameters … ]
  ```

  Enter the certificate parameters interactively or use **parameters** option to specify them inline. Once SSL key and certificate are generated, they can be used in the **ssl profile**.

- The generated certificate needs to be copied to AVA Nucleus using either **more** or use **copy** command on the switch CLI.

```
switch# more certificate:<certificate-name>  --> Will emit certificate
 on the switch console
```

```
Arista# copy certificate:<certificate-name> <destination> --> To copy
 certificate to external location
```

20.9.2.2 Monitor Security Awake Configuration

- To configure the feature, enter **monitor security awake** mode:

```
switch(config)# [no|default] monitor security awake
```

- To enable Monitor security awake:

```
switch(config-monitor-security-awake)# [no|default] disabled
```

- To configure the maximum flow table size:

```
switch(config-monitor-security-awake)# [no|default] flow table size
 <SIZE> entries
! The flow table size configuration change will cause the FlowWatcher
 agent restart and all active flows to be lost.
Do you wish to proceed with this command? [y/N]
```

The default flow table size is 16k entries. Flow table size configuration change will restart the FlowWatcher agent.

- To configure Kafka topic name:

```
switch(config-monitor-security-awake)# [no|default] topic <name>
```

The default topic name is: **packet-analysis-sessions**

- To configure monitor-point identifier (MPID) to identify campus/site:

```
switch(config-monitor-security-awake)# [no|default] monitor-point
 identifier <id>
```

Every AVA sensor needs to be configured with a unique monitor-point identifier and provisioned in the Nucleus. The default monitor point id used is: 0.

20.9.2.3 Nucleus Configuration

- To configure the Nucleus enter nucleus mode:

```
switch(config-monitor-security-awake)# [no|default] nucleus <name>
```

- To configure Nucleus IP and port:

```
switch(config-monitor-security-awake-nucleus)# [no|default] destination
 <ipv4 address>/<ipv6 address>/<dns> [port <port>]
```

The default port is: 9094

- To configure the local interface for source IP, VRF information:

```
switch(config-monitor-security-awake-nucleus-<name>)# [no|default]
 local interface <local-interface>
```

- To configure SSL profile:

```
switch(config-monitor-security-awake-nucleus-<name>)# [no|default] ssl
 profile <profile-name>
```

20.9.2.4 Loopback Interface Configuration

If at least one Nucleus doesn't have a local interface configured, then ***Loopback0*** interfaces need to be configured with an IP address. ***Loopback0*** interface will be used by Hardware flow tracking as a local interface for sending IPFIX records to CPU.

```
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address <ip>[/n] [ip subnet mask]
```

20.9.2.5 Configuration Examples

Example configuration sequence:

```
switch# Generate SSL client key
switch# security pki key generate rsa 2048 client-key
switch# show management security ssl key client-key
…
switch# Generate SSL client certificate
switch# security pki certificate generate self-signed client-cert key
 client-key generate rsa 2048 parameters common-name SwitchName country
 US state CA locality "Santa Clara" organization Arista organization-unit
 IT
certificate:client-cert generated
switch# show management security ssl certificate client-cert
…
switch# Copy SSL client certificate to AVA nucleus
switch# copy certificate:client-cert <destination>

switch# Copy AVA nucleus certificate onto Switch
switch# copy terminal: certificate:ca-cert
enter input line by line; when done enter one or more control-d
….
Copy completed successfully.
switch# show management security ssl certificate ca-cert
…

# Create SSL profile with client-key, client-cert and ca-cert
switch(config)# management security
switch(config-mgmt-security)# ssl profile awake-nucleus
switch(config-mgmt-sec-ssl-profile-awake-nucleus)# certificate client-
cert key client-key
switch(config-mgmt-sec-ssl-profile-awake-nucleus)# trust certificate ca-
cert
switch(config-mgmt-sec-ssl-profile-awake-nucleus)# end

# Enable IP routing
switch# conf
switch(config)# ip routing
```

```
# Configure monitor security awake and enable
switch(config)# monitor security awake
switch(config-monitor-security-awake)# monitor-point identifier 1
switch(config-monitor-security-awake)# nucleus awake-nucleus
switch(config-monitor-security-awake-nucleus-awake-nucleus)# local
 interface Management 1
switch(config-monitor-security-awake-nucleus-awake-nucleus)# destination
 nucleus1.foo.com
switch(config-monitor-security-awake-nucleus-awake-nucleus)# ssl profile
 awake-nucleus
switch(config-monitor-security-awake-nucleus-awake-nucleus)# exit
switch(config-monitor-security-awake)# no disabled
switch(config-monitor-security-awake)# end
```

Running configuration.

