- **Sand Jericho+ fixed configuration switches**: 900 seconds

- 7280CR2 series
- 7280SR2 series

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the reload-delay mlag command.

Severing the physical connection (cable) that establishes the peer-link between MLAG peers may result in a ***split brain*** state where each peer independently enters spanning tree state to prevent topology loops. Sessions established through one interface of a dual attached device may fail if its path is disrupted by the STP reconvergence, possibly resulting in temporarily lost connectivity. Sessions can be reestablished if permitted by the resulting topology.

11.3.3.3 Upgrading MLAG Peers

MLAG ISSU (In-Service Software Upgrade) upgrades EOS software on one MLAG peer with minimal traffic disruptions on active MLAG interfaces and without changing the network topology.

11.3.3.3.1 Verifying Configuration Compatibility

A seamless EOS upgrade on an MLAG peer requires that the following features are configured consistently on each switch:

- VLANs.
- Switchport configuration on port channel interfaces that are configured with an MLAG ID.
- STP configuration (global).

11.3.3.3.2 Version Compatibility

A switch running MLAG can be upgraded without disrupting MLAG traffic when the upgrade EOS version is compatible with the version on the peer switch. Refer to the Release Notes for a list of compatible EOS versions.

11.3.3.3.3 Reload Warning Conditions

Entering an EOS reload command while MLAG is active generates warning messages if conditions that can result in packet loss during the upgrade are present. All warnings should be resolved before confirming the reload request. The following table displays the reload conditions and a common resolution method for each condition.

Table 64: Reload Warning Resolutions

Reload Condition	Resolution Method
Compatibility check	Refer to the Release Notes to verify that the new version is compatible with the currently installed version.
Active-partial MLAG warning	Bring up the remote port-channel. If the MLAG is not actively used, then this warning can be ignored.
STP is not restartable	Wait for STP to be restartable: typically 30 seconds, up to 120 seconds for a newly started STP agent. Refer to MLAG Availability through a Single Functional Peer for information on checking restartability.
Reload delay too low	Configure a reload delay value greater than or equal to the default. Recommend delay is 300 seconds for TOR switches, 900 seconds for modular switches, and 600 seconds for Sand platform fixed configuration switches (7020 and 7280 series (except 7280CR2 and 7280SR2)).
Peer has error-disabled interfaces	Wait for reload-delay to expire on the peer.

Example

The following **reload** command generates MLAG warning conditions that should be addressed before confirming the ***proceed with reload*** prompt.

```
switch(config)# reload
If you are performing an upgrade, and the Release Notes for the
new version of EOS indicate that MLAG is not backwards-compatible
with the currently installed version (4.9.2), the upgrade will
result in packet loss.

The following MLAGs are not in Active mode. Traffic to or from these ports will
be lost during the upgrade process.
                                                                  local/remote
  mlag      desc               state      local      remote          status
--------- --------- ------------------- ---------- ----------- ------------
    14               active-partial       Po14        Po14         up/down
    15               active-partial       Po15        Po15         up/down

Stp is not restartable. Topology changes will occur during the upgrade process.

The configured reload delay of 100 seconds is below the default
value of 300 seconds. A longer reload delay allows more time to
rollback an unsuccessful upgrade due to incompatibility.

The other MLAG peer has errdisabled interfaces. Traffic loss will occur during
the upgrade process.

Proceed with reload? [confirm]
```

11.3.3.3.4 Performing an MLAG ISSU Upgrade

The following procedure performs an MLAG ISSU upgrade:

1. Verify configuration consistency on each peer (Verifying Configuration Compatibility).
2. Verify version compatibility between the new and existing images (Version Compatibility).
3. Configure reload-delay mlag (MLAG Availability through a Single Functional Peer) if needed. Recommended delay period varies by switch type, and each switch defaults to its recommended delay period.
4. Install the new image onto one of the peers:
   a. Upload the new image to the switch.
   b. Set the boot path to the new image.
   c. Enter the **reload** command.
5. Resolve all reload warnings.
6. Confirm the reload.
7. Wait for MLAG peers to renegotiate to the active state and reload-delay expiry on rebooted peer; until reload-delay period has expired, ports on the rebooted peer (except the peer-link) will be in ***errdisabled*** state with err-disabled reason being ***mlag-issu***.

   Avoid configuration changes on both peers until after this step.
8. Repeat the upgrade process for the other peer.

   When upgrading modular switches with dual supervisors, upgrade the standby supervisors first, then upgrade the active supervisors.

11.3.4 MLAG Dual Primary Detection and Release

When the MLAG peer-link goes down, the secondary peer assumes the primary peer is down or dead, and takes over the primary role. It is possible that when peer-link is down, the primary is not actually down or dead, and both MLAG peers think they are the primary. This is called **dual-primary** condition or state. In this state, each peer runs Layer-2 protocols such as Spanning Tree Protocol independently. Depending on the topology, this can cause loops in the network. This can also impact the IGMP snooping feature.

The Dual Primary Detection feature uses the management interface as an out-of-band connection between the two peers along with the peer-link. Once configured, the MLAG peers sends UDP heartbeat packets on the management interface. When the peer-link goes down and the heartbeat is still active on out-of-band connection, both MLAG peers detects **dual-primary** condition. The switch can take optional action to shutdown all links except the peer-link on the original secondary MLAG peer.

Beginning with the ***EOS Release 4.23.1F***, there is support for dual primary recovery delay.

Recovery delay is an improvement to the current dual-primary detection feature. Use only when MLAG pairs recover from dual-primary detection with configured errdisable all-interfaces. When recovery delay is configured, the old secondary MLAG peer expects to un-errdisable MLAG interfaces later than non-MLAG to allow more time for L3 interfaces to converge.

Beginning with the ***EOS Release 4.25.0F***, when dual-primary-detection is enabled, there will be heartbeats transferred on both the peer-link and the management link at the same time. This improves dual-primary-detection because both the management link and the peer-link need to fail before the detection fails.

11.3.4.1 Supported EOS Versions

MLAG dual primary detection is supported beginning with ***EOS Release 4.20.0F*** and onwards.

11.3.4.2 Limitations

The following limitaions apply to the MLAG Dual Primary Detection feature.

1. UDP port 4432 is used to exchange control information between the peers, and must not be blocked on the management interfaces on both of the MLAG peers.
2. At least one MLAG port-channel must be configured on the MLAG peers to perform dual primary detection and the corresponding errdisable action.
3. Errdisable action brings down all physical Ethernet interfaces excluding the MLAG peer-link and management port. However, Layer-2 port-channels go down and VLAN SVIs may go down (i.e. autostate taking down VLAN SVIs).
4. When the errdisable action is configured with the non-MLAG interfaces recovery delay the errdisable action must always be less than the MLAG interfaces recovery delay. Otherwise, MLAG interfaces will come up sooner and cause northbound traffic loss.
5. Do not configure this feature if there can be consecutive peer-link flaps. There is an issue that if there are consecutive peer-link flaps during which MLAG peers also happen to switch roles, you can have unexpired recovery timers on the new primary and the secondary can not go dual primary detected until the MLAG recovery timer expires. This can open a small window for L3 traffic blackholing on the primary depending on the delta between recovery delay for MLAG and non-MLAG interfaces.
6. Changing the recovery delay configurations during active recovery delay may cause interfaces to stay errdisabled.

11.3.4.3 MLAG Dual Primary Detection and Release Configuration

To enable MLAG dual primary detection feature, you must configure the following commands on both MLAG peers in the ***MLAG*** configuration mode.

```
switch(config-mlag)# peer-address heartbeat Peer-IP [vrf VRF-NAME ]
```

Parameters:

- ***Peer-IP*** The Management IP address of the MLAG peer reachable in the targeted VRF.
- ***VRF-NAME*** The MLAG peer reachable in VRF (or default VRF if no VRF is configured).

The **peer-address heartbeat** command causes the MLAG agent to start using ***Peer-IP*** address in the given VRF for UDP-based heartbeat control messages.

The **dual-primary detection delay** command configures dual primary detection delay with an optional action to errdisable all interfaces on secondary MLAG peer after detecting the dual primary condition.

```
switch(config-mlag)# dual-primary detection delay SECONDS [action
 errdisable all-interfaces]
```

Parameters:

- **delay** Specifies the number of seconds to wait after MLAG failover to listen for MLAG heartbeats to determine dual primary condition.
- **action errdisable all-interfaces** Errdisables all local physical interfaces on the secondary MLAG peer after detecting the dual primary condition.

Note: This feature must be configured on both MLAG peers.

Use both the **peer-address heartbeat** command and the **dual-primary detection** command on each peer to disable the Dual Primary Detection feature.

The **peer-address heartbeat** command triggers MLAG to revert using the peer-link for heartbeat control messages instead of the management IP address of the MLAG peer.

```
switch(config-mlag)# (no|default) peer-address heartbeat
```

The **dual-primary detection** command removes the detection delay time as well as detection action.

Examples

- This example specifies the MLAG Peer's Management IP address ***172.30.118.190*** in default VRF for heartbeats.

  ```
  switch(config)# mlag
  switch(config-mlag)# peer-address heartbeat 172.30.118.190
  ```

- In this example, the command errdisables all physical interfaces on secondary MLAG peer when dual primary condition is detected.

  ```
  switch(config-mlag)# dual-primary detection delay 5 action errdisable
   all-interfaces
  ```

  Both MLAG peers must have equivalent configurations.

The following commands remove the Dual Primary Detection feature. You must unconfigure both MLAG peers.

```
switch(config-mlag)# no peer-address heartbeat
switch(config-mlag)# no dual-primary detection
```

The **dual-primary recovery delay** command configures the dual-primary detection recovery-delay for MOLG interfaces and non-MPLG interfaces. Negating the configurations or configuring default values makes both recovery delay values reset back to 0. The non-MLAG delay must always be less than the MLAG delay so that you have more time for L3 convergence before you enable the

MLAG interfaces. A suggested value for MLAG is 60 seconds, and non-MLAG is 0 seconds. These values can be adjusted depending on the network scale.

```
switch(config-mlag)# dual-primary recovery delay mlag <0-1000> non-
mlag <0-1000>
switch(config-mlag)# [no|default] dual-primary recovery delay
```

11.3.4.3.1 ISSU Implications

When upgrading from an EOS release that does not support the Dual Primary Detection feature, you must configure this feature only after both MLAG peers are upgraded to the release that has support. When downgrading to a release without Dual Primary Detection support, the configuration must be removed from both the peers before the downgrade process is initiated on either peer. Otherwise, MLAG fails configuration sanity.

11.3.4.4 Viewing the MLAG Dual Primary Detection and Release Status

Use the **show running-config** command to display the MLAG dual primary detection configuration.

Example

```
switch# show running-config
...
mlag configuration
 domain-id test_domain_1
 local-interface Vlan4094
 peer-address 10.0.0.2
 peer-address heartbeat 172.30.118.190
 primary-priority 11
 peer-link Port-Channel1
dual-primary detection delay 5 action errdisable all-interfaces
 ...
```

Use the **show mlag detail** command to display MLAG dual primary interface errdisabled status, recovery delay status, and the heartbeat counts sent and received. You can infer that the status of recovery delay is active if the dual-primary detection is Configured (dual primary resolved) and dual-primary interface errdisabled is True.

Example

```
switch(config-mlag)# show mlag detail
 MLAG Configuration:
 domain-id : test_domain_1
 local-interface : Vlan4094
 peer-address : 10.0.0.1
 peer-link : Port-Channel1
 hb-peer-address : 172.30.117.28
 peer-config : consistent

MLAG Status:
 state : Active
 negotiation status : Connecting
 peer-link status : Down
 local-int status : Up
 system-id : 46:4c:a8:c6:42:dd
 dual-primary detection : Detected

MLAG Ports:
 Disabled : 0
 Configured : 0
```

```
 Inactive : 0
 Active-partial : 0
 Active-full : 0

MLAG Detailed Status:
 State : primary
 State changes : 5
 Last state change time : 1:06:19 ago
 Hardware ready : True
 Failover : True
 Last failover change time : 1:06:19 ago
 Secondary from failover : False
 primary-priority : 12
 Peer primary-priority : 11
 Peer MAC address : 44:4c:a8:c6:42:dd
 Peer MAC routing supported : True
 Reload delay : 0 seconds
 Non-MLAG reload delay : 0 seconds
 Peer ports errdisabled : False
 Lacp standby : False
 Configured heartbeat interval : 4000 ms
 Effective heartbeat interval : 4000 ms
 Heartbeat timeout : 60000 ms
 Last heartbeat timeout : never
 Heartbeat timeouts since reboot : 0
 UDP heartbeat alive : True
 Heartbeats sent/received : 3189/3189
 Peer monotonic clock offset : unknown
 Agent should be running : True
 P2p mount state changes : 4
 Fast MAC redirection enabled : False
 Dual-primary detection delay : 5
 Dual-primary action : errdisable-all
```

When the dual-primary action is errdisable and detects the **dual-primary** condition, all the ethernet interfaces on the secondary MLAG peer are errdisabled with a **mlagdualprimary** reason.

Example

```
switch# show interfaces status errdisabled
 Port Name Status Reason
 ------------ ---------------- ----------------- --------------------
 Et1 errdisabled mlagdualprimary
 Et2 errdisabled mlagdualprimary
 Et14 errdisabled mlagdualprimary
...
```

11.3.5 Configuring MLAG

These sections describe the basic MLAG configuration steps:

- Configuring the MLAG Peers
- Configuring MLAG Services

11.3.5.1 Configuring the MLAG Peers

Connecting two switches as MLAG peers requires the establishment of the peer link and an SVI that defines local and peer IP addresses on each switch.

The peer link is composed of a LAG between the switches. When all devices that connect to the MLAG domain are dually connected to the switches through an MLAG, a peer link of two Ethernet interfaces

is sufficient to handle MLAG control data and provide N+1 redundancy. When the domain connects to devices through only one MLAG peer, the peer link may require additional Ethernet interfaces to manage data traffic.

Disruptions to peer link connectivity due to forwarding agent restarts may cause an extended MLAG outage. Forwarding agent restart event include some configuration changes, such as port speed change or UFT mode change). The following precautions can reduce the risk of losing peer-link connectivity:

- all switches: constructing peer-links from port-channels in preference to a single Ethernet interface.
- modular systems: peer-link port-channel members should span multiple line cards.
- multi-chip systems: peer-link port-channel member should span multiple chips.

Managing Switch Configuration Settings describes modular systems.

The steps that configure two switches as MLAG peers include:

- Configuring the Port Channels, VLAN Interfaces, and IP addresses
- Configuring Peer Parameters
- Configuring MLAG Peer Gateway

11.3.5.1.1 Configuring the Port Channels, VLAN Interfaces, and IP addresses

The peer link is a normal port channel. The local address is the SVI that maps to the peer link port channel. The port channel and SVI must be configured on each peer switch. The port channel should be an active LACP port. The local and peer addresses must be located on the same IP address subnet. Autostate should be disabled on the SVI configured as the local interface.

Examples

- These commands create an active mode LACP port channel interface from two Ethernet interfaces and configure it as part of a trunk group on each switch.

  The **`switchport mode trunk`** command permits all VLANs on the interface by default, so all VLANs are permitted on port channel 10 in the following example. The configuration of a trunk group for a VLAN restricts only that specific VLAN to the associated ports: VLAN 4094 is only permitted on port channel 10, and not on any other ports on the switch. It is important to remember that all VLANs must be permitted between the peers on the peer link for correct operation.

  Switch 1

```
switch1# config
switch1(config)# vlan 4094
switch1(config-vlan-4094)# trunk group m1peer
switch1# config
switch1(config)# interface ethernet 1-2
switch1(config-if-et1-2)# channel-group 10 mode active
switch1(config-if-et1-2)# interface port-channel 10
switch1(config-if-po10)# switchport mode trunk
switch1(config-if-po10)# switchport trunk group m1peer
switch1(config-if-po10)# exit
switch1(config)#
```

  Switch 2

```
switch2# config
switch2(config)# vlan 4094
switch2(config-vlan-4094)# trunk group m1peer
switch2(config-vlan-4094)# exit
switch2(config)# interface ethernet 1-2
switch2(config-if-et1-2)# channel-group 10 mode active
```

```
switch2(config-if-et1-2)# interface port-channel 10
switch2(config-if-po10)# switchport mode trunk
switch2(config-if-po10)# switchport trunk group m1peer
switch2(config-if-po10)# exit
switch2(config)#
```

- These commands create an SVI for the local interface and associate it to the trunk group assigned to the peer link port channel.

  The SVI creates a Layer 3 endpoint in the switch and enables MLAG processes to communicate via TCP. The IP address can be any unicast address that does not conflict with other SVIs.
  STP is disabled for the peer link ***vlan 4094*** to prevent any potential STP disruption of inter peer communications. Recall that the VLAN has been restricted to port-channel 10 by the earlier trunk group configuration thus preventing potential Layer 2 loop conditions within ***vlan 4094***.

  Switch 1

```
switch1# config
switch1(config)# interface vlan 4094
switch1(config-if-vl4094)# ip address 10.0.0.1/30
switch1(config-if-vl4094)# no autostate
switch1(config-if-vl4094)# exit
switch1(config)# no spanning-tree vlan-id 4094
switch1(config)#
```

  Switch 2

```
switch2# config
switch2(config)# interface vlan 4094
switch2(config-if-vl4094)# ip address 10.0.0.2/30
switch2(config-if-vl4094)# no autostate
switch2(config-if-vl4094)# exit
switch2(config)# no spanning-tree vlan-id 4094
switch2(config)#
```

11.3.5.1.2 Configuring Peer Parameters

Peer connection parameters configure the connection between the MLAG peer switches. This section describes the following peer configuration parameters.

- MLAG Configuration Mode
- Local VLAN Interface
- Peer Address
- Peer Link
- Domain ID
- Heartbeat Interval and Timeout
- Reload Delay Period
- Shutdown

11.3.5.1.2.1MLAG Configuration Mode

Peer connection parameters are configured in MLAG-configuration mode. The mlag configuration (global configuration) command places the switch in MLAG configuration mode.

Example

This command places the switch in MLAG configuration mode.

```
switch(config)# mlag configuration
```

```
switch(config-mlag)#
```

11.3.5.1.2.2Local VLAN Interface

The local interface specifies the SVI upon which the switch sends MLAG control traffic. The local IP address is specified within the definition of the VLAN associated with the local interface. The Peer Address configures the control traffic destination on the peer switch.

The **`local-interface`** command specifies a VLAN interface as the peer link SVI.

Example

This command configures ***vlan 4094*** as the local interface.

```
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#
```

11.3.5.1.2.3Peer Address

The peer address is the destination address on the peer switch for MLAG control traffic. If the peer IP address is unreachable, MLAG peering fails and both peer switches revert to their independent state.

The **`peer-address`** command specifies the peer address.

Example

This command configures a peer address of ***10.0.0.2***.

```
switch(config-mlag)# peer-address 10.0.0.2
switch(config-mlag)#
```

11.3.5.1.2.4Peer Link

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries MLAG advertisements, keepalive messages, and data traffic between the switches. This information keeps the two switches working together as one. While interfaces comprising the peer links on each switch must be compatible, they need not use the same interface number. Ethernet and port-channel interfaces can be configured as peer links.

The **`peer-link`** command specifies the interface the switch uses to communicates MLAG control traffic.

Example

This command configures ***port-channel 10*** as the peer link.

```
switch(config-mlag)# peer-link port-channel 10
switch(config-mlag)#
```

11.3.5.1.2.5Domain ID

The MLAG domain ID is a unique identifier for an MLAG domain. The MLAG domain ID must be the identical on each switch to facilitate MLAG communication.

The domain-id command configures the MLAG domain ID.

Example

This command configures ***mlagDomain*** as the domain ID:

```
switch(config-mlag)# domain-id mlagDomain
```

```
switch(config-mlag)#
```

11.3.5.1.2.6Heartbeat Interval and Timeout

The heartbeat interval specifies the period between the transmission of successive keepalive messages. Each MLAG switch transmits keepalive messages and monitors message reception from its peer. The heartbeat timeout is reset when the switch receives a keepalive message. If the heartbeat timeout expires, the switch disables MLAG under the premise that the peer switch is not functioning.

The heartbeat-interval (MLAG) command configures the heartbeat interval between ***1*** and ***30*** seconds, with a default value of ***4*** seconds. The heartbeat timeout expiry is 30 seconds.

Note: On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to ***10*** seconds.

Example

This command configures the heartbeat interval as ***2500*** milliseconds (2.5 seconds).

```
switch(config-mlag)# heartbeat-interval 2500
switch(config-mlag)#
```

11.3.5.1.2.7Reload Delay Period

The reload delay period specifies the interval that non-peer links are disabled after an MLAG peer reboots. This interval allows non-peer links to learn multicast and OSPF states and synchronize ARP caches before the ports start handling traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform.

- Fixed configuration switches: ***300*** seconds (five minutes).
- Trident II platform modular switches: ***1200*** seconds (twenty minutes).
- Sand platform fixed configuration switches (7020 and 7280 series (except 7280CR2 and 7280SR2)): ***600*** seconds (ten minutes).
- Sand platform modular switches: ***1800*** seconds (thirty minutes).

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the reload-delay mlag command.

Example

This command configures the reload delay interval as ***2.5*** minutes (***150*** seconds).

```
switch(config-mlag)# reload-delay 150
switch(config-mlag)#
```

11.3.5.1.2.8Shutdown

The shutdown (MLAG) command disables MLAG operations without disrupting the MLAG configuration. The **`no mlag configuration`** command (global configuration mode) disables MLAG and removes the MLAG configuration. The **`no shutdown`** command resumes MLAG activity.

Examples

- This command disables MLAG activity on the switch.

```
switch(config-mlag)# shutdown
switch(config-mlag)#
```

- This command resumes MLAG activity on the switch.

```
switch(config-mlag)# no shutdown
switch(config-mlag)#
```

11.3.5.1.3 Configuring MLAG Peer Gateway

In an MLAG setup, routing on a MLAG peer switch is possible using its own bridge system MAC, VARP MAC, or VRRP MAC. On a peer receiving an IP packet with destination MAC set to one of these MACs, a packet gets routed if its hardware has enough information to route the packet. Configuring sending traffic to a cached MAC involves routing the session table and MLAG peer traffic if packets are received with the MAC peer.

Examples

- This command enables the MLAG peer gateway.

```
switch(config)# ip virtual-router mac-address mlag-peer
switch1(config)#
```

- This command disables the MLAG peer gateway.

```
switch(config)# no ip virtual-router mac-address mlag-peer
switch1(config)#
```

11.3.5.1.4 Configuring Ingress Replication to LAGs

Hardware support for ingress replication to LAGs is enabled by default when the user configures ingress replication. When multicast traffic is sent over the LAG, the hardware uses its built-in algorithm, based on the L2/L3/L4 headers, to load balance traffic over ports in the LAG. When a port goes down in a LAG, the hardware quickly hashes the multicast traffic over the remaining ports in the LAG, resulting in fewer drops than software based LAG support.

Examples

- This command enables ingress replication.

```
switch(config)# platform sand multicast replication default ingress
switch(config)#
```

- This command configures the maximum members (within a range of ***1*** through ***64***) for ingress only replication in a multicast group.

```
switch(config)# platform sand multicast replication ingress maximum 32
switch(config)#
```

11.3.5.2 Configuring MLAG Services

An MLAG is a pair of links that originate on a network attached device and terminate on the two MLAG peer switches. The MLAG switches coordinate traffic to the device through a common mlag (port-channel interface configuration) command on the interfaces that connect to the device.

The MLAG ID differs from the MLAG domain ID. The MLAG domain ID is assigned globally per switch in MLAG configuration mode, and the same MLAG domain ID must be on both switches.

Port channels configured as an MLAG must have identical port channel numbers. Although the MLAG ID is a distinct parameter from the port channel number, best practices recommend assigning the MLAG ID to match the port channel number.

Note: Arista recommends configuring the downstream switch or router connected to the MLAG peers to negotiate a LAG using LACP rather than configuring static LAGs. (On Arista switches, LACP is enabled using the command **`channel-group mode active`**. See Port Channels and LACP .) Using LAGs negotiated by LACP can help avoid problems caused by miscabling because LACP PDUs include the system ID and LACP key, which identify the switch and the LAG it belongs to. If MLAG miscabling happens using a LACP LAG, some ports will be inactive in the LAG which prevents it from bridging traffic erroneously. More importantly, when the MLAG state is primary on one switch and inactive on another, the peer switches are acting as two independent L2 switches rather than as one logical L2 switch. In this scenario, the downstream switch will have its LAG (logical L2 port) connected to two distinct L2 switches, which can result in spanning tree problems on the downstream switch because it will receive BPDUs with different system IDs on the same LAG. If spanning tree is not running, an L2 loop will be created between MLAG peer switches and the downstream device. Allowing LACP to negotiate the downstream LAG will avoid this problem because only ports connected to a given peer will be active in the LAG., and the other set of ports will not be able to bridge traffic.

The example below does not follow this convention to emphasize the parameters that are distinct. The example in MLAG Implementation Example follows the best practices convention.

Examples

- These ***switch1*** commands bundle Ethernet interfaces ***3*** and ***4*** in ***port channel 20***, then associate that port channel with ***mlag 12***.

```
switch1(config)# interface ethernet 3-4
switch1(config-if-et3-4)# channel-group 20 mode active
switch1(config-if-et3-4)# interface port-channel 20
switch1(config-if-po20)# mlag 12
switch1(config-if-po20)# exit
switch1(config)#
```

- These ***switch2*** commands bundle Ethernet interfaces ***9*** and ***10*** in ***port channel 20***, then associate that port channel with ***mlag 12***.

```
switch2(config)# interface ethernet 9-10
switch2(config-if-et9-10)# channel-group 20 mode active
switch2(config-if-et9-10)# interface port-channel 20
switch2(config-if-po20)# mlag 12
switch2(config-if-po20)# exit
switch2(config)#
```

- These commands configure the port channels that attach to the MLAG on network attached device:

```
NAD(config)# interface ethernet 1-4
NAD(config-if-Et1-4)# channel-group 1 mode active
NAD(config-if-Et1-4)# exit
NAD(config)#
```

The following figure displays the result of the interface MLAG configuration.

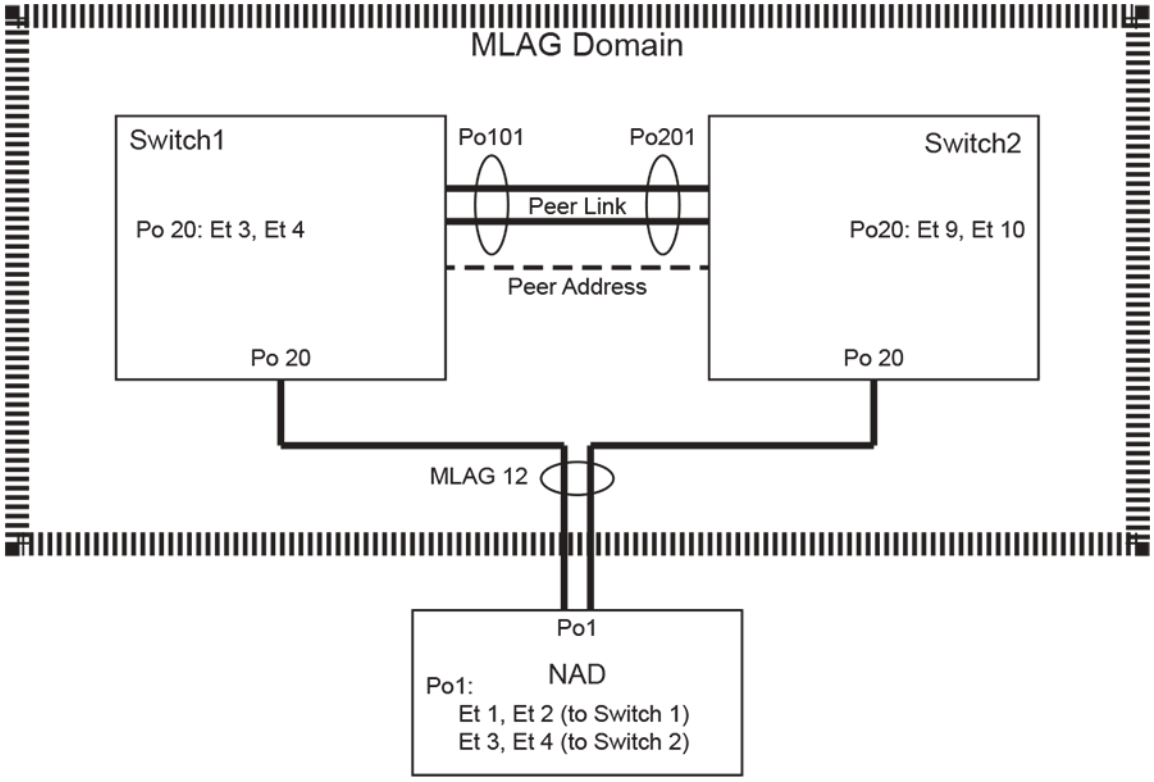

Figure 24: MLAG Interface Configuration

11.3.6 EVPN - MLAG Single-homed Hosts

Add a local VTEP to each MLAG peer for the control plane to advertise singly connected hosts as being directly behind a specific local VTEP-MLAG peer. Outgoing EVPN route advertisements contain nexthop and router MAC extended community when multi-VTEP MLAG mode is enabled. The following table summarizes the information. For symmetric IRB support, MLAG shared router MAC must be enabled.

Table 65: Route Advertisement

Routes	Single-homed Host	Multi-homed Host
MAC/IP routes (Type-2)	Local VTEP IP / Bridge MAC	MLAG VTEP IP / Shared MLAG Router MAC
IMET routes (Type-3)	MLAG VTEP IP	
IP Prefix routes (Type-5)	Local VTEP IP / Bridge MAC	

In multi-VTEP MLAG mode, IP prefix routes are advertised independently by each MLAG peer with its own local VTEP IP as nexthop, even when both peers are connected to that route. Additionally, egress VXLAN packets use the appropriate source IP to match what is advertised by the EVPN control plane.

Show Commands

The following displays the nexthop of locally generated EVPN Type-2 and Type-3 routes. The real IP address helps identify the VTEP being used. The nexthop of locally generated EVPN Type-5 routes are displayed as "-". The shared MLAG VTEP IP is ***1.1.1.1*** and the local VTEP IPs of the two MLAG peers are ***1.0.1.1*** and ***1.0.2.2***.

```
switch# show bgp evpn
```

```
BGP routing table information for VRF default

```

Limitations

- BUM traffic is advertised on the MLAG VTEP IP. VXLAN flooded packets may be seen on the peer-link.
- The singly connected interfaces or non-MLAG interfaces have to be placed in an exclusive vlan that does not have any MLAG interface as a member.
- MLAG shared router MAC needs to be enabled to support symmetric IRB.
- For EVPN Type-5 setup, the VRF to VNI mapping must be configured on both VTEPs of the MLAG pair.
- For EVPN Type-5 setup as well as EVPN symmetric IRB setup, the VRF to VNI mapping must be configured to be the same across all the VTEPs in the network. That is, the same VRF must be mapped to the same value of VNI on all the VTEPs which participate in the EVPN network.

11.3.7 MLAG Implementation Example

This example creates an MLAG Domain, then configures MLAG connections between the peer switches and four Network Attached Devices (NADs). The MLAG switches connect through a LAG and communicate with the NADs through MLAGs. Although the NADs can be any device that supports LACP LAGs, the devices in this example are Arista switches.

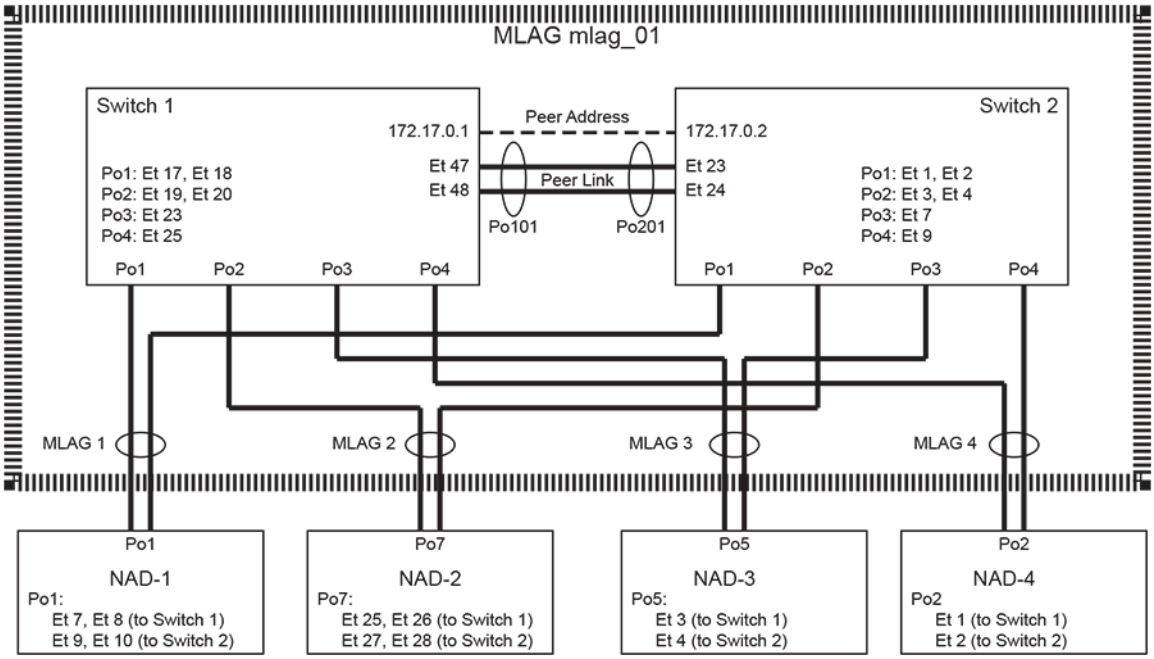

Figure 25: MLAG Implementation Example

11.3.7.1 Topology

Figure 25: MLAG Implementation Example displays the MLAG topology. Switch 1 and Switch 2 are MLAG peers that logically represent a single Layer 2 switch. The peer link between the switches contains the following interfaces:

- ***Switch 1: ethernet 47***, ***ethernet 48***
- ***Switch 2: ethernet 23***, ***ethernet 24***

The example configures MLAGs from the MLAG Domain to four network attached devices (NAD-1, NAD-2, NAD-3, NAD-4).

11.3.7.2 Configuring the Peer Switch Connections

To configure the switches in the described topology, perform the tasks in these sections:

- Configuring the Peer Switch Port Channels
- Configuring the Peer Switch SVIs
- Configuring the Peer Links

11.3.7.2.1 Configuring the Peer Switch Port Channels

These commands create the port channels the switches use to establish the peer link.

These commands create port channels on Switch1

```
switch1(config)# interface ethernet 47-48
switch1(config-if-et47-48)# channel-group 101 mode active
switch1(config-if-et47-48)# interface port-channel 101
switch1(config-if-po101)# switchport mode trunk
switch1(config-if-po101)# switchport trunk group peertrunk
switch1(config-if-po101)# exit
switch1(config)#
```

These commands create port channels on Switch2

```
switch2(config)# interface ethernet 23-24
switch2(config-if-et23-24)# channel-group 201 mode active
switch2(config-if-et23-24)# interface port-channel 201
switch2(config-if-po201)# switchport mode trunk
switch2(config-if-po201)# switchport trunk group trunkpeer
switch2(config-if-po201)# exit
switch2(config)#
```

11.3.7.2.2 Configuring the Peer Switch SVIs

For each peer switch, these commands create an SVI and associate it to the trunk group assigned to the peer link port channel. STP is disabled on the VLAN.

These commands configure the SVI on Switch1

```
switch1(config)# vlan 4094
switch1(config-vlan-4094)# trunk group peertrunk
switch1(config-vlan-4094)# interface vlan 4094
switch1(config-if-vl4094)# ip address 172.17.0.1/30
switch1(config-if-vl4094)# no autostate
switch1(config-if-vl4094)# exit
switch1(config)# no spanning-tree vlan-id 4094
switch1(config)#
```

These commands configure the SVI on Switch2

```
switch2(config)# vlan 4094
switch2(config-vlan-4094)# trunk group trunkpeer
switch2(config-vlan-4094)# interface vlan 4094
switch2(config-if-vl4094)# ip address 172.17.0.2/30
switch2(config-if-vl4094)# no autostate
switch2(config-if-vl4094)# exit
switch2(config)# no spanning-tree vlan-id 4094
switch2(config)#
```

11.3.7.2.3 Configuring the Peer Links

These commands create the peer links on each MLAG switch.

These commands create peer links on Switch1

```
switch1(config)# mlag configuration
switch1(config-mlag)# local-interface vlan 4094
switch1(config-mlag)# peer-address 172.17.0.2
switch1(config-mlag)# peer-link port-channel 101
switch1(config-mlag)# domain-id mlag_01
switch1(config-mlag)# heartbeat-interval 2500
switch1(config-mlag)# reload-delay 150
switch1(config-mlag)# exit
switch2(config)#
```

These commands create peer links on Switch2

```
switch2(config)# mlag configuration
```

```
switch2(config-mlag)# local-interface vlan 4094
switch2(config-mlag)# peer-address 172.17.0.1
switch2(config-mlag)# peer-link port-channel 201
switch2(config-mlag)# domain-id mlag_01
switch2(config-mlag)# heartbeat-interval 2500
switch2(config-mlag)# reload-delay 150
switch2(config-mlag)# exit
switch2(config)#
```

11.3.7.3 Configuring Peer Switch MLAGs

These commands create the MLAGs that connect the MLAG domain to the network attached devices.

These commands configure MLAG 1 on Switch1

```
switch1(config)# interface ethernet 17-18
switch1(config-if-et17-18)# channel-group 1 mode active
switch1(config-if-et17-18)# interface port-channel 1
switch1(config-if-po1)# mlag 1
switch1(config-if-po1)# exit
switch1(config)#
```

These commands configure MLAG 1 on Switch2

```
switch2(config)# interface ethernet 1-2
switch2(config-if-et1-2)# channel-group 1 mode active
switch2(config-if-et1-2)# interface port-channel 1
switch2(config-if-po1)# mlag 1
switch2(config-if-po1)# exit
switch2(config)#
```

These commands configure MLAG 2 on Switch1

```
switch1(config)# interface ethernet 19-20
switch1(config-if-et19-20)# channel-group 2 mode active
switch1(config-if-et19-20)# interface port-channel 2
switch1(config-if-po2)# mlag 2
switch1(config-if-po2)# exit
switch1(config)#
```

These commands configure MLAG 2 on Switch2

```
switch2(config)# interface ethernet 3-4
switch2(config-if-et3-4)# channel-group 2 mode active
switch2(config-if-et3-4)# interface port-channel 2
switch2(config-if-po2)# mlag 2
switch2(config-if-po2)# exit
switch2(config)#
```

These commands configure MLAG 3 on Switch1

```
switch1(config)#  interface ethernet 23
switch1(config-if-et23)# channel-group 3 mode active
switch1(config-if-et23)# interface port-channel 3
switch1(config-if-po3)# mlag 3
switch1(config-if-po3)# exit
```

```
switch1(config)#
```

These commands configure MLAG 3 on Switch2

```
switch2(config)# interface ethernet 7
switch2(config-if-et7)# channel-group 3 mode active
switch2(config-if-et7)# interface port-channel 3
switch2(config-if-po3)# mlag 3
switch2(config-if-po3)# exit
switch2(config)#
```

These commands configure MLAG 4 on Switch1

```
switch1(config)# interface ethernet 25
switch1(config-if-et25)# channel-group 4 mode active
switch1(config-if-et25)# interface port-channel 4
switch1(config-if-po4)# mlag 4
switch1(config-if-po4)# exit
switch1(config)#
```

These commands configure MLAG 4 on Switch2

```
switch2(config)# interface ethernet 9
switch2(config-if-et9)# channel-group 4 mode active
switch2(config-if-et9)# interface port-channel 4
switch2(config-if-po4)# mlag 4
switch2(config-if-po4)# exit
switch2(config)#
```

11.3.7.4 Configuring the Network Attached Devices

These commands create the LAGs on the Network Attached Devices that connect to the MLAG domain.

These commands configure the port channels on NAD-1

```
NAD-1(config)# interface ethernet 7-10
NAD-1(config-if-Et7-10)# channel-group 1 mode active
NAD-1(config-if-Et7-10)# exit
NAD-1(config)#
```

These commands configure the port channels on NAD-2

```
NAD-2(config)# interface ethernet 25-28
NAD-2(config-if-Et25-28)# channel-group 7 mode active
NAD-2(config-if-Et25-28)# exit
NAD-2(config)#
```

These commands configure the port channels on NAD-3

```
NAD-3(config)# interface ethernet 3-4
NAD-3(config-if-Et3-4)# channel-group 5 mode active
NAD-3(config-if-Et3-4)# exit
NAD-3(config)#
```

These commands configure the port channels on NAD-4

```
NAD-4(config)# interface ethernet 1-2
NAD-4(config-if-Et1-2)# channel-group 2 mode active
NAD-4(config-if-Et1-2)# exit
NAD-4(config)#
```

11.3.7.5 Verification

The following tasks verify the MLAG peer and connection configuration:

- Verify the Peer Switch Connection
- Verify the MLAGs
- Verify Spanning Tree Protocol (STP)
- Verify the MLAG Port Channel
- Verify the VLAN Membership

11.3.7.5.1 Verify the Peer Switch Connection

To display the MLAG configuration and the MLAG status on ***switch 1***, use the **show mlag** command:

```
switch1# show mlag
MLAG Configuration:
domain-id          :            mlag_01
local-interface    :          Vlan4094
peer-address       :       172.17.0.2
peer-link          :    Port-Channel101

MLAG Status:
state              :             Active
peer-link status   :                 Up
local-int status   :                 Up
system-id          :  02:1c:FF:00:15:38

MLAG Ports:
Disabled           :   0
Configured         :   0
Inactive           :   0
Active-partial     :   0
Active-full        :   4
```

To display the MLAG configuration and the MLAG status on ***switch 2***, use the **show mlag** command:

```
switch2# show mlag
MLAG Configuration:
domain-id          :            mlag_01
local-interface    :          Vlan4094
peer-address       :       172.17.0.1
peer-link          :    Port-Channel102

MLAG Status:
state              :             Active
peer-link status   :                 Up
local-int status   :                 Up
system-id          :  02:1c:FF:00:15:41

MLAG Ports:
Disabled           :   0
Configured         :   0
Inactive           :   0
```

```
Active-partial    :   0
Active-full       :   4
```

11.3.7.5.2 Verify the MLAGs

The show mlag interfaces command displays MLAG connections between the MLAG switches and the Network Attached Devices.

- This show mlag interfaces command displays MLAG connections between the MLAG peer ***switch 1*** and the network attached devices:

```
switch1# show mlag interfaces
                                                                  local/remote
  mlag     desc                    state     local     remote         status
-------------------------------------------------------------------------------
     1     sw1.po1          active-full       Po1        Po1          up/up
     2     sw1.po2          active-full       Po2        Po2          up/up
     3     sw1.po3          active-full       Po3        Po3          up/up
     4     sw1.po4          active-full       Po4        Po4          up/up
```

- The following show mlag interfaces command, with the **detail** option, displays MLAG connections between the MLAG peer ***switch 1*** and the network attached devices.

```
switch2#show mlag interfaces detail
                                local/remote
mlag       state local remote   oper   config          last change  changes
-------------------------------------------------------------------------------
   1 active-full   Po1    Po1  up/up  ena/ena  6 days, 2:08:28 ago        5
   2 active-full   Po2    Po2  up/up  ena/ena  6 days, 2:08:30 ago        5
   3 active-full   Po3    Po3  up/up  ena/ena  6 days, 2:08:33 ago        5
   4 active-full   Po4    Po4  up/up  ena/ena  6 days, 2:08:41 ago        5
switch2#
```

11.3.7.5.3 Verify Spanning Tree Protocol (STP)

STP functions can be displayed from each peer switch. MLAG interfaces are displayed as a single entry. Configured interfaces on each switch that are not included in an MLAG are displayed. Local interfaces have the normal notation; remote interfaces are preceded by ***P*** or ***Peer***.

VLAN Output 1: Assume VLAN 3903 includes MLAG 1

```
switch1# show spanning-tree vlan-id 3903
Spanning tree instance for vlan 3903
VL3903
  Spanning tree enabled protocol rapid-pvst
  Root ID    Priority    36671
             Address     001c.730c.3009
             Cost        1999 (Ext) 0 (Int)
             Port        105 (Port-Channel5)
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

  Bridge ID  Priority    36671  (priority 32768 sys-id-ext 3903)
             Address     021c.7300.1319
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

Interface        Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- --------------------
Po1              root       forwarding 1999      128.105  P2p
switch1#
```

The output displays ***mlag 1*** under its local interface name (***Po1***). A peer interface is not displayed because spanning tree considers the local and remote Port Channels as a single MLAG interface.

VLAN Output 2: Assume VLAN 3908 does not include any MLAGs

```
switch1# show spanning-tree vlan-id 3908
Spanning tree instance for vlan 3908
```

```
VL3908
  Spanning tree enabled protocol rapid-pvst
  Root ID    Priority    36676
             Address     021c.7300.1319
             This bridge is the root

  Bridge ID  Priority    36676  (priority 32768 sys-id-ext 3908)
             Address     021c.7300.1319
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

Interface        Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- ---------------
Et17             designated forwarding 2000      128.217  P2p
Et18             designated forwarding 2000      128.218  P2p
PEt17            designated forwarding 2000      128.17   P2p
PEt18            designated forwarding 2000      128.18   P2p
```

The output displays all interfaces from both switches. Each interface is explicitly displayed because they are individual units that STP must consider when selecting ports to block.

- ***Et17*** and ***Et18*** are located on the switch where the **`show spanning-tree`** command is issued.
- ***PEt17*** and ***PEt18*** are located on the remote switch from where the command was issued

An identical command issued on the peer switch displays similar information.

Verify the MLAG does not create topology loops (show spanning-tree blocked)

```
switch1# show spanning-tree blocked
Name       Blocked Interfaces List
-------------------------------------------------------

Number of blocked ports (segments) in the system : 0
switch1#
```

11.3.7.5.4 Verify the MLAG Port Channel

Issue the command **`show port-channel`** for channels ***1-4*** from ***switch 1***:

```
switch# show port-channel 1-4
Port Channel Port-Channel1:
  Active Ports: Ethernet17     Ethernet18     PeerEthernet1 PeerEthernet2
Port Channel Port-Channel2:
  Active Ports: Ethernet19     Ethernet20     Ethernet21     Ethernet22
                PeerEthernet3 PeerEthernet4 PeerEthernet5 PeerEthernet6
Port Channel Port-Channel3:
  Active Ports: Ethernet23     Ethernet24     PeerEthernet7 PeerEthernet8
Port Channel Port-Channel4:
  Active Ports: Ethernet25     Ethernet26     PeerEthernet9 PeerEthernet1
0
```

Issue the command **`show port-channel load-balance fields detailed`** command for ***channel 1*** from ***switch 2***:

```
switch2# show port-channel 1 detailed
Port Channel Port-Channel1:
  Active Ports:
       Port                Time became active       Protocol    Mode
     ------------------------------------------------------------------------
       Ethernet17          7/7/11 15:27:36          LACP        Active
       Ethernet18          7/7/11 15:27:36          LACP        Active
       PeerEthernet1       7/7/11 15:27:36          LACP        Active
       PeerEthernet2       7/7/11 15:27:36          LACP        Active
```

11.3.7.5.5 Verify the VLAN Membership

The **show vlan** command displays VLAN member ports, including MLAG ports and ports on each peer not bundled in an MLAG.

```
Switch1# show vlan 3903, 3908
VLAN  Name                            Status    Ports
----- ------------------------------- --------- -------------------------------
3903  ar.mg.rn.172.17.254.16/29       active    Cpu, Po1
3908  po.ra.ar.mg.172.17.254.64/29    active    Cpu, Et17, Et18, PEt17, PEt18
```

11.3.8 MLAG Commands

Global MLAG Commands

- mlag configuration (global configuration)

MLAG Interface Configuration Commands

- mlag (port-channel interface configuration)

MLAG Configuration Commands

- domain-id
- dual-primary detection delay
- dual-primary recovery delay
- heartbeat-interval (MLAG)
- local-interface
- peer-address
- peer-address heartbeat
- peer-link
- reload-delay mlag
- reload-delay mode
- reload-delay non-mlag
- shutdown (MLAG)

Display Commands

- show mlag
- show mlag interfaces
- show mlag interfaces members
- show mlag interfaces states
- show mlag issu warnings

11.3.8.1 domain-id

The **domain-id** command specifies a name for the Multi-chassis Link AGgregation (MLAG) domain.

The **no domain-id** and **default domain-id** commands remove the MLAG domain name by deleting the **domain-id** statement from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

domain-id ***identifier***

no domain-id

default domain-id

Parameters

identifier alphanumeric string that names the MLAG domain.

Example

This command names the MLAG domain ***mlag1***.

```
switch(config)# mlag
switch(config-mlag)# domain-id mlag1
switch(config-mlag)#
```

11.3.8.2 dual-primary detection delay

Use the **dual-primary detection delay** command to configure a dual primary detection delay with an optional action to errdisable all interfaces on secondary MLAG peer after a dual primary condition is detected.

Command Mode

MLAG configuration mode

Command Syntax

dual-primary detection delay ***seconds*** [action erridisable all-interfaces]

no dual-primary detection delay ***seconds*** [action erridisable all-interfaces]

default dual-primary detection delay ***seconds*** [action erridisable all-interfaces]

Parameters

- ***seconds*** Dual primary detection delay in seconds.
- **action** Specifies the action when dual-primary is detected.
- **erridisable** Errdisable interfaces.
- **all-interfaces** Disables all Ethernet interfaces except the peer-link.

Examples

- In this example, the command errdisables all physical interfaces on secondary MLAG peer when dual primary condition is detected.

```
switch(config-mlag)# dual-primary detection delay 5 action errdisable
 all-interfaces
```

  Both MLAG peers must have equivalent configurations.
- The following command removes the Dual Primary Detection feature. You must unconfigure both MLAG peers.

```
switch(config-mlag)# no dual-primary detection
```

11.3.8.3 dual-primary recovery delay

Use the **dual-primary recovery delay** command to configure dual-primary detection recovery-delay for MLAG interfaces and non-MLAG interfaces. Negating the configurations or configuring default values makes both recovery delay values reset back to ***0***. The non-MLAG delay must always be less than the MLAG delay so you have more time for L3 convergence before enabling MLAG interfaces.

Command Mode

MLAG configuration mode

Command Syntax

dual-primary recovery delay mlag ***seconds*** non-mlag ***seconds***

no dual-primary recovery delay mlag ***seconds*** non-mlag ***seconds***

default dual-primary recovery delay mlag ***seconds*** non-mlag ***seconds***

Parameters

- **mlag *seconds*** Delay in seconds after dual-primary detection resolves until non peer-link ports that are part of an MLAG are enabled. Range ***0 - 1000*** seconds. A suggested value for MLAG is ***60*** seconds. These values can be adjusted depending on the network scale.
- **non-mlag *seconds*** Delay in seconds after dual-primary detection resolves until ports that are not part of an MLAG are enabled. Range ***0 - 1000*** seconds. A suggested value for non-MLAG is ***0*** seconds. These values can be adjusted depending on the network scale.

Example

```
switch(config)# mlag
switch(config-mlag)# dual-primary recovery delay mlag 60 non-mlag 0
```

11.3.8.4 heartbeat-interval (MLAG)

The **heartbeat-interval** command configures the interval at which heartbeat messages are issued in a Multi-chassis Link AGgregation (MLAG) configuration.

The **no heartbeat-interval** and **default heartbeat-interval** commands revert the heartbeat interval to the default setting by removing the **heartbeat-interval** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

heartbeat-interval ***period***

no heartbeat-interval

default heartbeat-interval

Parameters

period Interval duration in milliseconds. Value ranges from ***1000*** through ***30000*** milliseconds. Default interval is ***4000*** milliseconds.

Guidelines

Heartbeat messages flow independently in both directions between the MLAG peers. If a peer stops receiving heartbeat messages within the expected time frame (***30*** seconds), the other peer can assume it no longer functions and without intervention or repair, the MLAG becomes disabled. Both switches revert to their independent state.

Note: On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to ***10*** seconds.

Example

This command configures the heartbeat interval to ***15000*** milliseconds:

```
switch(config)# mlag
switch(config-mlag)# heartbeat-interval 15000
switch(config-mlag)#
```

11.3.8.5 local-interface

The **local-interface** command assigns a VLAN interface for use in Multi-chassis Link AGgregation (MLAG) configurations. The VLAN interface is used for both directions of communication between the MLAG peers.

The **no local-interface** and **default local-interface** commands delete the VLAN interface assignment by removing the **local-interface** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

local-interface vlan ***vlan_number***

no local-interface

default local-interface

Parameters

vlan_number VLAN number, in the range from ***1*** through ***4094***.

Guidelines

When configuring the local interface, the VLAN interface must exist already. To configure a VLAN interface, issue the command **interface vlan**.

Example

This command assigns ***VLAN 4094*** as the local interface.

```
switch(config)# mlag
switch(config-mlag)# local-interface vlan 4094
switch(config-mlag)#
```

11.3.8.6 mlag (port-channel interface configuration)

The **mlag** command assigns an MLAG ID to a port-channel. MLAG peer switches form an MLAG when each switch configures the same MLAG ID to a port-channel interface. Only one MLAG ID can be assigned to an interface. An individual MLAG number cannot be assigned to more than one interface.

The **no mlag** and **default mlag** commands remove the MLAG ID assignment from the configuration mode interface by deleting the corresponding **mlag** command from ***running-config***.

Command Mode

Interface-Port Channel Configuration

Command Syntax

mlag ***number***

no mlag

default mlag

Parameters

number Number used as MLAG ID. Value ranges from ***1*** to ***2000***.

Example

These commands configures a port channel and assigns it ***mlag 4***.

```
switch(config)# interface ethernet 5-10
switch(config-if-Et5-10)# channel-group 1 mode active
switch(config-if-Et5-10)# interface port-channel 4
switch(config-if-Po4)# switchport trunk group group4
switch(config-if-Po4)# mlag 4
switch(config-if-Po4)# exit
switch(config)#
```

11.3.8.7 peer-address

The **peer-address** command specifies the peer IPv4 address for a Multi-chassis Link AGgregation (MLAG) domain. MLAG control traffic, including keepalive messages, is sent to the peer IPv4 address. If the peer IPv4 address is unreachable, then MLAG peering fails and both peer switches revert to their independent state.

The **no peer-address** and **default peer-address** commands remove the MLAG peer's IPv4 address assignment by deleting the peer-address command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

peer-address ***ipv4_addr***

no peer-address

default peer-address

Parameters

ipv4_addr MLAG peer IPv4 address.

Example

These commands configure the MLAG peer address.

```
switch(config)# mlag
switch(config-mlag)# peer-address 10.0.0.2
switch(config-mlag)#
```

11.3.8.8 peer-address heartbeat

The peer-address heartbeat command causes the MLAG agent to start using ***Peer-IP*** address in the given VRF for UDP-based heartbeat control messages.

To enable MLAG dual primary detection feature, the command must be configured on both MLAG peers in the MLAG config mode.

Command Mode

MLAG configuration mode

Command Syntex

`peer-address heartbeat` ***Peer-IP*** [vrf ***vrf_name***]

`no peer-address heartbeat` ***Peer-IP*** [vrf ***vrf_name***]

`default peer-address heartbeat` ***Peer-IP*** [vrf ***vrf_name***]

Parameters

- ***Peer-IP*** The Management IP address of the MLAG peer reachable in the VRF **VRF-NAME** (or default VRF if there is no VRF configured).
- **vrf *vrf_name*** Named VRF.

Examples

- ```
  switch(config)# mlag
  switch(config-mlag)# peer-address heartbeat 172.30.118.190
  ```
- This example removes the feature.

  ```
  switch(config-mlag)# no peer-address heartbeat
  ```
  ```

11.3.8.9 peer-link

The **peer-link** command specifies the interface that connects Multi-chassis Link AGgregation (MLAG) peers. To form an MLAG, two switches are connected through an interface called a peer link. The peer link carries control and data traffic between the two switches. Control traffic includes MLAG-related advertisements and keepalive messages. This information keeps the two switches working as one.

The **no peer-link** and **default peer-link** command remove the peer link by deleting the **peer-link** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

peer-link INT_NAME

no peer-link

default peer-link

Parameters

INT_NAME denotes the interface type and number of the interface. Values include:

- **ethernet *e_num*** Ethernet interface range specified by ***e_num***.
- **port-channel *p_num*** Channel group interface range specified by ***p_num***.

Example

These commands creates a peer link.

```
switch(config)# mlag configuration
switch(config-mlag)# peer-link port-channel 10
switch(config-mlag)
```

11.3.8.10 mlag configuration (global configuration)

The **mlag configuration** command enters MLAG configuration mode to configure Multi-chassis Link AGgregation (MLAG) features. MLAG configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no mlag configuration** and **default mlag configuration** commands remove all MLAG configuration commands from ***running-config***.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

mlag configuration

no mlag configuration

default mlag configuration

mlag and **mlag configuration** are identical commands.

Guidelines

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries control and data traffic between the switches, including advertisements and keepalive messages. This information coordinates the switches. Functioning peers are in the **active** state.

Each peer switch uses IP-level connectivity between their local addresses and the MLAG peer IP address to form and maintain the peer link.

Commands Available in MLAG Configuration Mode

- domain-id
- heartbeat-interval (MLAG)
- local-interface
- peer-address
- peer-link
- reload-delay mlag
- shutdown (MLAG)

Example

These commands enter MLAG configuration mode and configure MLAG parameters:

```
switch(config)# mlag
switch(config-mlag)# local-interface vlan 4094
switch(config-mlag)# peer-address 10.0.0.2
switch(config-mlag)# peer-link port-channel 10
switch(config-mlag)# domain-id mlagDomain
switch(config-mlag)# heartbeat-interval 2500
switch(config-mlag)# reload-delay 2000
switch(config-mlag)# exit
switch(config)#
```

11.3.8.11 reload-delay mlag

The **reload-delay mlag** command configures the reload delay period for MLAG links. The command also specifies the reload delay period for non-MLAG links when the reload-delay non-mlag command is not configured.

Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches**: ***300*** seconds
- **Trident II modular switches**: ***1200*** seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches**: ***600*** seconds
  - 7280 series (except 7280CR2 and 7280SR2)
  - 7020 series
- **Sand platform modular switches**: ***1800*** seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S
- **Sand Jericho+ fixed configuration switches**: *900* seconds
  - 7280CR2 series
  - 7280SR2 series

The **no reload-delay mlag** and **default reload-delay mlag** commands restore the default value by deleting the **reload-delay mlag** statement from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

reload-delay [**mlag**] **PERIOD**

no reload-delay [**mlag**]

default reload-delay [**mlag**]

Parameters

- **PERIOD** Period that non-peer links are disabled after an MLAG peer reboots. Options include:
  - **infinity** link is not enabled after reboot.
  - ***0*** to ***86400*** disabled link interval (seconds). Default varies by switch platform as described above.

Guidelines

The **reload-delay** and **reload-delay mlag** commands are equivalent.

Example

These commands configure the reload-delay interval to ***15*** minutes.

```
switch(config)# mlag configuration
switch(config-mlag)# reload-delay mlag 900
switch(config-mlag)#
```

11.3.8.12 reload-delay mode

The **reload-delay mode** command specifies the state of LACP LAG ports during the MLAG reload delay period. By default, MLAG ports remain in the errdisabled state during reload delay. This command configures MLAG ports to come up to standby mode before the expiration of the reload delay period.

The **no reload-delay mode** and **default reload-delay mode** commands restore the default behavior of MLAG ports by deleting the **reload-delay mode** statement from ***running-config***. The default behavior is for the MLAG ports to remain in the errdisabled state until the expiration of the reload delay period

Command Mode

MLAG Configuration

Command Syntax

reload-delay mode lacp standby

no reload-delay mode

default reload-delay mode

Related Commands

reload-delay mlag configures the MLAG reload delay period.

Example

These commands configure the MLAG port to come up to standby state before the end of the reload delay period.

```
switch(config)# mlag configuration
switch(config-mlag)# reload-delay mode lacp standby
switch(config-mlag)#
```

11.3.8.13 reload-delay non-mlag

The **reload-delay non-mlag** command specifies the period that non-MLAG links are disabled after an MLAG peer reboots. This interval allows non peer links to learn multicast and OSPF states before the ports start handling traffic. The recommended minimum value required to ensure the forwarding hardware is initialized with the topology state depends on the switch platform:

- Fixed configuration switches: ***300*** seconds (five minutes)
- Sand platform fixed configuration switches (7020 and 7280 series (except 7280CR2 and 7280SR2)): ***600*** seconds (ten minutes)
- Modular switches: ***1200*** seconds (twenty minutes)

When the **reload-delay non-mlag** command is not configured, the reload-delay mlag command specifies the reload delay time for non-MLAG and MLAG links.

The **no reload-delay non-mlag** and **default reload-delay non-mlag** command restores the default behavior by deleting the **reload-delay non-mlag** statement from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

reload-delay non-mlag **PERIOD**

no reload-delay non-mlag

default reload-delay non-mlag

Parameters

PERIOD Period that non-MLAG links are disabled after an MLAG peer reboots. Options include:

- **infinity** links are not enabled after reboot.
- ***0*** to ***86400*** disabled link interval (seconds). Values range from ***0*** to ***86400*** (24 hours).

Example

These commands configure the reload-delay interval of non-MLAG links to ***20*** minutes.

```
switch(config)# mlag configuration
switch(config-mlag)# reload-delay non-mlag 1200
switch(config-mlag)#
```

11.3.8.14 show mlag interfaces members

The **show mlag interfaces members** command displays information about the Multi-chassis Link AGgregation (MLAG) members on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag interfaces members

Example

This command displays the MLAG interface members.

```
switch# show mlag interface members
Mlag4 is Port-Channel4
  Active Ports: Ethernet3 PeerEthernet3
Mlag5 is Port-Channel5
  Active Ports: Ethernet14
Mlag7 is Port-Channel7
  Active Ports: Ethernet5 PeerEthernet5
Mlag8 is Port-Channel8
  Active Ports: Ethernet10 PeerEthernet10
Mlag9 is Port-Channel9
  Active Ports: Ethernet15 Ethernet21 PeerEthernet19 PeerEthernet20
Mlag10 is Port-Channel10
  Active Ports: Ethernet19 Ethernet20 PeerEthernet21 PeerEthernet22
switch#
```

11.3.8.15 show mlag interfaces states

The **show mlag interfaces states** command displays information about the Multi-chassis Link AGgregation (MLAG) states on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag interfaces [**MLAGS**] **states** [**STATE_NAMES**][**INFO_LEVEL**]

Parameters

- **MLAGS** MLAG channels for which command displays data. Options include:
  - ***no parameter*** command displays data for all MLAGs.
  - ***mlag_id*** specifies MLAG for which command displays data. Value ranges from ***1*** to ***2000***.
- **STATE_NAMES** MLAG channels for which command displays data. Parameter may specify more than one name, which can be listed in any order. Valid state names include:
  - **active-full** includes active-full interfaces.
  - **active-partial** includes active-partial interfaces.
  - **configured** includes configured interfaces.
  - **disabled** includes disabled interfaces.
  - **inactive** includes inactive interfaces.
- **INFO_LEVEL** specifies information displayed by command. Options include:
  - ***no parameter*** command displays basic MLAG interface parameters.
  - **detail** command displays detailed MLAG interface state parameters.

Example

This command displays the MLAG interface states that are active-full.

```
switch# show mlag interfaces states active-full
                                                                  local/remote
  mlag     desc                       state     local     remote         status
-------- -------------------- --------------- --------- ---------- ------------
     4     b.po1                active-full       Po4        Po4          up/up
     7     ar.mg.au.po1         active-full       Po7        Po7          up/up
     8     co.po1               active-full       Po8        Po8          up/up
     9     k.po5                active-full       Po9        Po9          up/up
    10     ar.mg.pt.ir.po10     active-full      Po10       Po10          up/up
switch#
```

11.3.8.16 show mlag interfaces

The **show mlag interfaces** command displays information about the Multi-chassis Link AGgregation (MLAG) configuration on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag interfaces [**MLAGS**][**INFO_LEVEL**]

Parameters

- **MLAGS** MLAG channels for which command displays data. Options include:
  - ***no parameter*** command displays data for all MLAGs.
  - ***mlag_id*** specifies MLAG for which command displays data. Value ranges from ***1*** to ***2000***.
- **INFO_LEVEL** specifies information displayed by command. Options include:
  - ***no parameter*** command displays basic MLAG interface parameters.
  - **detail** command displays detailed MLAG interface parameters.

Example

This command displays output from the **show mlag interfaces detail** command:

```
switch> show mlag interfaces detail
                                  local/remote
mlag       state local remote   oper   config          last change  changes
--------------------------------------------------------------------------------
   4 active-full   Po4    Po4  up/up  ena/ena  6 days, 1:19:26 ago        5
   5 active-full   Po5    Po5  up/up  ena/ena  6 days, 1:19:24 ago        5
   6 active-full   Po6    Po6  up/up  ena/ena  6 days, 1:19:23 ago        5
   7 active-full   Po7    Po7  up/up  ena/ena  6 days, 1:19:23 ago        5
```

11.3.8.17 show mlag issu warnings

The **show mlag issu warnings** command displays a warning message regarding the backward-compatibility of this feature before you upgrade.

Command Mode

EXEC

Command Syntax

show mlag issu warnings

Example

This command displays the MLAG backward-compatibility warning message. Refer to the latest version of the release notes for additional information before you upgrade.

```
switch# show mlag issu warnings
If you are performing an upgrade, and the Release Notes for the new
version of EOS indicate that MLAG is not backwards-compatible with the
currently installed version, the upgrade will result in packet loss.

Stp is not restartable. Topology changes will occur during the upgrade
process.

switch#
```

11.3.8.18 show mlag

The **show mlag** command displays information about the Multi-chassis Link AGgregation (MLAG) configuration on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies information displayed by command. Options include:

- ***no parameter*** command displays MLAG configuration, status, and ports.
- **detail** command displays MLAG configuration, status, ports, and detailed status.

Example

This command displays output from the **show mlag** command:

```
switch> show mlag
MLAG Configuration:
domain-id          :         ar.mg.mlag
local-interface    :           Vlan3901
peer-address       :       172.17.254.2
peer-link          :      Port-Channel1

MLAG Status:
state              :             Active
peer-link status   :                 Up
local-int status   :                 Up
system-id          :  02:1c:73:00:13:19

MLAG Ports:
Disabled           :   0
Configured         :   0
Inactive           :   0
Active-partial     :   0
Active-full        :   5
switch>
```

11.3.8.19 shutdown (MLAG)

The **shutdown** command disables MLAG on the switch without modifying the MLAG configuration.

The **no shutdown** and **default shutdown** commands re-enable MLAG by removing the **shutdown** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Example

These commands disable MLAG on the switch.

```
switch(config)# mlag configuration
switch(config-mlag)# shutdown
switch(config-mlag)#
```

11.4 Data Transfer

Arista switches support the transfer of packets (network layer) and frames (data link layer). This chapter describes concepts and processes that are referenced by routing and switching protocols that Arista switches support.

Sections in this chapter include:

- Data Transfer Introduction
- Data Transfer Methods
- MAC Address Table
- Configuring Ports
- Monitoring Links
- PHY test pattern CLI
- Data Transfer Commands

11.4.1 Data Transfer Introduction

Arista switches transfer data through switching, routing, and Layer 3 switching. This chapter provides an introduction to these transfer methods.

Data structures and processes that support data transfer methods and referenced in specific protocol chapters are also described, including:

- routed ports
- switched ports
- MAC address table
- port mirroring
- storm control
- loopback interfaces
- route redistribution
- null0 interfaces
- MTUs

11.4.2 Data Transfer Methods

This section describes these data transfer methods:

- Switching and Bridging
- Routing
- Layer 3 Switching

11.4.2.1 Switching and Bridging

Switching and bridging operations transmit data link layer frames between devices within a single subnet. Each port is assigned a 48 bit Media Access Control (MAC) address. Frames arriving at a hub are bridged, or sent to all other ports on the subnet. Switches can associate ports with their MAC addresses, obviating the need to flood the subnet when sending a frame.

Subnets in the switch are defined by VLANs. A Virtual Local Area Network (VLAN) is a group of devices that are configured to communicate as if they are attached to the same network regardless of their physical location. **`VLANs`** describes VLANS.

Four MAC address types identify the scope of LAN interfaces that an address represents:

- **unicast:** represents a single interface.
- **broadcast:** represents all interfaces.

- **multicast:** represents a subset of all interfaces.
- **reserved:** assigned to nodes that have no configured MAC address.

The Individual/Group (I/G) bit distinguishes unicast MAC addresses from multicast addresses. As shown in Figure 26: MAC Address Format , the I/G bit is the least significant bit of the most significant byte in a MAC address.

11.4.2.1.1 MAC Address Format

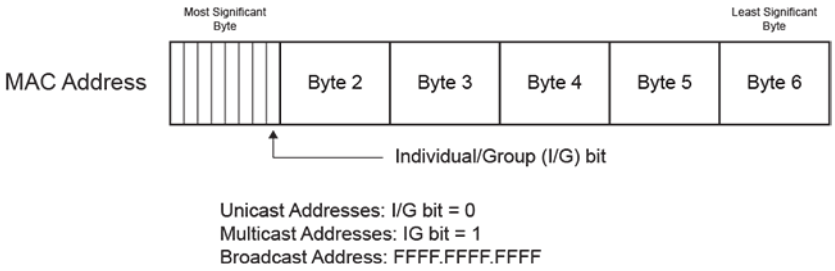

Figure 26: MAC Address Format

- Unicast address: the I/G bit is ***0***: ***1234.1111.1111*** is a unicast MAC address (the most significant byte is an even number).
  - Reserved address: all bits set to ***0 (0000.0000.0000)***.
- Multicast address: the I/G bit is ***1***: ***1134.1111.1111*** is a multicast MAC address (the most significant byte is an odd number).
- Broadcast address: all bits set to ***1 (FFFF.FFFF.FFFF)***.

Examples

- The following are unicast MAC addresses:

```
0200.0000.0000
1400.0000.0000
```

- The following are multicast MAC addresses:

```
0300.0000.0000
2500.0000.0000
```

The following sections describe MAC address functions and data structures:

- Assigning a MAC Address to an Interface
- MAC Address Table

11.4.2.2 Routing

Routing transmits network layer packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. Connected subnets have IP address ranges that do not overlap. A router connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address.

IPv4 and IPv6 are internet layer protocols that facilitate packet-switched networking, including transmissions across multiple networks.

These chapters describe available IP features:

- IPv4

- IPv6

11.4.2.2.1 Static Routing

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate.

Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as ***connected*** routes that are available for redistribution into routing domains defined by dynamic routing protocols.

These sections describe static route configuration commands:

- IPv4 Address Configuration
- Configuring Default and Static IPv6 Routes

11.4.2.2.2 Dynamic Routing

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic routing protocols:

- Open Shortest Path First – Version 2
- Open Shortest Path First – Version 3
- Border Gateway Protocol (BGP)
- Routing Information Protocol
- IS-IS

11.4.2.3 Layer 3 Switching

Layer 3 switches establish data paths through routing processes (Layer 3) and transfer data as a switch (Layer 2) through speed-optimized hardware. Layer 3 switches use a control plane (routing) and data plane (switching) to manage these processes.

11.4.2.3.1 Control plane

The control plane builds and maintains the IP routing table, which identifies IP packet routes in terms of destination addresses. The routing table defines a route by its next hop address and the egress interface that accesses the next hop.

The control plane derives routing information from three sources:

- Status of physical and virtual interfaces on the switch.
- Static routes entered through the CLI.
- Routes established through dynamic routing protocols.

Applying an ACL to the Control Plane

The control plane supports routing and management functions, handling packets that are addressed to the switch without regard to any switch interface.

To apply an IP ACL to the control plane, enter ip access-group (Control Plane mode) in control-plane mode. The system control-plane command places the switch in control-plane mode.

ACLs and Route Maps describes access control lists.

Example

These commands place the switch in control-plane mode and assigns ***CP-Test1*** to the control plane.

```
switch(config)# system control-plane
switch(config-system-cp)# ip access-group CP-Test1 in
switch(config-system-cp)#
```

11.4.2.3.2 Data plane

The data plane routes IP packets based on information derived by the control plane. Each packet's path includes Layer 2 addresses that reach its next hop destination. The data plane also performs other operations required by IP routing, such as recalculating IP header checksums and decrementing the Time-To-Live (TTL) field.

Arista data planes support these packet forwarding modes:

- **Store and forward:** the switch accumulates entire packets before forwarding them.
- **Cut through:** the switch begins forwarding frames before their reception is complete.

Cut through mode reduces switch latency at the risk of decreased reliability. Packet transmissions can begin immediately after the destination address is processed. Corrupted frames may be forwarded because packet transmissions begin before CRC bytes are received.

Packet forwarding mode availability varies by switch platform:

- **Arad**: store and forward mode only.
- **FM6000**: both modes are available.
- **Petra**: store and forward mode only.
- **Trident**: both modes are available.
- **Trident II**: both modes are available.

The data plane is also referred to as the forwarding plane.

Data Plane Forwarding Mode Configuration

The switch forwarding-mode command specifies the forwarding mode of the switch's data plane. This command is available on Trident, Trident II, and FM6000 platform switches. The forwarding mode is **`store-and-forward`** on Arad and Petra platform switches.

Examples

- This command changes the forwarding mode to **`store-and-forward`**.

```
switch(config)# switch forwarding-mode store-and-forward
switch(config)#
```

- The show switch forwarding-mode command displays the switch's forwarding mode.

```
switch(config)# show switch forwarding-mode
Current switching mode:    store and forward
Available switching modes: cut through, store and forward
```

11.4.3 MAC Address Table

The switch maintains a MAC address table for switching frames efficiently between ports. The MAC address table contains static and dynamic MAC addresses.

- Static MAC addresses are entered into the table through a CLI command.

- Dynamic MAC addresses are entered into the table when the switch receives a frame whose source address is not listed in the MAC address table. The switch builds the table dynamically by referencing the source address of frames it receives.

11.4.3.1 MAC Address Table Configuration

These sections describe MAC address table configuration tasks.

- Static MAC Address Table Entries
- Dynamic MAC Address Table Entries

11.4.3.1.1 Static MAC Address Table Entries

The MAC address table accepts static MAC addresses, including multicast entries. Each table entry references a MAC address, a VLAN, and a list of Layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The mac address-table static command adds a static entry to the MAC address table.

Examples

- This command adds a static entry for unicast MAC address ***0012.3694.03ec*** to the MAC address table.

```
switch(config)# mac address-table static 0012.3694.03ec vlan 3
 interface Ethernet
7
switch(config)# show mac address-table static
          Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
   3    0012.3694.03ec    STATIC      Et7
Total Mac Addresses for this criterion: 1

          Multicast Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
Total Mac Addresses for this criterion: 0

switch(config)#
```

- This command adds the static entry for the multicast MAC address ***0112.3057.8423*** to the MAC address table.

```
switch(config)# mac address-table static 0112.3057.8423 vlan 4
 interface
port-channel 10 port-channel 12
switch(config)# show mac address-table
          Mac Address Table
------------------------------------------------------------------
```

```
Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
Total Mac Addresses for this criterion: 0

          Multicast Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
   4    0112.3057.8423    STATIC      Po10 Po12
Total Mac Addresses for this criterion: 1
switch(config)#
```

11.4.3.1.2 Dynamic MAC Address Table Entries

Learning Mode

The switch maintains a MAC address table for switching frames efficiently between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The switchport mac address learning command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

Example

These commands disables MAC address learning for ***interface ethernet 8***, then displays the active configuration for the interface.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# no switchport mac address learning
switch(config-if-Et8)# show active
interface Ethernet8
no switchport mac address learning
switch(config-if-Et8)#
```

Aging Time

Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Aging time ranges from ***10*** to ***1000000*** seconds with a default of ***300*** seconds (five minutes).

Example

This command sets the MAC address table aging time to two minutes (***120*** seconds).

```
switch(config)# mac address-table aging-time 120
switch(config)#
```

The mac address-table aging-time command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Mac Moves

Secure MAC addresses is allowed to move when they appear on another interface, when configured. By default, secure MAC addresses does not move.

```
switch(config)# default switchport port-security mac address moveable
switch(config)#
```

Persistent Port Security

When the persistent PortSec-Protect is enabled, secure MAC addresses persist across device reboots and interface flaps. These MAC addresses can still be aged or moved when configured using the commands **`mac address-table aging-time`** and **`default switchport port-security mac address moveable`**. Persistent port security is enabled by default, and can be disabled.

```
switch(config)# default switchport port-security persistence disabled
```

Example

`show port-security` command displays the settings for the new global port security configurations, including MAC aging, MAC moves, and persistent port security.

```
switch(config)# show port-security
Secure address moves: disabled
Secure address aging: disabled
Secure address reboot persistence: enabled
Secure address link down persistence: enabled
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
                (Count)       (Count)          (Count)
-------------------------------------------------------------------------------
-------------------------------------------------------------------------------
Total Addresses in System: 0
```

Clearing Dynamic Addresses

The clear mac address-table dynamic command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and Layer 2 (Ethernet or port channel) interface.

Example

This command clears all dynamic mac address table entries for ***port channel 5*** on ***VLAN 34***.

```
switch(config)# clear mac address-table dynamic vlan 34 interface port-
channel 5
switch(config)
```

11.4.3.2 Displaying the MAC Address Table

The show mac address-table command displays the specified MAC address table entries.

Example

This command displays the MAC address table.

```
switch# show mac address-table
          Mac Address Table
------------------------------------------------------------------
Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------

Total Mac Addresses for this criterion: 0
```

Beginning with ***EOS Release 4.26.0F***, **PortSec-Protect** enforces a limit on the number of MAC addresses, that can be learn. For example, **PortSec-Protect** is configured with a maximum of 1, **`show mac address-table`** shows a single address installed.

```
switch# show mac address-table
          Mac Address Table
------------------------------------------------------------------
Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
 101    001c.8224.36d7    DYNAMIC     Po2        1       9 days, 15:57:28
 ago
Total Mac Addresses for this criterion: 1
```

11.4.3.3 MAC Address Learning Per-VLAN

MAC address learning per-VLAN enables or disables MAC address learning per-VLAN instead of per-port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is disabled, the entry is not added to the table.

11.4.3.3.1 MAC Address Learning Configuration

The mac address learning command enables MAC address learning on a VLAN interface. By default, MAC address learning on a VLAN is enabled.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

To disable MAC learning on a particular VLAN, use **`no mac address learning`** command on a VLAN configuration.

Examples

- These commands enable MAC address learning on ***vlan 10*** configuration.

```
switch(config)# vlan 10
switch(config-vlan-10)# mac address learning
```

- These commands disable MAC address learning on ***vlan 10*** configuration.

```
switch(config)# vlan 10
```

```
switch(config-vlan-10)# no mac address learning
```

11.4.4 Configuring Ports

This section describes these port properties:

- Port Mirroring
- Storm Control
- Switched and Routed Ports
- Loopback Ports
- MAC Security
- Null0 Interface
- Maximum Transmission Units (MTU)

11.4.4.1 Port Mirroring

Port mirroring, also known as port monitoring, is the duplication of traffic from a collection of source ports to a destination port. A mirror session correlates a set of source ports to a destination port.

Valid mirror sources are Ethernet or port channel interfaces, including port channels which are part of an MLAG. Mirror destination ports are usually Ethernet interfaces; port channel destination ports are also supported on some platforms.

Note: On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

Layer 2 control protocols do not run on destination ports. An interface cannot be in more than one mirror session and cannot simultaneously be a source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

- **Ingress Mirroring**: Packets received by a source port are duplicated, including all valid data frames and L2 control PDUs. Ports mirror data before forwarding logic is applied. Packets subsequently dropped because of forwarding decisions are mirrored.
- **Egress Mirroring**: Packets transmitted by a source port are duplicated, with these exceptions:
  - **Flooded/Multicast Packets**: Packets sent to multiple mirror ports generate one copy, except in multi-chip devices when the mirror source and destination ports are on different chips; in this case, an extra copy is generated.
  - **Dropped Packets**: Packets dropped by forwarding decisions (such as output STP state checks) on egress sources are not duplicated. Packets dropped because of congestion may be duplicated.
- **Filtered Mirroring**: Specific packets are selected for mirroring based on PERMIT and DENY configurations.
- **Mirroring to GRE Tunnel**: Mirrored packets are encapsulated with GRE protocols for transiting Layer 3 network.

VLAN tags on duplicate packets from an egress source are identical to tags on inbound source packets.

When a packet's path through the switch includes multiple mirror source ports in different mirror sessions, the traffic is duplicated once and sent to the destination of the highest numbered session.

11.4.4.1.1 Port Mirroring Capacity

Port mirroring capacity varies by platform. This section describes session limits for each platform.

FM6000 Platform Switches

- **Maximum Number of Sessions:** 4.

- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (any number), Port channel interfaces (any number), CPU.
- Egress IP ACL on destination port is not supported.

Sessions can mirror Rx, Tx, or both ways without impacting the number of available sessions.

Enabling each of the following features reduces the number of available sessions by one: ACL Logging, MLAG Peer Link, sFlow, VTEP Learning (VXLAN), LANZ Sampling

Arad Platform Switches

- **Maximum Number of Sessions:** 14.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on destination port is not supported.

Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

Although the number of configured source interfaces is unlimited, the number of interfaces that can be effectively mirrored is restricted by the destination port speed.

Petra Platform Switches

- **Maximum Number of Sessions:** 16.
- **Session Sources:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Session Destinations:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- Egress IP ACL on destination port is not supported.

  Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

Trident Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on destination port is supported.

  Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

Trident II Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on Destination Port is supported.

  Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

11.4.4.1.2 Configuring Mirror Ports

Mirror sessions associate a set of source ports to a destination port using the monitor session source and monitor session destination commands. An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction. On Trident and Trident II platform switches (DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series), all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device cannot process VLAN tags properly, mirroring should be configured exclusively for ingress traffic by specifying **rx** in the monitor session source command.

Filtering on TX traffic in a mirror session is not supported.

Example

These commands configure ***interface ethernet 7*** as the source port and ***Ethernet interface 8*** as the destination port for the ***redirect_1*** mirroring session. The session mirrors ingress and egress traffic.

```
switch(config)# monitor session redirect_1 source ethernet 7
switch(config)# monitor session redirect_1 destination ethernet 8
```

The show monitor session command displays the configuration of the specified port mirroring session.

Example

This command shows the configuration of the ***redirect_1*** mirroring session.

```
switch(config)# show monitor session

Session redirect_1
------------------------

Source Ports

  Both:        Et7

Destination Port: Et8

switch(config)#
```

The monitor session ip access-group command configures an ACL to filter the traffic being mirrored to the destination port.

Example

These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session ***redirect_1***.

```
switch(config)# ip access-list allow-host
switch(config-acl-allow-host)# 10 permit ip host 192.168.11.24 host
 10.0.215.23
switch(config-acl-allow-host)# 20 deny ip any any
switch(config-acl-allow-host)# exit
switch(config)# monitor session redirect_1 ip access-group allow-host
switch(config)#
```

11.4.4.1.3 Configuring Filtered Mirroring

Filtered mirroring allows for configuring IPv4, IPv6, and MAC access lists and then updating a monitor session with corresponding configuration changes. EOS mirrors the packets that match permit statements. EOS does not select those packets for mirroring that match deny statements.

Note: EOS supports all standard IPv4, IPv6, and MAC qualifiers.

On Strata series platforms, packets from a single monitor source can be mirrored in multiple sessions that use the same access-list. You can attach multiple monitor sources with various access-lists to a monitor session. Each monitor session should contain one access-list type only. Hence, IPv4, IPv6, and MAC access-lists from the same monitor source must appear in different monitor sessions.

When multiple IPv6 monitor sessions share the same monitor source, only one of the monitor sessions remains active and others are automatically inactivated. When the active monitor session is removed from the monitor source, the system automatically activates the inactive monitor sessions.

Packets matching both IP and MAC access lists behave differently on various platforms.

Platform Series	Behavior of Filtered Mirroring
DCS-7050/7050X, DCS-7250X, and DCS-7300X	When entry packets match both IPv4 and MAC access-lists, mirrored copies are created for both IPv4 and MAC access-lists; and forwarded to configured destinations.
DCS-7280SE and DCS-7500E	When entry packets match both IPv4 and MAC access-lists, a mirrored copy is created only for IPv4 access-list. The behavior of filtered mirroring varies in the following ways when a packet matches an entry in both access-list types: • Mirroring is permitted when a packet contradicts with permit and deny configurations. • Mirroring is denied when an entry packet matches deny configurations in both. • IP access-list is prioritized over MAC access-list when an entry packet matches permit configurations in both.

Note: User-Defined Field (UDF) qualifiers in filtered mirroring access-lists allow matching packets using arbitrary user-defined patterns.

Use the **`system profile`** command to enable the Mirroring ACL profile that supports matching on IPv6, MAC and UDFs.

The following table provides the matching types supported in default and Mirroring ACL profiles.

Profiles	IPv4	IPv6	MAC	UDF
Default	Yes	No	No	No
Mirroring ACL	Yes	Yes	Yes	Yes

Note: MAC mirroring-ACLs do not accept routed IPv4/IPv6 packets and bridged IPv6 packets.

Examples

- These commands create an IPv4 access-list and then attach the access-list to monitor sessions.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# 10 permit tcp any any rst
switch(config-acl-acl1)# 20 permit tcp any any syn
switch(config-acl-acl1)# 30 permit tcp any any ack

switch(config)# monitor session 1 source Ethernet1 rx ip access-group
 acl1
switch(config)# monitor session 1 source Ethernet2 rx ip access-group
 acl1
switch(config)# monitor session 1 destination <destination>
```

- These commands create an IPv6 access-list and then attach the access-list to monitor sessions.

```
Arista(config)# ipv6 access-list acl2
Arista(config-ipv6-acl-acl2)# 10 permit ipv6 any any
```

```
Arista(config)#monitor session 2 source Ethernet4 rx ipv6 access-group
 acl2
Arista(config)#monitor session 2 destination Ethernet5
```

- These commands configure the same monitor source in multiple monitor sessions.

```
switch(config)# monitor session 1 source Ethernet1 rx ip access-group
 acl1
switch(config)# monitor session 1 destination <destination 1>

switch(config)# monitor session 2 source Ethernet1 rx ip access-group
 acl2
switch(config)# monitor session 2 destination <destination 2>
```

- This command configures access-list priorities for dictating the matching order across multiple access-lists that are attached to the same monitor source.

```
switch(config)# monitor session 1 source Ethernet1 rx ip access-group
 acl1
priority 1
switch(config)# monitor session 1 destination <destination 1>

switch(config)# monitor session 2 source Ethernet1 rx ip access-group
 acl2
priority 2
switch(config)# monitor session 2 destination <destination 2>
```

- This command enables the Mirroring ACL profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile mirroring-acl
switch(config-hw-tcam)# show hardware tcam profile
                    Configuration        Status
FixedSystem         mirroring-acl        mirroring-acl
switch(config-hw-tcam)#
```

11.4.4.1.4 Filtered Mirroring to CPU

Filtered mirroring to CPU adds a special destination to port mirroring that allows mirrored traffic to be sent to the switch supervisor. The traffic can then be monitored and analyzed locally without the need of a remote port analyzer. Filtered mirroring to CPU can also be used for debugging and troubleshooting configured to mirror RX traffic, TX traffic or both, with up to 14 mirroring profiles used simultaneously. In addition, mirroring to CPU uses control plane protection to limit the rate of the traffic sent to the CPU.

Examples

- These commands configure the source for normal mirroring and the destination to CPU.

```
switch(config)# monitor session mySession source ethernet 3/1 both
switch(config)# monitor session mySession destination cpu
switch(config)#
```

- These commands configure reserved bandwidth and shape rate of mirrored traffic.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-control-plane-copp-system-policy)# class copp-
system-mirroring
switch(config-pmap-c-copp-system-policy-copp-system-
mirroring)# bandwidth kbps 2000
```

```
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)# shape
 kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#
```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```
switch(config)# show monitor session

                        Session mySession

                        ------------------------

                        Source Ports:

                          Both : Et3/1

                        Destination Ports:

                          Cpu : active (mirror0)
switch(config)#
```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```
switch(config)# show policy-map type copp copp-system-policy class cop-
system-mirroring

                          Class-map: copp-system-mirroring (match-any)

                             shape : None

                             bandwidth : None
switch(config)#
```

11.4.4.1.5 Configuring Filtered Mirroring to GRE Tunnel

The monitor session source and monitor session destination commands configure source and destination ports to the specified port mirroring session in a GRE tunnel.

On DCS-7010T, DCS-7050/7050X, DCS-7060X, DCS-7250X, DCS-7260X, DCS-7300X, a special GRE tunnel destination is supported to mirror ingress packets that are dropped during ASIC forwarding. This GRE destination is referred as the “forwarding-drop” destination, and the corresponding session is called as the “forwarding-drop” session.

Note: Forwarding-drop sessions are the sessions corresponding to forwarding-drop destinations.

Note: From Release ***EOS 4.25.2F*** onwards platforms DCS-7050X, DCS-7060X, DCS-7250X, DCS-7260X, CCS-720X started supporting the **tx** keyword, which specifies that outgoing packets should be mirrored.

Examples

- These commands configure ingress filtered mirroring to a GRE tunnel.

```
switch(config)# monitor session abc source Ethernet1 rx ip access-group
 acl1
switch(config)# monitor session abc destination tunnel mode gre source
 1.1.1.1
destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be
```

- These commands configure egress filtered mirroring to a GRE tunnel.

```
switch(config)# monitor session abc source Ethernet1 tx ip access-group
 acl1
switch(config)# monitor session abc destination tunnel mode gre source
 2.2.2.2
destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be
```

- This command configures forwarding-drop sessions.

```
switch(config)# monitor session 1 forwarding-drop destination tunnel
 mode gre source 1.1.1.1 destination 2.2.2.2
```

- A forwarding-drop session is configured by using the **forwarding-drop** keyword when configuring the GRE destination:

```
switch(config)# monitor session 1 source <source>
switch(config)# monitor session 1 forwarding-drop destination tunnel
 mode gre
                                source <sourceIp>
                                destination <destIp>
                                [ ttl <value> ]
                                [ dscp <value> ]
                                [ protocol <value> ]
                                [ vrf <value> ]
```

- A mirroring to GRE destination can be configured as follows:

```
switch(config)# monitor session 1 source <source> rx | tx
switch(config)# monitor session 1 destination tunnel mode gre
                                source <sourceIp>
                                destination <destIp>
                                [ ttl <value> ]
                                [ dscp <value> ]
                                [ protocol <value> ]
                                [ vrf <value> ]
```

The **rx** keyword specifies that incoming packets should be mirrored.

11.4.4.1.6 Security ACL Filtered Mirroring

Security ACL Filtered Mirroring is configured using port security ACLs.

Configuring Security ACL Filtered Mirroring

The following configures ***interface ethernet 8*** as the destination port for the ***redirect_1*** mirroring session, and ***interface ethernet 9*** as the destination port for the ***redirect_2*** mirroring session. A source port is not needed to create a mirror session. Other destination options for monitor sessions such as GRE or CPU are also configurable.

```
switch (config)# monitor session redirect_1 destination ethernet 8
switch (config)# monitor session redirect_2 destination ethernet 9
```

Examples

Egress IPv4 ACL

The following commands create an IPv4 access-list, and then attach the access-list to ***interface ethernet 7*** in the out direction with the following rules.

- matching Rule 10 will be mirrored to ***interface ethernet 8***.

- matching Rule 20 will not be mirrored.
- matching Rule 30 will be mirrored to ***interface ethernet 9***.
- matching Rule 40 will be dropped and not mirrored.

Specifying a mirror session in a deny rule for egress ACL has no effect.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# 10 permit ip host 10.0.0.4 any mirror session
 redirect_1
switch(config-acl-acl1)# 20 permit ip host 10.0.0.5 any
switch(config-acl-acl1)# 30 permit ip host 10.0.0.6 any mirror session
 redirect_2
switch(config-acl-acl1)# 40 deny ip any any

switch(config)# interface ethernet 7
switch(config-if-Et7)# ip access-group acl1 out
```

Note: Security ACL Filtered Mirroring has higher priority over standard Port Mirroring.

Using the same configuration as above with ***interface ethernet 7*** as the source port of ***redirect_1***, the following configuration displays the impact on packets egressing from ***interface ethernet 7***.

```
switch(config)# monitor session redirect_1 source ethernet 7
```

- matching Rule 10 and Rule 20 will be mirrored to ***interface ethernet 8***.
- matching Rule 30 will be mirrored to ***interface ethernet 9***.
- matching Rule 40 will be dropped and not mirrored.

Egress IPv6 ACL

The following commands create an IPv6 access-list, and then attach the access-list to ***interface ethernet 7*** in the egress direction.

```
switch(config)# ipv6 access-list acl1
switch(config-ipv6-acl-acl1)# 10 permit ipv6 host 10:10:10:10:10:10:10:1
 any mirror session redirect1
switch(config-ipv6-acl-acl1)# 20 permit ipv6 host 10:10:10:10:10:10:10:5
 any
switch(config-ipv6-acl-acl1)# 30 permit ipv6 host 10:10:10:10:10:10:10:6
 any mirror session redirect2
switch(config-ipv6-acl-acl1)# 40 deny ipv6 any any

switch(config)# interface ethernet 7
switch(config-if-Et7)# ipv6 access-group acl1 out
```

Note: The mirroring behavior of egress IPv6 ACL is identical to egress IPv4 ACL. The egress IPv6 ACL is supported only on R3 Series and forward.

Egress MAC ACL

The following commands create a MAC access-list, and then attach the access-list to ***interface ethernet 7*** in the out direction. The mirroring behavior of egress MAC ACL is identical to egress IPv4 ACL.

```
switch(config)# mac access-list acl1
switch(config-mac-acl-acl1)# 10 permit 0000.1111.4444 0000.0000.0000 any
 mirror session redirect_1
switch(config-mac-acl-acl1)# 20 permit 0000.1111.5555 0000.0000.0000 any
switch(config-mac-acl-acl1)# 30 permit 0000.1111.6666 0000.0000.0000 any
 mirror session redirect_2
```

```
switch(config-mac-acl-acl1)# 40 deny any any

switch(config)# interface ethernet 7
switch(config-if-Et7)# mac access-group acl1 out
```

Ingress IPv4 ACL

The following commands create an IPv4 access-list, and then attach the access-list to ***interface ethernet 7*** in the in direction with the following rules.

- matching Rule 10 and Rule 20 will be mirrored to ***interface ethernet 8***.
- matching Rule 30 will be mirrored to ***interface ethernet 9*** since Security ACL Filtered Mirroring has higher priority.
- matching Rule 40 will be dropped and mirrored to ***interface ethernet 8***.

```
switch(config)# ip access-list acl2
switch(config-acl-acl2)# 10 permit ip host 10.0.0.4 any mirror session
 redirect_1
switch(config-acl-acl2)# 20 permit ip host 10.0.0.5 any
switch(config-acl-acl2)# 30 permit ip host 10.0.0.6 any mirror session
 redirect_2
switch(config-acl-acl2)# 40 deny ip host 10.0.0.7 any mirror session
 redirect_1

switch(config)# interface ethernet 7
switch(config-if-Et7)# ip access-group acl2 in

switch(config)# monitor session redirect_1 source ethernet 7
```

Note: Unlike egress ACL, mirror session specified in a deny rule for ingress ACL will take effect.

The mirroring behavior of ingress IPv6 and MAC ACLs are identical to ingress IPv4 ACL.

Limitations

- The feature is not supported in AlgoMatch mode.
- Egress Security ACL Filtered Mirroring works on IPv4 - permit rules, and MAC - permit rules.
- By default, egress MAC ACL is disabled. Egress MAC ACL is required to be enabled.
- By default, bridged traffic is not subject to Egress IP ACLs, therefore, the bridged packets will not be mirrored.
- RACL and subinterface ACL are not supported for filtering mirroring.
- If a packet is dropped by an ingress ACL and the destination is GRE, the metadata of the GRE packet cannot be computed as expected.

11.4.4.2 Storm Control

A traffic storm is a flood of packets entering a network, resulting in excessive traffic and degraded performance. Storm control prevents network disruptions by limiting traffic beyond specified thresholds on individual physical LAN interfaces.

Storm control monitors inbound traffic levels over one-second intervals and compares the traffic level with a specified benchmark.

Storm control has three modes:

- **Storm control all**: When inbound traffic exceeds the specified threshold within a one-second control interval, all traffic is dropped until the end of the interval.
- **Storm control broadcast**: When inbound broadcast traffic exceeds the specified threshold within a one-second control interval, broadcast traffic is dropped until the end of the interval.

- **Storm control multicast**: When inbound multicast traffic exceeds the specified threshold within a one-second control interval, multicast traffic is dropped until the end of the interval.

Broadcast and multicast storm control are independent features and can be enabled simultaneously. The **`storm control all`** threshold overrides broadcast and multicast thresholds.

Storm Control Configuration

The storm-control command configures and enables broadcast or multicast storm control on the configuration mode interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The **`storm-control all`** threshold overrides broadcast and multicast thresholds.

When storm control is enabled, the switch monitors inbound traffic levels over one second intervals and compares the traffic level with a specified threshold. The threshold is a percentage of the total available port bandwidth and is configurable on each interface for each transmission mode.

Examples

- These commands enable multicast storm control on Ethernet interfaces ***2*** through ***4*** and set a threshold of ***65%***. During each one second interval, the interface drops inbound multicast traffic in excess of ***65%*** of capacity.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et4/4/4)# storm-control multicast level 65
switch(config-if-Et4/4/4)#
```

- These commands clear multicast storm control on Ethernet interfaces ***2*** through ***4***.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# no storm-control multicast
switch(config-if-Et2/3/4)#
```

- These commands enable broadcast storm control on Ethernet interfaces ***2*** through ***4*** and set broadcast traffic to ***50%***. During each one second interval, the interface drops inbound multicast traffic in excess of ***50%*** of capacity.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# storm-control broadcast level 50
switch(config-if-Et2/3/4)#
```

- These commands enable broadcast storm control on Ethernet interfaces ***2*** through ***4*** and set a threshold of ***5000*** packets per second (pps).

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# storm-control broadcast level pps 5000
switch(config-if-Et2/3/4)#
```

Note: User cannot configure a PPS setting and a percentage setting on the same interface at the same time, they are mutually exclusive.

- These commands clear broadcast storm control on Ethernet interfaces ***2*** through ***4***.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# no storm-control broadcast
switch(config-if-Et2/3/4)#
```

The show storm-control command displays the storm-control level and interface inbound packet capacity for the specified interface.

Examples

- This command displays the storm control configuration for Ethernet ports ***2*** through ***4***.

```
switch(config-if-Et2/3/4)# show storm-control
Port            Type     Level   Units Rate(Mbps)   Status   Drops
 Reason
Et2/3/4          all     75.00       %       7500   active       0
           multicast     55.00       %       5500   active       0
           broadcast     50.00       %       5000   active       0
switch(config-if-Et2/3/4)#
```

- The output of **`show storm-control`** command displaying the PPS settings:

```
switch(config-if-Et5)# show storm-control
show storm-control
Port Type      Level Units Rate(Mbps) Status Drops Reason
Et5  broadcast 5000  pps   -          active 101
```

11.4.4.3 Switched and Routed Ports

A switched port is an Ethernet or port channel interface that is configured as a Layer 2 interface. Switched ports bridge frames and are assigned to at least one VLAN. Switched ports are not associated with any IP addresses. By default, Ethernet and port channel interfaces are in switched port mode.

A routed port is an Ethernet or port channel interface that is configured as a Layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

Configuring an interface as a routed port is similar to creating a VLAN with spanning-tree disabled, making the port the only member of that VLAN and configuring the IP address on the switch virtual interface (SVI) associated with the VLAN.

All IP-level interface configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. If the interface is reverted to switched port mode, ***running-config*** maintains IP level interface configuration statements. These changes become active again if the interface is configured back to routed port mode.

A LAG that is created with the **`channel-group`** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration is not propagated to the LAG from its component members.

The broadcast queue towards the CPU is shared among all interfaces of the forwarding chip. Broadcast storm on a single port adversely impacts other interfaces of the same chip by potentially dropping even low rate broadcast frames. Routed port storm control attempts to mitigate this effect by performing storm control on the broadcast frames for routed ports.

Routed Port Configuration

The switching-routing configuration of Ethernet and port channel interfaces is specified by the switchport and **`no switchport`** commands. These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

The no switchport command places the configuration mode interface in **`routed port`** mode. Routed ports behave as Layer 3 interfaces. They do not bridge packets and are not VLAN members. An IP address can be assigned to a routed port for the direct routing of packets to and from the interface.

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from ***1006*** to ***4094***. VLANs that are allocated internally for a routed interface cannot be directly created or configured. Allocating Internal VLANs describes VLAN allocation configuration procedures.

Example

This command places ***interface ethernet 5*** in routed port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
```

Switched Port Configuration

The switchport command places the configuration mode interface in **`switched port (Layer 2)`** mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments. By default, Ethernet and port channel interfaces are switched ports.

Example

This command places ***interface ethernet 5*** in switched port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport
```

The switchport default mode routed command places the configuration mode interface for a switch with all ports in **switched port (Layer 3) routed** mode, changing the switch with all ports from **switchport default mode access**.

Examples

- This command places a switch with all ports in routed mode.

```
switch(config)# switchport default mode routed
```

- This command places a switch with all ports in access mode.

```
switch(config)# switchport default mode access
```

11.4.4.4 Loopback Interfaces

A loopback interface is a virtual network interface implemented in software that is not tied to a specific hardware interface. Loopback interface configuration mode is used for creating loopback interfaces and modifying their operating parameters.

Internet protocols reserve specific addresses for loopback network segments:

- IPv4 designates ***127/8*** as loopback subnet, which includes ***127.0.0.0*** through ***127.255.255.255***.
- IPv6 designates ::1/128 as the loopback address, which includes ***0:0:0:0:0:0:0:1*** (also written as ::1).

Arista switches support the configuration of 1001 loopback interfaces, numbered from 0 to 1000.

Loopback Interface Configuration

Loopback ports are instantiated by entering loopback interface configuration mode for the desired loopback interface number. Loopback interface configuration mode also provides access to loopback

configuration commands. Previously instantiated ports are edited by entering loopback interface configuration mode for the specified interface.

The interface loopback command places the switch in loopback interface configuration mode for the specified interface, creating the specified loopback interface if it does not exist. Configuration mode can also be entered for a range of loopback interfaces, but they must all have been previously created

Example

These commands instantiate ***interface loopback 2*** and assign it IP address ***10.1.1.42/24***.

```
switch(config)# interface loopback 2
switch(config-if-Lo2)# ip address 10.1.1.42
switch(config-if-Lo2)# show active
interface Loopback2
   ip address 10.1.1.42/24
switch(config-if-Lo2)#
```

11.4.4.5 MAC Security

MAC security restricts input to a switched port by limiting the number of MAC addresses that can access the port. Ports with MAC security enabled restrict traffic to a limited number of hosts, as determined by their MAC addresses. When the limit is exceeded, the port becomes errdisabled.

Port Security Configuration

MAC address security is enabled by switchport port-security . The default MAC address limit on an interface where port security is enabled is one; to change that default limit, use the switchport port-security mac-address maximum command.

Example

These commands enable MAC security on ***interface ethernet 7***, set the maximum number of assigned MAC addresses to 2, assign two static MAC addresses to the interface, and clear the dynamic MAC addresses for the interface.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# switchport port-security
switch(config-if-Et7)# switchport port-security mac-address maximum 2
switch(config-if-Et7)# exit
switch(config)# mac address-table static 0034.24c2.8f11 vlan 10 interface ethernet 7
switch(config)# mac address-table static 4464.842d.17ce vlan 10 interface ethernet 7
switch(config)# clear mac address-table dynamic interface ethernet 7
switch(config)# show port-security
Secure Port      MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
                    (Count)        (Count)      (Count)
--------------------------------------------------------------------------
     Et7              2             2            0            Shutdown
--------------------------------------------------------------------------
Total Addresses in System: 1
switch(config)# show port-security mac-address
          Secure Mac Address Table
------------------------------------------------------------
Vlan    Mac Address       Type                      Ports   Remaining Age
                                                              (mins)
----    -----------       ----                      -----   -------------
  10    0034.24c2.8f11    SecureConfigured          Et7     N/A
  10    4464.842d.17ce    SecureConfigured          Et7     N/A
------------------------------------------------------------------------
Total Mac Addresses for this criterion: 2
switch(config)#
```

MAC Security LLDP Bypass

When MAC address security configuration is applied on the interface, it encrypts and decrypts all the other protocols PDU and other data packets. **LLDP bypass** allows LLDP packets to be sent or received from the port even when the port is not authorized.

The following configuration allows LLDP packets to be received or sent from an interface where the MAC security profile is applied.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# l2-protocol lldp bypass
 unauthorized
```

unauthorized allows the LLDP packet to be received and sent out when MKA session between the MACsec peers is yet to come up.

Show Command

The following command shows LLDP packets is bypassed for encryption or decryption.

```
switch(config)# show mac security interface ethernet 4/4/1 detail
Interface: Ethernet4/4/1
Profile: profile1
SCI: d4:af:f7:2e:67:b0::786
SSCI: 00000002
Controlled port: True
Key server priority: 1
Session rekey period: 30
Traffic: Protected
Bypassed protocols: LLDP
Key in use: c0645d4332ba2e1d4d5fb17f:129
Latest key: None
Old key: c0645d4332ba2e1d4d5fb17f:129(RT)
```

11.4.4.6 Null0 Interface

The **null0 interface** is a virtual interface that drops all inbound packets. A null0 route is a network route whose destination is **null0 interface**. Inbound packets to a null0 interface are not forwarded to any valid address. Many interface configuration commands provide **null0** as an interface option.

11.4.4.7 Maximum Transmission Units (MTU)

The MTU of a communications protocol refers to the size in bytes of the largest frame (Ethernet) or packet (IP) that can be sent on the network.

Different protocols support a variety of MTU sizes. Most IP over Ethernet implementations use the Ethernet V2 frame format, which specifies an MTU of ***1500*** bytes. Jumbo frames are Ethernet frames containing more than ***1500*** bytes.

11.4.4.7.1 Switching interface MTU size

On Arista devices, layer two interfaces (either trunk or access ports) are set with a default ethernet MTU of 9236 bytes. This value cannot be changed and is derived as follows: 9214 + 6 (source MAC) + 6 (dst MAC) + 4 (VLAN tag) + 2 (ether type) + 4 (crc) totals 9236 bytes.

The output of show interfaces command for a layer two interface displays the following:

Trunk

```
Ethernet1 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.731c.5073 (bia 001c.731c.5073)
Ethernet MTU 9214 bytes , BW 1000000 kbit
```

Access

```
Ethernet3 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.731c.5075 (bia 001c.731c.5075)
 Ethernet MTU 9214 bytes , BW 1000000 kbit
```

11.4.4.7.2 Routing Interface MTU Size

The MTU size on Layer 3 interfaces varies between a minimum of ***68*** to the maximum ***9214*** bytes. The default size is ***1500*** bytes. The **`show interface`** output for a Layer 3 interface displays the following:

VLAN Routed Interface

```
Vlan100 is up, line protocol is up (connected)
 Hardware is Vlan, address is 001c.731c.5072 (bia 001c.731c.5072)
 Internet address is 10.1.1.2/24
 Broadcast address is 255.255.255.255
 Address determined by manual configuration
 IP MTU 9214 bytes
```

Physical Routed Interface

```
Ethernet4 is down, line protocol is down (connect)
 Hardware is Ethernet, address is 001c.731c.5072
 Internet address is 10.10.10.10/24
 Broadcast address is 255.255.255.255
 Address determined by manual configuration
 IP MTU 9214 bytes
```

A routed interface fragments packets that exceed the configured IP MTU on the interface. For example, if a ***2000*** byte packet is received on routed interface 1 and is forwarded from routed interface 2 then routed interface 2 fragments the packet into a ***1500*** byte packet plus an additional packet containing the remaining data. This fragmentation should be avoided by configuring a consistent IP MTU across all systems within the operational domain.

The IP MTU set on a routed interface is valid for both IPv4 and IPv6 packets.

MTU Configuration

The mtu command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. An interface's MTU value is displayed with the **`show interface`** command. The command is valid for all routable interfaces.

Examples

- This command sets the MTU size of ***1492*** bytes on ***VLAN interface 20***.

```
switch(config-if-Vl20)# mtu 1492
switch(config-if-Vl20)#
```

- This command displays status for a routed interface.

```
switch(config-if-Et3)# show interface e3
Ethernet3 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.731c.5072
  Internet address is 10.1.1.2/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes , BW 1000000 kbit
  Full-duplex, 1Gb/s, auto negotiation: on, uni-link: unknown
  Up 22 days, 7 hours, 47 minutes, 58 seconds
switch(config)#
```

- Using ping on a Linux host, you can test the maximum transmission through the interface.
-

```
[user@linux ~]$ ping -M do -s 1472 10.1.1.2
PING 10.1.1.2 (10.1.1.2) 1472(1500) bytes of data.
1480 bytes from 10.1.1.2: icmp_seq=1 ttl=64 time=0.206 ms
1480 bytes from 10.1.1.2: icmp_seq=2 ttl=64 time=0.191 ms
--- 10.1.1.2 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 999ms
rtt min/avg/max/mdev = 0.191/0.198/0.206/0.015 ms
```

The size ***1472*** has ***8*** bytes of ICMP information added and ***20*** bytes of IP headers added, generating a total packet size of ***1500*** bytes.

- The option **-M do** specifies that fragmentation is prohibited for this test.
- The option **-s** specifies the size of the packet being generated.
- A capture of the frame displays total length of ***1514*** bytes on the wire which includes the Ethernet headers and type field.

11.4.5 Monitoring Links

These section describes link monitoring and object tracking processes:

- Object Tracking
- Errdisabled Ports
- Error Disable Detect Cause for ACL
- Configuring Error Disable Recovery Interval for each Cause
- Link Flap Monitoring
- Fabric Link Monitoring
- Rapid Automated Indication of Link-Loss

11.4.5.1 Object Tracking

Object tracking makes it possible for the switch to take action in response to changes in specific switch properties by creating an object to track those properties. When the tracked property changes, the object then changes state, allowing configured agents to react accordingly.

Object Tracking Configuration

The track command creates an object that changes state to reflect changes in a specific switch property. Agents configured to track that object are then able to react to the change.

Example

These commands create an object that tracks the line protocol state on ***interface ethernet 8***, then configures ***interface ethernet 5*** to disable VRRP when that tracked object changes state to **down**.

```
switch(config)# track ETH8 interface ethernet 8 line-protocol
switch(config)# interface ethernet 5
switch(config-if-Et5)# vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```

These commands use object tracking:

- link tracking group
- vrrp tracked-object

11.4.5.2 Errdisabled Ports

The switch places an Ethernet or management interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. Conditions that error-disable an interface include:

- **bpduguard**
- **link-flap**
- **no-internal-vlan**
- **portchannelguard**
- **portsec**
- **tapagg**
- **uplink-failure-detection**
- **xcvr_unsupported**

Most conditions are programmed by the configuration of other features, such as Spanning Tree protocol (bpduguard). Link flap error-disabling is configured through errdisable commands or link flap monitor commands (Link Flap Monitoring).

Error-disabled interfaces are recovered either through manual or automated methods.

To manually recover an interface, enter its configuration mode and execute **shutdown** and **no shutdown** commands.

Example

These commands manually recover ***interface ethernet 30*** from the errdisable state.

```
switch(config)# interface ethernet 30
switch(config-if-Et30)# shutdown
switch(config-if-Et30)# no shutdown
switch(config-if-Et30)#
```

Automated recovery of Ethernet interfaces that are error-disabled by a specified condition is enabled by errdisable recovery cause . The errdisable recovery interval specifies the period that an interface remains disabled until it is enabled and begins operating normally. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

Example

These commands configure automated recovery for all interfaces that are error-disabled from link flap and **bpduguard** conditions. Automated recovery begins five minutes after the port is disabled.

```
switch(config)# errdisable recovery cause link-flap
```

```
switch(config)# errdisable recovery cause bpduguard
switch(config)# errdisable recovery interval 300
switch(config)#
```

11.4.5.3 Error Disable Detect Cause for ACL

The **no errdisable detect cause acl** command configures routed ports, subinterfaces, and physical ports to not get into the **errdisabled** state on ACL failure, the default behavior. To reestablish the default behavior, use the **errdisable detect cause acl** command.

The following displays the output when ***errdisabling*** is enabled for ACLs.

```
switch(config) #show errdisable detect
   Errdisable Reason           Detection Status
------------------------------ ----------------
   acl                         Enabled
```

The following displays the output when ***errdisabling*** is disabled for ACLs.

```
switch(config)# show errdisable detect
   Errdisable Reason           Detection Status
------------------------------ ----------------
   acl                         Disabled
```

11.4.5.4 Configuring Error Disable Recovery Interval for each Cause

The duration after which an interface tries to recover from being error disabled is programmable for each trigger which causes the interface to be error disabled using the **errdisable recovery cause NAME_OF_CAUSE interval DURATION** command. The command applies only to interfaces that are enabled for error recovery after being error disabled.

Example

This command configures interfaces to recover in ***30*** seconds when the cause is **bpduguard**.

```
switch(config)# errdisable recovery cause bpduguard interval 30
```

Example

Either of these commands revert the interval to the global value when the cause is **bpduguard**.

```
switch(config)# no errdisable recovery cause bpduguard interval
```

```
switch(config)# default errdisable recovery cause bpduguard
 interval
```

This command displays the status of the interfaces.

```
switch# show errdisable recovery
Errdisable Reason              Timer Status   Timer Interval
```

```
------------------------------ ----------------- --------------
   bpduguard                      Disabled                  30
   hitless-reload-down            Disabled                 300
   lacp-no-portid                 Disabled                 N/A
   lacp-rate-limit                Disabled                 300
   license-enforce                Disabled                 N/A
   link-flap                      Disabled                 300
   no-internal-vlan               Disabled                 300
   uplink-failure-detection       Disabled                 300
```

11.4.5.5 Link Flap Monitoring

Link flap frequency is the quantity of link flaps (connection state changes) over a specified period. Excessive link flaps result in network stability issues, including spanning tree and routing recalculations. Link flaps are often caused by Layer 1 issues, such as a bad cable or duplex mismatch. Link flap monitoring specifies link flap thresholds and disables a port when a threshold is exceeded.

Link flap monitoring can be enabled on all interfaces through errdisable link flap commands or on individual interfaces with the link flap monitor.

11.4.5.5.1 Global Link Flap Monitor

Global link flap detection is configured through two global configuration mode commands:

- errdisable flap-setting cause link-flap configures the link-flap frequency that defines link-flap errors on an Ethernet interface.
- errdisable detect cause link-change enables the error-disabling of Ethernet interfaces that exceed the threshold link flap frequency.

Link-flap detection is enabled by default.

Example

These commands sets the link flap error criteria of ***15*** connection state changes over a ***30*** second period, then enables error detection on all interfaces.

```
switch(config)# errdisable flap-setting cause link-flap max-flaps 15 time
 30
switch(config)# errdisable detect cause link-change
switch(config)#
```

11.4.5.5.2 Interface Link Flap Monitor

An interface is monitored for link flap errors with link flap profiles. A link flap profile specifies conditions that define a link-flap error. Profiles are assigned to Ethernet interfaces. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

The global link flap monitor is used by interfaces that are not individually monitored for link flap errors.

Configuring Link Flap Profiles

Link flap profiles are configuration statements that define a link flap error in terms of these criteria:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

The monitor link-flap policy command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. The profile max-flaps (Link Flap Configuration) command configures link flap profiles.

The default-profile set is a list of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled but link-flap profiles are not assigned. The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, errdisable flap-setting cause link-flap specifies default error-disable criteria. When the default-profile set contains multiple profiles, the criteria is satisfied when conditions match any profile.

Example

These commands enter link flap configuration mode and create four link flap profiles.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile LF01 max-flaps 15 time 60
switch(config-link-flap)# profile LF02 max-flaps 10 time 30 violations 5
 intervals 10
switch(config-link-flap)# profile LF03 max-flaps 20 time 75 violations 2
 intervals 6
switch(config-link-flap)# profile LF04 max-flaps 30 time 100 violations 4
 intervals 7
switch(config-link-flap)# show active
monitor link-flap policy
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
   profile LF02 max-flaps 20 time 75 violations 2 intervals 6
   profile LF02 max-flaps 30 time 100 violations 4 intervals 7
switch(config-link-flap)#
```

The default-profiles command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a default-profile command replaces the current default-profile statement in ***running-config***.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, errdisable flap-setting cause link-flap specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single default-profiles command.

Example

This command assigns configures ***LF01*** and ***LF02*** as the default-profile set.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# default-profiles LF01 LF02
switch(config-link-flap)# show active
monitor link-flap policy
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
   profile LF02 max-flaps 20 time 75 violations 2 intervals 6
   profile LF02 max-flaps 30 time 100 violations 4 intervals 7
   default-profiles LF01 LF02
switch(config-link-flap)#
```

Interface Link Flap Profile Assignments

Link flap monitoring is enabled on individual Ethernet interfaces and can optionally specify one or more profiles to define link-flap error-disabling criteria. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can

be assigned to an interface to monitor a set of error conditions; a port is disabled when conditions match any of the profiles assigned to an interface.

The monitor link-flap profiles command controls link-flap monitoring on a configuration mode interface. The command provides these link flap detection options:

- **`monitor link-flap`** ***(no profiles listed)***: Interface detects link flaps using default-profile set criteria.
- **`monitor link-flap`** ***(at least one profile listed)***: Interface detects link flaps using listed profile criteria.
- **`default monitor link-flap`**: The interface uses global link flap monitor commands (Global Link Flap Monitor).
- **`no monitor link-flap`**: The interface does not detect link flaps.

Examples

- This command assigns ***LF03*** and ***LF04*** link flap profiles to ***interface ethernet 33***.

```
switch(config)# interface ethernet 33
switch(config-if-Et33)# monitor link-flap profiles LF03 LF04
switch(config-if-Et33)# show active
interface Ethernet33
   monitor link-flap profiles LF04 LF03
switch(config-if-Et33)#
```

- This command disables link-flap monitoring on ***interface ethernet 34***.

```
switch(config)# interface ethernet 34
switch(config-if-Et34)# no monitor link-flap
switch(config-if-Et34)# show active
interface Ethernet34
   no monitor link-flap
switch(config-if-Et34)#
```

- This command assigns the default-profile set to ***interface ethernet 35***.

```
switch(config)# interface ethernet 35
switch(config-if-Et35)# monitor link-flap
switch(config-if-Et35)# show active
interface Ethernet35
   monitor link-flap
switch(config-if-Et35)#
```

- This command configures ***interface ethernet 36*** to use the global link flap monitoring commands.

```
switch(config)# interface ethernet 36
switch(config-if-Et36)# default monitor link-flap
switch(config-if-Et36)# show active
interface Ethernet36
switch(config-if-Et36)#
```

11.4.5.6 Fabric Link Monitoring

Fabric link monitoring enables EOS to monitor low error rate errors on all fabric links for long durations, and automatically isolates fabric links on consistent error detection over an extended time interval. Isolated fabric links are restored when the error rate drops below a configured threshold.

The error rate over each configurable polling interval is derived by comparing the number of cells with CRC errors against the total number of received cells. Links are automatically isolated when the error rate is above the configured threshold for the configured consecutive number of polling intervals.

On an isolated fabric link, control cells (but not data cells) are sent. Once the error rate drops below a set threshold for the configured consecutive number of polling intervals, EOS revives the fabric link to continue sending data traffic.

11.4.5.6.1 Configuring Fabric Link Monitoring

Configuration mode commands globally enable and disable fabric link monitoring and syslog messages for the settings described below.

The **`no platform sand monitor`** command disables fabric link monitoring.

Generate Serdes Error Syslog

The platform sand monitor serdes error log command generates syslog fabric link monitoring for serdes error logging.

Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config)# platform sand monitor serdes error log
switch(config)#
```

The following syslog messages are not enabled by default. Fabric link monitoring syslog is enabled by configuring the platform sand monitor serdes error log command.

Examples

- The following Syslog message is generated when a fabric link for serdes is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes withdrawn from the switch
 fabric.
```

- Here is another instance where a Syslog message is generated when a fabric link is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes Arad10/5-FabricSerdes-11
 withdrawn from the switch fabric.
```

- The following Syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes restored to the switch
 fabric.
```

- Here is another instance where a Syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes Arad10/5-FabricSerdes-11
 restored to the switch fabric.
```

Generate Serdes Error Threshold

The platform sand monitor serdes error threshold command generates a fabric link monitoring serdes error threshold.

Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between ***200*** and ***30000*** received cells.

```
switch(config)# platform sand monitor serdes error threshold 200 30000
switch(config)#
```

Enable Serdes Poll Period

The platform sand monitor serdes poll period command sets the serdes poll period.

Example

This command changes the serdes polling period for fabric link monitoring to ***6*** seconds.

```
switch(config)# platform sand monitor serdes poll period 6
switch(config)#
```

Monitor Serdes Poll Threshold Isolation

The platform sand monitor serdes poll threshold isolation command sets and enables fabric link monitoring for serdes poll threshold isolation.

Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is ***5*** consecutive polls.

```
switch(config)# platform sand monitor serdes poll threshold isolation 5
switch(config)#
```

Monitor Serdes Poll Threshold Recovery

The platform sand monitor serdes poll threshold recovery command sets and enables fabric link monitoring for serdes poll threshold recovery.

Example

This command changes the number of consecutive serdes polls used for threshold recovery to ***6*** seconds.

```
switch(config)# platform sand monitor serdes poll threshold recovery 6
switch(config)#
```

Show Fabric Monitoring Health

The show fabric monitoring health command displays the fabric monitoring connected state status with isolated links.

Example

When fabric links are isolated, their connected state status is shown with isolated links.

```
switch(config)# show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]
```

```
Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

11.4.5.7 Rapid Automated Indication of Link-Loss

Rapid Automated Indication of Link-Loss (RAIL) is a software feature that reduces the wait time of applications on hosts that are blocked due to a failed link. When a link goes down because of link-flapping or the unavailability of a directly connected server, the switch drops all traffic to servers whose next-hop destination was learned on the port connected to the link. Applications that drive the traffic (clients on source hosts) are blocked because of the dropped edge-switch traffic. Connection timeout varies by application and is usually measured in seconds or minutes.

RAIL is functional on a switch if it is routing-enabled and available for servers that set the switch as the default router.

11.4.5.7.1 RAIL Method

When a link monitored by RAIL goes down, the switch performs these steps for servers that the switch proxies:

1. IP addresses of servers on the failed link are extracted from ARP cache. The interface that accesses the server is determined by searching for the MAC address in the hardware MAC address tables.
2. Upon link shutdown, a dynamic MAC entry is added in the MAC address table for each server that was learned on the failed interface. Each new entry lists its interface as **CPU**.

The figure below titled **RAIL Scenarios** depicts three switch-server scenarios: link is up, link is down with RAIL disabled, and link is down with RAIL enabled. A failed link with RAIL enabled results in these behaviors:

1. All ingress packets whose destination MAC address matches an address added to the MAC address table are sent to the CPU.
2. For packets scheduled to be forwarded to the source address, the switch sends one of the following, based on the type of received segment:
   - **TCP**: TCP RST segment to the source IP address and port.
   - **UDP**: ICMP unreachable segment to the source IP address and port.
3. The client closes the socket associated with the transmitted segment and notifies the application. The application reacts immediately instead of maintaining the block until connection timeout expiry.

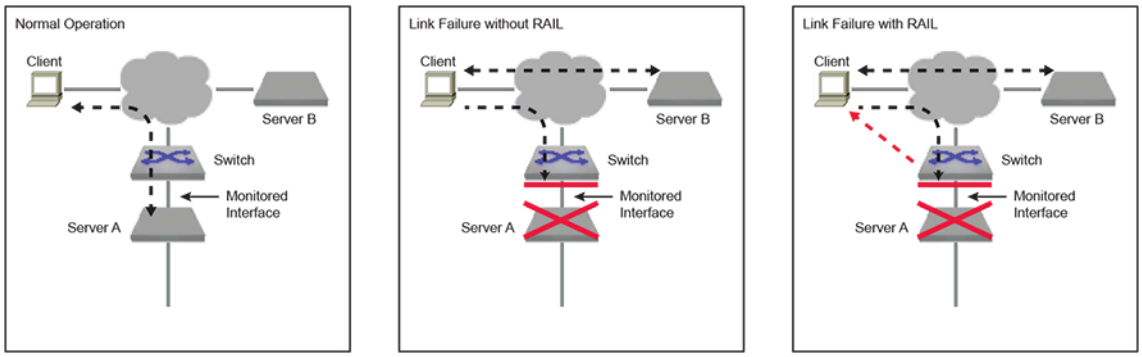

Figure 27: RAIL Scenarios

11.4.5.7.2 RAIL Implementation

RAIL defines a state machine that manages the RAIL activity level relative to a specified server. The state machine consists of four states:

- **Up**: Transitions to this state from ***Inactive*** when ARP and MAC entries are added for the server.
- **Proxying**: Transitions to this state from ***Up*** when Link Down is detected and RAIL proxying is enabled. The switch is a proxy for messages to the server.
- **Down**: Transitions to this state from ***Up*** when Link Down is detected and RAIL proxying is not enabled. Messages from the client remain unanswered and the application recovers only after timeout expiry.
- **Inactive**: Transitions to this state upon any of the following conditions:
  - Server's MAC address or ARP entry is deleted (from any state).
  - Proxy timeout expiry (from ***Proxying*** state).
  - Link down timeout expiry (from ***Down*** state).

11.4.5.7.3 RAIL Configuration

Server-failure configuration mode commands globally enable RAIL and configure RAIL parameters. RAIL is functional on individual interfaces only when it is globally enabled and enabled on the interface. RAIL monitors an interface for link errors when RAIL is globally enabled and enabled on the interface.

Entering Server-failure Configuration Mode

The monitor server-failure command places the switch in server-failure configuration mode. The **`exit`** command returns the switch to global configuration mode. Server-failure mode is not a group change mode; ***running-config*** is changed when commands are entered and not affected by exiting the mode.

The **`no monitor server-failure`** deletes all server-failure mode commands from ***running-config***.

Examples

- These commands place the switch in the ***server-failure*** configuration mode.

```
switch(config)# monitor server-failure
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from ***running-config***.

```
switch(config)# no monitor server-failure
switch(config)#
```

Enabling RAIL on the Switch

RAIL is disabled by default and is enabled by no shutdown (server-failure configuration mode). The **shutdown** command disables RAIL without removing RAIL commands from ***running-config***.

Examples

- These commands enable RAIL globally.

```
switch(config)# monitor server
switch(config-server-failure)# no shutdown
switch(config-server-failure)# show active
monitor server-failure
   no shutdown
switch(config-server-failure)#
```

- This command disables RAIL globally.

```
switch(config-server-failure)# shutdown
switch(config-server-failure)#
```

Enabling Proxy Mode

The proxy (server-failure configuration mode) command sets the RAIL proxy setting to ***enabled*** and specifies the interval that RAIL responds to messages sent to servers on failed links. The proxy timeout is measured individually for each server whose link has failed. The switch enters RAIL proxy state only when the proxy setting is enabled.

When RAIL is enabled but the proxy setting is disabled, the switch maintains a list of unavailable servers without responding to messages sent to the servers. The RAIL proxy setting is ***disabled*** by default. When RAIL proxy is enabled, the default period is three minutes.

The **no proxy** and **default proxy** commands return the RAIL proxy setting to ***disabled***. The **no proxy lifetime** and **default proxy lifetime** commands set the proxy timeout to its default of three minutes if the RAIL proxy setting is **enabled**. The lifetime commands have no effect if RAIL proxy is **disabled**.

Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of ***10*** minutes.

```
switch(config)# monitor server
switch(config-server-failure)# proxy lifetime 10
switch(config-server-failure)# show active
monitor server-failure
   proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of ***3*** minutes.

```
switch(config-server-failure)# no proxy lifetime
switch(config-server-failure)# show active
monitor server-failure
   proxy
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)# no proxy
switch(config-server-failure)# show active
switch(config-server-failure)#
```

Selecting Networks to Monitor

The network (server-failure configuration mode) command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. ***Running-config*** can contain multiple **network** statements, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or ***ICMP Unreachable*** segments to devices sending packets to the unavailable server.

Example

These commands specify two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)# monitor server
switch(config-server-failure)# network 10.1.1.0/24
switch(config-server-failure)# network 10.2.1.96/28
switch(config-server-failure)# show active
monitor server-failure
   network 10.2.1.96/28
   network 10.1.1.0/24
switch(config-server-failure)#
```

Enabling RAIL on an Interface

RAIL monitors an interface for link errors only when RAIL is globally enabled and enabled for the interface. The monitor server-failure link command enables RAIL on the configuration mode interface. Configuration settings are effective for all Ethernet and port channel interfaces that enable RAIL.

Example

These commands enable RAIL on ***port channel interface 100***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# monitor server-failure link
switch(config-if-Po100)# show active
interface Port-Channel100
   monitor server-failure link
switch(config-if-Po100)#
```

11.4.5.7.4 Displaying RAIL Status

The switch provides commands to display RAIL configuration and status information:

Displaying RAIL Configuration settings

The show monitor server-failure command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.

Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch> show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
```

```
   10.2.1.96/28      : 0 servers
   10.1.1.0/24       : 0 servers
   10.3.0.0/16       : 3 servers
switch>
```

Displaying RAIL History for All Connected Servers

The show monitor server-failure history command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure.

Example

This command displays the link failure history from the time RAIL is instantiated on the switch.

```
switch> show monitor server-failure history
Total server failures: 4

Server IP   Server MAC              Interface           Last Failed
----------- -----------------       -----------         -------------
------
10.1.67.92  01:22:ab:cd:ee:ff       Ethernet17          2013-02-02
 11:26:22
44.11.11.7  ad:3e:5f:dd:64:cf       Ethernet23          2013-02-10
 00:07:56
10.1.1.1    01:22:df:42:78:cd       Port-Channel6       2013-02-09
 19:36:09
10.1.8.13   01:33:df:ee:39:91       Port-Channel5       2013-02-10
 00:03:39

switch>
```

Displaying Server Configuration and Status

The show monitor server-failure servers command displays status and configuration data about each server that RAIL monitors. The display format depends on the parameter specified by the command:

Examples

- This command displays RAIL information for the server at IP address ***10.11.11.7***.

```
switch> show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address        : 10.11.11.7
MAC Address              : ad:3e:5f:dd:64:cf
Current state            : down
Interface                : Ethernet23
Last Discovered          : 2013-01-06 06:47:39
Last Failed              : 2013-02-10 00:07:56
Last Proxied             : 2013-02-10 00:08:33
Last Inactive            : 2013-02-09 23:52:21
Number of times failed   : 3
Number of times proxied  : 1
Number of times inactive : 18

switch>
```

- This command displays RAIL information for the all servers on configured interfaces.
-

```
switch> show monitor server-failure servers all
Total servers monitored: 5

Server IP   Server MAC         Interface       State Last Failed
----------  -----------------  --------------  ---------  -----------

switch>
```

11.4.6 PHY test pattern CLI

Use the Ethernet Physical Layer (PHY) test pattern CLI to check the quality of the physical layer for an Ethernet interface. You can do this by generating a specific test pattern to a peer, and having the peer check the test pattern that is received, and vice versa. Because the test pattern is a well-known sequence of bits, the peer can check that the pattern received matches this well-known sequence; any difference is a bit error introduced by the peculiarities of the physical layer. The quality of the link is determined based on the acceptable bit errors, as published by the hardware vendors.

To enable the test pattern generator, configure a specific test pattern on the transmitter side of an interface. The test pattern checker is enabled by configuring the test pattern to be checked on the receiver side of the interface. PRBS is the test pattern supported by EOS.

Note: Physical links are bidirectional; to test both directions, the generator and checker both need to be enabled on both sides of the link. Both directions can be tested simultaneously or separately. The order of testing does not matter.

11.4.6.1 Configuration

You can configure a test pattern is configured using the **`phy diag`** interface configuration mode command.

1. Enter interface configuration mode, entering the targeted interface name.

```
switch(config)# interface <interfaceName>
```

2. Enable a test pattern on an interface using the **`phy diag`** command. You can select the transmitter or the receiver. To display the available interfaces, select **test pattern ?**.

```
switch(config-if)# phy diag [ transmitter | receiver ] test pattern ?
  PRBS11  Configure the PRBS11 test pattern
  PRBS15  Configure the PRBS15 test pattern
  PRBS23  Configure the PRBS23 test pattern
  PRBS31  Configure the PRBS31 test pattern
  PRBS49  Configure the PRBS49 test pattern
  PRBS58  Configure the PRBS58 test pattern
  PRBS7   Configure the PRBS7 test pattern
  PRBS9   Configure the PRBS9 test pattern
```

3. To disable a test pattern on an interface, enter the following command. You can select the tranmitter or the receiver, as well as the selected named test pattern.

```
switch(config-if)# no phy diag [transmitter|receiver] test
 pattern TestPattern
```

4. By default, a test pattern is disabled.

```
switch(config-if)# default phy diag [transmitter|receiver] test pattern
```

5. The following command clears the recorded test pattern status data for all the interfaces. Upon running the command, all the counter values are set to ***0*** and link states are marked as **`not locked`**.

```
switch# clear phy diag test pattern
```

11.4.6.2 Show Commands

To display the configured and operational test pattern, as well as the test patterns available for an interface, use the **show interfaces** command.

In the following example, interfaces ***ethernet 36/1*** and ***ethernet 31/1*** are selected for display. The user-configured test pattern is displayed under the **Configured** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **Operational** column. The **Available** column lists the test patterns available for the interface.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern
                    Configured       Operational
Interface        Transmit Receive Transmit Receive Available

---------------- -------- ------- -------- ------- -------------
-----------
Ethernet26/1     PRBS15   PRBS15  PRBS15   PRBS15  PRBS
 7,9,11,15,23,31,58
Ethernet31/1     PRBS7    PRBS31  PRBS7    PRBS31  PRBS
 7,9,11,15,23,31,58
```

Use the **show interfaces [<interface range>] phy detail** command to display the operational test pattern for an interface. In the example below, the **Test pattern** field will not be available, on disabling the test pattern.

Note: This command is not available on DCS-7060PX4 and DCS-7060DX4.

```
switch# show interfaces ethernet 26/1 phy detail | i Test pattern
  Test pattern                enabled
switch# show interfaces ethernet 31/1 phy detail | i Test pattern
  Test pattern                enabled
```

Use the **show interfaces [<interface range>] phy diag test pattern counters** to display test pattern link state and error information.

Available error information:

- **Link state:** whether or not the checker locked on to the configured test pattern.
- **Bit Errors:** the accumulated number of bit errors.
- **Largest Burst:** the largest burst of errors that occurred.
- **Burst Count:** the number of occurrences of errors.
- **Last Error Time:** the last time an error has occurred, ‘never’ if no errors have occurred.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern
 counters

```

Use the **`show interfaces [<interface range>] phy diag test pattern counters`** to display the lock state of an interface along with a detailed information on the recorded bit errors.

Available detailed information:

- **Last clear:** the time when the test pattern results were last cleared.
- **Operational test pattern:** the test pattern operational at the receiver side.
- **Bit rate:** the transmission bit rate.
- **Lock state:** the current lock status, number of times it changed and the last time the lock status got changed.
  - **locked:** receiver is able to lock on to the incoming test pattern.
  - **not locked:** receiver is not able to lock on to the incoming test pattern.
- **Largest burst:** the largest burst of errors that occurred.
- **Bit errors*:** the accumulated number of errors, number of occurrences of errors, and last time errors were captured. The ***** suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- **Total Bits:** the total bits received.
- **Bit error rate (BER)*:**the ratio of captured bit errors to the total bit received. The ***** suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- **Bit errors since last lock:** the accumulated number of errors since last time lock was gained.
- **Total bits since last lock:** the total bits received since last lock.
- **BER since last lock:** the ratio of captured bit errors to the total bit received since last lock.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern
 counters detail
*: Data may not be accurate due to loss of lock.

11.4.6.3 Bit Error Rate (BER)

Bit error rate is the ratio of the recorded bit errors to the total bits received for the duration of the test run. To achieve a reliable transmission, BER should be relatively small. As per IEEE 802.3 standard, the minimum BER requirement for Ethernet links is 1E-12. Therefore, links with BER lower than 1E-12 are to be considered reliable.

The BER reported by the **test pattern** CLI is the pre-FEC (Forward Error Correction) BER. For links that have FEC enabled, it is expected to see a higher BER, in the range of ***1E-4*** to ***1E-8***, because they are calculated before FEC is applied on the link. Based on the type of FEC applied on the link, these errors could get corrected to achieve the minimum BER requirement of 1E-12 or less.

11.4.6.4 Limitations

The configuration of test patterns is supported only on a few types of ports. The available test patterns that may be configured on an interface are found in the **`Available`** field of the **`show interfaces phy diag test pattern`** CLI command.

The test pattern CLI calculates only pre-FEC BER.

If one end of the system is from another vendor, consult the vendor’s documentation for the equivalent command(s) to achieve the appropriate behavior.

11.4.7 Data Transfer Commands

Control Plane and Data Plane Commands

- ip access-group (Control Plane mode)
- show switch forwarding-mode
- switch forwarding-mode
- system control-plane

Errdisable Commands

- errdisable detect cause link-change
- errdisable flap-setting cause link-flap
- errdisable recovery cause
- errdisable recovery interval
- show errdisable recovery

Fabric Link Monitoring Commands

- platform sand monitor serdes error log
- platform sand monitor serdes error threshold
- platform sand monitor serdes poll period
- platform sand monitor serdes poll threshold isolation
- platform sand monitor serdes poll threshold recovery
- show fabric monitoring health
- show platform trident mirroring

RAIL Commands

- clear server-failure servers inactive
- monitor server-failure
- monitor server-failure link
- network (server-failure configuration mode)
- proxy (server-failure configuration mode)
- show monitor server-failure
- show monitor server-failure history
- show monitor server-failure servers
- shutdown (server-failure configuration mode)

Link Flap Monitor Commands

- default-profiles
- monitor link-flap policy
- monitor link-flap profiles
- profile max-flaps (Link Flap Configuration)

MAC Address Table Commands

- clear mac address-table dynamic
- mac address-table aging-time
- mac address-table static
- show bridge mac-address-table aging timeout
- show mac address-table

- show mac address-table count
- show mac address-table mlag-peer
- show mac address-table multicast
- show mac address-table multicast brief
- switchport mac address learning

Port Configuration Commands

- clear counters
- description
- interface loopback
- load interval
- mac address learning
- mtu
- phy diag
- show interfaces
- show interfaces description
- show interfaces phy diag
- show port-channel load-balance
- switchport
- switchport default mode access
- switchport default mode routed

Port Mirroring Commands

- monitor session destination
- monitor session destination cpu
- monitor session forwarding-drop
- monitor session ip access-group
- monitor session source
- monitor session source ip access-group
- monitor session truncate
- no monitor session
- show monitor session

Port Security Commands

- show port-security
- show port-security interface
- show port-security mac-address
- switchport port-security
- switchport port-security mac-address maximum
- switchport port-security violation

Storm Control Commands

- show storm-control
- storm-control

Tracking Commands

- links minimum
- link tracking group

- link tracking group (interface)
- show link tracking group
- show track
- track
- traffic-loopback

11.4.7.1 clear counters

The **`clear counters`** command resets the counters to zero for the specified interfaces. The command provides the following options:

- ***No parameter*:** When no option is selected, the counters are reset on the switch.
- ***Session parameter*:** The command resets the counters in software for the current CLI session, establishing a baseline upon which subsequent **`show interfaces`** or **`show interfaces counters`** commands are relative. Counters are not affected for other CLI sessions.

Note: The **`clear counters`** command (and other commands that reset counters to zero) do not reset SNMP counters (such as IF-MIB::ifInOctets). As specified in ***RFC 2578***, ***sections 7.1.6*** and ***7.1.10***, a single value of a counter in SNMP has no information content. Instead, meaningful information is given by the difference between two separate fetches of a particular counter. SNMP counters automatically reset to ***0*** when they reach their maximum values.

Command Mode

Privileged EXEC

Command Syntax

`clear counters` [**INTERFACE**][**SCOPE**]

Parameters

- **INTERFACE** Interface type and number. Options include:
  - ***no parameter*** Display information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.
- Valid ***e_range***, ***l_range***, ***m_range***, ***p_range***, ***v_range***, and ***vx_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **SCOPE** Duration of the reset results. Options include:
  - ***no parameter*** counters are cleared on the switch.
  - **session** counters are reset only for the current session.

Example

These commands display interface counters, clear the counters, then display the counters again.

```
switch# show interfaces ethernet 1
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.7302.2fff (bia 001c.7302.2fff)
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 minutes input rate 301 bps (0.0% with framing), 0 packets/sec
  5 minutes output rate 0 bps (0.0% with framing), 0 packets/sec
     2285370854005 packets input, 225028582832583 bytes
     Received 29769609741 broadcasts, 3073437605 multicast
     113 runts, 1 giants
     118 input errors, 117 CRC, 0 alignment, 18 symbol
     27511409 PAUSE input
     335031607678 packets output, 27845413138330 bytes
     Sent 14282316688 broadcasts, 54045824072 multicast
     108 output errors, 0 collisions
     0 late collision, 0 deferred
     0 PAUSE output

Et5                        0               0               0               0

Port               OutOctets    OutUcastPkts    OutMcastPkts    OutBcastPkts
Et1                        0               0               0               0
Et2                        0               0               0               0
Et3                        0               0               0               0
Et4                        0               0               0               0
Et5                        0               0               0               0
switch#
```

11.4.7.2 clear mac address-table dynamic

The **clear mac address-table dynamic** command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and Layer 2 (Ethernet or port channel) interface.

- To remove a specific entry, include its VLAN and interface in the command.
- To remove all dynamic entries for a VLAN, do not specify an interface.
- To remove all dynamic entries for an interface, do not specify a VLAN.
- To remove all dynamic entries, do not specify a VLAN or an interface.

Command Mode

Privileged EXEC

Command Syntax

clear mac address-table dynamic [**VLANS**][**INTERFACE**]

Parameters

- **VLANS** Table entries are cleared for specified VLANs. Options include:
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLAN specified by ***v_num***.
- **INTERFACE** Table entries are cleared for specified interfaces. Options include:
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **interface ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **interface port-channel *p_range*** port channel interfaces specified by ***p_range***.
  - **vxlan *vx_range*** VXLAN interfaces specified by ***vx_range***.

  Valid ***range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command clears all dynamic mac address table entries for ***port channel 5*** on ***vlan 34***.

```
switch# clear mac address-table dynamic vlan 34 interface port-channel 5
switch#
```

11.4.7.3 clear server-failure servers inactive

The **clear server-failure servers inactive** command removes all inactive server entries from the server failed history list. The switch maintains this list, even after a server's ARP entry is removed, to maintain a list of servers that are connected to the switch and log the most recent time of the failure of the link that connects the switch to the server.

Command Mode

Privileged EXEC

Command Syntax

clear server-failure servers inactive

Related Command

show monitor server-failure history

Example

This command clears the inactive servers from the server failed history list.

```
switch# clear server-failure servers inactive
switch#
```

11.4.7.4 default-profiles

The **default-profiles** command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a **default-profile** command replaces the current default-profile statement in ***running-config***.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, errdisable flap-setting cause link-flap specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single **default-profiles** command.

The **no default-profiles** and **default default-profiles** commands restore the empty default-profile set by deleting the **default-profiles** command from ***running-config***.

Command Mode

Link-flap Configuration

Command Syntax

default-profiles [**LF_PROFILES**]

no default-profiles

default default-profiles

Parameters

LF_PROFILES Name of link-flap profiles assigned to default profile set. Parameter may contain zero, one, or multiple link-flap profile names:

- ***no parameter*** default-profile set is empty.
- ***profile*** name of single link-flap profile.
- ***profile_1 profile_2 ... profile_N*** list of link-flap profile names.

Related Commands

- monitor link-flap policy places the switch in ***link-flap-profiles*** configuration mode.
- profile max-flaps (Link Flap Configuration) configures link flap profiles.

Guidelines

The errdisable flap-setting cause link-flap statement is also configurable through the profile max-flaps (Link Flap Configuration) command.

Example

This command assigns configures ***LF01*** and ***LF02*** as the default-profile set.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# default-profiles LF01 LF02
switch(config-link-flap)# show active
monitor link-flap policy
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
   profile LF03 max-flaps 25 time 100 violations 2 intervals 12
   profile LF04 max-flaps 5 time 15 violations 1 intervals 3
   default-profiles LF01 LF02
switch(config-link-flap)#
```

11.4.7.5 description

The **description** command adds comment text for the configuration mode interface. The text provides information about the interface and has no effect on interface functions. The show interfaces description command displays interface description text.

The **no description** command removes the description text for the configuration mode interface from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

description ***label_text***

no description

default description

Parameters

label_text character string assigned to description attribute.

Example

These commands add description text to ***interface ethernet 23***, then displays the text through the show interfaces description command.

```
switch(config)# interface ethernet 23
switch(config-if-Et23)# description external line
switch(config-if-Et23)# show interfaces ethernet 23 description
Interface              Status     Protocol    Description
Et23                   up         up          external line
```

11.4.7.6 errdisable detect cause link-change

The **errdisable detect cause link-change** command enables the error-disabling of Ethernet interfaces when the switch detects a link flap error on the interface. The errdisable flap-setting cause link-flap command defines a link flap error in terms of the frequency of connection state changes.

The switch places an interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. To re-enable an error-disabled interface, enter **shutdown** and **no shutdown** command in the configuration mode for the interface.

By default, link flap detection is enabled. The **no errdisable detect cause link-change**command disables the triggering of error-disable actions. The **errdisable detect cause link-change** and **default errdisable detect cause link-change** commands enable the triggering of error-disable actions by removing the **no errdisable detect cause link-change** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

errdisable detect cause link-change

no errdisable detect cause link-change

default errdisable detect cause link-change

Examples

- This command disables error detection on the switch.

```
switch(config)# no errdisable detect cause link-change
switch(config)#
```

- These commands sets the link flap error criteria of ***15*** connection state changes over a ***30*** second period, then enables error detection on the switch.

```
switch(config)# errdisable flap-setting cause link-flap max-flaps 15
 time 30
switch(config)# errdisable detect cause link-change
switch(config)#
```

11.4.7.7 errdisable flap-setting cause link-flap

The **`errdisable flap-setting cause link-flap`** command configures the link-flap frequency that defines an link-flap error on an Ethernet interface. The errdisable detect cause link-change command uses this criteria to trigger an error-disable action.

The link-flap frequency is defined by the quantity of link flaps (connection state changes) over a specified period. The default settings are five link flaps and ten seconds.

The **`no errdisable flap-setting cause link-flap`** and **`default errdisable flap-setting cause link-flap`** commands restore the default link flap cause settings by removing the **errdisable flap-setting cause link-flap** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`errdisable flap-setting cause link-flap max-flaps` *quantity* time ***period***

`no errdisable flap-setting cause link-flap`

`default errdisable flap-setting cause link-flap`

Parameters

- ***quantity*** Number of link flaps. Value ranges from ***1*** to ***100***. Default value is ***5***.
- ***period*** Interval over which link flaps accumulate to trigger an error condition (seconds). Value ranges from ***1*** to ***1800***. Default value is ***10***.

Example

This command sets the link flap error criteria of ***15*** connection state changes over ***30*** second periods.

```
switch(config)# errdisable flap-setting cause link-flap max-flaps 15 time
 30
switch(config)#
```

11.4.7.8 errdisable recovery cause

The **errdisable recovery cause** command enables the automated recovery of error-disabled Ethernet interfaces. An interface that is disabled as a result of a specified condition attempts normal operation after a specified interval. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

Running-config can simultaneously store **errdisable recovery cause** statements for each error-disable condition. By default, error-disable recovery is disabled for all conditions.

The **no errdisable recovery cause** and **default errdisable recovery cause** commands disable automated recovery for interfaces disabled by the specified condition by removing the corresponding **errdisable recovery cause** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

errdisable recovery cause **CONDITION**

no errdisable recovery cause **CONDITION**

default errdisable recovery cause **CONDITION**

Parameters

CONDITION Disabling condition for which command automates recovery. Options include:

- **arp-inspection**
- **bpduguard**
- **link-flap**
- **no-internal-vlan**
- **portchannelguard**
- **portsec**
- **tapagg**
- **uplink-failure-detection**
- **xcvr_unsupported**

Related Command

errdisable recovery interval configures the period that an ethernet interface remains disabled before automated recovery begins.

Example

This command enables error-disable recovery for interfaces that are disabled by link-flap and bpduguard conditions and sets the errdisable recovery period at ***10*** minutes.

```
switch(config)# errdisable recovery cause bpduguard
switch(config)# errdisable recovery cause link-flap
switch(config)# errdisable recovery interval 600
switch(config)# show running-config
! Command: show running-config

errdisable recovery cause bpduguard
errdisable recovery cause link-flap
errdisable recovery interval 600
!
```

```
switch(config)#
```

11.4.7.9 errdisable recovery interval

The **`errdisable recovery interval`** command specifies the period that an error-disabled Ethernet interface remains disabled before automated errdisable recovery begins. This command affects only interfaces whose automated recovery is enabled for the disabling condition (errdisable recovery cause). When automated recovery is not enabled, interfaces are recovered manually by entering **`shutdown`** and **`no shutdown`** from the interface's configuration mode.

The **`no errdisable recovery interval`** and **`default errdisable recovery interval`** commands restore the default error recovery period of ***300*** seconds by removing the **`errdisable recovery interval`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`errdisable recovery interval` ***period***

`no errdisable recovery interval`

`default errdisable recovery interval`

Parameters

period Error disable recovery period (seconds). Value ranges from ***30*** to ***86400***. Default value is ***300***.

Related Command

errdisable recovery cause enables the automated recovery of error-disabled Ethernet interfaces.

Example

This command enables error-disable recovery for interfaces that are disabled by link-flap conditions and sets the errdisable recovery period at ***10*** minutes.

```
switch(config)# errdisable recovery cause link-flap
switch(config)# errdisable recovery interval 600
switch(config)# show running-config
! Command: show running-config

!
errdisable recovery cause link-flap
errdisable recovery interval 600
!

!
i
switch(config)#
```

11.4.7.10 interface loopback

The **interface loopback** command places the switch in loopback interface configuration mode for the specified interface and creates a loopback interface if one does not exist. It can also be used to configure multiple loopback interfaces if they have all been previously created.

The command can specify a single interface or multiple interfaces:

- **Single interface:** Command creates an interface if it specifies one that was not previously created.
- **Multiple interfaces:** Command is valid only if all specified interfaces were previously created.

The **no interface loopback** command removes the specified interfaces from ***running-config***, including all interface configuration statements. The **default interface loopback** command removes all configuration statements for the specified loopback interface without deleting the loopback interface from ***running-config***.

The following commands are available in loopback interface configuration mode:

- **description**
- **exit**
- **ip address**
- **ip proxy-arp**
- **ipv6 address**
- **ipv6 enable**
- **load interval**
- **logging event**
- **mtu**
- **shutdown (Interfaces)**
- **snmp trap**

Command Mode

Global Configuration

Command Syntax

interface loopback ***l_range***

no interface loopback ***l_range***

default interface loopback ***l_range***

Parameters

l_range Loopback interfaces (number, range, or comma-delimited list of numbers and ranges). Loopback number ranges from ***0*** to ***1000***.

Examples

- This command enters loopback interface configuration mode for loopback interfaces ***1*** through ***5***.

```
switch(config)# interface loopback 1-5
switch(config-if-Lo1-5)#
```

- This command creates interface ***23*** and enters loopback interface configuration mode.

```
switch(config)# interface loopback 23
switch(config-if-Lo23)#
```

- This command removes loopback interfaces ***5*** through ***7*** from ***running-config***.

```
switch(config)# no interface loopback 5-7
switch(config)#
```

11.4.7.11 ip access-group (Control Plane mode)

The **ip access-group** command applies an IPv4 or standard IPv4 Access Control List (ACL) to the control plane.

The **no ip access-group** and **default ip access-group** commands remove the corresponding **ip access-group** command from ***running-config***.

Command Mode

Control-plane Configuration

Command Syntax

ip access-group ***list_name*** [**VRF_INSTANCE**] **DIRECTION**

no ip access-group [***list_name***][**VRF_INSTANCE**] **DIRECTION**

default ip access-group [***list_name***][**VRF_INSTANCE**] **DIRECTION**

Parameters

- ***list_name*** name of ACL assigned to interface.
- **VRF_INSTANCE** specifies the VRF instance being modified.
  - ***no parameter*** changes are made to the default VRF.
  - **vrf** ***vrf_name*** changes are made to the specified user-defined VRF.
- **DIRECTION** transmission direction of packets, relative to interface. Valid options include:
  - **in** inbound packets.

Example

These commands apply the IPv4 ACL named ***test2*** to the control plane.

```
switch(config)# system control-plane
switch(config-system-cp)# ip access-group test2 in
switch(config-system-cp)#
```

11.4.7.12 link tracking group (interface)

The **`link tracking group`** command adds the configuration mode interface to a link-state group and specifies whether it is upstream or downstream.

The **`no link tracking group`** and **`default link tracking group`** commands remove the specified link-state group assignment for the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

`link tracking group` *group_name* **DIRECTION**

`no link tracking group` [*group_name*]

`default link tracking group` [*group_name*]

Parameters

- ***group_name*** link tracking group name.
- **DIRECTION** position of the interface in the link-state group. Valid options include:
  - **upstream**
  - **downstream**

Example

These commands create link-state group "***xyz***" and add ***VLAN interface 100*** to the group as an upstream interface.

```
switch(config)#link tracking group xyz
switch(config-link-state-xyz)#show active
link tracking group xyz
switch(config-link-state-xyz)#exit
switch(config)#interface vlan 100
switch(config-if-Vl100)#link tracking group xyz upstream
switch(config-if-Vl100)#show active
 interface Vlan100
   link state group xyz upstream
switch(config-if-Vl100)#
```

11.4.7.13 link tracking group

The **`link tracking group`** command creates and enables a link-state group and places the switch in link-state-group configuration mode. A link-state group consists of “upstream” interfaces (connections to servers) and “downstream” interfaces (connections to switches and clients). In the event of a failure of all upstream interfaces in the link-state group, the downstream interfaces are shut down.

The **`no link tracking group`** and **`default link tracking group`** commands delete the link tracking group from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`link tracking group` ***group_name***

`no link tracking group` ***group_name***

`default link tracking group` ***group_name***

Parameters

group_name link-state group name.

Commands available in link-state Configuration Mode

links minimum configures the minimum number of links that the link-state group requires.

Example

This command creates and enables ***link-state group 1***.

```
switch(config)# link tracking group 1
switch(config-link-state-1)#
```

11.4.7.14 links minimum

The **`links minimum`** command specifies the minimum number of links the configuration mode link-state group requires.

The **`no links minimum`** and **`default links minimum`** commands restore the default minimum value of 1 by deleting the corresponding **`links minimum`** statement from ***running-config***.

Command Mode

Link-State Configuration

Command Syntax

`links minimum` ***quantity***

`no links minimum`

`default links minimum`

Parameters

quantity Minimum number of links. Value ranges from ***1*** to ***100000***. Default value is ***1***.

Related Commands

- link tracking group creates and enables a link-state group and places the switch in ***link-state*** configuration mode.
- link tracking group (interface) adds the configuration mode interface to the specified link-state group.

Example

These commands configure link-state tracking group ***link-a*** to have at least ***60*** links.

```
switch(config)# link tracking group link-a
switch(config-link-state-1ink-a)# links minimum 60
switch(config-link-state-link-a)#
```

11.4.7.15 load interval

The **load-interval** command changes the load interval for the configuration mode interface. Load interval is the time period over which data is used to compute interface rate counters. Interface rates are exponentially weighted moving averages; recent data samples have greater influence than older samples. Statistics calculated with shorter load intervals are usually more sensitive to short traffic bursts.

The **no load-interval** and **default load-interval** commands restore the default value of ***300*** seconds by removing the corresponding **load-interval** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

load-interval ***delay***

no load-interval

default load-interval

Parameters

delay Load interval delay. Values range from ***5*** to ***600*** (seconds). Default value is ***300*** (five minutes).

Example

These commands set the load interval for ***interface ethernet 7*** at ***60*** seconds.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# load-interval 60
switch(config-if-Et7)#
```

11.4.7.16 mac address learning

The **mac address learning** command enables MAC address learning on a VLAN configuration mode. By default, MAC address learning is enabled by on a VLAN.

The **no mac address learning** command disables MAC address learning for the VLAN configuration mode. The **mac address learning** and **default mac address learning** commands enable MAC address learning for the VLAN configuration mode by deleting the corresponding **no mac address learning** command from the ***running-config***.

Command Mode

Interface-VLAN Configuration

Command Syntax

mac address learning local limit

no mac address learning local limit

default mac address learning local limit

Parameter

local limit Maximum number of locally learned dynamic hosts. Range ***0-10000***. To reset the learning limit threshold to have no limit, use the **mac address learning** command.

Examples

- These commands enable MAC address learning on ***vlan 10*** configuration.

```
switch(config)# vlan 10
switch(config-vlan-10)# mac address learning
```

- These commands disable MAC address learning on ***vlan 10*** configuration.

```
switch(config)# vlan 10
switch(config-vlan-10)# no mac address learning
```

- An example for ***5,000*** MACs:

```
switch(config-vla-10)# mac address learning local limit 5000 hosts
```

  Mac address learning local limit ***5000*** host.

  No mac address learning local limit ***5000*** host.

  Default mac address learning local limit ***5000*** host.

11.4.7.17 mac address-table aging-time

The **mac address-table aging-time** command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

The **no mac address-table aging-time** and **default mac address-table aging-time** commands reset the aging time to its default by removing the **mac address-table aging-time** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

mac-address-table aging-time ***period***

no mac-address-table aging-time

default mac-address-table aging-time

Parameters

- ***period*** MAC address table aging time. Default is ***300*** seconds. Options include:
  - ***0*** disables deletion of table entries on the basis of aging time.
  - ***10*** through ***1000000*** (one million) aging period (seconds).

Example

This command sets the MAC address table aging time to two minutes (***120*** seconds).

```
switch(config)# mac address-table aging-time 120
switch(config)#
```

11.4.7.18 mac address-table static

The **mac address-table static** command adds a static entry to the MAC address table. Each table entry references a MAC address, a VLAN, and a list of Layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The command replaces existing dynamic or static table entries with the same VLAN-MAC address. Static entries are not removed by aging (mac address-table aging-time). Static MAC entries for mirror destinations or LAG members are typically avoided.

The most important byte of a MAC address distinguishes it as a unicast or multicast address:

- **Unicast:** most significant byte is an even number. Examples: ***0200.0000.0000*** ***1400.0000.0000***.
- **Multicast:** most significant byte is an odd number. Examples: ***0300.0000.0000*** ***2500.0000.0000***.

The **no mac address-table static** and **default mac address-table static** commands remove corresponding **mac address-table static** commands from ***running-config*** and MAC address table entries.

Command Mode

Global Configuration

Command Syntax

mac address-table static ***mac_address*** vlan ***v_num*** [**DESTINATION**]

no mac address-table static ***mac_address*** vlan ***v_num*** [**DESTINATION**]

default mac address-table static ***mac_address*** vlan ***v_num*** [**DESTINATION**]

Parameters

- ***mac_address*** Table entry's MAC address (dotted hex notation – H.H.H).
- ***v_num*** Table entry's VLAN.
- **DESTINATION** Table entry's port list.

  For multicast MAC address entries, the command may contain multiple ports, listed in any order. The CLI accepts only one interface for unicast entries.
- **drop** creates drop entry in table. Valid only for unicast addresses.
  - **interface ethernet** ***e_range*** Ethernet interfaces specified by ***e_range***.
  - **interface port-channel** ***p_range*** Port channel interfaces specified by ***p_range***.
  - ***no parameter*** Valid for **no** and **default** commands that remove multiple table entries.

    e_range and ***p_range*** formats include number, range, comma-delimited list of numbers and ranges.

Examples

- This command adds a static entry for unicast MAC address ***0012.3694.03ec*** to the MAC address table.

```
switch(config)# mac address-table static 0012.3694.03ec vlan 3
 interface ethernet 7
switch(config)# show mac address-table static
          Mac Address Table
------------------------------------------------------------
```

```
Vlan    Mac Address       Type        Ports    Moves   Last Move
----    -----------       ----        -----    -----   ---------
   3    0012.3694.03ec    STATIC      Et7
Total Mac Addresses for this criterion: 1

          Multicast Mac Address Table
------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
Total Mac Addresses for this criterion: 0

switch(config)#
```

- These commands adds a static drop entry for MAC address ***0012.3694.03ec*** to the MAC address table, then displays the entry in the MAC address table.

```
switch(config)# mac address-table static 0012.3694.03ec vlan 3 drop
switch(config)# show mac address-table static
          Mac Address Table
------------------------------------------------------------

Vlan    Mac Address       Type        Ports    Moves   Last Move
----    -----------       ----        -----    -----   ---------
   1    0012.3694.03ec    STATIC
Total Mac Addresses for this criterion: 1

          Multicast Mac Address Table
------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
Total Mac Addresses for this criterion: 0

switch(config)#
```

- This command adds a static entry for the multicast MAC address ***0112.3057.8423*** to the MAC address table.

```
switch(config)# mac address-table static 0112.3057.8423 vlan 4
 interface
port-channel 10 port-channel 12
switch(config)# show mac address-table
          Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports    Moves   Last Move
----    -----------       ----        -----    -----   ---------

----    -----------       ----        -----
   4    0112.3057.8423    STATIC      Po10 Po12
Total Mac Addresses for this criterion: 1
switch(config)#
```

11.4.7.19 monitor link-flap policy

The **`monitor link-flap policy`** command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. Link-flap configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **`exit`** command does not affect the configuration.

Link flap profiles are assigned to Ethernet interfaces and specify conditions that define a link-flap error. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

Command Mode

Global Configuration

Command Syntax

`monitor link-flap policy`

Commands Available in Link-flap Configuration Mode

- default-profiles configures the set of profiles that define the default-profile set.
- profile max-flaps (Link Flap Configuration) configures a link-flap profile.

Examples

- These commands place the switch in ***link-flap*** configuration mode.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)#
```

- This command returns the switch to ***global*** configuration mode.

```
switch(config-link-flap)# exit
switch(config)#
```

11.4.7.20 monitor link-flap profiles

The **monitor link-flap profiles** command enables link-flap monitoring on the configuration mode interface and specifies the error-disable criteria for the interface. Entering a **monitor link-flap profiles** command replaces the corresponding statement in ***running-config***.

The command enables the following link flap detection options:

- **monitor link-flap** (***no profiles listed***): The interface detects link flaps using the criteria defined by the default-profile set (default-profiles).
- **monitor link-flap profiles** (***at least one profile listed***): The interface detects link flaps using the criteria of the listed profiles. Error-disable criteria require conditions that match at least one profile.
- **default monitor link-flap**: The interface detects link flaps using the **errdisable flap-setting cause link-flap** and **errdisable recovery cause** commands.
- **no monitor link-flap**: The interface does not detect link flaps.
- **Default monitor link flap** is the default setting.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

monitor link-flap [**LF_PROFILES**]

no monitor link-flap

default monitor link-flap

Parameters

LF_PROFILES Name of link-flap profiles assigned to interface. Parameter may contain zero, one, or multiple link-flap profile names:

- ***no parameter*** Link flap criteria determined by default-profile set.
- **profiles *profile_name*** Name of single link-flap profile.
- **profiles *profile_name_1 profile_name_2 ... profile_name_N*** List of link-flap profile names.

Examples

- This command applies the ***LF03*** and ***LF04*** link flap profiles to ***interface ethernet 33***.

```
switch(config)# interface ethernet 33
switch(config-if-Et33)# monitor link-flap profiles LF03 LF04
switch(config-if-Et33)# show active
interface Ethernet33
   monitor link-flap profiles LF04 LF03
switch(config-if-Et33)#
```

- This command disables link-flap monitoring on ***interface ethernet 34***.

```
switch(config)# interface ethernet 34
switch(config-if-Et34)# no monitor link-flap
switch(config-if-Et34)# show active
interface Ethernet34
   no monitor link-flap
switch(config-if-Et34)#
```

11.4.7.21 monitor server-failure link

The **monitor server-failure link** command enables Rapid Automated Indication of Link-loss (RAIL) on the configuration mode interface. RAIL must be properly configured globally or this command has no effect on switch operation.

When an interface monitored by RAIL goes down, the switch performs these steps for servers that the switch accesses from the interface:

1. IP addresses of the servers are removed from ARP cache.
2. A dynamic MAC entry is added to the MAC address table for each server. The port for each entry is listed as CPU.

The **no monitor server-failure link** and **default monitor server-failure link** commands disable RAIL on the configuration mode interface by deleting the corresponding **monitor server-failure link** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

monitor server-failure link

no monitor server-failure link

default monitor server-failure link

Related Commands

monitor server-failure places the switch in server-failure configuration mode for configuring RAIL.

Example

These commands enable RAIL on ***interface port-channel 100***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# monitor server-failure link
switch(config-if-Po100)# show active
interface Port-Channel100
   monitor server-failure link
switch(config-if-Po100)#
```

11.4.7.22 monitor server-failure

The **monitor server-failure** command places the switch in server-failure configuration mode. Rapid Automated Indication of Link-loss (RAIL) settings are configured in server-failure configuration mode. RAIL is disabled by default and is enabled by the **no shutdown** command in server-failure configuration mode.

The **no monitor server-failure** and **default monitor server-failure** commands disable RAIL and restore all settings to their default state by removing all server-failure configuration mode statements from ***running-config***.

Server-failure configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting server-failure configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

monitor server-failure

no monitor server-failure

default monitor server-failure

Commands Available in server-failure Configuration Mode

- network (server-failure configuration mode)
- proxy (server-failure configuration mode)
- shutdown (server-failure configuration mode)

Examples

- These commands place the switch in server-failure configuration mode and enables RAIL.

```
switch(config)# monitor server-failure
switch(config-server-failure)# show active
switch(config-server-failure)# no shutdown
switch(config-server-failure)# show active
monitor server-failure
   no shutdown
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from ***running-config***.

```
switch(config)# no monitor server-failure
switch(config)#
```

11.4.7.23 monitor session destination cpu

The **monitor session destination cpu** command configures the CPU as the destination port of a specified port mirroring session. The **monitor session source** command configures the source port of the mirroring session. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction.

The CPU can only be configured as a destination for a mirroring session, not as a source. However, the CPU can serve as the destination for multiple mirroring sessions. Traffic mirrored to the CPU can be viewed using tcpdump.

The **no monitor session destination cpu** and **default monitor session destination cpu** commands remove the mirror session destination assignment by deleting the corresponding **monitor session destination cpu** command from ***running-config***. The **no monitor session** command removes the entire mirror session.

Command Mode

Global Configuration

Command Syntax

monitor session ***session_name*** **destination cpu**

no monitor session ***session_name*** **destination cpu**

default monitor session ***session_name*** **destination cpu**

Parameters

session_name Label assigned to port mirroring session.

Guidelines

To view the traffic mirrored to the CPU from a source port, use tcpdump from the Bash shell, with the source interface as an argument. This causes tcpdump to capture packets from the kernel interface of the source port.

Examples

- These commands configure ***interface ethernet 35*** as the source and the CPU as the destination port for the ***redirect_1*** mirroring session, then display the mirror interface.

```
switch(config)# monitor session redirect_1 destination cpu
switch(config)# monitor session redirect_1 source ethernet 35
switch(config)# show monitor session

Session redirect_1
------------------------
Source Ports:

  Both:        Et35

Destination Ports:

    Cpu :  active (mirror0)

switch(config)#
```

- This command uses tcpdump to view the traffic mirrored by the ***redirect_1*** mirroring session. The CPU mirror interface specified in the previous output must be used in the tcpdump expression (in this case, ***mirror0***).

```
switch# bash tcpdump -i mirror0
tcpdump: WARNING: mirror0: no IPv4 address assigned
```

```
tcpdump: verbose output suppressed, use -v or -vv for full protocol
 decode
listening on mirror0, link-type EN10MB (Ethernet), capture size 65535
 bytes

switch#
```

11.4.7.24 monitor session destination

The **`monitor session destination`** command configures an interface as the destination port of a specified port mirroring session. The destination is usually an Ethernet interface, but other options are available on certain platforms (see **Guidelines**). The monitor session source command configures the source port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously used as both source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic only from one direction.

Note: On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

The **`no monitor session destination`** and **`default monitor session destination`** commands remove the mirroring session destination assignment by deleting the corresponding **monitor session destination** command from ***running-config***. The **`no monitor session`** removes the entire mirroring session.

Command Mode

Global Configuration

Command Syntax

`monitor session` ***session_name*** **`destination`**{cpu | ethernet ***e_range*** | port-channel ***p_range*** | tunnel mode}

`no monitor session` ***session_name*** **`destination`**

`default monitor session` ***session_name*** **`destination`**

Parameters

- ***session_name*** label assigned to the port mirroring session.
- **cpu** configures a CPU as the destination interface.
- **ethernet *e_range*** configures Ethernet interfaces specified by ***e_range*** as the destination interface. The ethernet interface value ranges from ***1*** to ***50***.
- **port-channel *p_range*** configures port channel interfaces specified by ***p_range*** as the destination interface. The port-channel value ranges from ***1*** to ***2000***.
- **tunnel mode** configures a tunnel as the destination interface. Option includes:
  - **gre** configures GRE-tunnel as the destination interface.

Guidelines

Tunnel mode is supported on select platforms only.

Port mirroring capacity varies by platforms. The session destination capacity of switches on each platform is listed below:

- **Arad Platform:** Ethernet interfaces (one).
- **FM6000 Platform:** Ethernet interfaces (any count), Port channel interfaces (any count), CPU.
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Trident Platform:** Ethernet interfaces (one).
- **Trident II Platform:** Ethernet interfaces (one).

When there are multiple transmit (Tx) sources in a monitor session, mirrored frames use Tx properties of the lowest numbered Tx mirror source configured. Packets are modified based on properties.

Allowed VLANs on the ***ethernet8*** source interface are ***10***, ***20*** and ***30***. Allowed VLANs on ***ethernet9*** source interface are ***30***, ***40***, and ***50***. The frames going out of ***ethernet9*** tagged with ***10***, ***20***, and ***30*** appears at the mirrored destination as tagged frames. The tagged frames with ***40*** or ***50*** on ***ethernet9***

appears at the mirrored destination as untagged frames. Since ***ethernet8*** is the lowest numbered source interface, all Tx frames on ethernet8 are tagged in the mirrored destination.

Examples

- This command configures ***interface ethernet 8*** as the destination port for the ***redirect_1*** mirroring session.

```
switch(config)# monitor session redirect_1 destination ethernet 2
switch(config)# show monitor session

Session redirect_1
------------------------
Source Ports:

Destination Ports:

    Et2 :  active

switch(config)#
```

- This command configures a GRE tunnel with source and destination addresses as ***1.1.1.1*** and ***2.2.2.2*** respectively as the destination interface for the ***redirect_2*** mirroring.

```
switch(config)# monitor session redirect_2 destination tunnel mode gre source
1.1.1.1 destination 2.2.2.2
switch(config)# show monitor session

Session redirect_2
-----------------------
Source Ports:

Destination Ports:

         status  source    dest    TTL  DSCP  proto    VRF     fwd-drop
 Gre1 :  active  1.1.1.1   2.2.2.2 128  0     0x88be   default no

switch(config)#
```

11.4.7.25 monitor session forwarding-drop

The **monitor session forwarding-drop** command configures a forwarding-drop session for mirroring ingress packets that are dropped during ASIC forwarding.

The **no monitor session forwarding-drop** and **default monitor session forwarding-drop** commands delete the current forwarding-drop configuration.

Command Mode

Global Configuration

Command Syntax

monitor session ***session_name*** **forwarding-drop destination tunnel mode**

no monitor session ***session_name*** **forwarding-drop destination tunnel mode**

default monitor session ***session_name*** **forwarding-drop destination tunnel mode**

Parameters

- **destination** specifies to mirror packets at destination.
- **tunnel mode** specifies to mirror packets that pass through a tunnel. Options include:
  - **gre** configures GRE-tunnel as the destination interface.

Related Commands

- monitor session destination
- monitor session destination cpu
- show monitor session

Guidelines

The forwarding-drop configuration is supported on select platforms only.

Example

This command configures a forwarding-drop session to ***1.1.1.1*** as the destination.

```
switch(config)# monitor session 1 forwarding-drop destination tunnel mode
 gre source 1.1.1.1 destination
2.2.2.2
switch(config)# show monitor session

Session 1
------------------------
Programmed in HW: No
Source Ports:
Destination Ports:
            status   source    dest      TTL   DSCP  proto    VRF
 fwd-drop
    Gre1 :  active   1.1.1.1   2.2.2.2   128    0    0x88be   default
 yes

switch(config)#
```

11.4.7.26 monitor session ip access-group

The **monitor session ip access-group** command configures an ACL to filter the traffic being mirrored to the destination port.ACLs applied to a source port affect the RX side of the interface, and do not impact the TX side of the interface. TX mirrored packets cannot be filtered, and will continue to be sent to the mirror destination.

The **no monitor session ip access-group** and **default monitor session ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session ip access-group** command from ***running-config***. The **no monitor session** command removes the entire mirror session.

Command Mode

Global Configuration

Command Syntax

monitor session ***session_name*** **ip access-group** ***acl_name***

no monitor session ***session_name*** **ip access-group**

default monitor session ***session_name*** **ip access-group**

Parameters

- ***session_name*** Label assigned to port mirroring session.
- ***acl_name*** The ACL to be applied to filter traffic for the specified session.

Examples

- These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session ***redirect_1***.

```
switch(config)# ip access-list allow-host
switch(config-acl-allow-host)# 10 permit ip host 192.168.11.24 host
 10.0.215.23
switch(config-acl-allow-host)# 20 deny ip any any
switch(config-acl-allow-host)# exit
switch(config)#
switch(config)# monitor session redirect_1 ip access-group allow-host
switch(config)#
```

- Use the **show monitor session** command to verify the configuration.

```
switch# show monitor session
Session redirect_1
------------------------
Source Ports:
Both:        Et35(Acl:allow-host)
Destination Ports:
Cpu :  active (mirror0)
ip access-group: allow-host
switch#
```

11.4.7.27 monitor session source

The **monitor session source** command configures the source port of a specified port mirroring session. The **monitor session destination** or **monitor session destination cpu** command configures the destination port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. An interface which is part of a port channel cannot be used as a source, but a port channel which is a member of an MLAG can be used. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

The **no monitor session source** and **default monitor session source** commands remove the mirroring session source assignment by deleting the corresponding **monitor session source** command from ***running-config***. The **no monitor session** removes entire the mirroring session.

Command Mode

Global Configuration

Command Syntax

monitor session *session_name* source INT_NAME DIRECTION

no monitor session *session_name* source INT_NAME DIRECTION

default monitor session *session_name* source INT_NAME DIRECTION

Parameters

- ***session_name*** Label assigned to port mirroring session.
- **INT_NAME** Source interface for the mirroring session.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **DIRECTION** transmission direction of traffic to be mirrored.
  - ***no parameter*** mirrors transmitted and received traffic.
  - **both** mirrors transmitted and received traffic.
  - **rx** mirrors received traffic only.
  - **tx** mirrors transmitted traffic only.

Guidelines

On DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series, due to limitations of the switch ASIC, all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device is unable to process VLAN tags in a desirable manner mirroring should be configured exclusively for ingress traffic by specifying **rx**.

Restrictions

Port mirroring capacity varies by platform. Session source capacity for each platform is listed below:

- **FM6000 Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Arad Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Trident Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Trident II Platform:** Ethernet interfaces (any number), port channel interfaces (any number).

  The number of interfaces that can be effectively mirrored is restricted by the destination port speed.

Example

This command configures ***interface ethernet 7*** as the source port for ***redirect_1*** mirroring session.

```
switch(config)# monitor session redirect_1 source ethernet 7
switch(config)#
```

11.4.7.28 monitor session source ip access-group

The **monitor session source ip access-group** command configures an ACL to filter the traffic being mirrored from a specific source port. This enables the ability to filter traffic using a different ACL on each source port and have the combined matched traffic sent to the destination port.

The **no monitor session source ip access-group** and **default monitor session source ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session source ip access-group** command from ***running-config***. The **no monitor session** command removes the entire mirror session.

Command Mode

Global Configuration

Command Syntax

monitor session ***s_name*** **source** **INT_NAME** [**DIRECT**] **ip access-group** ***acl_name***

no monitor session ***s_name*** **source** **INT_NAME** [**DIRECT**] **ip access-group** ***acl_name***

default monitor session ***s_name*** **source** **INT_NAME** [**DIRECT**] **ip access-group** ***acl_name***

Parameters

- ***s_name*** Label assigned to port mirroring session.
- **INT_NAME** Source interface for the mirroring session.
  - **ethernet** ***e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel** ***p_range*** Port channel interfaces specified by ***p_range***.
- **DIRECT** transmission direction of traffic to be mirrored. Options include:
  - ***no parameter*** mirrors received traffic only.
  - **rx** mirrors received traffic only.
- ***acl_name*** The ACL to be applied to filter traffic for the specified session.

Example

These commands create ACLs and apply them to filter the traffic mirrored from two source ports by session ***redir_1***.

```
switch(config)# ip access-list allow-host-x
switch(config-acl-allow-host-x)# 10 permit ip host 192.168.11.24 host
 10.0.215.23
switch(config-acl-allow-host-x)# 20 deny ip any any
switch(config-acl-allow-host-x)# exit
switch(config)# ip access-list allow-host-y
switch(config-acl-allow-host-y)# 10 permit ip host 172.16.233.80 host
 10.0.215.23
switch(config-acl-allow-host-y)# 20 deny ip any any
switch(config-acl-allow-host-y)# exit
switch(config)# monitor session redir_1 source ethernet 5,9 rx
switch(config)# monitor session redir_1 source ethernet 5 ip access-group
 allow-host-x
switch(config)# monitor session redir_1 source ethernet 9 ip access-group
 allow-host-y
switch(config)#
```

11.4.7.29 monitor session truncate

The **monitor session truncate** command configures a port mirroring session to truncate mirrored packets, retaining only the first ***160*** bytes. Packet truncation can be used to prevent oversubscription of the session's destination port.

Packet truncation applies to the mirroring session as a whole, and cannot be applied to individual source ports.

The **no monitor session truncate** and **default monitor session truncate** commands restores mirroring of full packets by deleting the corresponding **monitor session truncate** command from ***running-config***. The **no monitor session** removes the entire mirroring session.

Command Mode

Global Configuration

Command Syntax

monitor session ***session_name*** **truncate**

no monitor session ***session_name*** **truncate**

default monitor session ***session_name*** **truncate**

Parameters

session_name Label assigned to port mirroring session.

Example

This command configures mirroring session ***redirect_1*** to truncate mirrored packets.

```
switch(config)# monitor session redirect_1 truncate
switch(config)#
```

11.4.7.30 mtu

The **mtu** command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. The switch fragments IP packets that are larger than the MTU value for the outbound interface. An interface's MTU value is displayed with the show interfaces command.

MTU is independently configurable on all routable interfaces.

The **no mtu** and **default mtu** commands restore the interface's MTU to the default value by removing the corresponding mtu command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

mtu ***bytes***

no mtu

default mtu

Parameters

bytes MTU size (bytes). Values range from ***68*** to ***9214***. The default MTU size is ***1500*** bytes.

Example

This command sets the MTU size of ***1492*** bytes on ***interface vlan 20***.

```
switch(config)#interface vlan 20
switch(config-if-Vl20)#mtu 1492
switch(config-if-Vl20)#
```

11.4.7.31 network (server-failure configuration mode)

The **network** command specifies the IPv4 network space that Rapid Automated Indication of Link-loss (RAIL) monitors for failed links to connected servers. RAIL reduces the wait time for applications on directly connected servers that are blocked due to a failed link. ***Running-config*** supports simultaneous network command, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or **ICMP Unreachable** segments to devices sending packets to the unavailable server.

The **no network** and **default network** commands terminate the RAIL monitoring of the specified IPv4 address space by deleting the corresponding **network** command from ***running-config***.

Command Mode

Server-failure Configuration

Command Syntax

network ***netv4_address***

no network ***netv4_address***

default network ***netv4_address***

Parameters

netv4_addr IPv4 subnet address to be monitored (CIDR or address-mask notation).

Related Command

monitor server-failure places the switch in server-failure configuration mode.

Example

This command specifies two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)# monitor server
switch(config-server-failure)# network 10.1.1.0/24
switch(config-server-failure)# network 10.2.1.96/28
switch(config-server-failure)# show active
monitor server-failure
   network 10.2.1.96/28
   network 10.1.1.0/24
switch(config-server-failure)#
```

11.4.7.32 no monitor session

The **`no monitor session`** and default monitor session commands remove the specified monitor session from the switch by deleting all corresponding monitor commands from ***running-config***. Commands that remove or alter individual commands within a session configuration are described in the monitor session destination and **monitor session source** commands.

Command Mode

Global Configuration

Command Syntax

`no monitor session` ***session_name***

`default monitor session` ***session_name***

Parameters

session_name Label assigned to port mirroring session.

Example

This command displays the configuration of the ***redirect_1*** mirroring session, deletes the session, then confirms that the session was removed.