```
…
management security
   ssl profile awake-nucleus
      certificate client-cert key client-key
      trust certificate ca-cert
…
ip routing
…
monitor security awake
   nucleus awake-nucleus
      local interface Management1
      destination nucleus1.foo.com
      ssl profile awake-nucleus
   no disabled
```

Sample configuration - with multiple profiles and Nucleus:

```
management security
   ssl profile awake-nucleus1
      certificate client-cert key client-key1
      trust certificate system
   ssl profile awake-nucleus2
      certificate client-cert key client-key2
      trust certificate root-cert2

monitor security awake
   topic packet-analysis-sessions
   monitor-point identifier 10
   flow table size 153600 entries
   !
   nucleus nucleus1
      local interface Loopback10
      destination nucleus1.foo.com
      ssl profile awake-nucleus1
   nucleus nucleus2
      local interface Management1
      destination nucleus2.foo.com
      ssl profile awake-nucleus2
   no disabled
```

20.9.3 Upgrade EOS and/or NDRSensor.swix Extension

1. Disable AVA sensor by configuring **`disabled`** under **`monitor security awake`**. This will stop the AVA switch sensor running on the switch.

2. Uninstall **`NDRSensor.swix`** extension.

```
switch# show installed-extensions
NDRSensor.swix

switch# no extension NDRSensor.swix
switch# show extensions
Name                                Version/Release      Status
 Extension
---------------------------------- -------------------- -----------
 ---------
NDRSensor.swix                      4.30.1F/316201\      A, NI, B    8
                                    29.4301F
```

3. Remove **`NDRSensor.swix`** from boot extensions.

```
switch# show boot-extensions
NDRSensor.swix # Old extension needs to be removed from boot-extension

switch# copy installed-extensions boot-extensions
Copy completed successfully.

switch# show boot
# boot-extensions empty.
```

4. Upgrade EOS image on the switch - Follow the steps to upgrade the EOS image on the box as described in the EOS configuration guide. Once the switch is back up and running.
5. Install new **`NDRSensor.swix`** extension corresponding to the new EOS image and copy it to boot-extensions. This step is same as NDR Sensor Extension Installation
6. Verify the AVA switch sensor is running by using the **`show monitor security awake`** command.

20.9.4 Show Commands

- Following CLI command shows the status of the Monitor security Awake feature:

```
switch# show monitor security awake [nucleus <nucleus>]
```

Example

```
switch# show monitor security awake
Monitor security awake status: active
Topic identifier: packet-analysis-sessions
Monitor point identifier: 0
Flow table size: 16384 entries
Flow table inactive timeout: 40.0 seconds
Active interfaces: Et37,39,49

Nucleus: nucleus1
Status: connected
VRF: default
Local interface: Management1 (172.28.134.144)
Destination: 10.243.93.139 port 9094
SSL profile: awake-nucleus1
Last established: 2 days, 19:58:23 ago
```

- Following CLI command shows the various counters of the Monitor security awake feature:

```
switch# show monitor security awake counters [flows|ipfix|nucleus
 [<nucleus>]]
```

Example

```
switch# show monitor security awake counters
Active flows: 269, RX packets: 8.943M (8943077)
Flows created: 558.655K (558655), expired: 558.386K (558386)

IPv4 flows:
Application       Flows Active       Flows Created           Flows
 Expired
----------------- ------------------ ----------------------
 -----------------
DHCP              9                  13.072K (13072)         13.063K
 (13063)
DNS               53                 279.857K (279857)       279.804K
 (279804)
HTTP              5                  34.759K (34759)         34.754K
 (34754)
LDAP              0                  15                      15
NetBios           0                  18                      18
SMB               0                  18                      18
TLS/SSL           45                 143.986K (143986)       143.941K
 (143941)
Other             157                86.93K (86930)          86.773K
 (86773)