```
switch(config)# show monitor session redirect_1
Session redirect_1
-----------------------
Source Ports
  Both:        Et7
Destination Port: Et8
switch(config)# no monitor session redirect_1
switch(config)# show monitor session redirect_1
Session not created

switch(config)#
```

11.4.7.33 phy diag

Use the **phy diag** command to configure a test pattern in the interface configuration mode. The **no** and **default** forms of the command disables the test pattern.

Command Mode

Interface configuration mode

Command Syntax

phy diag [transmitter | receiver] test pattern ***TestPattern***

no phy diag [transmitter | receiver] test pattern ***TestPattern***

default phy diag [transmitter | receiver] test pattern ***TestPattern***

Parameters

- **transmitter** Configures the physical transmitter.
- **receiver** Configures the physical receiver.
- **test pattern *TestPattern*** Configures the named test pattern.

Examples

- Enable a test pattern on an interface using the **phy diag** command. You can select the transmitter or the receiver. To display the available interfaces, select **test pattern ?**.

```
switch(config-if)# phy diag [ transmitter | receiver ] test pattern ?
  PRBS11  Configure the PRBS11 test pattern
  PRBS15  Configure the PRBS15 test pattern
  PRBS23  Configure the PRBS23 test pattern
  PRBS31  Configure the PRBS31 test pattern
  PRBS49  Configure the PRBS49 test pattern
  PRBS58  Configure the PRBS58 test pattern
  PRBS7   Configure the PRBS7 test pattern
  PRBS9   Configure the PRBS9 test pattern
```

- To disable a test pattern on an interface, enter the following command. You can select the tranmitter or the receiver, as well as the selected named test pattern.

```
switch(config-if)# no phy diag [ transmitter | receiver ] test
 pattern TestPattern
```

- By default, a test pattern is disabled.

```
switch(config-if)# default phy diag [ transmitter | receiver ] test
 pattern
```

- The following command clears the recorded test pattern status data for all the interfaces. Upon running the command, all the counter values are set to ***0*** and link states are marked as **not locked**.

```
switch# clear phy diag test pattern
```

11.4.7.34 platform sand monitor serdes error log

The **platform sand monitor serdes error log** command is used for enabling the serdes error log for fabric link monitoring.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes error log

Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config)# platform sand monitor serdes error log
switch(config)#
```

11.4.7.35 platform sand monitor serdes error threshold

The **platform sand monitor serdes error threshold** command is used for generating a fabric link monitoring serdes error threshold.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes error threshold

Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between ***200*** and ***30000*** received cells.

```
switch(config)# platform sand monitor serdes error threshold 200 30000
switch(config)#
```

11.4.7.36 platform sand monitor serdes poll period

The **platform sand monitor serdes poll period** command is used to enable the serdes poll period.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes poll period

Example

This command changes the serdes polling period for fabric link monitoring to ***6*** seconds.

```
switch(config)# platform sand monitor serdes poll period 6
switch(config)#
```

11.4.7.37 platform sand monitor serdes poll threshold isolation

The **platform sand monitor serdes poll threshold isolation** command is used to set and enables fabric link monitoring for serdes poll threshold isolation.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes poll threshold isolation

Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is ***5*** consecutive polls.

```
switch(config)# platform sand monitor serdes poll threshold isolation 5
switch(config)#
```

11.4.7.38 platform sand monitor serdes poll threshold recovery

The **platform sand monitor serdes poll threshold recovery** command is used to set and enable fabric link monitoring for serdes poll threshold recovery.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes poll threshold recovery

Example

This command changes the number of consecutive serdes polls used for threshold recovery to **6** seconds.

```
switch(config)# platform sand monitor serdes poll threshold recovery 6
switch(config)#
```

11.4.7.39 profile max-flaps (Link Flap Configuration)

The **`profile max-flaps`** command creates a link flap profile that, when assigned to an Ethernet interface, specifies the conditions that result in an error-disable action. Link flap profile parameters include:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

By default, **violations** and **intervals** are each set to one, resulting in a profile that triggers a link-flap error when the specified frequency is exceeded once. By configuring violations and intervals, link-flap errors are defined when the frequency is exceeded multiple times over a specified set of intervals.

Default is a reserved profile name that modifies the errdisable flap-setting cause link-flap statement in ***running-config***. When configuring the **default** profile, **violations** and **intervals** are disregarded.

The **`no profile max-flaps`** command removes the specified profile by deleting the corresponding **`profile max-flaps`** command from ***running-config***. The **`no profile max-flaps default`** command restores default errdisable flap-setting cause link-flap values by removing that command from ***running-config***.

Command Mode

Link-flap Configuration

Command Syntax

`profile` **PROFILE_NAME** **`max-flaps`** ***flap_max*** time ***period*** [**EXTENSIONS**]

`no profile` **LF_PROFILE**

Parameters

- **PROFILE_NAME** Name of link flap profile. Options include:
  - **default** command modifies default values (errdisable flap-setting cause link-flap).
  - ***profile_name*** command modifies specified link-flap profile.
- ***flap_max*** Threshold number of interface state changes. Value ranges from ***1*** to ***100***.
- ***period*** Interval when flaps accumulate toward threshold (seconds). Value ranges from ***1*** to ***1800***.
- **EXTENSIONS** Configures multi-flap triggers. Options include:
  - ***no parameter*** Sets errors and episodes to default values (one).
  - **violations *errors* intervals *episodes*** Link flap errors (***errors***) and number of periods (***episodes***).
    - ***Errors*** range is ***1*** to ***1000***. Default value is ***1***.
    - ***Episodes*** range is ***1*** to ***1000***. Default value is ***1***.

Related Command

monitor link-flap policy places the switch in ***link-flap*** configuration mode.

Example

These commands create two link flap profiles with various trigger settings.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile LF01 max-flaps 15 time 60
switch(config-link-flap)# profile LF02 max-flaps 10 time 30 violations 5
 intervals 10
switch(config-link-flap)# show active
monitor link-flap policy
```

```
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)#
```

11.4.7.40 proxy (server-failure configuration mode)

The **proxy** command enables the Rapid Automated Indication of Link-loss (RAIL) proxy setting and specifies the interval that RAIL responds to messages sent to servers on failed links, starting from when the switch detects the failed link. The RAIL state machine is in the proxying state during the timeout interval this command specifies. When RAIL proxy is not enabled, the switch maintains a list of unavailable servers without responding to messages sent the servers. The switch can enter RAIL proxy state only when this command is enabled.

The RAIL proxy setting is **disabled** by default. When RAIL proxy is enabled, the default period is three minutes.

The **no proxy** and **default proxy** commands return the RAIL proxy setting to disabled by removing the proxy statement from ***running-config***.

The **no proxy lifetime** and **default proxy lifetime** command sets the proxy time setting to its default value of three minutes if the RAIL proxy setting is **enabled**. These commands have no effect if the RAIL proxy setting is **disabled**.

Command Mode

Server-failure Configuration

Command Syntax

proxy [lifetime ***time_span***]

no proxy [lifetime]

default proxy [lifetime]

Parameters

timespan proxy timeout period (minutes). Value ranges from *1* to ***10080***. Default value is ***3***.

Related Command

monitor server-failure places the switch in server-failure configuration mode.

Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of **10** minutes.

```
switch(config)# monitor server
switch(config-server-failure)# proxy lifetime 10
switch(config-server-failure)# show active
monitor server-failure
   proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of **3** minutes.

```
switch(config-server-failure)# no proxy lifetime
switch(config-server-failure)# show active
monitor server-failure
   proxy
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)# no proxy
switch(config-server-failure)# show active
monitor server-failure
switch(config-server-failure)#
```

11.4.7.41 show bridge mac-address-table aging timeout

The **show bridge mac-address-table aging timeout** command displays the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries that exceed the aging time.

Aging time ranges from ***10*** seconds to ***1000000*** seconds with a default of ***300*** seconds (five minutes).

Command Mode

EXEC

Command Syntax

show bridge mac-address-table aging timeout

Example

This command shows the MAC address table aging time.

```
switch> show bridge mac-address-table aging timeout
Global Aging Time:  120
switch>
```

11.4.7.42 show errdisable recovery

The **show errdisable recovery** command displays information about the recovery intervals and error disable causes.

Command Mode

EXEC

Command Syntax

show errdisable recovery

Parameters

- ***no parameter*** state of the system.

The following output is for a system where the causes are listed and interval timer for each cause is identified along with the timer status.

```
switch# show errdisable recovery
Errdisable Reason              Timer Status   Timer Interval
------------------------------ ---------------- --------------
   bpduguard                      Disabled                 30
   hitless-reload-down            Disabled                300
   lacp-no-portid                 Disabled                N/A
   lacp-rate-limit                Disabled                300
   license-enforce                Disabled                N/A
   link-flap                      Disabled                300
   no-internal-vlan               Disabled                300
   uplink-failure-detection       Disabled                300
```

11.4.7.43 show fabric monitoring health

The **`platform sand monitor health`** command is used to display the fabric monitoring connected state status with isolated links.

Command Mode

Global Configuration

Command Syntax

`platform sand monitor health`

Example

This command displays the connected state status with isolated links.

```
switch(config)# show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

11.4.7.44 show interfaces

The **show interfaces** command displays operational status and configuration information of specified interfaces. The output includes speed, duplex, flow control information and basic interface statistics.

The input and output bit rates, as displayed, do not include framing bits that are part of the Ethernet standard, the inter-frame gap and preamble that total 20 bytes per packet. The percentage number includes those framing bits to provide a better link utilization estimate.

Command Mode

EXEC

Command Syntax

show interfaces [**INT_NAME**]

Parameters

INT_NAME Interface type and numbers. Options include:

- ***no parameter*** all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command display configuration and status information for Ethernet interface ***1*** and ***2***.

```
switch> show interfaces ethernet 1-2
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2481.7647 (bia 001c.2481.7647)
  Description: mkt.1
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 33.5 Mbps (0.3% with framing), 846 packets/sec
  5 seconds output rate 180 kbps (0.0% with framing), 55 packets/sec
     76437268 packets input, 94280286608 bytes
     Received 2208 broadcasts, 73358 multicast
     0 runts, 0 giants
     0 input errors, 0 CRC, 0 alignment, 0 symbol
     0 PAUSE input
     6184281 packets output, 4071319140 bytes
     Sent 2209 broadcasts, 345754 multicast
     0 output errors, 0 collisions
     0 late collision, 0 deferred
     0 PAUSE output
Ethernet2 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2481.7648 (bia 001c.2481.7648)
  Description: mkt.2
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 711 kbps (0.0% with framing), 271 packets/sec
  5 seconds output rate 239 kbps (0.0% with framing), 65 packets/sec
```

```
     73746370 packets input, 78455101010 bytes
     Received 11 broadcasts, 83914 multicast
     0 runts, 0 giants
     0 input errors, 0 CRC, 0 alignment, 0 symbol
     0 PAUSE input
     5687714 packets output, 4325064454 bytes
     Sent 15 broadcasts, 107279 multicast
     0 output errors, 0 collisions
     0 late collision, 0 deferred
     0 PAUSE output
switch>
```

11.4.7.45 show interfaces description

The **show interfaces description** command displays the status and description text of the specified interfaces. The description command configures an interface's description parameter.

Command Mode

EXEC

Command Syntax

show interfaces [**INT_NAME**] **description**

Parameters

INT_NAME Interface type and labels. Options include:

- ***no parameter*** all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***vx_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Range formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays description text and status of ***interfaces ethernet 1-10***.

```
switch> show interfaces ethernet 1-10 description
Interface                      Status         Protocol Description
Et1                            up             up       ctar_01
Et2                            up             up       ctar_02
Et3                            up             up       ctar_03
Et4                            up             up       fobd_01
Et5                            up             up       fobd_02
Et6                            up             up       yzrq_01
Et7                            up             up       yzrq_02
Et8                            down           down     yzrq_03
Et9                            up             up       yzrq_04
Et10                           up             up       yzrq_05
switch>
```

11.4.7.46 show interfaces phy diag

Command Mode

EXEC

Command Syntax

`show interfaces` [interface type ***interface range***] **`phy diag`** [error-correction | test pattern]

Parameters

- **interface type *interface range*** Type of interface and range.
- **error-correction** Forwards error correction.
- **test pattern** Displays test patterns.

Guidelines

The user-configured test pattern is displayed under the **`Configured`** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **`Operational`** column. The **`Available`** column lists the test patterns available for the interface.

Example

- In this example, interfaces ethernet ***26/1*** and ***31/1*** in the **`show interfaces ethernet 26/1,31/1 phy diag test pattern`** command are selected to display the the configured and operational test pattern, and the available test patterns.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern
                Configured       Operational
Interface     Transmit Receive Transmit Receive Available
------------- -------- ------- -------- ------- ----------------------
Ethernet26/1  PRBS15   PRBS15  PRBS15   PRBS15  PRBS 7,9,11,15,23,31,58
Ethernet31/1  PRBS7    PRBS31  PRBS7    PRBS31  PRBS 7,9,11,15,23,31,58
```

  The user-configured test pattern is displayed under the **`Configured`** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **`Operational`** column. The **`Available`** column lists the test patterns available for the interface.
- In this example, the **`show interfaces ethernet 26/1 phys detail | i Test pattern`** command displays the operational test pattern for an interface. Here the **`Test pattern`** field will not be available, on disabling the test pattern.

```
switch# show interfaces ethernet 26/1 phy detail | i Test pattern
  Test pattern                enabled
switch# show interfaces ethernet 31/1 phy detail | i Test pattern
  Test pattern                enabled
```

- In this example, the **`show interfaces ethernet 26/1,31/1 phy diag test pattern counters`** command displays test pattern link state and error information.

  The following information is listed in the display output:

  - **Link state:** whether or not the checker locked on to the configured test pattern.
  - **Bit Errors:** the accumulated number of bit errors.
  - **Largest Burst:** the largest burst of errors that occurred.
  - **Burst Count:** the number of occurrences of errors.
  - **Last Error Time:** the last time an error has occurred, ‘never’ if no errors have occurred.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern counters
Current System Time: Wed May 30 22:24:32 2018
                                                Largest    Burst
Interface        Lane  Link State  Bit Errors   Burst      Count  Last Error Time
---------------- ----- ----------- ------------ ---------- ------ ----------------
Ethernet26/1     0     locked      409266       409266     1       0:21:27 ago
```

```
Ethernet26/1     1     locked      347084       347084     1       0:21:27 ago
Ethernet26/1     2     locked      420681       420681     1       0:21:27 ago
Ethernet26/1     3     locked      392969       392969     1       0:21:27 ago
Ethernet31/1     0     not locked  1417655      651822     3       0:03:20 ago
Ethernet31/1     1     not locked  1782238      736819     3       0:03:20 ago
Ethernet31/1     2     not locked  1760538      866185     3       0:03:20 ago
Ethernet31/1     3     not locked  1817413      923941     3       0:03:20 ago
```

- In this example, the **`show interfaces ethernet 26/1,31/1 phy diag test pattern counters`** command displays the lock state of an interface along with a detailed information on the recorded bit errors.

  The following information is listed in the display output:

  - **Last clear:** the time when the test pattern results were last cleared.
  - **Operational test pattern:** the test pattern operational at the receiver side.
  - **Bit rate:** the transmission bit rate.
  - **Lock state:** the current lock status, number of times it changed and the last time the lock status got changed.
    - **locked:** receiver is able to lock on to the incoming test pattern.
    - **not locked:** receiver is not able to lock on to the incoming test pattern.
  - **Largest burst:** the largest burst of errors that occurred.
  - **Bit errors*:** the accumulated number of errors, number of occurrences of errors, and last time errors were captured. The ***** suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
  - **Total Bits:** the total bits received.
  - **Bit error rate (BER)*:** the ratio of captured bit errors to the total bit received. The ***** suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
  - **Bit errors since last lock:** the accumulated number of errors since last time lock was gained.
  - **Total bits since last lock:** the total bits received since last lock.
  - **BER since last lock:** the ratio of captured bit errors to the total bit received since last lock.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern counters detail
*: Data may not be accurate due to loss of lock.

11.4.7.47 show link tracking group

The **show link tracking group** command displays information about a specified link-state group or about all groups.

Command Mode

EXEC

Command Syntax

show link tracking group [**DATA_LEVEL**][**GROUPS**]

Parameters

- **DATA_LEVEL** device for which the command provides data. Options include:
  - ***no parameter*** information about all groups in group list.
  - **detail** detailed information about all groups in group list.
- **GROUPS**
  - ***no parameter*** all link-state groups.
  - ***group_name*** link-state group name.

Example

This command displays all the link-state group information.

```
switch# show link tracking group detail
Link State Group: 1 Status: up
Upstream Interfaces : Vlan100
Downstream Interfaces : Vlan200
Number of times disabled : 2
Last disabled 0:10:29 ago

Link State Group: group3 Status: down
Upstream Interfaces : Ethernet24
Downstream Interfaces : Ethernet8
Number of times disabled : 2
Last disabled 0:30:35 ago

Link State Group: 2 Status: up
Upstream Interfaces : Ethernet2 Ethernet5
Downstream Interfaces : Ethernet12
Number of times disabled : 0
Last disabled never
switch#
```

11.4.7.48 show mac address-table

The **show mac-address-table** command displays the specified MAC address table entries.

Command Mode

EXEC

Command Syntax

show mac address-table [**ENTRY_TYPE**][**MAC_ADDR**][**INTF_1 ... INTF_N**][**VLANS**]

Parameters

- **ENTRY_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - ***no parameter*** all table entries.
  - **configured** static entries; includes unconfigured VLAN entries.
  - **dynamic** entries learned by the switch.
  - **static** entries entered by CLI commands and include a configured VLAN.
  - **unicast** entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - ***no parameter*** all MAC addresses table entries.
  - **address *mac_address*** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **VLANS** command filters display by VLAN.
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLANs specified by ***v_num***.

Related Commands

- show mac address-table mlag-peer
- show mac address-table multicast

Examples

- This command displays the MAC address table.

11.4.7.49 show mac address-table count

The **show mac-address-table count** command displays the number of entries in the MAC address table for the specified VLAN or for all VLANs.

Command Mode

EXEC

Command Syntax

show mac address-table count [**VLANS**]

Parameters

VLANS The VLANs for which the command displays the entry count.

- ***no parameter*** all configured VLANs.
- **vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command displays the number of entries on ***VLAN 39***.

```
switch> show mac address-table count vlan 39

Mac Entries for Vlan 39:
---------------------------
Dynamic Address Count            : 1
Unicast Static  Address Count    : 1
Multicast Static  Address Count  : 0
Total Mac Addresses              : 2

switch>
```

11.4.7.50 show mac address-table mlag-peer

The **`show mac-address-table mlag-peer`** command displays the specified MAC address table entries learned from the MLAG peer switch.

Command Mode

EXEC

Command Syntax

`show mac address-table mlag-peer` [**ENTRY_TYPE**][**MAC_ADDR**][**INTF_1 ... INTF_N**] [**VLANS**]

Parameters

- **ENTRY_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - ***no parameter*** all MLAG peer entries.
  - **configured** static entries on MLAG peer; includes unconfigured VLAN entries.
  - **dynamic** entries learned on MLAG peer.
  - **static** MLAG entries entered by CLI commands and include a configured VLAN.
  - **unicast** MLAG entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - ***no parameter*** all MAC addresses table entries.
  - **address *mac_address*** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **VLANS** command filters display by VLAN.
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLANs specified by ***v_num***.

Related Commands

- show mac address-table
- show mac address-table multicast

11.4.7.51 show mac address-table multicast

The **`show mac-address-table`** command displays the specified multicast MAC address table entries.

Command Mode

EXEC

Command Syntax

`show mac address-table multicast` [**MAC_ADDR**][**INTF**][**VLANS**]

Parameters

- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - ***no parameter*** all MAC addresses table entries.
  - **address *mac_address*** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **VLANS** command filters display by VLAN.
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLANs specified by ***v_num***.

Related Commands

- show mac address-table
- show mac address-table multicast brief

11.4.7.52 show mac address-table multicast brief

The **show mac-address-table** command displays a summary of multicast MAC address table entries.

Command Mode

EXEC

Command Syntax

show mac address-table multicast [**VLANS**] **brief**

Parameters

VLANS command filters display by VLAN.

- ***no parameter*** all VLANs.
- **vlan *v_num*** VLANs specified by ***v_num***.

Related Command

show mac address-table multicast.

11.4.7.53 show monitor server-failure

The **show monitor server-failure** command displays Rapid Automated Indication of Link-loss (RAIL) configuration settings and the number of servers on each monitored network.

Command Mode

EXEC

Command Syntax

show monitor server-failure

Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch> show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
   10.2.1.96/28      : 0 servers
   10.1.1.0/24       : 0 servers
   10.3.0.0/16       : 3 servers
switch>
```

11.4.7.54 show monitor server-failure history

The **show monitor server-failure history** command displays the time of all link failures detected by Rapid Automated Indication of Link-loss (RAIL) and includes the interface name for each failure.

The history is cleared by removing RAIL from the switch (**no monitor server-failure**).

Command Mode

EXEC

Command Syntax

show monitor server-failure history

Related Command

clear server-failure servers inactive

Example

This command displays the Fast Server Failure link failure history from the time RAIL is instantiated on the switch.

```
switch> show monitor server-failure history
Total server failures: 4

Server IP   Server MAC           Interface       Last Failed
----------- -----------------    -----------     -------------------
10.1.67.92  01:22:ab:cd:ee:ff    Ethernet17      2013-02-02 11:26:22

10.1.8.13   01:33:df:ee:39:91    Port-Channel5   2013-02-10 00:03:39

switch>
```

11.4.7.55 show monitor server-failure servers

The **show monitor server-failure servers** command displays status and configuration information about each server that RAIL is monitoring. The display format depends on the parameter specified by the command:

- **single IP address:** command displays information about the server at the specified address, including IP address, MAC address, RAIL state, the time of most recent entry of all RAIL states, and the number of failed, proxied, and inactive state entries.
- **no parameter, key specifying a server list:** command displays a table. Each row corresponds to a monitored server. Information that the command displays includes IP address, MAC address, RAIL state, the time of most recent link failure.

Command Mode

EXEC

Command Syntax

show monitor server-failure servers [**SERVER_LIST**]

Parameters

SERVER_LIST Servers for which command displays information. Valid options include:

- ***no parameter*** all servers in up, down, and proxying states.
- ***ipv4_addr*** individual server; command displays detailed information.
- **all** all servers on monitored networks.
- **inactive** all servers in inactive state.
- **proxying** all servers in proxying state.

Examples

- This command displays RAIL information for the server at IP address ***10.11.11.7***.

```
switch> show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address        : 10.11.11.7
MAC Address              : ad:3e:5f:dd:64:cf
Current state            : down
Interface                : Ethernet23
Last Discovered          : 2013-01-06 06:47:39
Last Failed              : 2013-02-10 00:07:56
Last Proxied             : 2013-02-10 00:08:33
Last Inactive            : 2013-02-09 23:52:21
Number of times failed   : 3
Number of times proxied  : 1
Number of times inactive : 18

switch>
```

- This command displays RAIL data for all servers in monitored networks that are in inactive state.

```
switch> show monitor server-failure servers inactive
Inactive servers: 1

switch>
```

11.4.7.56 show monitor session

The **show monitor session** command displays the configuration of the specified port mirroring session. The command displays the configuration of all mirroring sessions on the switch when the session name parameter is omitted.

Command Mode

EXEC

Command Syntax

show monitor session **SESSION_NAME**

Parameters

SESSION_NAME Port mirroring session identifier. Options include:

- ***no parameter*** displays configuration for all sessions.
- ***label*** command displays configuration of the specified session.

Example

This command displays the mirroring configuration of the specified monitor session.

```
switch> show monitor session redirect_1

Session redirect_1
------------------------

Source Ports

  Both:        Et7

Destination Port: Et8
switch(config)>
```

11.4.7.57 show platform trident mirroring

The **show platform trident mirroring** command displays current parameters of all configured mirroring sessions in Trident series platforms.

Command Mode

Privileged EXEC

Command Syntax

show platform trident mirroring [detail | session]

Parameters

- **detail** displays the detailed information of all configured mirroring sessions.
- **session *session_name*** displays the information of specified mirroring session.

Guidelines

This command is supported on DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

Examples

- This command displays the detailed information of all configured mirroring sessions.

```
switch(config)# show platform trident mirroring detail

11.4.7.58 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

The distribution values displayed are based on the total interface counters which start from zero at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the clear counters command.

Command Mode

EXEC

Command Syntax

show port-channel load-balance [**MEMBERS**]

Parameters

MEMBERS List of port channels for which information is displayed. Options include:

- ***no parameter*** All configured port channels.
- ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).

Example

This command displays traffic distribution for all configured port channels.

```
switch> show port-channel load-balance
ChanId Port      Rx-Ucst Tx-Ucst Rx-Mcst Tx-Mcst Rx-Bcst Tx-Bcst
------ --------- ------- ------- ------- ------- ------- -------
8      Et10      100.00% 100.00% 100.00% 100.00% 0.00%   100.00%

switch>
```

11.4.7.59 show port-security

The **show port-security** command displays a summary of MAC address port security configuration and status on each interface where switchport port security is enabled.

Command Mode

EXEC

Command Syntax

show port-security

Display Values

Each column corresponds to one physical interface. The table displays interfaces with port security enabled.

- **Secure Port:** Interface with switchport port-security enabled.
- **MaxSecureAddr:** Maximum quantity of MAC addresses that the specified port can process.
- **CurrentAddr:** Static MAC addresses assigned to the interface.
- **SecurityViolation:** Number of frames with unsecured addresses received by port.
- **Security Action:** Action triggered by a security violation.

These are the value displayed by the command.

- **Aging Time:** Age of Mac address.
- **MAC Moveable:** Mac address movement.
- **Port Security:** Enabled or disabled status

Examples

- This command displays switchport port security configuration and status data.

```
switch> show port-security
Secure Port    MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
               (Count)        (Count)      (Count)
--------------------------------------------------------------------------
     Et7             5             3            0            Shutdown
     Et10            1             0            0            Shutdown
--------------------------------------------------------------------------
Total Addresses in System: 3
switch>
```

- From ***EOS Release 4.26.0F***, **show port-security** command displays the settings for the new global port security configurations, including MAC aging, MAC moves, and persistent port security.

```
switch(config)# show port-security
Secure address moves: disabled
Secure address aging: disabled
Secure address reboot persistence: enabled
Secure address link down persistence: enabled
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security
 Action
                (Count)       (Count)          (Count)
--------------------------------------------------------------------------
------
--------------------------------------------------------------------------
-----
Total Addresses in System: 0
```

11.4.7.60 show port-security interface

The **show port-security interface** command displays the switchport port-security status of all specified interfaces.

Command Mode

EXEC

Command Syntax

show port-security interface [**INT_NAME**]

Parameters

INT_NAME Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Valid ***range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command display port-security configuration and status for the specified interfaces.

```
switch> show port-security interface ethernet 7-8
Interface                  : Ethernet7
Port Security              : Enabled
Port Status                : Secure-down
Violation Mode             : Shutdown
Maximum MAC Addresses      : 5
Aging Time                 : 5 mins
Aging Type                 : Inactivity
SecureStatic Address Aging : Disabled
Total MAC Addresses        : 3
Configured MAC Addresses   : 3
Learn/Move/Age Events      : 5
Last Source Address:Vlan   : 164f.29ae.4e14:10
Last Address Change Time   : 0:39:47 ago
Security Violation Count   : 0
Interface                  : Ethernet8
Port Security              : Disabled
Port Status                : Secure-down
Violation Mode             : Shutdown
Maximum MAC Addresses      : 1
Aging Time                 : 5 mins
Aging Type                 : Inactivity
SecureStatic Address Aging : Disabled
switch>
```

11.4.7.61 show port-security mac-address

The **show port-security mac-address** command display static unicast MAC addresses assigned to interfaces where switchport port security is enabled.

Command Mode

EXEC

Command Syntax

show port-security mac-address

Example

This command displays MAC addresses assigned to port-security protected interfaces.

```
switch> show port-security mac-address
Secure Mac Address Table
------------------------------------------------------------------
Vlan    Mac Address       Type                Ports   Remaining Age
                                                             (mins)
----    -----------       ----------------    -----   -------------
  10    164f.29ae.4e14    SecureConfigured     Et7     N/A
  10    164f.29ae.4f11    SecureConfigured     Et7     N/A
  10    164f.320a.3a11    SecureConfigured     Et7     N/A
------------------------------------------------------------------
Total Mac Addresses for this criterion: 3
switch>
```

11.4.7.62 show storm-control

The **show storm-control** command displays the storm-control level and interface inbound packet capacity for the specified interface.

The configured value (storm-control) differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. This command displays the broadcast or multicast rate after this adjustment.

Command Mode

Privileged EXEC

Command Syntax

show storm-control [**INT_NAME**]

Parameters

- ***no parameter*** Command returns data for all interfaces configured for storm control.
- **INT_NAME** interface type and port range. Settings include:
  - **ethernet *e_range*** Ethernet interfaces that ***e_range*** denotes.
  - **port-channel *p_range*** Port channel interfaces that ***p_range*** denotes.

    When storm control commands exist for a port-channel and an Ethernet port that is a member of the port channel, the command for the port-channel takes precedence.

    Valid ***range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the storm control configuration for ***ethernet port 2*** through ***ethernet port 4***.

```
switch# show storm-control
Port          Type  Level Rate(Mbps)   Status      Drops Reason
Et10/2         all     75       7500   active          0
Et10/3   multicast     55       5500   active          0
Et10/4   broadcast     50       5000   active          0
switch#
```

11.4.7.63 show switch forwarding-mode

The **show switch forwarding-mode** command displays the switch's current and available forwarding plane hardware modes.

Command Mode

EXEC

Command Syntax

show switch forwarding-mode

Related Command

switch forwarding-mode configures the switch's forwarding mode setting.

Example

This command changes the switch's forward mode to **store-and-forward**, then displays the forwarding mode.

```
switch(config)# switch forwarding-mode store-and-forward
switch(config)# show switch forwarding-mode
Current switching mode:    store and forward
Available switching modes: cut through, store and forward
```

11.4.7.64 show track

The **show track** command displays information about tracked objects configured on the switch.

Command Mode

EXEC

Command Syntax

show track [**OBJECT**][**INFO_LEVEL**]

Parameters

- **OBJECT** tracked object for which information is displayed. Options include:
  - ***no parameter*** displays information for all tracked objects configured on the switch.
  - ***object_name*** displays information for the specified object.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** displays complete information including object status, number of status changes, time since last change, and client process tracking the object (if any).
  - **brief** displays brief list of all tracked objects and their current status.

Examples

- This command displays all information for tracked object ***ETH8***.

```
switch# show track ETH8
Tracked object ETH8 is up
   Interface Ethernet8 line-protocol
      4 change, last change time was 0:36:12 ago
   Tracked by:
      Ethernet5/1 vrrp instance 50
switch#
```

- This command displays summary information for all tracked objects.

```
switch# show track brief
Tracked object ETH2 is up
Tracked object ETH4 is down
Tracked object ETH6 is up
Tracked object ETH8 is up
switch#
```

11.4.7.65 shutdown (server-failure configuration mode)

The **shutdown** command disables Rapid Automated Indication of Link-Loss (RAIL). By default, RAIL is disabled.

After entering server-failure configuration mode, a **no shutdown** command is required to enable RAIL.

The **no shutdown** command enables RAIL on the switch. The **shutdown** and **default shutdown** commands disable RAIL by removing the shutdown command from ***running-config***.

Command Mode

Server-failure Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- This command enables RAIL on the switch.

```
switch(config)# monitor server
switch(config-server-failure)# no shutdown
switch(config-server-failure)#  show active
monitor server-failure
   no shutdown
switch(config-server-failure)#
```

- This command disables RAIL on the switch.

```
switch(config-server-failure)# shutdown
switch(config-server-failure)# show active
monitor server-failure
switch(config-server-failure)#
```

11.4.7.66 storm-control

The **storm-control** command configures and enables storm control on the configuration mode physical interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The **storm-control all** threshold overrides broadcast and multicast thresholds.

The threshold is a percentage of the available port bandwidth and is configurable on each interface for each transmission mode.

The **no storm-control** and **default storm-control** commands remove the corresponding **storm-control** statement from ***running-config***, disabling storm control for the specified transmission type on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

storm-control MODE level ***threshold***

no storm-control MODE

default storm-control MODE

Parameters

- **MODE** packet transmission type. Options include:
  - **all**
  - **broadcast**
  - **multicast**
- ***threshold*** Inbound packet level that triggers storm control, as a percentage of port capacity. Value ranges from ***0.01*** to ***100***. Storm control is suppressed by a level of ***100***.

  The configured value differs from the programmed threshold in that the hardware accounts for InterFrame Gaps (IFG) based on the minimum packet size. The show storm-control command displays the broadcast or multicast rate after this adjustment.

Restrictions

The **storm-control all** option is not available on Arad platform switches.

Example

These commands enable multicast and broadcast storm control on ***Ethernet port 20*** and sets thresholds of ***65%*** (multicast) and ***50%*** (broadcast). During each one second interval, the interface drops inbound multicast traffic and broadcast traffic in excess of the specified thresholds.

```
switch(config)# interface ethernet 20
switch(config-if-Et20)# storm-control multicast level 65
switch(config-if-Et20)# storm-control broadcast level 50
switch(config-if-Et20)# show active
interface Ethernet20
   storm-control broadcast level 50
   storm-control multicast level 65
switch(config-if-Et20)#
```

11.4.7.67 switch forwarding-mode

The **`switch forwarding-mode`** command specifies the mode of the switch's forwarding plane hardware. The default forwarding mode is **cut through**.

The **`no switch forwarding-mode`** and **`default switch forwarding-mode`** commands restore the default forwarding mode by removing the **`switch forwarding-mode`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`switch forwarding-mode` **MODE_SETTING**

`no switch forwarding-mode`

`default switch forwarding-mode`

Parameters

MODE_SETTING Specifies the switch's forwarding plane hardware mode. Options include:

- **cut-through** the switch begins forwarding frames before their reception is complete.
- **store-and-forward** the switch accumulates entire packets before forwarding them.

Guidelines

The forwarding plane mode is **store-and-forward** on Petra and Arad platform switches.

Related Command

show switch forwarding-mode displays the current forwarding mode.

Example

This command changes the forwarding mode to **store-and-forward**.

```
switch(config)# switch forwarding-mode store-and-forward
switch(config)#
```

11.4.7.68 switchport

The **switchport** command places the configuration mode interface in ***switched port*** (Layer 2) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

The no switchport command places the configuration mode interface in ***routed port*** (Layer 3) mode. Routed ports are not members of any VLANs and do not switch or bridge packets. All IP level configuration commands, including IP address assignments, apply directly to the routed port interface.

By default, Ethernet and Port Channel interfaces are in switched port mode. The **default switchport** command also places the configuration mode interface in switched port mode by removing the corresponding **no switchport** command from ***running-config***.

These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport

no switchport

default switchport

Guidelines

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from ***1006*** to ***4094***. VLANs that are allocated internally for a routed interface cannot be directly created or configured. The **vlan internal order** command specifies the method that VLANs are allocated.

All IP-level configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. Any IP-level configuration changes made to a routed interface are maintained when the interface is toggled to switched port mode.

A LAG that is created with the **channel-group** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration statements are not propagated to the LAG from its component members.

Examples

- These commands put ***interface ethernet 5*** in routed port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)#
```

- These commands returns ***interface ethernet 5*** to switched port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport
switch(config-if-Et5)#
```

11.4.7.69 switchport default mode access

The **`switchport default mode access`** command places the configuration mode interface in ***switched port default access*** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

Command Mode

Global Configuration

Command Syntax

`switchport default mode access`

Related Command

switchport default mode routed puts a switch with all ports in routed port mode.

Example

This command puts a switch with all ports in access port mode.

```
switch(config)# switchport default mode access
```

11.4.7.70 switchport default mode routed

The **`switchport default mode routed`** command places the configuration mode interface in ***switched port default routed*** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

By default, on a switch with default startup config or no config, all ports come up in access mode. By adding the CLI command **`switchport default mode routed`** to kickstart config, all ports will come up in routed mode after boot up. On boot up, Zero Touch Provisioning (ZTP) is enabled by default if the startup config (**`/mnt/flash/startupconfig`**) is deleted. ZTP can be disabled by setting DISABLE=True in ZTP config (**`/mnt/flash/zerotouchconfig`**). Kickstart config (/mnt/flash/kickstart-config) is used when startup config is missing and ZTP is disabled.

Command Mode

Global Configuration

Command Syntax

`switchport default mode routed`

Related Command

switchport default mode access puts a switch with all ports in access port mode.

Example

This command puts a switch with all ports in routed port mode.

```
switch(config)# switchport default mode routed
```

11.4.7.71 switchport mac address learning

The **switchport mac address learning** command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The **no switchport mac address learning** command disables MAC address learning for the configuration mode interface. The **switchport mac address learning** and **default switchport mac address learning** commands enable MAC address learning for the configuration mode interface by deleting the corresponding **no switchport mac address learning** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport mac address learning

no switchport mac address learning

default switchport mac address learning

Example

These commands disables MAC address learning for ***interface ethernet 8***, then displays the active configuration for the interface.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# no switchport mac address learning
switch(config-if-Et8)# show active
interface Ethernet8
   no switchport mac address learning
switch(config-if-Et8)#
```

11.4.7.72 switchport port-security

The **switchport port-security** command enables MAC address port security on the configuration mode interface. Ports with port security enables restrict traffic to a limited number of hosts, as determined by their MAC addresses. On enabling the **switchport port-security** command, the port-security mode would be 'shutdown', by default.

The switchport port-security mac-address maximum command specifies the maximum number of MAC addresses. The switchport port-security violation command enables port security in protect mode.

The **no switchport port-security** and **default switchport port-security** commands disable port security on the configuration mode interface by removing the corresponding **switchport port-security** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport port-security

no switchport port-security

default switchport port-security

Example

These commands enable port security on ***interface ethernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# switchport port-security
switch(config-if-Et7)#
```

11.4.7.73 switchport port-security mac-address maximum

The **switchport port-security mac-address maximum** command specifies the maximum MAC address limit for the configuration mode interface when configured as a secure port. When port security is enabled, the port accepts traffic and adds source addresses to the MAC table until the maximum is reached. Once the maximum is reached, if any traffic arrives from a source not already in the MAC table for the secure port, the port becomes errdisabled. The switchport port-security command configures an interface as a secure port.

The **no switchport port-security mac-address maximum** and **default switchport port-security mac-address maximum** commands restore the maximum MAC address limit of one on the configuration mode interface by removing the corresponding **switchport port-security mac-address maximum** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport port-security mac-address maximum ***max_addr***

no switchport port-security mac-address maximum

default switchport port-security mac-address maximum

Parameters

max_addr maximum number of MAC addresses. Value ranges from ***1*** to ***1000***. Default value is ***1***.

Example

These commands configure a maximum of five incoming addresses for secure ***interface port-channel 14***.

```
switch(config)# interface port-channel 14
switch(config-if-Po14)# switchport port-security mac-address maximum 5
switch(config-if-Po14)#
```

11.4.7.74 switchport port-security violation

The **switchport port-security violation** command configures port security in protect mode (with the option of enabling logging) or the shutdown mode.

The **no switchport port-security** and **no switchport port-security violation protect log** commands disable port security protect mode and port security protect mode logging on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport port-security violation {protect [log]| shutdown}

no switchport port-security violation protect log

default switchport port-security violation protect log

Parameters

- **protect** configures the port security in the protect mode.
- **shutdown** configures the port security in the shutdown mode.
- **log** the log of new addresses seen after limit is reached in the protect mode.

Guidelines

When port security is enabled, the port accepts traffic and adds source addresses to the MAC table until the maximum is reached. The **switchport port-security** command configures an interface as a secure port.

In the protect mode, the ACLs are dynamically created to block incoming MAC addresses when the configured maximum MAC value is reached.

In the shutdown mode, once the maximum is reached, if any traffic arrives from a source not already in the MAC table for the secure port, the port is set to be errdisabled.

Examples

- These commands configure port security violation protect mode for ***secure port channel interface 14***.

```
switch(config)# interface port-channel 14
switch(config-if-Po14)# switchport port-security violation protect
switch(config-if-Po14)#
```

- These commands configure port security violation protect logging mode for ***secure port channel interface 14***.

```
switch(config)# interface port-channel 14
switch(config-if-Po14)# switchport port-security violation protect log
switch(config-if-Po14)#
```

- These commands configure port security violation shutdown mode for ***secure port channel interface 15***.

```
switch(config)# interface port-channel 15
switch(config-if-Po15)# switchport port-security violation shutdown
switch(config-if-Po15)#
```

11.4.7.75 system control-plane

The **`system control-plane`** command places the switch in ***control-plane*** configuration mode. Control-plane mode is used for assigning an ACL (access control list) to the control plane.

The ***control-plane*** configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. Exiting ***control-plane*** configuration mode does not affect the configuration.

The **`exit`** command returns the switch to ***global*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`system control-plane`

Command Available in control-plane Configuration Mode

ip access-group (Control Plane mode)

Examples

- This command places the switch in the ***control plane*** mode.

```
switch(config)# system control-plane
switch(config-system-cp)#
```

- This command assigns the ***control-plane-2*** ACL to the control plane.

```
switch(config-system-cp)# ip access-group control-plane-2
switch(config-system-cp)#
```

- This command exits the ***control plane*** mode.

```
switch(config-system-cp)# exit
switch(config)#
```

11.4.7.76 track

The **track** command creates an object whose state changes to provide information to a client process. The client process must be separately configured for object tracking to have an effect on the switch.

The **no track** and **default track** commands remove the specified tracked object by removing the corresponding **track** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

track ***object_name*** interface **INTERFACE_NAME PROPERTY**

no track ***object_name***

default track ***object_name***

Parameters

- ***object_name*** User-created name for the tracked object.
- **INTERFACE_NAME** Interface associated with the tracked object. Options include:
  - **ethernet** ***e_num*** Ethernet interface specified by ***e_num***.
  - **loopback** ***l_num*** Loopback interface specified by ***l_num***.
  - **management** ***m_num*** Management interface specified by ***m_num***.
  - **port-channel** ***p_num*** Port-channel interface specified by ***p_num***.
  - **vlan** ***v_num*** VLAN interface specified by ***v_num***.
  - **vxlan** ***vx_num*** VXLAN interface specified by ***vx_num***.
- **PROPERTY** Tracked property. Options include:
  - **line-protocol** Object changes when the state of the associated interface changes.

Example

This command creates a tracked object which tracks the state of the line protocol on ***interface ethernet 8***.

```
switch(config)# track ETH8 interface ethernet 8 line-protocol
switch(config)#
```

11.4.7.77 traffic-loopback

The **traffic-loopback** command is used to create loopbacks to verify the functionality of interfaces and partner links. The **source** determines whether outgoing traffic is being looped back to the interface (**system**) to test the interface itself, or incoming traffic is being looped back to the link partner (**network**) to test the link between the systems. The **device** determines whether **system** traffic is looped on the physical level (**phy**) or Layer-2 level (**mac**). Only the **phy** level is available for **network** traffic.

The **no traffic-loopback** command deletes the loopback configuration.

Command Mode

Interface Configuration

Command Syntax

traffic-loopback source [system|network] device [phy|mac]

no traffic-loopback

Parameters

- **system** loops outgoing traffic back to the interface.
- **network** loops incoming traffic back to the link partner.
- **phy** implements loopback in the physical layer.
- **mac** implements loopback in the MAC layer (available only for **system** traffic).

Examples

- These commands cause outgoing traffic on ***interface ethernet 1*** to be looped back to the interface at the MAC level.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# traffic-loopback source system device mac
switch(config-if-Et1)#
```

- These commands cause incoming traffic on ***interface ethernet 1*** to be looped back to the link partner at the physical level.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# traffic-loopback source network device phy
switch(config-if-Et1)#
```

- These commands delete the loopback configuration from ***interface ethernet 1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no traffic-loopback
switch(config-if-Et1)#
```

11.5 Octal Port Renumber to Four Interfaces

For an octal port such as a QSFPDD or OSFP, this feature renumbers the ports on a system to have 4 configurable interfaces instead of eight. The original octal would have had eight interfaces named ***x/1*** to ***x/8*** where x is the front panel port number.

The four interfaces created by this feature are named ***x/1*** to ***x/4*** instead and each interface has two transceiver lanes attached to it. Thus each interface can be configured to two-lane, four-lane or eight-lanes speeds as appropriate. However, the interfaces are restricted from any single-lane speeds and are not capable of a full breakout.

The entire chassis must be renumbered. This feature is not supported on a per-line card or per-port basis. Any cards in the same chassis that do not support this feature are unaffected. For affected line cards, both the configurable speeds and the default speeds of all interfaces are affected.

Supported Speeds

Table 66: Supported Speeds on Octal Ports

Interface Name With Feature	Interface Name Without Feature	Supported Speeds with Feature	Default Speed
Ethernetx/1	Ethernetx/1	400G-8, 200G-4, 100G-2, 100G-4	400G-8
Nonexistent	Ethernetx/2	N/A	N/A
Ethernetx/2	Ethernetx/3	100G-2	100G-2
Nonexistent	Ethernetx/5	N/A	N/A
Ethernetx/3	Ethernetx/5	200G-4, 100G-2, 100G-4	100G-2
Nonexistent	Ethernetx/6	N/A	N/A
Ethernetx/4	Ethernetx/7	100G-2	100G-2
Nonexistent	Ethernetx/8	N/A	N/A

11.5.1 Configuring Octal Port Renumber to 4 Interfaces

In order to configure a chassis to octal port renumbering with four interfaces, a boot command is used.

The boot command is different from a standard CLI command since it takes effect very early in the boot process but can be configured in the same way. Therefore it requires a reboot after the CLI command in order to take effect.

Since the ports will be renumbered for all cards that support the feature, the current configuration of the switch may no longer make sense after the reboot. Please ensure all interface configurations reflect the new naming scheme. The following items should be addressed prior to enabling or disabling the feature and performing a reboot:

1. Change interface naming appropriately.
2. Review interface speeds to ensure they are supported with the feature.
3. Review change in interface defaults to ensure the feature's defaults are desired.
4. Review changes to SNMP OIDs for affected interfaces.

From the CLI configuration mode, use the following command to enable the feature:

```
switch(config)# boot port numbering octal interfaces 4
```

The command warns that the switch needs to be rebooted for the command to take effect. Reboot the box afterward.

From the CLI configuration mode, use the following command to disable the feature:

```
switch(config)# no boot port numbering octal interfaces 4
```

The command warns that the switch needs to be rebooted for the command to take effect. Reboot the box afterward.

11.5.2 Show Commands

To confirm the command has taken effect, expose inactive interfaces with the **`service interface inactive expose`** CLI command and confirm the affected linecards only have four interfaces for each front panel port.

```
switch#(config-if-Et16/1,16/3)# show interfaces et15/1-16/1 status
Port       Name   Status       Vlan     Duplex Speed  Type         Flags Encapsulation
Et15/1            connected    1        full   400G   400GBase-CR8
Et15/2            inactive     1        full   100G   Not Present
Et15/3            inactive     1        full   100G   Not Present
Et15/4            inactive     1        full   100G   Not Present
Et16/1            connected    1        full   400G   400GBase-CR8
```

11.5.3 Limitations

- A config replace of the startup config does not affect the configuration of this feature.
- Since the feature is stored in **`flash:boot-config`**, removing or overwriting the boot-config can affect the presence of the feature on the next reboot.

11.5.4 Commands

- **boot port numbering octal interfaces 4**

11.5.4.1 boot port numbering octal interfaces 4

The **`boot port numbering octal interfaces 4`** command configures a chassis to octal port renumbering with four interfaces.

The **`no boot port numbering octal interfaces 4`** command disable the ***boot port numbering octal interfaces 4*** configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

`boot port numbering octal interfaces 4`

`no boot port numbering octal interfaces 4`

Example

To enable ***boot port numbering octal interfaces 4***, use the following command:

```
switch(config)#boot port numbering octal interfaces 4
```

Chapter 12

Layer 2 Configuration

This chapter contains the following sections:

12.1 Spanning Tree Protocol

Spanning Tree Protocols prevent bridging loops in Layer 2 Ethernet networks. Arista switches support Rapid Spanning Tree, Multiple Spanning Tree, and Rapid-Per VLAN Spanning Tree protocols.

These sections describe the Arista Spanning Tree Protocol implementation.

12.1.1 Introduction to Spanning Tree Protocols

Arista Switches support the leading spanning tree protocols: RSTP, MST and Rapid-PVST. This variety of options simplifies integration into existing networks without compromising network reliability, scalability or performance.

12.1.2 Spanning Tree Overview

An Ethernet network functions properly when only one active path exists between any two stations. A spanning tree is a loop-free subset of a network topology. STP is a L2 network protocol that ensures a loop-free topology for any bridged Ethernet LAN. STP allows a network to include spare links as automatic backup paths that are available when an active link fails without creating loops or requiring manual intervention. The original STP is standardized as IEEE 802.1D.

Several variations to the original STP improve performance and add capacity. Arista switches support these STP versions:

- Rapid Spanning Tree (RSTP)
- Multiple Spanning Tree (MSTP)
- Rapid Per-VLAN Spanning Tree (Rapid-PVST)

The Overview contains the following sections:

12.1.2.1 Spanning Tree Protocol Versions

STP versions supported by Arista switches address two limitations of the original Spanning Tree protocol that was standardized as ***IEEE 802.1D***:

- Slow convergence to the new spanning tree topology after a network change.
- The entire network is covered by one spanning tree instance.

The following sections describe the supported STP versions, compatibility issues in networks containing switches running different STP versions, and supported alternatives to spanning tree.

12.1.2.1.1 Rapid Spanning Tree Protocol (RSTP)

RSTP is specified in ***802.1w*** and supersedes STP. RSTP provides rapid convergence after network topology changes. Similar to STP, RSTP provides a single instance of spanning tree for the entire network. Standard ***802.1D-2004*** incorporates RSTP and obsoletes STP.

The RSTP instance is the base unit of MST and Rapid-PVST spanning trees.

12.1.2.1.2 Rapid Per-VLAN Spanning Tree Protocol (Rapid-PVST)

Rapid Per-VLAN Spanning Tree (PVST) extends the original STP to support a spanning tree instance on each VLAN in the network. The maximum number of PVST instances that can be created on a switch depends on the hardware platform. In most of the cases, it is 510. PVST can load balance Layer-2 traffic without creating a loop because it handles each VLAN as a separate network. However, PVST does not address slow network convergence after a network topology change.

Arista switches support Rapid-PVST, which is a variation of PVST based on RSTP instances. Rapid-PVST provides rapid connectivity recovery after the failure of a bridge, port, or LAN. Rapid-PVST can be enabled or disabled on individual VLANs.

12.1.2.1.3 Multiple Spanning Tree Protocol (MSTP)

MST extends Rapid Spanning Tree Protocol (RSTP) to support multiple spanning tree instances on a network, but is still compatible with RSTP. By default, Arista switches use MSTP.

MST supports multiple spanning tree instances, similar to Rapid PVST. However, MST associates an instance with multiple VLANs. This architecture supports load balancing by providing numerous forwarding paths to data traffic. Network fault tolerance is improved because failures in one instance do not affect other instances.

MST Regions

An *MST region* is a group of connected switches with identical MST configuration. Each region can support a maximum of 65 spanning-tree instances. MST regions are identified by a version number, name, and VLAN-to-instance map. You must configure identical parameters on all switches in the regions. Only MST region members participate with the MST instances defined in the region. A VLAN can be simultaneously assigned to only one spanning-tree instance. MST does not specify the maximum number of regions that a network can contain.

MST Instances

Each MST instance is identified by an instance number that ranges from 0 to 4094 and is associated with a set of VLANs. An MST region contains two types of spanning tree instances: an Internal Spanning Tree Instance (IST) and Multiple Spanning Tree Instances (MSTI).

- IST is the default spanning tree instance in MST regions; and is always zero. It gives a root switch to the region that contains all VLANs configured across all switches in the region but not assigned to a MST instance. IST considers all interfaces regardless of the VLAN membership.

- **Multiple Spanning Tree instances (MSTIs)** consist of VLANs that are assigned through MST configuration statements. VLANs assigned to an MSTI are removed from the IST instance. VLANs in an MSTI operate as a part of a single Spanning Tree topology. Because each VLAN can belong to only one instance, MST instances (and the IST) are topologically independent.

MSTP-Rapid PVST+ Interoperation

MSTP-Rapid PVST+ interoperation allows protocol-level interaction between MSTP and Rapid PVST + by consuming and transmitting PVST BPDUs through MSTP at the border ports. While transmitting from Rapid PVST+ to MSTP or vice-versa, you can deploy MSTP in certain regions and Rapid PVST + in other regions based on their merits or other factors. MSTP-Rapid PVST+ interoperation allows MSTP to work with any Rapid PVST+ implementation.

MSTP inter-operation can be viewed as bi-directional BPDU conversion occurring at MSTP PVST+ border ports as following:

- The outgoing Common Internal Spanning Tree (CIST) BPDU is projected as Rapid PVST+ BPDUs across various VLANs.
- Incoming PVST+ topology BPDU is mapped to corresponding MSTI based on incoming VLAN.

The following restrictions are enforced based on port role. These are relevant only for border ports with roles designated or root (for CIST) that can potentially forward.

- Case (A): If the MSTP-Rapid PVST+ border port role is designated for CIST, it should not receive any superior PVST BPDU (with respect to CIST). Root of all VLANs in the PVST region should be towards the MSTP region.
- Case (B): If the MSTP-Rapid PVST+ border port role is root for CIST, it should not receive any inferior Rapid PVST+ BPDU (with respect to CIST). Root of all VLANs in the Rapid PVST+ region should be within the PVST+ region.

Note: If the restrictions are violated, the port enters blocking state. The BPDU translation occurs only on MSTP-Rapid PVST+ border ports with the forwarding state for CIST.

It is desirable to configure multiple MSTP-Rapid PVST+ border ports confirming to Case(A) for a specified Rapid PVST+ region as it allows VLAN load balancing across the ports. This can be achieved by adjusting the per-VLAN port cost towards the Rapid PVST+ region such that the per-VLAN root port is evenly distributed across the border ports.

12.1.2.1.4 Version Interoperability

A network can contain switches running different spanning tree versions. The Common Spanning Tree (CST) is a single forwarding path the switch calculates for STP, RSTP, MSTP, and Rapid-PVST topologies in networks containing multiple spanning tree variations.

In multi-instance topologies, the following instances correspond to the CST:

- **Rapid-PVST**: VLAN 1
- **MST**: IST (instance 0)

RSTP and MSTP are compatible with other spanning tree versions:

- An RSTP bridge sends 802.1D (original STP) BPDUs on ports connected to an STP bridge.
- RSTP bridges operating in 802.1D mode remain in 802.1D mode even after all STP bridges are removed from their links.
- An MST bridge detects a port is at a region boundary when it receives an STP BPDU or an MST BPDU from a different region.
- MST ports assume they are boundary ports when the bridges to which they connect join the same region.

The `clear spanning-tree detected-protocols` command forces MST ports to renegotiate with their neighbors.

12.1.2.1.5 Switchport Interface Pairs

Switchport interface pairs associate two interfaces in a primary-backup configuration. When the primary interface is functioning, the backup interface remains dormant in standby mode. When the primary interface stops functioning, the backup interface handles the traffic.

An alternative implementation balances traffic between the primary and backup interfaces. If either interface shuts down, the other handles traffic addressed to the pair.

The following guidelines apply to switchport interface pairs.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLAN interfaces can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- STP is disabled on ports configured as primary or backup interfaces.
- Static MAC addresses should be configured after primary-backup pairs are established.

12.1.2.2 Structure of a Spanning Tree Instance

A Layer 2 network consists of bridges and network segments. A loop exists when multiple active paths connect two components. Spanning tree protocols allow only one active path between any two network components. Loops are removed by blocking selected ports that connect bridges to network segments.

Ports are assigned cost values that reflect their transmission speed and any other criteria selected by the administrator. Ports with faster transmission speeds and other desirable characteristics are assigned lower costs. High cost ports are blocked in deference to lower cost ports.

A network topology defines multiple possible spanning trees. Network bridges collectively compute and implement one spanning tree to maintain connectivity between all network components while blocking ports that could result in loops. Administrators improve network performance by adjusting parameter settings to select the most efficient spanning tree.

Spanning tree bridges continuously transmit topology information to notify all other bridges on the network when topology changes are required, such as when a link fails. Bridge Protocol Data Units (BPDUs) are STP information packets that bridges exchange.

The following sections describe spanning tree configuration parameters.

12.1.2.2.1 Root and Designated Bridges

The **root bridge** is the center of the STP topology. A spanning tree instance has one root bridge. Spanning tree bases path calculations on each network components distance from the root bridge.

All other network bridges calculate paths to the root bridge when selecting spanning tree links. STP calculates the distance to the root bridge to build a loop-free topology that features the shortest distance between devices among all possible paths.

Each switch is assigned a unique bridge ID number for each instance. All network switches collectively elect the root bridge by comparing bridge IDs. The root bridge is the switch with the lowest bridge ID.

The bridge ID contains the following eight bytes, in order of decreasing significance:

- Port priority (four bits)
- Instance number (12 bits): VLAN number (Rapid-PVST); instance number (MST); 0 (RST)
- MAC address of switch (six bytes)

A **designated bridge** is defined for each network segment as the switch that provides the segments shortest path to the root bridge. A designated bridge is selected for each segment after a root bridge is selected; a switch can be a designated bridge for multiple segments.

The following network calculations in Spanning Tree Network Example assume that each path has the same cost:

- ***Switch B*** is the root bridge its bridge ID is lowest because it has the smallest port priority.
- ***Switch A*** is the designated bridge for ***VLAN 11***.
- ***Switch B*** is the designated bridge for ***VLAN 10***, ***VLAN 13***, ***VLAN 16***, ***VLAN 18***, ***VLAN 19***.
- ***Switch C*** is the designated bridge for ***VLAN 25***.
- ***Switch D*** is the designated bridge for ***VLAN 21***, ***VLAN 23***.

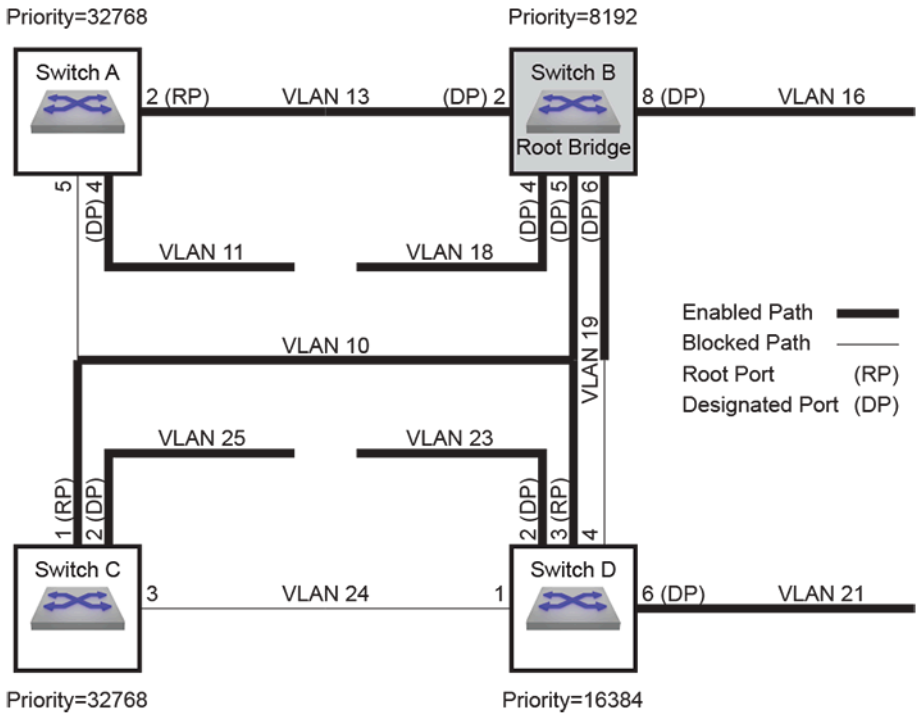

Figure 28: Spanning Tree Network Example

12.1.2.2.2 Port Roles

Messages from connected devices to the root bridge traverse a least-cost path, which has the smallest cost among all possible paths to the root bridge. The cost of a path is the sum of the costs of all path segments, as defined through port cost settings.

Active ports in a least cost-path fulfill one of two possible roles: root port and designated port. STP blocks all other network ports. STP also defines alternate and backup ports to handle traffic when an active port is inaccessible.

- Root Port (RP) accesses the bridges least-cost path to the root bridge. Each bridge selects its root port after calculating the cost of each possible path to the root bridge.

  The following ports in Spanning Tree Network Example are root ports:

  - ***Switch A***: ***port 2***
  - ***Switch C***: ***port 1***
  - ***Switch D***: ***port 3***
- Designated Port (DP) accesses a network segments designated bridge. Each segment defines one DP. Switches can provide DPs for multiple segments. All ports on the root bridge are DPs.

The following ports in Spanning Tree Network Example are designated ports:

- ***Switch A***: ***port 4*** (***VLAN 11***)
- ***Switch B***: ***port 2*** (***VLAN 13***), ***port 4*** (***VLAN 18***), ***port 5*** (***VLAN 10***), ***port 6*** (***VLAN 19***), ***port 8*** (***VLAN 16***)
- ***Switch C***: ***port 2*** (***VLAN 25***)
- ***Switch D***: ***port 2*** (***VLAN 23***), ***port 6*** (***VLAN 21***)

- Alternate ports provide backup paths from their bridges to the root bridge. An alternate port is blocked until a network change transforms it into a root port.
- Backup ports provide alternative paths from VLANs to their designated bridges. A backup port is blocked until a network change transforms it into a designated port.

12.1.2.2.3 Port Activity States

A ports activity state defines its current STP activity level. STP monitors BPDUs for network changes that require an activity state transition.

STP defines three port activity states:

- **Forwarding:** The port receives and sends data. Root ports and designated ports are either in, or transitioning to, this state.
- **Discarding:** The port does not receive or send data. Blocked ports receive BPDU packets. All ports except RPs and DPs are blocked, including alternate and backup ports.
- **Learning:** The transitional post-discarding state where the port prepares to forward frames by adding source addresses from inbound data packets to the switching database.

12.1.2.2.4 Port Types

Port type is a configurable parameter that reflects the type of network segment that is connected to the port. Proper port type configuration results in rapid convergence after network topology changes. RSTP port types include normal, network, and edge ports. **Normal** is the default port type.

- **Normal** ports have an unspecified topology.
- **Network** ports connect only to switches or bridges.

  RSTP immediately transitions network ports to the discarding state.
- **Edge** ports connect directly to end stations.

  Edge ports transition directly to forwarding state because they do not create loops. An edge port becomes a normal port when it receives a BPDU.

12.1.2.2.5 Link Types

Link type is a configurable parameter that determines candidates for RSTP fast state transition.

- The default link type for full-duplex ports is **point-to-point**.
- The default link type for half-duplex ports is **shared**.

Fast state transitions are allowed on point-to-point links that connect bridges. Fast state transitions are not allowed on shared ports regardless of the duplex setting.

12.1.2.3 Bridge Protocol Data Units (BPDUs)

Spanning tree rules specify a root bridge, select designated bridges, and assign roles to ports. STP rule implementation requires that network topology information is available to each switch.

Switches exchange topology information through Bridge Protocol Data Units (BPDUs). Information provided by BPDU packets include bridge IDs and root path costs.

12.1.2.3.1 BPDU Types

STP defines three BPDU types:

- Configuration BPDU (CBPDU), used for computing the spanning tree.
- Topology Change Notification (TCN) BPDU, announces network topology changes.
- Topology Change Notification Acknowledgment (TCA), acknowledges topology changes.

Bridges enter the following addresses in outbound BPDU frames:

- Source address: outbound port's MAC address.
- Destination address: STP multicast address ***01:80:C2:00:00:00***.

Bridges regularly exchange BPDUs to track network changes that trigger STP recomputations and port activity state transitions. The **hello timer** specifies the period between consecutive BPDU messages; the default is two seconds.

12.1.2.3.2 Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

The switch recomputes the spanning tree topology if it does not receive another BPDU before the max-age timer expires. When **edge** ports and **point-to-point** links are properly configured, RSTP network convergence does not require forward-delay and max-age timers.

12.1.2.3.3 MSTP BPDUs

MSTP BPDUs are targeted at a single instance and provide STP information for the entire region. MSTP encodes a standard BPDU for the IST, then adds region information and MST instance messages for all configured instances, where each message conveys spanning tree data for an instance. Frames assigned to VLANs operate in the instance to which the VLAN is assigned. Bridges enter an MD5 digest of the VLAN-to-instance map table in BPDUs to avoid including the entire table in each BPDU. Recipients use this digest and other administratively configured values to identify bridges in the same MST region.

MSTP BPDUs are compatible with RSTP. RSTP bridges view an MST region as a single-hop RSTP bridge regardless of the number of bridges inside the region because:

- RSTP bridges interpret MSTP BPDUs as RSTP BPDUs.
- RSTP bridges increment the **message age timer** only once while data flows through an MST region; MSTP measures **time to live** with a **remaining hops** variable, instead of the message age timer.

Ports at the edge of an MST region connecting to a bridge (RSTP or STP) or to an endpoint are *boundary ports*.

12.1.3 Configuring a Spanning Tree

These sections describe the following configuration processes:

- Version Configuration and Instance Creation
- Spanning Tree Instance Configuration
- Port Roles and Rapid Convergence
- Configuring BPDU Transmissions

12.1.3.1 Version Configuration and Instance Creation

The switch supports three STP versions and switchport backup interface pairs. Disabling spanning tree is also supported but not recommended.

The `spanning-tree mode` global configuration command specifies the spanning tree version the switch runs. This section describes command options that enable and configure STP versions.

12.1.3.1.1 Multiple Spanning Tree (MST)

Multiple Spanning Tree is enabled by the `spanning-tree mode` command with the **mstp** option. MSTP is the default STP version.

Example

This command enables Multiple Spanning Tree.

```
switch(config)# spanning-tree mode mstp
switch(config)#
```

Configuring MST Regions

All switches in an MST region must have the same name, revision, and VLAN-to-instance map. MST configuration mode commands sets the region parameters. The ***MST*** configuration mode is a group-change mode where changes are saved by exiting the mode.

Example

The `spanning-tree mst configuration` command places the switch in the ***MST*** configuration mode.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)#
```

The `instance` command assigns VLANs to MST instances. The `name (mst-configuration mode)` and `revision (mst-configuration mode)` commands configure the MST region name and revision.

Examples

- These commands assign ***vlans 4-7*** and ***9*** to instance ***8*** and remove ***vlan 6*** from instance ***10***.

```
switch(config-mst)# instance 8 vlans 4-7,9
switch(config-mst)#no instance 10 vlans 6
switch(config-mst)#
```

- These commands assign the **name** (***corporate_1***) and **revision** (***3***) to the switch.

```
switch(config-mst)# name corporate_1
switch(config-mst)# revision 3
switch(config-mst)#
```

The `exit (mst-configuration mode)` command transitions the switch out of the ***MST*** configuration mode and saves all pending changes. The `abort (mst-configuration mode)` command exits the ***MST*** configuration mode without saving the pending changes.

Example

This command exits the ***MST*** configuration mode and saves all pending changes.

```
switch(config-mst)# exit
switch(config)#
```

Configuring MST Instances

These STP commands provide an optional MST instance parameter. These commands apply to instance ***0*** when the optional parameter is not included.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`

Examples

- This command configures priority for MST instance ***4***.

```
switch(config)# spanning-tree mst 4 priority 4096
switch(config)#
```

- Each of these commands configure priority for MST instance ***0***.

```
switch(config)# spanning-tree mst 0 priority 4096
```

or

-

```
switch(config)# spanning-tree priority 4096
```

12.1.3.1.2 Rapid Spanning Tree (RST)

Rapid spanning tree is enabled through the `spanning-tree mode` command with the **rstp** option.

Example

- This command enables Rapid Spanning Tree.

```
switch(config)#spanning-tree mode rstp
switch(config)#
```

These STP commands, when they do not include an optional MST or VLAN parameter, apply to RSTP. Commands that configure MSTP instance ***0*** also apply to the RSTP instance.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`

Examples

- These commands apply to the RST instance.

```
switch(config)# spanning-tree priority 4096
```

and

```
switch(config)# spanning-tree mst 0 priority 4096
```

- These commands do not apply to the RST instance.

```
switch(config)# spanning-tree mst 4 priority 4096
```

and

```
switch(config)# spanning-tree vlan-id 3 priority 4096
```

Show commands (such as `show spanning-tree`) displays the RSTP instance as MST0 (MST instance ***0***).

Example

- This command, while the switch is in RST mode, displays RST instance information.

```
switch(config)# show spanning-tree
MST0
  Spanning tree enabled protocol rstp<---RSTP mode indicator
  Root ID    Priority    32768
             Address     001c.730c.1867
             This bridge is the root

  Bridge ID  Priority    32768  (priority 32768 sys-id-ext 0)
             Address     001c.730c.1867
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15
 sec

Interface        Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- -----
Et51             designated forwarding 2000      128.51   P2p

switch(config)#
```

12.1.3.1.3 Rapid Per-VLAN Spanning Tree (Rapid-PVST)

Rapid-PVST mode is enabled by the `spanning-tree mode` command with the **rapid-pvst** option.

Example

- This command enables Rapid Per-VLAN Spanning Tree.

```
switch(config)# spanning-tree mode rapid-pvst
switch(config)#
```

These commands provide an optional VLAN parameter for configuring Rapid-PVST instances.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`
- `spanning-tree mst pvst border`

Examples

- This command configures bridge priority for ***vlan 4***.

```
switch(config)# spanning-tree vlan-id 4 priority 4096
switch(config)#
```

- This command enables MSTP PVST+ border ports. The command is effective only if spanning-tree mode is MSTP.

```
switch(config)# spanning-tree mst pvst border
```

12.1.3.1.4 Switchport Backup Mode

Switchport backup interface pairs are enabled through the `spanning-tree mode` command with the **backup** option. Enabling switchport backup disables all spanning-tree modes. For loop avoidance under switchport backup mode, use the Loop Protection feature.

Example

This command enables switchport backup.

```
switch(config)# spanning-tree mode backup
switch(config)#
```

The `switchport backup-link` command establishes an interface pair between the command mode interface (primary) and the interface specified by the command (backup).

Example

These commands establish ***interface ethernet 7*** as the backup port for ***interface ethernet 1***.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport backup-link ethernet 7
switch(config-if-Et1)#
```

The **prefer** option of the `switchport backup-link` command establishes a peer relationship between the primary and backup interfaces and specifies VLAN traffic that the backup interface normally carries. If either interface goes down, the other interface carries traffic normally handled by both interfaces.

Examples

These steps perform the following:

- configures ***interface ethernet 1*** as a trunk port that handles VLANs ***4*** through ***9*** traffic.
- configures ***interface ethernet 2*** as the backup interface.
- assigns ***ethernet 2*** as the preferred interface for VLANs ***7*** through ***9***.

1. Enter configuration mode for the primary interface.

```
switch(config)# interface ethernet 1
```

2. Configure the primary interface as a trunk port that services VLANs ***4-9***

```
switch(config-if-Et1)# switchport mode trunk
switch(config-if-Et1)# switchport trunk allowed vlan 4-9
```

3. Configure the backup interface and specify the VLANs that it normally services.

```
switch(config-if-Et1)# switchport backup-link Ethernet 2 prefer vlan
 7-9
switch(config-if-Et1)#
```

12.1.3.1.5 Loop Protection

Loop protection is a loop detection and prevention method which is independent of STP and is not disabled when the switch is in switchport backup mode. When loop protection is active on an interface, that interface periodically sends out loop-detection frames; if one is received that originated on the switch, the receiving port is errdisabled until a timeout period has passed or it is manually reset.

Loop protection is configured and enabled per VLAN, but individual ports in a VLAN can be configured to disable loop protection.

Note: Loop protection cannot be enabled on an MLAG peer link.

This feature is disabled by default. To enable it, use the `monitor loop-protection` command to enter loop-protection configuration mode, then use the `no shutdown (Loop-protection)` command to enable the feature. To enable loop protection on a VLAN, use the `protect vlan` command. To exclude a port from loop protection, use the `no loop-protection` command.

The feature is configured with the following additional commands:

- `transmit-interval`
- `disabled-time`
- `rate-limit`

Examples

- This command enters loop protection configuration mode.

```
switch(config)# monitor loop-protection
switch(config-monitor-loop-protect)#
```

- These commands enable loop protection on VLANs ***1025-2000***.

```
switch(config)# monitor loop-protection
switch(config-monitor-loop-protect)# no shutdown
switch(config-monitor-loop-protect)# protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```

- These commands exclude ***interface ethernet 38*** from loop protection.

```
switch(config)# interface ethernet 38
switch(config-if-Et38)# no loop-protection
switch(config-if-Et38)#
```

- These commands configure loop protection with a transmission interval of ***10*** seconds, a disabled time of two days, and a maximum rate of ***500*** loop detection frames per second.

```
switch(config-monitor-loop-protect)# transmit-interval 10
switch(config-monitor-loop-protect)# disabled-time 172800
switch(config-monitor-loop-protect)# rate-limit 500
switch(config-monitor-loop-protect)#
```

12.1.3.1.6 Disabling Spanning Tree

Spanning tree is disabled by the `spanning-tree mode` command with the **none** option. The switch does not generate STP packets. Switchport interfaces forward packets when connected to other ports. The switch forwards inbound STP packets as multicast data packets on the VLAN where they are received.

Example

This command disables all STP functions.

```
switch(config)# spanning-tree mode none
switch(config)#
```

12.1.3.2 Spanning Tree Instance Configuration

A network performs these steps to set up an STP instance:

1. The bridge with the lowest ID is elected root bridge.
2. Root Ports (RP) are selected on all other bridges.
3. Designated bridges are selected for each network segment.
4. Designated Ports (DP) are selected on each designated bridge.
5. Networks begin forwarding data through RPs and DPs. All other ports are blocked.

12.1.3.2.1 Root Bridge Parameters

STPs use bridge IDs for electing the root bridge. Switches denote a bridge ID for each configured Spanning Tree instance. The bridge ID composition is:

- Priority (four bits)

  Priority is expressed as a multiple of 4096 because it is stored as the four most significant bits of a two-byte number.
- Protocol Dependent (twelve bits)
  - **Rapid-PVST:** VLAN number
  - **MST:** Instance number
  - **RST:** 0
- MAC address of switch (six bytes)

Example

The switch defines bridge IDs for three MST instances:

- **MST 0:** ***32768*** (Priority (***32768***)+Instance number(***0***)) and ***001c.7301.23de*** (MAC address)
- **MST101:** ***32869*** (Priority (***32768***)+Instance number(***101***)) and ***001c.7301.23de*** (MAC address)
- **MST102:** ***32870*** (Priority (***32768***)+Instance number(***102***)) and ***001c.7301.23de*** (MAC address)

This command displays a table of root bridge information.

```
switch> show spanning-tree root
                  Root ID          Root    Hello  Max  Fwd
Instance    Priority    MAC addr Cost    Time   Age  Dly  Root Port
----------  ----------  -------- ------ -----  ---  ---  ----------
MST0         32768 001c.7301.23de     0    2    20  15   Po937
MST101       32869 001c.7301.23de  3998    0     0   0   Po909
MST102       32870 001c.7301.23de  3998    0     0   0   Po911
```

The switch provides two commands that configure the switch priority: `spanning-tree priority` and `spanning-tree root`. The commands differ in the available parameter options:

- **spanning-tree priority** options are integer multiples of ***4096*** between ***0*** and ***61440***.
- **spanning-tree root** options are **primary** and **secondary**.
- **primary** assigns a priority of ***8192***.
- **secondary** assigns a priority of ***16384***.

The default priority value is ***32768***.

The following examples configure bridge IDs with both commands.

Examples

- These commands configure MST instance bridge priorities with the **root** command:

```
switch(config)# spanning-tree mst 0 root primary
switch(config)# spanning-tree mst 1 root secondary
switch> show spanning-tree root
                   Root ID          Root    Hello  Max  Fwd
Instance    Priority   MAC addr  Cost    Time   Age  Dly  Root Port
----------  ---------- -------- ------- -----  ---  ---  ----------
MST0          8192 001c.7301.6017      0    2    20  15   None
MST1         16385 001c.7301.6017      0    0     0   0   None
MST2         32770 001c.7301.6017      0    0     0   0   None
```

  - Instance ***0*** root priority is ***8192***: primary priority plus the instance number of ***0***.
  - Instance ***1*** root priority is ***16385***: secondary priority plus the instance number of ***1***.
  - Instance ***2*** root priority is ***32770***: default priority plus the instance number of ***2***.

These priority settings normally program the switch to be the primary root bridge for instance 0, the secondary root bridge for instance 1, and a normal bridge for instance 2. Primary and secondary root bridge elections also depend on the configuration of other network bridges.

- These priority commands configure Rapid-PVST VLAN bridge priorities:

```
switch(config)# spanning-tree vlan-id 1 priority 8192
switch(config)# spanning-tree vlan-id 2 priority 16384
switch(config)# spanning-tree vlan-id 3 priority 8192
switch(config)# no spanning-tree vlan-id 4 priority
switch(config)# show spanning-tree root
                   Root ID          Root    Hello  Max  Fwd
Instance    Priority    MAC addr  Cost   Time   Age  Dly  Root Port
----------  ------------------- ------- -----  ---  ---  ----------
VL18193       001c.7301.6017       0        2     20   15   None
VL216386      001c.7301.6017       0        2     20   15   None
VL38195       001c.7301.6017       0        2     20   15   None
VL432788      001c.7301.6017       0        2     20   15   None
```

  - VLAN ***1*** root priority is ***8193***: configured priority plus the VLAN number of ***1***.
  - VLAN ***2*** root priority is ***16386***: configured priority plus the VLAN number of ***2***.
  - VLAN ***3*** root priority is ***8195***: configured priority plus the VLAN number of ***3***.

  These priority settings normally program the switch to be the primary root bridge for VLANs ***1*** and ***3***, the secondary root bridge for ***vlan 2***, and a normal bridge for ***vlan 4***. Primary and secondary root bridge elections also depend on the configuration of other network bridges.***vlan 4*** root priority is ***32788***: default priority plus the VLAN number of ***4***.

12.1.3.2.2 Path Cost

Spanning tree calculates the costs of all possible paths from each component to the root bridge. The path cost is equal to the sum of the cost assigned to each port in the path. Ports are assigned a cost by default or through CLI commands. Cost values range from *1* to ***200000000*** (200 million).

The default cost is a function of the interface speed:

- 1 gigabit interfaces have a default cost of ***20000***.
- 10 gigabit interfaces have a default cost of ***2000***.

The `spanning-tree cost` command configures the path cost of the configuration mode interface. Costs can be specified for Ethernet and port channel interfaces. The command provides a mode parameter for assigning multiple costs to a port for MST instances or Rapid-PVST VLANs.

Examples

- These commands configure a port cost of ***25000*** to ***interface ethernet 5***. This cost is valid for RSTP or MSTP instance ***0***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree cost 25000
switch(config-if-Et5)#
```

- This command configures a path cost of ***300000*** to ***interface ethernet 5*** in MST instance ***200***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree mst 200 cost 300000
switch(config-if-Et5)#
```

- This command configures a path cost of ***10000*** to ***interface ethernet 5*** in Rapid-PVST VLAN ***200-220***.

```
switch(config)# interface ethernet 5
```

```
switch(config-if-Et5)# spanning-tree vlan-id 200-220 cost 10000
switch(config-if-Et5)#
```

12.1.3.2.3 Port Priority

STP uses the port priority interface parameter to select ports when resolving loops. The port with the lower port priority numerical value is placed in forwarding mode. When multiple ports are assigned equal port priority numbers, the port with the lower interface number is placed in forwarding mode. Valid port-priority numbers are multiples of 16 between ***0*** and ***240***; the default is ***128***.

The `spanning-tree port-priority` command configures the port-priority number for the configuration mode interface. The command provides a mode option for assigning different priority numbers to a port for multiple MST instances or Rapid-PVST VLANs. Port-priority can be specified for Ethernet and port channel interfaces.

Examples

- This command sets the access port priority of ***144*** for Ethernet ***5*** interface.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree port-priority 144
switch(config-if-Et5)#
```

- This command sets the access port priority of ***144*** for Ethernet ***5*** interface in MST instance ***10***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree mst 10 port-priority 144
switch(config-if-Et5)#
```

12.1.3.3 Port Roles and Rapid Convergence

Spanning Tree provides the following options for controlling port configuration and operation:

- **portfast**: Allows ports to skip learning state before entering the forwarding state.
- **port type** and **link type**: Designates ports for rapid transitions to the forwarding state.
- **root guard**: Ensures that a port will not become the root port.
- **loop guard**: Prevents loops resulting from unidirectional failure of links.
- **bridge assurance**: Prevents loops caused by unidirectional links or a malfunctioning switch.

12.1.3.3.1 PortFast

PortFast allows devices to gain immediate network access before convergence of the spanning tree. Enabling PortFast on ports connected to another switch can create loops.

A **portfast** port that receives a BPDU sets its operating state to **non-portfast** while remaining in **portfast** configured state. In this state, the port is subject to topology changes and can enter the discarding state.

The spanning-tree portfast command programs access ports to immediately enter the forwarding state. PortFast connects devices attached to an access port, such as a single workstation, to the network immediately without waiting for STP convergence. PortFast can also be enabled on trunk ports.

Example

This command unconditionally enables portfast on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast
switch(config-if-Et5)#
```

12.1.3.3.2 Port Type and Link Type Configuration

RSTP only achieves rapid transition to forwarding state on edge ports and point-to-point links.

Port Type

Edge ports are directly connected to end stations. Because edge ports do not create loops, they transition directly to forwarding state when a link is established.

The spanning-tree portfast <port type> command sets the configuration mode interfaces port type. Spanning tree ports can be configured as **edge** ports, **network** ports, or **normal** ports. The default port type is **normal**.

- **edge ports** connect to a host (end station). Configuring a port that connects to a bridge as an edge port may create a loop. Edge ports that receive a BPDU become a normal spanning tree port.
- **network ports** connect only to a Layer 2 switch or bridge. Configuring a port connected to a host as a network port transitions the port to the discarding state.
- **normal ports** have an unspecified topology.

Examples

- This command configures ***interface ethernet 5*** as a network port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast network
switch(config-if-Et5)#
```

- Auto-edge detection converts ports into edge ports when they do not receive a new BPDU before the current BPDU expires, as measured by the max-age timer. The spanning-tree portfast auto command enables auto-edge detection on the configuration mode interface, superseding the **spanning-tree portfast** command. Auto-edge detection is enabled by default.

  This command enables auto-edge detection on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast auto
switch(config-if-Et5)#
```

Link Type

The switch derives a ports default link type from its duplex mode:

- full-duplex ports are **point-to-point**.
- half-duplex ports are **shared link**.

The spanning-tree link-type command specifies the configuration mode interfaces link-type. RSTP fast transition is not allowed on **shared link** ports, regardless of their duplex setting. Because the ports are full-duplex by default, the default link-type setting is **point-to-point**.

Example

This command configures ***interface ethernet 5*** as a shared port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree link-type shared
switch(config-if-Et5)#
```

12.1.3.3.3 Root Guard and Loop Guard

Root guard stops a port from becoming a root port, which stops connected switches from becoming root bridges. When a switch detects a new root bridge, its root-guard-enabled ports enter blocked

(root-inconsistent) state. When the switch no longer detects a new root, these ports enter learning state.

Root guard is enabled on a per-port basis. The setting applies to all STP instances. Disabling root guard places the port in learning state.

The spanning-tree guard command, with the root option, enables root guard on the configuration mode interface.

Example

This command enables root guard on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree guard root
switch(config-if-Et5)#
```

Loop guard prevents loops resulting from unidirectional failure of point-to-point links by verifying that non-designated ports (root, blocked, and alternate) are receiving BPDUs from their designated ports. A loop-guard-enabled root or blocked port that stops receiving BPDUs transitions to the discarding (loop-inconsistent) state. The port recovers from this state when it receives a BPDU.

Loop guard, when enabled globally, applies to all point-to-point ports. Loop guard is configurable on individual ports and applies to all STP instances of an enabled port. Loop-inconsistent ports transition to learning state when loop guard is disabled.

If loop guard is enabled on a root switch, it takes effect only if the switch becomes a nonroot switch.

When using loop guard:

- Do not enable loop guard on portfast-enabled ports.
- Loop guard is not functional on ports not connected to point-to-point links.
- Loop guard has no effect on disabled spanning tree instances.

Loop guard aspects on port channels include:

- BPDUs are sent over the channels first operational port. Loop guard blocks the channel if that link becomes unidirectional even when other channel links function properly.
- Creating a new channel destroys state information for its component ports; new channels with loop-guard-enabled ports can enter forwarding state as a DP.
- Dissembling a channel destroys its state information; component ports from a blocked channel can enter the forwarding state as DPs, even if the channel contained unidirectional links.
- If a link on any port of the channel becomes unidirectional, the channel is blocked. Transmission resumes if the port is removed from the channel or the bidirectional communication is restored.

Loop guard configuration commands include:

- `spanning-tree guard loop default` command enables loop guard as a default on all switch ports.
- spanning-tree guard control the loop guard setting on the configuration mode interface. This command overrides the default command for the specified interface.

Examples

- This command enables loop guard as the default on all switch ports.

```
switch(config)# spanning-tree guard loop default
switch(config)#
```

- This command enables loop guard on ***interface ethernet 6***.

```
switch(config)# interface ethernet 6
switch(config-if-Et6)# spanning-tree guard loop
```

```
switch(config-if-Et6)#
```

12.1.3.3.4 Bridge Assurance

Bridge assurance protects against unidirectional link failures, other software failures, and devices that continue forwarding data traffic after they quit running spanning tree.

Bridge assurance programs the switch to send BPDUs at each hello time period through all bridge assurance-enabled ports (i.e., network ports). Bridge assurance operates only on **network** ports with **point-to-point** links, ideally with bridge assurance enabled on each side of the link. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled.

Ports not receiving a BPDU packet within a hello time period enter inconsistent (blocking) state. In this case, the show spanning-tree transmit active command will show a bridge assurance status of inconsistent for the port. If the other side of the link has bridge assurance enabled, or if the other switch is the root bridge, it will send periodic BPDUs, preventing an inconsistent blocking state.

Bridge assurance is globally enabled by default, but must also be enabled on a per-port basis by designating the port as a network port with the `spanning-tree portfast <port type>` command. The `no spanning-tree transmit active` command disables bridge assurance globally.

Example

These commands enable bridge assurance on the switch, then enable bridge assurance on ***interface ethernet 5*** by designating it a network port.

```
switch(config)# spanning-tree transmit active
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast network
switch(config-if-Et5)#
```

12.1.3.4 Configuring BPDU Transmissions

The following sections describe instructions that configure BPDU packet contents and transmissions.

12.1.3.4.1 Configuring Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

In standard STP, ports passively wait for **forward_delay** and **max_age** periods before entering the forwarding state. RSTP achieves faster convergence by relying on edge port and link type definitions to start forwarding traffic. When edge ports and link types are properly configured, bridge timers are used in RSTP as backup or when interacting with networks running standard STP.

The `spanning-tree hello-time` command configures the hello time.

Examples

- This command configures a hello-time of ***1*** second (***1000*** ms).

```
switch(config)# spanning-tree hello-time 1000
switch(config)#
```

The `spanning-tree max-hops` command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the max hop value to ***40***.

```
switch(config)# spanning-tree max-hops 40
switch(config)#
```

The `spanning-tree forward-time` command configures the forward delay setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the forward delay timer value to ***25*** seconds.

```
switch(config)# spanning-tree forward-time 25
switch(config)#
```

The `spanning-tree max-age` command configures the max age setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the max age timer value to ***25*** seconds.

```
switch(config)# spanning-tree max-age 25
switch(config)#
```

12.1.3.4.2 BPDU Transmit Hold-Count

The `spanning-tree bpdu tx hold-count` command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from ***1*** to ***10*** BPDUs with a default of ***6*** BPDUs.

Higher hold-count settings can significantly impact CPU utilization, especially in Rapid-PVST mode. Smaller values can slow convergence in some configurations.

Example

This command configures a transmit hold-count of ***8*** BPDUs.

```
switch(config)# spanning-tree bpdu tx hold-count 8
switch(config)#
```

12.1.3.4.3 BPDU Guard

PortFast interfaces do not receive BPDUs in a valid configuration. BPDU Guard provides a secure response to invalid configurations by disabling ports when they receive a BPDU. Disabled ports differ from blocked ports in that they are re-enabled only through manual intervention.

- When configured globally, BPDU Guard is enabled on ports in the operational portfast state.
- When configured on an individual interface, BPDU Guard disables the port when it receives a BPDU, regardless of the portfast state of the port.

The `spanning-tree edge-port bpduguard default` global configuration command enables BPDU Guard by default on all portfast ports. BPDU Guard is disabled on all ports by default.

The `spanning-tree bpduguard` interface configuration command controls BPDU Guard on the configuration mode interface. This command takes precedence over the default setting configured by `spanning-tree edge-port bpduguard default`.

- **`spanning-tree bpduguard`** enables BPDU Guard on the configuration mode interface.
- **`spanning-tree bpduguard disable`** disables BPDU Guard on the configuration mode interface.

- **`no spanning-tree bpduguard`** reverts the configuration mode interface to the default BPDU Guard setting.

Example

These commands enable BPDU Guard by default on all portfast ports, then disable BPDU Guard on ***interface ethernet 5***.

```
switch(config)# spanning-tree edge-port bpduguard default
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree bpduguard disable
switch(config-if-Et5)
```

12.1.3.4.4 BPDU Filter

BPDU filtering prevents the switch from sending or receiving BPDUs on specified ports. BPDU filtering is configurable on Ethernet and port channel interfaces.

Ports with BPDU filtering enabled do not send BPDUs and drops inbound BPDUs. Enabling BPDU filtering on a port not connected to a host can result in loops as the port continues forwarding data while ignoring inbound BPDU packets.

The `spanning-tree bpdufilter` command controls BPDU filtering on the configuration mode interface. BPDU filtering is disabled by default.

Example

These commands enable BPDU filtering on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree bpdufilter enable
switch(config-if-Et5)#
```

12.1.3.4.5 BPDU Rate Limit

BPDU input rate limiting restricts the number of BPDUs that a port on which BPDU Guard and BPDU Filter are both disabled accepts during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as `bpduguard`.

Configuring the rate limiter requires two steps:

- Establishing the rate limit threshold
- Enabling rate limiting

Establishing the Rate Limit Threshold

The `spanning-tree bpduguard rate-limit count (interface)` command specifies the BPDU reception rate (quantity per interval) that triggers the discarding of BPDUs. The command is available in global and interface configuration modes.

- The **`spanning-tree bpduguard rate-limit count`** global command specifies the maximum reception rate for ports that are not covered by interface rate limit count commands. The global command specifies the default limit.

Note: Arista Networks recommends retaining the default rate-limit values. In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limiting on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this

case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

- The **`spanning-tree bpduguard rate-limit count`** interface command defines the maximum BPDU reception rate for ports in the configuration mode interface.

Examples

- This command configures the global limit of ***5000*** BPDUs over a ***4*** second interval.

```
switch(config)# spanning-tree bpduguard rate-limit count 5000 interval
 4
switch(config)#
```

- These commands configure a limit of ***7500*** BPDUs over an ***8*** second interval on the ***interface ethernet 2***.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# spanning-tree bpduguard rate-limit count 7500
 interval 8
switch(config-if-Et2)#
```

Enabling Rate Limiting

BPDU rate limiting is enabled globally or on individual ports:

- `spanning-tree bpduguard rate-limit default` enables rate limiting on all ports that are not covered by the interface rate limiting command. The default setting is **enabled**.
- `spanning-tree bpduguard rate-limit enable / disable` interface command enables or disables BPDU rate limiting on the configuration mode interface. This command has precedence over the global command.

Examples

- This command enables rate limiting on ports that are not covered by interface rate limit commands:

```
switch(config)# spanning-tree bpduguard rate-limit default
switch(config)#
```

- These commands enable rate limiting on the ***interface ethernet 15***:

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

12.1.4 STP Commands

Spanning Tree Commands: Global Configuration

- spanning-tree bpdu tx hold-count
- spanning-tree bpduguard rate-limit count (global)
- spanning-tree bpduguard rate-limit default
- spanning-tree edge-port bpdufilter default
- spanning-tree edge-port bpduguard default
- spanning-tree forward-time
- spanning-tree guard loop default
- spanning-tree hello-time
- spanning-tree max-age
- spanning-tree max-hops
- spanning-tree mode
- spanning-tree mst configuration
- spanning-tree mst pvst border
- spanning-tree portchannel guard misconfig
- spanning-tree priority
- spanning-tree root
- spanning-tree transmit active
- spanning-tree vlan-id

Loop Protection Commands

- disabled-time
- loop-protection
- monitor loop-protection
- protect vlan
- rate-limit
- show loop-protection
- shutdown (Loop-protection)
- transmit-interval

Spanning Tree Commands: Interface Configuration Mode

- spanning-tree bpdufilter
- spanning-tree bpduguard
- spanning-tree bpduguard rate-limit count (interface)
- spanning-tree bpduguard rate-limit enable / disable
- spanning-tree cost
- spanning-tree guard
- spanning-tree link-type
- spanning-tree port-priority
- spanning-tree portfast
- spanning-tree portfast auto
- spanning-tree portfast <port type>
- switchport backup-link

MST Configuration Commands

- abort (mst-configuration mode)
- exit (mst-configuration mode)
- instance
- name (mst-configuration mode)
- revision (mst-configuration mode)
- show (mst-configuration mode)

Display Commands

- show spanning-tree
- show spanning-tree blockedports
- show spanning-tree counters
- show spanning-tree instance
- show spanning-tree instance detail
- show spanning-tree interface
- show spanning-tree mst
- show spanning-tree mst configuration
- show spanning-tree mst interface
- show spanning-tree mst test information
- show spanning-tree root
- show spanning-tree topology status
- show spanning-tree transmit active

Clear Commands

- clear spanning-tree counters
- clear spanning-tree counters session
- clear spanning-tree detected-protocols

12.1.4.1 abort (mst-configuration mode)

The **abort** command, in MST-configuration mode, discards pending changes to the MST region configuration, then returns the switch to global configuration mode.

The **exit (mst-configuration mode)** command saves MST region changes to ***running-config*** before returning the switch to global configuration mode.

Command Mode

MST-configuration

Command Syntax

abort

Example

This command discards changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst)# abort
switch(config)#
```

12.1.4.2 clear spanning-tree counters

The **clear spanning-tree counters** command resets the BPDU counters for the specified interfaces to zero in all CLI sessions.

Command Mode

Privileged EXEC

Command Syntax

clear spanning-tree counters [**INT_NAME**]

Parameters

INT_NAME Interface type and number. Options include:

- ***no parameter*** resets counters for all interfaces.
- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by ***l_num***.
- **interface management *m_num*** Management interface specified by ***m_num***.
- **interface port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command resets the BPDU counters on ***interface ethernet 15***.

```
switch# show spanning-tree counters
            Port    Sent      Received    Tagged Error   Other Error
-------------------------------------------------------------------
      Ethernet15    32721          0           0              0
  Port-Channel10     8487          0           0              0

switch# clear spanning-tree counters interface ethernet 15<---Clear command
switch# show spanning-tree counters
            Port    Sent       Received   Tagged Error    Other Error
-----------------------------------------------------------------------
      Ethernet15      11            0           0              0
  Port-Channel10    84942           6           0

switch#
```

12.1.4.3 clear spanning-tree counters session

The **clear spanning-tree counter session** command resets the BPDU counters to zero on all interfaces in the current CLI session. Counters in other CLI sessions are not affected.

Command Mode

Privileged EXEC

Command Syntax

clear spanning-tree counters session

Example

This command resets the BPDU counters in the current CLI session.

```
switch# show spanning-tree counters
            Port       Sent      Received       Tagged Error    Other Error
-------------------------------------------------------------------------------
      Ethernet15      32721             0                  0              0
  Port-Channel10       8487             0                  0              0

switch# clear spanning-tree counters session
switch# show spanning-tree counters
            Port       Sent       Received       Tagged Error    Other Error
-------------------------------------------------------------------------------
      Ethernet15         11             0                  0              0
  Port-Channel10          7             2                  6              0

switch#
```

12.1.4.4 clear spanning-tree detected-protocols

The **clear spanning-tree detected-protocols** command restarts the Spanning Tree Protocol (STP) migration state machine on the specified interfaces. The switch is reset to running rapid spanning tree protocol on an interface where it previously detected a bridge running an old version of the protocol.

Command Mode

Privileged EXEC

Command Syntax

clear spanning-tree detected-protocols [**INT_NAME**]

Parameters

INT_NAME Interface type and number. Values include:

- ***no parameter*** all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command restarts the STP migration machine on all switch interfaces.

```
switch# clear spanning-tree detected-protocols
switch#
```

12.1.4.5 disabled-time

The **`disabled-time`** command sets the time for which the port remains disabled after a loop is detected by loop protection. The **`no disabled-time`** and **`default disabled-time`** commands reset the disabled time to the default of ***604800*** seconds (seven days).

Note: If this value is changed, interfaces that are already disabled by loop protection will remain disabled for the previously configured period.

Command Mode

Loop-protection Configuration

Command Syntax

`disabled-time` [***period***]

`no disabled-time` [***period***]

`default disabled-time` [***period***]

Parameters

period Time in seconds for which the port remains disabled. Values range from ***0*** to ***604800*** (seven days). Default is ***604800***. A value of ***0*** disables the interface until it is manually reset, even if the disabled time is later set to a non-zero value. To restore the port manually, shut it down and then re-enable it.

Example

This command configures loop protection to disable a port on which a loop is detected for a period of two days (***172800*** seconds).

```
switch(config-monitor-loop-protect)# disabled-time 172800
switch(config-monitor-loop-protect)#
```

12.1.4.6 exit (mst-configuration mode)

The **exit** command, in MST-configuration mode, saves changes to the MST region configuration, then returns the switch to global configuration mode. MST region configuration changes are also saved by entering a different configuration mode.

Command Mode

MST-configuration

Command Syntax

exit

Examples

- This command saves changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst)# exit
switch(config)#
```

- This command saves changes to the MST region, then places the switch in Interface-Ethernet mode.

```
switch(config-mst)# interface ethernet 3
switch(config-if-Et3)#
```

12.1.4.7 instance

The **instance** command inserts an entry into the VLAN-to-instance map that associates a set of VLANs to an MST instance. In addition to defining the MST topology, the VLAN-to-instance map is one of three parameters, along with the MST name and revision number, that identifies the switchs MST region.

The **no instance** command removes specified entries from the VLAN-to-instance map. If the command does not provide a VLAN list, all entries are removed for the specified instance. The **no instance** and **default instance** commands function identically.

Command Mode

MST-Configuration

Command Syntax

instance ***mst_inst*** vlans ***v_range***

no instance ***mst_inst*** [vlans ***v_range***]

no default instance ***mst_inst*** [vlans ***v_range***]

Parameters

- ***mst_inst*** MST instance number. Value of ***mst_inst*** ranges from ***0*** to ***4094***.
- ***v_range*** VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command maps VLANs ***20-39*** to MST instance ***2***.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# instance 2 vlans 20-39
switch(config-mst)#
```

- This command removes all VLAN mappings to MST instance ***10***.

```
switch(config-mst)# no instance 10
switch(config-mst)#
```

12.1.4.8 loop-protection

The **loop-protection** command enables loop protection on the configuration mode interface. All interfaces in a VLAN under loop protection have loop protection enabled by default. The **no loop-protection** and **default loop-protection** commands disable loop protection on the interface.

When loop protection is disabled (at the VLAN or interface level), the computed state of the interface is forgotten and packets queued to be sent are dropped. If an interface is err-disabled by loop protection, disabling loop protection removes the err-disable.

Command Mode

Interface-Ethernet Configuration

Command Syntax

loop-protection

no loop-protection

default loop-protection

Example

These commands disable loop protection on ***interface ethernet 2/4***. If the interface is currently errdisabled by loop protection, the errdisable is removed.

```
switch(config)# interface ethernet 2/4
switch(config-if-Et2/4)# no loop-protection
switch(config-if-Et2/4)#
```

12.1.4.9 monitor loop-protection

The **`monitor loop-protection`** command places the switch in loop-protection configuration mode.

Command Mode

Global Configuration

Command Syntax

`monitor loop-protection`

Commands available in loop-protection configuration mode:

- shutdown (Loop-protection)
- protect vlan
- transmit-interval
- disabled-time
- rate-limit

Example

This command places the switch in ***loop-protection*** configuration mode.

```
switch(config)# monitor loop-protection
switch(config-monitor-loop-protect)#
```

12.1.4.10 name (mst-configuration mode)

The **name** command configures the MST region name. The name is one of three parameters, along with the MST revision number and VLAN-to-instance map, that identifies the switchs MST region.

The name has up to 32 characters. The default name is an empty string. The name string accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from ***running-config***.

Command Mode

MST-Configuration

Command Syntax

name ***label_text***

no name

default name

Parameters

label_text character string assigned to name attribute. Maximum 32 characters. The space character is not permitted in the name string.

Example

This command assigns ***corporate_100*** as the MST region name.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# name corporate_100
switch(config-mst)# show pending
Active MST configuration
Name      [corporate_100]
Revision  0    Instances configured 1

Instance  Vlans mapped
------------------------------------------------------------
0         1-4094
------------------------------------------------------------
```

12.1.4.11 protect vlan

The **protect vlan** command specifies which VLANs participate in loop protection. The **no protect vlan** and **default protect vlan** commands remove loop protection from the specified VLANs.

Command Mode

Loop-protection Configuration

Command Syntax

protect vlan ***vlan-range***

Parameters

vlan-range List of VLANs (number, range, comma-delimited list of numbers and ranges). Numbers range from ***1*** to ***4094***.

Example

This command enables loop protection on VLANs ***1025-2000***.

```
switch(config-monitor-loop-protect)# protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```

12.1.4.12 rate-limit

The **rate-limit** command sets the maximum number of loop detection frames which can be sent by the switch per second. The **no rate-limit** and **default rate-limit** commands return the rate limit to the default value of ***1000***.

Command Mode

Loop-protection Configuration

Command Syntax

rate-limit [***frames***]

no rate-limit [***frames***]

default rate-limit [***frames***]

Parameters

frames Maximum number of frames sent per second. Values range from ***0-1000***, default is ***1000***. A value of ***0*** disables throttling.

Example

This command sets the maximum number of loop detection frames to ***500*** per second.

```
switch(config-monitor-loop-protect)# rate-limit 500
switch(config-monitor-loop-protect)#
```

12.1.4.13 revision (mst-configuration mode)

The **revision** command configures the MST revision number. The revision number is one of three parameters, along with the MST name and VLAN-to-instance map, that identifies the switchs MST region. Revision numbers range from ***0*** to ***65535***. The default revision number is *0*.

The **no revision** and **default revision** commands restore the revision number to its default value by removing the revision command from ***running-config***.

Command Mode

MST-Configuration

Command Syntax

revision ***rev_number***

no revision

default revision

Parameters

rev_number revision number. Possible ranges from ***0*** to ***65535*** with a default of ***0***.

Example

This command sets the revision number to ***15***.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# revision 15
switch(config-mst)# show pending
Active MST configuration
Name      []
Revision 15Instances configured 1

Instance  Vlans mapped
--------  ------------------------------------------------
0         1-4094
-----------------------------------------------------------
```

12.1.4.14 show (mst-configuration mode)

The **show** command displays the current and pending MST configuration:

Exiting MST configuration mode stores all pending configuration changes to ***running-config***.

Command Mode

MST-Configuration

Command Syntax

show [EDIT_VERSION]

Parameters

EDIT_VERSION specifies configuration version that the command displays. Options include:

- ***no parameter*** command displays pending MST configuration.
- **active** command displays MST configuration stored in ***running-config***.
- **current** command displays MST configuration stored in ***running-config***.
- **pending** command displays pending MST configuration.

Example

These commands contrast the difference between the active and pending configuration by adding MST configuration commands, then showing the configurations.

```
switch(config-mst)# show pending
Active MST configuration
Name      []
Revision  0    Instances configured 1

Instance  Vlans mapped
-------------------------------------------------------
0         1-4094
-------------------------------------------------------
switch(config-mst)# instance 2 vlan 20-29,102
switch(config-mst)# revision 2
switch(config-mst)# name baseline
switch(config-mst)# show pending
Pending MST configuration
Name      [baseline]
Revision  2    Instances configured 2

Instance  Vlans mapped
-------------------------------------------------------
0         1-19,30-101,103-4094
2         20-29,102
-------------------------------------------------------
switch(config-mst)# show active
Active MST configuration
Name      []
Revision  0    Instances configured 1

Instance  Vlans mapped
-------------------------------------------------------
0         1-4094
-------------------------------------------------------
```

12.1.4.15 show loop-protection

The **show loop-protection** command displays loop protection status.

Command Syntax

show loop-protection [**detail**]

Examples

- This command displays basic loop protection information.

```
switch# show loop-protection
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800(or Permanent)
Packets Transmitted rate: 12/second(or Unthrottled)
Total: 3 Vlans enabled.
switch>
```

- This command displays detailed information about loop protection.

```
switch# show loop-protection detail
Loop protection is enabled

Transmit interval: 5
Disable Time: 604800
Packets Transmitted rate: 12/second
Total: 3 Vlans enabled.
Destination address: ffff.ffff.ffff
Ethernet type: 0x88b7
Receive action: Interface Disable

Vlan        Loop      Disabled Intfs Total Latest
Detected              Intfs Disabled Time

switch#
```

12.1.4.16 show spanning-tree

The **show spanning-tree command** displays spanning tree protocol (STP) data, organized by instance.

Command Mode

EXEC

Command Syntax

show spanning-tree [**VLAN_ID**][**INFO_LEVEL**]

Parameters

- **VLAN_ID** specifies the VLANs for which the command displays information. Formats include:
  - ***no parameter*** displays information for all VLANs.
  - **vlan** displays data for instances containing the first VLAN listed in running-config.
  - **vlan *v_range*** displays data for instances containing a VLAN in the specified range.
- **INFO_LEVEL** specifies level of information detail provided by the command.
  - ***no parameter*** displays table for each instance listing status, configuration, and history.
  - **detail** displays data blocks for each instance and all ports on each instance.

Display Values

- **Root ID** Displays information on the ROOT ID (elected spanning tree root bridge ID):
  - **Priority** Priority of the bridge. Default value is ***32768***.
  - **Address** MAC address of the bridge.
- **Bridge ID** bridge status and configuration information for the locally configured bridge:
  - **Priority** Priority of the bridge. The default priority is ***32768***.
  - **Address** MAC address of the bridge.
  - **Hello Time** Interval (seconds) between bridge protocol data units (BPDUs) transmissions.
  - **Max Age** Maximum time that a BPDU is saved.
  - **Forward Delay** Time (in seconds) that is spent in the learning state.
- **Interface** STP configuration participants. Link-down interfaces are not shown.
- **Role** Role of the port as one of the following:
  - **Root** The best port for a bridge to a root bridge used for forwarding.
  - **Designated** A forwarding port for a LAN segment.
  - **Alternate** A port acting as an alternate path to the root bridge.
  - **Backup** A port acting as a redundant path to another bridge port.
- **State** Displays the interface STP state as one of the following:
  - **Learning**
  - **Discarding**
  - **Forwarding**
- **Cost** STP port path cost value.
- **Prio. Nbr.** STP port priority. Values range from **0** to **240**. Default is **128**.
- **Type** The link type of the interface (automatically derived from the duplex mode of an interface):
  - **P2p Peer (STP)** Point to point full duplex port running standard STP.
  - **shr Peer (STP)** Shared half duplex port running standard STP.

Examples

- This command displays STP data, including a table of port parameters.

```
switch# show spanning-tree vlan 1000
MST0
```

```
  Spanning tree enabled protocol rstp
  Root ID    Priority    32768
             Address     001c.7301.07b9
             Cost        1999 (Ext) 0 (Int)
             Port        101 (Port-Channel2)
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

  Bridge ID  Priority    32768  (priority 32768 sys-id-ext 0)
             Address     001c.7304.195b
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

```

```
switch#
```

12.1.4.17 show spanning-tree blockedports

The **show spanning-tree blockedports** command displays the list of blocked (discarding) ports.

Command Mode

EXEC

Command Syntax

show spanning-tree blockedports

Example

This command shows the ports that are in discarding state.

```
switch# show spanning-tree blockedports
Name   Blocked Interfaces List
------------------------------------------------------------------------
MST0   Po903, Po905, Po907, Po909, Po911, Po913, Po915, Po917, Po919, Po921, Po923

       Po925, Po927, Po929, Po931, Po933, Po935, Po939, Po941, Po943, Po945, Po947

Number of blocked ports (segments) in the system : 22
switch#
```

12.1.4.18 show spanning-tree counters

The **show spanning-tree counters** command displays the number of BPDU transactions on each interface running spanning tree.

Command Mode

EXEC

Command Syntax

show spanning-tree counters

Example

This command displays the BPDU counter status on each interface running spanning tree.

```
switch# show spanning-tree counters
          Port      Sent   Received   Tagged Error   Other Error  sinceTimer
-------------------------------------------------------------------------------
    Ethernet2   1008399          0               0             0            0
    Ethernet3   1008554          0               0             0            0

switch#
```

12.1.4.19 show spanning-tree instance

The **show spanning-tree instance** command displays spanning tree protocol bridge configuration settings for each instance on the switch. The display includes **Bridge ID**, **Hello Time**, **Max Age**, and **Forward Delay** times.

The command also displays the restartability of the STP agent when the **detail** option is selected. A switch can continue support of MLAG operation when its peer is offline and the STP agent is unavailable.

Command Mode

EXEC

Command Syntax

show spanning-tree instance [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies level of information detail provided by the command.

- ***no parameter*** command displays information in a data table.
- **detail** command displays bridge information in data blocks for each instance.

Examples

- This command displays a bridge data table.

```
switch# show spanning-tree instance
                           Bridge ID                      Hello  Max  Fwd
Instance     Priority                  MAC addr           Time   Age  Dly
----------   ------------------------------------------   -----  ---  ---
MST0         32768(32768, sys-id 0   ) 001c.7302.2f98      2000   20   15
MST101       32869(32768, sys-id 101 ) 001c.7302.2f98      2000   20   15
MST102       32870(32768, sys-id 102 ) 001c.7302.2f98      2000   20   15

switch#
```

- This command displays bridge data blocks.

```
switch# show spanning-tree instance detail

```

12.1.4.20 show spanning-tree instance detail

The **show spanning-tree instance detail** command displays detailed MST information including MSTP-Rapid PVST+ interoperation status.

Command Mode

EXEC

Command Syntax

show spanning-tree instance detail

Example

This command displays detailed MST information.

```
switch# show spanning-tree instance detail
Stp Detailed Status:
 Stp agent restartable : True
 MST-PVST interoperation : Enabled
 Stp heartbeat timeout : 2.0
 Last local heartbeat timeout : 36 days, 19:10:46 ago
 Local heartbeat timeout since reboot : 1
MST0
 Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
 Address 001c.7374.8572
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec
switch#
```

12.1.4.21 show spanning-tree interface

The **show spanning-tree interface** command displays spanning tree protocol information for the specified interface.

Command Mode

EXEC

Command Syntax

show spanning-tree interface **INT_NAME** [**INFO_LEVEL**]

Parameters

- **INT_NAME** Interface type and number. Values include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **peer ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **peerport-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - ***no parameter*** command displays a table of STP data for the specified interface.
  - **detail** command displays a data block for the specified interface.

Examples

- This command displays an STP table for Ethernet interface 5.

```
switch# show spanning-tree interface ethernet 5
Instance         Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- ----
MST0             designated forwarding 20000     128.5    P2p
switch#
```

- This command displays a data block for Ethernet interface 5.

```
switch# show spanning-tree interface ethernet 5 detail
 Port 5 (Ethernet5) of MST0 is designated forwarding
   Port path cost 20000, Port priority 128, Port Identifier 128.5.
   Designated root has priority 32768, address 001c.7301.07b9
   Designated bridge has priority 32768, address 001c.7304.195b
   Designated port id is 128.5, designated path cost 1999 (Ext) 0 (Int)
   Timers: message age 1, forward delay 15, hold 20
   Number of transitions to forwarding state: 1
   Link type is point-to-point by default, Internal
   BPDU: sent 1008766, received 0, taggedErr 0, otherErr 0,
 rateLimiterCount 0
   Rate-Limiter: enabled, Window: 10 sec, Max-BPDU: 400

switch#
```

12.1.4.22 show spanning-tree mst

The **show spanning-tree mst** command displays configuration and state information for Multiple Spanning Tree protocol (MST) instances.

Command Mode

EXEC

Command Syntax

show spanning-tree mst [**INSTANCE**] [**INFO_LEVEL**]

Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - ***no parameter*** all MST instances.
  - **mst_inst** MST instance number. Value of ***mst_inst*** ranges from ***0*** to ***4094***.
- **INFO_LEVEL** type and amount of information in the output. Options include:
  - ***no parameter*** output is interface data in tabular format.
  - **detail** output is a data block for each interface.

Examples

- This command displays interface data blocks for MST instance ***3***.

```
switch# show spanning-tree mst 3 detail
##### MST3vlans mapped:3

```

12.1.4.23 show spanning-tree mst configuration

The **show spanning-tree mst configuration** command displays information about the MST regions VLAN-to-instance mapping. The command provides two display options:

- **default** displays a table that lists the instance to VLAN map.
- **digest** displays the configuration digest.

The configuration digest is a 16-byte hex string calculated from the md5 encoding of the VLAN-to-instance mapping table. Switches with identical mappings have identical digests.

Command Mode

EXEC

Command Syntax

show spanning-tree mst configuration [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies data provided by the output. Options include:

- ***no parameter*** command displays VLAN-to-instance map.
- **digest** command displays the MST configuration digest.

Examples

- This command displays the MST regions VLAN-to-instance map.

```
switch# show spanning-tree mst configuration
Name      []
Revision  0    Instances configured 3

Instance  Vlans mapped
------------------------------------------------------------
01,4-4094
22
33
------------------------------------------------------------
switch#
```

- This command displays the MST regions configuration digest.

```
switch# show spanning-tree mst configuration digest
Name      []
Revision  0    Instances configured 1
Digest         0xAC36177F50283CD4B83821D8AB26DE62
switch#
```

12.1.4.24 show spanning-tree mst interface

The **show spanning-tree mst interface** command displays Multiple Spanning Tree Protocol (MSTP) information for a specified interface on the specified MST instances.

Command Mode

EXEC

Command Syntax

show spanning-tree mst [**INSTANCE**] **interface** **INT_NAME** [**INFO_LEVEL**]

Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - ***no parameter*** all MST instances.
  - **mst_inst** denotes a single MST instance. Value of ***mst_inst*** ranges from ***0*** to ***4094***.
- **INT_NAME** Interface type and number. Values include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **peerethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **peerport-channel *p_num*** Port-channel interface specified by ***p_num***.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - ***no parameter*** command displays a table of STP instance data for the specified interface.
  - **detail** command displays a data block for all specified instance-interface combinations.

Examples

- This command displays an table of STP instance data for ***interface ethernet 1***:

```
switch# show spanning-tree mst interface ethernet 1
Ethernet1 of MST0 is root forwarding
Edge port: nobpdu guard: disabled
Link type: point-to-point
Boundary : Internal
Bpdus sent 2120, received 2164, taggedErr 0, otherErr 0

Instance Role Sts CostPrio.Nbr Vlans mapped

0RootFWD2000128.11,4-4094
2DesgFWD2000128.12
3RootFWD2000128.13
```

- This command displays blocks of STP instance information for ***interface ethernet 1***.

```
switch# show spanning-tree mst 3 interface ethernet 1 detail
Edge port: nobpdu guard: disabled
Link type: point-to-point
Boundary : Internal
Bpdus sent 2321, received 2365, taggedErr 0, otherErr 0

Ethernet1 of MST3 is root forwarding
Vlans mapped to MST3 3
Port infoport id128.1priority128 cost2000
Designated rootaddress 0011.2233.4401priority32768 cost0
Designated bridgeaddress 0011.2233.4401priority32768 port id128.1
```

12.1.4.25 show spanning-tree mst test information

The **show spanning-tree mst test information** displays diagnostic spanning tree protocol information.

Command Mode

EXEC

Command Syntax

show spanning-tree mst test information

Example

This command displays diagnostic STP information.

```
switch# show spanning-tree mst test information
bi = MstInfo.BridgeInfo( "dut" )
bi.stpVersion = "rstp"
bi.mstpRegionId = ""
bi.bridgeAddr = "00:1c:73:01:60:17"
si = MstInfo.BridgeStpiInfo( "Mst" )
bi.stpiInfoIs( "Mst", si )
si.cistRoot = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
si.cistPathCost = 0
bmi = MstInfo.BridgeMstiInfo( "Mst0" )
bmi.bridgeId = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
bmi.designatedRoot = Tac.Value( "Stp::BridgeId", priority=32768,
 systemId=0,
address='00:1c:73:01:60:17' )
si.mstiInfoIs( "Mst0", bmi )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Ethernet15" )
bmii.portId = Tac.Value( "Stp::PortId",
                    portPriority=128, portNumber=15 )
bmii.role = "designated"
bmii.operIntPathCost = 2000
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Ethernet15", bmii )
bii = MstInfo.BridgeIntfInfo( "Ethernet15" )
bii.operExtPathCost = 2000
si.intfInfoIs( "Ethernet15", bii )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Port-Channel10" )
bmii.portId = Tac.Value( "Stp::PortId",
                    portPriority=128, portNumber=101 )
bmii.role = "designated"
bmii.operIntPathCost = 1999
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Port-Channel10", bmii )
bii = MstInfo.BridgeIntfInfo( "Port-Channel10" )
bii.operExtPathCost = 1999
si.intfInfoIs( "Port-Channel10", bii )
switch>
```

12.1.4.26 show spanning-tree root

The **show spanning-tree root** command displays the Bridge-ID, cost to the root bridge, root port, and the root bridge timer settings for all instances.

Command Mode

EXEC

Command Syntax

show spanning-tree root [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies output format. Options include:

- ***no parameter*** output displays data in tabular format.
- **detail** output displays a data block for each instance.

Examples

- This command displays a table of root bridge information.

```
switch# show spanning-tree root
                  Root ID          Root    Hello  Max  Fwd
Instance     Priority    MAC addr   Cost    Time   Age  Dly  Root Port
----------   ------------------- --------- -----  ---  ---  ------------

switch>
```

12.1.4.27 show spanning-tree topology status

The **show spanning-tree topology status** command displays the forwarding state of ports on the specified VLANs.

Command Mode

EXEC

Command Syntax

show spanning-tree topology [**VLAN_NAME**] **status** [**INFO_LEVEL**]

Parameters

- **VLAN_NAME** specifies the VLANs that the output displays. Options include:
  - ***no parameter*** output includes all VLANs.
  - **vlan** output includes all VLANs.
  - **vlan *v_num*** command includes specified VLAN; ***v_num*** ranges from ***1*** to ***4094***.
- **INFO_LEVEL** specifies information provided by output. Options include:
  - ***no parameter*** output lists forwarding state of interfaces.
  - **detail** output lists forwarding state and change history of interfaces.

Examples

- This command displays forwarding state for ports mapped to all VLANs.

```
switch# show spanning-tree topology status
Topology: Cist
Mapped Vlans: 1-4,666,1000-1001,1004-1005
Cpu:               forwarding
Ethernet2:         forwarding
Ethernet3:         forwarding
Ethernet4:         forwarding
Ethernet5:         forwarding
Ethernet6:         forwarding
Ethernet8:         forwarding
Ethernet10:        forwarding
Port-Channel1:     forwarding
Port-Channel2:     forwarding
Port-Channel3:     forwarding

switch>
```

- This command displays forwarding state and history for ports mapped to ***vlan 1000***.

```
switch# show spanning-tree topology vlan 1000 status detail
Topology: Cist
Mapped Vlans: 1000
Cpu:               forwarding (1 changes, last 23 days, 22:54:43 ago)
Ethernet2:         forwarding (3 changes, last 23 days, 22:48:59 ago)
Ethernet4:         forwarding (3 changes, last 10 days, 19:54:17 ago)
Ethernet5:         forwarding (3 changes, last 23 days, 22:54:38 ago)
Ethernet6:         forwarding (3 changes, last 19 days, 15:49:10 ago)
Ethernet10:        forwarding (3 changes, last 9 days, 7:37:05 ago)
Port-Channel1:     forwarding (3 changes, last 23 days, 22:54:34 ago)
Port-Channel3:     forwarding (5 changes, last 21 days, 4:56:41 ago)

switch>
```

12.1.4.28 show spanning-tree transmit active

The **show spanning-tree transmit active** command displays spanning tree protocol bridge assurance information for network ports or for all ports. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent (blocking) for that port.

Command Mode

EXEC

Command Syntax

show spanning-tree transmit active **INFO_LEVEL**

Parameters

INFO_LEVEL specifies level of information detail provided by the command.

- ***no parameter*** command displays bridge assurance information for network ports.
- **detail** command displays bridge assurance information for all ports.

Example

This command displays the bridge assurance status of network ports.

```
switch# show spanning-tree transmit active
Name                 Bridge Assurance Status
-------------------------------------------
VL1        Et5/1       consistent

Number of bridge assurance inconsistent ports in the system : 0
switch>
```

12.1.4.29 shutdown (Loop-protection)

The **shutdown** command disables loop protection globally. The feature is disabled by default, and is enabled by using the **no shutdown** command.

Note: To function, loop protection must also be enabled on a per-VLAN basis using the **protect vlan** command.

Command Mode

Loop-protection Configuration

Command Syntax

shutdown

no shutdown

Example

This command enables loop protection globally on the switch.

```
switch(config-monitor-loop-protect)# no shutdown
switch(config-monitor-loop-protect)#
```

12.1.4.30 spanning-tree bpdu tx hold-count

The **spanning-tree bpdu tx hold-count** command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from ***1*** to ***10*** BPDUs with a default of ***6*** BPDUs.

The **no spanning-tree bpdu tx hold-count** and **default spanning-tree bpdu tx hold-count** commands restore the transmit hold count default of ***6*** BPDUs by removing the **spanning-tree bpdu tx hold-count** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree bpdu tx hold-count *max_bpdu*

no spanning-tree bpdu tx hold-count

default spanning-tree bpdu tx hold-count

Parameters

max_bpdu BPDU packets. Value ranges from ***1*** to ***10***. Default is ***6***.

Example

This command configures a transmit hold-count of ***8*** BPDUs.

```
switch(config)# spanning-tree bpdu tx hold-count 8
switch(config)#
```

12.1.4.31 spanning-tree bpdufilter

The **spanning-tree bpdufilter** command controls bridge protocol data unit (BPDU) filtering on the configuration mode interface. BPDU filtering is disabled by default.

- **spanning-tree bpdufilter enabled** enables BPDU filtering.
- **spanning-tree bpdufilter disabled** disables BPDU filtering by removing the **spanning-tree bpdufilter** command from ***running-config***.

The BPDU filter default setting for portfast ports is configured by the **spanning-tree edge-port bpdufilter default** command; BPDU filter is disabled by default on all non-portfast ports.

The **no spanning-tree bpdufilter** and **default spanning-tree bpdufilter** commands restore the global BPDU filter setting on the configuration mode interface by removing the corresponding **spanning-tree bpdufilter** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree bpdufilter FILTER_STATUS

no spanning-tree bpdufilter

default spanning-tree bpdufilter

Parameters

FILTER_STATUS BPDU filtering status. Options include:

- **enabled** BPDU filter is enabled on the interface.
- **disabled** BPDU filter is disabled on the interface.

Example

This command enables BPDU filtering on ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdufilter enabled
switch(config-if-Et5)#
```

12.1.4.32 spanning-tree bpduguard

The **spanning-tree bpduguard** command controls BPDU Guard on the configuration mode interface. A BPDU Guard-enabled port is error disabled if it receives a BPDU packet.

The BPDU Guard default setting for portfast ports is configured by the spanning-tree edge-port bpduguard default command; BPDU Guard is disabled by default on all non-portfast ports.

The **no spanning-tree bpduguard** and **default spanning-tree bpduguard** commands restore the global BPDU Guard setting on the configuration mode interface by removing the corresponding **spanning-tree bpduguard** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree bpduguard GUARD_ACTION

no spanning-tree bpduguard

default spanning-tree bpduguard

Parameters

GUARD_ACTION BPDU Guard setting. Options include:

- **disable** Disable BPDU Guard.
- **enable** Enable BPDU Guard.
- **rate-limit** BPDU input rate limiter options.

Example

These commands enable BPDU Guard on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree bpduguard enabled
switch(config-if-Et5)
```

12.1.4.33 spanning-tree bpduguard rate-limit count (global)

The **spanning-tree bpduguard rate-limit count** command sets the maximum BPDU reception rate (quantity per interval) for ports that are not covered by a spanning-tree bpduguard rate-limit count (interface) command.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as `bpduguard`.

To enable or disable BPDU rate limiting, use the spanning-tree bpduguard rate-limit enable / disable command.

The **no spanning-tree bpduguard rate-limit count** and **default spanning-tree bpduguard rate-limit count** commands restore the global setting to its default value by removing the **spanning-tree bpduguard rate-limit count** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree bpduguard rate-limit count ***max_bpdu*** [interval period]

no spanning-tree bpduguard rate-limit count

default spanning-tree bpduguard rate-limit count

Parameters

- ***max_bpdu*** configures the maximum number of BPDUs per timer interval. Values range from ***1*** to ***20000***.
- **interval** ***period*** configures the timer interval in seconds. The value of ***period*** ranges from ***1*** to ***15***.

Guidelines

Arista Networks recommends retaining the default rate-limit values.

In PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limiting on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add ***300*** more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

Example

This command configures the global rate limit as ***5000*** BPDUs per ***4*** second period.

```
switch(config)# spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```

12.1.4.34 spanning-tree bpduguard rate-limit count (interface)

The **spanning-tree bpduguard rate-limit count** command configures the maximum BPDU reception rate for the configuration mode interface. The default rate limit is specified by the spanning-tree bpduguard rate-limit count (global) command.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as `bpduguard`.

To enable or disable BPDU rate limiting, use the spanning-tree bpduguard rate-limit enable / disable command.

The **no spanning-tree bpduguard rate-limit count** and **default spanning-tree bpduguard rate-limit count** commands restore the interface value to the global setting by removing the corresponding **spanning-tree bpduguard rate-limit count** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree bpduguard rate-limit count ***max_bpdu*** [**TIMER**]

no spanning-tree bpduguard rate-limit count

default spanning-tree bpduguard rate-limit count

Parameters

- ***max_bpdu*** BPDU quantity. Value ranges from ***1*** to ***20000***.
- **TIMER** BPDU reception interval (seconds). Options include:
  - ***period*** reception interval defaults to **hello-time**.
  - **interval** ***period*** Value of ***period*** ranges from ***1*** to ***15***.

Example

These commands configure a rate limit of ***7500*** BPDUs per ***8*** second period on ***interface Ethernet 2***.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# spanning-tree bpduguard rate-limit count 7500
 interval 8
switch(config-if-Et2)#
```

12.1.4.35 spanning-tree bpduguard rate-limit default

The **spanning-tree bpduguard rate-limit default** command configures the global default BPDU rate limit setting. This setting provides the default for individual ports whose configuration does not include a spanning-tree bpduguard rate-limit enable / disable command. The default global setting is enabled.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. s

BPDU rate limits are established by spanning-tree bpduguard rate-limit count (global) commands.

The **no spanning-tree bpduguard rate-limit default** sets the global BPDU rate limit setting to disabled. The **spanning-tree bpduguard rate-limit default** and **default spanning-tree bpduguard rate-limit default** commands restore the default global rate limit setting to enabled by removing the **nospanning-tree bpduguard rate-limit default** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree bpduguard rate-limit default

no spanning-tree bpduguard rate-limit default

default spanning-tree bpduguard rate-limit default

Example

This command enables rate limiting on all ports not covered by an interface rate limit command.

```
switch(config)# spanning-tree bpduguard rate-limit default
switch(config)#
```

12.1.4.36 spanning-tree bpduguard rate-limit enable / disable

These commands enable and disable BPDU rate limiting on the configuration mode interface:

- **spanning-tree bpduguard rate-limit enable** enables BPDU rate limiting.
- **spanning-tree bpduguard rate-limit disable** disables BPDU rate limiting.

The spanning-tree bpduguard rate-limit default command enables BPDU rate limiting on all ports not configured with a **spanning-tree bpduguard rate-limit** command.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as `bpduguard`.

To specify the BPDU rate limit for an interface, use the spanning-tree bpduguard rate-limit count (interface) command.

The **no spanning-tree bpduguard rate-limit** and **default spanning-tree bpduguard rate-limit** commands restore the global rate limit setting on the configuration mode interface by removing the corresponding **spanning-tree bpduguard rate-limit** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree bpduguard rate-limit enable

spanning-tree bpduguard rate-limit disable

no spanning-tree bpduguard rate-limit

default spanning-tree bpduguard rate-limit

Example

These commands enable rate limiting on ***interface ethernet 15***.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

12.1.4.37 spanning-tree cost

The **spanning-tree cost** command configures the path cost of the configuration mode interface. Cost values range from ***1*** to ***200000000*** (***200*** million). The default cost depends on the interface speed:

- ***1*** gigabit interface: cost = ***20000***
- ***10*** gigabit interface: cost = ***2000***

The **spanning-tree cost** command provides a mode option:

- RST instance cost is configured by not including a mode.
- MST instance 0 cost is configured by not including a mode or with the **mst** mode option.
- MST instance cost is configured with the **mst** mode option.
- Rapid-PVST VLAN cost is configured with the **vlan** mode option.

The **no spanning-tree cost** and **default spanning-tree cost** commands restore the default cost on the configuration mode interface by removing the corresponding **spanning-tree cost** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree MODE cost *value*

no spanning-tree MODE cost

default spanning-tree MODE cost

Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - ***no parameter*** RST instance, MST instance ***0***, or all Rapid-PVST instances permitted on the interface.
  - **mst *m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan *v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.***value*** path cost assigned to interface. Values range from ***1*** to ***200000000*** (***200*** million). Default values are ***20000*** (1 G interfaces) or ***2000*** (10 G interfaces).

Examples

- These commands configure a port cost of ***25000*** for ***interface Ethernet 5*** when configured as an RST port, as a port in MST instance ***0***, or all unconfigured Rapid-PVST instances that are not explicitly configured.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning tree cost 25000
```

- This command configures a port cost of ***30000*** for ***interface Ethernet 5*** when configured as a port in MST instance ***200***.

```
switch(config-if-Et5)# spanning tree mst 200 cost 30000
```

- This command configures a port cost of ***100000*** for ***interface Ethernet 5*** when configured as a port in VLANs ***200-220***.

```
switch(config-if-Et5)# spanning tree vlan 200-220 cost 100000
```

```
switch(config-if-Et5)#
```

12.1.4.38 spanning-tree edge-port bpdufilter default

The **`spanning-tree edge-port bpdufilter default`** command configures the global BPDU filter setting as **enabled**. Ports not covered by a spanning-tree bpdufilter command use the global BPDU filter setting.

Command Mode

Global Configuration

Command Syntax

`spanning-tree edge-port bpdufilter default`

`no spanning-tree edge-port bpdufilter default`

`default spanning-tree edge-port bpdufilter default`

Example

This command configures the BPDU filter global setting to **enabled**.

```
switch(config)# spanning-tree edge-port bpdufilter default
switch(config)#
```

12.1.4.39 spanning-tree edge-port bpduguard default

The **`spanning-tree edge-port bpduguard default`** command sets the global BPDU guard setting as **enabled**. Ports not covered by a spanning-tree bpduguard command use the global BPDU guard setting.

Command Mode

Global Configuration

Command Syntax

`spanning-tree edge-port bpduguard default`

`no spanning-tree edge-port bpduguard default`

`default spanning-tree edge-port bpduguard default`

Example

This command configures the global BPDU guard setting to enabled.

```
switch(config)# spanning-tree edge-port bpduguard default
switch(config)#
```

12.1.4.40 spanning-tree forward-time

The **spanning-tree forward-time** command configures the forward delay timer. Forward delay is the time that a port is in learning state before it begins forwarding data packets.

The switch inserts the forward delay timer value in BPDU packets it sends as the root bridge. The forward delay value ranges from ***4*** to ***30*** seconds with a default of ***15*** seconds.

The **no spanning-tree forward-time** and **default spanning-tree forward-time** commands restore the forward delay timer default of ***15*** seconds by removing the **spanning-tree forward-time** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree forward-time ***period***

no spanning-tree forward-time

default spanning-tree forward-time

Parameters

period forward delay timer (seconds). Value ranges from ***4*** to ***30***. Default is ***15***.

Example

This command sets the forward delay timer value to ***25*** seconds.

```
switch(config)# spanning-tree forward-time 25
switch(config)#
```

12.1.4.41 spanning-tree guard

The **spanning-tree guard** command enables root guard or loop guard on the configuration mode interface. The **spanning-tree guard loop default** command configures the global loop guard setting.

- Root guard prevents a port from becoming a root or blocked port. A root guard port that receives a superior BPDU transitions to the root-inconsistent (blocked) state.
- Loop guard protects against loops resulting from unidirectional link failures on point-to-point links by preventing non-designated ports from becoming designated ports. When loop guard is enabled, a root or blocked port transitions to loop-inconsistent (blocked) state if it stops receiving BPDUs from its designated port. The port returns to its prior state when it receives a BPDU.

The **no spanning-tree guard** and **default spanning-tree guard** commands sets the configuration mode interface to the global loop guard mode by removing the **spanning-tree guard** statement from ***running-config***. The **spanning-tree guard none** command disables loop guard and root guard on the interface, overriding the global setting.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree guard **PORT_MODE**

no spanning-tree guard

default spanning-tree guard

Parameters

PORT_MODE the port mode. Options include:

- **loop** enables loop guard on the interface.
- **root** enables root guard on the interface.
- **none** disables root guard and loop guard.

Example

This command enables root guard on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree guard root
switch(config-if-Et5)#
```

12.1.4.42 spanning-tree guard loop default

The **`spanning-tree guard loop default`** command configures the global loop guard setting as **enabled**. Ports not covered by a spanning-tree guard command use the global loop guard setting. Loop guard prevents blocked or root ports from becoming a designated port due to failures resulting in a unidirectional link. The spanning-tree guard interface configuration statement overrides the global setting for a specified interface. The default global loop guard setting is disabled.

The **`no spanning-tree guard loop default`** and **`default spanning-tree guard loop default`** commands restore the global loop guard setting of disabled by removing the **`spanning-tree guard loop default`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`spanning-tree guard loop default`

`no spanning-tree guard loop default`

`default spanning-tree guard loop default`

Example

This command enables loop guard as the default on all switch ports.

```
switch(config)# spanning-tree guard loop default
switch(config)#
```

12.1.4.43 spanning-tree hello-time

The **spanning-tree hello-time** command configures the hello time, which specifies the transmission interval between consecutive bridge protocol data units (BPDU) that the switch sends as a root bridge. The hello time is also inserted in outbound BPDUs.

This hello time ranges from ***0.2*** seconds to ***10*** seconds with a default of ***2*** seconds.

The **no spanning-tree hello-time** and **default spanning-tree hello-time** commands restore the hello time default of 2 seconds by removing the **spanning-tree hello-time** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree hello-time ***period***

no spanning-tree hello-time

default spanning-tree hello-time

Parameters

period hello-time (milliseconds). Value ranges from ***200*** to ***10000***. Default is ***2000***.

Example

This command configures a hello-time of ***1*** second.

```
switch(config)# spanning-tree hello-time 1000
switch(config)#
```

12.1.4.44 spanning-tree link-type

The **`spanning-tree link-type`** command specifies the configuration mode interfaces link type, which is normally derived from the ports duplex setting. The default setting depends on a ports duplex mode:

- full-duplex ports are **point-to-point**.
- half-duplex ports are **shared**.

The **`no spanning-tree link-type`** and **`default spanning-tree link-type`** commands restore the default link type on the configuration mode interface by removing the corresponding **`spanning-tree link-type`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`spanning-tree link-type` **TYPE**

`no spanning-tree link-type`

`default spanning-tree link-type`

Parameters

TYPE link type of the configuration mode interface. Options include:

- **point-to-point**
- **shared**

Example

This command configures ***interface ethernet 5*** as a shared port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree link-type shared
switch(config-if-Et5)#
```

12.1.4.45 spanning-tree max-age

The **spanning-tree max-age** command configures the switchs max age timer, which specifies the max age value that the switch inserts in outbound BPDU packets it sends as a root bridge. The max-age time value ranges from ***6*** to ***40*** seconds with a default of ***20*** seconds.

Max age is the interval, specified in the BPDU, that BPDU data remains valid after its reception. The bridge recomputes the spanning tree topology if it does not receive a new BPDU before max age expiry.

The **no spanning-tree max-age** and **default spanning-tree max-age** commands restore the max-age default of ***20*** seconds by removing the **spanning-tree max-age** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree max-age ***period***

no spanning-tree max-age

default spanning-tree max-age

Parameters

period max age period (seconds). Value ranges from ***6*** to ***40***. Default is ***20***.

Example

This command sets the max age timer value to ***25*** seconds.

```
switch(config)# spanning-tree max-age 25
switch(config)#
```

12.1.4.46 spanning-tree max-hops

The **spanning-tree max-hops** command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge. The max hop setting determines the number of bridges in an MST region that a BPDU can traverse before it is discarded. The max-hop value ranges from ***1*** to ***40*** with a default of ***20***.

The **no spanning-tree max-hops** and **default spanning-tree max-hops** commands restore the max-hops setting to its default value of ***20*** by removing the **spanning-tree max-hops** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree max-hops ***ports***

no spanning-tree max-hops

default spanning-tree max-hops

Parameters

ports max hops (bridges). Value ranges from ***1*** to ***40***. Default is ***20***.

Example

This command sets the max hop value to ***40***.

```
switch(config)# spanning-tree max-hop 40
switch(config)#
```

12.1.4.47 spanning-tree mode

The **spanning-tree mode** command specifies the spanning tree protocol version that the switch runs. The default mode is Multiple Spanning Tree Protocol (MSTP).

The **no spanning-tree mode** and **default spanning-tree mode** commands restore the default spanning tree protocol version.

Note: The **spanning-tree mode** command may disrupt user traffic. When the switch starts a different STP version, all spanning-tree instances are stopped, then restarted in the new mode.

Command Mode

Global Configuration

Command Syntax

spanning-tree mode VERSION

no spanning-tree mode

default spanning-tree mode

Parameters

VERSION spanning tree version that the switch runs. Options include:

- **mstp** multiple spanning tree protocol described in the ***IEEE 802.1Q-2005*** specification and originally specified in the ***IEEE 802.1s*** specification.
- **rstp** rapid spanning tree protocol described in the ***IEEE 802.1D-2004*** specification and originally specified in the ***IEEE 802.1w*** specification.
- **rapid-pvst** rapid per-VLAN spanning tree protocol described in the ***IEEE 802.1D-2004*** specification and originally specified in the ***IEEE 802.1w*** specification.
- **backup** disables STP and enables switchport interface pairs configured with the **switchport backup-link** command.
- **none** disables STP. The switch does not generate STP packets. Each switchport interface forwards data packets to all connected ports and forwards STP packets as multicast data packets on the VLAN where they are received.

Guidelines

Backup mode is not available on Trident platform switches.

Example

This command configures the switch to run multiple spanning tree protocol.

```
switch(config)# spanning-tree mode mstp
switch(config)#
```

12.1.4.48 spanning-tree mst configuration

The **spanning-tree mst configuration** command places the switch in MST-configuration mode, which is the group change mode where MST region parameters are configured.

Changes made in a group change mode are saved by leaving the mode through the **exit** command or by entering another configuration mode. To discard changes from the current edit session, leave the mode with the **abort** command.

These commands are available in MST-configuration mode:

- **abort (mst-configuration mode)**
- **exit (mst-configuration mode)**
- **instance**
- **name (mst-configuration mode)**
- **revision (mst-configuration mode)**
- **show (mst-configuration mode)**

The **no spanning-tree mst configuration** and **default spanning-tree mst configuration** commands restore the MST default configuration.

Command Mode

Global Configuration

Command Syntax

spanning-tree mst configuration

no spanning-tree mst configuration

default spanning-tree mst configuration

Examples

- This command enters MST configuration mode.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)#
```

- This command exits MST configuration mode, saving MST region configuration changes to ***running-config***.

```
switch(config-mst)# exit
switch(config)#
```

- This command exits MST configuration mode without saving MST region configuration changes to ***running-config***.

```
switch(config-mst)# abort
switch(config)#
```

12.1.4.49 spanning-tree mst pvst border

The **spanning-tree mst pvst border** command configures MSTP PVST border feature to automatically detect border ports facing PVST+ regions. By default, spanning-tree mst pvst border is disabled.

The **no spanning-tree mst pvst border** and **default spanning-tree mst pvst border** commands restore the default MST configuration.

Command Mode

MST Configuration

Command Syntax

spanning-tree mst pvst border

no spanning-tree mst pvst border

default spanning-tree mst pvst border

Example

This command enters the MST configuration mode.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# spanning-tree mst pvst border
```

12.1.4.50 spanning-tree portchannel guard misconfig

The **spanning-tree portchannel guard misconfig** command enables the switch to detect misconfigured port channels that may cause network loops by monitoring inbound BPDUs. When a port channel receives ***75*** inconsistent BPDUs within ***30*** seconds, the switch error disables the port. When a port channel receives ***5*** BPDUs with the same source BPDU during the ***30*** second measurement interval, the error counter is reset and the port continues normal port channel operation. Misconfigured port channel detection is disabled by default.

The **no spanning-tree portchannel guard misconfig**and **default spanning-tree portchannel guard misconfig**commands disables the detection of misconfigured port channels by removing the **spanning-tree portchannel guard misconfig** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree portchannel guard misconfig

no spanning-tree portchannel guard misconfig

default spanning-tree portchannel guard misconfig

spanning-tree etherchannel guard misconfig

no spanning-tree etherchannel guard misconfig

default spanning-tree etherchannel guard misconfig

Guidelines

The **spanning-tree portchannel guard misconfig** and **spanning-tree etherchannel guard misconfig** commands are equivalent.

Examples

- This command enables port channel misconfiguration detection on the switch.

```
switch(config)# spanning-tree portchannel guard misconfig
switch(config)# show running-config
!
spanning-tree mode mstp
spanning-tree portchannel guard misconfig
!

!
end
switch(config)#
```

- This command disables port channel misconfiguration detection on the switch.

```
switch(config)# no spanning-tree portchannel guard misconfig
switch(config)# show running-config
!
spanning-tree mode mstp
!

!
end
switch(config)#
```

12.1.4.51 spanning-tree portfast

The **spanning-tree portfast** command programs configuration mode ports to immediately enter forwarding state when they establish a link. PortFast ports are included in spanning tree topology calculations and can enter discarding state. This command overrides the **spanning-tree portfast auto** command.

The **no spanning-tree portfast** and **default spanning-tree portfast** commands remove the corresponding **spanning-tree portfast** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree portfast

no spanning-tree portfast

default spanning-tree portfast

Example

This command unconditionally enables portfast on ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast
switch(config-if-Et5)#
```

12.1.4.52 spanning-tree portfast auto

The **spanning-tree portfast auto** command enables auto-edge detection on the configuration mode interface. When auto-edge detection is enabled, the port is configured as an edge port if it does not receive a new BPDU before the current BPDU expires. Auto-edge detection is enabled by default. The **spanning-tree portfast** command, when configured, has priority over this command.

The **no spanning-tree portfast auto** command disables auto-edge port detection. This command is removed from ***running-config*** with the **spanning-tree portfast auto** and **default spanning-tree portfast auto** commands.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree portfast auto

no spanning-tree portfast auto

default spanning-tree portfast auto

Example

This command enables auto-edge detection on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast auto
switch(config-if-Et5)#
```

12.1.4.53 spanning-tree portfast <port type>

The **spanning-tree portfast** command specifies the STP port mode for the configuration mode interface. Default port mode is **normal**.

Port modes include:

- **Edge**: Edge ports connect to hosts and transition to the forwarding state when the link is established. An edge port that receives a BPDU becomes a normal port.
- **Network**: Network ports connect only to switches or bridges and support bridge assurance. Network ports that connect to hosts or other edge devices transition to the discarding state.
- **Normal**: Normal ports function as normal STP ports and can connect to any type of device.

The **no spanning-tree portfast <port-type>** and **default spanning-tree portfast <port-type>** commands restore the default port mode of normal by removing the corresponding **spanning-tree portfast <port-type>** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree portfast PORT_MODE

no spanning-tree portfast PORT_MODE

default spanning-tree portfast PORT_MODE

Parameters

PORT_MODE STP port mode. Options include:

- **edge**
- **network**
- **normal**

  The **normal** option is not available for the **no** and **default** commands.

Related Commands

The **spanning-tree portfast** command also affects the **spanning-tree portfast auto** and **spanning-tree portfast** configuration for the configuration mode interface:

- **spanning-tree portfast normal**: **spanning-tree portfast auto** is enabled.
- **spanning-tree portfast edge**: **spanning-tree portfast** is enabled.
- **spanning-tree portfast network**: **spanning-tree portfast auto** is disabled.

Example

This command configures ***interface ethernet 5*** as a network port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast network
switch(config-if-Et5)#
```

12.1.4.54 spanning-tree port-priority

The **spanning-tree port-priority** command specifies the configuration mode interfaces port-priority number. The switch uses this number to determine which interface it places into forwarding mode when resolving a loop. Valid settings are all multiples of ***16*** between ***0*** and ***240***. Default value is ***128***. Ports with lower numerical priority values are selected over other ports.

The **no spanning-tree port-priority** and default spanning-tree port-priority commands restore the default of ***128*** for the configuration mode interface by removing the **spanning-tree port-priority** command from ***running-config***.

The **spanning-tree port-priority** command provides a mode option:

- RST instance port-priority is configured by not including a mode.
- MST instance ***0*** port-priority is configured by not including a mode or with the **mst** mode option.
- MST instance port-priority is configured with the **mst** mode option.
- Rapid-PVST VLAN port-priority is configured with the **vlan** mode option.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree [**MODE**] **port-priority** ***value***

no spanning-tree [**MODE**] **port-priority**

default spanning-tree [**MODE**] **port-priority**

Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - ***no parameter*** RST instance or MST instance 0.
  - **mst** ***m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan** ***v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.
- ***value*** bridge priority number. Values range from ***0*** to ***240*** and must be a multiple of ***16***.

Example

This command sets the port priority of ***interface ethernet 5*** to ***144***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree port-priority 144
switch(config-if-Et5)#
```

12.1.4.55 spanning-tree priority

The **spanning-tree priority** command configures the bridge priority number. The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from ***0*** to ***65535*** (***16*** bits); bridges with smaller bridge IDs are elected over other bridges.

Because bridge priority sets the four most significant bits of the bridge ID, valid settings include all multiples of ***4096*** between ***0*** and ***61440***. Default value is ***32768***.

The **spanning-tree priority** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance ***0*** priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree priority** and **default spanning-tree priority** commands restore the bridge priority default of ***32768*** for the specified mode by removing the corresponding **spanning-tree priority** command from ***running-config***.

Another method of adding **spanning-tree priority** commands to the configuration is through the spanning-tree root command. Similarly, the **no spanning-tree root** command removes the corresponding **spanning-tree priority** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree [**MODE**] **priority** ***level***

no spanning-tree [**MODE**] **priority**

default spanning-tree [**MODE**] **priority**

Parameters

- **MODE** spanning tree instances for which the command configures priority. Options include:
  - ***no parameter*** RST instance or MST instance ***0***.
  - **mst** ***m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan** ***v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.
- ***level*** priority number. Values include multiples of ***4096*** between ***0*** and ***61440***. Default is ***32768***.

Examples

- This command configures a bridge priority value of ***20480*** for Rapid-PVST VLANs ***20***, ***24***, ***28***, and ***32***.

```
switch(config)# spanning-tree vlan-id 20,24,28,32 priority 20480
switch(config)#
```

- This command configures a bridge priority value of ***36864*** for the RST instance. When MST is enabled, this command configures a priority of ***36864*** for MST instance ***0***.

```
switch(config)# spanning-tree priority 36864
switch(config)#
```

12.1.4.56 spanning-tree root

The **`spanning-tree root`** command configures the bridge priority number by adding a spanning-tree priority command to the configuration. Parameter settings set the following priority values:

- **primary** sets the bridge priority to ***8192***.
- **secondary** sets the bridge priority to ***16384***.

The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from ***0*** to ***65535*** (***16*** bits); bridges with smaller bridge IDs are elected over other bridges.

When no other switch in the network is similarly configured, assigning the primary value to the switch facilitates its selection as the root switch. Assigning the secondary value to the switch facilitates its selection as the backup root in a network that contains one switch with a smaller priority number.

The **`spanning-tree root`** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance ***0*** priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **`no spanning-tree root`** and **`default spanning-tree root`** commands restore the bridge priority default of ***32768*** by removing the corresponding **spanning-tree priority** command from ***running-config***. The **`no spanning-tree root`**, **`no spanning-tree priority`**, **`default spanning-tree root`** and **`default spanning-tree priority`** commands perform the same function.

Command Mode

Global Configuration

Command Syntax

`spanning-tree` [**MODE**] **`root`** **TYPE**

`no spanning-tree` [**MODE**] **`root`**

`default spanning-tree` [**MODE**] **`root`**

Parameters

- **MODE** specifies the spanning tree instances for which priority is configured. Values include:
  - ***no parameter*** RST instance or MST instance ***0***.
  - **mst** ***m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan** ***v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.
- **TYPE** sets the bridge priority number. Values include:
  - **primary** sets the bridge priority to ***8192***.
  - **secondary** sets the bridge priority to ***16384***.

Examples

- This command configures a bridge priority value of ***8192*** for Rapid-PVST VLANs ***20*** to ***36***.

```
switch(config)# spanning-tree vlan-id 20-36 root primary
```

- This command configures a bridge priority value of ***16384*** for the RSTP instance and MST instance ***0***.

```
switch(config)# spanning-tree root secondary
```

12.1.4.57 spanning-tree transmit active

The **spanning-tree transmit active** command enables bridge assurance globally, which enables bridge assurance on all ports with a port type of **network**. Bridge assurance protects against unidirectional link failure, other software failure, and devices that quit running a spanning tree algorithm.

Bridge assurance is available only on point-to-point links on spanning tree **network** ports. Both ends of the link should ideally have bridge assurance enabled. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent (blocking) for that port.

The **no spanning-tree transmit active** command disables bridge assurance.

The **spanning-tree transmit active** and **default spanning-tree transmit active** commands restore the default behavior by removing the **no spanning-tree transmit active** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree transmit active

no spanning-tree transmit active

default spanning-tree transmit active

Example

This command enables bridge assurance on the switch.

```
switch(config)# spanning-tree transmit active
switch(config)#
```

12.1.4.58 spanning-tree vlan-id

The **spanning-tree vlan-id** command enables Spanning Tree Protocol (STP) on specified VLANs by removing any corresponding **no spanning-tree vlan-id** statements from ***running-config***. Spanning-tree is enabled on all VLANs by default.

The **no spanning-tree vlan-id** command disables STP on the specified interfaces. The **default spanning-tree vlan-id** enables STP on the specified interfaces.

Note: Disabling STP is not recommended, even in topologies free of physical loops; STP guards against configuration mistakes and cabling errors. When disabling STP, ensure that there are no physical loops in the VLAN.

When disabling STP on a VLAN, ensure that all switches and bridges in the network disable STP for the same VLAN. Disabling STP on a subset of switches and bridges in a VLAN may have unexpected results because switches and bridges running STP will have incomplete information regarding the network's physical topology.

The following STP global configuration commands provide a **vlan** option for configuring Rapid-PVST VLAN instances:

- spanning-tree priority
- spanning-tree root

Command Mode

Global Configuration

Command Syntax

spanning-tree vlan-id ***v_range***

no spanning-tree vlan-id ***v_range***

default spanning-tree vlan-id ***v_range***

Parameters

v_range VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.

Examples

- This command disables STP on ***VLANs 200-205***.

```
switch(config)# no spanning-tree vlan-id 200-205
switch(config)#
```

- This command enables STP on ***vlan 203***.

```
switch(config)# spanning-tree vlan-id 203
switch(config)#
```

12.1.4.59 switchport backup-link

The **switchport backup-link** command establishes a primary-backup configuration for forwarding VLAN traffic between the command mode interface and a specified interface. The **show interfaces switchport backup-link** command displays the state of backup interface pairs on the switch:

- the primary interface is the command mode interface.
- the backup interface is the interface specified in the command.

The following guidelines apply to primary and backup interfaces:

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLANs can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- The STP mode is backup.
- Static MAC addresses should be configured after primary-backup pairs are established.

When load balancing is not enabled, the primary and backup interfaces cannot simultaneously forward VLAN traffic. When the primary interface is forwarding VLAN traffic, the backup interface drops all traffic. If the primary interface fails, the backup interface forwards VLAN traffic until the primary interface is functional.

The **prefer vlan** option balances the load across the primary and backup interfaces. When the command includes the **prefer vlan** option, each interface is the primary for a subset of the vlans carried by the pair. When both interfaces are up, prefer option vlans are forwarded on the backup interface and all other configured vlans are carried by the primary interface.

The **no switchport backup-link** and **default switchport backup-link** commands remove the primary-backup configuration for the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport backup-link **INT_NAME** [**BALANCE**]

no switchport backup-link

default switchport backup-link

Parameters

- **INT_NAME** the backup interface. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Channel group interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **BALANCE** VLANs whose traffic is normally handled on the backup interfaces. Values include:
  - ***no parameter*** backup interface handles no traffic if the primary interface is operating.
  - **prefer vlan *v_range*** list of VLANs whose traffic is handled by backup interface.

Examples

- These commands establish ***interface ethernet 7*** as the backup port for ***interface ethernet 1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport backup-link ethernet 7
switch(config-if-Et1)#
```

- These commands configure the following:
  - ***interface ethernet 1*** as a trunk port that handles VLAN ***4*** through ***9*** traffic.
  - ***interface ethernet 2*** as its backup interface.
  - ***interface ethernet 2*** as the preferred interface for VLANs ***7*** through ***9***.

```
switch(config-if-Et1)# switchport mode trunk
switch(config-if-Et1)# switchport trunk allowed vlan 4-9
switch(config-if-Et1)# switchport backup-link Ethernet 2 prefer vlan
 7-9
switch(config-if-Et1)#
```

12.1.4.60 transmit-interval

The **`transmit-interval`** command sets the interval at which loop detection packets are transmitted. The **`no transmit-interval`** and **`default transmit-interval`**commands restore the transmission interval to the default of ***5*** seconds.

Command Mode

Loop-protection Configuration

Command Syntax

`transmit-interval` ***interval***

Parameters

interval Interval in seconds at which loop-detection packets are transmitted. Values range from ***1*** to ***10***; default is ***5***.

Example

This command sets the loop detection packet transmission interval to ***10*** seconds.

```
switch(config-monitor-loop-protect)# transmit-interval 10
switch(config-monitor-loop-protect)#
```

12.2 Link Layer Discovery Protocol

This section describes Link Layer Discovery Protocol (LLDP) configuration tasks. Refer to the command descriptions for information about commands used in this chapter.

Topics in this section include:

12.2.1 LLDP Introduction

Link Layer Discovery Protocol (LLDP) lets Ethernet network devices to advertise details about themselves, such as capabilities, identification, and device configurations to directly connected devices on the network that are also using LLDP.

12.2.2 LLDP Overview

LLDP is a discovery protocol that allows devices to advertise information about themselves to peer devices that are on the same physical LAN and store information about the network. LLDP allows a device to learn higher layer management reachability and connection endpoint information from adjacent devices.

Each switch with an active LLDP agent sends and receives messages on all physical interfaces enabled for LLDP transmission. These messages are sent periodically and are typically configured for short time intervals to ensure that accurate information is always available. These messages are then stored for a configurable period of time, and contained within the received packet. The message information expires and is discarded when the configured value is met. The only other time an advertisement is sent is when a relevant change takes place in the switch. If information changes for any reason, the LLDP agent is notified and sends out and update the new values.

12.2.2.1 LLDP Data Units

A single LLDP Data Unit (LLDPDU) is transmitted in a single 802.3 Ethernet frame. The basic LLDPDU includes a header and a series of Type-Length-Value elements (TLVs). Each TLV advertises different types of information, such as its device ID, type, or management addresses.

LLDP advertises the following TLVs by default:

- port-description
- system-capabilities
- system-description
- system-name
- management-address
- port-vlan

12.2.2.2 Transmission and Reception

Every device that uses LLDP has its own LLDP agent. The LLDP agent is responsible for the reception, transmission, and management of LLDP. When LLDP is enabled on a port, transmission and reception of LLDPDUs are both enabled by default, but the agent can be configured to only transmit or only receive.

Transmission

When LLDP transmission is enabled, the LLDP agent advertises information about the switch to neighbors at regular intervals. Each transmitted LLDPDU contains the mandatory TLVs, and any enabled optional TLVs.

Reception

When LLDP reception is enabled, the LLDP agent receives and stores advertised information from neighboring devices.

12.2.2.3 Storing LLDP Information

Whenever the switch receives a valid and current LLDP advertisement from a neighbor, it stores the information in a Simple Network Management Protocol (SNMP) Management Information Base (MIB).

12.2.2.4 Guidelines and Limitations

LLDP has the following configuration limitations:

- LLDP must be enabled globally before it can be enabled on an interface.
- LLDP is not supported on virtual interfaces.
- LLDP can discover only one device per port.

12.2.3 LLDP Configuration Procedures

These sections describe the following configuration processes:

- Enabling LLDP Globally
- Enabling LLDP on an Interface
- Optional LLDP Parameters
- Clearing LLDP Statistics
- Displaying LLDP Information

12.2.3.1 Enabling LLDP Globally

The lldp run command globally enables LLDP on the Arista switch. Once LLDP is enabled, the switch will transmit advertisements from the ports that are configured to send TLVs. The neighbor information table is populated as advertisements from the neighbors arrive on the ports.

Example

This command enables LLDP globally on the Arista switch.

```
switch(config)# lldp run
switch(config)#
```

12.2.3.2 Enabling LLDP on an Interface

When enabling LLDP, it is enabled on all interfaces by default. By using the lldp transmit and lldp receive commands, LLDP can be enabled or disabled on individual interfaces or configured to only send or only receive LLDP packets.

Example

- These commands enable ***interface ethernet port 3/1*** to transmit LLDP packets.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# lldp transmit
```

```
switch(config-if-Et3/1)#
```

- These commands enable ***interface ethernet port 3/1*** to receive LLDP packets.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# lldp receive
switch(config-if-Et3/1)#
```

12.2.3.3 Optional LLDP Parameters

The following sections describe these tasks:

- Setting the LLDP Timer
- Setting the LLDP Hold Time
- Setting the LLDP Re-initialization Timer
- Setting the IP Management Address to be used in the TLV
- Selecting the LLDP TLVs
- Configuring LLDP for Power over Ethernet

12.2.3.3.1 Setting the LLDP Timer

The lldp timer command specifies the time in seconds between LLDP updates sent by the switch.

Examples

- This command specifies that the LLDP updates should be sent every ***120*** seconds.

```
switch(config)# lldp timer 120
switch(config)#
```

- This command reverts the LLDP timer to its default value of ***30*** seconds.

```
switch(config)# no lldp timer 120
switch(config)#
```

12.2.3.3.2 Setting the LLDP Hold Time

The lldp hold-time command sets the amount of time a receiving device should retain the information sent by the device.

Examples

- This command specifies that the receiving device should retain the information for ***180*** seconds before discarding it.

```
switch(config)# lldp hold-time 180
switch(config)#
```

- This command reverts the LLDP hold time and to the default value of ***120*** seconds.

```
switch(config)# no lldp hold-time 180
switch(config)#
```

12.2.3.3.3 Setting the LLDP Re-initialization Timer

The lldp run command specifies the amount in time in seconds to delay the re-initialization attempt by the switch.

Example

This command specifies that the switch waits ***10*** seconds before attempting to re-initialize.

```
switch(config)# lldp timer reinitialization 10
switch(config)#
```

12.2.3.3.4 Setting the IP Management Address to be used in the TLV

The lldp management-address command specifies the IP management address or the IP address of the VRF interface in LLDP Type-Length-Value (TLV) triplets.

Example

This command specifies the IP management address to be used in the TLV.

```
switch(config)# lldp management-address ethernet 3/1
switch(config)#
```

12.2.3.3.5 Selecting the LLDP TLVs

The lldp tlv transmit command specifies which Type, Length, and Value elements (TLVs) are to be included in LLDP packets. The **`no lldp tlv transmit`** command removes the TLV configuration.

Example

This command enables the system descriptions to be included in the TLVs.

```
switch(config)# lldp tlv transmit system-description
switch(config)#
```

12.2.3.3.6 Configuring LLDP for Power over Ethernet

Initial Power over Ethernet (PoE) power-level negotiation with a Powered Device (PD) takes place in hardware (see Configuring Power over Ethernet (PoE)). Once hardware negotiation has taken place, IEEE 802.3at Power Via MDI Type-Length-Value elements (TLVs) are included by default in LLDP packets sent to connected PDs to allow LLDP to further negotiate power needs. LLDP allows the switch to deal with more granular power requests from PDs, and also allows dynamic power-level setting. TLVs received from connected Power-Sourcing Equipment (PSE) are ignored.

Note: Power Via MDI TLVs are not sent (even when enabled) under the following circumstances:

1. there is a user-configured power limit on the port, or
2. hardware negotiation sets the power to higher than class ***4*** because ***IEEE 802.3bt***, which increases the maximum power output for PoE, is not yet supported by LLDP.

To disable Power Via MDI TLVs globally, use the no lldp tlv transmit command and specify the Power Via MDI TLV. Hardware negotiation and manual power limits will remain in effect.

Example

This command disables the sending of Power Via MDI TLVs globally.

```
switch(config)# no lldp tlv transmit power-via-mdi
switch(config)#
```

To disable Power Via MDI TLVs on an individual interface, use the poe negotiation lldp disabled command. Hardware negotiation and manual power limits will remain in effect.

Example

These commands disable the sending of Power Via MDI TLVs on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe negotiation lldp disabled
switch(config-if-Et5)#
```

New LLDP Fields Defined by IEEE 802.3at-2009

Arista switches *do not* support the following new LLDP/SNMP fields defined in ***IEEE standard 802.3at-2009***:

- **Power type** a LldpXdot3RemPowerType
- **Power source** a LldpXdot3RemPowerSource
- **Power priority** a LldpXdot3RemPowerPriority
- **PD requested power value** a LldpXdot3RemPDRequestedPowerValue
- **PSE allocated power value** a LldpXdot3RemPSEAllocatedPowerValue

12.2.3.4 Clearing LLDP Statistics

- clear lldp counters
- clear lldp table

12.2.3.5 Displaying LLDP Information

- Viewing LLDP Global Information
- Viewing LLDP Local Information
- Viewing LLDP Neighbors
- Viewing LLDP Traffic

12.2.3.5.1 Viewing LLDP Global Information

The show lldp command displays LLDP information.

Examples

- This command displays global information about LLDP.

```
switch# show lldp
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size
Port       Tx Enabled  Rx Enabled
Et3/1      Yes         Yes

switch#
```

- This command displays LLDP information.

```
switch# show lldp ethernet interface 3/1
```

```
LLDP transmit interval      : 30 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
switch#
```

12.2.3.5.2 Viewing LLDP Local Information

The show lldp local-info command displays the information contained in the LLDP TLVs to be sent about the local system.

Example

This command displays information contained in the TLVS about the local systems.

```
switch# show lldp local-info management 1
Local System:
  - Chassis ID type: MAC address (4)
    Chassis ID     : 001c.730f.11a8
  - System Name: "switch.aristanetworks.com"
  - System Description: "Arista Networks EOS version 4.13.2F running on
 an Arista
Networks DCS-7150S-64-CL"
  - System Capabilities : Bridge, Router
    Enabled Capabilities: Bridge

Interface Management1:
  - Port ID type: Interface name (5)
    Port ID     : "Management1"
  - Port Description: ""
  - Management Address Subtype: IPv4 (1)
    Management Address        : 172.22.30.154
    Interface Number Subtype  : ifIndex (2)
    Interface Number          : 999001
    OID String                :
  - IEEE802.1 Port VLAN ID: 0
  - IEEE802.1/IEEE802.3 Link Aggregation
    Link Aggregation Status: Not Capable (0x00)
    Port ID                : 0
  - IEEE802.3 Maximum Frame Size: 1518 bytes
switch(config)#
```

12.2.3.5.3 Viewing LLDP Neighbors

The show lldp neighbors command displays information about LLDP neighbors.

Examples

- This command shows information about LLDP neighbors.

```
switch# show lldp neighbor
Last table change time   : 0:12:33 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0
```

```
Port      Neighbor Device ID              Neighbor Port ID           TTL
Et3/1     tg104.sjc.aristanetworks.com    Ethernet3/2                120

Ma1/1     dc1-rack11-tor1.sjc             1/1                        120
switch#
```

- This command displays detailed information about the neighbor ***ethernet 3/1***.

```
switch# show lldp neighbor ethernet 3/1
Last table change time   : 0:16:24 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID              Neighbor Port ID           TTL
Et3/1     tg104.sjc.aristanetworks.com    Ethernet3/2                120
switch#
```

12.2.3.5.4 Viewing LLDP Traffic

The show lldp counters command displays the LLDP traffic information for the switch.

Example

This command displays the LLDP counters on the switch.

```
switch# show lldp counters
Port          Tx Frames Tx Length Exceeded

Et20              69485                  0
Et21              69394                  0
Et22              69203                  0
Et23              57546                  0
Et24                  0                  0
Ma1               69665                  0
Port      Rx Frames     Rx Errors    Rx Discard  TLVs Discard  TLVs Unknown

Et20          69470             0             0             0             0
Et21          69383             0             0             0             0
Et22          69143             0             0             0             0
Et23          55370             0             0             0             0
Et24              0             0             0             0             0
Ma1           69078         69078             0         69078             0
switch#
```

12.2.4 LLDP Configuration Commands

Global Configuration Commands

- lldp hold-time
- lldp management-address
- lldp management-address vrf
- lldp receive packet tagged drop
- lldp run
- lldp timer
- lldp timer reinitialization
- lldp tlv transmit

Interface Configuration Commands – Ethernet Interface

- lldp receive
- lldp transmit
- poe negotiation lldp disabled

Privileged EXEC Commands

- clear lldp counters
- clear lldp table

EXEC Commands

- show lldp
- show lldp counters
- show lldp local-info
- show lldp neighbors

12.2.4.1 clear lldp counters

The **clear lldp counters** command resets the LLDP counters to zero.

Command Mode

Privileged EXEC

Command Syntax

clear lldp counters [**SCOPE**]

Parameters

SCOPE Session affected by command. Options include:

- ***no parameter*** command affects counters on all CLI sessions.
- **session** clears LLDP counters for the current CLI session only.

Examples

- This command resets all the LLDP counters to zero.

```
switch(config)# clear lldp counters
switch(config)#
```

- This command resets only the LLDP counters for the current CLI session.

```
switch(config)# clear lldp counters session
switch(config)#
```

12.2.4.2 clear lldp table

The **clear lldp table** command clears neighbor information from the LLDP table.

Command Mode

Privileged EXEC

Command Syntax

clear lldp table

Example

This command clears neighbor information from the LLDP table.

```
switch(config)# clear lldp table
switch(config)#
```

12.2.4.3 lldp hold-time

The **lldp hold-time** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it.

Command Mode

Global Configuration

Command Syntax

lldp hold-time ***period***

no lldp hold-time

default lldp hold-time

Parameters

period The amount of time a receiving device should hold LLDPDU information before discarding it. Value ranges from ***10*** to ***65535*** second; default value is ***120*** seconds.

Examples

- This command sets the amount of time before the receiving device discards LLDPDU information to ***180*** seconds.

```
switch(config)# lldp hold-time 180
switch(config)#
```

- This command restores the hold-time to its default value of ***120*** seconds.

```
switch(config)# no lldp hold-time 180
switch(config)#
```

12.2.4.4 lldp management-address

The **lldp management-address** command enables the user to add the IP management address used for LLDP Type-Length-Value (TLV).

Command Mode

Global Configuration

Command Syntax

lldp management-address [**INTERFACE**]

no lldp management-address [**INTERFACE**]

default lldp management-address [**INTERFACE**]

Parameters

INTERFACE Interface type and number. Options include:

- **all** all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.

Examples

- This command specifies the IP management address to be used in the TLV.

```
switch(config)# lldp management-address ethernet 3/1
switch(config)#
```

- This command removes the IP management address used in the TLV.

```
switch(config)# no lldp management-address ethernet 3/1
switch(config)#
```

- This command specifies that ***vlan200*** is used in the TLV.

```
switch(config)# lldp management-address vlan 200
switch(config)#
```

- This command removes the VLAN ID used in the TLV.

```
switch(config)# no lldp management-address vlan 200
switch(config)#
```

12.2.4.5 lldp management-address vrf

The **lldp management-address vrf** command enables the user to add the IP address of the VRF interface used in LLDP Type-Length-Value (TLV).

Command Mode

Global Configuration

Command Syntax

lldp management-address vrf VRF_INSTANCE

no lldp management-address vrf VRF_INSTANCE

default lldp management-address vrf VRF_INSTANCE

Parameters

VRF_INSTANCE specifies the VRF instance.

Examples

- This command specifies the management address VRF to be used in the TLV.

```
switch(config)# lldp management-address vrf test 1
switch(config)#
```

- This command removes the management VRF used in the TLV.

```
switch(config)# no lldp management-address vrf test 1
switch(config)#
```

12.2.4.6 lldp receive

The **lldp receive** command enables LLDP packets on an interface. The **no lldp receive** command disables the acceptance of LLDP packets.

Command Mode

Interface-Ethernet configuration

Interface-Management configuration

Command Syntax

lldp receive

no lldp receive

default lldp receive

Examples

- These commands enable the reception of LLDP packets on ***interface ethernet 4/1***.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# lldp receive
switch(config-if-Et4/1)#
```

- These commands disable LLDP the reception of LLDP packets on ***interface ethernet 4/1***.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# no lldp receive
switch(config-if-Et4/1)#
```

12.2.4.7 lldp receive packet tagged drop

The **`lldp receive packet tagged drop`** command is a global configuration command and when configured the LLDP ignores all the packets with **VLAN-tag**. By default, this command is disabled.

Command Mode

Global Configuration

Command Syntax

`lldp receive packet tagged drop`

Example

This command when configured, the LLDP ignores all the packets with **VLAN-tag**.

```
switch(config)# lldp receive packet tagged drop
```

12.2.4.8 lldp run

The **lldp run** command enables LLDP on the switch.

Command Mode

Global Configuration

Command Syntax

lldp run

no lldp run

default lldp run

Examples

- This command enables LLDP globally on the switch.

```
switch(config)# lldp run
switch(config)#
```

- This command disables LLDP globally on the switch.

```
switch(config)# no lldp run
switch(config)#
```

12.2.4.9 lldp timer reinitialization

The **lldp timer reinitialization** command sets the time delay in seconds for LLDP to initialize.

Command Mode

Global Configuration

Command Syntax

lldp timer reinitialization ***delay***

no lldp timer reinitialization

default lldp timer reinitialization

Parameters

delay the amount of time the device should wait before re-initialization is attempted. Value ranges from ***1*** to ***20*** seconds; default value is ***2*** seconds.

Examples

- This command specifies that the switch should wait ***10*** seconds before attempting to re-initialize.

```
switch(config)# lldp timer reinitialization 10
switch(config)#
```

- This command restores the default initialization delay of ***2*** seconds.

```
switch(config)# no lldp timer reinitialization 10
switch(config)#
```

12.2.4.10 lldp timer

The **lldp timer** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it. The **no lldp timer** command removes the configured LLDP timer.

Command Mode

Global Configuration

Command Syntax

lldp timer ***transmission_time***

no lldp timer

default lldp timer

Parameters

transmission_time the period of time at which LLDPDUs are transmitted. Values range from ***5*** to ***32768*** seconds; the default is ***30*** seconds.

Examples

- This command configures a period of ***180*** seconds at which the LLDPDUs are transmitted.

```
switch(config)# lldp timer 180
switch(config)#
```

- This command removes the configured period of time at which the LLDPDUs are transmitted.

```
switch(config)# no lldp timer 180
switch(config)#
```

12.2.4.11 lldp tlv transmit

The **lldp tlv transmit** command allows the user to specify the Type-Length-Values (TLVs) to include in LLDP packets.

Command Mode

Global Configuration

Command Syntax

lldp tlv transmit TLV_NAME

no lldp tlv transmit TLV_NAM

default lldp tlv transmit TLV_NAME

Parameters

TLV_NAME Options include:

- **link-aggregation** specifies the link aggregation TLV.
- **management-address** specifies the management address TLV.
- **max-frame-size** specifies the Frame size TLV.
- **port-description** specifies the port description TLV.
- **port-vlan** specifies the port VLAN ID TLV.
- **power-via-mdi** specifies the power over Ethernet TLV.
- **system-capabilities** specifies the system capabilities TLV.
- **system-description** specifies the system description TLV.
- **system-name** specifies the system name TLV.

Examples

- This command enables the system description TLV:

```
switch(config)# lldp tlv transmit system-description
switch(config)#
```

- This command disables the system description TLV:

```
switch(config)# no lldp tlv transmit system-description
switch(config)#
```

- This command enables the max-frame-size TLV:

```
switch(config)# lldp tlv transmit max-frame-size
switch(config)#
```

- This command disables the max-frame-size TLV:

```
switch(config)# no lldp tlv transmit max-frame-size
switch(config)#
```

12.2.4.12 lldp transmit

The **lldp transmit** command enables the transit of LLDP packets on an interface.

Command Mode

Interface-Ethernet configuration

Interface-Management configuration

Command Syntax

lldp transmit

no lldp transmit

default lldp transmit

Examples

- These commands enable the transmission of LLDP packets.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# lldp transmit
switch(config-if-Et4/1)#
```

- These commands disable the transmission of LLDP packets.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# no lldp transmit
switch(config-if-Et4/1)#
```

12.2.4.13 poe negotiation lldp disabled

Power Via MDI TLVs are included by default in LLDP packets sent to Power over Ethernet (PoE) Powered Devices (PDs) to allow dynamic negotiation of power levels. The **poe negotiation lldp disabled** command disables the sending of Power Via MDI TLVs from the configuration-mode interface.

The **no poe negotiation lldp disabled** and **default poe negotiation lldp disabled** commands restore the default behavior (sending Power Via MDI TLVs) by removing the corresponding **poe negotiation lldp disabled** command from ***running-config***.

To disable Power Via MDI TLVs globally, use the no lldp tlv transmit command and specify the Power Via MDI TLV.

Command Mode

Interface-Ethernet configuration

Command Syntax

poe negotiation lldp disabled

no poe negotiation lldp disabled

default poe negotiation lldp disabled

Example

These commands disable the sending of power via MDI TLVs on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe negotiation lldp disabled
switch(config-if-Et5)#
```

12.2.4.14 show lldp counters

The **show lldp counters** command displays LLDP traffic information for the switch.

Command Mode

EXEC

Command Syntax

show lldp counters [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the LLDP counters on the switch.

```
switch# show lldp counters

Port          Tx Frames Tx Length Exceeded

Et20              69485                  0
Et21              69394                  0
Et22              69203                  0
Et23              57546                  0
Et24                  0                  0
Ma1               69665                  0

Port          Rx Frames     Rx Errors    Rx Discard  TLVs Discard  TLVs Unknown

Et20              69470             0             0             0             0
Et21              69383             0             0             0             0
Et22              69143             0             0             0             0
Et23              55370             0             0             0             0
Et24                  0             0             0             0             0
Ma1               69078         69078             0         69078             0
```

12.2.4.15 show lldp local-info

The **show lldp local-info** command displays LLDP errors and overflows.

Command Mode

EXEC

Command Syntax

show lldp local-info [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the specific LLDP errors and overflows on ***management interface 1***.

```
switch# show lldp local-info management 1
Local System:
  - Chassis ID type: MAC address (4)
    Chassis ID     : 001c.730f.11a8qqq
  - System Name: "switch.aristanetworks.com"
  - System Description: "Arista Networks EOS version 4.13.2F running on
 an Arista
Networks DCS-7150S-64-CL"
  - System Capabilities : Bridge, Router
    Enabled Capabilities: Bridge

Interface Management1:
  - Port ID type: Interface name (5)

  - IEEE802.3 Maximum Frame Size: 1518 bytes
se505.16:01:44#
switch#
```

12.2.4.16 show lldp neighbors

The **show llpd neighbors** command displays information about the switch's LLDP neighbors.

Command Mode

EXEC

Command Syntax

show lldp neighbors [**INTERFACE**][**INFO_LEVEL**]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** displays information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** Displays information for all interfaces.
  - **detailed** LLDP information for all the adjacent LLDP devices.

Examples

- This command displays the neighbor's information about LLDP.

```
switch(config)# show lldp neighbors
Last table change time   : 0:12:33 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID             Neighbor Port ID      TTL
Et3/1     tg104.sjc.aristanetworks.com   Ethernet3/2           120

Ma1/1     dc1-rack11-tor1.sjc            1/1                   120
switch#
```

- This command displays LLDP neighbor information for ***interface ethernet 3/1***.

```
switch# show lldp neighbors ethernet 3/1
Last table change time   : 0:16:24 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID             Neighbor Port ID       TTL
Et3/1     tg104.sjc.aristanetworks.com   Ethernet3/2            120
switch#
```

- This command displays detailed LLDP neighbor information for ***interface ethernet 3/1***.

```
switch# show lldp neighbors 3/1 detail

Interface Ethernet 3/1 detected 1 LLDP neighbors:

  Neighbor 001c.7300.1506/Ethernet6/25, age 8 seconds
  Discovered 5 days, 3:58:58 ago; Last changed 5 days, 3:56:57 ago

      Interface Number           : 999999
      OID String                 :
    - IEEE802.1 Port VLAN ID: 1
    - IEEE802.1/IEEE802.3 Link Aggregation
      Link Aggregation Status: Capable, Disabled (0x01)
      Port ID                : 0
    - IEEE802.3 Maximum Frame Size: 9236 bytes
switch#
```

12.2.4.17 show lldp

The **show lldp** command displays LLDP information.

Command Mode

EXEC

Command Syntax

show lldp [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command displays all LLDP information.

```
switch# show lldp
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : test

Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size

Port       Tx Enabled  Rx Enabled
Et3/1      Yes         Yes

switch#
```

- This command displays specific information about LLDP for ***interface ethernet 3/1***.

```
switch# show lldp ethernet 3/1
LLDP transmit interval      : 30 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default

Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
switch#
```

- This command displays specific information about LLDP for ***management interface 1/1***.

```
switch# show lldp management 1/1
```

```
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default

Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size

Port       Tx Enabled  Rx Enabled
Ma1/1      Yes         Yes
switch#
```

12.3 Virtual LANs (VLANs)

This chapter describes Arista's Virtual LANs (VLANs) implementation and MAC address tables.

Sections in this chapter include:

12.3.1 VLAN Introduction

Arista switches support industry standard 802.1q VLANs. Arista EOS provides tools to manage and extend VLANs throughout the data center network.

12.3.2 VLAN Conceptual Overview

12.3.2.1 VLAN Definition

A Virtual Local Area Network (VLAN) allows a group of devices to communicate as if they were in the same network regardless of their physical location. VLANs are Layer 2 structures based on the 802.1Q standard.

These parameters are associated with a VLAN:

- VLAN number (***1-4094***): VLAN numbers uniquely identify the VLAN within a network. `VLAN 1` exists by default; all other VLANs only exist after they are configured.
- VLAN name (optional): The VLAN name is a text string that describes the VLAN.
- VLAN state (***active*** or ***suspended***): The state specifies the VLAN transmission status within the switch. In the ***suspended*** state, VLAN traffic is blocked on all switch ports. The default state is ***active***.

VLANs define Layer 2 broadcast domains in a Layer 2 network, in which each device can receive broadcast frames sent by any other within the domain. Switches accommodating multiple broadcast domains serve as multi-port bridges where each broadcast domain is a distinct virtual bridge. Traffic does not pass directly between different VLANs within a switch or between two switches.

12.3.2.2 VLAN Switching

Ethernet and port channel interfaces are configured as switched ports by default. Switched ports are configurable as members of one or more VLANs. Switched ports ignore all IP-level configuration commands, including IP address assignments.

12.3.2.2.1 VLAN Trunking and Trunk Groups

Trunking extends multiple VLANs beyond the switch through a common interface or port channel.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs, i.e., VLANs configured in a trunk group are pruned of all ports that are not associated with the trunk group. See the Trunk Ports example section for further details.

Note: Be cautious when using allowed VLAN lists or trunk groups to ensure that the VLAN topology is consistent with any Layer-2 control protocol topology, or unpredictable results can occur.

VLAN traffic is carried through Ethernet or LAG ports. A port's switchport mode defines the number of VLANs for which the port can carry traffic.

- Access ports carry traffic for one VLAN – the access VLAN. Access ports associate untagged frames with the access VLAN. Access ports drop tagged frames that are not tagged with the access VLAN.
- Trunk ports carry traffic for multiple VLANs. Tag frames specify the VLAN for which trunk ports process packets.

12.3.2.2.2 Q-in-Q Trunking

A Q-in-Q network is a multi-tier layer 2 VLAN network. A typical Q-in-Q network is composed of a service provider network (tier 1) where each node connects to a customer network (tier 2).