IPv6 flows:
Application       Flows Active       Flows Created       Flows Expired
----------------- ------------------ ------------------- -------------

Nucleus: nucleus1
Activity records sent: 578.306K (578306), last sent 0:00:00 ago
Progress records sent: 172.057K (172057), last sent 0:00:00 ago
Last successful connection: 10:11:22 ago
Successful connections: 11
Last connection failure: 10:11:51 ago
Connection failures: 46
Activity records in queue: 0
Progress records in queue: 1

IPFIX counters:
Exporter: 172.22.197.142 Source port: 36582 Observation domain ID: 1
Messages received: 379.455K (379455)
Template records received: 208
Options template records received: 0
Data records received: 7.308M (7308225)
Options data records received: 0
Unknown template ID errors: 0
Invalid IPFIX messages received: 0
Flow record queue full: 0
```

- Following CLI command shows the flow table snapshot of all the flows currently active in the FlowWatcher agent:

```
switch# switch# show monitor security awake flow-table [detail]
```

This is debugging CLI and can take a while to dump the snapshot of the current flow table.

Example 1:

```
switch# show monitor security awake flow-table
IPv4 flows: 5
```

```

Packets L2H: 0, Bytes L2H: 0, Packets H2L: 2, Bytes H2L: 180
```

20.9.5 Limitations

- **NDRSensor.swix** is supported on the 32-bit EOS version only.
- In an MLAG setup, AVA switch sensor doesn't correlate bidirectional flows that are hashed to different MLAG peers.
- AVA switch sensor doesn't correlate bidirectional flows that are NATed.
- When AVA switch sensor is enabled, the TerminAttr agent will also process IPFIX packets sent to the CPU, and the Traffic flows feature on the CloudVision portal is automatically enabled and can

cause additional CPU usage on the switch. If "Traffic flows" feature is not required on ClouldVision, disable TerminAttr IPFIX processing by adding **`-ipfix=false`** argument to **`exec /usr/bin/TerminAttr`** under **`daemon TerminAttr`** configuration.

20.9.6 AVA Sensor Commands

- monitor security awake
- show monitor security awake
- show monitor security awake counters

20.9.6.1 monitor security awake

The **monitor security awake** command when enabled the FlowWatcher agent enables Hardware flow tracking with filter based packet sampling, IP/IPv6 access lists and Mirroring features to receive the first few packets of every new flow and flow volume using IPFIX.

The **no** form of the **monitor security awake** command disables the monitor security awake feature from the **running config**.

Note: Before enabling **monitor security awake** command the **NDRSensor.swix** extension needs to be installed on the system running supported EOS version.

Command Mode

Global Configuration

Command Syntax

monitor security awake

no monitor security awake

default monitor security awake

Example

These commands create and enable a non-persistent DirectFlow flow.

```
switch(config)# monitor security awake
switch(config-monitor-security-awake)#
```

20.9.6.2 show monitor security awake

The **show monitor security awake** command displays the status of the Monitor security Awake feature on the switch.

Command Mode

EXEC

Command Syntax

show monitor security awake [nucleus ***nucleus***]

Example

This command displays the status of the Monitor security Awake feature on the switch..

```
switch# show monitor security awake
Monitor security awake status: active
Topic identifier: packet-analysis-sessions
Monitor point identifier: 0
Flow table size: 16384 entries
Flow table inactive timeout: 40.0 seconds
Active interfaces: Et37,39,49

Nucleus: nucleus1
Status: connected
VRF: default
Local interface: Management1 (172.28.134.144)
Destination: 10.243.93.139 port 9094
SSL profile: awake-nucleus1
Last established: 2 days, 19:58:23 ago
```

20.9.6.3 show monitor security awake counters

The **show monitor security awake counters** command displays the various counters of the Monitor security awake feature on the switch.

Command Mode

EXEC

Command Syntax

show monitor security awake counters [flows | ipfix | nucleus [***nucleus***<>]]

Example

This command displays the various counters of the Monitor security awake feature on the switch.

```
switch# show monitor security awake counters
Active flows: 269, RX packets: 8.943M (8943077)
Flows created: 558.655K (558655), expired: 558.386K (558386)

IPv4 flows:
Application       Flows Active       Flows Created           Flows Expired
----------------- ------------------ ---------------------- -----------------