802.1ad is a networking standard that supports Q-in-Q networks by allowing multiple 802.1Q tags in an Ethernet frame.

Each interface in a customer network is assigned to a customer-VLAN (c-VLAN). Packets in c-VLANs contain 802.1q tags that switch traffic within the network. c-VLANs access the service provider VLAN (s-VLAN) through a provider switch. Customer switch ports connect to an s-VLAN through provider switch edge ports, which are configured as dot1q ports and operate as follows:

- **Inbound traffic (from customer switches)**: adds an s-VLAN tag, then forwards packets to the provider network.
- **Outbound traffic (to customer switches)**: removes the s-VLAN tag, then forwards packets to the customer network.

12.3.2.2.3 TPID (Configurable Ethertypes)

By default, VLAN-tagged packets carry a Tag Protocol Identifier (TPID) of 0x8100. On some Arista platforms, however, the TPID of a switchport can be modified in accordance with IEEE 802.1ad to allow for the use of 802.1q TPIDs other than 0x8100. Well known and standard tags include:

0x8100 customer VLAN.

- **0x88a8** service VLAN tag used in provider bridging.
- **0x9100** service VLAN tag used in provider bridging (common, but not standardized).

Other non-standard TPID values may also be configured for interoperability with legacy equipment or non-standard systems. Values range from 0x600 (1536) through 0xFFFF (65535).

Non-default TPID values are most commonly used for provider bridging on a network-to-network interface.

12.3.2.3 VLAN Routing

Each VLAN can be associated with a Switch Virtual Interface (SVI), also called a VLAN interface. The VLAN interface functions in a routed network (Layer 3) with an assigned IP subnet address. Connecting different VLANs requires Layer 3 networking.

12.3.2.3.1 VLAN Interfaces

A Switched Virtual Interface (SVI) connects to the VLAN segment on the switch to provide Layer 3 processing for packets from the VLAN. An SVI can be activated only after it is connected to a VLAN. SVIs are typically configured for a VLAN to a default gateway for a subnet to facilitate traffic routing with other subnets.

In a Layer 3 network, each VLAN SVI is associated with an IP subnet, with all stations in the subnet members of the VLAN. Traffic between different VLANs is routed when IP routing is enabled.

12.3.2.3.2 Internal VLANs

A routed port is an Ethernet or port channel interface that functions as a Layer 3 interface. Routed ports do not bridge frames nor switch VLAN traffic. Routed ports have IP addresses assigned to them and packets are routed directly to and from the port.

The switch allocates an internal VLAN for an interface when it is configured as a routed port. The internal VLAN is assigned a previously unused VLAN ID. The switch prohibits the subsequent configuration of VLANs and VLAN interfaces with IDs corresponding to allocated internal VLANs.

12.3.2.3.3 Support for Private VLAN

Private VLAN is a feature that segregates a regular VLAN broadcast domain while maintaining all ports in the same IP subnet. There are three types of VLAN within a private VLAN:

1. **Primary VLAN**: Ports in the primary VLAN can send and or receive traffic from ports in all the corresponding PVLANs. There is only one primary VLAN in a private VLAN.
2. **Community VLAN**: This is a secondary VLAN. Hosts in a community VLAN forward traffic to each other as well as ports in the primary VLAN. There are multiple community VLANs in a private VLAN.
3. **Isolated VLAN**: This is a secondary VLAN. Hosts in an isolated VLAN only forward traffic to ports in the primary VLAN. Hosts within an isolated VLAN can not communicate with each other useing bridging. There are multiple isolated VLANs in a private VLAN.

12.3.2.3.3.1Limitations

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

- Private VLAN and Algomatch features are mutually exclusive. Disable algomatch with the **`hardware access-list mechanism tcam`** command . Note that this requires a reload of the system to take effect.
- L2 and L3 multicast traffic is not supported.

On All Platforms except 7300X3, CCS-720XP, DCS-7050X3

Private VLAN and IPv4/IPv6 uRPF features are mutually exclusive.

On All Platforms

- Tunnel termination on PVLAN ports is not supported.
- Ingress IPv4/IPv6 RACLs on the primary VLAN are not honored for packets ingressing through ports in secondary VLANs.
- Only isolated private VLAN trunks and normal trunk ports are supported. It allows trunk ports to forward and receive traffic for all primary and or secondary VLANs. An isolated trunk translates traffic coming in on a primary VLAN to the lowest valued secondary VLAN on the trunk port.
- Private VLAN is not supported on L2 subinterfaces.
- Hardware accelerated Sflow is not supported on Private VLAN ports.
- VLAN Mapping and or Translation is not supported with Private VLAN.

12.3.2.3.3.2Show Commands

- Use the **`show vlan private-vlan`** command to display the primary and secondary defined VLANs:

```
switch# show vlan private-vlan
Primary Secondary Type         Ports
------- --------- ----------- ------------------------
100      101      community    Et1, Et6
```

```
100      102      isolated     Et1, Et7, Et8
200      201      community    Et10, Et9
```

- Use the **show vlan 100,101,102,200,201** command to diplay which interfaces are member of which VLANs:

```
# show vlan 100,101,102,200,201
VLAN  Name          Status    Ports
----- ------------- --------- -------------------------------
100   VLAN0100      active    Et1, Et6+, Et7+, Et8+
101   VLAN0101      active    Et1+, Et6
102   VLAN0102      active    Et1+, Et7, Et8
200   VLAN0200      active    Et10
201   VLAN0201      active    Et10+, Et9

+ indicates a private VLAN promoted port
```

Promoted ports are displayed to indicate they are part of the same broadcast domain as the indicated VLAN. Interfaces in a primary VLAN are included in the display of all its associated secondary VLANs. Interfaces in secondary VLANs are included in the display of both its primary VLAN and its own domain.

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

Use the **show platform sand pvlan interfaces** command to display the status of the interfaces to configure a private VLAN.

```
switch# show platform sand pvlan interfaces
Interface           Secondary      Primary     State
                         VLAN         VLAN
-----------------  ----------  ----------  ---------
Ethernet6                 101         100    enabled
Ethernet7                 102         100    enabled
Ethernet8                 102         100    enabled
Po1                       102         100    enabled
Ethernet9                 201         200     failed
Po2                       202         200     failed
```

In this output, the **Secondary VLAN** column indicates the VLAN which is configured on the interface. The **Primary VLAN** column indicates the primary VLAN to which the secondary VLAN belongs to. The **State** field has three possible values - enabled, failed, configured. The **enabled** state indicates that the private VLAN is configured and enabled on that interface. The **failed** state indicates that the private VLAN configuration has failed for that interface The **configured** state indicates that private VLAN is configured on that interface but has not taken effect. When port channels are configured in a private VLAN, it is enabled only if entries for all the member interfaces are successfully programmed in the hardware. If the hardware entries for any one of the member interfaces fails, the entries for other member interfaces are also removed from the hardware and the state is marked as failed.

12.3.2.3.4 VLAN Translation

VLAN translation allows you to map packets from one VLAN to another. This can be carried out only on packets having a dot1q header (tagged frames). The translation rewrites the Vlan ID field (VID) in dot1q headers on packets passing through a switched port without changing any other fields.

VLAN translation also supports the ability to translate packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

When configuring the VLAN translation mode, consider the following:

- VLAN translation is only supported for tagged packets.
- BPDUs from STP, LLDP and other protocols are not affected by this mapping.
- VLAN translation is not applicable for access ports.
- Untagged packets entering the switch on the trunk native VLAN are not mapped.
- TPID and VLAN priority does not get re-written during the translation.

12.3.3 VLAN Configuration Procedures

These sections describe basic VLAN configuration tasks.

- Creating and Configuring VLANs
- Configuring VLAN Switching
- Creating and Configuring VLAN Interfaces
- Allocating Internal VLANs
- Private VLAN Configuration
- Configuring VLAN Translation

12.3.3.1 Creating and Configuring VLANs

The CLI provides two methods of creating VLANs.

- Explicitly through the vlan command.
- Implicitly through the switchport access vlan command.

The switchport access vlan command generates a warning message when it creates a VLAN.

To create a VLAN, use the **`vlan`** command in global configuration mode. Valid VLAN numbers range between ***1*** and ***4094***. To create multiple VLANs, specify a range of VLAN numbers.

To edit an existing VLAN, enter the **`vlan`** command with the number of the existing VLAN.

Examples

- This command creates ***VLAN 45*** and enters VLAN configuration mode for the new VLAN.

```
switch(config)# vlan 45
switch(config-vlan-45)#
```

- Use the name (VLAN configuration mode) command to assign a name to a VLAN.

  These commands assign the name Marketing to ***VLAN 45***.

```
switch(config)# vlan 45
switch(config-vlan-45)# name Marketing
switch(config-vlan-45)# show vlan 45

VLAN Name                            Status    Ports
---- ------------------------------- --------- -------
45   Marketing                       active    Et1

switch(config-vlan-45)#
```

- To change a VLAN's state, use the state command in VLAN configuration mode.

  These commands suspend ***VLAN 45***. VLAN traffic is blocked on all switch ports.

```
switch(config)# vlan 45
switch(config-vlan-45)# state suspend
switch(config-vlan-45)# show vlan 45
```

```
VLAN Name                              Status    Ports
---- --------------------------------- --------- ------
45   Marketing                         suspended

switch(config-vlan-45)#
```

- These commands activate ***VLAN 45***.

```
switch(config)# vlan 45
switch(config-vlan-45)# state active
switch(config-vlan-45)# show vlan 45

VLAN Name                              Status    Ports
---- --------------------------------- --------- ------
45   Marketing                         active    Et1

switch(config-vlan-45)#
```

12.3.3.1.1 VLAN Policy

The VLAN policy configuration command enables a switch to configure a VLAN policy when it receives a packet with unknown destination MAC address on a VLAN. The mac address forwarding command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default behavior is to flood the L2 miss packets on all ports of the VLAN.

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

Examples

- These commands create a ***vlan 333*** and then set the unicast policy to ‘drop’ and the multicast policy to ‘log’ for the specific ***vlan 333***.

```
switch(config)# vlan 333
switch(config-vlan-333)# mac address forwarding unicast miss action
 drop
switch(config-vlan-333)# mac address forwarding multicast miss action
 log
```

- These commands display the VLAN policy that was defined when ***vlan 333*** is created.

```
switch(config)# show vlan 333 mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
 333  flood         flood
```

- These commands display the VLAN policy type that was defined when ***vlan 333*** is configured with the ‘drop’ unicast policy and the ‘log’ multicast policy.

```
switch(config)# show vlan 333 mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
 333  drop          log

switch(config)# show vlan mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
   1  flood         flood
 333  drop          log
```

12.3.3.2 Configuring VLAN Switching

The following describe the configuration of VLAN ports.

12.3.3.2.1 Access Ports

Access ports carry traffic for one VLAN, as designated by a switchport access vlan command. Access ports associate untagged frames with the access VLAN. Tagged frames received by the interface are dropped unless they are tagged with the access VLAN.

To configure an interface group as an access port, use the switchport mode command.

Examples

- These commands configure ***interface ethernet 1*** as an access port.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport mode access
switch(config-if-Et1)#
```

- To specify the port’s access VLAN, use the **`switchport access vlan`** command.

  These commands configure ***vlan 15*** as the access VLAN for ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport access vlan 15
switch(config-if-Et5)#
```

- These commands configure interface Ethernet ***1*** through ***3*** as access ports that process untagged frames as ***vlan 5*** traffic.

```
switch(config)# interface Ethernet 1-3
switch(config-if-Et1-3)# switchport mode access
switch(config-if-Et1-3)# switchport access vlan 5
switch(config-if-Et1-3)# show interfaces ethernet 1-3 vlans
Port       Untagged Tagged
Et1        None     23,25
Et2        18       -
Et3        None     14
switch(config-if-Et1-3)#
```

12.3.3.2.2 Trunk Ports

Trunk ports carry traffic for multiple VLANs. Messages use tagged frames to specify the VLAN for which trunk ports process traffic.

- The **vlan trunk list** specifies the VLANs for which the port handles tagged frames. The port drops any packets tagged for VLANs not in the VLAN list.
- The **native vlan** is the VLAN where the port switches untagged frames.

To configure an interface group as a trunk port, use the switchport mode command.

Example

These commands configure ***interface ethernet 8*** as a trunk port.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# switchport mode trunk
switch(config-if-Et8)#
```

By default all VLANs are permitted on a port configured with 'switchport mode trunk'. To limit the port's VLAN trunk list, use the **switchport trunk allowed vlan** command. Only VLANs in the allowed list will be permitted.

Examples

- These commands configure VLAN ***15***, ***20***, ***21***, ***22***, ***40***, and ***75*** as the explicitly permitted VLAN trunk list for ethernet interface ***12-16***.

  ```
  switch(config)# interface ethernet 12-16
  switch(config-if-Et12-16)# switchport trunk allowed vlan 15,20-22,40,75
  switch(config-if-Et12-16)#
  ```

- These commands explicitly permit VLAN ***100*** through ***120*** to the VLAN trunk list for ***interface ethernet 14***.

  ```
  switch(config)# interface ethernet 14
  switch(config-if-Et14)# switchport trunk allowed vlan add 100-120
  switch(config-if-Et14)#
  ```

- To specify the port's native VLAN, use the **switchport trunk native vlan** command.

  These commands configure ***vlan 12*** as the native VLAN trunk for ***interface ethernet 10***.

  ```
  switch(config)# interface ethernet 10
  switch(config-if-Et10)# switchport trunk native vlan 12
  switch(config-if-Et10)#
  ```

- By default, ports send native VLAN traffic with untagged frames. The **switchport trunk native vlan** command can also configure the port to send native VLAN traffic with tag frames.

  These commands configure ***interface ethernet 10*** to send native VLAN traffic as tagged.

  ```
  switch(config)# interface ethernet 10
  switch(config-if-Et10)# switchport trunk native vlan tag
  switch(config-if-Et10)#
  ```

- These commands configure ***interface ethernet 12*** as a trunk with ***vlan 15*** as the native VLAN. The port's trunk list includes all VLANs except ***201-300***.

  ```
  switch(config)# interface ethernet 12
  switch(config-if-Et12)# switchport mode trunk
  switch(config-if-Et12)# switchport trunk native vlan 15
  switch(config-if-Et12)# switchport trunk allowed vlan except 201-300
  switch(config-if-Et12)#
  ```

- Assume that all ports on the switch are configured with switchport mode trunk similar to Ethernet ***1*** and ***2*** shown below:

```
!
interface ethernet 1
    switchport mode trunk
!
interface ethernet 2
    switchport mode trunk
!
```

- Further assume that ***vlan 30*** is not configured as part of a trunk group.

```
switch# show vlan
VLAN  Name                             Status    Ports
----- -------------------------------- --------- ----------
1     default                          active    Et1, Et2
30    vlan30                           active    Et1, Et2
```

- Now configure ***vlan 30*** as part of ***trunk group 30***:

```
switch(config)# vlan 30
switch(config-vlan-30)# trunk group 30
```

- This updates the VLAN membership for ***vlan 30***.

```
switch#show vlan
VLAN  Name                             Status    Ports
----- -------------------------------- --------- -----------
1     default                          active    Et1, Et2
30    vlan30                           active
```

Note: ***Vlan 30*** is no longer on Et1, Et2 i.e. it has been 'pruned' due to the trunk group command in the vlan configuration.

- To permit ***vlan 30*** on ***Et1***, you need to associate the interface with the trunk group as follows:

```
switch(config-if-Et1)# switchport trunk group 30

Now we see Et1 included in the vlan 30 list

switch# show vlan
VLAN  Name                             Status    Ports
----- -------------------------------- --------- ----------
1     default                          active    Et1, Et2
30    vlan30                           active    Et1
```

- The trunk group command is not additive to the allowed VLAN command.

```
interface ethernet 1
        switchport mode trunk
        switchport trunk allowed vlan 10
        switchport trunk group trunk30

Vlan 30 will not be permitted on the interface as it is not listed in
 the allowed
vlan list.
```

12.3.3.2.3 Dot1q Tunnel Ports

Dot1q (802.1Q) is a tunneling protocol that encapsulates traffic from multiple customer (c-tag) VLANs in an additional single outer service provider (s-tag) VLAN for transit across a larger network structure

that includes traffic from all customers. Tunneling eliminates the service provider requirement that every VLAN be configured from multiple customers, avoiding overlapping address space issues.

Tunneling preserves the inner VLANs through the tunneled network; these inner VLANs are ignored by intermediate devices that make forwarding decisions based only on the outermost VLAN tag (S-Tag)

A dot1q-tunnel port sits at the edge of the tunneled network. Unlike regular access ports, a dot1q-tunnel port does not drop traffic that arrives with ***802.1Q*** tags in place; it ignores existing 802.1Q information and associates arriving traffic (with or without ***802.1Q*** headers) with a new tunnel VLAN ID.

Packets arriving at a tunnel port are encapsulated with an additional ***802.1Q*** tag that can be trunked between multiple devices like any traditional VLAN. When exiting a dot1-tunnel port, the S-Tag is removed to revert the customer traffic to its original tagged or untagged state.

To configure an interface group as a dot1q tunnel port, use the **`switchport mode`** command.

Example

These commands configure ***interface ethernet 12*** as a dot1q tunnel port.

```
switch(config)# interface ethernet 12
switch(config-if-Et12)# switchport mode dot1q-tunnel
switch(config-if-Et12)#
```

To specify the dot1q-tunnel port's access VLAN, use the **`switchport access vlan`** command. The port then handles all inbound traffic as untagged VLAN traffic.

Example

These commands configure ***vlan 60*** as the access VLAN for ***interface ethernet 12***.

```
switch(config)# interface ethernet 12
switch(config-if-Et12)# switchport access vlan 60
switch(config-if-Et12)#
```

12.3.3.2.4 TPID Configuration

The default Tag Protocol IDentifier (TPID, also called dot1q ethertype) on all switch ports is 0x8100. To configure a different TPID on a port, use the switchport dot1q ethertype command. This feature is available only on 7280E and 7500E platforms.

Note: If dot1q tunneling is enabled on the interface, a TPID configured on the interface becomes irrelevant.

Example

In this provider bridging example, ***interface ethernet 1*** is the user network interface and ***interface ethernet 2*** is the network-to-network interface. These commands configure dot1q tunneling on ***interface ethernet 1*** and set the TPID of ***interface ethernet 2*** to ***0x9100***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport mode dot1q-tunnel
switch(config-if-Et1)# interface ethernet 2
switch(config-if-Et2)# switchport mode trunk
switch(config-if-Et2)# switchport dot1q ethertype 0x9100
switch(config-if-Et2)#
```

In the above configuration, packets from ***Et1*** to ***Et2*** will undergo dot1q-tunneling (stacking of an additional dot1q tag), with an outer TPID of 0x9100 at egress, while packets with outer TPID 0x9100 going from ***Et2*** to ***Et1*** will have the outer tag removed at egress.

12.3.3.2.5 Layer 2 802.1Q Encapsulation

Layer 2 traffic encapsulation is enabled on the configuration mode interface for a specified VLAN through l2-protocol encapsulation dot1q vlan.

Example

These commands enable traffic encapsulation for ***vlan 200*** traffic passing through ***interface ethernet 5/2***.

```
switch(config)# interface ethernet 5/2
switch(config-if-Et5/2)# l2-protocol encapsulation dot1q vlan 200
```

12.3.3.2.6 Port VLAN Scaling on DCS-7160

Port VLAN scaling allows the user to configure a subset of ports in the scale mode. The switchport vlan forwarding command forwards packets between the ports belonging to VLAN in the interface configuration mode. Port-VLAN table is used for storing the configuration on a per port/VLAN combination. The scaling configuration is applicable on a per-port basis and supports a maximum of ***128*** ports.

Note: The configuration is applicable to trunk ports only.

Example

- This command enables VLAN scaling on a port with an ***interface ethernet 2***.

```
switch# config terminal
switch(config)# interface ethernet 2
switch(config-if-Et2)# switchport vlan forwarding accept all
```

- This command disables VLAN scaling on a port.

```
switch# config
switch(config)# interface ethernet 2
switch(config-if-Et2)# no switchport vlan forwarding accept all
```

12.3.3.3 Creating and Configuring VLAN Interfaces

The interface vlan command places the switch in ***VLAN-interface*** configuration mode for modifying an SVI. An SVI provides a management address point and Layer 3 processing for packets from all VLAN ports.

Example

This command enters ***VLAN-interface*** configuration mode for ***vlan 12***. The command also creates ***vlan 12*** interface if it was not previously created.

```
switch# config t
switch(config)# interface vlan 12
switch(config-if-Vl12)#
```

12.3.3.4 Allocating Internal VLANs

The vlan internal order command specifies the VLANs that the switch allocates as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order. The default allocation range is between VLAN ***1006*** and VLAN ***4094***.

The **no switchport** command converts an Ethernet or port channel interface into a routed port, disabling Layer 2 switching for the interface.

Examples

- This command configures the switch to allocate internal VLANs in ascending order starting with ***1006***.

```
switch(config)# vlan internal order ascending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order starting with ***4094***.

```
switch(config)# vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order from ***4094*** through ***4000***.

```
switch(config)# vlan internal order descending range 4000 4094
switch(config)#
```

12.3.3.5 Private VLAN Configuration

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

- On systems with algomatch hardware, the access-list mechanism must explicitly be set to TCAM using the following command. Ignore this step when on non-algomatch hardware based systems.

```
switch(config)# hardware access-list mechanism tcam
```

- To enable the private VLAN feature, you must also enable the forwarding-ID feature.

```
switch(config)# platform sand l2 forwarding-id sharing
```

On All Platforms

- Any regular VLAN can act as a primary without any extra configuration. The only requirement is that the VLAN must be active. Use the following command to configure a VLAN as active or inactive:

```
switch(config)# vlan 100
```

```
switch(config)# no vlan 100
```

```
switch(config)# default vlan 100
```

- Configure VLANs as secondary inside the ***VLAN*** configuration mode. Use the configuration to specify the primary VLAN as isolated and the type of secondary VLAN:

```
switch(config)# vlan 20
switch(config-vlan-20)# private-vlan isolated primary vlan 10
switch(config)# vlan 30
switch(config-vlan-30)# private-vlan community primary vlan 10
```

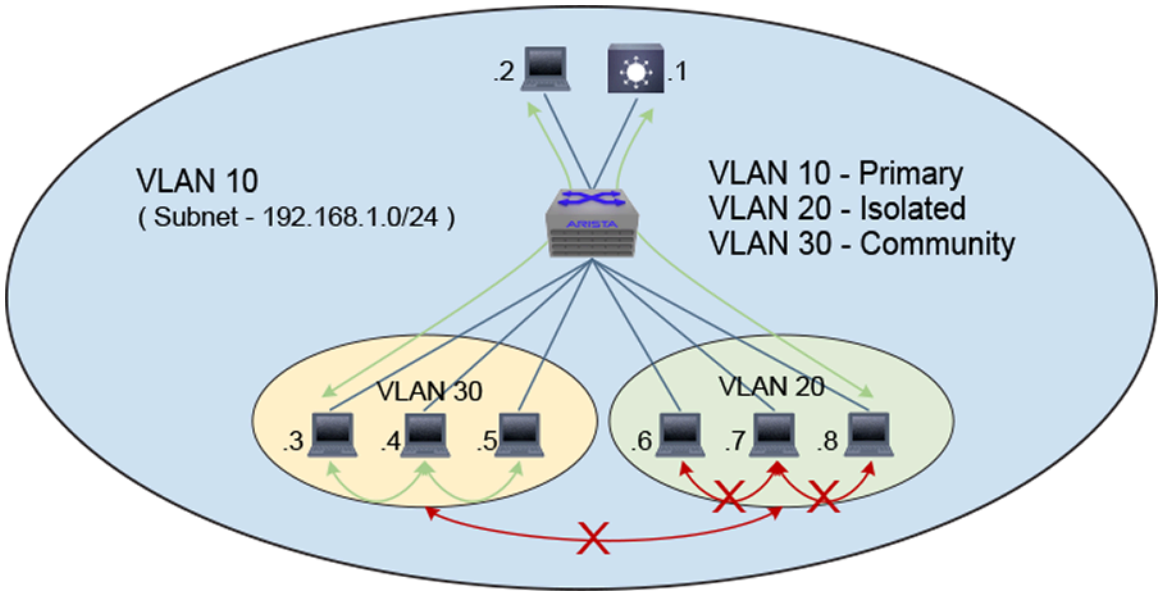

Figure 29: Support for Private VLAN

- Interfaces are assigned to primary or secondary VLANs in the same way as regular VLANs. It works with both access and trunk ports. The following shows the standard switchport command configuring an access interface to the secondary VLAN configured before:

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# switchport access vlan 20
```

- Trunk ports forward any traffic within the allowed VLANs configured on the interface, whether they are primary or secondary VLANs. To configure trunk ports to translate traffic from primary VLAN to secondary (this maps to the lowest secondary VLAN if multiple are allowed) configure the following on the trunk port:

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# switchport trunk private-vlan secondary
```

Steps to Unconfigure

On all Platforms

- To unconfigure a private VLAN, use the following command. This reverts the VLAN back to a regular VLAN. At this point, the broadcast domain for this VLAN adjusts and all hosts start to be learned in the regular VLAN, as opposed to the primary VLAN. The MAC table entries previously learned on the primary VLAN are not used anymore for forwarding.

```
switch(config-vlan-20)# no private-vlan
```

- To restore trunk port behavior to allow traffic on all primary and secondary VLANs:

```
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)# no switchport trunk private-vlan secondary
```

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

To unconfigure forwarding-id sharing:

```
switch(config)# no platform sand l2 forwarding-id sharing
```

```
Note: This configuration needs the device to be rebooted to take effect.
```

12.3.3.6 Configuring VLAN Translation

VLAN translation changes the VLAN ID of specified packets entering or leaving a port. The following sections describe the configuration of VLAN translation.

12.3.3.6.1 Per-port VLAN Translation on Switched Ports

The switchport vlan translation command allows translation of the VLAN tag of traffic entering or exiting a switched port.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the switchport mode command.

Examples

- This command configures ***interface ethernet 5*** as a trunk port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport mode trunk
switch(config-if-Et5)#
```

- By default, the translation is bidirectional: packets ingressing an interface through ***vlan A*** are internally mapped to ***vlan B***; ***vlan B*** packets egressing the same interface are mapped to ***vlan A***.
  - These commands map ***interface ethernet 5*** traffic with dot1q tag ***50*** to bridging ***vlan 60***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation 50 60
switch(config-if-Et5)#
```

  - These commands provides multiple 1:1 VLAN mappings under an interface.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation 50 60
switch(config-if-Et5)# switchport vlan translation 61 71
switch(config-if-Et5)# switchport vlan translation 62 72
switch(config-if-Et5)#
```

  - These commands translate only incoming packets.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation in 50 60
switch(config-if-Et5)#
```

  - These commands translate only egress packets.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation out 60 50
switch(config-if-Et5)#
```

12.3.3.6.2 Per-port VLAN Translation on Routed Ports

On routed ports, the encapsulation dot1q vlan command (permitted only on routed ports) configures the VLAN on the interface to act as the native VLAN. This command will map packets ingressing with the specified VLAN ID to the internal VLAN ID of the routed port. All traffic egressing out of the routed port will be tagged with the VLAN ID specified in the command.

Example

These commands translate between ***vlan 50*** and the internal VLAN for ***interface ethernet 5*** (a routed port).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)#encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

12.3.3.6.3 Double VLAN Translation

Double VLAN translation creates mappings between an inner and outer VLAN ID pair of a double-tagged packet and a single bridging VLAN. On ingress, specified double-tagged packets are mapped to the bridging VLAN, and on egress packets with the ID of the bridging VLAN are double tagged as specified. By default, the translation is bidirectional, but it can be applied only on ingress or egress.

Example

These commands causes packets entering ***interface ethernet 3/1*** with an outer VLAN ID of ***1000*** and an inner VLAN ID of ***100*** to be processed in bridging ***vlan 200***.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# switchport vlan translation in 1000 inner 100
 200
switch(config-if-Et3/1)#
```

12.3.4 VLAN Configuration Commands

Global VLAN Configuration Commands

- interface vlan
- vlan
- vlan internal order

VLAN Configuration Mode Commands

- mac address forwarding
- name (VLAN configuration mode)
- state
- trunk group

Layer 2 Interface (Ethernet and Port Channel) Configuration Commands

- switchport access vlan
- switchport dot1q ethertype
- switchport mode
- switchport trunk allowed vlan
- switchport trunk group
- switchport trunk native vlan
- switchport vlan forwarding
- switchport vlan translation

VLAN Interface Configuration Mode Commands

- autostate
- encapsulation dot1q vlan
- l2-protocol encapsulation dot1q vlan
- pvlan mapping

Show Commands

- show dot1q-tunnel
- show interfaces switchport
- show interfaces switchport backup-link
- show interfaces switchport vlan mapping
- show interfaces trunk
- show interfaces vlans
- show pvlan mapping interfaces
- show vlan
- show vlan brief count
- show vlan dynamic
- show vlan internal allocation policy
- show vlan internal usage
- show vlan trunk group

12.3.4.1 autostate

When **autostate** is **enabled**, the VLAN interface will be up when:

- the corresponding VLAN exists and is in the active state.
- one or more Layer 2 ports in the VLAN are up and in spanning-tree forwarding state.
- the VLAN interface exists and is not in a shutdown state.

Autostate is **enabled** by default. When autostate is **disabled**, the VLAN interface is forced to be active.

- The **no autostate** command disables autostate on the configuration mode interface. The **no autostate** command is stored to ***running-config***.
- The **autostate** command enables the autostate function on the configuration mode VLAN SVI by removing the corresponding **no autostate** statement from ***running-config***.
- The **default autostate** command restores the autostate default state of **enabled** by removing the corresponding **no autostate** statement from ***running-config***.

Command Mode

Interface-VLAN Configuration

Command Syntax

autostate

no autostate

default autostate

Guidelines

Autostate should be disabled on SVIs configured as an MLAG local interface.

Examples

- These commands disable autostate on ***vlan 100***.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# no autostate
switch(config-if-Vl100)#
```

- These commands enable autostate on ***vlan 100***.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# autostate
switch(config-if-Vl100)#
```

12.3.4.2 encapsulation dot1q vlan

Routed Port VLAN Translation

In the configuration mode for an Ethernet or port channel interface, the **`encapsulation dot1q vlan`** translates packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port, and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

Subinterface VLAN Assignment

When used in the configuration mode for an Ethernet or port channel subinterface, however, the **`encapsulation dot1q vlan`** command assigns a dot1q tag to the subinterface. Traffic ingressing on the parent interface with that dot1q tag will then be sent to the configured subinterface. See **Subinterfaces** and **Subinterface Configuration** for details.

The **`no encapsulation dot1q vlan`** and **`default encapsulation dot1q vlan`** commands restore the default VLAN to the configuration mode interface by removing the corresponding **`encapsulation dot1q vlan`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-port-channel Configuration

Subinterface-Ethernet Configuration

Subinterface-port-channel Configuration

Command Syntax

`encapsulation dot1q vlan` ***vlan_id***

`no encapsulation dot1q vlan`

`default encapsulation dot1q vlan`

Parameters

vlan_id For VLAN translation, the ID of the external VLAN to be translated; for subinterface configuration, the VLAN of the subinterface. Values range from ***1*** to ***4094***.

Examples

- These commands translate between ***vlan 50*** and the internal VLAN for ***interface ethernet 5*** (a routed port).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

- These commands assign packets ingressing on ***interface ethernet 1/1*** with ***vlan ID 100*** to subinterface ***ethernet 1/1.1***.

```
switch(config)# interface ethernet1/1.1
switch(config-if-Et1/1.1)# no switchport
switch(config-if-Et1/1.1)# encapsulation dot1q vlan 100
switch(config-if-Et1/1.1)#
```

12.3.4.3 interface vlan

The **`interface vlan`** command places the switch in VLAN-interface configuration mode for modifying parameters of the Switch Virtual Interface (SVI). An SVI provides Layer 3 processing for packets from all ports associated with the VLAN. There is no physical interface for the VLAN.

When entering configuration mode to modify existing SVIs, the command can specify multiple interfaces. The command creates an SVI if the specified interface does not exist prior to issuing the command. When creating an SVI, the command can only specify a single interface.

The **`no interface vlan`** command deletes the specified SVI interfaces from **`running-config`**. The **`default interface vlan`** commands remove all configuration statements for the specified SVI interfaces from ***running-config*** without deleting the interfaces.

Command Mode

Global Configuration

Command Syntax

`interface vlan` ***v_range***

`no interface vlan` ***v_range***

`default interface vlan` ***v_range***

Parameter

v_range VLAN interfaces (number, range, or comma-delimited list of numbers and ranges). VLAN number ranges from ***1*** to ***4094***.

Restrictions

Internal VLANs: A VLAN interface cannot be created or configured for internal VLAN IDs. The switch rejects any interface vlan command that specifies an internal VLAN ID.

Example

This example creates an SVI for ***vlan 12***:

```
switch# config
switch(config)# interface vlan 12
switch(config-if-Vl12)#
```

12.3.4.4 l2-protocol encapsulation dot1q vlan

The **l2-protocol encapsulation dot1q vlan** command enables Layer 2 802.1Q traffic encapsulation on the configuration mode interface for a specified VLAN. The default VLAN for all interfaces is VLAN 1.

The **no l2-protocol encapsulation dot1q vlan** and **default l2-protocol encapsulation dot1q vlan** commands disable the specified encapsulation on the configuration mode interface by removing the corresponding **l2-protocol encapsulation dot1q vlan** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

l2-protocol encapsulation dot1q vlan ***vlan_id***

no l2-protocol encapsulation dot1q vlan

default l2-protocol encapsulation dot1q vlan

Parameters

vlan_id the ID of the native VLAN. Values range from ***1*** to ***4094***.

Example

These commands enable 802.1Q encapsulation of traffic on ***vlan 200***.

```
switch(config)# interface ethernet 5/2
switch(config-if-Et5/2)# l2-protocol encapsulation dot1q vlan 200
switch(config-if-Et5/2)# show active
interface Ethernet5/2
   l2-protocol encapsulation dot1q vlan 200
switch(config-if-Et5/2)#
```

12.3.4.5 mac address forwarding

The **mac address forwarding** command enables a switch to configure a VLAN policy when it receives a packet with an unknown destination MAC address on a VLAN. The command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default state is to flood the L2 miss packets on all ports of the VLAN.

The **show vlan** command displays information about the VLAN policy that is being configured.

The **no** form and the **default** form of the command removes the previously configured VLAN policy on the VLAN.

Command Mode

VLAN Configuration

Command Syntax

mac address forwarding [unicast | multicast] **miss action** [drop | flood | log]

no mac address forwarding [unicast | multicast] **miss action** [drop | flood | log]

default mac address forwarding [unicast | multicast] **miss action** [drop | flood | log]

Parameters

- **unicast** the unicast type of transmission.
- **multicast** the multicast type of transmission.
- **drop** the selected packets are dropped.
- **flood** the selected packets are flooded in the specific VLAN.
- **log** the selected packets are sent to the CPU for logging purpose.

Guidelines

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

Examples

- These commands create a ***vlan 333*** and then set the unicast policy to **drop** and the multicast policy to **log** for the specific ***vlan 333***.

```
switch(config)# vlan 333
switch(config-vlan-333)# mac address forwarding unicast miss action
 drop
switch(config-vlan-333)# mac address forwarding multicast miss action
 log
```

- These commands display the VLAN policy that was defined when ***vlan 333*** is created.

```
switch(config)# show vlan 333 mac address forwarding
```

```
VLAN  UcMissAction  McMissAction
----  ------------  ------------
 333  flood         flood
```

- These commands display the VLAN policy type that was defined when ***vlan 333*** is configured with the **`drop`** unicast policy and the **`log`** multicast policy.

```
switch(config)# show vlan 333 mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
 333  drop          log

switch(config)#show vlan mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
   1  flood         flood
 333  drop          log
```

12.3.4.6 name (VLAN configuration mode)

The **name** command configures the VLAN name. The name can have up to 32 characters. The default name for VLAN 1 is **default**. The default name for all other VLANs is VLANxxxx, where xxxx is the VLAN number. The default name for ***vlan 55*** is ***VLAN0055***. The show vlan command displays the VLAN name.

The **name** command accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from ***running-config***.

Command Mode

VLAN Configuration

Command Syntax

name ***label_text***

no name

default name

Parameters

label_text character string assigned to name attribute. Maximum length is ***32*** characters. The space character is not permitted in the name string.

Example

These commands assign ***corporate_100*** as the name for ***vlan 25***, then displays the VLAN name.

```
switch(config)# vlan 25
switch(config-vlan-25)# name corporate_100
switch(config-vlan-25)# show vlan 25
VLAN  Name                            Status    Ports
----- ------------------------------- --------- ---------
25    corporate_100                   active

switch(config-vlan-25)#
```

12.3.4.7 pvlan mapping

The pvlan mapping command maps a Switch Virtual Interface (SVI) available in the primary VLAN to the secondary VLAN or VLANs in the VLAN configuration mode. The show pvlan mapping interfaces command displays the list of mapped VLANs.

The **`no pvlan mapping`** and **`default pvlan mapping`** commands restore the default state of the private VLAN mapping.

Command Mode

VLAN Configuration

Command Syntax

`pvlan mapping` {**add** | **remove** | *vlan ID*}

`no pvlan mapping` {**add** | **remove** | *vlan ID*}

`default pvlan mapping` {**add** | **remove** | *vlan ID*}

Parameters

- **add** adding VLANs to the PVLAN mapping of the current VLAN interface.
- **remove** removing VLANs from the PVLAN mapping of the current VLAN interface.
- ***vlan ID*** The secondary VLAN IDs of the private VLAN mapping. The IDs range from ***1*** to ***4094***.

Related Commands

show pvlan mapping interfaces

Example

These commands assign a secondary VLAN ID of ***50*** to the primary VLAN.

```
switch(config)# vlan 25
switch(config-vlan-25)# pvlan mapping 50
switch(config-vlan-25)#
```

12.3.4.8 show dot1q-tunnel

The **show dot1q-tunnel** command displays the ports that are configured in dot1q-tunnel switching mode. The switchport mode command configures the switching mode for the configuration mode interface.

Command Mode

EXEC

Command Syntax

show dot1q-tunnel [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Valid ***range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the ports that are configured in dot1q-tunnel switching mode.

```
switch> show dot1q-tunnel
dot1q-tunnel mode LAN Port (s)
------------------------------
Po4
Po21
Po22
switch>
```

12.3.4.9 show interfaces switchport backup-link

The **show interfaces switchport backup-link** command displays interfaces that are configured as switchport backup pairs and the operational status of each interface. For each pair, the command displays the names, roles, status, and VLAN traffic of each interface.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] **switchport backup-link**

show interfaces switchport backup-link [module {Fabric ***f_num*** | Linecard ***lc_num*** | Supervisor ***svr_num*** | Switchcard | ***1-2*** | ***3-6*** }]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** Display information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.

    Valid ***e_range***, ***l_range***, ***m_range***, ***p_range***, and ***v_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **module** Displays interfaces of the specified module. Options include:
  - **Fabric *f_num*** Displays interfaces of the specified fabric module. Value ranges from ***1*** to ***6***.
  - **Linecard *lc_num*** Displays interfaces of the specified linecard module. Value ranges from ***3*** to ***6***.
  - **Supervisor *svr_num*** Displays interfaces of the specified supervisor module. Accepted values are ***1*** and ***2***.
  - **Switchcard** Displays interfaces of switchcard modules.
  - ***1-2*** Displays interfaces of the specified supervisor module.
  - ***3-6*** Displays interfaces of the specified linecard module.

Display Values

- **State** Operational status of the interface. Values include:
  - **Up** Spanning tree mode is *backup*, interface status is **up**.
  - **Down** Spanning tree mode is *backup*, interface status is **down**.
  - **Inactive Configuration** The spanning tree mode is not **backup**.
- **Forwarding vlans** VLANs forwarded by the interface. Depends on interface operation status and prefer option specified by the **switchport backup** command.

Examples

- This command displays the configured switchport primary-backup pairs.

```
switch> show interfaces switchport backup-link
Switch backup interface pair: Ethernet3/17, Ethernet3/8
Primary Interface: Ethernet3/17     State:  Inactive Configuration
Backup Interface:  Ethernet3/8      State:  Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
```

```
Mac move destination: ff:ff:ff:ff:ff:ff
```

- This command displays interfaces of the module for ***linecard 4***.

```
switch(config)# show int switchport backup-link module Linecard 4
Switch backup interface pair: Ethernet4/19/1, Ethernet4/19/2
Primary Interface: Ethernet4/19/1   State:  Inactive Configuration
Backup Interface:  Ethernet4/19/2   State:  Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
Mac move destination: ff:ff:ff:ff:ff:ff
```

12.3.4.10 show interfaces switchport vlan mapping

The **show interfaces switchport vlan mapping** command displays mapping information of the configured VLANs in an interface mode.

Command Mode

EXEC

Command Syntax

show interfaces switchport vlan mapping

Examples

- This command displays mapping information of the configured VLAN IDs.

```
switch# show interfaces switchport vlan mapping
--------------
Ethernet3
                                    Direction   Direction
Original Vlan  New Vlan  Status    Configured  Active
-------------- --------- --------- ----------- -----------
10             100       Active    In/Out      In/Out
11             200       Active    In          In
300            12        Active    Out         Out
```

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)# show interfaces switchport vlan mapping
--------------
Ethernet3/1
Direction     Direction

```

12.3.4.11 show interfaces switchport

The **`show interfaces switchport`** command displays the switching configuration and operational status of the specified ports.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`switchport`**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display the switching status for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.

  Valid ***e_range***, ***l_range***, ***m_range***, ***p_range***, and ***v_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command displays the switching status for all interfaces.

```
switch(config)# show interface switchport
Default switchport mode: access

Name: Et5/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

Name: Et5/2
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

[...]

switch(config)#
```

- This command displays the switching status of port channel interfaces ***21*** and ***22***.

```
switch> show interface port-channel 21-22 switchport
```

```
Name: Po21
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 100 (VLAN0100)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups: foo

Name: Po22
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups:

switch>
```

- This command displays the configured status of VLAN scaling for the ***interface ethernet 2/1*** port.

```
switch# show interface Ethernet 2/1 switchport
Name: Ethernet 2/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
MAC Address Learning: enabled
Dot1q ethertype/TPID: 0x8100 (active)
Dot1q VLAN Tag: Allowed
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:
Source interface filtering: enabled
VLAN forwarding mode: allConfiguredVlans

switch>
```

12.3.4.12 show interfaces trunk

The **show interfaces trunk** command displays configuration and status information for interfaces configured in switchport trunk mode.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **trunk**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

  Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the trunk status for all interfaces configured in switchport trunk mode.

```
switch> show interfaces trunk
Port            Mode            Status          Native vlan
Po1             trunk           trunking        1
Po2             trunk           trunking        1

Port            Vlans allowed
Po1             1-15
Po2             16-30

Port            Vlans allowed and active in management domain
Po1             1-10
Po2             21-30

Port            Vlans in spanning tree forwarding state
Po1             1-10
Po2             21-30

switch>
```

12.3.4.13 show interfaces vlans

The **show interfaces vlans** command displays a table that lists the VLANs that are carried by the specified interfaces. Interfaces that do not carry VLANs are not listed in the table. The table lists the untagged (native or access) and tagged VLANs for each interface.

Command Mode

EXEC

Command Syntax

show interfaces [**INT_NAME**] **vlans**

Parameters

INT_NAME Interface type and number. Values include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.

Example

This command displays the VLANs carried by all L2 ports.

```
switch> show interfaces vlans
Port       Untagged Tagged
Et9        3910     -
Et11       3912     -
Et16       500      -
Et17       3908     -
Et18       3908     -
Po1        1        101-102,500,721,3000,
Po2        101      -
Po4        3902     -
Po5        3903     -
Po6        3992     -
Po7        661      -
Po8        3911     -
```

12.3.4.14 show pvlan mapping interfaces

The **show pvlan mapping interfaces** command displays information about the private VLAN mapping interfaces.

Command Mode

EXEC

Command Syntax

show pvlan mapping interfaces

Example

This command displays information about the private VLAN mapping interfaces.

```
switch(config)# int vlan 50
switch(config-if-Vl50)# pvlan mapping 70
switch(config-if-Vl50)# show pvlan mapping interfaces
Interface    Secondary Vlans
---------    ---------------
Vlan50       70
```

12.3.4.15 show vlan

The **show vlan** command displays the VLAN ID, name, status, and member ports of all configured VLANs. The command only displays active ports by default; by specifying **configured-ports**, the command displays all ports that are members of a configured VLAN regardless of their activity status, including Ethernet ports that are members of a port channel.

Command Mode

EXEC

Command Syntax

show vlan [**VLAN_LIST**] [**PORT_ACTIVITY**]

Parameters

- **VLAN_LIST** List of VLANs displayed by command. Options include:
  - ***no parameter*** all VLANs.
  - ***v_range*** VLANs specified by ***v_range***.
  - **id *v_range*** VLANs specified by ***v_range***.
  - **name *v_name*** VLANs specified by the VLAN name ***v_name***.

  v_range formats include number, number range, or comma-delimited list of numbers and ranges.
- **PORT_ACTIVITY** Ports listed in table. Options include:
  - ***no parameter*** table displays only active ports (same as **active-configuration** option).
  - **active-configuration** table displays only active ports.
  - **configured-ports** table displays all configured ports.

Display Values

- **VLAN** The VLAN ID.
- **Name** The name of the VLAN.
- **Status** The status of the VLAN.
- **Ports** The ports that are members of the VLAN.

Examples

- This command displays status and ports of VLANs ***1-1000***.

```
switch> show vlan 1-1000
VLAN  Name                   Status    Ports
----- ---------------------- --------- --------------
1     default                active    Po1
184   fet.arka               active    Cpu, Po1, Po2
262   mgq.net                active    PPo2, Po1
512   sant.test              active    Cpu, Et16, Po1
821   ipv6.net               active    Cpu, Po1, Po7

switch>
```

- This command displays the list of all the member interfaces under each SVI.

```
switch# show vlan
VLAN  Name                   Status    Ports
----- ---------------------- --------- ----------------
1     default                active
2148  VLAN2148               active    Cpu, Et1, Et26
2700  VLAN2700               active    Cpu, Et18
```

12.3.4.16 show vlan brief count

The **show vlan brief count** command displays the number of VLANs that are configured on the switch.

Command Mode

EXEC

Command Syntax

show vlan brief count

Example

This command displays the number of VLANs on the switch.

```
switch> show vlan brief count
Number of existing VLANs           : 18

switch>
```

12.3.4.17 show vlan dynamic

The **show vlan dynamic** command displays the source and quantity of dynamic VLANs on the switch. Dynamic VLANs support VM Tracer monitoring sessions.

Command Mode

EXEC

Command Syntax

show vlan dynamic

Example

This command displays the source and quantity of dynamic VLANs on the switch.

```
switch> show vlan dynamic
Dynamic VLAN source       VLANS
vmtracer-poc              88
switch>
```

12.3.4.18 show vlan internal allocation policy

The **show vlan internal allocation policy** command displays the method the switch uses to allocate VLANs to routed ports. The vlan internal order command configures the allocation method.

The allocation method consists of two configurable components:

- **range:** the list of VLANs that are allocated to routed ports.
- **direction:** the direction by which VLANs are allocated (ascending or descending).

Command Mode

EXEC

Command Syntax

show vlan internal allocation policy

Example

This command displays the internal allocation policy.

```
switch> show vlan internal allocation policy
Internal VLAN Allocation Policy: ascending
Internal VLAN Allocation Range: 1006-4094
switch>
```

12.3.4.19 show vlan internal usage

The **show vlan internal usage** command shows the VLANs that are allocated as internal VLANs for routed ports.

A routed port is an Ethernet or port channel interface that is configured as a layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

When an interface is configured as a routed port, the switch allocates an SVI with a previously unused VLAN ID. The switch prohibits the configuration of VLANs with numbers corresponding to internal VLAN interfaces allocated to a routed port. VLAN interfaces corresponding to SVIs allocated to a routed port cannot be configured by VLAN interface configuration mode commands.

Command Mode

EXEC

Command Syntax

show vlan internal usage

Example

This command displays the VLANs that are allocated to routed ports.

```
switch> show vlan internal usage
1006  Ethernet3
1007  Ethernet4
switch>
```

12.3.4.20 show vlan trunk group

The **show vlan trunk group** command displays the trunk group membership of the specified VLANs.

Command Mode

EXEC

Command Syntax

show vlan [**VLAN_LIST**] **trunk group**

Parameters

VLAN_LIST VLAN list. Options include:

- ***no parameter*** all VLANs.
- ***v_range*** VLANs specified by ***v_range***.
- **id *v_range*** VLANs specified by ***v_range***.
- **name *v_name*** VLANs specified by the VLAN name ***v_name***.

Display Values

- **VLAN** VLAN ID.
- **Trunk Groups** Trunk groups associated with the listed VLANs.

Example

This command displays the trunk group membership of all configured VLANs.

```
switch> show vlan trunk group
VLAN     Trunk Groups
----     ------------------------------------
5
10       first_group
12
40       second_group
100      third_group
101      middle_group
102
200

switch>
```

12.3.4.21 state

The **state** command configures the VLAN transmission state of the configuration mode VLAN.

- **Active state**: Ports forward VLAN traffic.
- **Suspend state**: Ports block VLAN traffic.

The default transmission status is **active**.

The **no state** command restores the default VLAN transmission state to the configuration mode VLAN by removing the corresponding **state** command from ***running-config***.

Command Mode

VLAN Configuration

Command Syntax

state OPERATION_STATE

no state

default state

Parameters

OPERATION_STATE VLAN transmission state. Options include:

- **active** VLAN traffic is forwarded.
- **suspend** VLAN traffic is blocked.

Example

These commands suspend VLAN traffic on VLANs ***100-102***.

```
switch(config)# vlan 100-102
switch(config-vlan-100-102)# state suspend
switch(config-vlan-100-102)#
```

12.3.4.22 switchport access vlan

The **switchport access vlan** command specifies the access VLAN of the configuration mode interface. Ethernet or port channel interfaces that are in access mode are members of only the access VLAN. Untagged frames that the interface receives are associated with the access VLAN. Frames tagged with the access VLAN are also associated with the access VLAN. The interface drops all other tagged frames that it receives. By default, VLAN 1 is the access VLAN of all Ethernet and port channel interfaces.

An interface's access mode is effective only when the interface is in access mode or dot1q-tunnel mode, as specified by the switchport mode command. Interfaces in dot1q-tunnel mode handle inbound traffic as untagged traffic and associate all traffic with the access VLAN. Interfaces configured to switchport trunk mode maintain and ignore existing switchport access commands.

The **no switchport access vlan** and **default switchport access vlan** commands restore ***VLAN 1*** as the access VLAN of the configuration mode interface by removing the corresponding **switchport access vlan** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport access vlan ***v_num***

no switchport access vlan

default switchport access vlan

Parameters

v_num number of access VLAN. Value ranges from ***1*** to ***4094***. Default is ***1***.

Example

These commands assign ***VLAN 100*** as the access VLAN to ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport access vlan 100
switch(config-if-Et5)#
```

12.3.4.23 switchport dot1q ethertype

The **switchport dot1q ethertype** command configures the tag protocol identifier (TPID, also known as a dot1q ethertype), of the configuration mode interface. By default, all switch ports use the standard TPID of ***0x8100***.

The **no switchport dot1q ethertype** and **default switchport dot1q ethertype** commands restore the TPID to ***0x8100*** by removing the corresponding **switchport dot1q ethertype** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

switchport dot1q ethertype ***ethertype***

no switchport dot1q ethertype

default switchport dot1q ethertype

Parameters

ethertype ethertype number (TPID). Value ranges from ***0x600*** (***1536***) through ***0xFFFF*** (***65535***), and can be entered in decimal or hexadecimal notation. Value is stored and displayed in hexadecimal form; the default value is ***0x8100***.

Example

These commands configure ***0x9100*** as the TPID of ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport dot1q ethertype 0x9100
switch(config-if-Et5)#
```

12.3.4.24 switchport mode

The **switchport mode** command specifies the switching mode of the configuration mode interface. The switch supports five switching modes: access, trunk, dot1q-tunnel, tap, and tool.

- **Access switching mode**: The interface is a member of one VLAN, called the access VLAN, as specified by the switchport access vlan command. Tagged frames received on the interface are dropped unless they are tagged with the access VLAN. Frames transmitted from the interface are always untagged.
- **Trunk switching mode**: The interface may be a member of multiple VLANs, as configured by the switchport trunk allowed vlan command. Untagged traffic is associated with the interface's native VLAN, as configured with the switchport trunk native vlan command.
- **Dot1q-tunnel switching mode**: The interface treats all inbound packets as untagged traffic and handles them as traffic of its access VLAN, as specified by the switchport access vlan command.
- **Tap mode**: The interface operates as a tap port. Tap ports receive traffic for replication on one or more tool ports.The interface may be a member of multiple VLANs, as configured by the **switchport tap allowed vlan** command. Untagged traffic is associated with the interface's native VLAN, as configured with the **switchport tap native vlan** command.

Tap ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

Tool mode: The interface operates as a tool port. Tool ports replicate traffic received by tap ports. The interface may be a member of multiple VLANs, as configured by the **switchport tool allowed vlan** command. MAC learning, control plane interaction and traps for inbound traffic are disabled.

Tool ports are in STP forwarding state and prohibit ingress traffic that uses port settings.

The status of switchport configured ports depends on the switch’s tap aggregation mode (which can be viewed by using the **mode** command):

- tap aggregation mode enabled: tap and tool ports are enabled. Switching ports are errdisabled.
- tap aggregation mode disabled: tap and tool ports are errdisabled. Switching ports are enabled.

The **no switchport mode** and **default switchport mode** commands return the configuration mode interface to its default setting as an access port by deleting the corresponding **switchport mode** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport mode MODE_TYPE

no switchport mode

default switchport mode

Parameters

MODE_TYPE switching mode of the configuration mode interfaces. Options include:

- **access** access switching mode.
- **dot1q-tunnel** dot1q-tunnel switching mode.
- **tap** tap switching mode.
- **tool** tool switching mode.
- **trunk** trunk switching mode.

Restrictions

Dot1q-tunnel switching mode is not available on Petra platform switches.

Tap aggregation (tap and tool modes) is available on FM6000 and Arad platform switches.

Example

These commands configure ***interface ethernet 4*** as a trunk port.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# switchport mode trunk
switch(config-if-Et4)#
```

12.3.4.25 switchport trunk allowed vlan

The **`switchport trunk allowed vlan`** command creates or modifies the list of VLANs for which the configuration mode interface, in trunk mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in ***running-config*** without taking effect when the switch is in tap aggregation mode or the interface is not in trunk mode.

The **`no switchport trunk allowed vlan`** and **`default switchport trunk allowed vlan`** commands restore the trunk mode default allowed VLAN setting of **all** by removing the corresponding **`switchport trunk allowed vlan`** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

`switchport trunk allowed vlan` **EDIT_ACTION**

`no switchport trunk allowed vlan`

`default switchport trunk allowed vlan`

Parameters

EDIT_ACTION modifications to the VLAN list.

- ***v_range*** Creates VLAN list from *v_range*.
- **add *v_range*** Adds specified VLANs to current list.
- **all** VLAN list contains all VLANs.
- **except *v_range*** VLAN list contains all VLANs except those specified.
- **none** VLAN list is empty (no VLANs).
- **remove *v_range*** Removes specified VLANs from current list.

Valid ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

These commands create the trunk mode allowed VLAN list of ***6-10*** for ***interface ethernet 14***, then verifies the VLAN list.

```
switch(config)# interface ethernet 14
switch(config-if-Et14)# switchport trunk allowed vlan 6-10
switch(config-if-Et14)# show interfaces ethernet 14 switchport
Name: Et14
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: 6-10
Trunk Groups:

switch(config-if-Et14)#
```

12.3.4.26 switchport trunk group

The **`switchport trunk group`** command assigns the configuration mode interface to the specified trunk group. Trunk group ports handle traffic of the VLANs assigned to the group.

The **`no switchport trunk group`** and **`default switchport trunk group`** commands remove the configuration mode interface from the specified trunk group by deleting the corresponding statement from running-config. If the command does not specify a trunk group, the interface is removed from all trunk groups to which it is assigned.

Note: On platforms which support the use of port channels as mirror destinations, a port channel which is being used as a mirror destination *must not* be assigned to an MLAG.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

`switchport trunk group` [***group_name***]

`no switchport trunk group` [***group_name***]

`default switchport trunk group` [***group_name***]

Parameters

group_name trunk group name.

Example

These commands assign ***port channel 4*** to trunk group ***fe-1***.

```
switch(config)# interface port-channel 4
switch(config-if-Po4)# switchport trunk group fe-1
switch(config-if-Po4)#
```

12.3.4.27 switchport trunk native vlan

The **switchport trunk native vlan** command specifies the trunk mode native VLAN for the configuration mode interface. Interfaces in trunk mode associate untagged frames with the native VLAN. Trunk mode interfaces can also be configured to drop untagged frames. The default native VLAN for all interfaces is VLAN 1.

The **no switchport trunk native vlan** and **default switchport trunk native vlan** commands restore ***vlan 1*** as the trunk mode native VLAN to the configuration mode interface by removing the corresponding **switchport trunk native vlan** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport trunk native vlan **VLAN_ID**

no switchport trunk native vlan

default switchport trunk native vlan

Parameters

- **VLAN_ID** the ID of the native VLAN. Options include:
  - ***v_num*** VLAN number. Value ranges from ***1*** to ***4094***.
  - **tag** interface drops all untagged frames.

Example

These commands configure ***vlan 100*** as the native VLAN for ***port channel 21***.

```
switch(config)# interface port-channel 21
switch(config-if-Po21)# switchport trunk native vlan 100
switch(config-if-Po21)#
```

12.3.4.28 switchport vlan forwarding

The **`switchport vlan forwarding`** command forwards packets between the ports belonging to VLAN in the interface configuration mode. The scaling configuration is applicable on a per-port basis. In the 7160 platform, the hardware uses a Port-VLAN table for storing the configuration on a per port/ VLAN combination and supports a maximum of ***128*** ports.

Note: The configuration is applicable to trunk ports only.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`switchport vlan forwarding` [**accept** | **all**]

Parameters

- **accept** accepts packets for VLAN.
- **all** all VLANs.

Example

This command forwards and accepts all the packets of VLAN of ***interface ethernet 2***.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# switchport vlan forwarding accept all
switch(config-if-Et2)#
```

12.3.4.29 switchport vlan translation

The **`switchport vlan translation`** command allows you to map packets from one VLAN to another using VLAN translation. This is carried out on packets having a dot1q header (tagged frames) only. The translation rewrites the VLAN ID (VID) field in dot1q headers on packets passing through a switched port without changing any other fields.

By default, the translation is bidirectional. The packets ingressing an interface through ***vlan A*** are internally mapped to ***vlan B***; ***vlan B*** packets egressing the same interface are mapped to ***vlan A***.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the **switchport mode** command.

VLAN translation on routed ports is accomplished through the encapsulation dot1q vlan command.

The **`no switchport vlan translation`** and **`default switchport vlan translation`** commands remove VLAN mapping by removing the switchport vlan translation command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

`switchport vlan translation` [**DIRECTION**] ***incoming_vlanid new_vlanid***

`no switchport vlan translation` ***incoming_vlanid new_vlanid***

`no switchport vlan translation` **DIRECTION** ***incoming_vlanid***

`default switchport vlan translation` ***incoming_vlanid new_vlanid***

`default switchport vlan translation` **DIRECTION** ***incoming_vlanid***

Parameters

- **DIRECTION** direction of traffic to be translated.
  - ***no parameter*** translates the specified VLAN IDs for transmitted and received traffic.
  - **in** translates the specified VLAN IDs for received traffic only.
  - **out** translates the specified VLAN IDs for transmitted traffic only.
  - ***incoming_vlanid*** Enter the VLAN ID to be translated. Value ranges from ***1*** to ***4094***.
- ***new_vlanid*** The new VLAN ID or bridging VLAN ID that will be used internally. Value ranges from ***1*** to ***4094***.

Example

- These commands translate only incoming packets, changing the VLAN ID to ***2008*** in the dot1q header of packets ingressing on ***vlan 201***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation in 201 2008
switch(config-if-Et5)#
```

- These commands translate multiple VLAN mappings on an ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation 50 60
switch(config-if-Et5)# switchport vlan translation 61 71
switch(config-if-Et5)# switchport vlan translation 62 72
switch(config-if-Et5)#
```

12.3.4.30 trunk group

The **trunk group** command assigns the configuration mode VLAN to a specified trunk group.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs. Switchport commands specify the physical interfaces that carry trunk group traffic.

The **no trunk group** and **default trunk group** commands remove the configuration mode VLAN from the specified trunk group by removing the corresponding **trunk group** statement from ***running-config***. If a trunk group is not specified, the commands remove the configuration mode VLAN from all trunk groups.

Command Mode

VLAN Configuration

Command Syntax

trunk group [***name***]

no trunk group [***name***]

default trunk group [***name***]

Parameters

name a name representing the trunk group.

Example

These commands assigns ***vlan 49*** to the trunk group ***mlagpeer***:

```
switch(config)# vlan 49
switch(config-vlan-49)# trunk group mlagpeer
switch(config-vlan-49)#
```

12.3.4.31 vlan

The **vlan** command places the switch in VLAN configuration mode to configure a set of virtual LANs. The command creates the specified VLANs if they do not exist prior to issuing the command. A VLAN that is in use as an internal VLAN may not be created or configured. The switch rejects any **vlan** command that specifies an internal VLAN ID.

The **default vlan** and **no vlan** commands removes the VLAN statements from ***running-config*** for the specified VLANs.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

vlan ***vlan_range***

no vlan ***vlan_range***

default vlan ***vlan_range***

Parameters

vlan_range VLAN list.

Formats include a name, number, number range, or comma-delimited list of numbers and ranges.

Commands Available in VLAN Configuration Mode

- name (VLAN configuration mode)
- state
- trunk group

Guidelines

In MLAG configurations, VLANs operate as follows:

- The VLAN must be configured identically on both MLAG peer switches.
- The port-specific bridging configuration originates on the switch where the port is physically located. This configuration includes the switchport access VLAN, switchport mode (trunk or access), trunk-allowed VLANs, the trunk native VLAN, and the switchport trunk groups.

Example

This command creates ***vlan 49*** and enters ***VLAN*** configuration mode for the new VLAN:

```
switch(config)# vlan 49
switch(config-vlan-49)#
```

12.3.4.32 vlan internal order

The **vlan internal order** command specifies the range that the switch can allocate as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order from VLAN ***1006*** to VLAN ***4094***.

The **no vlan internal order** and **default vlan internal order** commands revert the policy to its default.

Command Mode

Global Configuration

Command Syntax

vlan internal order **DIRECTION** [**RANGE_VLAN**]

no vlan internal order

default vlan internal order

Parameters

- **DIRECTION** VLAN allocation number direction. Options include:
  - **ascending** allocates internal VLANs from lower VLAN bound to upper VLAN bound.
  - **descending** allocates internal VLAN from upper VLAN bound to lower VLAN bound.
- **RANGE_VLAN** allocation range. Options include:
  - ***no parameter*** ***1006*** (lower bound) to ***4094*** (upper bound).
  - **range**, **lower**, **upper** specifies lower bound (**lower**) and upper bound (**upper**).

Examples

- This command configures the switch to allocate internal VLANS from ***3000*** through ***3999***.

```
switch(config)# vlan internal order ascending range 3000 3999
switch(config)#
```

- This command configures the switch to allocate internal VLANS from ***4094*** through ***1006***.

```
switch(config)# vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANS from ***4094*** down through ***4000***.

```
switch(config)# vlan internal order descending range 4000 4094
switch(config)#
```

- This command reverts the allocation policy to its default (ascending, between ***1006*** and ***4094***).

```
switch(config)# no vlan internal order
switch(config)#
```

12.4 DCBX and Flow Control

This section describes Data Center Bridging Capability Exchange (DCBX) configuration tasks. Topics in this section include:

12.4.1 Introduction

EOS implements Link Layer Discovery Protocol (LLDP) and the Data Center Bridging Capability Exchange (DCBX) protocol to help automate the configuration of Data Center Bridging (DCB) parameters, including the Priority-Based Flow Control (PFC) standard, which allows an end-to-end flow-control feature.

This feature enables a switch to recognize when it is connected to an iSCSI device and automatically configure the switch link parameters (such as priority flow control) to provide optimal support for that device. DCBX can be used to prioritize the handling of iSCSI traffic to help ensure that packets are not dropped or delayed. DCBX is off by default.

12.4.2 Overview

12.4.2.1 Data Center Bridging Capability Exchange (DCBX)

DCBX works with LLDP to allow switches to exchange information about their Data Center Bridging (DCB) capabilities and configuration and automatically negotiate common Priority-Based Flow Control (PFC) parameters.

Data is exchanged in Type-Length-Value (TLV) format. For DCBX to function on an interface LLDP must be enabled on that interface as well.

12.4.2.2 Priority-Based Flow Control (PFC)

Priority-Based Flow Control (PFC) uses a new control packet defined in IEEE 802.1Qbb and is not compatible with 802.3x Flow Control (FC). An interface that is configured for PFC will be disabled for FC. When PFC is disabled on an interface, the FC configuration for the interface becomes active. Any FC frames received on a PFC configured interface are ignored.

Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

When PFC is disabled, the interface defaults to the IEEE 802.3x flow control setting for the interface. PFC is disabled by default.

12.4.2.3 PFC Watchdog

The PFC watchdog identifies the egress queues that are unable to transmit packets for a long time due to receiving continuous PFC pause frames. On identifying such stuck tx-queue PFC watchdog error-disables the respective port with a error-disable reason of stuck-queue. When there is an error reported on a port the traffic is re-routed through a different port to the destination.

The PFC watchdog supports the following PFC watchdog configurations:

- PFC watchdog forced recovery of queues

- PFC watchdog polling interval configuration
- PFC Watchdog non-disruptive priorities configuration
- Displaying stuck queue and recovery counters

12.4.3 DCBX Configuration and Verification

12.4.3.1 Set the Priority Rank to the Traffic Class

The dcbx application priority command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports ***860*** and ***3260***) should be assigned the given priority of ***5***.

```
switch(config)# dcbx application tcp-sctp 860 priority 5
switch(config)# dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)# dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the **dcbx application tcp-sctp** command. The DCBX peer that iSCSI frames are assigned are the given the priority ***5***.

```
switch(config)# dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)# no dcbx application tcp-sctp 860 priority 5
switch(config)# no dcbx application tcp-sctp 3260 priority 5
```

12.4.3.2 Configuring CEE DCBX Priority Group

The priority-flow-control priority command configures the Enhanced Transmission Selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as ***7*** and sets traffic class priority to ***5***.

```
switch(config)# dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority as ***7*** and bandwidth value to ***70*** percent.

```
switch(config)# dcbx ets traffic-class 7 bandwidth 70
```

12.4.3.3 DCBX Verification

To display the DCBX status and the interfaces on which DCBX is enabled, use the show dcbx command.

Example

This command displays the DCBX status for ***Ethernet 50***.

```
switch# show dcbx Ethernet 50
Ethernet50:
 IEEE DCBX is enabled and active
 Last LLDPDU received on Thu Feb 14 12:06:01 2013
 No priority flow control configuration TLV received
 No application priority configuration TLV received
switch#
```

12.4.4 Configuring Priority-Flow-Control (PFC)

12.4.4.1 Enable Priority-Flow-Control (PFC)

The priority-flow-control command enables Priority-Flow-Control (PFC) on an individual port.

Example

The **priority-flow-control** command in DCBX mode enables PFC on an interface.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
```

12.4.4.2 Set the Priority Flow Control Priority

The priority-flow-control priority command in DCBX mode creates a priority group that pauses priority. Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

Examples

- The **priority-flow-control priority** command in DCBX mode creates a priority group that pauses priority ***5*** on ***interface ethernet 2***.

  ```
  switch(config)# interface ethernet 2
  switch(config-if-Et2)# priority-flow-control on
  switch(config-if-Et2)# priority-flow-control priority 5 no-drop
  ```

- To enable lossy behavior, use the drop option of the **priority-flow-control priority** command.

  ```
  switch(config)# interface ethernet 2
  switch(config-if-Et2)# priority-flow-control on
  switch(config-if-Et2)# priority-flow-control priority 5 drop
  ```

12.4.4.3 Disable Priority-Flow-Control (PFC)

To disable Priority Flow Control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, use the priority-flow-control priority command.

Example

To disable PFC, use the **no priority-flow-control** command.

```
switch (config)# interface ethernet 2
switch(config-if-Et2)# no priority-flow-control
```

12.4.5 Configuring PFC Watchdog

12.4.5.1 Enabling PFC Watchdog

The **priority-flow-control pause watchdog default timeout** command starts monitoring all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled.

Note: To enable PFC watchdog, user is required to configure guaranteed bandwidth on the tx-queue to be monitored. Also, PFC must be enabled on the port for the traffic flowing into the queue that is being monitored.

Example

These commands enable the PFC watchdog monitoring on ***tx-queue 3*** of ***Ethernet 1/1***, and configures a PFC congestion timeout of ***10*** seconds which error-disables the port if the queue is stuck.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default timeout 10
```

12.4.5.2 Enabling PFC Watchdog Queue Recovery

The **priority-flow-control pause watchdog default recovery-time forced** command recovers a stuck queue after the PFC storm ceases. PFC watchdog supports the following two recovery methods.

- Auto Recovery – recover queue(s) after the PFC storm ceases.
- Forced Recovery – recover queue(s) after a fixed duration, irrespective of PFC storm being received.

Note: The default recovery mode is “auto”.

Example

This command recovers a stuck queue after a fixed duration of ***10*** seconds.

```
switch(config)# priority-flow-control pause watchdog default recovery-
time 10 forced
```

12.4.5.3 Configuring PFC Watchdog Polling Interval

The **priority-flow-control pause watchdog default polling-interval** command configures the frequency at which queues should be checked for stuck or recovery detection. By default, polling interval is calculated internally or it considers the value configured through the CLI.

Note: Configuring a very low polling interval may increase load on the CPU.

Example

This command configures a polling interval of ***10*** seconds on the switch.

```
switch(config)# priority-flow-control pause watchdog default polling-
interval 10
```

12.4.5.4 Displaying Stuck Queue and Recovery Counters

The **show priority-flow-control counters watchdog** command displays the value of number of times a queue is identified as stuck and recovered. These counters are maintained only for those queues that have PFC watchdog functionality enabled. These counters are cleared when either PFC or PFC watchdog configuration is disabled. Alternatively, show interfaces priority-flow-control counters watchdog command can be used to display the counters.

Examples

- This command displays the value of number of times the queue was stuck and recovered for all the interfaces.

```
switch# show priority-flow-control counters watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
Et2/1      UC2            12            12
Et2/1      UC3            31            30
```

- This command displays the value of number of times the queue was stuck and recovered for a specific interface. In this case it is ***Et1/1***.

```
switch# show priority-flow-control interfaces Ethernet 1/1 counters
 watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
```

12.4.5.5 PFC Watchdog Non-disruptive Priorities

The PFC Watchdog acts to drop the traffic entering or leaving the port at the stuck PFC priority. Later when the queue recovers, this action is reversed. While applying these actions, some traffic (for all priorities) is dropped on that port. In such case, the priority-flow-control pause watchdog hardware non-disruptive priority command can be used to avoid the traffic drop on ports at stuck queues.

This traffic drop can be avoided by configuring specific PFC priorities as non-disruptive. When queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

Examples

- This command configures the specific PFC priorities as non-disruptive, and the priority is set to ***3***.

```
switch(config)# priority-flow-control pause watchdog hardware non-
disruptive priority 3
```

- This command configures all the ports, having a subset of non-disruptive priorities as a part of their no-drop priorities, start in non-disruptive mode.

```
switch(config)# priority-flow-control pause watchdog hardware port non-
disruptive-only
```

12.4.5.6 Displaying PFC Watchdog Information

The `show priority-flow-control` command displays the PFC watchdog status information. Note, if the PFC watchdog default timeout value is non-zero then PFC watchdog is active on the switch.

Example

This command displays the PFC watchdog default timeout value, in this show example the timeout value is ***3.0*** which means the PFC watchdog is active.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port   Enabled Priorities Active Note
Et1/1   Yes       34      Yes    DCBX disabled
Et1/2   Yes       34      Yes    DCBX disabled
Et1/3   Yes       34      Yes    DCBX disabled
Et1/4   Yes       34      Yes    DCBX disabled
```

The **`show interface status errdisabled`** command displays the port which is error-disabled due to stuck- queue condition.

Example

This command displays the interface Ethernet ***Eth1/1*** status as errdisabled and the reason.

```
switch# show interface Eth1/1 status errdisabled

Port            Name          Status         Reason
---------- ---------------- ----------------- ---------
Et1/1                        errdisabled    stuck-queue
```

The **`show priority-flow-control status`** command displays the current PFC watchdog details.

Example

This command displays the PFC watchdog configuration details at global and interface level.

```
switch# show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port     Status  Priorities Note
Et1/1    E A W    1     7   DCBX disabled
Et1/2    E A -              DCBX disabled
Et1/3    D - -
Et1/4    D - -
Et2/1    D - -
..
..
```

12.4.6 DCBX and Flow Control Commands

Configuration Commands

- dcbx application priority
- dcbx ets
- dcbx mode
- no priority-flow-control
- platform fm6000 pfc-wm
- priority-flow-control
- priority-flow-control pause watchdog action
- priority-flow-control pause watchdog default
- priority-flow-control pause watchdog hardware
- priority-flow-control priority

Show Commands

- show dcbx
- show dcbx application-priority-configuration
- show dcbx priority-flow-control-configuration
- show dcbx status
- show interfaces priority-flow-control
- show platform fm6000 pfc-wm
- show priority-flow-control

12.4.6.1 dcbx application priority

The **dcbx application priority** command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

The **no dcbx application priority** and **default dcbx application priority** commands remove the specified DCBX traffic class priority assignment by deleting the corresponding **dcbx application priority** command from ***running-config***. When the command does not specify a traffic class, all DCBX traffic class priority assignments are removed.

Command Mode

Global Configuration

Command Syntax

dcbx application [**APPLICATION_TYPE priority**] *rank*

no dcbx application [**APPLICATION_TYPE priority**]

default dcbx application [**APPLICATION_TYPE priority**]

Parameters

- **APPLICATION_TYPE** traffic class receiving the priority assignment. Options include:
  - **ether *ethertype_number*** Ethernet traffic. ***ethertype_number*** varies from ***1536*** to ***65535***.
  - **iscsci** iSCSCI traffic. Maps to TCP/SCTP ports ***860*** and ***3260***.
  - **tcp-sctp *port_number*** TCP/SCTP traffic. Port number varies from ***1*** to ***65535***.
  - **tcp-sctp-udp *port_number*** TCP/SCTP/UDP traffic. Port number varies from ***1*** to ***65535***.
  - **udp *port_number*** UDP traffic. Port number varies from ***1*** to ***65535***.
- ***rank*** priority assigned to traffic class. Values range from ***0*** to ***7***.

Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports ***860*** and ***3260***) should be assigned the given priority of ***5***.

```
switch(config)# dcbx application tcp-sctp 860 priority 5
switch(config)# dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)# dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the **dcbx application tcp-sctp** command. The DCBX peer that iSCSI frames are assigned to is given priority ***5***.

```
switch(config)# dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)#no dcbx application tcp-sctp 860 priority
switch(config)#no dcbx application tcp-sctp 3260 priority
```

12.4.6.2 dcbx ets

The **dcbx ets** command configures the enhanced transmission selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

The **no dcbx ets** and **default dcbx ets** commands remove the specified DCBX traffic classs priority assignment by deleting the corresponding **dcbx ets** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

dcbx ets [qos map cos ***value*** traffic-class ***value*** | traffic-class ***value*** bandwidth ***value***]

no dcbx ets [qos map cos ***value*** traffic-class ***value*** | traffic-class ***value*** bandwidth ***value***]

default dcbx ets [qos map cos ***value*** traffic-class ***value*** | traffic-class ***value*** bandwidth ***value***]

Parameters

- **qos** QoS to configure.(The sub options include):
  - **map** QoS map to configure.
  - **cos** CoS value assigned to port. Value ranges from ***0*** to ***7***. Default value is ***0***.
  - **traffic-class** Assigns the traffic-class priority to the QoS map. The value ranges from ***0*** to ***7***.
- **traffic-class** Assigns the traffic class priority. The value ranges from ***0*** to ***7***. (The sub options include):
  - **bandwidth** The percentage of bandwidth assigned to the packets received from traffic class. The value ranges from ***0*** to ***100*** in percentage. The default value is ***0***.

Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as ***7*** and sets the traffic class priority to ***5***.

```
switch(config)# dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority value to ***7*** and sets the bandwidth value to ***70*** percent.

```
switch(config)# dcbx ets traffic-class 7 bandwidth 70
```

12.4.6.3 dcbx mode

The **dcbx mode** command enables DCBX mode on the configuration mode interface. The switch supports ***IEEE P802.1Qaz***. When DCBX is enabled, two TLVs are added to outgoing LLDPDUs, which instruct the peer on the interface to configure PFC (priority flow control) and the application priority table in the same way as the switch.

The **no dcbx mode**, **default dcbx mode**, and **dcbx mode none** commands disable DCBX on the configuration mode interface by removing the corresponding **dcbx mode** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

dcbx mode **MODE_NAME**

no dcbx mode

default dcbx mode

Parameters

MODE_NAME Specifies the DCBX version. Options include:

- **ieee** IEEE version.
- **cee** Converged Enhanced Ethernet version.
- **none** DCBX is disabled.

Examples

- These commands enable ***interface ethernet 2*** to use IEEE DCBX.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# dcbx mode ieee
switch(config-if-Et2)#
```

- These commands disable DCBX on ***interface ethernet 2***.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# dcbx mode none
switch(config-if-Et2)
```

12.4.6.4 no priority-flow-control

The **`no priority-flow-control`** and **`default priority-flow-control`** commands disable the priority flow control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, which takes effect when PFC is re-enabled. The commands delete all corresponding priority-flow-control commands from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`no priority-flow-control`

`default priority-flow-control`

Example

These commands disable Priority Flow Control (PFC) on ***interface ethernet 3***.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# no priority-flow-control
switch(config-if-Et3)#
```

12.4.6.5 priority-flow-control

The **priority-flow-control** command enables Priority Flow Control (PFC) on the configuration mode interface to pause selected traffic classes.

The **no priority-flow-control** and **default priority-flow-control** commands disable PFC on the configuration mode interface by deleting the corresponding **priority-flow-control** command from ***running-config***. The priority-flow-control priority command also disables PFC on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

priority-flow-control on

no priority-flow-control on

default priority-flow-control on

Example

- These commands enable PFC on ***interface ethernet 3***.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# priority-flow-control on
switch(config-if-Et3)#
```

- These commands disable PFC on ***interface ethernet 3***.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# no priority-flow-control
switch(config-if-Et3)#
```

12.4.6.6 platform fm6000 pfc-wm

The **`platform fm6000 pfc-wm`** command configures the hardware buffer space allocated to the Priority Flow Control (PFC) RX-Private buffer. The command provides options to configure the buffer size and specify when PFC frames are sent to request that a neighbor stop sending traffic. The default values are as follows:

- **RX-Private:** ***18400*** bytes
- **on (watermark):** ***9280*** bytes
- **off (watermark):** ***1600*** bytes

Values that are entered in the command are rounded up to the closest multiple of ***160***. The **RX-Private** value must be greater than the **off** value, which must be larger than the **on** value.

The no **`platform fm6000 pfc-wm`** and **`default platform fm6000 pfc-wm`** commands restore the default settings by removing the **`platform fm6000 pfc-wm`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform fm6000 pfc-wm` [**RX-PRIVATE_SIZE**][**PFC-ON_WM**][**PFC-OFF_WM**]

`no platform fm6000 pfc-wm`

`default platform fm6000 pfc-wm`

The platform **`fm6000 pfc-wm`** command must explicitly configure at least one parameter.

Parameters

- **RX-PRIVATE_SIZE** Specifies size of rx-private buffer. Options include:
  - ***no parameter*** rx-private buffer retains previously configured size.
  - **rx-private** ***18268*** to ***102400*** Size of rx-private buffer (bytes).
- **PFC-ON_WM** Buffer capacity that triggers the switch to send PFC frames. Options include:
  - ***no parameter*** Parameter retains previously configured value.
  - **on** ***9134*** to ***102400*** Buffer capacity that triggers PFC frames (bytes).
- **PFC-OFF_WM** Buffer capacity that triggers the switch to stop PFC frame transmissions. Options include:
  - ***no parameter*** Parameter retains previously configured value.
  - **off** ***1536*** to ***102400*** Buffer capacity that turns off PFC frames.

Related Command

show platform fm6000 pfc-wm displays the PFC RX-Private buffer memory allocations.

Example

This command configures the rx-private hardware buffer.

```
switch(config)# platform fm6000 pfc-wm rx-private 24800 on 16000 off 3200
switch(config)#
```

12.4.6.7 priority-flow-control pause watchdog action

The **priority-flow-control pause watchdog** action command either drops the traffic on a stuck queue, or error disables the port which has a stuck queue, or notifies if there is no action on the stuck queue. The following actions are performed based on the queue status.

The **no priority-flow-control pause watchdog** action command removes the specified **priority-flow-control pause watchdog action configuration** by deleting the corresponding **priority-flow-control pause watchdog action** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

priority-flow-control pause watchdog action

no priority-flow-control pause watchdog action

Parameters

action PFC watchdog action for stuck transmit queues. Options include.

- **drop** Drop traffic on the stuck queue.
- **errdisable** Error disable port which has the stuck transmit queue.
- **notify-only** No action on the stuck queue.

Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

Example

These commands enables the pfc-watchdog monitoring on ***tx-queue 3*** of ***Ethernet 1/1***, and configures a PFC watchdog action drop and drops the traffic if the queue is a stuck queue.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog action drop
```

12.4.6.8 priority-flow-control pause watchdog default

The **priority-flow-control pause watchdog** default command monitors all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled. Guaranteed bandwidth is needed to ensure starvation due to higher priority traffic is not wrongly flagged as a stuck-queue due to congestion. The stuck duration after which the port needs to be error disabled is also configurable.

The **no priority-flow-control pause watchdog default** command removes the specified priority-flow-control pause watchdog configuration by deleting the corresponding **priority-flow-control pause watchdog** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

priority-flow-control pause watchdog default

no priority-flow-control pause watchdog default

Parameters

default Specifies the default value. Options include.

- ***polling-interval*** Configures the interval at which the watchdog should poll the queues. The polling interval value ranges from ***0.005*** to ***30*** seconds.
- ***recovery-time*** Configures recovery-time after which stuck queue should recover and start forwarding. The recovery-time value ranges from ***0.01*** to ***60*** seconds.
  - **forced** Force recover any stuck queue(s) after the recovery-time interval, irrespective of whether PFC frames are being received or not.
- ***timeout*** Configures timeout after which port should be errdisabled or should start dropping on congested priorities. The timeout value ranges from ***0.01*** to ***60*** seconds.

Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

- Polling Interval Discrepancy

  For user configured polling-interval to be valid, it must satisfy the following conditions

  When the recovery-mode is auto and timeout, recovery-time, and polling-interval are non-default, polling-interval <= min (timeout, recovery-time) / 2,

  When recovery-mode is forced or recovery-time is not configured, polling-interval <= (timeout / 2)

  For better functioning of PFC Watchdog, when user configured polling interval is too large compared to either timeout or recovery time values, Watchdog will use auto calculated value instead of user configured value until the discrepancy is resolved. Also, CLI warning and syslog messages are generated to inform user of the discrepancy.
- CLI Warnings

  When there is discrepancy between timeout and polling-interval, the format of the message is as shown below:

```
! User configured polling interval <user-cfgd polling-interval>
 second(s) is
greater than half of timeout <user-cfgd timeout> second(s). Setting
polling-interval to <to-be-used polling-interval> second(s)
```

When there is discrepancy between recovery-time and polling-interval, the format of the message is as shown below

```
! User configured polling interval <user-cfgd polling-interval>
 second(s) is
greater than half of recovery-time <user-cfgd recovery-time> second(s).
 Setting
polling-interval to <to-be-used polling-interval> second(s)
```

Examples

- These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***interface ethernet1/1***, and configures a PFC congestion timeout of ***10*** seconds which error-disables the port if the queue is stuck.

```
switch# config
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default timeout 10
```

- These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***interface ethernet1/1***, and configures a PFC forced recovery-time interval of ***30*** seconds after which the stuck queue(s) are recovered, irrespective of whether PFC frames are being received or not.

```
switch# config
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default recovery-
time 30 forced
```

- These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***Ethernet 1/1***, and configures a PFC polling-interval of ***20*** seconds after which queue is polled.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default polling-
interval 20
```

12.4.6.9 priority-flow-control pause watchdog hardware

The **priority-flow-control pause watchdog** hardware command configures specific PFC priorities as non-disruptive. This will avoid traffic drop on queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

The **no priority-flow-control pause watchdog hardware** command removes the specified ***priority-flow-control pause watchdog non-disruptive*** configuration by deleting the corresponding **priority-flow-control pause watchdog hardware** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

priority-flow-control pause watchdog hardware

no priority-flow-control pause watchdog hardware

Parameters

hardware Configure PFC priority through hardware. Options include:

- ***non-disruptive*** PFC watchdog non-disruptive configuration. The priority value ranges from ***0*** to ***7***.

Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

Example

These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***interface ethernet 1/1***, and configures PFC priorities as non-disruptive on PFC priorities ***3*** and ***4***.

```
switch# config
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog hardware non-
disruptive priority 3 4
```

12.4.6.10 priority-flow-control priority

The **priority-flow-control priority** command configures the packet resolution setting on the configuration mode interface. This setting determines if packets are dropped when priority flow control (PFC) is enabled on the interface. Packets are dropped by default.

The **no priority-flow-control priority** and **default priority-flow-control priority** commands restore the default packet drop setting on the configuration mode interface by deleting the corresponding **priority-flow-control priority** command from ***running-config***. The **priority-flow-control priority** command also restores the default setting on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

priority-flow-control priority pack-drop

no priority-flow-control priority

default priority-flow-control priority

Parameters

pack-drop denotes the interfaces. Options include:

- **drop** Packets are dropped. Default setting.
- **no drop** Packets are not dropped.

Examples

- These commands in DCBX mode create a priority group that pauses dot1p priority ***5*** on ***interface ethernet 2***.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# priority-flow-control priority 5 no-drop
```

- These commands enable lossy behavior.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# priority-flow-control priority 5 drop
```

- These commands remove the priority group that pauses dot1p priority ***5*** on ***interface ethernet 2***.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# no priority-flow-control priority
```

12.4.6.11 show dcbx

The **show dcbx** command list DCBX status and the interfaces on which DCBX is enabled.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**]

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** all configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Examples

- This command displays the DCBX status for ***ethernet 50***.

```
switch# show dcbx ethernet 50
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:06:01 2013
  No priority flow control configuration TLV received
  No application priority configuration TLV received
switch#
```

- This command displays the DCBX status for ***ethernet 50*** when Priority Flow Control (PFC) is not enabled.

```
switch# show dcbx ethernet 50
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:08:29 2013
  - PFC configuration: willing
    not capable of bypassing MACsec
    supports PFC on up to 4 traffic classes
    PFC enabled on priorities: 5 7
    WARNING: peer PFC configuration does not match the local PFC
 configuration
  - Application priority configuration:
    2 application priorities configured:
      tcp-sctp 860 priority 5
      tcp-sctp 3260 priority 5
switch#
```

12.4.6.12 show dcbx application-priority-configuration

The **show dcbx application-priority-configuration** command displays the DCBX peer application priority configuration.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**] **application-priority-configuration**

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** All configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Guidelines

This command and the show priority-flow-control command function identically.

Example

This command displays the DCBX peer application priority configuration for all DCBX-enabled interfaces.

```
switch# show dcbx application-priority-configuration
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
...
Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:08:29 2013
  - Application priority configuration:
    2 application priorities configured:
      tcp-sctp 860 priority 5
      tcp-sctp 3260 priority 5
switch#
```

12.4.6.13 show dcbx priority-flow-control-configuration

The **show dcbx priority-flow-control-configuration** command displays the IEEE DCBX peer priority flow control configurations.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**] **priority-flow-control-configuration**

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** all configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Example

This command displays the DCBX peer priority flow control configuration for the DCBX-enabled interfaces on the device.

```
switch# show dcbx priority-flow-control-configuration
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
...
Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:11:29 2013
  - PFC configuration: willing
    not capable of bypassing MACsec
    supports PFC on up to 4 traffic classes
    PFC enabled on priorities: 5 7
    WARNING: peer PFC configuration does not match the local PFC
 configuration
switch#
```

12.4.6.14 show dcbx status

The **show dcbx status** command displays the DCBX status on the interfaces on which DCBX is enabled.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**] **status**

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** all configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Example

This command displays the DCBX status for the DCBX-enabled interfaces.

```
switch# show dcbx status
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:11:54 2013
switch#
```

12.4.6.15 show interfaces priority-flow-control

The **`show interfaces priority-flow-control`** command displays the status of PFC on all interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`priority-flow-control`** [**INFO_LEVEL**]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** Display information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

    Valid range formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** specifies the type of information displayed. Options include:
  - ***no parameter*** Displays information about all DCBX neighbor interfaces.
  - **status** Displays the DCBX status.
  - **counters** Displays the DCBX counters.

Guidelines

This command and the **show priority-flow-control** command function identically.

Example

This command displays the PFC for all interfaces.

```
switch# show interfaces priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7

Port    Enabled Priorities Active Note
Et1     No                 No
Et2     No                 No
...
Et50    Yes          5     Yes
...
Port                RxPfc           TxPfc
Et1                     0               0
Et2                     0               0
...
Et50                    0               0
...
switch#
```

12.4.6.16 show platform fm6000 pfc-wm

The **show platform fm6000 pfc-wm** command displays the buffer space allocated to the RX-Private buffer and buffer levels that trigger PFC frame transmission activities.

Command Mode

Privileged EXEC

Command Syntax

show platform fm6000 pfc-wm

Related Command

priority-flow-control priority specifies the PFC RX-Private buffer memory allocation.

Example

This command displays the rx-private hardware buffer memory allocation.

```
switch# show platform fm6000 pfc-wm
Pfc_Rx_Private_WM: 24800 Bytes
Pfc_On_WM: 16000 Bytes
Pfc_Off_WM: 3200 Bytes
switch#
```

12.4.6.17 show priority-flow-control

The **show priority-flow-control** command displays the status and other PFC and PFC watchdog information on all interfaces if no specific interface is specified.

Command Mode

EXEC

Command Syntax

show priority-flow-control [status | counters | ***interfaces***]

Parameters

- ***interfaces*** specifies the interface for which the information is displayed. Options include:
  - **Ethernet** Hardware Ethernet interface.
  - **Loopback** Loopback interface.
  - **Management** Management interface.
  - **Port-Channel** Lag interface.
  - **Recirc-Channel** Recirculation interface.
  - **Tunnel** Tunnel interface.
  - **Vlan** VLAN interface.
  - **Vxlan** VXLAN Tunnel Interface.
- ***status*** displays the interface PFC status.
- ***counters*** displays the interface PFC counters. Options include:
  - ***detail*** displays the DCBX counters for each priority class. This option is available only on Trident switches.
  - ***watchdog*** displays the PFC watchdog counters.

Examples

- This command displays the PFC status on all interfaces.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
Port    Enabled Priorities Active Note

Et1     No                 No

Et2     No                 No

...
Et50    Yes          5     Yes

...
Port                 RxPfc           TxPfc
Et1                      0               0
Et2                      0               0
...
Et50                     0               0
...
```

- This command displays the PFC watchdog status. If PFC watchdog default timeout is non-zero (in this case it is 3.0) then PFC watchdog is actively running on the switch.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port   Enabled Priorities Active Note
```

```
Et1/1   Yes       34      Yes    DCBX disabled
Et1/2   Yes       34      Yes    DCBX disabled
Et1/3   Yes       34      Yes    DCBX disabled
Et1/4   Yes       34      Yes    DCBX disabled
...
```

- This command displays the current value of these counters for all the interfaces being monitored by PFC watchdog. Alternatively, show interfaces priority-flow-control counters watchdog command can be used for the same.

```
switch# show priority-flow-control counters watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
Et2/1      UC2            12            12
Et2/1      UC3            31            30
```

- This command displays the current value of these counters for a specific subset of interfaces. Alternatively, **show interfaces priority-flow-control counters watchdog** command can be used for the same.

```
switch# show priority-flow-control interfaces ethernet 1/1 counters
 watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
```

- This command displays the configuration details of PFC watchdog at global and interface level.

```
switch# show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port     Status  Priorities Note
Et1/1    E A W    1     7   DCBX disabled
Et1/2    E A -              DCBX disabled
Et1/3    D - -
Et1/4    D - -
Et2/1    D - -
..
```

12.5 IP Locking

This section describes IP Locking configuration tasks. Topics in this section include:

12.5.1 IP Locking

IP Locking is an EOS feature configured on an Ethernet Layer 2 port.

When enabled, IP Locking ensures that a port will only permit IP and ARP packets with IP source addresses that have been authorized. As of the ***EOS Release 4.25.0F*** release update, IP locking can run in two modes - IPv4 Locking (which will be referred to as IP Locking) and IPv6 Locking, which is configured using the commands mentioned in the following sections. IP Locking prevents another host on a different interface from claiming ownership of an IP address through ARP spoofing. IPv6 Locking extends this behavior to IPv6 packets, including ICMPv6 Neighbor Discovery (Router Advertisement, Redirect) and DHCP (server-to-client) packets. Mode specific commands are also discussed.

On an IP Locked Port,

- ARP probes with ***0.0.0.0*** as Sender Protocol Address (SPA) and is allowed for Duplicate Address Detection (DAD).
- Incoming DHCP server response packets are dropped to avoid rogue device(s) acting as DHCP server(s).
- Incoming DHCP client request packets are allowed for devices to complete DHCP handshake and obtain DHCP leases.

On an IPv6 Locked Port,

- Incoming DHCPv6 server response packets are dropped and incoming DHCPv6 client request packets are allowed.
- Incoming ICMPv6 ND : Router Advertisement packets are dropped as only routers should send these packets.
- Incoming ICMPv6 ND : Router Solicitation packets are allowed.
- Incoming ICMPv6 ND : Redirect packets are dropped as only routers should send these packets.

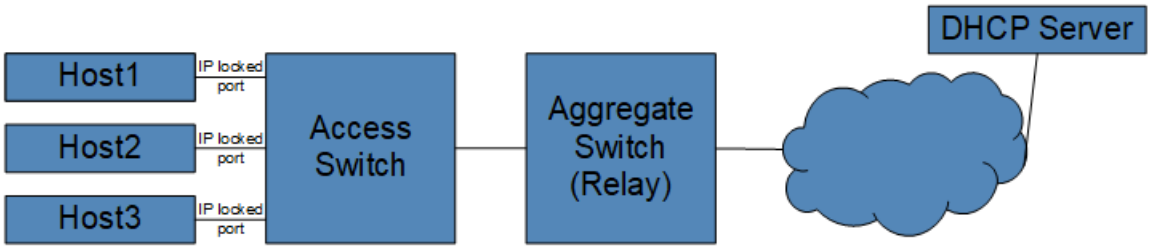

Figure 30: IP Locking

IP Locking relies on DHCP LeaseQuery (***RFC4388***) and MAC address learning to determine that an IP address has been authorized on a particular port. It is necessary to ensure that DHCP servers used in the network allow LeaseQuery messages.

12.5.1.1 Release Updates

Refer to the release updates for IP Locking.

***EOS Release 4.25.1F*:**

Added support for disabling address filtering for IPv6 packets while still keeping all packet type specific drop rules such as ICMPv6 ND:RA, and ICMPv6 ND:Redirect and DHCPv6 (server-to-client) packets, using the **`locked-address ipv6 enforcement disabled`** command.

***EOS Release 4.24.0F*:**

- Added support for expiration modes of locked addresses, using the **`locked-address expiration mac disabled`** command.
- Added support for counters, using the **`show address locking counters`** and **`clear address locking counters`** commands.

***EOS Release 4.23.2F*:**

Added support for **`static lease`** command, **`lease <V4ADDR> mac <MACADDR>`**.

***EOS Release 4.23.1F*:**

Added support for **`clear address locking lease`** command.

***EOS Release 4.23.0F*:**

- Initial release.
- Supports IPv4 address locking.

12.5.1.2 IPv4 Locking Configuration Commands

Configure IP Locking commands in the ***address locking*** configuration mode.

Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)#
```

To enable IP Locking, you must configure

- the DHCP servers from which hosts are expected to acquire leases. IP Locking communicates with these DHCP servers to learn the IP addresses that must be authorized on the switch.

```
switch(config-address-locking)# dhcp server ipv4 10.1.1.1
switch(config-address-locking)# dhcp server ipv4 10.30.1.3
```

- a local L3 interface to communicate with the DHCP server(s). This could be the management interface, a routed interface, or a Switch Virtual Interface (SVI). This interface requires a valid IP address assigned, routable to the configured DHCP server(s), and can reside in non-default VRF. The interface IP is used as the source IP in the switch's packets to the DHCP server.

```
switch# configure
switch(config)# interface Vlan2160
switch(config-if-Vl2160)# ip address 10.10.1.2/16

switch# configure
switch(config)# address locking
switch(config-address-locking)# local-interface Vlan2160
```

To activate IP Locking on ports connected to clients, IP Locking must be enabled in the interface configuration mode. Running this command only activates IPv4 Locking and overrides the previous configuration for the interface.

Example

```
switch(config)# interface Ethernet27/1
switch(config-if-Et27/1)# address locking ipv4
```

It is possible to disable IP Locking using the **`disabled`** command in address-locking mode. This turns off the feature and allows a host to use any IP address, authorized or unauthorized, on any port.

Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# disabled
```

12.5.1.2.1 Clear Commands

The **clear address locking lease...** command removes the lease from hardware. This enable mode command removes lease bindings at different granularities.

- The **clear address locking lease ipv4 V4ADDR** command removes a single lease associated with an IPv4 address.
- The **clear address locking lease ipv6 V6ADDR** removes a single lease associated with an IPv6 address.
- The **clear address locking lease intf ethernet slot** removes all leases associated with the specified interface.
- The **clear address locking lease all** removes all leases on the switch.

12.5.1.2.2 Static Lease Commands

The **lease mac** command within address locking configuration mode installs a lease into hardware for the configured IP address on the interface the configured MAC address is associated with. If the MAC address is not in the MAC table or the MAC address is on an interface that is not configured with IP Locking feature, the lease is not installed until the MAC address is added to an interface that is configured with IP Locking.

Note: Any lease from the DHCP server that matches either the same IP or MAC as a statically configured lease is removed from the switch.

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# lease 1.1.1.1 mac a.b.c
```

12.5.1.2.3 Locked Address Expiration Commands

The IP addresses remain authorized and installed even after their corresponding MAC addresses have aged out. IP Locking, by default, deauthorizes leases after their corresponding MAC addresses age out. The **locked-address expiration mac disabled** command configures IP Locking to keep leases installed, even after their corresponding MAC addresses have aged out.

Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address expiration mac
 disabled
```

12.5.1.2.4 IP Locking Counters

The **show address locking counters** command displays DHCP lease query messages sent, received, and dropped. There are two sets of counters: first, the number of packets sent to and

received from each DHCP server; and second, the number of packets sent and received for each locked interface. There are separate counters for the different kinds of messages communicated between the switch and the DHCP server.

Example

```
switch# show address locking counters
                  Lease Active Lease Unknown Lease Unassigned
DHCP Server Query  Rcvd   Drop   Rcvd   Drop Rcvd     Drop    Unknown
----------- ----- ----- ------ ------ ------ -------- ------- -------
80.80.80.80 32860  8002 34     8001   32     13423     134    3234

Interface Query Lease Active Lease Unknown Lease Unassigned
--------- ----- ------------ ------------- ----------------
Ethernet2  1747 1234         189           324
```

The **clear address locking counters** command resets all the counters associated with IP Locking to zero.

12.5.1.3 IPv6 Locking

12.5.1.3.1 IPv6 Locking Configuration Commands

To enable IPv6 locking, you must:

Disable enforcement of IPv6 address locking.

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv6 enforcement disabled
```

To activate IPv6 Locking on ports connected to clients, IPv6 Locking must be enabled in the interface configuration mode. Running this command only activates IPv6 Locking and overrides the previous configuration for the interface.

Example

```
switch(config)# interface ethernet 27/1
switch(config-if-Et27/1)# address locking ipv6
```

Both IPv4 and IPv6 locking can be activated on a port by running commands similar to the following:

```
switch(config)# interface ethernet 27/1
switch(config-if-Et27/1)# address locking ipv4 ipv6
```

It is possible to disable IPv6 Locking using the **disabled** command in address-locking mode. This turns off the feature and allows a host to use any IP address, authorized or unauthorized, on any port. Note that this will also disable IP Locking as well.

Example

```
switch# configure
switch(config)# address locking
```

```
switch(config-address-locking)# disabled
```

12.5.1.3.2 Locked Address IP Enforcement Commands

The **locked-address ipv4 enforcement disabled** command disables address filtering for all ports that have IPv4 Locking enabled. This permits IPv4 packets while still keeping all other drop rules.

Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv4 enforcement
 disabled
```

The **locked-address ipv6 enforcement disabled** command disables address filtering for all ports that have IPv6 Locking enabled. This permits IPv6 packets while still keeping all other drop rules.

Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv6 enforcement
 disabled
```

12.5.1.4 Show Commands

Use the **show address locking** command to display the status of IP and IPv6 locking.

Example

```
switch# show address locking
IP Locking is active
Interface        IPv4            IPv6
---------------- ------------------   --------------------------
Ethernet27/1     yes             no (not configured)
Ethernet31/1     no (not configured)   no (not a layer 2
 interface)
```

The **show address locking** command also displays the reason as to why IP Locking is not enabled for an interface. For an interface, the following priority (highest at top) is imposed on the output when IP Locking is not enabled for an interface:

- not configured
- not a Layer 2 interface
- no local interface
- no dhcp server

The **show address locking table ipv4** command displays all the DHCP leases that IP Locking knows about, whether or not those leases are installed and the interfaces on which these IP addresses are authorized.

Example

```
switch# show address locking table ipv4
IP Address     MAC Address      Interface  Installed    Expiration Time
-------------- ---------------- ---------- ------------ ---------------
10.30.4.4      ba76.a467.7ff8   Et27/1     installed     in 0:01:57
```

12.5.1.5 Limitations

The IP Locking feature contains the following limitations:

- IP Locking is supported for IPv4 but has limited functionality for IPv6.
- IP Locking works only with DHCP servers that support ***RFC 4388*** (LeaseQuery) and are configured to allow lease queries. ISC DHCPD and BlueCat are currently known servers that support LeaseQuery.
- IP Locking can only be configured on Ethernet interfaces, excluding sub-interfaces.
- IP Locking and DHCP relay cannot be configured on the same switch. When both are configured, IP Locking is disabled.
- IP Locking and DHCP snooping cannot be configured on the same switch. When both are configured, IP Locking is disabled.
- IP Locking and DHCP server cannot be configured on the same switch. When both are configured, IP Locking is disabled.
- Do not configure IP Locking and the ARP inspection feature on the same switch.
- Do not configure IP Locking and the IP source guard feature on the same switch.
- IP Locking may not immediately invalidate a lease on an access port if the host moves to another port on a different access switch.
- IP Locking supports up to 3400 hosts on the DCS-7050X3 platform, and up to 3800 hosts on the CCS-720XP platform. This scale may reduce further with other features using TCAM resources.
- IPv6 Locking currently only allows disabling address filtering for IPv6 packets while keeping all packet type specific drop rules such as ND:RA, ND:RD, and DHCP Server-to-Client.
- Some DHCP server implementations (such as ISC DHCPD) do not respond to lease query if the **fixed-address** configuration is used. Use reserved leases instead.
- CVP Endpoint Identification is not able to identify hosts connected to an IP Locking enabled switch.

12.5.1.6 IP Locking Commands

IPv4 Clear Commands

- clear address locking lease

IPv4 Static Lease Commands

- lease mac

IPv4 Lock Address Expiration Commands

- locked-address expiration mac disabled
- locked-address ipv4 enforcement disabled
- locked-address ipv6 enforcement disabled

IP Locked Show Commands

- show address locking
- show address locking counters
- show address locking table ipv4

12.5.1.6.1 clear address locking lease

Use the **clear address locking lease** command to remove lease bindings at different granularities.

Support beginning with ***EOS Release 4.23.1F***:

- The **clear address locking lease...** command removes the lease from the hardware.
  - The **clear address locking lease ipv4 V4ADDR** command removes a single lease associated with an IPv4 address.
  - The **clear address locking lease ipv6 V6ADDR** command removes a single lease associated with an IPv6 address.
  - The **clear address locking lease intf ethernet slot** command removes all leases associated with the specified interface.
  - The **clear address locking lease all** command remove all leases on the switch.

Command Mode

Address locking mode

Command Syntax

clear address locking lease [all | interface [ethernet ***slot***] | ipv4 ***V4ADDR*** | ipv6 ***V6ADDR***]

Parameters

- **all** The entire lease table.
- **interface** The interface of the lease to be cleared.
  - **ethernet *slot*** Ethernet interface slot number.
- **ipv4 *V4ADDR*** IPv4 address of the lease to be cleared.
- **ipv6 *V6ADDR*** IPv6 address of the lease to be cleared.

Example

```
switch(config-address-locking)# clear address locking lease all
```

12.5.1.6.2 lease mac

The **lease mac** command within the address locking configuration mode installs a lease into hardware for the configured IP address on the interface the configured MAC address is associated with. If the MAC address is not in the MAC table or the MAC address is on an interface that is not configured with IP Locking feature, the lease is not installed until the MAC address is added to an interface that is configured with IP Locking. The **no** and **default** forms of the command removes the lease into hardware for the configured IP address on the interface the configured MAC address is associated with.

Command Mode

Address locking configuration mode

Command Syntax

lease ***V4ADDR*** **mac** ***MACADDR***

no lease ***V4ADDR*** **mac** ***MACADDR***

default lease ***V4ADDR*** **mac** ***MACADDR***

Parameters

- **lease** ***V4ADDR*** The lease IP address.
- **mac** ***MACADDR*** The configured mac address for static lease.

Example

```
Arista# config t
Arista(config)# address locking
Arista(config-address-locking)# lease 1.1.1.1 mac a.b.c
```

12.5.1.6.3 locked-address expiration mac disabled

IP Locking, by default, deauthorizes leases after their corresponding MAC addresses age out. Use the **locked-address expiration mac disabled** command to configure IP Locking to keep leases installed, even after their corresponding MAC addresses have aged out.

Command Mode

Address locking configuration mode

Command Syntax

locked-address expiration mac disabled

no locked-address expiration mac disabled

default locked-address expiration mac disabled

Parameters

- **expiration** Configures expiration mode for locked addresses.
- **mac** Configures deauthorizing locked addresses upon MAC aging out.
- **disabled** Disables deauthorizing locked address upon MAC aging out.

Example

```
switch# configure t
switch(config)# address locking
switch(config-address-locking)# locked-address expiration mac disabled
```

12.5.1.6.4 locked-address ipv4 enforcement disabled

The **locked-address ipv4 enforcement disabled** command disables address filtering for all ports that have IPv4 Locking enabled. This permits IPv4 packets while still keeping all other drop rules.

Command Mode

Address locking Configuration Mode

Command Syntax

locked-address ipv4 enforcement disabled

no locked-address ipv4 enforcement disabled

default locked-address ipv4 enforcement disabled

Parameters

- ipv4 IPv4 address configuration.
- **enforcement** Configure enforcement for locked addresses.
- **disabled** Disable enforcement for locked addresses.

Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv4 enforcement disabled
```

12.5.1.6.5 locked-address ipv6 enforcement disabled

The **locked-address ipv6 enforcement disabled** command disables address filtering for all ports that have IPv6 Locking enabled. This permits IPv6 packets while still keeping all other drop rules.

Command Mode

Address locking Configuration Mode

Command Syntax

locked-address ipv6 enforcement disabled

no locked-address ipv6 enforcement disabled

default locked-address ipv6 enforcement disabled

Parameters

- ipv6 IPv6 address configuration.
- **enforcement** Configure enforcement for locked addresses.
- **disabled** Disable enforcement for locked addresses.

Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv6 enforcement disabled
```

12.5.1.6.6 show address locking

Use the **show address locking** command to display the status of IP and IPv6 locking.

The **show address locking** command also displays the reason as to why IP Locking is not enabled for an interface. For an interface, the following priority (highest at top) is imposed on the output when IP Locking is not enabled for an interface:

- not configured
- not a Layer 2 interface
- no local interface
- no dhcp server

Command Mode

EXEC

Command Syntax

show address locking

Example

```
switch# show address locking
IP Locking is active
   Interface    IPv4              IPv6
-------------- -------------------   --------------------------
  Ethernet27/1  yes               no (not configured)
  Ethernet31/1  no (not configured)    no (not a layer 2 interface)
```

12.5.1.6.7 show address locking counters

The **show address locking counters** command displays DHCP lease query messages sent, received, and dropped. There are two sets of counters: first, the number of packets sent to and received from each DHCP server; and second, the number of packets sent and received for each locked interface. There are separate counters for the different kinds of messages communicated between the switch and the DHCP server.

Command Mode

EXEC

Command Syntax

show address locking counters

Related Commands

The **clear address locking counters** command resets all the counters associated with IP Locking to zero.

Example

```
switch# show address locking counters
                  Lease Active Lease Unknown Lease Unassigned
DHCP Server Query  Rcvd   Drop   Rcvd   Drop Rcvd     Drop    Unknown
----------- ----- ----- ------ ------ ------ -------- ------- -------
80.80.80.80 32860  8002 34     8001   32     13423     134    3234

Interface Query Lease Active Lease Unknown Lease Unassigned
--------- ----- ------------ ------------- ----------------
Ethernet2  1747 1234         189           324
```

12.5.1.6.8 show address locking table ipv4

Use the **show address locking table ipv4** command to display all the DHCP leases that IP Locking knows about, whether or not those leases are installed and the interfaces on which these IP addresses are authorized.

Command Mode

EXEC

Command Syntax

show address locking table ipv4 [dynamic [installed | [interface Ethernet ***slot***] | installed | interface [Ethernet [***slot***] | static [installed | interface [Ethernet ***slot***]]]

Parameters

- **dynamic** Only display the dynamic leases.
  - **installed** Only display the leases that are installes in the hardware.
  - **interface** Only display the leases belonging to a specified interface.
- **installed** Only display the leases that are installes in the hardware.
- **interface** Only display the leases belonging to a specified interface.
  - **Ethernet *slot*** Specified Ethernet sub-interface.
- **static** Only display the static leases.
  - **installed** Only display the leases that are installes in the hardware.
  - **interface** Only display the leases belonging to a specified interface.
    - **Ethernet*slot*** Specified Ethernet sub-interface.

Example

```
switch# show address locking table ipv4
IP Address     MAC Address      Interface  Installed    Expiration Time
-------------- ---------------- ---------- ------------ ---------------
10.30.4.4      ba76.a467.7ff8   Et27/1     installed     in 0:01:57
```

12.6 Layer 2 Protocol Forwarding

Layer2 (L2) Protocol Forwarding on Ethernet interfaces is supported, in addition to Type-5 PW. Also, selective forwarding of certain L2 Protocol packets (tagged/untagged/all) as opposed to forwarding all LACP frames (both tagged and untagged) is allowed. The protocol list on which L2 Protocol Forwarding is supported has been extended to PAUSE, LACP, LLDP, MACSEC, STP.

12.6.1 Configuring L2 Protocol Forwarding

The following commands allow creation of a profile that allows forwarding tagged/untagged/all types of PAUSE/LACP/LLDP/MACSEC/STP/E-LMI/ ISIS/micro-BFD frames.

```
switch(config-l2-protocol)# forwarding profile abc
switch(config-l2-protocol-abc)# isis forward
switch(config-l2-protocol-abc)# macsec tagged forward
switch(config-l2-protocol-abc)# pause untagged forward
switch(config-l2-protocol-abc)# exit
```

The following commands allow application of a profile on an interface or subinterface:

```
switch(config)#int ethernet1/1
switch(config-if-Et1/1)# l2-protocol forwarding profile abc
switch(config-if-Et1/1)# exit
switch(config)# int ethernet2/1.1
switch(config-if-Et2/1.1)# l2-protocol forwarding profile def
switch(config-if-Et2/1.1)# exit
```

12.6.1.1 TCAM Profile

A specific TCAM profile is required to configure L2 Protocol Forwarding profiles except if the L2 Protocol Forwarding profile has only ‘lacp forward’ and is configured on Type-5 PW ports on Type-1 platforms (mentioned above). One such TCAM profile is as follows:

```
switch(config)# hardware tcam
switch(config-tcam)# profile l2protocolfwd
switch(config-tcam-profile-12protocolfwd)# feature acl port ip
switch(config-tcam-feature-acl-port-ip)# sequence 45
switch(config-tcam-feature-acl-port-ip)# key size limit 160
switch(config-tcam-feature-acl-port-ip)# key field dscp dst-ip ip-frag
 ip-protocol l4-dst-port l4-ops l4-src-port src-ip tcp-control ttl
switch(config-tcam-feature-acl-port-ip)# action count drop
switch(config-tcam-feature-acl-port-ip)# packet ipv4 forwarding bridged
switch(config-tcam-feature-acl-port-ip)# packet ipv4 forwarding routed
switch(config-tcam-feature-acl-port-ip)# packet ipv4 forwarding routed
 multicast
switch(config-tcam-feature-acl-port-ip)# packet ipv4 mpls ipv4 forwarding

switch(config-tcam-feature-qos-ip)# packet ipv4 forwarding routed
 multicast
switch(config-tcam-feature-qos-ip)# packet ipv4 mpls ipv4 forwarding mpls
 decap
switch(config-tcam-feature-qos-ip)# packet ipv4 mpls ipv6 forwarding mpls
 decap
switch(config-tcam-feature-qos-ip)# packet ipv4 non-vxlan forwarding
 routed decap
switch(config-tcam-feature-qos-ip)# feature qos ipv6
switch(config-tcam-feature-qos-ipv6)# sequence 70
switch(config-tcam-feature-qos-ipv6)# key field dst-ipv6 ipv6-next-header
 ipv6-traffic-class l4-dst-port l4-src-port src-ipv6-high src-ipv6-low
switch(config-tcam-feature-qos-ipv6)# action set-dscp set-policer set-tc
switch(config-tcam-feature-qos-ipv6)# packet ipv6 forwarding routed
switch(config-tcam-feature-qos-ipv6)# feature tunnel vxlan
switch(config-tcam-feature-tunnel-vxlan)# sequence 50
```

```
switch(config-tcam-feature-tunnel-vxlan)# key size limit 160
switch(config-tcam-feature-tunnel-vxlan)# packet ipv4 vxlan eth ipv4
 forwarding routed decap
switch(config-tcam-feature-tunnel-vxlan)# packet ipv4 vxlan forwarding
 bridged decap
```

For ISIS protocol forwarding, “snoop” action has to be present in the TCAM profile for l2-protocol forwarding feature as follows:

```
switch(config-tcam)# feature l2-protocol forwarding
switch(config-tcam-l2-protocol forwarding)# sequence 95
switch(config-tcam-l2-protocol forwarding)# key size limit 160
switch(config-tcam-l2-protocol forwarding)# key field dst-mac vlan-tag-
format
switch(config-tcam-l2-protocol forwarding)# action mirror redirect-to-cpu
 set-tc snoop
switch(config-tcam-l2-protocol forwarding)# packet non-ip forwarding
 bridged
switch(config-tcam-l2-protocol forwarding)# packet non-ip forwarding
 bridged sub-interface
```

For the special case of micro-BFD protocol forwarding the following TCAM profile needs to be applied:

```
switch(config)# hardware tcam
switch(config-tcam)# profile l2protocolfwd-bfd-rfc-7130
switch(config-tcam-profile l2protocolfwd-bfd-rfc-7130)# feature acl port
 ip egress mpls-tunnelled-match
switch(config-tcam-feature-acl-port-ip-egress-mpls-tunnelled-mat
ch)# sequence 95
switch(config-tcam-feature-acl-port-ip-egress-mpls-tunnelled-mat
ch)# feature acl port ipv6 egress
switch(config-tcam-feature-acl-port-ipv6-egress)# sequence 105
switch(config-tcam-feature-acl-port-ipv6-egress)# key field dst-ipv6
 ipv6-next-header ipv6-traffic-class l4-dst-port l4-src-port src-ipv6-
high src-ipv6-low tcp-control
switch(config-tcam-feature-acl-port-ipv6-egress)# action count drop
 mirror
switch(config-tcam-feature-acl-port-ipv6-egress)# packet ipv6 forwarding
 bridged
switch(config-tcam-feature-acl-port-ipv6-egress)# packet ipv6 forwarding
 routed
switch(config-tcam-feature-acl-port-ipv6-egress)# feature acl port mac
switch(config-tcam-feature-acl-port-mac)# sequence 55
switch(config-tcam-feature-acl-port-mac)# key size limit 160
switch(config-tcam-feature-acl-port-mac)# key field dst-mac ether-type
 src-mac
switch(config-tcam-feature-acl-port-mac)# action count drop mirror
switch(config-tcam-feature-acl-port-mac)# packet ipv4 forwarding bridged
switch(config-tcam-feature-acl-port-mac)# packet ipv4 forwarding routed

```

Once **l2protocolfwd** or **l2protocolfwd-bfd-rfc-7130** tcam profile is created, the profile needs to be applied to the switch using the following command under config mode:

```
switch(config)# hardware tcam
switch(config-tcam)# system profile l2protocolfwd
```

Consumption of TCAM

The following table describes how TCAM is consumed when the **same** L2 Protocol Forwarding profile is applied:

Level of application	Type-1 platforms	Type-2 platforms
Front panel ports	Separate TCAM entries for each port	Same set of TCAM entries for ports on the same fap **and** core
Subinterfaces	Same set of TCAM entries for subinterfaces on the same fap	Same set of TCAM entries for subinterfaces on the same fap **and** core

12.6.2 L2 Protocol Forwarding Limitations

1. A maximum of ***31*** distinct L2 Protocol Forwarding profiles are applied across multiple subinterfaces on the same FAP.
2. A maximum of ***31*** distinct L2 Protocol Forwarding profiles are applied across multiple subinterfaces, and front panel ports on the same FAP on Type-2 platforms.
3. The feature is not supported for subinterfaces on Type-1 platforms if any of the below features are present in the TCAM Profile:
   - feature pbr subintf ip
   - feature pbr subintf ipv6
   - feature pbr subintf mpls

12.6.3 L2 Protocol Forwarding Show commands

The show l2-protocol forwarding interface displays the L2 protocol forwarding profile configuration corresponding to the interfaces or subinterfaces.

```
switch(config)# show l2-protocol forwarding interface

Interface     Profile
------------- -------
Ethernet1/1   abc
Ethernet2/1.1 def

switch> show l2-protocol forwarding interface Ethernet1/1

Interface   Profile
----------- --------
Ethernet1/1 abc
```

The following show commands displays all packets forwarding behaviour on an interface or a subinterface:

```
switch(config)# show l2-protocol forwarding interface detail

Tagging Types: T: tagged U: untagged
Actions: F: forward
                      BFD RFC-7130 E-LMI ISIS LACP LLDP MACSEC PAUSE STP
Interface     Profile   T     U    T  U  T U  T U  T U  T   U  T  U  T U
------------- ------- ----- ------ -- -- - -- - -- - -- -- --- -- -- - -

Ethernet2/2.1 def       -     -    -  -  - -  - -  - -  -   -  -  -  - -
```

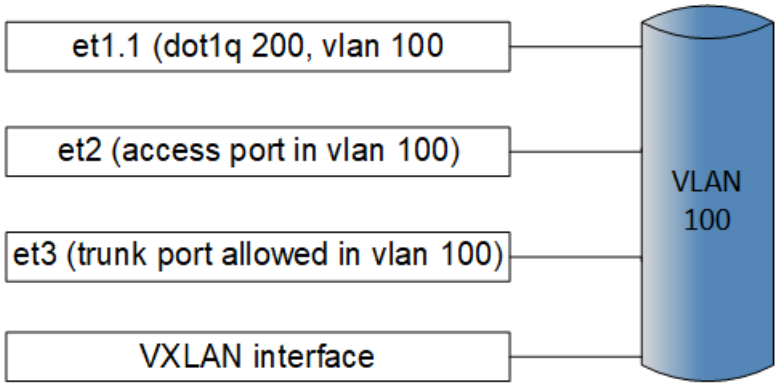
12.7 Layer 2 Subinterfaces

A Layer 2 subinterface is a logical bridging endpoint associated with traffic on an interface distinguished by 802.1Q tags, where each ***interface, 802.1q tag*** tuple is treated as a first-class bridging interface.

Like other types of interfaces, an L2 subinterface is a normal bridging endpoint in the bridging domain.



12.7.1 Configurations

12.7.1.1 Creating a Layer 2 Subinterface

Complete the following steps to configure a Layer 2 (L2) subinterface on an Arista switch:

1. Configure the parent interface to be a routed port.

```
switch(config)# interface et1
switch(config-if-Et1)# no switchport
```

2. Create a subinterface on the parent interface (***et1.1***), assign 802.1q encapsulation (***vlan 100***), and assign the forwarding VLAN ID (***vlan 200***).

```
switch(config-if-Et1)# interface et1.1
switch(config-if-Et1.1)# encapsulation dot1q vlan 100
switch(config-if-Et1.1)# vlan id 200
! VLAN does not exist. Creating vlan 200
```

3. An alternative to configuring a forwarding VLAN id is to use VLAN name (***office***).

```
switch(config)# vlan 200
switch(config-vlan-200)# name office
switch(config-vlan-200)# int et1.2
switch(config-if-Et1.2)# encapsulation dot1q vlan 101
switch(config-if-Et1.2)# vlan name office
```

4. Now subinterfaces ***et1.1*** and ***et1.2*** have been created and added to ***vlanVLAN 200***.

```
switch# show interface et1.1-2 status
Port      Name   Status       Vlan     Duplex Speed  Type                 Flags Encapsulation
Et1.1            connected    200      full   10G    dot1q-encapsulation  100

Et1.2            connected    200      full   10G    dot1q-encapsulation  101
```

12.7.1.2 MAC Address on Layer 2 Subinterface

MAC addresses can either be statically configured or dynamically assigned behind Layer 2 (L2) subinterfaces.

```
switch(config)# mac address-table static 0000.000a.000a vlan 200
 interface et1.1
```

```
switch# show mac address-table interface et1.1-2
          Mac Address Table
------------------------------------------------------------

Vlan  Mac Address     Type     Ports   Moves  Last Move
----  -----------     ----     -----   -----  ---------
 200  0000.000a.000a  STATIC   Et1.1
 200  0000.000b.000b  DYNAMIC  Et1.2   1      0:00:06 ago
Total Mac Addresses for this criterion: 2
```

MAC address learning can be enabled or disabled on an L2 subinterface using the following commands:

In the following example, the **`show interface ethernet1.1 switchport`** command has this ***running-config***:

```
switch(config-if-Et1.1)# show interface ethernet1.1 switchport
Name: Et1.1
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
MAC Address Learning: disabled
Dot1q ethertype/TPID: 0x8100 (active)
Dot1q VLAN Tag: Allowed
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:
Source interface filtering: enabled
VLAN forwarding mode: allowedVlansOnly
```

To enable MAC address learning, use the **`no mac address learning disabled`** command:

```
switch(config-if-Et1.1)# no mac address learning disabled
```

12.7.1.3 QoS Feature

Supported QoS features are:

Shaping

After creating an L2 subinterface, you can configure a shape rate (in Kbps) on the sub-interface. For example, the shape rate is configured to ***50000000*** Kbps.

```
switch(config-if-Et1.1)# shape rate 50000000
```

The configuration of non-default shape rate results in the allocation of dedicated virtual output queues (VOQ) for the subinterface. Each subinterface allocates four (4) VOQs. Different TC traffic goes to the VOQ according to the following mapping:

TC6-7 :	VOQ3
TC4-5 :	VOQ2
TC2-3 :	VOQ1
TC0-1 :	VOQ0

VOQ3 is in strict-priority mode to the other VOQs.

VOQ2, VOQ1, and VOQ0 are in WRR with a static credit ratio 2:3:6 (higher ratio implies more credits).

The subinterface inherits the trust mode of the parent interface.

Before ***EOS Release 4.24.2F***, shaping is supported only on L2 subinterfaces of which the parents are Ethernet interfaces, for example, ***Et1.1***. Beginning with ***EOS Release 4.24.2F***, shaping on L2 subinterface over a parent interface which is port-channel (for example, ***Po1.1***), is supported.

Guaranteed Bandwidth

After configuring shaping on an L2 sub-interface, user can configure a guaranteed bandwidth (in Kbps or percent) on the subinterface using the **bandwidth guaranteed** command.

```
switch(config-if-Et1.1)# bandwidth guaranteed 10000000
switch(config-if-Et1.1)# bandwidth guaranteed percent 10
```

Policing

For policing to work on the L2 subinterface, you must switch to the QoS profile.

Example

```
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile qos

Sample Policy-map Configuration:

switch(config)# ip access-list a1
switch(config-acl-a1)# statistics per-entry
switch(config-acl-a1)# 10 permit ip any any

switch(config)# class-map type qos match-any c1
switch(config-cmap-qos-c1)# match ip access-group a1

switch(config)# class-map type qos match-any c2
switch(config-cmap-qos-c2)# match vlan 100 0xfff

switch(config)# ipv6 access-list a1
switch(config-ipv6-acl-a1)# statistics per-entry
switch(config-ipv6-acl-a1)# 10 permit ipv6 any any
```

```
switch(config)# class-map type qos match-any c3
switch(config-cmap-qos-c3)# match ipv6 access-group a1

switch(config)# policy-map type quality-of-service p1
switch(config-pmap-quality-of-service-p1)# class c1
switch(config-pmap-quality-of-service-p1-c1)# police cir 10 Mbps bc
 100000 bytes
    exit
exit
```

After you create an L2 subinterface, you can configure a policy-map on the sub-interface, similar to the following example.

```
switch(config-if-Et1.1)# service-policy type qos input p1
```

Interface Counters

To enable the hardware features for counting packets on L2 subinterfaces ingress and/or egress, use the **`hardware counter feature`** command, similar to the following example. In the example, subinterface ***layer2*** is enabled for ingress then enabled for egress.

Example

```
switch(config)# hardware counter feature subinterface in layer2
switch(config)# hardware counter feature subinterface out layer2
```

To display the L2 subinterface counters, use the **`show interface counters`** command similar to the following example. In the example, subinterface ***et1.1*** is configured to be displayed.

```
switch# show interfaces et1.1 counters

Port         InOctets      InPkts
Et1.1        0             0

Port          OutOctets    OutPkts
Et1.1         0             0
```

To clear all of the interface counters, use the **`clear counters`** command similar to the following example:

```
switch# clear counters
```

To learn counters for a specific L2 interface, use the **`clear counters`** command, and specify the L2 subinterface to clear, similar to the following example. In the example, L2 subinterface ***et1.1*** is to be cleared.

```
switch# clear counters et1.1
```

12.7.1.4 Limitations

The following limitations apply to the Layer 2 subinterface feature:

- A total of ***256*** Layer 2 subinterfaces with shaping are supported across the entire switch and they can be distributed across any number of Ethernet ports.
- When a shape rate is configured on an L2 subinterface over a parent interface which is port-channel (example: ***Po1.1***), traffic load-balancing is disabled and is directed to a selected port-channel member. Also, the bandwidth of the port-channel subinterface will be equal to the selected

member. However, the **show interface** command continues to show the bandwidth of the port-channel which is incorrect.

- After configuring a shape rate on an L2 subinterface, the L2 subinterface must be flapped by using the **shut**" and **no shut** commands.
- Shaping of BUM traffic on L2 subinterfaces is supported only with "***ingress replication***".
- Layer 3 forwarding through SVIs is not supported.
- Routing through the parent interface of a subinterface is not supported.
- Control plane processing, such as IGMP snooping and STP BPDU is not supported.
- When IGMP protocol packets are expected to be forwarded on L2 subinterfaces, then IGMP snooping must be disabled globally on the entire switch using the **no ip igmp snooping** command. When IGMP snooping is configured on any VLAN, then IGMP protocol packets are discarded by L2 subinterfaces.
- Double tagged packets arriving on L2 subinterfaces with a single **encapsulation dot1q vlan <outer_vid>** command configured will match on the outer VLAN tag, and have only the outer VLAN tags terminated.
- Configuration of double tagged L2 subinterfaces through the **encapsulation dot1q vlan <outer_vid> inner <inner_vid>** command is not supported.
- Mixing of shaped and non-shaped subinterfaces under the same parent interface is not supported.
- Traffic classification on ingress traffic to l2 subinterface is disabled by default. To enable this feature, configure using the **qos trust cos** command on the parent interface.
- L2 subinterfaces are not supported in an MLAG environment.

12.7.2 QoS Show Commands

Use the **show interfaces status** command to display the subinterface status.

Example

```
switch# show interfaces status sub-interfaces
Port     Name   Status       Vlan     Duplex Speed  Type                Flags
 Encapsulation
Et1.1           connected    200      full   10G    dot1q-encapsulation       100
Et1.2           connected    200      full   10G    dot1q-encapsulation       101
```

Use the **show vlan** command to display the VLAN membership. In the following example, ***vlan 200*** is configured to be displayed.

Example

```
switch# show vlan 200
VLAN  Name                 Status    Ports
----- -------------------- --------- -------------------
200   office               active    Et1.1, Et1.2, Et5
```

Use the **show qos interface** command to display the QoS configuration on an L2 subinterface. In the following example, QoS subinterface ***Ethernet 1.1*** is configured to be displayed.

Example

```
switch# show qos interface Ethernet 1.1
Ethernet1.1:
```

```
   Trust Mode: DSCP
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: 50625 / 50000 kbps
```

Use the **`show interface counters`** with the queue keyword to display the L2 subinterface counters. For example subinterface ***Ethernet 1.1*** is configured to display the L2 subinterface counters.

Example

```
switch# show interface Ethernet 1.1 counters queue
Aggregate VoQ Counters
Egress   Traffic   Pkts     Octets     DropPkts  DropOctets
Port     Class
-----------------------------------------------------------
Et1.1    TC0-1      0        0          0         0
Et1.1    TC2-3      0        0          0         0
Et1.1    TC4-5      0        0          0         0
Et1.1    TC6-7      460266   276159600  109316    65589600
```

Use the **`show mac address-table`** command to display the MAC address on L2 subinterfaces. For example, subinterfaces ***Et1.1*** and ***Et1.2*** are configured to be displayed.

Example

```
switch# show mac address-table interface et1.1-2
          Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
 200    0000.000a.000a    STATIC      Et1.1
 200    0000.000b.000b    DYNAMIC     Et1.2      1       0:00:16 ago
Total Mac Addresses for this criterion: 2
```

Chapter 13

Layer 3 Configuration

This chapter covers the following Layer 3 sections:

- IPv4
- IPv6
- Ingress and Egress Per-Port for IPv4 and IPv6 Counters
- ACLs and Route Maps
- VRRP and VARP
- DirectFlow
- Decap Groups
- Nexthop Groups
- Global Knob to Set MTU for all Layer 3 Interfaces
- Support for Layer 3 MTU on 7280R3/7500R3/7800R3
- Segment Security

13.1 IPv4

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista's implementation of IPv4 and includes these topics:

- IPv4 Addressing
- IPv4 Routing
- IPv4 Multicast Counters
- Route Management
- IPv4 Route Scale
- IP Source Guard
- DHCP Server
- DHCP Relay Global Configuration Mode
- DHCP Relay Across VRF
- DHCP Relay in VXLAN EVPN
- DHCP Snooping with Bridging
- TCP MSS Clamping
- IPv4 GRE Tunneling
- GRE Tunneling Support
- BfRuntime to Use Non-default VRFs
- IPv4 Commands

13.1.1 IPv4 Addressing

Each IPv4 network device is assigned a 32-bit IP address that identifies its network location. These sections describe IPv4 address formats, data structures, configuration tasks, and display options:

- IPv4 Address Formats
- IPv4 Address Configuration
- Address Resolution Protocol (ARP)
- Displaying ARP Entries

13.1.1.1 IPv4 Address Formats

IPv4 addresses are composed of 32 bits, expressed in dotted decimal notation by four decimal numbers, each ranging from `0` to `255`. A subnet is identified by an IP address and an address space defined by a routing prefix. The switch supports the following subnet formats:

- **IP address and subnet mask:** The subnet mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. The subnet address space is calculated by performing an AND operation between the IP address and subnet mask.
- **IP address and wildcard mask:** The wildcard mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. Wildcard masks differ from subnet masks in that the bits are inverted. Some commands use wildcard masks instead of subnet masks.
- **CIDR notation:** CIDR notation specifies the scope of the subnet space by using a decimal number to identify the number of leading ones in the routing prefix. When referring to wildcard notation, CIDR notation specifies the number of leading zeros in the routing prefix.

Examples

- These subnets (subnet mask and CIDR notation) are calculated identically:

```
10.24.154.13 255.255.255.0
10.24.154.13/24
```

- The defined space includes all addresses between ***10.24.154.0*** and ***10.24.154.255***. These subnets (wildcard mask and CIDR notation) are calculated identically:

```
124.17.3.142 0.0.0.15
124.17.3.142/28
```

  The defined space includes all addresses between ***124.17.3.128*** and ***124.17.3.143***.

13.1.1.2 IPv4 Address Configuration

Assigning an IPv4 Address to an Interface

The **ip address** command specifies the IPv4 address of an interface and the mask for the subnet to which the interface is connected.

Example

These commands configure an IPv4 address with subnet mask for ***VLAN 200***:

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip address 10.0.0.1/24
switch(config-if-Vl200)#
```

Assigning an IPv4 Class E Address to an Interface

The **ipvr routable 240.0.0.0/4**command assigns a class E addresses to an interface. When configured, the class E address traffic are routed through BGP, OSPF, ISIS, RIP, static routes and programmed to the FIB and kernel. By default, this command is disabled.

Example

- These commands configure an IPv4 Class E (***240/4***) address to an interface.

```
switch(config)# router general
switch(config-router-general)# ipv4 routable 240.0.0.0/4
```

Detecting duplicate IP Addresses on an Interface

The **ip address duplicate detection disabled** command detects any duplicate IP address on the interface. When the duplicate IP address is detected, a syslog message is generated. It helps the network operator to identify IP addresses misconfiguration. By default, this feature is enabled.

Examples

- This command disables the feature on the switch.

```
switch(config)# ip address duplicate detection disabled
```

- This command enables the feature.

```
switch(config)# ip address duplicate detection logging
```

Note: Commands are in global configuration mode, and are not per VRF.

This is an example of a Syslog message, when a duplicate IP address is detected.

```
Mar 24 16:41:57 cd290 Arp: %INTF-4-DUPLICATE_ADDRESS_WITH_HOST: IP
 address 100.1.1.2
configured on interface Ethernet1/1 is in use by a host with
MAC address 00:00:01:01:00:00 on interface Ethernet1/1 in VRF default
```

13.1.1.3 Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is a protocol that maps IP addresses to MAC addresses that local network devices recognize. The ARP cache is a table that stores the correlated addresses of the devices for which the router facilitates data transmissions.

After receiving a packet, routers use ARP to find the MAC address of the device assigned to the packet's destination IP address. If the ARP cache contains both addresses, the router sends the packet to the specified port. If the ARP cache does not contain the addresses, ARP broadcasts a request packet to all devices in the subnet. The device at the requested IP address responds and provides its MAC address. ARP updates the ARP cache with a dynamic entry and forwards the packet to the responding device. Static ARP entries can also be added to the cache through the CLI.

Proxy ARP is an ARP variant. A network device (proxy) responds to ARP requests for network addresses on a different network with its MAC address. Traffic to the destination is directed to the proxy device which then routes the traffic toward the ultimate destination.

Configuring ARP

The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses. The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the Layer 3 interface. The default duration is ***14400*** seconds (four hours).

Entries are refreshed and expired at a random time that is in the range of ***80%-100%*** of the cache expiry time. The refresh is tried three times at an interval of ***2%*** of the configured timeout.

Static ARP entries never time out and must be removed from the table manually.

Example

This command specifies an ARP cache duration of ***7200*** seconds (two hours) for dynamic addresses added to the ARP cache that were learned through ***VLAN 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# arp aging timeout 7200
switch(config-if-Vl200)# show active
interface Vlan200
   arp aging timeout 7200
switch(config-if-Vl200)#
```

The **arp** command adds a static entry to an Address Resolution Protocol (ARP) cache.

Example

This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)# arp 172.22.30.52 0025.900e.c63c arpa
```

```
switch(config)#
```

13.1.1.3.1 Gratuitous ARP

Gratuitous ARP packets are broadcast by a device in response to an internal change rather than as a response to an ARP request. The gratuitous ARP packet is a request packet (no reply expected) that supplies an unrequested update of ARP information. In a gratuitous ARP packet, both the source and destination IP addresses are the IP of the sender, and the destination MAC address is the broadcast address (***ff:ff:ff:ff:ff:ff***).

Gratuitous ARP packets are generated to update ARP tables after an IPv4 address or a MAC address change occurs.

Configuring Gratuitous ARP

By default, Arista switch interfaces reject gratuitous ARP request packets. The **arp gratuitous accept** command configures an L3 interface to accept the gratuitous ARP request packets sent from a different device in the network and add their mappings to the ARP table. Gratuitous ARP can be configured on Ethernet interfaces, VLANs/SVI, or L3 port channels, but has no effect on L2 interfaces.

Example

These commands enable gratuitous ARP packet acceptance on ***interface ethernet 2/1***.

```
switch (config)# interface ethernet 2/1
switch (config-if-Et2/1)# arp gratuitous accept
```

13.1.1.4 Displaying ARP Entries

The **show ip arp** command displays ARP cache entries that map an IP address to a corresponding MAC address. The table displays addresses by their host names when the command includes the ***resolve*** argument.

Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch> show ip arp

Address         Age (min)  Hardware Addr   Interface
172.25.0.2              0  004c.6211.021e  Vlan101, Port-
Channel2
172.22.0.1              0  004c.6214.3699  Vlan1000, Port-
Channel1
172.22.0.2              0  004c.6219.a0f3  Vlan1000, Port-
Channel1
172.22.0.3              0  0045.4942.a32c  Vlan1000,
 Ethernet33
172.22.0.5              0  f012.3118.c09d  Vlan1000, Port-

switch>
```

13.1.1.4.1 ARP Inspection

Address Resolution Protocol (ARP) inspection command ip arp inspection vlan**ip arp inspection vlan** activates a security feature that protects the network from ARP spoofing. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification.

Enabling and Disabling ARP Inspection

By default, ARP inspection is disabled on all VLANs.

Examples

- This command enables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)# ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)# no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs ***1*** through ***150***.

```
switch(config)# default ip arp inspection vlan 1 - 150
switch(config)#
```

- These commands enable ARP inspection on multiple VLANs ***1*** through ***150*** and ***200*** through ***250***.

```
switch(config)# ip arp inspection vlan 1-150,200-250
switch(config)#
```

Syslog for Invalid ARP Packets Dropped

When an invalid ARP packet is dropped, the following syslog message appears. The log severity level can be set higher if required.

```
%SECURITY-4-ARP_PACKET_DROPPED: Dropped ARP packet on interface
 Ethernet28/1 Vlan
2121 because invalid mac and ip binding. Received: 00:0a:00:bc:0
0:de/1.1.1.1.
```

Displaying ARP Inspection States

The command **`show ip arp inspection vlan`** displays the configuration and operation state of ARP inspection. For a VLAN range specified by **`show ip arp inspection vlan`** only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to **Active** when hardware is ready to trap ARP packets for inspection.

Example

This command displays the configuration and operation state of ARP inspection for VLANs ***1*** through ***150***.

```
switch(config)# show ip arp inspection vlan 1 - 150

VLAN 1
----------
Configuration
: Enabled
Operation State : Active
VLAN 2
----------
Configuration
: Enabled
Operation State : Active
{...}
VLAN 150
----------
Configuration
: Enabled
Operation State : Active

switch(config)#
```

Displaying ARP Inspection Statistics

The command show ip arp inspection statistics**show ip arp inspection statistics** displays the statistics of inspected ARP packets. For a VLAN specified by **show ip arp inspection vlan** only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

The command **clear arp inspection statistics** clears ARP inspection.

Examples

- This command displays ARP inspection statistics for ***VLAN 1***.

```
switch(config)# show ip arp inspection statistics vlan 2

Vlan : 2
------------
ARP Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command displays ARP inspection statistics for ***ethernet interface 3/1***.

```
switch(config)# show ip arp inspection statistics ethernet
 interface 3/1

Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command clears ARP inspection statistics.

```
switch(config)# clear arp inspection statistics
```

```
switch(config)#
```

Configure Trust Interface

By default, all interfaces are untrusted. The command **ip arp inspection trust** configures the trust state of an interface.

Examples

- This command configures the trust state of an interface.

```
switch(config)# ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)# no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to its default (untrusted).

```
switch(config)# default ip arp inspection trust
switch(config)#
```

Configure Rate Limit

When ARP inspection is enabled, ARP packets are trapped to the CPU. Two actions can be taken when the incoming ARP rate exceeds expectation. For notification purpose, the command **ip arp inspection logging** will enable logging of the incoming ARP packets. To prevent a denial-of-service attack, the command **ip arp inspection limit** will error-disable interfaces.

Examples

- This command enables logging of incoming ARP packets when its rate exceeds the configured value, and sets the rate to ***2048*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***15*** seconds.

```
switch(config)# ip arp inspection logging rate 2048 burst
 interval 15
switch(config)#
```

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to ***512*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***11*** seconds.

```
switch(config)# ip arp inspection limit rate 512 burst
 interval 11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)# interface ethernet 3/1
```

```
switch(config)# ip arp inspection limit rate 20 burst interval
 5
switch(config)# interface Ethernet 3/3
switch(config)# ip arp inspection trust
switch(config)# show ip arp inspection interfaces

 Interface      Trust State  Rate (pps) Burst Interval
 -------------  -----------  ---------- --------------
 Et3/1          Untrusted    20         5
 Et3/3          Trusted      None       N/A

switch(config)#
```

Configure Errdisable Caused by ARP Inspection

If the incoming ARP packet rate on an interface exceeds the configured rate limit in burst interval, the interface will be errdisabled (by default). If errdisabled, the interface will stay in this state until you intervene with the command **`errdisable detect cause arp-inspection`** (e.g., after you perform a **`shutdown`** or **`no shutdown`** of the interface) or it automatically recovers after a certain time period. The command **`errdisable recovery cause arp-inspection`** will enable auto recovery. The command **`errdisable recovery interval`** will enable sharing the auto recovery interval among all errdisable interfaces. (See the chapter **Data Transfer Introduction** for information on all **`errdisable`** commands.

Examples:

- This command enables errdisable caused by an ARP inspection violation.

```
switch(config)# errdisable detect cause arp-inspection
switch(config)#
```

- This command disables errdisable caused by an ARP inspection violation.

```
switch(config)# no errdisable detect cause arp-inspection
switch(config)#
```

- This command enables auto recovery.

```
switch(config)# errdisable recovery cause arp-inspection
switch(config)#
```

- This command disables auto recovery.

```
switch(config)# no errdisable recovery cause arp-inspection
switch(config)#
```

- This command enables sharing the auto recovery interval of ***10*** seconds among all errdisable interfaces.

```
switch(config)# errdisable recovery interval 10
switch(config)#
```

- This command disables sharing the auto recovery interval of ***10*** seconds among all errdisable interfaces.

```
switch(config)# no errdisable recovery interval 10
switch(config)#
```

- This command displays the reason for a port entering the errdisable state.

```
switch(config)# show interfaces status errdisabled

Port          Name          Status       Reason
------------ ------------ ------------ ---------------
Et3/2                      errdisabled  arp-inspection

switch(config)#
```

Configure Static IP MAC Binding

The ARP inspection command **ip source binding** allows users to add static IP-MAC binding. If enabled, ARP inspection verifies incoming ARP packets based on the configured IP-MAC bindings. The static IP-MAC binding entry s only be configured on Layer 2 ports. By default, there is no binding entry on the system.

Examples

- This command configures static IP-MAC binding for IP address ***127.0.0.1,*** MAC address ***0001.0001.0001***, ***vlan 1***, and Ethernet interface ***slot 4*** and ***port 1***.

```
switch(config)# ip source binding 127.0.0.1 0001.0001.0001
 vlan 1 interface
ethernet 4/1
switch(config)#
```

- This command configures static IP-MAC binding for IP address ***127.0.0.1***, MAC address ***0001.0001.0001***, ***vlan 1***, and ***port-channel interface 20***.

```
switch(config)# ip source binding 127.0.0.1 0001.0001.0001
 vlan 1 interface
port-channel 20
switch(config)#
```

- This command displays the configured IP-MAC binding entries. Note that the Lease column is mainly used for displaying dynamic DHCP snooping binding entries. For static binding entries, lease time is shown as infinite.

```
switch(config)# show ip source binding 127.0.0.1 0001.0001.0001 static vlan 1
interface port-channel 20

MacAddress      IpAddress   Lease(sec)  Type   VLAN  Interface
--------------- ----------- ----------- ------ ----- --------------
0001.0001.0001  127.0.0.1   infinite    static 1     Port-Channel20

switch(config)#
```

13.1.2 IPv4 Routing

Internet Protocol version 4 (IPv4) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. The connected subnets have IP address ranges that do not overlap.

A router is a network device that connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address. IPv4 and IPv6 are internet

layer protocols that define packet-switched internetworking, including source-to-destination datagram transmission across multiple networks.

These sections describe IPv4 routing and route creation options:

- Enabling IPv4 Routing
- Static and Default IPv4 Routes
- Dynamic IPv4 Routes
- Viewing IPv4 Routes and Network Components

13.1.2.1 Enabling IPv4 Routing

When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The ip routing command enables IPv4 routing.

Example

This command enables IP routing:

```
switch(config)# ip routing
switch(config)#
```

13.1.2.2 Static and Default IPv4 Routes

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate. Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as connected routes that are available for redistribution into routing domains defined by dynamic routing protocols.

The ip route command creates a static route. The destination is a network segment; the nexthop is either an IP address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

A route tag is a 32-bit number that is attached to a route. Route maps use tags to filter routes. Static routes have a default tag value of ***0***.

Example

This command creates a static route:

```
switch(config)# ip route 172.17.252.0/24 vlan 500
switch(config)#
```

Creating Default IPv4 Routes

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv4 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv4 destination prefix is ***0.0.0.0/0*** and the next-hop is the default gateway.

Example

This command creates a default route and establishes ***192.14.0.4*** as the default gateway address:

```
switch(config)# ip route 0.0.0.0/0 192.14.0.4
switch(config)#
```

13.1.2.3 Dynamic IPv4 Routes

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic IPv4 routing protocols:

- OSPFv2 Introduction
- Border Gateway Protocol (BGP)
- Routing Information Protocol (RIP)
- IS-IS

13.1.2.4 Viewing IPv4 Routes and Network Components

Displaying the FIB and Routing Table

The show ip route command displays routing table entries that are in the forwarding information base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **`show running-config`** command displays configured commands not in the FIB. The show ip route summary command displays the number of routes, categorized by source, in the routing table.

Examples

- This command displays IP routes learned through BGP.

```
switch> show ip route bgp

Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type
 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type
 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, A - Aggregate

 B E    170.44.48.0/23 [20/0] via 170.44.254.78
 B E    170.44.50.0/23 [20/0] via 170.44.254.78
 B E    170.44.52.0/23 [20/0] via 170.44.254.78
 B E    170.44.54.0/23 [20/0] via 170.44.254.78
 B E    170.44.254.112/30 [20/0] via 170.44.254.78
 B E    170.53.0.34/32 [1/0] via 170.44.254.78
 B I    170.53.0.35/32 [1/0] via 170.44.254.2
```

```
                                via 170.44.254.13
                                via 170.44.254.20
                                via 170.44.254.67
                                via 170.44.254.35
                                via 170.44.254.98

switch>
```

- This command displays a summary of routing table contents.

```
switch> show ip route summary

Route Source         Number Of Routes
-------------------------------------
connected                    15
static                        0
ospf                         74
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9
  NSSA External-1:0 NSSA External-2:0
bgp                           7
  External: 6 Internal: 1
internal                     45
attached                     18
aggregate                     0

switch>
```

Displaying the IP Route Age

The show ip route age command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

Example:

This command displays the amount of time since the last update to ip route ***172.17.0.0/20***.

```
switch> show ip route 172.17.0.0/20 age

Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

 B E    172.17.0.0/20 via 172.25.0.1, age 3d01h

switch>
```

Displaying Gateways

A gateway is a router that provides access to another network. The gateway of last resort, also known as the default route, is the route that a packet uses when the route to its destination address is unknown. The IPv4 default route in is ***0.0.0.0/0***.

The show ip route gateway command displays IP addresses of all gateways (next hops) used by active routes.

Example

This command displays next hops used by active routes.

```
switch> show ip route gateway

The following gateways are in use:
   172.25.0.1 Vlan101
   172.17.253.2 Vlan2000
   172.17.254.2 Vlan2201
   172.17.254.11 Vlan2302
   172.17.254.13 Vlan2302
   172.17.254.17 Vlan2303
   172.17.254.20 Vlan2303
   172.17.254.66 Vlan2418
   172.17.254.67 Vlan2418
   172.17.254.68 Vlan2768
   172.17.254.29 Vlan3020

switch>
```

Displaying Host Routes

The show ip route host command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = ***255.255.255.255*** or prefix = ***/32***). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Example

This command displays all host routes in the host forwarding table.

```
switch# show ip route host

R - receive B - broadcast F - FIB, A - attached

F   127.0.0.1 to cpu
B   172.17.252.0 to cpu
A   172.17.253.2 on Vlan2000
R   172.17.253.3 to cpu
A   172.17.253.10 on Vlan2000
R   172.17.254.1 to cpu
A   172.17.254.2 on Vlan2901
B   172.17.254.3 to cpu
B   172.17.254.8 to cpu
A   172.17.254.11 on Vlan2902
R   172.17.254.12 to cpu

F   172.26.0.28 via 172.17.254.20 on Vlan3003
                via 172.17.254.67 on Vlan3008
                via 172.17.254.98 on Vlan3492
via 172.17.254.86 on Vlan3884
                via 172.17.253.2 on Vlan3000
F   172.26.0.29 via 172.25.0.1 on Vlan101
F   172.26.0.30 via 172.17.254.29 on Vlan3910
```

```
F   172.26.0.31 via 172.17.254.33 on Vlan3911
F   172.26.0.32 via 172.17.254.105 on Vlan3912

switch#
```

13.1.3 IPv4 Multicast Counters

IPv4 multicast counters allow association of IPv4 multicast routes with a packet or byte counter.

This chapter contains the following sections.

- Multicast Counters Hardware Overview
- Multicast Counters iBGP and eBGP Configuration
- Configuring IPv4 Multicast Counters

13.1.3.1 Multicast Counters Hardware Overview

This section describes a hardware overview for multicast counters, and contains the following sections.

- Platform Independent Requirements for Counters
- Policer Counter Overview
- BGP Functions Supported for Arista Switches
- Additional Requirements

13.1.3.1.1 Platform Independent Requirements for Counters

The following platform independent requirements include:

- Enable/Disable counters
- Clear counters
- Show counters
- Configure counter mode for byte (default) or frame mode

13.1.3.1.2 Policer Counter Overview

The switch hardware has two policer banks, each with 4k entries and each entry has one 32 bit entry1, and one 32 bit entry2, which can be used as either packet counter or byte counter.

In the pipeline, each bank can have one policer index coming from upstream blocks, which means different features cannot update multiple policer entries in the same bank simultaneously. Therefore, different features cannot share entries in the same bank.

In switch hardware routing, each FFU/BST entry points to a corresponding RAM. A policer index is saved in the action ram, so when installing a multicast route into hardware, platform code will get a policer index and saved in the action field. If a policer index is unavailable, a counter is not added to the action field.

Switch hardware can have multiple features competing for the policer banks. It is desirable to have a platform command to reserve policer banks dedicated for a certain feature.

The following command reserves one or two policer banks to be used only by the named feature:

```
[no] platform fm6000 [nat|acl|qos|multicast] policer banks <1|2>
```

Available bank(s) are reserved for the feature. Otherwise the command takes effect at the next reboot or FocalPointV2 agent restart. This reservation guarantees the configured number of bank(s) for this feature. However, the feature can still possibly obtain the other policer bank if it needs more, and the other bank is available.

If a feature has a pending reservation request which is not fulfilled because of availability, and some other feature frees a bank, the bank will be allocated to the pending feature.

13.1.3.1.3 BGP Functions Supported for Arista Switches

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (IBGP) and external (EBGP) peering
- Multiprotocol BGP
- BGP Confederations

13.1.3.1.4 Additional Requirements

On switch hardware, the following additional requirements include:

- Reservation of policer banks
- Notification of policer bank availability when a policer entry is freed by other features

13.1.3.2 Multicast Counters iBGP and eBGP Configuration

This section describes the commands required to configure an iBGP and an eBGP topology, and contains the following sections.

- **Policer Usage**

13.1.3.2.1 Policer Usage

There are two types of counters – those created by wildcard creation and by specific creation. When a specific counter is required and the hardware runs out of policer entries, a wildcard counter is forced to give up its policer entry.

If the user configures a specific counter and the Starter Group (SG) already has a wildcard-created counter for it, then this counter is upgraded to a specific one, with no change in hardware policer index. If the user configures both a wildcard counter and specific counter for this SG, and subsequently deletes the specific counter, the counter for this SG is downgraded to a wildcard, with no change in hardware policer index. However, if another specific counter is pending for a hardware policer index, then this policer entry will be assigned to that counter due to its higher precedence.

Even if a counter is configured by the user, in order to conserve the use of hardware resources, do not allocate a policer entry until a real route (G, S) is programmed into the Frame Filtering and Forwarding Unit (FFU).

13.1.3.3 Configuring IPv4 Multicast Counters

Perform the following CLI steps to configure IPv4 multicast counters on the FM6000 platform:

1. Execute the global configuration command:

   - **no|default `ip multicast count` bytes| packets**

     Enables wildcard counters. Also used to change bytes / packets mode. When hardware runs of resources, specific creation has priority to preempt counters from wildcard creation. The **bytes | packets** optional keyword enables the counter to be in either bytes mode or packets mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

   - **no|default `ip multicast count` <*G*> <*S*>**

     This is only takes affect when **`ip multicast count`** is enabled. Either **<*G*> <*S*>** or **bytes|packets** optional keyword is used. They can not be used concurrently.

No | default Commands: (default is same as no)

- **`no ip multicast count`** Deletes all multicast counters, including explicit ***<G> <S>*** routes
  - **`no ip multicast count`** ***<G> <S>*** Removes the config. Does not delete the counter because the wildcard is still active.
  - If no ***<G, S>*** is specified, all multicast routes will have counters unless the hardware runs out of resources. The creation of counters is referred to as “wildcard creation.”
  - If ***<G, S>*** is specified, only ***<G, S>*** will get a counter (and no other route). The creation of counters is referred to as “specific creation.” By default, all mcast routes will have counters allocated. This ***<G, S>*** configuration is applicable when the hardware runs out of resources. Specific ***<G, S>*** creation has priority to preempt counters from wildcard creation.

The ***byte | frame*** optional keyword enables the counter to be in either byte mode or frame mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

Either ***<G, S>***, or ***byte | frame*** optional keywords are used but cannot be used together. All counters are ***byte|frame***. The ***byte|frame*** mode is global, and not applicable on a ***<G, S>*** basis.

2. Execute clear command:

```
clear ip multicast count <G> <S>
```

3. Execute show command:

```
show multicast fib ipv4 <G> count
```

This command currently exists but does not show anything.

This show command is intended to display the following (example):

```
switch> show multicast fib ipv4 count
Activity poll time: 60 seconds
225.1.1.1 100.0.0.2
Byte: 123
Vlan100 (iif)
Vlan200
Activity 0:00:47 ago
```

Total counts is the sum of counts from all sources in that group.

The count value can be **N/A** if a mroute does not have an associated counter.

If the count value for any source in a ***G*** is **N/A**, then the total counts for ***G*** will be shown as **N/A**. However, the count values for other sources are still shown.

13.1.4 Route Management

When routing is enabled, the switch discovers the best route to a packet’s destination address by exchanging routing information with other devices. IP routing is disabled by default.

The following sections describes routing features that the switch supports:

- Route Redistribution
- Equal Cost Multipath Routing (ECMP) and Load Sharing
- Unicast Reverse Path Forwarding (uRPF)
- Routing Tables / Virtual Routing and Forwarding (VRF)
- RIB Route Control

13.1.4.1 Route Redistribution

Route redistribution is the advertisement, into a dynamic routing protocol's routing domain, of connected (static) routes or routes established by other routing protocols. By default, the switch advertises only routes in a routing domain that are established by the protocol that defined the domain.

Route redistribution commands specify the scope of the redistribution action. By default, all routes from a specified protocol (or all static routes) are advertised into the routing domain. Commands can also filter routes by applying a route map, which defines the subset of routes to be advertised.

13.1.4.2 Equal Cost Multipath Routing (ECMP) and Load Sharing

Equal Cost Multi-Path (ECMP) is a routing strategy where traffic is forwarded over multiple paths that have equal routing metric values.

Configuring ECMP (IPv4)

All ECMP paths are assigned the same tag value; commands that change the tag value of a path also change the tag value of all paths in the ECMP route.

In a network topology using ECMP routing, hash polarization may result when all switches perform identical hash calculations. Hash polarization leads to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform hash calculations.

The ip load-sharing command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to a specified subnet.

Example

This command sets the IPv4 load sharing hash seed to ***20***:

```
switch(config)# ip load-sharing fm6000 20
switch(config)#
```

Multicast Traffic Over ECMP

The switch attempts to spread outbound unicast and multicast traffic to all ECMP route paths equally. To disable the sending of multicast traffic over ECMP, use the multipath none command or the no version of the multipath deterministic command.

Resilient ECMP

Resilient ECMP is used for those prefixes where it is not desirable for routes to be rehashed due to link flap, typically where ECMP is being used for load balancing. Resilient ECMP configures a fixed number of next-hop entries in the hardware ECMP table for all the routes within a specified IP address prefix. Implementing fixed table entries for a specified next-hop address allows data flows that are hashed to a valid next-hop number to remain intact even when some of the next hops go down or come back online.

Resilient ECMP is enabled for all routes within a specified prefix using the ip hardware fib ecmp resilience command. The command specifies the maximum number of next-hop addresses that the hardware ECMP table can contain for the specified IP prefix, and configures a redundancy factor that facilitates the duplication of next-hop addresses in the table. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor. When the table contains the maximum number of next-hop addresses, the redundancy factor specifies the number of times each address is listed in the table. When the table contains fewer than the maximum number of next-hop addresses, the table space entries are filled by additional duplication of the nexthop addresses.

Resilient ECMP is also available for IPv6 IP addresses.

Example

This command configures a hardware ECMP table space of 24 entries for the IP address ***10.14.2.2/24***. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)# ip hardware fib ecmp resilience 10.14.2.2/24
 capacity 6 redundancy 4
switch(config)#
```

13.1.4.2.1 Resilient Equal-Cost Multi-Path (RECMP) Deduping

Routes covered by a Resilient Equal-Cost Multi-Path (RECMP) prefix are types of routes that make use of hardware tables dedicated for Equal-Cost Multi-Path (ECMP) routing. Resilient ECMP (RECMP) deduping reduces the number of ECMP hardware table entries allocated by the switch by forcing the routes that share the same set of next hops but point to different hardware table entries to point to the same hardware table entry when hardware resource utilization is high. Forcing RECMP routes to change the hardware table entry that they point to may potentially cause a traffic flow disruption for any existing flows going over that route. The deduping process will attempt to minimize the amount of potential traffic loss caused.

Each route needs to allocate hardware table entries in the ASIC, which contains forwarding information for the route, such as what its next-hops are, what egress links each next-hop uses, etc. The network device uses these hardware table entries when making forwarding decisions for a packet that is meant for a certain route. These ECMP hardware tables are limited in size and can fill up quickly if there are a large number of these hardware table entries allocated. One option to ease the usage of these hardware tables is to force RECMP routes to share hardware table entries.

There is already an existing feature for RECMP routes to get them to point to the same hardware table entry if they share the same set of next hops and the ordering of the next-hops is the same. However, RECMP routes may end up sharing the same set of next-hops, but the next-hop ordering may be different between them, and therefore the routes end up occupying different hardware table entries in the ASIC. RECMP routing has a property wherein the current ordering of next-hops for a given route is influenced by its previous orderings. The ordering between the routes can differ because these routes may have had a different set of next hops at some previous time before they finally converged onto the same set of next-hops.

When the ECMP hardware resource usage crosses the high threshold, the deduping process begins, and it lasts until the ECMP hardware resource usage falls below the low threshold. Use the **`IP hardware fib next-hop resource optimization thresholds`** command to modify the thresholds.

13.1.4.2.1.1Configuring Resilient ECMP Deduping

The Resilient ECMP Deduping is enabled by default.

- The following command is used to disable all the hardware resource optimization features:

```
switch(config)# ip hardware fib next-hop resource optimization disabled
```

- The following command is used to re-enable the all hardware resource optimization features after disabling them:

```
switch(config)# no ip hardware fib next-hop resource optimization
 disabled
```

- The following command is used to configure the thresholds for starting and stopping the optimization:

```
switch(config)# ip hardware fib next-hop resource optimization
 thresholds low <20> high <80>
```

Note:

- The value specified for the threshold represents the percentage of resource utilization, and is an integer between ***0*** and ***100***.
- Setting the high threshold to ***80*** indicates that optimization starts when the resource utilization is above ***80%***. The default value of this threshold is ***90***.
- Setting the low threshold to ***20*** indicates that optimization stops when the resource utilization is below ***20%***. The default value of this threshold is ***85***.

13.1.4.2.1.2Show Commands

- The **`show ip hardware fib summary`** command is used to display the statistics of this RECMP deduping:

  Example

```
switch# show ip hardware fib summary
Fib summary
-----------
Adjacency sharing: disabled
BFD peer event: enabled
Deletion Delay: 0
Protect default route: disabled
PBR: supported
URPF: supported
ICMP unreachable: enabled
Max Ale ECMP: 600
UCMP weight deviation: 0.0
Maximum number of routes: 0
Fib compression: disabled
Resource optimization for adjacency programming: enabled
Adjacency resource optimization thresholds: low 20, high 80
```

  The last two lines of the output shows whether RECMP deduping is enabled, and what are the corresponding threshold values for starting and stopping the optimization process.

- The **`show hardware capacity`** command is used to display the utilization of the hardware resources. The example below shows the multi-level hierarchy ECMP resources:

```
switch# show hardware capacity
Forwarding Resources Usage

Table    Feature         Chip    Used     Used    Free Committed    Best Case    High
                                 Entries  (%)     Entries    Entries      Max          Watermark
                                                                                      Entries
------- --------------- ------- -------- ------- --------   ------------ ------------ ---------
ECMP                             0        0%      4095       0        4095         0
ECMP     Mpls                    0        0%      4095       0        4095         0
ECMP     Routing                 0        0%      4095       0        4095         0
ECMP     VxlanOverlay            0        0%      4095       0        4095         0
ECMP     VxlanTunnel             0        0%      3891       0        3891         0
```

13.1.4.2.1.3Limitations

- With RECMP deduping, optimization of a sub-optimal ECMP route requires releasing and reallocating hardware resources for the route. Therefore the process may increase overall convergence time for route programming. It may not be desirable to always start the optimization when the hardware resource is sufficient. The threshold value for starting the optimization should be adjusted based on the route scale of the network.
- The deduping of ECMP hardware resources may cause potential traffic flow disruption for traffic flows going over RECMP routes with changing hardware table entries. While the deduping process tries to minimize the amount of traffic flow disruption, it is still sometimes inevitable.
- RECMP hardware table entries can only be deduped to other RECMP hardware table entries that share the same set of nexthops. This puts a limit to the amount of RECMP hardware table entries that can be reduced to the number of RECMP hardware table entries with unique nexthop sets.

13.1.4.3 Unicast Reverse Path Forwarding (uRPF)

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. The switch drops a packet when uRPF determines that the routing table does not contain an entry with a valid path to that packet's source IP address.

IPv4 and IPv6 uRPF operate independently. uRPF is VRF aware. Commands that do not specify a VRF utilize the default instance. Multicast routing is not affected by uRPF.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF also verifies that a packet is received on the interface that its routing table entry will use for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface.

13.1.4.3.1 uRPF Operation

uRPF is configurable on interfaces. For packets arriving on a uRPF-enabled interfaces, the source IP address is verified by examining the source and destination addresses of unicast routing table entries.

uRPF requires a reconfigured routing table to support IP address verification. When uRPF is enabled for the first time, unicast routing is briefly disabled to facilitate the routing table reconfiguration. Multicast routing is not affected by the initial uRPF enabling.

A packet fails uRPF verification if the table does not contain an entry whose source or destination address matches the packet's source IP address. In strict mode, the uRPF also fails when the matching entry's outbound interface does not match the packet's ingress interface.

uRPF verification is not available for the following packets:

- DHCP (Source is ***0.0.0.0*** – Destination is ***255.255.255.255***).
- IPv6 link local (***FE80::/10***).
- Multicast packets.

ECMP uRPF

When verifying ECMP routes, strict mode checks all possible paths to determine that a packet is received on the correct interface. Strict mode is supported for ECMP groups with a maximum of eight routing table entries. The switch reverts to loose mode for ECMP groups that exceed eight entries.

Default Routes

uRPF strict mode provides an **`allow-default`** option that accepts default routes. On interfaces that enable allow-default and a default route is defined, uRPF strict mode validates a packet even when the routing table does not contain an entry that matches the packet's source IP address. When allow-default is not enabled, uRPF does not consider the default route when verifying an inbound packet.

Null Routes

NULL0 routes drop traffic destined to a specified prefix. When uRPF is enabled, traffic originating from null route prefixes is dropped in strict and loose modes.

13.1.4.3.2 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) is enabled for IPv4 packets ingressing the configuration mode interface through the **ip verify** command.

Note: uRPF cannot be enabled on interfaces with ECMP member FECs.

Examples

- This command enables uRPF loose mode on ***interface vlan 17***.

```
switch(config)# interface vlan 17
switch(config-if-Vl17)# ip verify unicast source reachable-via
 any
switch(config-if-Vl17)# show active
 interface Vlan17
   ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on ***interface vlan 18***.

```
switch(config)# interface vlan 18
switch(config-if-Vl18)# ip verify unicast source reachable-via
 rx
switch(config-if-Vl18)# show active
 interface Vlan18
   ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

13.1.4.4 Routing Tables / Virtual Routing and Forwarding (VRF)

An IP routing table is a data table that lists the routes to network destinations and metrics (distances) associated with those routes. A routing table is also known as a Routing Information Base (RIB).

Virtual Routing and Forwarding (VRF) allows traffic separation by maintaining multiple routing tables. Arista switches support multiple VRF instances: one global or default VRF called “default” and multiple user-defined VRFs; the number of user-defined VRFs supported varies by platform. VRFs can be used as management or data plane VRFs.

- Management VRFs have routing disabled. They are typically used for management-related traffic.
- Dataplane VRFs have routing enabled. They support routing protocols and packet forwarding (hardware and software).

Dataplane VRFs are supported by Trident, FM6000, and Arad platform switches.

VRFs support unicast IPv4 and IPv6 traffic and multicast traffic. Loopback, SVI, and routed ports may be added to VRFs. Management ports may be added without any hardware forwarding.

To allow overlap in the sets of IP addresses used by different VRF instances, a Route Distinguisher (RD) may be prepended to each address. RDs are defined in ***RFC 4364***.

13.1.4.4.1 Default VRF

The default VRF on Arista switches is called “default.” It is created automatically and cannot be renamed or configured. Some configuration options accept “default” as a VRF input.

13.1.4.4.2 User-Defined VRFs

A user-defined VRF is created with the vrf instance command. After its creation, a VRF may be assigned a Route Distinguisher (RD) with the rd (VRF configuration mode) command in the VRF submode of Router-BGP Configuration Mode.

Examples

- These commands create a VRF named ***purple***, place the switch in BGP VRF configuration mode for that VRF, and specify a route distinguisher for the VRF identifying the administrator as ***AS 530*** and assigning ***12*** as its local number.

```
switch(config)# vrf instance purple
switch(config-vrf-purple)# router bgp 50
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# rd 530:12
switch(config-router-bgp-vrf-purple)#
```

- To add interfaces to a user-defined VRF, enter configuration mode for the interface and use the vrf (Interface mode) command. Loopback, SVI, and routed ports can be added to a VRF.

  These commands add ***vlan 20*** to the VRF named ***purple***.

```
switch(config)# interface vlan 20
switch(config-if-Vl20)# vrf purple
switch(config-if-Vl20)#
```

- The show vrf command shows information about user-defined VRFs on the switch.

  This command displays information for the VRF named ***purple***.

```
switch> show vrf purple
Vrf     RD          Protocols  State       Interfaces
------- ----------- ---------- ----------- ------------
purple  64496:237   ipv4       no routing  Vlan42, Vlan43

switch>
```

13.1.4.4.2.1rd (VRF configuration mode)

The **rd** command issued in VRF Configuration Mode is a legacy command supported for backward compatibility. To configure a Route Distinguisher (RD) for a VRF, use the **rd (VRF configuration mode)** command.

Note: Legacy RDs that were assigned to a VRF in VRF Configuration Mode will still appear in **show vrf** outputs if an RD has not been configured in Router-BGP VRF Configuration Mode, but they no longer have an effect on the system.

13.1.4.4.3 Context-Active VRF

The context-active VRF specifies the default VRF that VRF-context aware commands use when displaying or refreshing routing table data.

VRF-context aware commands include:

- clear arp-cache
- show ip
- show ip arp
- show ip route
- show ip route gateway
- show ip route host

The cli vrf command specifies the context-active VRF.

Example

This command specifies ***magenta*** as the context-active VRF.

```
switch# cli vrf magenta
switch# show routing-context vrf
Current VRF routing-context is magenta
```

The show routing-context vrf command displays the context-active VRF.

Example

This command displays the context-active VRF.

```
switch> show routing-context vrf
Current VRF routing-context is magenta

switch>
```

13.1.4.5 RIB Route Control

The Routing Information Base (RIB) is composed of the routing information learned by the routing protocols, including static routes. The Forwarding Information Base (FIB) is composed of the routes actually used to forward traffic through a router.

Forwarding Information Base (FIB) makes IP destination prefix-based switching decisions. The FIB is similar to a routing table or information base. It maintains the forwarding information for the winning routes from the RIB. When routing or topology changes occur in the network, the IP routing table information is updated, and those changes are reflected in the FIB.

13.1.4.5.1 Configuring FIB policy

The RIB calculates the best/winning routes to each destination and place these routes in the forwarding table. Based on the FIB policy configured the best routes are advertised.

For example, a FIB policy can be configured to deny the routes for FIB programming, however, it does not prevent these routes from being advertised by a routing protocol, or to be redistributed into another routing domain, or to be used for recursive resolution in the IP RIB. FIB policies control the size and content of the routing tables, and the best route to take to reach a destination.

The **`rib ipv4 | ipv6 fib policy`** command is used to enable FIB policy for a particular VRF under router general configuration mode.

The following match statements are supported:

- **`match interface`**
- **`match`** [ip | ipv6] address ***prefix-list***
- **`match`** [ip | ipv6] resolved-next-hop ***prefix-list***
- **`match isis level`**
- **`match metric`**
- match source-protocol

Example

The following example enables FIB policy for IPv4 in the default VRF, using the route map, ***map1***.

```
switch(config)# router general
switch(config-router-general)# vrf default
switch(config-router-general-vrf-default)# rib ipv4 fib policy
 map1
```

13.1.4.5.2 Displaying FIB Information

Use the **`show rib route <ipv4|ipv6> fib policy exclude`** command to display the RIB information. The **fib policy excluded** option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

Example

The following example displays the routes filtered by FIB policy using the **fib policy excluded** option of the **`show rib route ip|ipv6`** command.

```
switch# show rib route ipv6 fib policy excluded
switch# show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B    10.1.0.0/24 [200/0]
         via 10.2.2.1 [115/20] type tunnel
            via 10.3.5.1, Ethernet1
         via 10.2.0.1 [115/20] type tunnel
            via 10.3.4.1, Ethernet2
            via 10.3.6.1, Ethernet3
>B    10.1.0.0/24 [200/0]
```

```
          via 10.2.2.1 [115/20] type tunnel
             via 10.3.5.1, Ethernet1
          via 10.2.0.1 [115/20] type tunnel
             via 10.3.4.1, Ethernet2
             via 10.3.6.1, Ethernet3
```

13.1.4.5.3 Displaying RIB Route Information

Use the show rib route ip command to view the IPv4 RIB information.

Example:

This command displays IPv4 RIB static routes.

```
switch# show rib route ip static

VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S    10.80.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected
>S    172.16.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected

switch#
```

13.1.5 IPv4 Route Scale

IPv4 routes are optimized to achieve route scale when route distribution has a large number of routes of one or two parameters, with each parameter consisting of prefix lengths ***12***, ***16***, ***20***, ***24***, ***28***, and ***32***. If two separate prefix lengths are configured (in any order), one of them must be the prefix length of ***32***.

Note: IPv4 Route Scale cannot be used with AlgoMatch.

The following sections describes IPv4 route scale configuration, show commands, and system log messages:

- Configuring IPv4 Route Scale
- IPv4 Routescale with 2-to-1 Compression
- Show Commands

13.1.5.1 Configuring IPv4 Route Scale

IPv4 route scale is enabled by the ip hardware fib optimize command for the configuration mode interface. The platform Layer 3 agent is restarted to ensure IPv4 routes are optimized with the agent SandL3Unicast terminate command for the configuration mode interface.

Example

This configuration command allows configuring prefix lengths ***12*** and ***32***.

```
switch(config)# ip hardware fib optimize exact-match prefix-
length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes
 are optimized
```

One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

Example

This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example:

This configuration command allows configuring prefix lengths ***32*** and ***16***.

```
switch(config)# ip hardware fib optimize exact-match prefix-
length 32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes
 are optimized
```

One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

Examples

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
- This configuration command allows configuring prefix length ***24***.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-
  length 24
  ```

```
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

In this instance, there is only one prefix-length, so a prefix-length of ***32*** is not required. For this command to take effect, you must restart the platform Layer 3 agent.

Examples

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
- This configuration command allows configuring prefix length ***32***.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-
  length 32
  ! Please restart layer 3 forwarding agent to ensure IPv4
   routes are optimized
  ```

  For this command to take effect, you must restart the platform Layer 3 agent.
- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)# agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
- This configuration command disables configuring prefix lengths ***12*** and ***32***.

  ```
  switch(config)#no ip hardware fib optimize exact-match prefix-
  length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4
   routes are not optimized
  ```

One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

Examples

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are not optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command attempts to configure prefix length ***20*** and ***28*** which triggers an error exception. One of the two prefixes in this command must be a prefix-length of ***32***, which is required in the instance where there are two prefixes.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 20 28
% One of the prefix lengths must be 32
```

IPv4 routes of certain prefix lengths can be optimized for enhanced route scale. The following command disable prefix optimization on the specified VRF(s) to provide more flexibility.

Examples

- This configuration command disables prefix optimization on the default VRF.

```
switch(config)# ip hardware fib optimize disable-vrf default
! Please restart layer 3 forwarding agent to ensure that the
 disable-vrf option change takes effect
```

- This configuration command disables prefix optimization on VRFs named *vrf1* and*vrf2*.

```
switch(config)# ip hardware fib optimize disable-vrf vrf1 vrf2
! Please restart layer 3 forwarding agent to ensure that the
 disable-vrf option change takes effect
```

- This configuration command restarts the platform Layer 3 agent to ensure disable-vrf configuration to take effect.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Starting from the *EOS Release 4.26.0F*, /32 prefix length optimization command is supported in the R3 series.

Examples

- This configuration command enables prefix optimization on the default VRF.

```
switch(config)# ip hardware fib optimize vrf default prefix-
length 32
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- This configuration command enables prefix optimization on VRFs named ***vrf1*** and ***vrf2***.

```
switch(config)# ip hardware fib optimize vrf vrf1 vrf2 prefix-
length 32
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- This configuration command disables optimization on ***vrf1*** and ***vrf2*** optimization configured in above example.

```
switch(config)# no ip hardware fib optimize vrf vrf1
```

```
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

The **platform trident forwarding-table partition flexible** command enables ALPM Mode in Flexible UFT mode using a subset of resources, so ALPM and Exact Match can coexist. Prior to this release, ALPM could only be programmed in mode 4 where all the UFT resources were used and in flexible partition mode, configuring ALPM was not supported. This limits the number of IP routes that can be supported.

Examples

- This configuration command sets up the flexible partition.

```
switch(config)# platform trident forwarding-table partition
 flexible ?
  alpm          Shared UFT bank entries for the ALPM table
  exact-match   Shared UFT bank entries for the exact-match
 table
  l2-shared     Shared UFT bank entries for the MAC table
  l3-shared     Shared UFT bank entries for the host table
```

- ALPM gives the route prefix in DEFIM (TCAM table for longest prefix matched (LPM) lookup) and ALPM tables.

```
switch(config)# platform trident forwarding-table partition
 flexible alpm ?
  184320  Upto 180K LPM routes
  368640  Upto 360K LPM routes
```

Note: The size parameter has following values:

- DCS-7300X3: 180k and 360k are accepted.
- CCS-720XP: 144k and 96k are accepted.
- Other sizes are invalid.

13.1.5.2 IPv4 Routescale with 2-to-1 Compression

The IPv4 routescale with 2-to-1 compression optimizes certain prefix lengths and enhances the route scale capabilities on 7500R, 7280R, 7500R2, and 7280R2 platforms. The compression is best suited to achieve route scale when route distribution has a large number of routes of one or two prefix lengths.

13.1.5.2.1 Configuring IPv4 Routescale 2-to-1 Compression

Use the **compress** command to increase the hardware resources available for the specified prefix length. This command allows configuring up to one compressed prefix length, and this command is supported only on 7500R, 7280R, 7500R2, and 7280R2 platforms.

Note: The **compress** command takes effect only when you restart the platform Layer3 agent on 7500R, 7280R, 7500R2, and 7280R2 platforms. Use command **agent SandL3Unicast terminate** to restart the platform Layer3 agent.

Examples

- In the following example we are configuring prefix length ***20*** and ***24***, expanding prefix length ***19*** and ***23***, and compressing prefix length ***25***.

```
switch(config)# ip hardware fib optimize prefix-length 20 24 expand 19
 23 compress 25
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- In the following example we are configuring prefix length ***20*** and ***23***, expanding prefix length ***19***, compressing prefix length ***24***.

```
switch(config)# ip hardware fib optimize prefix-length 20 23 expand 19
 compress 24
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- Optionally, you can also use the **internet** profile to configure the IPv4 route scale compression.

```
switch(config)# ip hardware fib optimize prefixes profile internet
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

Configure a new TCAM profile for the **`compress`** configuration to work, and disable a few features in the new TCAM profile to make space for the flex-route feature in the hardware. Features like **acl vlan ip** and the **mirror ip** have to be disabled, if you need any of these features or any other features to be enabled with flex-route feature, contact the Arista team.

The **internet** profile works differently based on whether the flex-route feature is enabled in the TCAM profile or not. If the flex-route feature is enabled, the **internet** profile behaves like **`ip hardware fib optimize prefix-length 20 23 expand 19 22 compress 24`**. If the flex-route feature is disabled, the **internet** profile behaves as **`ip hardware fib optimize prefix-length 20 24 expand 19 23`**.

Example

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile flex-route copy default
switch(config-hw-tcam-profile-flex-route)# feature flex-route copy
 system-feature-source-profile
switch(config-hw-tcam-profile-flex-route-feature-flex-route)# exit
switch(config-hw-tcam-profile-flex-route)# no feature acl vlan ip
switch(config-hw-tcam-profile-flex-route)# no feature mirror ip
switch(config-hw-tcam-profile-flex-route)# exit
Saving new profile 'flex-route'
switch(config-hw-tcam)# system profile flex-route
```

13.1.5.2.2 Limitations

- A maximum of two prefix lengths can be optimized directly at any point of time, of which only one can be a non-nibble aligned prefix length. Additional prefix lengths can be optimized using the **expand** or the **compress** options.
- A maximum of 1-to-4 way expansion and 2-to-1 way compression into any optimized prefix length is supported. Multiple expansion prefix lengths can be programmed at any time, however, there can be just one compression prefix length programmed at any given point in time.
- A maximum of ***4096*** next-hops can be reliably pointed to by the compressed prefixes using 2-to-1 way compression.
- The 2-to-1 compression cannot be enabled along with unicast RPF. When both features are enabled together, unicast RPF functionality may not be correct.

- The flex-route feature in TCAM profiles based only on the default profile, while disabling the **acl vlan ip** and the **mirror ip** features. Contact the Arista team if any other feature, that is not available in the default TCAM profile, is required to be supported along with the flex-route feature, including support for Mirror to GRE tunnel or ACLs on SVI.
- VXLAN is not supported with the compress option of this feature. There is no Syslog or a warning message when VXLAN is configured along with the 2-to-1 way compression feature.

13.1.5.3 Show Commands

The IPv4 route scale summary is displayed by the show platform arad ip route summary command for the configuration mode interface. Resources for all IPv4 route scale routes are displayed by the show platform arad ip route command for the configuration mode interface.

Examples

- This command shows hardware resource usage of IPv4 routes.

```
switch(config)# show platform arad ip route summary

Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4
```

- This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources appear with an asterisk (*).

```
switch(config)# show platform arad ip route

Tunnel Type: M(mpls), G(gre)
* - Routes in LEM
-------------------------------------------------------------------------------------------------
|                              Routing Table                                      |             |

```

13.1.6 IP Source Guard

IP Source Guard (IPSG) prevents IP spoofing attacks.

IP Source Guard (IPSG) filters inbound IP packets based on their source MAC and IP addresses. IPSG is supported in hardware. IPSG enabled on a Layer 2 port verifies IP packets received on this port. Packets are permitted if each packet source MAC and IP addresses match any of the user-configured IP-MAC binding entries on the receiving VLAN and port. Packets with no match are dropped immediately.

13.1.6.1 Configuring IPSG

IPSG is applicable only to Layer 2 ports, and is enabled by the ip verify source command for the configuration mode interface. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therfore, source IP MAC binding entries should be configured on port channels using the ip source binding command. When

configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Examples

- These configuration commands exclude VLAN IDs ***1*** through ***3*** from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs ***4*** through ***10*** on ***ethernet 36*** will be filtered by IPSG, while those received on VLANs ***1*** through ***3*** are permitted.

```
switch(config)# no ip verify source vlan 1-3
switch(config)# interface ethernet 36
switch(config-if-Et36)# switchport mode trunk
switch(config-if-Et36)# switchport trunk allowed vlan 1-10
switch(config-if-Et36)# ip verify source
switch(config-if-Et36)#
```

- This configuration command configures source IP-MAC binding entries to IP address ***10.1.1.1***, MAC address ***0000.aaaa.1111***, ***VLAN ID 4094***, and ***interface ethernet 36***.

```
switch(config)# ip source binding 10.1.1.1 0000.aaaa.1111 vlan
 4094 interface ethernet 36
switch(config)#
```

13.1.6.2 DHCP Server Show Commands

Use the **`show dhcp server`** command to display DHCP server information.

- DHCPv4 display example:

```
switch# show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
   Interface   Status
------------------------------------------------
   Ethernet1   Inactive (Could not determine VRF)
   Ethernet2   Inactive (Not in default VRF)
   Ethernet3   Inactive (Kernel interface not created yet)
   Ethernet4   Inactive (Not up)
   Ethernet5   Inactive (No IP address)
   Ethernet6   Active

Vendor information:
Vendor ID: default
  Sub-options         Data
---------------- ----------------
      1          192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo
  Sub-options       Data
```

```
---------------- -----------
      2            192.0.2.2
      3            "Foo"

Subnet: 10.0.0.0/8
Subnet name: subnetFoo
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.1.1.1 10.2.2.2
Lease duration: 3 days 3 hours 3 minutes
Default gateway address: 10.0.0.3
TFTP server:
subnetServerFoo (Option 66)
10.0.0.4 (Option 150)
TFTP boot file: subnetFileFoo
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.1

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.2
```

- For DHCPv6, there are two additional fields in subnet information output, **`Direct`** field and the **`Relay`** field. These two fields specify if the DHCP Server is accepting broadcast or relayed messages.

  The **`Direct`** field displays **`Active`** when the subnet matches the interface with DHCPv6 configured. This indicates the server is accepting broadcast messages.

  The **`Direct`** field displays **Inactive** when there is another existing subnet already matching the interface, or when the subnet matches more than one DHCP configured interface.

  Examples of outputs for the DHCPv6 **`show dhcp server`** command:

  In this example, DHCPv6 is configured with subnet ***fe80::/10*** while being enabled on ***Ethernet1*** with address ***fe80::1/64*** and on ***Ethernet3*** with address ***fe80::2/64***.

```
switch# show dhcp server ipv6
IPv6 DHCP server is active
Debug log is enabled

DNS server(s): fe80::6

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:
```

```
   Interface    Status

--------------- ------

   Ethernet1    Active
   Ethernet3    Active

Subnet: fe80::/10

Subnet name: foo

Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5

Direct: Inactive (Multiple interfaces match this subnet: Ethernet1
 Ethernet3)
Relay: Active

Active leases: 0
```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets ***fc00::/7*** and **fe80::/10** while being enabled on ***Ethernet1*** with address ***fe80::1/10*** and ***fc00::1/7***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active

DNS server(s):  fc00::2

DNS domain name: testaristanetworks.com
```

```
Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

   Ethernet1    Active

Subnet: fc00::/7

Subnet name: foo

Range: fc00::1 to fc00::5

DNS server(s): fc00::6 fc00::8

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0

Subnet: fe80::/10
```

```
Subnet name: bar

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
```

- When a subnet is disabled, the **show dhcp server** command displays the disable message with a reason. The number of active leases of the disabled subnets will be ***0***. In this example, there are overlapping subnets.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet
 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet
 10.0.0.0/24)
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12
 overlaps with an existing pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example shows duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is
 reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server (including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address).

```
switch# show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.ffac
```

13.1.7 DHCP Server

The router with DHCP Server enabled acts as a server that allocates and delivers network addresses with desired configuration parameters to its hosts.

The DHCP server is based on ISC Kea.

The router with an DHCP Server enabled acts as a server that allocates and delivers network addresses with desired configuration parameters to its hosts.

DHCP Server support includes:

DHCPv4 support includes:

- Configurable on different interfaces: Routed, VLAN, LAG, Sub-interface, and LAG Sub-interface.
- Configurable lease time for allocated network addresses.
- Configurable DNS domain.
- Configurable DNS servers.
- Configurable subnets with parameters:
  - Default gateway
  - DNS servers
  - Ranges

- Lease time

Additional features for DHCPv4 include:

- Configurable TFTP server
- Configurable TFTP bootfile

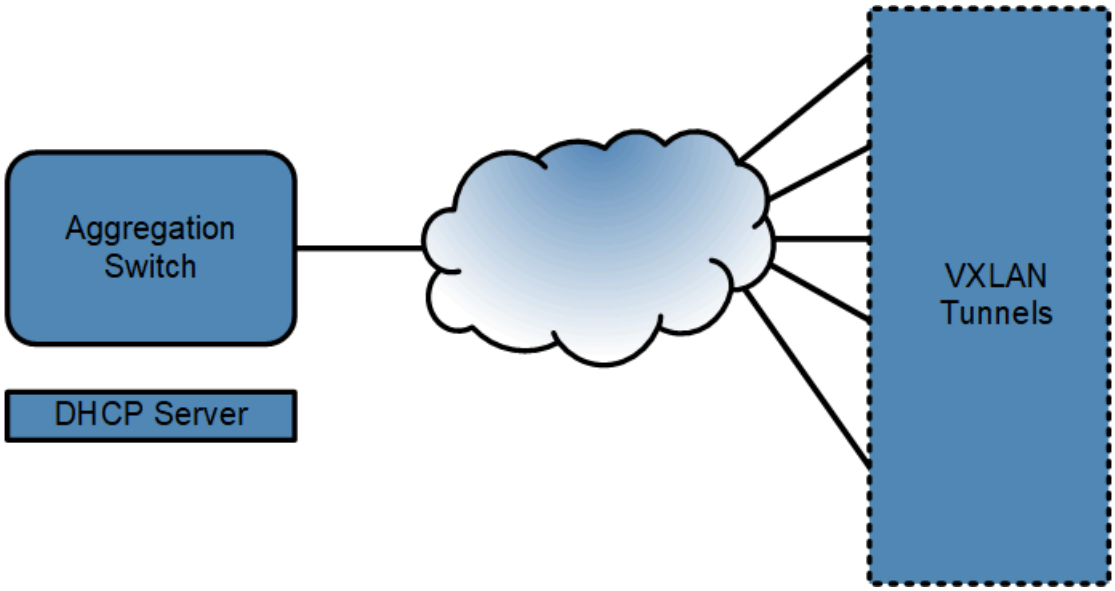
Additional features for DHCPv4 includes:

- Configurable Vendor options with sub options
- Configurable sub option types include: IPv4 address, array of IPv4 addresses, and string
- TFTP bootfile now supports an URI

Additional features for DHCPv4 include a configurable static IP address for exclusive use by a given client, based on the client's MAC address.

Example deployment:

DHCP Server on an aggregation switch, via VXLAN tunnels.



13.1.7.1 Configuring the DHCP Server

You can enable DHCP Server per interface with the IPv4 or IPv6 address family option.

Example

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# dhcp server ipv4

switch(config)# interface Ethernet2
switch(config-if-Et2)# dhcp server ipv6
```

For DHCPv4 to receive and reply to requests, minimum configurations of a valid subnet corresponding to the enabled interface with at least one valid range are required.

Example

```
switch(config)# interface Ethernet1
```

```
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# dhcp server ipv4
switch(config-if-Et1))# ip address 10.0.0.1/8
switch(config-if-Et1)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-if-Et1)# range 10.0.0.4 10.0.0.6
```

At least one non link-local address is required for DHCPv6.

Example

```
switch(config)# interface Vlan1409
switch(config-if-vlan1409)# dhcp server ipv6
switch(config-dhcp-server)# ipv6 address fe80::1/10

switch(config-if-vlan1409)# dhcp server
   subnet fe80::/10
      range fe80::4 fe80::6
```

To enter DHCP Server global configuration mode ***config-dhcp-server***:

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)#
```

To disable DHCP Server:

```
switch(config-dhcp-server)# disabled
switch(config)#
```

To set the lease time for allocated IP addresses. Lease time is configured globally and applied to all subnets. In the example, the lease time is set to 1 day.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# lease time (ipv4|ipv6) 1 days 0 hours 0
 minutes
```

To set the domain name for allocated IP addresses. In this example, the domain name is configured to ***aristanetworks.com***.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# dns domain name (ipv4|ipv6) aristanetwork
s.com
```

To set the DNS servers. You can only configure up to two servers. In this example, ***10.2.2.2*** for ***DHCPv4*** and ***fe80::2*** for ***DHCPv6***.

```
switch>config
switch(config)# dhcp server
switch(config-dhcp-server)# dns server ipv4 10.2.2.2
switch(config-dhcp-server)# dns server ipv6 fe80::2
```

To set TFTP server. The server can be in the form of either an IP address or a fully qualified domain name. This is only available in DHCPv4. In this example, ***TFTP*** server ***10.0.0.2***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#tftp server option 66 ipv4 10.0.0.2
```

To set a list of TFTP servers. The server can only be in the form of an IP address. This is only available in DHCPv4. In this example, ***3.0.0.3*** and ***4.0.0.4*** TFTP servers are configured.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# tftp server option 150 ipv4 10.0.0.3 10.0.0.4
```

To set TFTP server boot file (such as DHCP option 67). This is only available in DHCPv4. In this example, TFTP boot **file bootfile.conf** is configurd.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# tftp server file ipv4 bootfile.conf
```

Or, a TFTP boot file URL **//john.doe@www.example.com:123/example/one**

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# tftp server file ipv4 https://john.
doe@www.example.com:123/example/one
```

To set a Vendor option, DHCP option 43, with sub options. Most of the time, different clients need different Vendor options. For this reason option 60, vendor class identifier, is used by the client to identify itself in order to request a specific Vendor option. To enter the Vendor option submode ***(config-dhcp-vendor)*** from ***(config-dhcp-server)*** configuration mode, specify a vendor class identifier. This is only available in DHCPv4.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# vendor-option ipv4 vendorClassIDA
switch(config-dhcp-vendor)#
```

If **default** is specified, the configured Vendor option is sent to those clients requesting for a Vendor option whose vendor class identifier does not match any configured Vendor option. In this example, the default Vendor option for clients without a configured Vendor option.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# vendor-option ipv4 default
```

The Vendor option may contain ***0*** or more sub options. The resulting Vendor option is sent in hexadecimal format to the desired client. In theis example, the Vendor option holding a sub option with IPv4 address ***10.0.0.1***, for clients with vendor class identifier **vendorClassIDA**, resulting in Vendor option ***1:4:a:0:0:1***. The sub option number is ***1***. Length of the Data is ***4***. Data is ***a:0:0:1***.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# vendor-option ipv4 vendorClassIDA
switch(config-dhcp-vendor)# sub-option 1 type ipv4-address data 10.0.0.1
```

In this example, Vendor option holding a sub option with IPv4 addresses ***10.0.0.5*** and ***10.0.0.6***, for clients with vendor class identifier **vendorClassIDA**. Resulting in Vendor option ***fe:4:a:0:0:5:a:0:0:6***.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# vendor-option ipv4 vendorClassIDA
switch(config-dhcp-vendor)# sub-option 254 type ipv4-address data
 10.0.0.5 10.0.0.6
```

In this example, Vendor option holding a sub option with a string ***FOO***, for all clients whose vendor class identifier does not match any configured Vendor option. Resulting in Vendor option ***1e:3:46:4f:4f***.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# vendor-option ipv4 default
switch(config-dhcp-vendor-option-default)# sub-option 30 type string data
 "FOO"
```

In this example, Vendor option holding two sub options, where sub option 1 holds the IPv4 address ***10.0.0.1***, and sub option 2 holds a string ***FOO***, for all clients whose vendor class identifier does not match any configured Vendor option. Resulting in Vendor option ***1:4:a:0:0:1:2:3:46:4f:4f***.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# vendor-option ipv4 default
switch(config-dhcp-vendor-option-default)# sub-option 1 type ipv4-address
 data 10.0.0.1
switch(config-dhcp-vendor-option-default)# sub-option 2 type string data
 "FOO"
```

Configuration options for subnets are configured under IPv4 or IPv6 address family specific subnet submode ***(config-dhcp-subnet)***. To enter the submode from ***(config-dhcp-server)*** config mode, specify a subnet mask. In this example, ***10.0.0.0/8*** for DHCPv4 and ***fe80::/10*** for DHCPv6.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-dhcp-server)# subnet fe80::/10
```

There can be multiple subnets configured, but they must not overlap. If this happens, all overlapping subnets are disabled.

For DHCPv6, a subnet may match only one interface and vice versa; otherwise no lease is assigned for that subnet.

In this example. the user enables DHCPv6 on ***ethernet1*** (with address ***fe80::1/64***) and ***ethernet3*** (with address ***fe80::2/64***), then configures a subnet ***fe80::/10*** for the DHCPv6:

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ipv6 address fe80::1/64
switch(config-if-Et1)# dhcp server ipv6

switch(config)# interface Ethernet3
switch(config-if-Et3)# no switchport
switch(config-if-Et3)# ipv6 address fe80::1/64
switch(config-if-Et3)# dhcp server ipv6

switch(config)# dhcp server
```

```
switch(config-dhcp-server)# subnet fe80::/1
```

To set default-gateway for a subnet. Only one default-gateway is allowed. This is only available in DHCPv4. In this example, ***10.0.0.3*** ia configured as the default gateway for subnet ***10.0.0.0/8***:

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-dhcp-server-subnet-ipv4)# default-gateway 10.0.0.3
```

To set the DNS servers for a subnet. In this example, ***10.1.1.1*** and ***10.2.2.2*** for DHCPv4 and ***fe80::1*** and ***fe80::2*** for DHCPv6. The number of DNS servers cannot exceed two (2).

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-dhcp-server-subnet-ipv4)# dns server 10.1.1.1 10.2.2.2
switch(config-dhcp-server-subnet-ipv4)# subnet fe80::/10
switch(config-dhcp-server-subnet-ipv6)# dns server fe80::1 fe80::2
```

To set the name of the subnet. In this example, the name ***foo*** for DHCPv4 and name ***bar*** for DHCPv6 are the selected names.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-dhcp-server-subnet-ipv4)# name foo
switch(config-dhcp-server-subnet-ipv4)# subnet fe80::/10
switch(config-dhcp-server-subnet-ipv6)# name bar
```

To set the range of IP addresses of the subnet. In this example, the IP address range for DHCPv4 is ***10.0.0.1*** to ***10.0.0.10*** and for DHCPv6 it is ***fe80::1 fe80::5***. The range must be within the subnet mask, otherwise the subnet is disabled.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-dhcp-server)#range 10.0.0.1 10.0.0.10
switch(config-dhcp-server)# subnet fe80::/10
switch(config-dhcp-server)# range fe80::1 fe80::5
```

To set TFTP server for a subnet. The server can be in the form of either an IP address or a fully qualified domain name. This is only available in DHCPv4. In this example, ***tftpserver.com*** is configured.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.8/24
switch(config-dhcp-server)# tftp server option 66 tftpserver.com
```

To set a list of TFTP servers. The server can only be in the form of an IP address. This is only available in DHCPv4. In this example, TFTP servers ***3.0.0.3 4.0.0.4*** are configured.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# 10.0.0.0/8
switch(config-dhcp-server)# tftp server option 150 3.0.0.3 4.0.0.4
```

To set a TFTP boot file for a subnet. This is only available in DHCPv4. In this example, ***subnet-bootfile.conf*** is configurd.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-dhcp-server)# tftp server file subnet-bootfile.conf
```

To set a static IP address for exclusive use by a client, first enter the client's MAC address reservation submode.

To enter the MAC address reservation submode: ***(config-dhcp-mac-address-ipv4)*** from the ***(config-dhcp-reservations-ipv4)*** configuration mode, then specify the client's MAC address. This is only available in DHCPv4. In this example, we use the static IP address of ***10.0.0.1*** for a client with MAC address of ***1a1b.1c1d.1e1f***.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# subnet 10.0.0.0/8
switch(config-dhcp-server)# reservations
switch(config-dhcp-server)# mac-address 1a1b.1c1d.1e1f
switch(config-dhcp-server)# ipv4-address 10.0.0.1
```

To enable a debug log and save log to a file (this disables kea syslog messages). In this example, you enable **`/tmp/debug-dhcp.log`** as the debug log.

```
switch> config
switch(config)# dhcp server
switch(config-dhcp-server)# debug log file:/tmp/debug-dhcp.log
```

13.1.7.2 DHCP Server Limitations

The DHCP Server and DHCP Relay cannot be configured on the same router. The DHCP Relay has a higher precedence so the DHCP Server will be disabled when the DHCP Relay is configured.

If DHCPD is enabled on the router, configuring the EOS DHCP Server may cause DHCPD to crash or have unexpected behaviors.

During reload, the DHCP Server is not able to save its leases information. In a modular system, the second supervisor does not have an up-to-date lease database. The clients need to request for new leases. During the synchronizing phase for clients and server, duplicate IP addresses in the network may occur.

The DHCP Server is only supported on default VRF and it currently does not support legacy bootp requests.

All DHCP Server options must be less than 256 bytes in size, otherwise, the DHCP Server will not be able to send the affected option.

On certain platforms VXLAN Recirculation has to be enabled: VXLAN Routing Configuration.

13.1.7.3 DHCP Server Show Commands

Use the **`show dhcp server`** command to display DHCP server information.

- DHCPv4 display example:

```
switch# show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
```

```
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Inactive (Could not determine VRF)
   Ethernet2   Inactive (Not in default VRF)
   Ethernet3   Inactive (Kernel interface not created yet)
   Ethernet4   Inactive (Not up)
   Ethernet5   Inactive (No IP address)
   Ethernet6   Active

Vendor information:
Vendor ID: default
  Sub-options         Data
---------------- ----------------
      1          192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo
  Sub-options       Data
---------------- -----------
      2            192.0.2.2
      3            "Foo"

Subnet: 10.0.0.0/8
Subnet name: subnetFoo
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.1.1.1 10.2.2.2
Lease duration: 3 days 3 hours 3 minutes
Default gateway address: 10.0.0.3
TFTP server:
subnetServerFoo (Option 66)
10.0.0.4 (Option 150)
TFTP boot file: subnetFileFoo
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.1

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.2
```

- For DHCPv6, there are two additional fields in subnet information output, **`Direct`** field and the **`Relay`** field. These two fields specify if the DHCP Server is accepting broadcast or relayed messages.

  The **`Direct`** field displays **`Active`** when the subnet matches the interface with DHCPv6 configured. This indicates the server is accepting broadcast messages.

  The **`Direct`** field displays **Inactive** when there is another existing subnet already matching the interface, or when the subnet matches more than one DHCP configured interface.

  Examples of outputs for the DHCPv6 **`show dhcp server`** command:

  In this example, DHCPv6 is configured with subnet ***fe80::/10*** while being enabled on ***Ethernet1*** with address ***fe80::1/64*** and on ***Ethernet3*** with address ***fe80::2/64***.

```
switch# show dhcp server ipv6
IPv6 DHCP server is active
```

```
Debug log is enabled

DNS server(s): fe80::6

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

   Ethernet1    Active
   Ethernet3    Active

Subnet: fe80::/10

Subnet name: foo

Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5
```

```
Direct: Inactive (Multiple interfaces match this subnet: Ethernet1
 Ethernet3)
Relay: Active

Active leases: 0
```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets ***fc00::/7*** and **fe80::/10** while being enabled on ***Ethernet1*** with address ***fe80::1/10*** and ***fc00::1/7***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active

DNS server(s):  fc00::2

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

   Ethernet1    Active

Subnet: fc00::/7

Subnet name: foo
```

```
Range: fc00::1 to fc00::5

DNS server(s): fc00::6 fc00::8

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0

Subnet: fe80::/10

Subnet name: bar

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
```

- When a subnet is disabled, the **`show dhcp server`** command displays the disable message with a reason. The number of active leases of the disabled subnets will be ***0***. In this example, there are overlapping subnets.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-----------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet
 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet
 10.0.0.0/24)
```

```
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12
 overlaps with an existing pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example shows duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is
 reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server (including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address).

```
switch# show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.ffac
```

13.1.8 DHCP Relay Global Configuration Mode

The dhcp relay command is configured under the global configuration mode. When configured, it places the switch on DHCP relay mode and allows the user to configure DHCP relay specific configuration on several interfaces with a single command. Furthermore, configuration entered in the DHCP Relay global configuration mode can be overridden by equivalent interface specific commands.

Example

- The **dhcp relay** command places the switch in the DHCP relay configuration mode.

```
switch(config)# dhcp relay
switch(config-dhcp-relay)#
```

- It is possible to specify the IP address of the default DHCP or DHCPv6 Server. Multiple IP addresses can be specified and DHCP requests are forwarded to all specified helper addresses. This is equivalent to configuring **ip helper-address <IP_Address>** under each desired routing interface.
- Example to forward DHCP broadcast packets received on interface ***Ethernet1*** and ***Vlan2*** to DHCP servers at ***10.0.0.1***, ***10.0.0.2***, and to hostname ***DefaultDHCPHostname***:

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ip address 192.168.1.1/16

switch(config)# interface vlan2
switch(config-if-Et1)# ip address 172.16.1.1/16

switch(config)# dhcp relay
switch(config-dhcp-relay)# server 10.0.0.1
switch(config-dhcp-relay)# server 10.0.0.2
switch(config-dhcp-relay)# server DefaultDHCPHostname
```

- Example to forward DHCPv6 broadcast packet received on interface ***ethernet1*** to DHCPv6 Server at ***fc00::3***.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ipv6 address fc00::1/10

switch(config)# dhcp relay
switch(config-dhcp-relay)# server fc00::3
```

- This will point a routed interface to the specified DHCP and DHCPv6 server(s), if all the following criteria are met:
  - The routed interface is in the default VRF.
  - The interface has an IP address configured.
  - The interface is not a Management or Loopback.
- Example to remove the default DHCP or DHCPv6 Server.

```
switch(config)# dhcp relay
switch(config-dhcp-relay)# no server 10.0.0.1
switch(config-dhcp-relay)# no server 10.0.0.2
switch(config-dhcp-relay)# no server DefaultDHCPHostname
switch(config-dhcp-relay)# no server fc00::3
```

To override the default DHCP Server on an interface, **ip helper-address <IP_Address>** must be used.

-

Example to forward DHCP broadcast packet received on interface Ethernet1 to DHCP Servers at ***10.0.0.1***, ***10.0.0.2*** and hostname ***DefaultDHCPHostname***, but VLAN2s broadcast packets to DHCP Server at ***10.0.0.3*** only.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ip address 192.168.1.1/16

switch(config)# interface vlan2
switch(config-if-Et1)# ip address 172.16.1.1/16
switch(config-if-Et1)# ip helper-address 11.0.0.3

switch(config)# dhcp relay
switch(config-dhcp-relay)# server 10.0.0.1
switch(config-dhcp-relay)# server 10.0.0.2
switch(config-dhcp-relay)# server DefaultDHCPHostname
```

To override the default DHCPv6 Server on an interface, **ipv6 helper-address <IPv6_Address>** must be used.

Example to forward DHCPv6 broadcast packet received on interface Ethernet1 to DHCPv6 Server at ***fc00::3***, but VLAN2s broadcast packets to DHCPv6 Server at ***fc00::4*** only.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ipv6 address fc00::1/10

switch(config)# interface vlan2
switch(config-if-Et1)# ipv6 address fc00::2/10
switch(config-if-Et1)# ipv6 helper-address fc00::4

switch(config)# dhcp relay
switch(config-dhcp-relay)# server fc00::3
```

You can disable DHCP or DHCPv6 Relay functionality from a specific interface. This will disable both DHCP Relay global and interface mode configurations.

- Example to disable DHCP Relay functionality only.

```
switch(config)# interface vlan3
switch(config-if-Et1)# dhcp relay ipv4 disabled
```

- Example to disable DHCPv6 Relay functionality only.

```
switch(config)# interface Vvlan3
switch(config-if-Et1)# dhcp relay ipv6 disabled
```

13.1.8.1 DHCP Relay Global Configuration Mode Limitations

The DHCP Relay global configuration mode's server commands do not apply to:

- Interfaces in non-default VRF.
- Interfaces without an IP address configured.
- Management and Loopback interfaces.

13.1.8.2 DHCP Relay Global Configuration Mode Show Command

Example

This command displays the VRF specifier for the server:

```
switch# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Ethernet9
Option 82 Circuit ID: Ethernet9
DHCP Smart Relay is disabled
DHCP servers: 10.40.2.3
10.40.2.3:vrf=qchyh-vrf
```

13.1.9 DHCP Relay Across VRF

The EOS DHCP relay agent supports forwarding of DHCP requests to DHCP servers located in a different VRF to the DHCP client interface VRF. In order to enable VRF support for the DHCP relay agent, Option 82 (DHCP Relay Agent Information Option) must first be enabled. The DHCP relay agent uses Option 82 to pass client specific information to the DHCP server.

These sections describe DHCP Relay across VRF features:

- Global Configuration
- DHCP Relay Global Configuration Mode Show Command

The DHCP relay agent inserts Option 82 information into the DHCP forwarded request, which requires the DHCP server belongs to a network on an interface, and that interface belongs to a different VRF than the DHCP client interface. Option 82 information includes the following:

- **VPN identifier:** The VRF name for the ingress interface of the DHCP request, inserted as sub-option 151.

  Table 67: VPN Identifier

SubOpt	Len	ASCII VRF Identifier						
151	7	V	R	F	N	A	M	E

- **Link selection:** The subnet address of the interface that receives the DHCP request, inserted as sub-option 5. When the DHCP smart relay is enabled, the link selection is filled with the subnet of the active address. The relay agent will set the Gateway IP address (gIPaddr) to its own IP address so that DHCP messages can be routed over the network to the DHCP server.

  Table 68: Link Selection

SubOpt	Len	Subnet IP Address			
5	4	A1	A2	A3	A4

- **Server identifier override:** The primary IP address of the interface that receives the DHCP request, inserted as sub-option 11. When the DHCP smart relay is enabled, the server identifier is filled with the active address (one of the primary or secondary addresses chosen by smart relay mechanism).

  Table 69: Link Selection

SubOpt	Len	Overriding Server Identifier Address			
11	4	B1	B2	B3	B4

- VSS control suboption as suboption 152: The DHCP server will strip out this suboption when sending the response to the relay, indicating that the DHCP server used VPN information to allocate IP address.

Note: The DHCP server must be capable of handling VPN identifier information in option 82.

Direct communication between DHCP client and server may not be possible as they are in separate VRFs. The Server identifier override and Link Selection sub-options set the relay agent to act as the DHCP server, and enable all DHCP communication to flow through the relay agent.

The relay agent adds all the appropriate sub-options, and forwards all (including renew and release) request packets to the DHCP server. When the DHCP server response messages are received by the relay, Option 82 information is removed and the response is forwarded to the DHCP client in the client VRF.

13.1.9.1 Global Configuration

The DHCP relay agent information option is inserted in DHCP messages relayed to the DHCP server. The ip helper-address command enables DHCP relay on an interface; and relays DHCP messages to the specified IPv4 address.

Example

This command enables DHCP relay on the ***interface ethernet 1/2***; and relays DHCP messages to the server at ***1.1.1.1***.

```
switch(config)# interface ethernet 1/2
switch(config-if-Et1/2)# ip helper-address 1.1.1.1
switch(config-if-Et1/2)#
```

The commands provided in examples below will turn on the attachment of VRF-related tags in the relay agent information option. If both the DHCP client interface and server interface are on the same VRF (default or non-default), then no VRF-related DHCP relay agent information option is inserted.

Examples

- This command configures the DHCP relay to add option 82 information.

```
switch(config)# ip dhcp relay information option
```

- These commands configures two new VRF instances and assign them Route Distinguishers (RDs).

```
switch(config)# vrf instance mtxxg-vrf
switch(config-vrf-mtxxg-vrf)# router bgp 50
switch(config-router-bgp)# vrf mtxxg-vrf
switch(config-router-bgp-vrf-mtxxg-vrf)# rd 5546:5546
switch(config)# vrf instance qchyh-vrf
switch(config-vrf-qchyh-vrf)# router bgp 50
switch(config-router-bgp)# vrf qchyh-vrf
switch(config-router-bgp-vrf-qchyh-vrf)# rd 218:218
```

- This command configures an interface connected to DHCP client in vrf ***mtxxg-vrf*** and assigns an IP address.

```
switch(config)# interface ethernet 9
```

```
switch(config-if-Et9)# no switchport
```

- This command configures the DHCP client interface in VRF ***mtxxg-vrf***.

```
switch(config-if-Et9)# vrf mtxxg-vrf
switch(config-if-Et9)# ip address 10.10.0.1/16
```

- This command configures the server interface in VRF ***qchyh-vrf.***

```
switch(config-if-Et11)# vrf qchyh-vrf
switch(config-if-Et11)# ip address 10.40.0.1/16
```

- This command configures a helper address for a DHCP server in VRF ***qchyh-vrf***.

```
switch(config-if-Et11)# ip helper-address 10.40.2.3 vrf qchyh-
vrf
```

13.1.9.2 DHCP Relay Global Configuration Mode Show Command

Example

This command displays the VRF specifier for the server:

```
switch# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Ethernet9
Option 82 Circuit ID: Ethernet9
DHCP Smart Relay is disabled
DHCP servers: 10.40.2.3
10.40.2.3:vrf=qchyh-vrf
```

13.1.10 DHCP Relay in VXLAN EVPN

The ip dhcp relay information option (Global) command enables the configuration of the DHCP server to uniquely identify the origin of the request using a source-interface and the helper address. Source interface is configured with a routable address, which is used by the DHCP server to uniquely identify the DHCP relay agent which forwarded the client's request.

Configuring DHCP Relay in VXLAN EVPN (IPv4)

The following enables DHCP relay information option (***Option 82***) required to specify a source interface.

```
switch (config)# ip dhcp relay information option
```

The following configures a Loopback interface as the source interface.

```
switch (config)# interface Loopback1
switch (config-if-Lo1)# ip address 1.1.1.1/24
```

The following configures the Loopback interface as the specified source interface for the helper address.

```
switch (config)# interface vlan100
```

```
switch (config-if-Vl100)# ip helper-address 10.1.1.4 source-interface
 Loopback1
```

The following configures the Loopback interface when the DHCP server is in a different VRF (***red***). The source interface must be configured in the DHCP server's VRF for the command to take effect.

```
switch (config)# interface Loopback3
switch (config-if-Lo3)# vrf red
switch (config-if-Lo3)# ip address 1.1.1.1/24

switch (config)# interface vlan100
switch (config-if-Vl100)# ip helper-address 10.1.1.4 vrf red source-
interface Loopback3
```

The following disables the use of source interface along with the helper address.

```
switch (config)# interface vlan100
switch (config-if-Vl100)# no ip helper-address 10.1.1.4 source-interface
 Loopback1
```

Configuring DHCP Relay in VXLAN EVPN (IPv6)

The following configures a local interface.

```
switch (config)# interface Loopback2
switch (config-if-Vl100)# ipv6 address 2001::10:20:30:1/128
```

The following configures the Loopback interface as the local interface for the helper address.

```
switch (config)# interface vlan200
switch (config-if-Vl200)# ipv6 dhcp relay destination 2002::10:20:30:2
 local-interface Loopback2
```

The following configures the Loopback interface when the DHCP server is in a different VRF (***red***). The local interface must be configured in the DHCP server's VRF for the command to take effect.

```
switch (config)# interface Loopback4
switch (config-if-Lo4)# vrf red
switch (config-if-Lo4)# ipv6 address 2001::10:20:30:1/128

switch (config)# interface vlan200
switch (config-if-Vl200)# ipv6 dhcp relay destination 2002::10:20:30:2
 vrf red local-interface Loopback4
```

The following disables the use of local interface along with the helper address.

```
switch (config-if-Vl200)# no ipv6 dhcp relay destination 2002::10:20:30:2
 local-interface Loopback4
```

The following displays the status of DHCP relay option (***Option 82***) and lists the configured DHCP servers.

```
switch# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Vlan100
  Option 82 Circuit ID: Vlan100
  DHCP Smart Relay is disabled
```

```
  DHCP servers: 10.1.1.4
Interface: Vlan200
  Option 82 Circuit ID: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 2002::10:20:30:2
```

Limitations

Client requests up to a rate of ***130*** packets/second are processed.

13.1.11 DHCP Snooping with Bridging

In this configuration, in addition to sending DHCP packets to relay (after adding information option), the packets will also be bridged within the VLAN. In the bridging mode, the switch intercepts DHCP packets, inserts option-82 if not already present, and bridges the packet within the VLAN. This mode of DHCP snooping can be configured without DHCP relay configuration.

13.1.11.1 Configuring DHCP Snooping with Bridging

Following are the steps to configure DHCP snooping with bridging:

1. Enable DHCP snooping feature using the ip dhcp snooping command.

```
switch# ip dhcp snooping
```

2. Enable the insertion of option-82 in DHCP request packets using the ip dhcp snooping information option command. By default, option-82 is not enabled and without this DHCP Snooping is not operational.

```
switch# ip dhcp snooping information option
```

3. Enable DHCP snooping on the corresponding VLANs using the ip dhcp snooping vlan command. By default, DHCP snooping is not enabled on any VLAN.

```
switch# ip dhcp snooping vlan
```

4. Set the circuit-id information that is sent in option-82. By default, Interface name and VLAN ID are sent. Remote circuit-id will always be the MAC address of the relay agent.

```
switch# ip dhcp snooping information option circuit-id type 2 format
%h:%p  Hostname and interface name
%p:%v  Interface name and VLAN ID
```

5. Enable bridging capabilities of DHCP snooping using the ip dhcp snooping bridging command. This command will enable DHCP snooping with or without DHCP relay configuration.

```
switch# ip dhcp snooping bridging
```

13.1.11.2 DHCP Snooping with Bridging Limitations

- DHCP snooping with bridging is supported only for IPv4.
- When DHCP snooping is configured without bridging configuration, packets with option-82 already present are dropped.

13.1.11.3 DHCP Snooping with Bridging Show Commands

The show ip dhcp snooping displays the DHCP snooping with bridging information.

```
switch# show ip dhcp snooping
```

```
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 650
DHCP Snooping bridging is operational on following VLANs:
 650
Insertion of Option-82 is enabled
 Circuit-id sub-option Type: 0
 Circuit-id format: Interface name:Vlan ID
 Remote-id: 00:1c:73:8d:eb:67 (Switch MAC)
```

13.1.12 TCP MSS Clamping

TCP MSS clamping limits the value of the Maximum Segment Size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. TCP MSS clamping can be used when connecting via GRE to cloud providers that require asymmetric routing.

When MSS clamping is configured on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit it will be overwritten with the configured limit and the TCP checksum will be recomputed and updated.

TCP MSS clamping is handled by default in the software data path, but the process can be supported through hardware configuration to minimize possible packet loss and a reduction in the number of TCP sessions which the switch can establish per second.

13.1.12.1 Cautions

This feature should be used with caution. When the TCP MSS clamping feature is enabled by issuing the tcp mss ceiling command on any routed interface, *all* routed IPv4 TCP SYN packets (TCP packets with the “SYN” flag set) are sent by default to the CPU and switched through software, even on interfaces where no TCP MSS ceiling has been configured, as long as TCP MSS clamping is enabled. This limits the number of TCP sessions that can be established through the switch per second, and, because throughput for software forwarding is limited, this feature can also cause packet loss if the rate at which TCP SYN packets are sent to the CPU exceeds the limits configured in the control-plane policy map.

Packet loss and TCP session reductions can be minimized by enabling TCP MSS clamping in hardware, but only SYN packets in which MSS is the first TCP option are clamped in the hardware data path; other TCP SYN packets are still switched through software.

To disable MSS clamping, the MSS ceiling must be removed from every interface on which it has been configured by issuing the **`no tcp mss ceiling`** command on each configured interface.

13.1.12.2 Enabling TCP MSS Clamping

There is no global configuration to enable TCP MSS clamping. It is enabled as soon as an MSS ceiling is configured on at least one interface.

13.1.12.3 Disabling TCP MSS Clamping

To disable TCP MSS clamping, the MSS ceiling configuration must be removed from every interface by using the **`no`** or **`default`** form of the tcp mss ceiling command on every interface where a ceiling has been configured.

13.1.12.4 Configuring the TCP MSS Ceiling on an Interface

The TCP MSS ceiling limit is set on an interface using the tcp mss ceiling command. This also enables TCP MSS clamping on the switch as a whole.

Note: Configuring a TCP MSS ceiling on any interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), the following limitations apply:

- This command works only on egress.
- TCP MSS ceiling is supported on IPv4 unicast packets entering the switch; the configuration has no effect on GRE transit packets.
- The feature is supported only on IPv4 routed interfaces. It is not supported on L2 (switchport) interfaces or IPv6 routed interfaces.
- The feature is not supported for IPv6 packets even if they are going to be tunneled over an IPv4 GRE tunnel.
- The feature is not supported on VXLAN, loopback or management interfaces.
- The feature is only supported on IPv4 unicast packets entering the switch. The configuration has no effect on GRE transit packets or GRE decap, even if the egress interface has a TCP MSS ceiling configured.

Example

- These commands configure ***interface ethernet 5*** as a routed port, then specify a maximum MSS ceiling value of ***1458*** bytes for TCP SYN packets exiting that port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# tcp mss ceiling ipv4 1458 egress
switch(config-if-Et5)#
```

- These commands apply TCP MSS clamping at ***1436*** bytes in the egress direction for IPv6 packets:

```
switch(config)# interface ethernet 26
switch(config)# tcp mss ceiling ipv6 1436 egress
```

- These commands apply TCP MSS clamping at ***1476*** bytes for IPv4 packets and ***1436*** bytes for IPv6 packets in egress direction:

```
switch(config)# interface ethernet 27
switch(config)# tcp mss ceiling ipv4 1476 ipv6 1436 egress
```

13.1.12.5 Verifying the TCP MSS Clamping

If TCP MSS ceiling is configured on an interface and if the command **`show cpu counters queue | nz`** is incrementing in **`CoppSystemL3Ttl1IpOptUcast`** field for Tcp packet with Syn flag, then TCP MSS clamping is being performed in Software.

```
switch# show cpu counters queue | nz
Fap0.1:
CoPP Class                    Queue    Pkts   Octets   DropPkts   DropOctets
Aggregate
-------------------------------------------------------------------------------
CoppSystemL3Ttl1IpOptUcast    TC0      1       82       0          0
```

13.1.12.6 Configuring TCP MSS Clamping

Interface Configuration

You can specify the TCP MSS value under the ***interface configuration mode***. The command syntax is shown below:

`tcp mss ceiling` [ipv4 | ipv6] ***64-65515*** egress

The keyword **egress** specifies that the MSS clamping is applied on packets transmitted out on the interface in egress direction.

The following example applies TCP MSS clamping at ***1436*** bytes in the egress direction for IPv4 packets:

```
switch(config)# interface ethernet 25
switch(config)#tcp mss ceiling ipv4 1436 egress
```

the following example applies TCP MSS clamping at ***1436*** bytes in the egress direction for IPv6 packets:

```
switch(config)# interface ethernet 26
switch(config)# tcp mss ceiling ipv6 1436 egress
```

The following example applies TCP MSS clamping at ***1476*** bytes for IPv4 packets and ***1436*** bytes for IPv6 packets in egress direction:

```
switch(config)# interface ethernet 27
switch(config)# tcp mss ceiling ipv4 1476 ipv6 1436 egress
```

Hardware TCP MSS Clamping Configuration

Hardware MSS clamping requires the system TCAM profile to have TCP MSS clamping enabled. You can achieve this by creating a user defined TCAM profile as described below. The **User Defined PMF Profiles - TOI** provides general guidelines on how to create and configure TCAM profiles.

The system TCAM profile must have the feature **`tcp-mss-ceiling ip`** in it in order to use hardware MSS clamping. This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

Step 1: Create the user defined TCAM profile

The following example demonstrates copying any source profile and adding the feature **`tcp-mss-ceiling ip`**. In this example, the profile name is ***Pro1*** and the source profile name is ***Source1***.

```
(config)# hardware tcam
(config-hw-tcam)# profile Pro1 copy Source1
(config-hw-tcam-profile-Pro1)# feature tcp-mss-ceiling ip copy system-
feature-source-profile
```

TCP MSS clamping is supported only for IPv4 routed packets. Set the packet type for the feature as follows. This is optional when using **`copy system-feature-source-profile`**. In this example, the system profile name is ***Pro1*** and the feature name is ***Source1***.

```
(config-hw-tcam-profile-Pro1-feature-Source1)# packet ipv4 forwarding
 routed
```

Set the key size limit to ***160***. This is also optional when the feature is copied from **`system-feature-source-profile`**. In this example, the system profile name is ***Pro1*** and the feature name is ***Source1***.

```
(config-hw-tcam-profile-Pro1-feature-Source1)# key size limit 160
```

Removing unused features to ensure that the TCP MSS TCAM DB is allocated. In this example, the system profile name is ***Pro1*** and the feature name is ***Source1***.

```
(config-hw-tcam-profile-Pro1-feature-Source1)# exit
(config-hw-tcam-profile-Pro1)# no feature mirror ip
(config-hw-tcam-profile-Pro1)# no feature acl port mac
```

Step 2: Apply the user defined TCAM profile to the system.

The following example sets the profile as the system profile under the *hardware tcam* mode. In this example, the system profile name is ***red***.

```
(config-hw-tcam)# system profile red
```

When the system TCAM profile is changed, it is expected that some agents will restart. Also it might be necessary to remove some unused features from the TCAM profile to ensure that the TCP MSS feature gets allocated a TCAM DB. For more information about configuring TCAM profiles, refer to **User Defined PMF Profiles**.

Note: The hardware clamping only works for TCP packets with MSS as the first TCP option. Packets where MSS is not the first TCP option are still trapped to CPU for clamping in software even if the **`feature tcp-mss-ceiling`** is configured in the system TCAM profile.

Backward Compatibility

The **`tunnel mss ceiling`** command which provides the same functionality is deprecated with the introduction of **`tcp mss ceiling`** command. The configuration option **`tunnel mss ceiling`** was available only on GRE tunnel interfaces, while **`tcp mss ceiling`** is supported on other routed IPv4 interfaces as well.

13.1.12.7 TCP MSS Clamping Limitations

- The TCP-MSS Clamping is not supported on L2 (switchport) interfaces.
- The TCP-MSS Clamping is NOT supported on VXLAN, Loopback and Management interfaces.
- The TCP-MSS Clamping is supported only in the Egress direction.
- The TCP-MSS Clamping is only supported on unicast routed packets entering the switch. The configuration has no effect on GRE transit packets and GRE decap case, even if the Egress interface has TCP MSS ceiling configured.

Software TCP MSS Clamping Limitations

- Once the TCP-MSS Clamping is enabled, all routed TCP-SYN packets will be software switched, even on interfaces where there is no TCP-MSS ceiling configuration.
- TCP SYN packets could get dropped under high CPU usage conditions or due to DOS attack protection mechanisms such as PDP/CoPP. These factors could limit the TCP connection establishment rate, i.e new TCP sessions established per second through the switch.

Hardware MSS Clamping Limitations

- Hardware TCP-MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- TCP SYN packets where TCP-MSS is not the first TCP option are trapped to CPU for MSS adjustment even in hardware MSS clamping mode.

- Hardware TCP-MSS clamping is not supported for IPv6 packets.

13.1.12.8 Configuring Hardware Support for TCP MSS Clamping

TCP MSS clamping can be supported in hardware, but some packets are still routed through the software data path, and an MSS ceiling value must be configured on each interface where clamping is to be applied.

Hardware support for clamping is accomplished through the use of a user-defined TCAM profile. The TCAM profile can be created from scratch or copied from an existing profile, but in either case it must include the **tcp-mss-ceiling ip** feature.

Guidelines

- When the system TCAM profile is changed, some agents will restart.
- To ensure that the TCP MSS feature is allocated a TCAM DB, it may be necessary to remove some unused features from the TCAM profile.
- Hardware TCP MSS clamping only works for TCP packets with MSS as the first TCP option. Other TCP SYN packets are still trapped to the CPU for clamping in software.
- Hardware TCP MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- The maximum MSS ceiling limit with hardware MSS clamping is 32727 even though the CLI allows configuration of much larger values.
- For more information on the creation of user-defined TCAM profiles, see https://www.arista.com/en/support/toi/eos-4-20-5f/13977-user-defined-pmf-profile.

To configure hardware support for TCP MSS clamping, create a TCAM profile that includes the tcp mss ceiling feature, then apply it to the system.

13.1.12.8.1 Creating the TCAM Profile

A TCAM profile that supports TCP MSS clamping can be created from scratch, or the feature can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

Modifying a Copy of the Default TCAM Profile

The following commands create a copy of the default TCAM profile, name it **tcp-mss-clamping**, and configure it to enable MSS clamping in hardware, then remove some unused features included in the default profile to ensure that there are sufficient TCAM resources for the clamping feature.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile tcp-mss-clamping copy default
switch(config-hw-tcam-profile-tcp-mss-clampingl)# feature tcp-mss-ceiling
 ip copy
system-feature-source-profile
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)# key
size limit 160
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)# packet
ipv4 forwarding routed
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)# exit

switch(config-hw-tcam-profile-tcp-mss-clamping)# no feature mirror ip
switch(config-hw-tcam-profile-tcp-mss-clamping)# no feature acl port mac
switch(config-hw-tcam-profile-tcp-mss-clampingl)# exit
```

```
switch(config-hw-tcam)# exit

switch(config)#
```

13.1.12.8.2 Applying the TCAM Profile to the System

The following commands enter Hardware TCAM Configuration Mode and set the **tcp-mss-clamping** profile as the system profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile tcp-mss-clamping
switch(config-hw-tcam)#
```

13.1.12.8.3 Verifying the TCAM Profile Configuration

The following command displays hardware TCAM profile information to verify that the user-defined TCAM profile has been applied correctly.

```
switch(config)# show hardware tcam profile

Configuration        Status
FixedSystem          tcp-mss-clamping         tcp-mss-clamping

switch(config)#
```

13.1.13 IPv4 GRE Tunneling

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation.

Note: The forwarding over GRE tunnel interface on DCS-7500R is supported only if all the line cards on the system have Jericho family chip-set.

13.1.13.1 Configuring GRE Tunneling Interface

On a Local Arista Switch

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.1/24
switch(config-if-Tu10)# tunnel source 10.1.1.1
switch(config-if-Tu10)# tunnel destination 10.1.1.2
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

On a Remote Arista Switch

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.2/24
switch(config-if-Tu10)# tunnel source 10.1.1.2
switch(config-if-Tu10)# tunnel destination 10.1.1.1
switch(config-if-Tu10)# tunnel path-mtu-discovery
```

```
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

Alternative Configuration for Tunnel Source IPv4 Address

```
switch(config)# interface Loopback 10
switch(config-if-Lo10)# ip add 10.1.1.1/32
switch(config-if-Lo10)# exit

switch(config)# conf terminal
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel source interface Loopback 10
```

Configuration for Adding an IPv4 Route over the GRE Tunnel Interface

```
switch(config)# ip route 192.168.100.0/24 Tunnel 10
```

Tunnel Mode

Tunnel Mode needs to be configured as gre, for GRE tunnel interface. Default value is **tunnel mode gre**.

IP Address

Configures the IP address for the GRE tunnel interface. The IP address can be used for routing over the GRE tunnel interface. The configured subnet is reachable over the GRE tunnel interface and the packets to the subnet are encapsulated in the GRE header.

Tunnel Source

Specifies the source IP address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel source IPv4 address should be a valid local IPv4 address configured on the Arista Switch. The tunnel source can also be specified as any routed interface on the Arista Switch. The routed interface's IPv4 address is assigned as the tunnel source IPv4 address.

Tunnel Destination

Specifies the destination IPv4 address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel destination IPv4 should be reachable from the Arista Switch.

Tunnel Path Mtu Discovery

Specifies if the "Do not Fragment" flag needs to set in the outer IPv4 encapsulation header for packets going over the GRE tunnel interface.

Tunnel TOS

Specifies the Tunnel Type of Service (ToS) value to be assigned to the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. Default TOS value of ***0*** will be assigned if tunnel TOS is not configured.

Tunnel TTL

Specifies the TTL value to the assigned to the outer IPv4 encapsulation header for packet going over the GRE tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel Path MTU Discovery to be configured.

13.1.13.2 Displaying GRE tunnel Information

- The following commands display the tunnel configuration.

```
switch# show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
 Hardware is Tunnel, address is 0a01.0101.0800
 Internet address is 192.168.1.1/24
 Broadcast address is 255.255.255.255
 Tunnel source 10.1.1.1, destination 10.1.1.2
 Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
 Tunnel TTL 10, Hardware forwarding enabled
 Tunnel TOS 10
 Path MTU Discovery
 Tunnel transport MTU 1476 bytes
 Up 3 seconds
```

-
```
switch# show gre tunnel static

Name     Index  Source   Destination  Nexthop  Interface
-------- ------ -------- ------------ -------- -----------
Tunnel10 10     10.1.1.1 10.1.1.2     10.6.1.2 Ethernet6/1

switch# show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary
   via 10.6.1.2, 'Ethernet6/1'
      GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

- Use the **show platform fap tcam summary** command to verify if the TCAM bank is allocated for GRE packet termination lookup.

```
switch# show platform fap tcam summary

           Tcam Allocation (Jericho0)
Bank        Used By     Reserved By
---------- ------------ -----------
0          dbGreTunnel   -
```

- Use the **show ip route** command to verify if the routes over tunnel is setup properly.

```
switch# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,

0       | No |
```

13.1.14 GRE Tunneling Support

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation. A maximum of 256 GRE-tunnel interfaces are supported.

Note: GRE keepalives are not supported.

To configure a local Arista switch on a GRE-tunnel interface, consider the following an example.

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.1/24
switch(config-if-Tu10)# tunnel source 10.1.1.1
switch(config-if-Tu10)# tunnel destination 10.1.1.2
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

To configure a remote Arista switch on a GRE-tunnel interface, consider the following an example.

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.2/24
switch(config-if-Tu10)# tunnel source 10.1.1.2
switch(config-if-Tu10)# tunnel destination 10.1.1.1underlayVrf
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
```

```
switch(config-if-Tu10)# tunnel ttl 10
```

To add a IPv4 route over the GRE-tunnel interface, configure simulare to the following.

```
switch(config)# ip route 192.168.100.0/24 Tunnel 10
```

Note: IPv6 GRE-Tunnels are not supported. This is only a data-plane limitation whereas IS-IS IPv6 (such as control-plane) can still work.

Use the **show interfaces Tunnel** command to display the interface tunnel.

```
switch(config)# show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
  Tunnel underlay VRF "underlayVrf"
  Up 3 seconds
```

Use the **show gre tunnel static** command to display a static interface tunnel.

```
switch(config)#show gre tunnel static
Name        Index      Source         Destination       Nexthop     Interface
----------- -------    -----------    -------------     ----------  ----------
Tunnel10    10         10.1.1.1       10.1.1.2          10.6.1.2    Ethernet6/1
```

Use the **show tunnel fib static interface** command to display a fib static interface tunnel.

```
switch(config)# show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary
   via 10.6.1.2, 'Ethernet6/1'
      GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

Tunnel Mode

Tunnel mode is **GRE** for a GRE-tunnel interface which is also the default tunnel mode.

IP address

Use this IP address for routing over the GRE-tunnel interface. The configuration subnet is reachable over the GRE-tunnel interface, and the packets to the subnet is encapsulated with the GRE header.

Tunnel Source

Specifies the source IP address for the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The tunnel source IPv4 address is a valid local IPv4 address configured on the Arista switch. It uses any route interface on the Arista switch. The routed interfaces IPv4 address assigns the tunnel source IPv4 address. Maximum of 16 unique tunnel source IPv4 addresses are supported across all GRE-tunnel interfaces.

The following is an example of an interface as a Tunnel source.

```
switch(config)# interface Loopback 10
```

```
switch(config-if-Lo10)# ip add 10.1.1.1/32
switch(config-if-Lo10)# exit
switch(config)# interface Tunnel 10
switch(config-if-Tu10)#  tunnel source interface Loopback 10
```

Note: Coexistence of GRE-tunnel interfaces and Decap-Groups is not supported.

Note: Coexistence of GRE-tunnel interfaces and VxLan is not supported.

Note: GRE-tunnel is not supported with MLAG configuration.

Tunnel Destination

Specifies the destination IPv4 address for the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The tunnel destination IPv4 is reachable from the Arista switch.

Note: Multicast traffic over GRE-Tunnels is not supported.

Tunnel Path MTU Discovery

The tunnel path Maximum Transmition Unit (MTU) Discovery specifies if the Don't Fragment (DF) flag needs to be set in the encapsulating IPv4 header of a packet going over the GRE-Tunnel interface. MTU configuration on the GRE-tunnel interface is used by control plane protocols and not enforced in hardware for packets forwarded in data-plane. The MTU change on the tunnel interface does not take effect until the tunnel interface is flapped.

Tunnel TOS

The Tunnel TOS specifies the TOS value to be set in the encapsulating IPv4 header of a packet going over the GRE-Tunnel interface. The default value of ***0*** is assigned if tunnel TOS is not configured. Maximum of seven unique tunnel TOS values are supported across all GRE-tunnel interfaces.

Tunnel TTL

The Tunnel TTL specifies the TTL value to be set in the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel path MTU discovery to be configured. Maximum of four unique tunnel TTL values are supported across all GRE-tunnel interfaces.

VRF Forwarding (Overlay VRF)

The following configuration is an example of overlay VRF, for a GRE tunnel interface.

```
switch(config)# vrf instance overlayVrf
switch(config)# ip routing vrf overlayVrf
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# vrf overlayVrf
```

Note: Both the tunnels source and destination address must be in the underlay VRF. GRE key forwarding is not supported.

The following is an example of a static route configuration, with an overlay VRF.

```
switch(config)# ip route vrf overlayVrf 7.7.7.0/24 192.168.1.2
```

VRF Forwarding (Underlay VRF)

The following is an configuration example of a underlay VRF for a GRE tunnel interface.

```
switch(config)# vrf instance underlayVrf
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel underlay vrf underlayVrf
```

13.1.14.1 TCAM Bank Allocation

Note: Command to check if Ternary Content-Addressable Memory (TCAM) bank is allocated for GRE packet termination lookup.

```
switch(config)# show platform fap tcam summary

            Tcam Allocation (Jericho0)
Bank        Used By                     Reserved By
----------- --------------------------- -----------
0            dbGreTunnel                 -
```

PBR is not supported on GRE terminated packets.

Verifing Tunnel Routes

Use the **show ip route** command to check if the routes over tunnel is setup correctly.

```
switch(config)# show ip route
VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort is not set

 C      192.168.1.0/24 is directly connected, Tunnel10, Static Interface
 GRE-Tunnel index 10, dst 10.1.1.2, src 10.1.1.1, TTL 10, TOS 10
 S      192.168.100.0/24 is directly connected, Tunnel10, Static
 Interface GRE-Tunnel index 10, dst 10.1.1.2, src 10.1.1.1, TTL 10, TOS
 10
```

Verifing Tunnel Encap

Use the **show platform fap eedb ip-tunnel gre interface Tunnel** command to check the tunnel encap programming on the GRE interface.

```
switch(config)# show platform fap eedb ip-tunnel gre interface Tunnel 10
 ------------------------------------------------------------------------------------------------------------------------
|                                                Jericho0                                                                |
|                                  GRE Tunnel Egress Encapsulation DB                                                    |
|-----------------------------------------------------------------------------------------------------------------------|
| Bank/   | OutLIF  | Next    | VSI   | Encap | TOS  | TTL  | Source    | Destination     | OamLIF | OutLIF  | Drop |
| Offset  |         | OutLIF  | LSB   | Mode  |      |      | IP        | IP              | Set    | Profile |      |
|-----------------------------------------------------------------------------------------------------------------------|
| 3/0     | 0x6000  | 0x4010  | 0     | 2     | 10   | 10   | 10.1.1.1  | 10.1.1.2        | No     | 0       | No   |
```

Use the **show platform fap eedb ip-tunnel** command to check the tunnel encap programming on the IP-tunnel interface.

```
switch(config)# show platform fap eedb ip-tunnel
 ------------------------------------------------------------------------------------------------------------
|                                              Jericho0                                                      |
|                                  IP Tunnel Egress Encapsulation DB                                         |
|------------------------------------------------------------------------------------------------------------|
| Bank/   | OutLIF  | Next    | VSI   | Encap | TOS | TTL | Src | Destination     | OamLIF | OutLIF  | Drop |
| Offset  |         | OutLIF  | LSB   | Mode  | Idx | Idx | Idx | IP              | Set    | Profile |      |
|------------------------------------------------------------------------------------------------------------|
| 3/0     | 0x6000  | 0x4010  | 0     | 2     | 9   | 0   | 0   | 10.1.1.2        | No     | 0       | No   |
```

Verifying Tunnel VRF

Use the **show ip interface tunnel** command to check the overlay VRF.

```
switch(config)# show ip interface tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1476 bytes
  VPN Routing/Forwarding "overlayVrf"
switch(config)# show ip route vrf overlayVrf

VRF: overlayVrf
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

Gateway of last resort is not set

 C        1.1.1.0/24 is directly connected, Ethernet1
 S        7.7.7.0/24 [1/0] via 192.168.1.2, Tunnel10, Static Interface
 GRE-Tunnel index 10, dst 10.1.1.2, src 10.1.1.1
 C        192.168.1.0/24 is directly connected, Tunnel10, Static
 Interface GRE-Tunnel index 10, dst 10.1.1.2, src 10.1.1.1
```

Tunnel underlay VRF Configuration

Use the **show interfaces Tunnel** command to check the underlay VRF.

```
switch(config)# show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
```

```
  Tunnel underlay VRF "underlayVrf"
  Up 3 seconds
```

Use the **show ip route vrf underlayVrf** command to check the IP route VFR underlayVRF.

```
switch(config)# show ip route vrf underlayVrf
VRF: underlayVrf
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,

       DP - Dynamic Policy Route, L - VRF Leaked,

Gateway of last resort is not set

 C        10.1.1.0/24 is directly connected, Ethernet1
```

13.1.15 BfRuntime to Use Non-default VRFs

Use the following to configure the VRF for the BfRuntime connection for the management interface on the switches that support it. The management interface may be configured on a different VRF from the default one.

Configuring BfRuntime to Use Non-default VRFs

The **platform barefoot bfrt vrf** command configures the forwarding plane agent to restart and listen on the configured VRFs for connections.

```
(config)# platform barefoot bfrt vrf <VRF name>
```

If left unconfigured, the default VRF is used for the IP and port for the the BfRuntime server.

The following shows a typical configuraiton.

```
(config)# vrf instance management
(config-vrf-management)# exit
(config)# platform barefoot bfrt 0.0.0.0 50052
(config)# platform barefoot bfrt vrf <VRF name>
(config)# int management1
(config-if-Ma1)# vrf management
```

Displaying BfRuntime Configuration

The **show platform barefoot bfrt** command displays the existing configuration for the BfRuntime server.

```
(switch)# show platform barefoot bfrt
Namespace: management
FixedSystem:0.0.0.0:50052
```

13.1.16 IPv4 Commands

IP Routing and Address Commands

- agent SandL3Unicast terminate
- clear arp inspection statistics
- compress
- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- ip hardware fib ecmp resilience
- ip hardware fib optimize
- ip hardware fib next-hop resource optimization
- ip icmp redirect
- ip load-sharing
- ip route
- ip routing
- ip source binding
- ip verify
- ip verify source
- ipv4 routable 240.0.0.0/4
- rib fib policy
- show dhcp server
- show hardware capacity
- show ip
- show ip arp inspection vlan
- show ip arp inspection statistics
- show ip hardware fib summary
- show ip interface
- show ip interface brief
- show ip route
- show ip route age
- show ip route gateway
- show ip route host
- show ip route match tag
- show ip route summary
- show ip verify source
- show platform arad ip route
- show platform arad ip route summary
- show rib route ip
- show rib route fib policy excluded
- show rib route summary
- show routing-context vrf
- show vrf
- tcp mss ceiling

IPv4 DHCP Relay

- clear ip dhcp relay counters
- dhcp relay

- ip dhcp relay all-subnets
- ip dhcp relay all-subnets default
- ip dhcp relay always-on
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id
- ip helper-address
- show ip dhcp relay
- show ip dhcp relay counters

IPv4 DHCP Snooping

- clear ip dhcp snooping counters
- ip dhcp snooping
- ip dhcp snooping bridging
- ip dhcp snooping information option
- ip dhcp snooping vlan
- show ip dhcp snooping
- show ip dhcp snooping counters
- show ip dhcp snooping hardware

IPv4 Multicast Counters

- clear ip multicast count
- ip multicast count

ARP Table

- arp
- arp aging timeout
- arp cache persistent
- arp gratuitous accept
- clear arp-cache
- clear arp
- ip local-proxy-arp
- ip proxy-arp
- show arp
- show ip arp

VRF Commands

- cli vrf
- description (VRF)
- platform barefoot bfrt vrf
- show platform barefoot bfrt
- show routing-context vrf
- show vrf
- vrf (Interface mode)
- vrf instance

Trident Forwarding Table Commands

- platform trident forwarding-table partition
- platform trident routing-table partition

- show platform trident forwarding-table partition

IPv4 GRE Tunneling Commands

- interface tunnel
- show interface tunnel
- show platform fap eedb ip-tunnel gre interface tunnel
- show platform fap tcam summary
- show tunnel fib static interface gre
- tunnel

13.1.16.1 agent SandL3Unicast terminate

The **agent SandL3Unicast terminate** command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

Command Mode

Global Configuration

Command Syntax

agent SandL3Unicast terminate

Related Commands

- ip hardware fib optimize enables IPv4 route scale.
- show platform arad ip route shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- show platform arad ip route summary shows hardware resource usage of IPv4 routes.

Example

This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

13.1.16.2 arp

The **arp** command adds a static entry to an Address Resolution Protocol (ARP) cache. The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses.

The **no arp** and **default arp** commands remove the ARP cache entry with the specified IP address. When multiple VRFs contain ARP cache entries for identical IP addresses, each entry can only be removed individually.

Command Mode

Global Configuration

Command Syntax

arp [**VRF_INSTANCE**] ***ipv4_addr mac_addr*** **arpa**

no arp [**VRF_INSTANCE**] ***ipv4_addr***

default arp [**VRF_INSTANCE**] ***ipv4_addr***

Parameters

- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf *vrf_name*** Changes are made to the specified user-defined VRF.
- ***ipv4_addr*** IPv4 address of ARP entry.
- ***mac_addr*** Local data-link (hardware) address (48-bit dotted hex notation – H.H.H).

Examples

- This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)# arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

- This command adds the same static entry to the ARP cache in the VRF named ***purple***.

```
switch(config)# arp vrf purple 172.22.30.52 0025.900e.c63c
 arpa
switch(config)#
```

13.1.16.3 arp aging timeout

The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the configuration mode interface. The default duration is ***14400*** seconds (four hours).

The **arp aging timeout** and **default arp aging timeout** commands restores the default ARP aging timeout for addresses learned on the configuration mode interface by deleting the corresponding **arp aging timeout** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

arp aging timeout ***arp_time***

no arp aging timeout

default arp aging timeout

Parameters

arp_time ARP aging timeout period (seconds). Values range from **60** to **65535**. Default value is ***14400***.

Example

This command specifies an ARP cache duration of ***7200*** seconds (two hours) for dynamic addresses added to the ARP cache that were learned through ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# arp aging timeout 7200
switch(config-if-Vl200)# show active
interface Vlan200
   arp aging timeout 7200
switch(config-if-Vl200)#
```

13.1.16.4 arp cache persistent

The **arp cache persistent** command restores the dynamic entries in the Address Resolution Protocol (ARP) cache after reboot.

The **no arp cache persistent** and **default arp cache persistent** commands remove the ARP cache persistent configuration from the running-config.

Command Mode

Global Configuration

Command Syntax

arp cache persistent

no arp cache persistent

default arp cache persistent

Example

This command restores the ARP cache after reboot.

```
switch(config)# arp cache persistent
switch(config)#
```

13.1.16.5 arp gratuitous accept

The **arp gratuitous accept** command configures the configuration mode interface to accept gratuitous ARP request packets received on that interface. Accepted gratuitous ARP requests are then learned by the ARP table.

The no and **default** forms of the command prevent the interface from accepting gratuitous ARP requests. Configuring gratuitous ARP acceptance on an L2 interface has no effect.

Command Mode

Interface-Ethernet Configuration

Interface-VLAN Configuration

Interface Port-channel Configuration

Command Syntax

arp gratuitous accept

no arp gratuitous accept

default arp gratuitous accept

Example

These commands configure ***interface ethernet 2/1*** to accept gratuitous ARP request packets.

```
switch(config)# interface ethernet 2/1
switch(config-if-Et2/1)# arp gratuitous accept
switch(config-if-Et2/1)#
```

13.1.16.6 clear arp inspection statistics

The **clear arp inspection statistics** command clears ARP inspection statistics.

Command Mode

EXEC

Command Syntax

clear arp inspection statistics

Related Commands

- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan
- show ip arp inspection statistics

Example

This command clears ARP inspection statistics.

```
switch(config)# clear arp inspection statistics
switch(config)#
```

13.1.16.7 clear arp

The **clear arp** command removes the specified dynamic ARP entry for the specified IP address from the Address Resolution Protocol (ARP) table.

Command Mode

Privileged EXEC

Command Syntax

clear arp [**VRF_INSTANCE**] ***ipv4_addr*** **Parameters**

- **VRF_INSTANCE** Specifies the VRF instance for which arp data is removed.
  - ***no parameter*** Specifies the context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- ***ipv4_addr*** IPv4 address of dynamic ARP entry.

Example

These commands display the ARP table before and after the removal of dynamic ARP entry for IP address ***172.22.30.52***.

```
switch# show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.52            0  0025.900e.c468  Management1
172.22.30.53            0  0025.900e.c63c  Management1
172.22.30.133           0  001c.7304.3906  Management1

switch# clear arp 172.22.30.52
switch# show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.53            0  0025.900e.c63c  Management1
172.22.30.133           0  001c.7304.3906  Management1

switch#
```

13.1.16.8 clear arp-cache

The **clear arp-cache** command refreshes dynamic entries in the Address Resolution Protocol (ARP) cache. Refreshing the ARP cache updates current ARP table entries and removes expired ARP entries not yet deleted by an internal, timer-driven process.

The command, without arguments, refreshes ARP cache entries for all enabled interfaces. With arguments, the command refreshes cache entries for the specified interface. Executing **clear arp-cache** for all interfaces can result in extremely high CPU usage while the tables are resolving.

Command Mode

Privileged EXEC

Command Syntax

clear arp-cache [**VRF_INSTANCE**][**INTERFACE_NAME**]

Parameters

- **VRF_INSTANCE** Specifies the VRF instance for which arp data is refreshed.
  - ***no parameter*** Specifies the context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- **INTERFACE_NAME** Interface upon which ARP cache entries are refreshed. Options include:
  - ***no parameter*** All ARP cache entries.
  - **interface ethernet *e_num*** ARP cache entries of specified Ethernet interface.
  - **interface loopback *l_num*** ARP cache entries of specified loopback interface.
  - **interface management *m_num*** ARP cache entries of specified management interface.
  - **interface port-channel *p_num*** ARP cache entries of specified port-channel Interface.
  - **interface vlan *v_num*** ARP cache entries of specified VLAN interface.
  - **interface vxlan *vx_num*** VXLAN interface specified by ***vx_num***.

Related Commands

The cli vrf command specifies the context-active VRF.

Example

These commands display the ARP cache before and after ARP cache entries are refreshed.

```
switch# show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.118           0  001c.7301.6015  Management1

switch# clear arp-cache
switch# show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1

switch#
```

13.1.16.9 clear ip dhcp relay counters

The **clear ip dhcp relay counters** command resets the DHCP relay counters. The configuration mode determines which counters are reset:

Interface configuration: command clears the counter for the configuration mode interface.

Command Mode

Privileged EXEC

Command Syntax

clear ip dhcp relay counters [**INTERFACE_NAME**]

Parameters

INTERFACE_NAME Entity for which counters are cleared. Options include:

- ***no parameter*** Clears counters for the switch and for all interfaces.
- **interface ethernet *e_num*** Clears counters for the specified Ethernet interface.
- **interface loopback *l_num*** Clears counters for the specified loopback interface.
- **interface port-channel *p_num*** Clears counters for the specified port-channel Interface.
- **interface vlan *v_num*** Clears counters for the specified VLAN interface.

Examples

- These commands clear the DHCP relay counters for ***vlan 1045*** and shows the counters before and after the **clear** command.

```
switch# show ip dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago

```
 Vlan1000 |    0    0    0 |  0:00:03 ago
 Vlan1045 |    0    0    0 |  0:00:03 ago
```

13.1.16.10 clear ip dhcp snooping counters

The **clear ip dhcp snooping counters** command resets the DHCP snooping packet counters.

Command Mode

Privileged EXEC

Command Syntax

clear ip dhcp snooping counters [**COUNTER_TYPE**]

Parameters

COUNTER_TYPE The type of counter that the command resets. Options include:

- ***no parameter*** Counters for each VLAN.
- **debug** Aggregate counters and drop cause counters.

Examples

- This command clears the DHCP snooping counters for each VLAN.

```
switch# clear ip dhcp snooping counters
switch# show ip dhcp snooping counters

     | Dhcp Request Pkts | Dhcp Reply Pkts |
Vlan |  Rcvd  Fwdd  Drop | Rcvd Fwdd  Drop | Last Cleared
-----|------ ----- ------|----- ---- ------|-------------
 100 |     0     0     0 |    0    0     0 |  0:00:10 ago

switch#
```

- This command clears the aggregate DHCP snooping counters.

```
switch# clear ip dhcp snooping counters debug
switch# show ip dhcp snooping counters debug

Counter                       Snooping to Relay Relay to Snooping
----------------------------- ----------------- -----------------

Dropped - Parse error                         0                 0
Dropped - Invalid Dhcp Optype                 0                 0
Dropped - Invalid Info Option                 0                 0
Dropped - Snooping disabled                   0                 0

Last Cleared:  0:00:08 ago

switch#
```

13.1.16.11 clear ip multicast count

The **clear ip multicast count** command clears all counters associated with the multicast traffic.

Command Mode

Gobal Configuration

Command Syntax

clear ip multicast count [***group_address*** [***source_address***]]

Parameters

- ***no parameters*** Clears all counts of the multicast route traffic.
- ***group_address*** Clears the multicast traffic count of the specified group address.
  - ***source_address*** Clears the multicast traffic count of the specified group and source addresses.

Guidelines

This command functions only when the ip multicast count command is enabled.

Examples

- This command clears all counters associated with the multicast traffic.

```
switch(config)# clear ip multicast count
```

- This command clears the multicast traffic count of the specified group address.

```
switch(config)# clear ip multicast count 16.39.24.233
```

13.1.16.12 cli vrf

The **cli vrf** command specifies the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data.

Command Mode

Privileged EXEC

Command Syntax

cli vrf [**VRF_ID**]

Parameters

VRF_ID Name of VRF assigned as the current VRF scope. Options include:

- ***vrf_name*** Name of user-defined VRF.
- **default** System-default VRF.

Guidelines

VRF-context aware commands include:

clear arp-cache

show ip

show ip arp

show ip route

show ip route gateway

show ip route host

Related Commands

The show routing-context vrf command displays the context-active VRF.

Example

These commands specify ***magenta*** as the context-active VRF, then display the context-active VRF.

```
switch# cli vrf magenta
switch# show routing-context vrf
Current VRF routing-context is magenta
switch#
```

13.1.16.13 compress

The **compress** command increases the hardware resources available for the specified prefix lengths.

The **no compress** command removes the 2-to-1 compression configuraion from the ***running-config***.

Note: The **compress** command is supported only on 7500R, 7280R, 7500R2 and 7280R2 platforms.

Command Mode

Global Configuration

Command Syntax

ip hardware fib optimize prefix-length ***prefix-length***expand ***prefix-length*** compress

no ip hardware fib optimize prefix-length ***prefix-length***expand ***prefix-length*** compress

Parameters

compress Allows configuring up to one compressed prefix length.

Example

In the following example we are configuring prefix length ***20*** and ***24***, expanding prefix length ***19*** and ***23***, and compressing prefix length ***25***.

```
switch(config)# ip hardware fib optimize prefix-length 20 24
 expand 19 23 compress 25
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes
 are optimized
```

13.1.16.14 description (VRF)

The **description** command adds a text string to the configuration mode VRF. The string has no functional impact on the VRF.

The **no description** and **default description** commands remove the text string from the configuration mode VRF by deleting the corresponding **description** command from ***running-config***.

Command Mode

VRF Configuration

Command Syntax

description ***label_text***

no description

default description

Parameters

label_text Character string assigned to the VRF configuration.

Related Commands

The vrf instance command places the switch in VRF configuration mode.

Example

These commands add description text to the ***magenta*** VRF.

```
switch(config)# vrf instance magenta
switch(config-vrf-magenta)# description This is the first vrf
switch(config-vrf-magenta)# show active
 vrf instance magenta
   description This is the first vrf

switch(config-vrf-magenta)#
```

13.1.16.15 dhcp relay

The **dhcp relay** command places the switch in the DHCP relay mode. This command is executed under ***global configuration mode***.

The **no dhcp relay** command removes DHCP relay configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

dhcp relay

no dhcp relay

Example

The **dhcp relay** command places the switch in the DHCP relay configuration mode.

```
switch(config)# dhcp relay
switch(config-dhcp-relay)#
```

13.1.16.16 interface tunnel

The **`interface tunnel`** command places the switch in interface-tunnel configuration mode.

Interface-tunnel configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed.

The **`no interface tunnel`** command deletes the specified interface tunnel configuration.

The **`exit`** command returns the switch to the global configuration mode.

Command Mode

Global Configuration

Command Syntax

`interface tunnel` ***number***

`no interface tunnel` ***number***

Parameter

number Tunnel interface number. Values range from **`0`** to **`255`**.

Example

This command places the switch in interface-tunnel configuration mode for tunnel interface ***10***.

```
switch(config)# interface tunnel 10
switch(config-if-Tu10)#
```

13.1.16.17 ip arp inspection limit

The **ip arp inspection limit** command err-disables the interface if the incoming ARP rate exceeds the configured value rate limit the incoming ARP packets on an interface.

Command Mode

EXEC

Command Syntax

ip arp inspection limit [**RATE** ***pps***] [**BURST_INTERVAL** ***sec*** | none]

no ip arp inspection limit [**RATE** ***pps***] [**BURST_INTERVAL** ***sec*** | none]

default ip arp inspection limit [**RATE** ***pps***] [**BURST_INTERVAL** ***sec*** | none]

Parameters

- **RATE** Specifies the ARP inspection limit rate in packets per second.
  - ***pps*** ARP inspection limit rate packets per second.
- **BURST_INTERVAL** Specifies the ARP inspection limit burst interval.
  - ***sec*** Burst interval second.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan

Examples

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to ***512*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***11*** seconds.

```
switch(config)# ip arp inspection limit rate 512 burst
 interval 11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)# interface ethernet 3/1
switch(config)# ip arp inspection limit rate 20 burst interval
 5
switch(config)# interface Ethernet 3/3
switch(config)# ip arp inspection trust
switch(config)# show ip arp inspection interfaces

 Interface      Trust State  Rate (pps) Burst Interval
 -------------  -----------  ---------- --------------
 Et3/1          Untrusted    20         5
 Et3/3          Trusted      None       N/A

switch(config)#
```

13.1.16.18 ip arp inspection logging

The **ip arp inspection logging** command enables logging of incoming ARP packets on the interface if the rate exceeds the configured value.

Command Mode

EXEC

Command Syntax

ip arp inspection logging [**RATE** ***pps***][**BURST_INTERVAL** ***sec*** | none]

no ip arp inspection logging [**RATE** ***pps***][**BURST_INTERVAL** ***sec*** | none]

default ip arp inspection logging [**RATE** ***pps***][**BURST_INTERVAL** ***sec*** | none]

Parameters

- **RATE** Specifies the ARP inspection limit rate in packets per second.
  - ***<pps>*** ARP inspection limit rate packets per second.
- **BURST_INTERVAL** Specifies the ARP inspection limit burst interval.
  - ***sec*** Burst interval second.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan

Example

This command enables logging of incoming ARP packets when the incoming ARP rate exceeds the configured value on the interface, sets the rate to ***2048*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***15*** seconds.

```
switch(config)# ip arp inspection logging rate 2048 burst
 interval 15
switch(config)#
```

13.1.16.19 ip arp inspection trust

The **ip arp inspection trust** command configures the trust state of an interface. By default, all interfaces are untrusted.

Command Mode

EXEC

Command Syntax

ip arp inspection trust

no ip arp inspection trust

default ip arp inspection trust

Related Commands

- ip arp inspection limit
- ip arp inspection logging
- show ip arp inspection vlan
- ip arp inspection vlan

Examples

- This command configures the trust state of an interface.

```
switch(config)# ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)# no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to its default (untrusted).

```
switch(config)# default ip arp inspection trust
switch(config)#
```

13.1.16.20 ip arp inspection vlan

The **ip arp inspection vlan** command enables ARP inspection. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification. By default, ARP inspection is disabled on all VLANs.

Command Mode

EXEC

Command Syntax

ip arp inspection vlan [**LIST**]

Parameters

LIST Specifies the VLAN interface number.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan

Example

- This command enables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)# ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)# no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs ***1*** through ***150***.

```
switch(config)# default ip arp inspection vlan 1 - 150
switch(config)#
```

- These commands enable ARP inspection on multiple VLANs 1 through ***150*** and ***200*** through ***250***.

```
switch(config)# ip arp inspection vlan 1-150,200-250
switch(config)#
```

13.1.16.21 ip dhcp relay all-subnets

The **ip dhcp relay all-subnets** command configures the DHCP smart relay status on the configuration mode interface. DHCP smart relay supports forwarding DHCP requests with a client's secondary IP addresses in the gateway address field. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

By default, an interface assumes the global DHCP smart relay setting as configured by the ip dhcp relay all-subnets default command. The **ip dhcp relay all-subnets** command, when configured, takes precedence over the global smart relay setting.

The **no ip dhcp relay all-subnets** command disables DHCP smart relay on the configuration mode interface. The **default ip dhcp relay all-subnets** command restores the interface's to the default DHCP smart relay setting, as configured by the **ip dhcp relay all-subnets default** command, by removing the corresponding **ip dhcp relay all-subnets** or **no ip dhcp relay all-subnets** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip dhcp relay all-subnets

no ip dhcp relay all-subnets

default ip dhcp relay all-subnets

Examples

- This command enables DHCP smart relay on VLAN interface ***100***.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# ip helper-address 10.4.4.4
switch(config-if-Vl100)# ip dhcp relay all-subnets
switch(config-if-Vl100)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command disables DHCP smart relay on VLAN interface ***100***.

```
switch(config-if-Vl100)# no ip dhcp relay all-subnets
switch(config-if-Vl100)# show active
 interface Vlan100
   no ip dhcp relay all-subnets
   ip helper-address 10.4.4.4
switch(config-if-Vl100)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command enables DHCP smart relay globally, configures VLAN interface ***100*** to use the global setting, then displays the DHCP relay status.

```
switch(config)# ip dhcp relay all-subnets default
switch(config)# interface vlan 100
switch(config-if-Vl100)# ip helper-address 10.4.4.4
switch(config-if-Vl100)# default ip dhcp relay
switch(config-if-Vl100)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  Option 82 Circuit ID: 333
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

13.1.16.22 ip dhcp relay all-subnets default

The **ip dhcp relay all-subnets default** command configures the global DHCP smart relay setting. DHCP smart relay supports forwarding DHCP requests with a client's secondary IP addresses in the gateway address field. The default global DHCP smart relay setting is disabled.

The global DHCP smart relay setting is applied to all interfaces for which an ip dhcp relay all-subnets statement is not configured. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

The **no ip dhcp relay all-subnets default** and **default ip dhcp relay all-subnets default** commands restore the global DHCP smart relay default setting of disabled by removing the **ip dhcp relay all-subnets default** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp relay all-subnets default

no ip dhcp relay all-subnets default

default ip dhcp relay all-subnets default

Related Commands

- ip helper-address Enables the DHCP relay agent on a configuration mode interface.
- ip dhcp relay all-subnets Enables the DHCP smart relay agent on a configuration mode interface.

Example

This command configures the global DHCP smart relay setting to **enabled**.

```
switch(config)# ip dhcp relay all-subnets default
switch(config)#
```

13.1.16.23 ip dhcp relay always-on

The **ip dhcp relay always-on** command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an ip helper-address statement.

The **no ip dhcp relay always-on** and **default ip dhcp relay always-on** commands remove the **ip dhcp relay always-on** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp relay always-on

no ip dhcp relay always-on

default ip dhcp relay always-on

Related Commands

These commands implement DHCP relay agent.

- ip helper-address
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id

Example

This command enables the DHCP relay agent.

```
switch(config)# ip dhcp relay always-on
switch(config)#
```

13.1.16.24 ip dhcp relay information option (Global)

The **ip dhcp relay information option** command configures the switch to attach tags to DHCP requests before forwarding them to the DHCP servers designated by ip helper-address commands. The command specifies the tag contents for packets forwarded by the interface that it configures.

The **no ip dhcp relay information option** and **default ip dhcp relay information option** commands restore the switch's default setting of not attaching tags to DHCP requests by removing the **ip dhcp relay information option** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp relay information option

no ip dhcp relay information option

default ip dhcp relay information option

Related Commands

These commands implement DHCP relay agent.

- ip helper-address
- ip dhcp relay always-on
- ip dhcp relay information option circuit-id

Example

This command enables the attachment of tags to DHCP requests that are forwarded to DHCP server addresses.

```
switch(config)# ip dhcp relay information option
switch(config)#
```

13.1.16.25 ip dhcp relay information option circuit-id

The **ip dhcp relay information option circuit-id** command specifies the content of tags that the switch attaches to DHCP requests before they are forwarded from the configuration mode interface to DHCP server addresses specified by ip helper-address commands. Tags are attached to outbound DHCP requests only if the information option is enabled on the switch (ip dhcp relay information option circuit-id). The default value for each interface is the name and number of the interface.

The **no ip dhcp relay information option circuit-id** and **default ip dhcp relay information option circuit-id** commands restore the default content setting for the configuration mode interface by removing the corresponding command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip dhcp relay information option circuit-id ***id_label***

no ip dhcp relay information option circuit-id

default ip dhcp relay information option circuit-id

Parameters

id_label Tag content. Format is alphanumeric characters (maximum 15 characters).

Related Commands

- ip helper-address
- ip dhcp relay always-on
- ip dhcp relay information option (Global)

Example

This command configures **x-1234** as the tag content for packets send from VLAN ***200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip dhcp relay information option
 circuit-id x-1234
switch(config-if-Vl200)#
```

13.1.16.26 ip dhcp snooping

The **ip dhcp snooping** command enables DHCP snooping globally on the switch. DHCP snooping is a set of Layer 2 processes that can be configured on LAN switches and used with DHCP servers to control network access to clients with specific IP/MAC addresses. The switch supports Option-82 insertion, which is a DHCP snooping process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

The **no ip dhcp snooping** and **default ip dhcp snooping** commands disables global DHCP snooping by removing the **ip dhcp snooping** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping

no ip dhcp snooping

default ip dhcp snooping

Related Commands

- ip dhcp snooping information option enables insertion of option-82 snooping data.
- ip helper-address enables the DHCP relay agent on a configuration mode interface.

Example

This command globally enables snooping on the switch, displaying DHCP snooping status prior and after invoking the command.

```
switch(config)# show ip dhcp snooping
DHCP Snooping is disabled
switch(config)# ip dhcp snooping
switch(config)# show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is not operational
DHCP Snooping is configured on following VLANs:
  None
DHCP Snooping is operational on following VLANs:
  None
Insertion of Option-82 is disabled
switch(config)#
```

13.1.16.27 ip dhcp snooping bridging

The **ip dhcp snooping bridging** command enables the DHCP snooping bridging configuration.

The **no ip dhcp snooping bridging** command removes the DHCP snooping bridging configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

ip dhcp snooping bridging

no ip dhcp snooping bridging

Example

This command configures the DHCP snooping bridging.

```
switch# configure
switch(config)# ip dhcp snooping bridging
```

13.1.16.28 ip dhcp snooping information option

The **ip dhcp snooping information option** command enables the insertion of option-82 DHCP snooping information in DHCP packets on VLANs where DHCP snooping is enabled. DHCP snooping is a layer 2 switch process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port.

DHCP snooping uses information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server through DHCP protocol processes.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping information option** command persists in ***running-config*** without any operational effect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable the insertion of option-82 DHCP snooping information in DHCP packets by removing the **ip dhcp snooping information option** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping information option

no ip dhcp snooping information option

default ip dhcp snooping information option

Related Commands

- ip dhcp snooping globally enables DHCP snooping.
- ip helper-address enables the DHCP relay agent on a configuration mode interface.

Example

These commands enable DHCP snooping on DHCP packets from ports on snooping-enabled VLANs. DHCP snooping was previously enabled on the switch.

```
switch(config)# ip dhcp snooping information option
switch(config)# show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
```

```
switch(config)#
```

13.1.16.29 ip dhcp snooping vlan

The **ip dhcp snooping vlan** command enables DHCP snooping on specified VLANs. DHCP snooping is a Layer 2 process that allows relay agents to provide remote-ID and circuit-ID information in DHCP packets. DHCP servers use this data to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP snooping is configured on a global and VLAN basis.

VLAN snooping on a specified VLAN requires each of these conditions:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping vlan** command persists in ***running-config*** without any operational affect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable DHCP snooping operability by removing the **ip dhcp snooping information option** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping vlan ***v_range***

no ip dhcp snooping vlan ***v_range***

default ip dhcp snooping vlan ***v_range***

Parameters

- ***v_range*** VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- The ip dhcp snooping command globally enables DHCP snooping.
- The ip dhcp snooping vlan command enables insertion of option-82 snooping data.
- The ip helper-address command enables the DHCP relay agent on a configuration mode interface.

Example

These commands enable DHCP snooping globally, DHCP on VLAN interface ***100***, and DHCP snooping on ***vlan100***.

```
switch(config)# ip dhcp snooping
switch(config)# ip dhcp snooping information option
switch(config)# ip dhcp snooping vlan 100
switch(config)# interface vlan 100
switch(config-if-Vl100)# ip helper-address 10.4.4.4
switch(config-if-Vl100)# show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
```

```
switch(config)#
```

13.1.16.30 ip hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command enables resilient ECMP for the specified IP address prefix and configures a fixed number of next hop entries in the hardware ECMP table for that prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command includes a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

Resilient ECMP is useful when it is not desirable for routes to be rehashed due to link flap, as when ECMP is being used for load balancing.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from ***running-config*** .

Command Mode

Global Configuration

Command Syntax

ip hardware fib ecmp resilience ***net_addr*** capacity ***nhop_max*** redundancy **duplicates**

no ip hardware fib ecmp resilience ***net_addr***

default ip hardware fib ecmp resilience ***net_addr***

Parameters

- ***net_addr*** IP address prefix managed by command. (CIDR or address-mask).
- ***nhop_max*** Maximum number of nexthop addresses for specified IP address prefix. Value range varies by platform:
  - Helix: <**2** to **64**>
  - Trident: <**2** to **32**>
  - Trident II: <**2** to **64**>
- **duplicates** Specifies the redundancy factor. Value ranges from ***1*** to ***128***.

Example

This command configures a hardware ECMP table space of 24 entries for the IP address ***10.14.2.2/24***. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)# ip hardware fib ecmp resilience 10.14.2.2/24
 capacity 6 redundancy 4
switch(config)#
```

13.1.16.31 ip hardware fib next-hop resource optimization

The **ip hardware fib next-hop resource optimization** command is used to enable or disable the resource optimization features on the switch. By default, RECMP is enabled on the switch.

The **no hardware fib next-hop resource optimization** command removes all the resource optimization features running on the switch.

Command Mode

Global Configuration Mode

Command Syntax

ip hardware fib next-hop resource optimization ***OPTIONS***

no ip hardware fib next-hop resource optimization ***OPTIONS***

Parameters

- The following two options are allowed to configure with this command:
  - ***disabled*** Disable hardware resource optimization for adjacency programming.
  - ***thresholds*** Utilization percentage for starting or stopping optimization. The resource utilization percentage value ranges from 0 to 100. It can be set to low and high.

Examples

- The following command is used to disable all hardware resource optimization features on the switch:

```
switch# configure terminal
switch(config)# ip hardware fib next-hop resource optimization disabled
```

- The following command is used to configure the thresholds for starting and stopping the optimization:

```
switch(config)# ip hardware fib next-hop resource optimization
 thresholds low 20 high 80
```

13.1.16.32 ip hardware fib optimize

The **ip hardware fib optimize** command enables IPv4 route scale. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the agent SandL3Unicast terminate command for the configuration mode interface.

Command Mode

Global Configuration

Command Syntax

ip hardware fib optimize exact-match prefix-length ***prefix-length prefix-length***

ip hardware fib optimize exact-match prefix-length ***prefix-length prefix-length***

Parameters

prefix-length The length of the prefix equal to ***12***, ***16***, ***20***, ***24***, ***28***, or ***32***. One additional prefix-length limited to the prefix-length of ***32*** is optional.

Related Commands

- The agent SandL3Unicast terminate command enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- The show platform arad ip route command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- The show platform arad ip route summary command shows hardware resource usage of IPv4 routes.

Examples

- This configuration command allows configuring prefix lengths ***12*** and ***32***.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 12
 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.
  - This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
  - This configuration command allows configuring prefix lengths ***32*** and ***16***.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 32
 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.

    - This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
    - This configuration command allows configuring prefix length ***24***.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 24
! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- In this instance, there is only one prefix-length, so a prefix-length of ***32*** is not required. For this command to take effect, the platform Layer 3 agent must be restarted.
    - This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
    - This configuration command allows configuring prefix length ***32***.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- For this command to take effect, the platform Layer 3 agent must be restarted.
    - This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
    - This configuration command disables configuring prefix lengths ***12*** and ***32***.

```
switch(config)# no ip hardware fib optimize exact-match prefix-length
 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 not optimized
```

    - One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.

13.1.16.33 ip helper-address

The **ip helper-address** command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The **no ip helper-address** and **default ip helper-address** commands remove the corresponding **ip helper-address** command from ***running-config***. Commands that do not specify an IP helper-address remove all helper-addresses from the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip helper-address ***ipv4_addr*** [vrf ***vrf_name***][source-address ***ipv4_addr*** | source-interface **INTERFACES**]

no ip helper-address [***ipv4_addr***]

default ip helper-address [***ipv4_addr***]

Parameters

- **vrf *vrf_name*** Specifies the user-defined VRF for DHCP server.
- ***ipv4_addr*** Specifies the DHCP server address accessed by interface.
- **source-address *ipv4_addr*** Specifies the source IPv4 address to communicate with DHCP server.
- **source-interface INTERFACES** Specifies the source interface to communicate with DHCP server. Options include:
  - **Ethernet *eth_num*** Specifies the Ethernet interface number.
  - **Loopback *lpbck_num*** Specifies the loopback interface number. Value ranges from **0** to **1000**.
  - **Management *mgmt_num*** Specifies the management interface number. Accepted values are ***1*** and ***2***.
  - **Port-Channel** {***int_num*** | ***sub_int_num***} Specifies the port-channel interface or subinterface number. Value of interface ranges from **1** to **2000**. Value of sub-interface ranges from **1** to **4094**.
  - **Tunnel *tnl_num*** Specifies the tunnel interface number. Value ranges from **0** to **255**.
  - **VLAN *vlan_num*** Specifies the Ethernet interface number. Value ranges from **1** to **4094**.

Related Commands

- ip dhcp relay always-on
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id

Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv4 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

Examples

- This command enables DHCP relay on the VLAN interface ***200***; and configure the switch to forward DHCP requests received on this interface to the server at ***10.10.41.15***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip helper-address 10.10.41.15
switch(config-if-Vl200)# show active
interface Vlan200
   ip helper-address 10.10.41.15
switch(config-if-Vl200)#
```

- This command enables DHCP relay on the ***interface ewthernet 1/2***; and configures the switch to use ***2.2.2.2*** as the source IP address when relaying IPv4 DHCP messages to the server at ***1.1.1.1***.

```
switch(config)# interface ethernet 1/2
switch(config-if-Et1/2)# ip helper-address 1.1.1.1 source-
address 2.2.2.2
switch(config-if-Et1/2)#
```

13.1.16.34 ip icmp redirect

The **ip icmp redirect** command enables the transmission of ICMP redirect messages. Routers send ICMP redirect messages to notify data link hosts of the availability of a better route for a specific destination.

The **no ip icmp redirect** disables the switch from sending ICMP redirect messages.

Command Mode

Global Configuration

Command Syntax

ip icmp redirect

no ip icmp redirect

default ip icmp redirect

Example

This command disables the redirect messages.

```
switch(config)# no ip icmp redirect
switch(config)# show running-config
              <-------OUTPUT OMITTED FROM EXAMPLE-------->
!
no ip icmp redirect
ip routing
!
               <-------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```

13.1.16.35 ip load-sharing

The **ip load-sharing** command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to an individual IPv4 subnet.

In a network topology using Equal-Cost Multipath routing, all switches performing identical hash calculations may result in hash polarization, leading to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform different hash calculations.

The **no ip load-sharing** and **default ip load-sharing** commands return the hash seed to the default value of zero by removing the **ip load-sharing** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip load-sharing **HARDWARE** ***seed***

no ip load-sharing **HARDWARE**

default ip load-sharing **HARDWARE**

Parameters

- **HARDWARE** The ASIC switching device. The available option depend on the switch platform. Verify available options with the CLI ? command.
  - **arad**
  - **fm6000**
  - **petraA**
  - **trident**
- ***seed*** The hash seed. Value range varies by switch platform. The default value on all platforms is **0**.
  - when **HARDWARE**=**arad** ***seed*** ranges from **0** to **2**.
  - when **HARDWARE**=**fm6000** ***seed*** ranges from **0** to **39**.
  - when **HARDWARE**=**petraA** ***seed*** ranges from **0** to **2**.
  - when **HARDWARE**=**trident** ***seed*** ranges from **0** to **5**.

Example

This command sets the IPv4 load sharing hash seed to one on FM6000 platform switches.

```
switch(config)# ip load-sharing fm6000 1
switch(config)#
```

13.1.16.36 ip local-proxy-arp

The **ip local-proxy-arp** command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. When local proxy ARP is enabled, ARP requests received on the configuration mode interface will return an IP address even when the request comes from within the same subnet.

The **no ip local-proxy-arp** and **default ip local-proxy-arp** commands disable local proxy ARP on the configuration mode interface by removing the corresponding **ip local-proxy-arp** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip local-proxy-arp

no ip local-proxy-arp

default ip local-proxy-arp

Example

These commands enable local proxy ARP on VLAN interface ***140***.

```
switch(config)# interface vlan 140
switch(config-if-Vl140)# ip local-proxy-arp
switch(config-if-Vl140)# show active
interface Vlan140
   ip local-proxy-arp
switch(config-if-Vl140)#
```

13.1.16.37 ip multicast count

The **ip multicast count** command enables the IPv4 multicast route traffic counter of group and source addresses in either bytes or packets.

The **no ip multicast count** command deletes all multicast counters including the routes of group and source addresses.

The **no ip multicast count *group_address source_address*** command removes the current configuration of the specified group and source addresses. It does not delete the counter because the wildcard is still active.

The **default ip multicast count** command reverts the current counter configuration of multicast route to the default state.

Command Mode

Global Configuration

Command Syntax

ip multicast count [***group_address*** [***source_address***] | bytes | packets]

no ip multicast count [***group_address*** [***source_address***] | bytes | packets]

default ip multicast count [***group_address*** [***source_address***] | bytes | packets]

Parameters

- ***group_address*** Configures the multicast route traffic count of the specified group address.
  - ***source_address*** Configures the multicast route traffic count of the specified group and source addresses.
- **bytes** Configures the multicast route traffic count to bytes.
- **packets** Configures the multicast route traffic count to packets.

Guidelines

This command is supported on the FM6000 platform only.

Examples

- This command configures the multicast route traffic count to bytes.

```
switch(config)# ip multicast count bytes
```

- This command configures the multicast route traffic count of the specified group and source addresses.

```
switch(config)# ip multicast count 10.50.30.23 45.67.89.100
```

- This command deletes all multicast counters including the routes of group and source addresses.

```
switch(config)# no ip multicast count
```

- This command reverts the current multicast route configuration to the default state.

```
switch(config)# default ip multicast count
```

13.1.16.38 ip proxy-arp

The **ip proxy-arp** command enables proxy ARP on the configuration mode interface. Proxy ARP is disabled by default. When proxy ARP is enabled, the switch responds to all ARP requests, including gratuitous ARP requests, with target IP addresses that match a route in the routing table.

The **no ip proxy-arp** and **default ip proxy-arp** commands disable proxy ARP on the configuration mode interface by removing the corresponding **ip proxy-arp** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip proxy-arp

no ip proxy-arp

default ip proxy-arp

Example

This command enables proxy ARP on ***interface ethernet 4***.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#ip proxy-arp
switch(config-if-Et4)#
```

13.1.16.39 ip route

The **ip route** command creates a static route. The destination is a network segment; the nexthop address is either an IPv4 address or a routable port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with an administrative distance value of 200 is overridden by OSPF intra-area routes, which have a default administrative distance of 110.

Tags are used by route maps to filter routes. The default tag value on static routes is 0.

Multiple routes with the same destination and the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic equally through all ECMP route paths. All paths comprising an ECMP are assigned identical tag values; commands that change the tag value of a path change the tag value of all paths in the ECMP.

The **no ip route** and **default ip route** commands delete the specified static route by removing the corresponding **ip route** command from ***running-config***. Commands that do not list a nexthop address remove all **ip route** statements with the specified destination from ***running-config***. If an **ip route** statement exists for the same IP address in multiple VRFs, each must be removed separately. All static routes in a user-defined VRF are deleted when the VRF is deleted.

Command Mode

Global Configuration

Command Syntax

ip route [**VRF_INSTANCE**] ***dest_net*** **NEXTHOP** [**DISTANCE**][**TAG_OPTION**][**RT_NAME**]

no ip route [**VRF_INSTANCE**] ***dest_net*** [**NEXTHOP**][**DISTANCE**]

default ip route [**VRF_INSTANCE**] ***dest_net*** [**NEXTHOP**][**DISTANCE**]

Parameters

- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf *vrf_name*** Changes are made to the specified VRF.
- ***dest_net*** Destination IPv4 subnet (CIDR or address-mask notation).
- **NEXTHOP** Location or access method of next hop device. Options include:
  - ***ipv4_addr*** An IPv4 address.
  - **null0** Null0 interface.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **DISTANCE** Administrative distance assigned to route. Options include:
  - ***no parameter*** Route assigned default administrative distance of one.
  - **1-255** The administrative distance assigned to route.
- **TAG_OPTION** Static route tag. Options include:
  - ***no parameter*** Assigns default static route tag of ***0***.
  - **tag *t_value*** Static route tag value. ***t_value*** ranges from **0** to **4294967295**.
- **RT_NAME** Associates descriptive text to the route. Options include:

- ***no parameter*** No text is associated with the route.
- **name *descriptive_text*** The specified text is assigned to the route.

Related Command

The ip route nexthop-group command creates a static route that specifies a Nexthop Group to determine the Nexthop address.

Example

This command creates a static route in the default VRF.

```
switch(config)# ip route 172.17.252.0/24 vlan 2000
switch(config)#
```

13.1.16.40 ip routing

The **ip routing** command enables IPv4 routing. When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The **no ip routing** and **default ip routing** commands disable IPv4 routing by removing the **ip routing** command from ***running-config***. When IPv4 routing is disabled, the switch attempts to deliver inbound packets to their destination MAC addresses. When this address matches the switch's MAC address, the packet is delivered to the CPU. IP packets with IPv4 destinations that differ from the switch's address are typically discarded. The **delete-static-routes** option removes static entries from the routing table.

IPv4 routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

ip routing [**VRF_INSTANCE**]

no ip routing [**DELETE_ROUTES**][**VRF_INSTANCE**

default ip routing [**DELETE_ROUTES**][**VRF_INSTANCE**]

Parameters

- **DELETE_ROUTES** Resolves routing table static entries when routing is disabled.
  - ***no parameter*** Routing table retains static entries.
  - **delete-static-routes** Static entries are removed from the routing table.
- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf *vrf_name*** Changes are made to the specified user-defined VRF.

Example

This command enables IPv4 routing.

```
switch(config)# ip routing
switch(config)#
```

13.1.16.41 ip source binding

IP source guard (IPSG) is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Note: IP source bindings are also used by static ARP inspection.

The **`no ip source binding`** and **`default ip source binding`** commands exclude parameters from IPSG filtering, and set the default for **`ip source binding`**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`ip source binding` [***IP_ADDRESS***][***MAC_ADDRESS***] vlan [***VLAN_RANGE***] interface [***INTERFACE***]

`no ip source binding` [***IP_ADDRESS***][***MAC_ADDRESS***] vlan [***VLAN_RANGE***] interface [***INTERFACE***]

`default ip source binding` [***IP_ADDRESS***][***MAC_ADDRESS***] vlan [***VLAN_RANGE***] interface [***INTERFACE***]

Parameters

- **IP_ADDRESS** Specifies the IP ADDRESS.
- **MAC_ADDRESS** Specifies the MAC ADDRESS.
- **VLAN_RANGE** Specifies the VLAN ID range.
- **INTERFACE** Specifies the Ethernet interface.

Related Commands

- ip verify source
- show ip verify source

Example

This command configures source IP-MAC binding entries to IP address ***10.1.1.1***, MAC address ***0000.aaaa.1111***, VLAN ID ***4094***, and ***interface ethernet 36***.

```
switch(config)# ip source binding 10.1.1.1 0000.aaaa.1111 vlan
 4094 interface
ethernet 36
switch(config)#
```

13.1.16.42 ip verify source

The **ip verify source** command configures IP source guard (IPSG) applicable only to Layer 2 ports. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therefore, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

The **no ip verify source** and **default ip verify source** commands exclude VLAN IDs from IPSG filtering, and set the default for **ip verify source**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ip verify source vlan [**VLAN_RANGE**]

no ip verify source [**VLAN_RANGE**]

default ip verify source

Parameters

VLAN_RANGE Specifies the VLAN ID range.

Related Commands

- ip source binding
- show ip verify source

Example

This command excludes VLAN IDs ***1*** through ***3*** from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs ***4*** through ***10*** on ***Ethernet 36*** will be filtered by IPSG, while those received on VLANs ***1*** through ***3*** are permitted.

```
switch(config)#no ip verify source vlan 1-3
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```

13.1.16.43 ip verify

The **ip verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv4 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface only that there is a valid return path.

The **no ip verify** and **default ip verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ip verify** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip verify unicast source reachable-via **RPF_MODE**

no ip verify unicast

default ip verify unicast

Parameters

RPF_MODE Specifies the uRPF mode. Options include:

- **any** Loose mode.
- **rx** Strict mode.
- **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

Guidelines

The first IPv4 uRPF implementation briefly disrupts IPv4 unicast routing. Subsequent **ip verify** commands on any interface do not disrupt IPv4 routing.

Examples

- This command enables uRPF loose mode on ***VLAN interface 17***.

```
switch(config)#interface vlan 17
switch(config-if-Vl17)#ip verify unicast source reachable-via
 any
switch(config-if-Vl17)#show active
 interface Vlan17
   ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on ***VLAN interface 18***.

```
switch(config)#interface vlan 18
switch(config-if-Vl18)#ip verify unicast source reachable-via
 rx
```

```
switch(config-if-Vl18)#show active
 interface Vlan18
   ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

13.1.16.44 ipv4 routable 240.0.0.0/4

The **ipv4 routable 240.0.0.0/4** command assignes an class E addresses to an interface. When configured, the class E address traffic are routed through BGP, OSPF, ISIS, RIP, static routes and programmed to the FIB and kernel. By default, this command is disabled.

The **no ipv4 routable 240.0.0.0/4** and **default ipv4 routable 240.0.0.0/4** commands disable IPv4 Class E routing by removing the **ipv4 routable 240.0.0.0/4** command from ***running-config***.

IPv4 routable ***240.0.0.0/4*** routing is disabled by default.

Command Mode

Router General Configuration

Command Syntax

ipv4 routable 240.0.0.0/4

no ipv4 routable 240.0.0.0/4

default ipv4 routable 240.0.0.0/4

Example

These commands configure an IPv4 Class E (***240/4***) address to an interface.

```
switch(config)#router general
switch(config-router-general)#ipv4 routable 240.0.0.0/4
```

13.1.16.45 platform barefoot bfrt vrf

The **platform barefoot bfrt vrf** command configures the forwarding plane agent on supported platforms to restart and listen on the configured VRF for connections. If left unconfigured, the default VRF is used for the IP and port for the the BfRuntime server.

Command Mode

Global Configuration

Command Syntax

platform barefoot bfrt vrf *VRF name*

Parameters

VRF name configured VRF for connections.

Example

These commands configure the forwarding plane agent to restart and listen on the configured VRF for connections.

```
switch(config)#vrf instance management
switch(config-vrf-management)#exit
switch(config)#platform barefoot bfrt 0.0.0.0 50052
switch(config)#platform barefoot bfrt vrf <VRF name>
switch(config)#int management1
switch(config-if-Ma1)#vrf management
```

13.1.16.46 platform trident forwarding-table partition

The **`platform trident forwarding-table partition`** command provides a shared table memory for L2, L3 and algorithmic LPM entries that can be partitioned in different ways.

Instead of having fixed-size tables for L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes, the tables can be unified into a single shareable forwarding table.

Note: Changing the Unified Forwarding Table mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **`no platform trident forwarding-table partition`** and **`default platform trident forwarding-table partition`** commands remove the **`platform trident forwarding-table partition`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform trident forwarding-table partition` **SIZE**

`no platform trident forwarding-table partition`

`default platform trident forwarding-table partition`

Parameters

SIZE Size of partition. Options include:

- ***0*** 288k l2 entries, 16k host entries, 16k lpm entries.
- ***1*** 224k l2 entries, 80k host entries, 16k lpm entries.
- ***2*** 160k l2 entries, 144k host entries, 16k lpm entries.
- ***3*** 96k l2 entries, 208k host entries, 16k lpm entries.

The default value is ***2*** (160k l2 entries, 144k host entries, 16k lpm entries).

Examples

- This command sets the single shareable forwarding table to option 2 that supports 160k L2 entries, 144k host entries, and 16k LPM entries.

```
switch(config)#platform trident forwarding-table partition 2
switch(config)
```

- This command sets the single shareable forwarding table to option 3 that supports 96k L2 entries, 208k host entries, and 16k LPM entries. Since the switch was previously configured to option 2, you'll see a warning notice before the changes are implemented.

```
#switch(config)#platform trident forwarding-table partition 3

Warning: StrataAgent will restart immediately
```

13.1.16.47 platform trident routing-table partition

The **platform trident routing-table partition** command manages the partition sizes for the hardware LPM table that stores IPv6 routes of varying sizes.

An IPv6 route of length /64 (or shorter) requires half the hardware resources of an IPv6 route that is longer than /64. The switch installs routes of varying lengths in different table partitions. This command specifies the size of these partitions to optimize table usage.

Note: Changing the routing table partition mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident routing-table partition** and **default platform trident routing-table partition** commands restore the default partitions sizes by removing the **platform trident routing-table partition** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

platform trident routing-table partition **SIZE**

no platform trident routing-table partition

default platform trident routing-table partition

Parameters

SIZE Size of partition. Options include:

- ***1*** 16k IPv4 entries, 6k IPv6 (/64 and smaller) entries, 1k IPv6 (any prefix length).
- ***2*** 16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).
- ***3*** 16k IPv4 entries, 2k IPv6 (/64 and smaller) entries, 3k IPv6 (any prefix length).

The default value is ***2*** (16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).

Restrictions

Partition allocation cannot be changed from the default setting when uRPF is enabled for IPv6 traffic.

Example

This command sets the shareable routing table to option ***1*** that supports ***6K*** prefixes equal to or shorter than ***/64*** and ***1K*** prefixes longer than ***/64***.

```
switch(config)#platform trident routing-table partition 1
switch(config)
```

13.1.16.48 rib fib policy

The **rib fib policy** command enables FIB policy for a particular VRF under router general configuration mode.The FIB policy can be configured to advertise only specific RIB routes and exclude all other routes.

For example, a FIB policy can be configured that will not place routes associated with a specific origin in the routing table. These routes will not be used to forward data packets and these routes are not advertised by the routing protocol to neighbors.

The **no rib fib policy** and **default rib fib policy** commands restore the switch to its default state by removing the corresponding rib fib policy command from ***running-config*** .

Command Mode

Router General Configuration

Command Syntax

rib [*ipv4* | *ipv6*] fib policy *name*

no rib [*ipv4* | *ipv6*] fib policy *name*

default rib [*ipv4* | *ipv6*] fib policy *name*

Parameters

- ***ipv4*** IPv4 configuration commands.
- ***ipv6*** IPv6 configuration commands.
- ***name*** Route map name.

Example

The following example enables FIB policy for IPv4 in the default VRF, using the route map, ***map1***.

```
Switch(config)#router general
Switch(config-router-general)#vrf default
Switch(config-router-general-vrf-default)#rib ipv4 fib policy
 map1
```

13.1.16.49 show arp

The **`show arp`** command displays all ARP tables. This command differs from the show ip arp command in that it shows MAC bindings for all protocols, whereas show ip arp only displays MAC address – IP address bindings. Addresses are displayed as their host name by including the ***resolve*** argument.

Command Mode

EXEC

`show arp` [**VRF_INST**][**FORMAT**][**HOST_ADD**][**HOST_NAME**][**INTF**][**MAC_ADDR**][**DATA**]

Parameters

The **VRF_INST** and **FORMAT** parameters are always listed first and second. The **DATA** parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **`default`**.
- **FORMAT** Displays format of host address. Options include:
  - ***no parameter*** Entries associate hardware address with an IPv4 address.
  - **resolve** Enter associate hardware address with a host name (if it exists).
- **HOST_ADD** IPv4 address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host address.
  - ***ipv4_addr*** Table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host name.
  - **host *hostname*** Entries matching ***hostname*** (text).
- **INTF** Interfaces for which command displays status.
  - ***no parameter*** Routing table entries are not filtered by interface.
  - **interface ethernet *e_num*** Routed Ethernet interface specified by ***e_num***.
  - **interface loopback *l_num*** Routed loopback interface specified by ***l_num***.
  - **interface management *m_num*** Routed management interface specified by ***m_num***.
  - **interface port-channel *p_num*** Routed port channel Interface specified by ***p_num***.
  - **interface vlan *v_num*** VLAN interface specified by ***v_num***.
  - **interface vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by interface MAC address.
  - **mac_address *mac_address*** Entries matching ***mac_address*** (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - ***no parameter*** Routing table entries.
  - **summary** Summary of ARP table entries.
  - **summary total** Number of ARP table entries.

Related Commands

The cli vrf command specifies the context-active VRF.

Example

This command displays the ARP table.

```
switch>show arp
Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.133           0  001c.7304.3906  Management1
switch>
```

13.1.16.50 show dhcp server

Use the **show dhcp server** command to display DHCP server information.

Command Mode

EXEC

Command Syntax

show dhcp server [ipv4 | ipv6 [leases [**A.B.C.D/E** | **NAME**]]] | [leases [ipv4 | ipv6 | **NAME**]]

Parameters

- **ipv4** Displays details related to IPv4.
- **ipv6** Displays details related to IPv6.
- **leases** Displays active leases.
  - **A.B.C.D/E** IPv4 subnet.
  - **NAME** Subnet name.

Examples

- DHCPv4 display example.

```
switch#show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
   Interface   Status
-----------------------------------------------
   Ethernet1   Inactive (Could not determine VRF)
   Ethernet2   Inactive (Not in default VRF)
   Ethernet3   Inactive (Kernel interface not created yet)
   Ethernet4   Inactive (Not up)
   Ethernet5   Inactive (No IP address)
   Ethernet6   Active

Vendor information:
Vendor ID: default
  Sub-options         Data
---------------- ----------------
      1          192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo

   Ethernet3    Active

Subnet: fe80::/10
```

```
Subnet name: foo

Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5

Direct: Inactive (Multiple interfaces match this subnet: Ethernet1
 Ethernet3)
Relay: Active

Active leases: 0
```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets ***fc00::/7*** and **fe80::/10** while being enabled on ***Ethernet1*** with address ***fe80::1/10*** and ***fc00::1/7***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active

DNS server(s):  fc00::2

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

```

```
   Ethernet1    Active

Subnet: fc00::/7

Subnet name: foo

Range: fc00::1 to fc00::5

DNS server(s): fc00::6 fc00::8

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0

Subnet: fe80::/10

Subnet name: bar

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
```

- When a subnet is disabled, the **show dhcp server** command displays the disable message with a reason. The number of active leases of the disabled subnets will be ***0***. In this example, there are overlapping subnets.

```
switch#show dhcp server
IPv4 DHCP Server is active
```

```
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet
 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet
 10.0.0.0/24)
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch#show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12
 overlaps with an existing pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example shows duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is
 reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server (including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address).

```
switch#show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
```

```
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.ffac
```

13.1.16.51 show hardware capacity

The **show hardware capacity** command displays the utilization of the hardware resources:

Command Mode

Privileged EXEC

Command Syntax

show hardware capacity

Example

- The following command is used to show the utilization of the hardware resources:

```
switch#show hardware capacity
Forwarding Resources Usage

Table         Feature           Chip             Used Used    Free
 Committed Best Case     High
                                                    Entries  (%)
 Entries   Entries       Max   Watermark

                          Entries
---------------- -------------------- --------------- ----------
 ------- ---------- ------------ ------------ ---------
ECMP                                                        0   0%
 4095         0      4095        0
ECMP          Mpls                                        0   0%    4095
       0      4095        0

       0      4095        0
ECMP          VxlanTunnel                                 0   0%    3891
       0      3891        0
```

13.1.16.52 show interface tunnel

The **`show interface tunnel`** command displays the interface tunnel information.

Command Mode

EXEC

Command Syntax

`show interface tunnel` *number*

Parameter

number Specifies the tunnel interface number.

Example

This command displays tunnel interface configuration information for tunnel interface ***10***.

```
switch#show interface tunnel 10

Tunnel10 is up, line protocol is up (connected)
 Hardware is Tunnel, address is 0a01.0101.0800
 Internet address is 192.168.1.1/24
 Broadcast address is 255.255.255.255
 Tunnel source 10.1.1.1, destination 10.1.1.2
 Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
 Tunnel TTL 10, Hardware forwarding enabled
 Tunnel TOS 10
 Path MTU Discovery
 Tunnel transport MTU 1476 bytes
 Up 3 seconds
```

13.1.16.53 show ip

The **show ip** command displays IPv4 routing, IPv6 routing, IPv4 multicast routing, and VRRP status on the switch.

Command Mode

EXEC

Command Syntax

show ip

Example

This command displays IPv4 routing status.

```
switch>show ip

IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10

switch>
```

13.1.16.54 show ip arp

The **`show ip arp`** command displays ARP cache entries that map an IPv4 address to a corresponding MAC address. The table displays addresses by their host names when the command includes the ***resolve*** argument.

Command Mode

EXEC

Command Syntax

`show ip arp` [**VRF_INST**][**FORMAT**][**HOST_ADD**][**HOST_NAME**][**INTF**][**MAC_ADDR**][**DATA**]

Parameters

The **VRF_INST** and **FORMAT** parameters are always listed first and second. The **DATA** parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **`default`**.
- **FORMAT** Displays format of host address. Options include:
  - ***no parameter*** Entries associate hardware address with an IPv4 address.
  - **resolve** Enter associate hardware address with a host name (if it exists).
- **HOST_ADDR** IPv4 address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host address.
  - ***ipv4_addr*** Table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host name.
  - **host *hostname*** Entries matching ***hostname*** (text).
- **INTERFACE_NAME** Interfaces for which command displays status.
  - ***no parameter*** Routing table entries are not filtered by interface.
  - **interface ethernet *e_num*** Routed Ethernet interface specified by ***e_num***.
  - **interface loopback *l_num*** Routed loopback interface specified by ***l_num***.
  - **interface management *m_num*** Routed management interface specified by ***m_num***.
  - **interface port-channel *p_num*** Routed port channel Interface specified by ***p_num***.
  - **interface vlan *v_num*** VLAN interface specified by ***v_num***.
  - **interface vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- MAC_ADDR MAC address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by interface MAC address.
  - **mac_address *mac_address*** entries matching ***mac_address*** (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - ***no parameter*** Routing table entries.
  - **summary** Summary of ARP table entries.
  - **summary total** Number of ARP table entries.

Related Commands

The cli vrf command specifies the context-active VRF.

Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch>show ip arp

Address         Age (min)  Hardware Addr   Interface

```

13.1.16.55 show ip arp inspection statistics

The **show ip arp inspection statistics** command displays the statistics of inspected ARP packets. For a VLAN specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

Command Mode

EXEC

Command Syntax

show ip arp inspection statistics [vlan [**VID**]|[**INTERFACE**] interface *intf_slot* | *intf_port*]

Parameters

- **VID** Specifies the VLAN interface ID.
- **INTERFACE** Specifies the interface (e.g., Ethernet).
  - ***intf_slot*** Interface slot.
  - ***intf_port*** Interface port.
- **INTF** Specifies the VLAN interface slot and port.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan

Examples

- This command display statistics of inspected ARP packets for VLAN ***10***.

```
switch(config)#show ip arp inspection statistics vlan 10

Vlan : 10
--------------
ARP
Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1
Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command displays ARP inspection statistics for Ethernet interface ***3/1***.

```
switch(config)#show ip arp inspection statistics ethernet
 interface 3/1
Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
```

```
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

13.1.16.56 show ip arp inspection vlan

The **`show ip arp inspection vlan`** command displays the configuration and operation state of ARP inspection. For a VLAN range specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to ***Active*** when hardware is ready to trap ARP packets for inspection.

Command Mode

EXEC

Command Syntax

`show ip arp inspection vlan` [**LIST**]

Parameters

LIST Specifies the VLAN interface number.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- show ip arp inspection statistics

Example

This command displays the configuration and operation state of ARP inspection for VLANs ***1*** through ***150***.

```
switch(config)#show ip arp inspection vlan 1 - 150

VLAN 1
----------
Configuration
: Enabled
Operation State : Active
VLAN 2
----------
Configuration
: Enabled
Operation State : Active
{...}
VLAN 150
----------
Configuration
: Enabled
Operation State : Active

switch(config)#
```

13.1.16.57 show ip dhcp relay counters

The **show ip dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Command Mode

EXEC

Command Syntax

show ip dhcp relay counters

Example

This command displays the IP DHCP relay counter table.

```
switch>show ip dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago
 All Resp |  277  277    0 |
          |                |
 Vlan1000 |    0    0    0 | 4 days, 19:54:24 ago
 Vlan1036 |  376  277    0 | 4 days, 19:54:24 ago

switch>
```

13.1.16.58 show ip dhcp relay

The **show ip dhcp relay** command displays the DHCP relay agent configuration status on the switch.

Command Mode

EXEC

Command Syntax

show ip dhcp relay

Example

This command displays the DHCP relay agent configuration status.

```
switch>show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
switch>
```

13.1.16.59 show ip dhcp snooping counters

The **show ip dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping counters [**COUNTER_TYPE**]

Parameters

COUNTER_TYPE The type of counter that the command resets. Formats include:

- ***no parameter*** Command displays counters for each VLAN.
- **debug** Command displays aggregate counters and drop cause counters.

Examples

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch>show ip dhcp snooping counters

     | Dhcp Request Pkts | Dhcp Reply Pkts |
Vlan |  Rcvd  Fwdd  Drop | Rcvd Fwdd  Drop | Last Cleared
-----|------ ----- ------|----- ---- ------|-------------
 100 |     0     0     0 |    0    0     0 |  0:35:39 ago

switch>
```

- This command displays the number of DHCP packets sent on the switch.

```
switch>show ip dhcp snooping counters debug
Counter                       Snooping to Relay Relay to
 Snooping
------------------------------ ----------------- -------------

Last Cleared:  3:37:18 ago
switch>
```

13.1.16.60 show ip dhcp snooping hardware

The **show ip dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping hardware

Example

This command DHCP snooping hardware status.

```
switch>show ip dhcp snooping hardware
DHCP Snooping is enabled
DHCP Snooping is enabled on following VLANs:
    None
    Vlans enabled per Slice
        Slice:  FixedSystem
        None
switch>
```

13.1.16.61 show ip dhcp snooping

The **show ip dhcp snooping** command displays the DHCP snooping configuration.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping

Related Commands

- ip dhcp snooping globally enables DHCP snooping.
- ip dhcp snooping vlan enables DHCP snooping on specified VLANs.
- ip dhcp relay information option (Global) enables insertion of option-82 snooping data.
- ip helper-address enables the DHCP relay agent on a configuration mode interface.

Example

This command displays the switch's DHCP snooping configuration.

```
switch>show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch>
```

13.1.16.62 show ip hardware fib summary

The **show ip hardware fib summary** command displays the statistics of the RECMP.

Command Mode

Privileged EXEC

Command Syntax

show ip hardware fib summary

Example

- The following command is used to show the statistics of RECMP:

```
switch#show ip hardware fib summary
Fib summary
-----------
Adjacency sharing: disabled
BFD peer event: enabled
Deletion Delay: 0
Protect default route: disabled
PBR: supported
URPF: supported
ICMP unreachable: enabled
Max Ale ECMP: 600
UCMP weight deviation: 0.0
Maximum number of routes: 0
Fib compression: disabled
Resource optimization for adjacency programming: enabled
Adjacency resource optimization thresholds: low 20, high 80
```

About Output

- The last two lines of the output shows whether the feature is enabled and what are the corresponding threshold values for starting and stopping the optimization process.

13.1.16.63 show ip interface

The **show ip interface** command displays the status of specified interfaces that are configured as routed ports. The command provides the following information:

- Interface description
- Internet address
- Broadcast address
- Address configuration method
- Proxy-ARP status
- MTU size

Command Mode

EXEC

Command Syntax

show ip interface [**INTERFACE_NAME**][**VRF_INST**]

Parameters

- **INTERFACE_NAME** Interfaces for which command displays status.
  - ***no parameter*** All routed interfaces.
  - ***ipv4_addr*** Neighbor IPv4 address.
  - **ethernet *e_range*** Routed Ethernet interfaces specified by ***e_range***.
  - **loopback *l_range*** Routed loopback interfaces specified by ***l_range***.
  - **management *m_range*** Routed management interfaces specified by ***m_range***.
  - **port-channel *p_range*** Routed port channel Interfaces specified by ***p_range***.
  - **vlan *v_range*** VLAN interfaces specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interfaces specified by ***vx_range***.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.

Example

- This command displays IP status of configured VLAN interfaces numbered between ***900*** and ***910***.

```
switch>show ip interface vlan 900-910
! Some interfaces do not exist
Vlan901 is up, line protocol is up (connected)
  Description: ar.pqt.mlag.peer
  Internet address is 170.23.254.1/30
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
Vlan903 is up, line protocol is up (connected)
  Description: ar.pqt.rn.170.23.254.16/29
  Internet address is 170.23.254.19/29
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
```

- This command displays the configured TCP Maximum Segment Size (MSS) ceiling value of ***1436*** bytes for an Ethernet interface ***25***.

```
switch>show ip interface ethernet 25
Ethernet25 is up, line protocol is up (connected)
  Internet address is 10.1.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1500 bytes
  IPv4 TCP MSS egress ceiling is 1436 bytes
```

13.1.16.64 show ip interface brief

Use the **`show ip interface brief`** command output to display the status summary of the specified interfaces that are configured as routed ports. The command provides the following information for each specified interface:

- IP address
- Operational status
- Line protocol status
- MTU size

Command Mode

EXEC

Command Syntax

`show ip interface` [**INTERFACE_NAME**][**VRF_INST**] brief

Parameters

- **INTERFACE_NAME** Interfaces for which command displays status.
  - ***no parameter*** All routed interfaces.
  - ***ipv4_addr*** Neighbor IPv4 address.
  - **ethernet *e_range*** Routed Ethernet interfaces specified by ***e_range***.
  - **loopback *l_range*** Routed loopback interfaces specified by ***l_range***.
  - **management *m_range*** Routed management interfaces specified by ***m_range***.
  - **port-channel *p_range*** Routed port channel Interfaces specified by ***p_range***.
  - **vlan *v_range*** VLAN interfaces specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **`default`**.

Example

This command displays the summary status of VLAN interfaces ***900-910***.

```
switch>show ip interface vlan 900-910 brief

! Some interfaces do not exist
Interface              IP Address         Status     Protocol
     MTU
Vlan901                170.33.254.1/30    up         up
    9212
Vlan902                170.33.254.14/29   up         up
    9212
Vlan905                170.33.254.17/29   up         up
    1500
Vlan907                170.33.254.67/29   up         up
    9212
Vlan910                170.33.254.30/30   up         up
    9212
```

13.1.16.65 show ip route

The **show ip route** command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays configured commands not in the FIB.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**][**ADDRESS**][**ROUTE_TYPE**][**INFO_LEVEL**][**PREFIX**]

Parameters

The **VRF_INSTANCE** and **ADDRESS** parameters are always listed first and second, respectively. All other parameters can be placed in any order.

- **VRF_INSTANCE** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Filters routes by IPv4 address or subnet.
  - ***no parameter*** All routing table entries.
  - ***ipv4_addr*** Routing table entries matching specified address.
  - ***ipv4_subnet*** Routing table entries matching specified subnet (CIDR or address-mask).
- **ROUTE_TYPE** Filters routes by specified protocol or origin. Options include:
  - ***no parameter*** All routing table entries.
  - **aggregate** Entries for BGP aggregate routes.
  - **bgp** Entries added through BGP protocol.
  - **connected** Entries for routes to networks directly connected to the switch.
  - ***isis*** Entries added through ISIS protocol.
  - **kernel** Entries appearing in Linux kernel but not added by EOS software.
  - **ospf** Entries added through OSPF protocol.
  - **rip** Entries added through RIP protocol.
  - **static** Entries added through CLI commands.
  - **vrf** Displays routes in a VRF.
- **INFO_LEVEL** Filters entries by next hop connection. Options include:
  - ***no parameter*** Filters routes whose next hops are directly connected.
  - **detail** Displays all routes.
- **PREFIX** Filters routes by prefix.
  - ***no parameter*** Specific route entry that matches the ADDRESS parameter.
  - **longer-prefixes** All subnet route entries in range specified by ADDRESS parameter.

Related Commands

The **cli vrf** command specifies the context-active VRF.

Examples

- This command displays IPv4 routes learned through BGP.

```
switch>show ip route bgp
Codes: C - connected, S - static, K - kernel,
```

```
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type

```

- This command displays the leaked routes from a source VRF.

```
switch#show ip route vrf VRF2 20.0.0.0/8
...
S L      20.0.0.0/8 [1/0] (source VRF VRF1) via 10.1.2.10,
 Ethernet1
```

13.1.16.66 show ip route age

The **show ip route age** command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

Command Mode

EXEC

Command Syntax

show ip route ADDRESS age

Parameters

ADDRESS Filters routes by IPv4 address or subnet.

- ***ipv4_addr*** Routing table entries matching specified address.
- ***ipv4_subnet*** Routing table entries matching specified subnet (CIDR or address-mask).

Example

This command shows the amount of time since the last update to ip route ***172.17.0.0/20***.

```
switch>show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

 B E    172.17.0.0/20 via 172.25.0.1, age 3d01h
switch>
```

13.1.16.67 show ip route gateway

The **show ip route gateway** command displays IP addresses of all gateways (next hops) used by active routes.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**] gateway

Parameters

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- ***no parameter*** Context-active VRF.
- **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.

Related Commands

The cli vrf command specifies the context-active VRF.

Example

This command displays next hops used by active routes.

```
switch>show ip route gateway
The following gateways are in use:
   172.25.0.1 Vlan101
   172.17.253.2 Vlan3000
   172.17.254.2 Vlan3901
   172.17.254.11 Vlan3902
   172.17.254.13 Vlan3902
   172.17.254.17 Vlan3903
   172.17.254.20 Vlan3903
   172.17.254.66 Vlan3908
   172.17.254.67 Vlan3908
   172.17.254.68 Vlan3908
   172.17.254.29 Vlan3910
   172.17.254.33 Vlan3911
   172.17.254.35 Vlan3911
   172.17.254.105 Vlan3912
   172.17.254.86 Vlan3984
   172.17.254.98 Vlan3992
   172.17.254.99 Vlan3992
switch>
```

13.1.16.68 show ip route host

The **`show ip route host`** command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = ***255.255.255.255*** or prefix = ***/32***). Each entry includes a code of the route's purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Command Mode

EXEC

Command Syntax

`show ip route` [**VRF_INSTANCE**] host

Parameters

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- ***no parameter*** Context-active VRF.
- **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **`default`**.

Related Commands

The cli vrf command specifies the context-active VRF.

Example

This command displays all host routes in the host forwarding table.

```
switch>show ip route host
R - receive B - broadcast F - FIB, A - attached

F   127.0.0.1 to cpu
B   172.17.252.0 to cpu
A   172.17.253.2 on Vlan2000
R   172.17.253.3 to cpu
A   172.17.253.10 on Vlan2000
B   172.17.253.255 to cpu
B   172.17.254.0 to cpu
R   172.17.254.1 to cpu
B   172.17.254.3 to cpu
B   172.17.254.8 to cpu
A   172.17.254.11 on Vlan2902
R   172.17.254.12 to cpu

F   172.26.0.28 via 172.17.254.20 on Vlan3003
                via 172.17.254.67 on Vlan3008
                via 172.17.254.98 on Vlan3492
                via 172.17.254.2 on Vlan3601
                via 172.17.254.13 on Vlan3602
via 172.17.253.2 on Vlan3000
F   172.26.0.29 via 172.25.0.1 on Vlan101
F   172.26.0.30 via 172.17.254.29 on Vlan3910
F   172.26.0.32 via 172.17.254.105 on Vlan3912
switch>
```

13.1.16.69 show ip route match tag

The **show ip route match tag** command displays the route tag assigned to the specified IPv4 address or subnet. Route tags are added to static routes for use by route maps.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**] **ADDRESS** match tag

Parameters

- **VRF_INSTANCE** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Displays routes of specified IPv4 address or subnet.
  - ***ipv4_addr*** Routing table entries matching specified IPv4 address.
  - ***ipv4_subnet*** Routing table entries matching specified IPv4 subnet (CIDR or address-mask).

Example

This command displays the route tag for the specified subnet.

```
switch>show ip route 172.17.50.0/23 match tag
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control
 Service,
       DH - DHCP client installed default route, M - Martian

 O E2   172.17.50.0/23 tag 0

switch>
```

13.1.16.70 show ip route summary

The **show ip route summary** command displays the number of routes, categorized by destination prefix, in the routing table.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**] summary **Parameters**

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- ***no parameter*** Context-active VRF.
- **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.

Example

This command displays a summary of the routing table contents.

```
switch>show ip route summary
Route Source         Number Of Routes
-------------------------------------
connected                    15
static                        0
ospf                         74
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9
  NSSA External-1:0 NSSA External-2:0
bgp                           7
  External: 6 Internal: 1
internal                     45
attached                     18
aggregate                     0
switch>
```

13.1.16.71 show ip verify source

The **show ip verify source** command displays the IP source guard (IPSG) configuration, operational states, and IP-MAC binding entries for the configuration mode interface.

Command Mode

EXEC

Command Syntax

show ip verify source [VLAN | DETAIL]

Parameters

- **VLAN** Displays all VLANs configured in **no ip verify source vlan**.
- **DETAIL** Displays all source IP-MAC binding entries configured for IPSG.

Related Commands

- ip source binding
- ip verify source

Examples

- This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface       Operational State
--------------- ------------------------
Ethernet1       IP source guard enabled
Ethernet2       IP source guard disabled
```

- This command displays all VLANs configured in **no ip verify source vlan**. Hardware programming errors, e.g.,VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)#show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN            Operational State
--------------- ------------------------
1               IP source guard disabled
2               Error: vlan classification failed
```

- This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)#show ip verify source detail
Interface      IP Address  MAC Address     VLAN  State
-------------- ----------- --------------- ----- ------------------------
Ethernet1      10.1.1.1    0000.aaaa.1111   5     active
Ethernet1      10.1.1.5    0000.aaaa.5555   1     IP source guard disabled
Port-Channel1  20.1.1.1    0000.bbbb.1111   4     Port-Channel down
```

13.1.16.72 show platform arad ip route summary

The **show platform arad ip route summary** command shows hardware resource usage of IPv4 routes.

Command Mode

EXEC

Command Syntax

show platform arad ip route summary

Related Commands

- The agent SandL3Unicast terminate command enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- The ip hardware fib optimize command enables IPv4 route scale.
- The show platform arad ip route command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Example

This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4

switch(config)#
```

13.1.16.73 show platform arad ip route

The **show platform arad ip route** command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Command Mode

EXEC

Command Syntax

show platform arad ip route

Examples

- This command displays the platform unicast forwarding routes. In this example, the ACL label field in the following table is ***4094*** by default for all routes. If an IPv4 egress RACL is applied to an SVI, all routes corresponding to that VLAN will have an ACL label value. In this case, the ACL Label field value is *2*.

```
switch#show platform arad ip route
 Tunnel Type: M(mpls), G(gre)

switch(config)#
```

13.1.16.74 show platform barefoot bfrt

The **show platform barefoot bfrt** command displays information about the current BfRuntime server configuration.

Command Mode

EXEC

Command Syntax

show platform barefoot bfrt

Parameters

no parameter state of the system.

Example

The following output is for a system where the BfRuntime server has been configured.

```
(switch)#show platform barefoot bfrt
Namespace: management
FixedSystem:0.0.0.0:50052
```

13.1.16.75 show platform fap eedb ip-tunnel gre interface tunnel

The **show platform fap eedb ip-tunnel gre interface tunnel** command verifies the tunnel encapsulation programming for the tunnel interface.

Command Mode

EXEC

Command Syntax

show platform fap eedb ip-tunnel gre interface tunnel *number*

Parameter

number Specifies the tunnel interface number.

Example

These commands verify the tunnel encapsulation programming for the ***tunnel interface 10***.

```
switch#show platform fap eedb ip-tunnel gre interface tunnel 10

```

13.1.16.76 show platform fap tcam summary

The **show platform fap tcam summary** command displays information about the TCAM bank that is allocated for GRE packet termination lookup.

Command Mode

EXEC

Command Syntax

show platform fap tcam summary

Example

This command verifies if the TCAM bank is allocated for GRE packet termination lookup.

```
switch# show platform fap tcam summary

Tcam Allocation (Jericho0)
Bank        Used By                Reserved By
----------- ---------------------- -----------
0           dbGreTunnel             -
```

13.1.16.77 show platform trident forwarding-table partition

The **show platform trident forwarding-table partition** command displays the size of the L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes.

Command Mode

Privileged EXEC

Command Syntax

show platform trident forwarding-table partition

show platform trident forwarding-table partition flexible

Example

The **show platform trident forwarding-table partition** command shows the Trident forwarding table information.

```
switch(config)# show platform trident forwarding-table partition
L2 Table Size: 96k
L3 Host Table Size: 208k
LPM Table Size: 16k
switch(config)#
```

The **show platform trident forwarding-table partition flexible**shows the banks allocated for ALPM as well.

```
switch(config)# show platform trident forwarding-table partition
 flexible
------------------------------------------------
Minimum L2 entries             = 32768
Minimum L3 entries             = 16384
Maximum L2 entries             = 262144
Maximum L3 entries             = 262144
Maximum Exact Match entries    = 131072
L2 entries per bucket          = 4
L3 entries per bucket          = 4
Exact Match entries per bucket = 2
Maximum entries per bucket     = 4
Maximum shared buckets         = 65536
Maximum entries per bank       = 32768
Maximum shared banks           = 8
ALPM entries per bank          = 46080
ALPM                           = Enabled

```

13.1.16.78 show rib route ip

The **show rib route ip** command displays a list of IPv4 Routing Information Base (RIB) routes.

Command Mode

EXEC

Command Syntax

show rib route ip [vrf ***vrf_name***][**PREFIX**][**ROUTE TYPE**]

Parameters

- **vrf *vrf_name*** Displays RIB routes from the specified VRF.
- **PREFIX** dDisplays routes filtered by the specified IPv4 information. Options include:
  - ***ip_address*** Displays RIB routes filtered by the specified IPv4 address.
  - ***ip_subnet_mask*** Displays RIB routes filtered by the specified IPv4 address and subnet mask.
  - ***ip_prefix*** Displays RIB routes filtered by the specified IPv4 prefix.
- **ROUTE TYPE** Displays routes filtered by the specified route type. Options include:
  - **bgp** Displays RIB routes filtered by BGP.
  - **connected** Displays RIB routes filtered by connected routes.
  - **dynamicPolicy** Displays RIB routes filtered by dynamic policy routes.
  - **host** Displays RIB routes filtered by host routes.
  - **isis** Displays RIB routes filtered by ISIS routes.
  - **ospf** Displays RIB routes filtered by OSPF routes.
  - **ospf3** Displays RIB routes filtered by OSPF3 routes.
  - **reserved** Displays RIB routes filtered by reserved routes.
  - **route-input** Displays RIB routes filtered by route-input routes.
  - **static** Displays RIB routes filtered by static routes.
  - **vrf** Displays routes in a VRF.
  - **vrf-leak** Displays leaked routes in a VRF.

Examples

- This command displays IPv4 RIB static routes.

```
switch# show rib route ip static
VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S    10.80.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected
>S    172.16.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected
switch#
```

- This command displays IPv4 RIB connected routes.

```
switch# show rib route ip connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
```

```
       L - Part of a recursive route resolution loop
>C    10.1.0.0/24 [0/1]
         via 10.1.0.102, Ethernet1
>C    10.2.0.0/24 [0/1]
         via 10.2.0.102, Ethernet2
>C    10.3.0.0/24 [0/1]
         via 10.3.0.102, Ethernet3
switch#
```

- This command displays routes leaked through VRF leak agent.

```
switch# show rib route ip vrf VRF2 vrf-leak
VRF: VRF2, Protocol: vrf-leak
...
>VL    20.0.0.0/8 [1/0] source VRF: VRF1
          via 10.1.2.10 [0/0] type ipv4
             via 10.1.2.10, Ethernet1
```

13.1.16.79 show rib route fib policy excluded

The **show rib route fib policy excluded** command displays the RIB routes filtered by FIB policy. The **fib policy excluded** option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

Command Mode

EXEC

Command Syntax

show rib route [***ipv4*** | ***ipv6***] fib policy excluded

Example

The following example displays the RIB routes excluded by the FIB policy using the fib policy excluded option of the **show rib route** command.

```
switch# show rib route ipv6 fib policy excluded
switch# show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B    10.1.0.0/24 [200/0]
         via 10.2.2.1 [115/20] type tunnel
            via 10.3.5.1, Ethernet1
         via 10.2.0.1 [115/20] type tunnel
            via 10.3.4.1, Ethernet2
            via 10.3.6.1, Ethernet3
>B    10.1.0.0/24 [200/0]
         via 10.2.2.1 [115/20] type tunnel
            via 10.3.5.1, Ethernet1
         via 10.2.0.1 [115/20] type tunnel
            via 10.3.4.1, Ethernet2
            via 10.3.6.1, Ethernet3
```

13.1.16.80 show rib route summary

The **show rib route summary** command displays information about the routes present in the Routing Information Base.

Command Mode

EXEC

Command Syntax

show rib route summary [**INFO_LEVEL**]

Parameters

- **no parameter** variable displays data in one table with the summary of all routes in the RIB for default VRF.
- **brief** keyword displays one table with the summary of all routes across all configured VRFs.
- **ip** keyword displays one table with the summary of all IPv4 in the RIB for default VRF.
- **ipv6** keyword displays one table with the summary of all IPv4 in the RIB for default VRF.
- **vrf *vrf_Name*** keyword displays one table with the summary of all routes in the Routing Information Base for the specified VRF.
- **vrf all** keyword displays one table with the summary of all routes in the Routing Information Base for each configured VRF.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - **Display Values**
    - **VRF** VRF RIB displayed.
    - **Route Source** Source for the route.
    - **Number of Routes** Number of routes for each source.

Examples

- The following displays data in one table with the summary of all routes in the RIB for default VRF.

```
switch> show rib route summary
VRF: default
Route Source         Number Of Routes
-------------------- ----------------
BGP                                1
Connected                          4
Dynamic policy                     0
IS-IS                              0
OSPF                               0
OSPFv3                             0
RIP                                0
Route input                        2
Static                             0
VRF leak                           0
```

- The following displays data in one table with the summary of all routes across all configured VRFs.

```
switch> show rib route summary brief
Route Source         Number Of Routes
-------------------- ----------------
BGP                                2
Connected                          8
Dynamic policy                     0
IS-IS                              0
```

```
OSPF                                    0
OSPFv3                                  0
RIP                                     0
Route input                             4
Static                                  0
VRF leak                                0
```

- The following displays data in one table with the summary of all IPv4 routes in the RIB for default VRF.

```
switch> show rib route summary ip
VRF: default
Route Source          Number Of Routes
--------------------- ----------------
BGP                                   1
Connected                             4
Dynamic policy                        0
IS-IS                                 0
OSPF                                  0
OSPFv3                                0
RIP                                   0
Route input                           2
Static                                0
VRF leak                              0
```

- The following displays data in one table with the summary of all IPv6 routes in the RIB for default VRF.

```
switch> show rib route summary ipv6
VRF: default
Route Source          Number Of Routes
--------------------- ----------------
BGP                                   0
Connected                             0
Dynamic policy                        0
IS-IS                                 0
OSPF                                  0
OSPFv3                                0
RIP                                   0
Route input                           0
Static                                0
VRF leak                              0
```

- The following displays data in one table with the summary of all routes in the RIB for the VRF named ***red***.

```
switch> show rib route summary vrf red
VRF: red
Route Source          Number Of Routes
--------------------- ----------------
BGP                                   1
Connected                             4
Dynamic policy                        0
IS-IS                                 0
OSPF                                  0
OSPFv3                                0
RIP                                   0
Route input                           2
Static                                0
VRF leak                              0
```

- The following displays data in one table with the summary of all routes in the RIB for each configured VRF.

```
switch> show rib route summary vrf all
VRF: red
Route Source         Number Of Routes
-------------------- ----------------
BGP                                1
Connected                          4
Dynamic policy                     0
IS-IS                              0
OSPF                               0
OSPFv3                             0

VRF leak                           0
```

13.1.16.81 show routing-context vrf

The **show routing-context vrf** command displays the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data from a specified VRF.

Command Mode

EXEC

Command Syntax

show routing-context vrf

Related Commands

The cli vrf command specifies the context-active VRF.

Example

This command displays the context-active VRF.

```
switch> show routing-context vrf
Current VRF routing-context is PURPLE
switch>
```

13.1.16.82 show tunnel fib static interface gre

The **show tunnel fib static interface gre** command displays the Forwarding Information Base (FIB) information for a static interface GRE tunnel.

Command Mode

EXEC

Command Syntax

show tunnel fib static interface gre *number*

Parameter

number Specifies the tunnel index number.

Example

This command display the interface tunnel configuration with GRE configured.

```
switch# show tunnel fib static interface gre 10

Type 'Static Interface', index 10, forwarding Primary
   via 10.6.1.2, 'Ethernet6/1'
      GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

13.1.16.83 show vrf

The **show vrf** command displays the VRF name, RD, supported protocols, state and included interfaces for the specified VRF or for all VRFs on the switch.

Command Mode

EXEC

Command Syntax

show vrf [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Specifies the VRF instance to display.

- ***no parameter*** Information is displayed for all VRFs.
- **vrf *vrf_name*** Information is displayed for the specified user-defined VRF.

Example

This command displays information for the VRF named ***purple***.

```
switch> show vrf purple
Vrf      RD          Protocols  State       Interfaces
-------- ----------- ---------- ----------- --------------
purple   64496:237   ipv4       no routing  Vlan42, Vlan43

switch>
```

13.1.16.84 tcp mss ceiling

The **tcp mss ceiling** command configures the Maximum Segment Size (MSS) limit in the TCP header on the configuration mode interface and enables TCP MSS clamping.

The **no tcp mss ceiling** and the **default tcp mss ceiling** commands remove any MSS ceiling limit previously configured on the interface.

Note: Configuring a TCP MSS ceiling on any Ethernet or tunnel interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

Command Mode

Interface-Ethernet Configuration

Subinterface-Ethernet Configuration

Interface-Port-channel Configuration

Subinterface-Port-channel Configuration

Interface-Tunnel Configuration

Interface-VLAN Configuration

Command Syntax

tcp mss ceiling {ipv4 ***segment size*** | ipv6 ***segment size***}{egress | ingress}

no tcp mss ceiling

default tcp mss ceiling

Parameters

- **ipv4** ***segment size*** The IPv4 segment size value in bytes. Values range from **64** to **65515**.
- **ipv6** ***segment size*** The IPv6 segment size value in bytes. Values range from **64** to **65495**. This option is not supported on Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+).
- **egress** The TCP SYN packets that are forwarded from the interface to the network.
- **ingress** The TCP SYN packets that are received from the network to the interface. Not supported on Sand platform switches.

Guidelines

- On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), this command works only for egress, and is supported only on IPv4 unicast packets entering the switch.
- Clamping can only be configured in one direction per interface and works only on egress on Sand platform switches.
- To configure ceilings for both IPv4 and IPv6 packets, both configurations must be included in a single command; re-issuing the command overwrites any previous settings.
- Clamping configuration has no effect on GRE transit packets.

Example

These commands configure ***interface ethernet 5*** as a routed port, then specify a maximum MSS ceiling value of ***1458*** bytes in TCP SYN packets exiting that port. This enables TCP MSS clamping on the switch.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# tcp mss ceiling ipv4 1458 egress
```

```
switch(config-if-Et5)#
```

13.1.16.85 tunnel

The **tunnel** command configures options for protocol-over-protocol tunneling. Because interface-tunnel configuration mode is not a group change mode, ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no tunnel** command deletes the specified tunnel configuration.

Command Mode

Interface-tunnel Configuration

Command Syntax

tunnel ***options***

no tunnel ***options***

Parameters

- ***options*** Specifies the various tunneling options as listed below.
  - **destination** Destination address of the tunnel.
  - **ipsec** Secures the tunnel with the IPsec address.
  - **key** Sets the tunnel key.
  - **mode** Tunnel encapsulation method.
  - **path-mtu-discovery** Enables the Path MTU discovery on tunnel.
  - **source** Source of the tunnel packets.
  - **tos** Sets the IP type of service value.
  - **ttl** Sets time to live value.
  - **underlay** Tunnel underlay.

Example

These commands place the switch in interface-tunnel configuration mode for ***interface Tunnel 10*** and with GRE tunnel configured on the interfaces specified.

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.1/24
switch(config-if-Tu10)# tunnel source 10.1.1.1
switch(config-if-Tu10)# tunnel destination 10.1.1.2
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

13.1.16.86 vrf (Interface mode)

The **vrf** command adds the configuration mode interface to the specified VRF. You must create the VRF first, using the vrf instance command.

The **no vrf** and **default vrf** commands remove the configuration mode interface from the specified VRF by deleting the corresponding **vrf** command from ***running-config***.

All forms of the **vrf** command remove all IP addresses associated with the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

vrf [***vrf_name***]

no vrf [***vrf_name***]

default vrf [***vrf_name***]

Parameters

vrf_name Name of configured VRF.

Examples

- These commands add the configuration mode interface (***vlan 20***) to the VRF named ***purple***.

```
switch(config)# interface vlan 20
switch(config-if-Vl20)# vrf purple
switch(config-if-Vl20)#
```

- These commands remove the configuration mode interface from VRF ***purple***.

```
switch(config)#  interface vlan 20
switch(config-if-Vl20)# no vrf purple
switch(config-if-Vl20)#
```

13.1.16.87 vrf instance

The **`vrf instance`** command places the switch in VRF configuration mode for the specified VRF. If the named VRF does not exist, this command creates it. The number of user-defined VRFs supported varies by platform.

To add an interface to the VRF once it is created, use the vrf (Interface mode) command.

The **`no vrf instance`** and **`default vrf instance`** commands delete the specified VRF instance by removing the corresponding **`vrf instance`** command from ***running-config***. This also removes all IP addresses associated with interfaces that belong to the deleted VRF.

The **`exit`** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

`vrf instance` [***vrf_name***]

`no vrf instance` [***vrf_name***]

`default vrf instance` [***vrf_name***]

Parameters

vrf_name Name of VRF being created, deleted or configured. The names ***main*** and ***default*** are reserved.

Example

This command creates a VRF named ***purple*** and places the switch in VRF configuration mode for that VRF.

```
switch(config)# vrf instance purple
switch(config-vrf-purple)#
```

13.2 IPv6

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista's implementation of IPv6 and includes these topics:

13.2.1 Introduction

Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range.

Connected subnets have IP address ranges that do not overlap. A router is a network device connecting multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address.

IPv4 and IPv6 are Internet layer protocols that define packet-switched inter-networking, including source-to-destination datagram transmission across multiple networks. The switch supports IP version 4 (IPv4) and IP version 6 (IPv6).

IPv6 is described by ***RFC 2460: Internet Protocol, Version 6 (IPv6) Specification***. ***RFC 2463*** describes ICMPv6 for IPv6. ICMPv6 is a core protocol of the Internet Protocol suite.

13.2.2 IPv6 Description

Internet Protocol version 6 (IPv6) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Each network device is assigned a 128 bit IP address that identifies its network location.

IPv6 specifies a packet format that minimizes router processing of packet headers. Since the IPv4 and IPv6 packet headers differ significantly, the protocols are not interoperable. Many transport and application-layer protocols require little or no change to operate over IPv6.

13.2.2.1 IPv6 Address Format

IPv6 addresses have 128 bits, represented by eight 16-bit hexadecimal numbers separated by colons. IPv6 addresses are abbreviated as follows:

- Leading zeros in each 16-bit number may be omitted.
- One set of consecutive 16-bit numbers that equal zero may be replaced by a double colon.

Example

The following three IPv6 hexadecimal number representations refer to the same address:

```
d28e:0000:0000:0000:0234:812f:61ed:4419
d28e:0:0:0:234:812f:61ed:4419
d28e::234:812f:61ed:4419
```

IPv6 addresses typically denote a 64-bit network prefix and a 64-bit host address.

Unicast and Anycast Addressing

Unicast addressing defines a one-to-one association between the destination address and a network endpoint. Each destination address uniquely identifies a single receiver endpoint. Anycast addressing defines a one-to-one-of-many association: packets to a single member of a group of potential receivers identified by the same destination address.

Unicast and anycast addresses are typically composed as follows:

- A 64-bit network prefix that identifies the network segment.
- A 64-bit interface identifier that is based on interface MAC address.

The format of a network address identifies the scope of the address:

- Global address: valid in all networks and connect with other addresses with global scope anywhere or to addresses with link-local scope on the directly attached network.
- Link-local address: scope extends only to the link to which the interface is directly connected. Link-local addresses are not routable off the link.

Link-local addresses are created by the switch and are not configurable. The following figure depicts the switch's link local address derivation method.

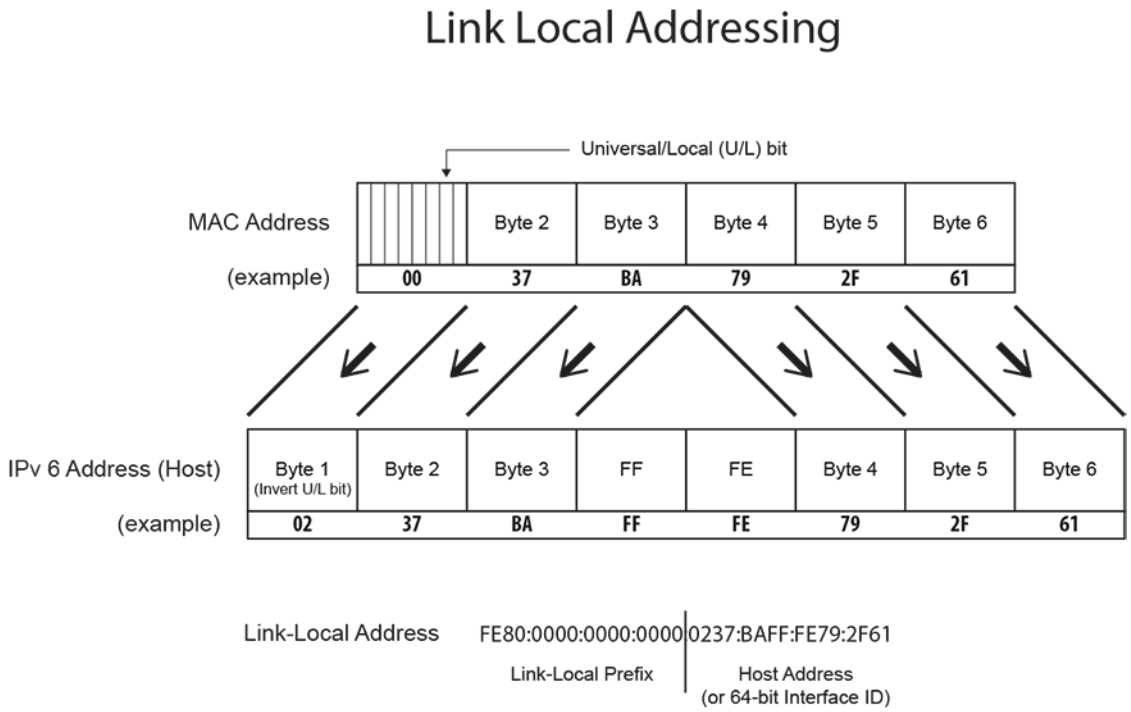

Figure 31: Link Local Address Derivation

Multicast Addressing

Multicast addressing defines a one-to-many association: packets are simultaneously routed from a single sender to multiple endpoints in a single transmission. The network replicates packets as required by network links that contain a recipient endpoint. One multicast address is assigned to an interface for each multicast group to which the interface belongs.

A solicited-node multicast address is an IPv6 multicast address whose scope extends only to the link to which the interface is directly connected. All IPv6 hosts have at least one such address per interface. Solicited-node multicast addresses are used by the Neighbor Discovery Protocol to obtain Layer 2 link-layer addresses of other nodes.

13.2.2.2 IPv6 DHCP Snooping

Dynamic Host Configuration Protocol (DHCP) snooping is a Layer 2 feature that is configured on LAN switches. The Arista EOS switch supports Option-37 insertion that allows relay agents to provide remote-id information in DHCP request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-37) to include the switch MAC address (router-id) along with the physical interface name and VLAN number (remote-id) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

13.2.2.3 Neighbor Discovery Protocol

The Neighbor Discovery Protocol (***RFC 4861***) operates with IPv6 to facilitate the following tasks for nodes within a specified prefix space:

- autoconfiguring a node's IPv6 address
- sensing other nodes on the link
- discovering the link-local addresses of other nodes on the link
- detecting duplicate addresses
- discovering available routers
- discovering DNS servers
- discovering the link's address prefix
- maintaining path reachability data to other active neighbor nodes

The Neighbor Discovery Protocol protocol defines five different ICMPv6 packet types:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

13.2.3 Configuring IPv6

These sections describe IPv6 configuration tasks:

- Configuring IPv6 on the Switch
- Configuring IPv6 on an Interface
- Configuring IPv6 DHCP Snooping
- Viewing IPv6 Network Components
- DHCP Relay Agent for IPv6
- TCP MSS Clamping for IPv6

13.2.3.1 Configuring IPv6 on the Switch

13.2.3.1.1 Enabling IPv6 Unicast Routing on the Switch

The ipv6 unicast-routing command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

Example

This command enables IPv6 unicast-routing.

```
switch(config)# ipv6 unicast-routing
switch(config)#
```

13.2.3.1.2 Configuring Default and Static IPv6 Routes

The ipv6 route command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

Example

This command creates an IPv6 static route.

```
switch(config)# ipv6 route 10:23:31:00:01:32:93/24 vlan 300
switch(config)#
```

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv6 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv6 default route source is ***::/0***. The default route destination is referred to as the default gateway.

Example

This command creates a default route and establishes ***fd7a:629f:52a4:fe61::2*** as the default gateway address.

```
switch(config)# ipv6 route ::/0 fd7a:629f:52a4:fe61::2
switch(config)#
```

13.2.3.1.3 IPv6 ECMP

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

Resilient ECMP is available for IPv6 routes. Equal Cost Multipath Routing (ECMP) and Load Sharing describes resilient ECMP. The ipv6 hardware fib ecmp resilience command implements IPv6 resilient ECMP.

Example

This command implements IPv6 resilient ECMP by configuring a hardware ECMP table space of 15 entries for IPv6 address ***2001:db8:0::/64***. A maximum of five nexthop addresses can be specified for the address. When the table contains five addresses, each appears in the table three times. When the table contains fewer than five addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)# ipv6 hardware fib ecmp resilience 2001:db8:0::/64
 capacity 5
redundancy 3
switch(config)#
```

13.2.3.2 Configuring IPv6 on an Interface

13.2.3.2.1 Enabling IPv6 on an Interface

The ipv6 enable command enables IPv6 on the configuration mode interface if it does not have a configured IPv6 address. It also configures the interface with an IPv6 address.

The **no** ipv6 enable command disables IPv6 on a configuration mode interface not configured with an IPv6 address. Interfaces configured with an IPv6 address are not disabled by this command.

Example

This command enables IPv6 on ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 enable
switch(config-vl200)#
```

13.2.3.2.2 Assigning an IPv6 Address to an Interface

The ipv6 address command enables IPv6 on the configuration mode interface, assigns a global IPv6 address to the interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

Example

These commands configure an IPv6 address with subnet mask for ***vlan 200***:

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 address 10:23:31::1:32:93/64
switch(config-if-Vl200)#
```

13.2.3.2.3 IPv6 Neighbor Discovery

The IPv6 Neighbor Discovery protocol defines a method for nodes to perform the following network maintenance tasks:

- determine Layer 2 addresses for neighbors known to reside on attached links.
- detect changed Layer 2 addresses.
- purge invalid values from the neighbor cache table.
- (hosts) find neighboring routers to forward packets.
- track neighbor reachability status.

IPv6 Neighbor Discovery is defined by ***RFC 2461***. IPv6 Stateless Address Autoconfiguration is described by ***RFC 2462***.

The following sections describe Neighbor Discovery configuration tasks.

13.2.3.2.3.1Reachable Time

The ipv6 nd reachable-time command specifies the time period that the switch includes in the reachable time field of Router Advertisements (RAs) sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

Example

These commands configure the entry of ***25000*** (25 seconds) in the reachable time field of RAs sent from ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd reachable-time 25000
switch(config-if-Vl200)# show active
   interface Vlan200
   ipv6 address fd7a:4321::1/64
   ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

13.2.3.2.3.2Router Advertisement Interval

The ipv6 nd ra interval command configures the interval between IPv6 RA transmissions from the configuration mode interface.

Example

These commands configure a RA transmission interval of ***60*** seconds on ***interface vlan 200***, then displays the interface status.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra interval 60
switch(config-if-Vl200)# show active
interface Vlan200
   ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

13.2.3.2.3.3Router Lifetime

The ipv6 nd ra lifetime command specifies the value that the switch places in the ***router lifetime*** field of IPv6 RAs sent from the configuration mode interface.

If the value is set to ***0***, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than ***0*** indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is ***0***, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

Example

This command configures the switch to enter ***2700*** in the router lifetime field of RAs transmitted from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra lifetime 2700
switch(config-if-Vl200)# show active
interface Vlan200
   ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

13.2.3.2.3.4Router Advertisement Prefix

The ipv6 nd prefix command configures neighbor discovery router advertisement prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses are advertised in the interface's RAs. The **`ipv6 nd prefix`** command with the **no-advertise** option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration

includes at least one **ipv6 nd prefix** command that enables prefix advertising, RAs advertise only prefixes specified through **ipv6 nd prefix** commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are ***2,592,000*** (valid) and ***604,800*** (preferred) seconds.

Example

These commands enable neighbor discovery advertising for IPv6 address ***3012:D678::/64***, specifying a valid lifetime of ***1,296,000*** seconds and the default preferred lifetime.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd prefix 3012:D678::/64 1296000
switch(config-if-Vl200)#
```

13.2.3.2.3.5Router Advertisement Suppression

The ipv6 nd ra disabled command suppress IPv6 RA transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

Example

This command suppresses all RAs on ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra disabled all
switch(config-vl200)#
```

13.2.3.2.3.6Router Advertisement MTU Suppression

The ipv6 nd ra mtu suppress command suppresses the router advertisement MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the router advertisement MTU option is not suppressed.

Example

This command suppresses the MTU option on ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra mtu suppress
switch(config-vl200)#
```

13.2.3.2.3.7Router Advertisement Flag Configuration

The following commands set the specified configuration flag in IPv6 RAs transmitted from the configuration mode interface:

- The ipv6 nd managed-config-flag command sets the **managed address configuration** flag. This bit instructs hosts to use stateful address autoconfiguration.
- The ipv6 nd other-config-flag command sets the **other stateful configuration** flag. This bit indicates availability of autoconfiguration information, other than addresses. Hosts should use stateful autoconfiguration when available. The setting of this flag has no effect if the **managed address configuration** flag is set.
- These commands configure the switch to set the **managed address configuration** flag in advertisements sent from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd managed-config-flag
```

```
switch(config-if-Vl200)#
```

- These commands configure the switch to set the **other stateful configuration** flag in advertisements sent from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

13.2.3.2.4 IPv6 Router Preference

The IPv6 Router Preference protocol supports an extension to RA messages for communicating default router preferences and more specific routes from routers to hosts. This provides assistance to hosts when selecting a router. RFC 4191 describes the IPv6 Router Preference Protocol.

The ipv6 nd router-preference command specifies the value that the switch enters in the Default Router Preference (DRP) field of RAs that it sends from the configuration mode interface. The default field entry value is **medium**.

Example

This command configures the switch as a medium preference router on RAs sent from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd router-preference medium
switch(config-if-Vl200)#
```

13.2.3.2.5 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. Unicast Reverse Path Forwarding (uRPF) describes uRPF. uRPF is enabled for IPv6 packets entering the configuration mode interface through the ipv6 verify command.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface only that there is a valid return path.

Example

This command enables uRPF strict mode on ***interface vlan 100***. If a default route is configured on the interface, all inbound packets will pass the uRPF check as valid.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# ipv6 verify unicast source reachable-via rx
 allow-default
switch(config-if-Vl100)# show active
 interface Vlan100
   ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

13.2.3.3 Configuring IPv6 DHCP Snooping

13.2.3.3.1 Enabling IPv6 DHCP Snooping on the Switch

The ipv6 dhcp snooping command enables DHCP snooping globally on the switch. DHCP snooping is a Layer 2 feature that can be configured on LAN switches. The Arista switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets.

Note: DHCPv6 VLAN classification and DHCPv4 VLAN classification share same hardware resource.

Examples

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)# ipv6 dhcp snooping
switch(config)# ipv6 dhcp snooping remote-id option
switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)# ipv6 dhcp snooping
switch(config)# show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
  2789-2790
DHCPv6 Snooping is operational on following VLANs:
  2789
Insertion of Option-37 is enabled
```

13.2.3.4 Viewing IPv6 Network Components

13.2.3.4.1 Displaying RIB Route Information

Use the show rib route ipv6 command view the IPv6 Routing Information Base (RIB) information.

Example

This command displays IPv6 RIB BGP routes.

```
switch# show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
 B    2001:10:1::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100::/64 [200/200]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:1::/64 [200/0]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:2::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected

switch#
```

13.2.3.4.2 Displaying the FIB and Routing Table

The show ipv6 route command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

Example

This command displays a route table entry for a specific IPv6 route.

```
switch> show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
     via f180::21c:73ff:fe00:1319, Vlan3601
     via f180::21c:73ff:fe00:1319, Vlan3602
     via f180::21c:73ff:fe00:1319, Vlan3608
     via f180::21c:73ff:fe0f:6a80, Vlan3610
     via f180::21c:73ff:fe00:1319, Vlan3611

switch>
```

13.2.3.4.3 Displaying the Route Age

The show ipv6 route age command displays the IPv6 route age to the specified IPv6 address or prefix.

Example

This command displays the route age for the specified prefix.

```
switch> show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

C 2001::3:0/11 age 00:02:34
switch>
```

13.2.3.4.4 Displaying Host Routes

The show ipv6 route host command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = ***/128***). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch# show ipv6 route host
R - receive F - FIB, A - attached

 F  ::1 to cpu
 A  fee7:48a2:0c11:1900:400::1 on Vlan102
```

```
 R  fee7:48a2:0c11:1900:400::2 to cpu
 F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
 R  fee7:48a2:0c11:1a00::17 to cpu
 F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
 F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                            via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch#
```

13.2.3.4.5 Displaying Route Summaries

The show ipv6 route summary command displays the current number of routes of the IPv6 routing table in summary format.

Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch> show ipv6 route summary
Route Source    Number Of Routes
----------------- ----------------
   connected                    2
   static                       0
   ospf                         5
   bgp                          7
   isis                         0
   internal                     1
   attached                     0
   aggregate                    2

   Total Routes                 17
switch>
```

13.2.3.5 DHCP Relay Agent for IPv6

13.2.3.5.1 Configuring IPv6 DHCP Relay

13.2.3.5.1.1Configuring the IPv6 DHCP Relay Agent (Global)

The ipv6 dhcp relay always-on command enables the switch DHCP relay agent globally regardless of the DHCP relay agent status ond any interface. The DHCP relay agent is enabled by default if at least one routable interface is configured with an ipv6 dhcp relay destination statement.

Example

This command enables the DHCP relay agent.

```
switch(config)# ipv6 dhcp relay always-on
switch(config)#
```

13.2.3.5.1.2Configuring DHCP for IPv6 Relay Agent

The ipv6 dhcp relay destination command enables the DHCPv6 relay agent function and specifies the client message destination address on an interface.

Example

This command enables the DHCPv6 relay agent function and sets the client message destination address to ***2001:0db8:0:1::1*** on ***interface ethernet 4***.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)
```

13.2.3.5.1.3Configuring the Client Link Layer Address for the IPv6 DHCP Relay Agent

The ipv6 dhcp relay option link-layer address command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode. The **no** ipv6 dhcp relay option link-layer address command disables the link layer address option (79) in the global configuration mode.

Example

This command enables the insertion of link layer address option (79) in the global configuration mode.

```
switch(config)# ipv6 dhcp relay option link-layer address
```

13.2.3.5.1.4Clearing IPv6 DHCP Relay Counters

The clear ipv6 dhcp relay counters command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- **Global configuration:** the command clears the counters for the switch and for all interfaces.
- **Interface configuration:** the command clears the counter for the configuration mode interface.

Examples

- These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Et4)# exit
switch(config)# clear ipv6 dhcp relay counters
switch(config)#
```

- These commands clear the DHCP relay counters for ***interface ethernet 4***.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# clear ipv6 dhcp relay counters
switch(config)#
```

13.2.3.5.2 Viewing IPv6 DHCP Relay Information

13.2.3.5.2.1IPv6 DHCP Status

The **show ip dhcp relay** command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command displays the status for both global and interface configurations.

Example

This command displays the DHCP Agent Relay parameter status.

```
switch(config)# interface ethernet 1/2
switch(config-if-Et1/2)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
```

```
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet1/2
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
                2001:db8:0:1::1
switch(config-if-Et1/2)#
```

13.2.3.5.2.2IPv6 DHCP Relay Counters

The show ipv6 dhcp relay counters command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Example

This command displays the IP DHCP relay counter table.

```
switch> show ipv6 dhcp relay counters

           |  Dhcp Packets  |
Interface  | Rcvd Fwdd Drop |          Last Cleared
-----------|----- ---- -----|----------------------
  All Req  |  376  376    0 | 4 days, 19:55:12 ago
 All Resp  |  277  277    0 |
           |                |
Ethernet4  |  207  148    0 | 4 days, 19:54:24 ago

switch>
```

13.2.3.6 TCP MSS Clamping for IPv6

TCP MSS clamping limits the value of the Maximum Segment Size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. TCP MSS clamping can be used when connecting via GRE to cloud providers that require asymmetric routing.

When MSS clamping is configured on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit it will be overwritten with the configured limit and the TCP checksum will be recomputed and updated.

TCP MSS clamping is handled by default in the software data path, but the process can be supported through hardware configuration to minimize possible packet loss and a reduction in the number of TCP sessions which the switch can establish per second.

13.2.3.6.1 Configuring the TCP MSS Ceiling on an IPv6 Interface

The TCP MSS ceiling limit is set on an interface using command **`tcp mss ceiling ipv6`**. This also enables TCP MSS clamping on the switch.

Note: Clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured without any hardware support. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

On platform switches ***DCS-7280R3, DCS-7500R3 Line Cards and DCS-7800R3 Line Cards***, the following limitations apply:

- This command works only on egress.
- TCP MSS ceiling is supported on unicast packets entering the switch; the configuration has no effect on GRE transit packets.

- It is not supported on L2 (switchport) interfaces.
- This is not supported on VXLAN, Loopback or management interfaces.
- This is only supported on unicast packets entering the switch. The configuration has no effect on GRE transit packets or GRE decap, even if the egress interface has a TCP MSS ceiling configured.
- This cannot co-exist with Policy Based Routing (PBR) on switches running releases ***EOS-4.21.5F*** or older.
- Only hardware TCP MSS clamping is supported from release ***EOS-4.26.1F***.

Example

These commands configure ***interface ethernet 26*** as a routed port, then specify a maximum MSS ceiling value of ***1436*** bytes for TCP SYN packets exiting that port.

```
switch(config)# interface ethernet 26
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# tcp mss ceiling ipv6 1436 egress
switch(config-if-Et5)#
```

13.2.4 IPv6 Commands

Global Configuration Commands

- ipv6 dhcp relay always-on
- ipv6 dhcp relay option link-layer address
- ipv6 hardware fib aggregate-address
- ipv6 hardware fib ecmp resilience
- ipv6 hardware fib nexthop-index
- ipv6 neighbor
- ipv6 neighbor cache persistent
- ipv6 route
- ipv6 unicast-routing

Interface Configuration Commands

- ipv6 address
- ipv6 dhcp relay destination
- ipv6 dhcp snooping
- ipv6 enable
- ipv6 nd managed-config-flag
- ipv6 nd ns-interval
- ipv6 nd other-config-flag
- ipv6 nd prefix
- ipv6 nd ra dns-server
- ipv6 nd ra dns-servers lifetime
- ipv6 nd ra dns-suffix
- ipv6 nd ra dns-suffixes lifetime
- ipv6 nd ra hop-limit
- ipv6 nd ra interval
- ipv6 nd ra lifetime
- ipv6 nd ra mtu suppress
- ipv6 nd ra disabled
- ipv6 nd reachable-time
- ipv6 nd router-preference
- ipv6 verify
- pim ipv6 sparse-mode

Privileged EXEC Commands

- clear ipv6 dhcp relay counters
- clear ipv6 dhcp snooping counters
- clear ipv6 neighbors

EXEC Commands

- show ipv6 dhcp relay counters
- show ipv6 dhcp snooping
- show ipv6 dhcp snooping counters
- show ipv6 dhcp snooping hardware
- show ipv6 hardware fib aggregate-address
- show ipv6 interface

- show ipv6 nd ra internal state
- show ipv6 neighbors
- show ipv6 route
- show ipv6 route age
- show ipv6 route host
- show ipv6 route interface
- show ipv6 route match tag
- show ipv6 route summary
- show platform fap mroute ipv6
- show rib route ipv6

13.2.4.1 clear ipv6 dhcp relay counters

The **clear ipv6 dhcp relay counters** command resets the DHCP relay counters. When no port is specified, the command clears the counters for the switch and for all interfaces. Otherwise, the command clears the counter for the specified interface.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 dhcp relay counters [**PORT**]

Parameters

PORT Interface through which neighbor is accessed. Options include:

- ***no parameter*** all dynamic entries are removed.
- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by ***l_num***.
- **interface port-channel *p_num*** Port-channel interface specified by ***p_num p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

These commands clear the DHCP relay counters for ***interface ethernet 4*** and shows the counters before and after the **clear** command.

```
switch(config)# show ipv6 dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago
 All Resp |  277  277    0 |
          |                |
Ethernet4 |  207  148    0 | 4 days, 19:54:24 ago

switch(config)# interface ethernet 4
switch(config-if-Et4)# clear ipv6 dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  380  380    0 | 4 days, 21:19:17 ago
 All Resp |  281  281    0 |
          |                |
Ethernet4 |    0    0    0 |4 days, 21:18:30 ago
These commands clear all DHCP relay counters on the switch.
switch(config-if-Et4)# exit

switch(config)# clear ipv6 dhcp relay counters

switch(config)# show ipv6 dhcp relay counters
          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop | Last Cleared
----------|----- ---- -----|-------------
  All Req |    0    0    0 |  0:00:03 ago
 All Resp |    0    0    0 |
          |                |
Ethernet4 |    0    0    0 | 0:00:03 ago
switch(config)#
```

13.2.4.2 clear ipv6 dhcp snooping counters

The **clear ipv6 dhcp snooping counters** command resets the DHCP snooping packet counters.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 dhcp snooping counters [**COUNTER_TYPE**]

Parameters

- **COUNTER_TYPE** The type of counter that the command resets.
- ***no parameter*** command clears the counters for each VLAN.
- **debug** command clears aggregate counters and drop cause counters.

Examples

- This command clears the number of DHCP packets sent and received on each VLAN.

```
switch# clear ipv6 dhcp snooping counters
switch# show ipv6 dhcp snooping counters

     | Dhcpv6 Request Pkts | Dhcpv6 Reply Pkts |
Vlan |  Rcvd   Fwdd   Drop |  Rcvd  Fwdd  Drop | Last Cleared
-----|------ ------ -------|------ ----- ------|-------------
2789 |     1      1      0 |     1     1     0 |  0:03:09 ago
```

- This command clears the number of DHCP packets sent on the switch.

```
switch# clear ipv6 dhcp snooping counters debug
switch# show ipv6 dhcp snooping counters debug

Counter                        Snooping to Relay Relay to Snooping
------------------------------ ----------------- -----------------
Received                                       1                 1
Forwarded                                      1                 1
Dropped - Invalid VlanId                       0                 0
Dropped - Parse error                          0                 0
Dropped - Invalid Dhcp Optype                  0                 0
Dropped - Invalid Remote-ID Option             0                 0
Dropped - Snooping disabled                    0                 0

Last Cleared:  0:04:29 ago
```

13.2.4.3 clear ipv6 neighbors

The **clear ipv6 neighbors** command removes the specified dynamic IPv6 neighbor discovery cache entries. Commands that do not specify an IPv6 address remove all dynamic entries for the listed interface. Commands that do not specify an interface remove all dynamic entries.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 neighbors [**PORT**][**DYNAMIC_IPV6**]

Parameters

- **PORT** Interface through which neighbor is accessed. Options include:
  - ***no parameter*** all dynamic entries are removed.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **DYNAMIC_IPV6** Address of entry removed by the command. Options include:
  - ***no parameter*** All dynamic entries for specified interface are removed.
  - ***ipv6_addr*** IPv6 address of entry.

Example

This command removes all dynamic neighbor entries for ***vlan 200***.

```
switch# clear ipv6 neighbors vlan 200
switch#
```

13.2.4.4 ipv6 address

The **ipv6 address** command assigns a global IPv6 address to the IPv6 interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

The **no ipv6 address** and **default ipv6 address** commands remove the IPv6 address assignment from the configuration mode interface by deleting the corresponding **ipv6 address** command from ***running-config***. If the command does not include an address, all address assignments are removed from the interface. IPv6 remains enabled on the interface after the removal of all IPv6 addresses only if an **ipv6 enable** command is configured on the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 address [***ipv6_prefix***]

no ipv6 address [***ipv6_prefix***]

default ipv6 address [***ipv6_prefix***]

Parameter

ipv6_prefix address assigned to the interface (CIDR notation).

Guidelines

This command is supported on routable interfaces.

Example

These commands configure an IPv6 address and prefix length for ***interface vlan 200***:

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 address 10:23:31:00:01:32:93/64
switch(config-if-Vl200)#
```

13.2.4.5 ipv6 dhcp relay always-on

The **iv6p dhcp relay always-on** command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an **ipv6 dhcp relay destination** statement.

The **no ipv6 dhcp relay always-on** and **default ipv6 dhcp relay always-on** commands remove the **ipv6 dhcp relay always-on** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 dhcp relay always-on

no ipv6 dhcp relay always-on

default ipv6 dhcp relay always-on

Example

This command enables the DHCP relay agent.

```
switch(config)# ipv6 dhcp relay always-on
switch(config)#
```

13.2.4.6 ipv6 dhcp relay destination

The **`ipv6 dhcp relay destination`** command enables the DHCPv6 relay agent and sets the destination address on the configuration mode interface.

The **`no ipv6 dhcp relay destination`** and **`default ipv6 dhcp relay destination`** commands remove the corresponding **`ipv6 dhcp relay destination`** command from ***running-config***. When the commands do not list an IPv6 address, all **`ipv6 dhcp relay destination`** commands are removed from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

`ipv6 dhcp relay destination` [***ipv6_addr***][***source-address ipv6_addr***]

`no ipv6 dhcp relay destination` [***ipv6_addr***]

`default ipv6 dhcp relay destination` [***ipv6_addr***]

Parameters

- ***ipv6_addr*** DCHP Server's IPv6 address.
- **source-address *ipv6_addr*** specify the source IPv6 address to communicate with DHCP server.

Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv6 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

Example

This command enables the DHCPv6 relay agent and sets the destination address to ***2001:0db8:0:1::1*** on ***interface ethernet 4***.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet4
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
                2001:db8:0:1::1
switch(config-if-Et4)#
```

13.2.4.7 ipv6 dhcp relay option link-layer address

The **ipv6 dhcp relay option link-layer address** command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode.

The **no ipv6 dhcp relay option link-layer address** command disables the link layer address option (79) in the global configuration mode.

Command Mode

Global Configuration

Command Syntax

ipv6 dhcp relay option link-layer address

no ipv6 dhcp relay option link-layer address

default ipv6 dhcp relay option link-layer address

Example

This command enables the insertion of link layer address option (79) in the global configuration mode.

```
switch(config)# ipv6 dhcp relay option link-layer address
```

13.2.4.8 ipv6 enable

The **`ipv6 enable`** command enables IPv6 on the configuration mode interface. Assigning an IPv6 address to an interface also enables IPv6 on the interface.

The **`no ipv6 enable`** and **`default ipv6 enable`** command remove the corresponding **`ipv6 enable`** command from ***running-config***. This action disables IPv6 on interfaces that are not configured with an IPv6 address.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

`ipv6 enable`

`no ipv6 enable`

`default ipv6 enable`

Example

This command enables IPv6 on ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 enable
switch(config-vl200)#
```

13.2.4.9 ipv6 hardware fib aggregate-address

The **ipv6 hardware fib aggregate-address** command specifies the routing table repository of specified IPv6 route.

By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command prevents the entry of the specified route into the hardware routing table. Specified routes that are in the hardware routing table are removed by this command. Specific routes that are encompassed within the specified route prefix are affected by this command.

The **no ipv6 hardware fib aggregate-address** and **default ipv6 hardware fib aggregate-address** commands remove the restriction from the hardware routing table for the specified routes by removing the corresponding **ipv6 hardware fib aggregate-address** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 hardware fib aggregate-address ***ipv6_prefix*** summary-only software-forward

no ipv6 hardware fib aggregate-address ***ipv6_prefix***

default ipv6 hardware fib aggregate-address ***ipv6_prefix***

Parameters

ipv6_prefix IPv6 prefix that is restricted from the hardware routing table (CIDR notation).

Example

These commands configure a hardware routing restriction for an IPv6 prefix, then displays that restriction.

```
switch(config)# ipv6 hardware fib aggregate-address fd77:4890:531
3:ffed::/64
summary-only software-forward
switch(config)# show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S  fd77:4890:5313:ffed::/64

switch(config)#
```

13.2.4.10 ipv6 hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command configures a fixed number of next hop entries in the hardware ECMP table for the specified IPv6 address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command introduces a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 hardware fib ecmp resilience ***net_prfx*** capacity *nhop_max* redundancy ***duplicates***

no ipv6 hardware fib ecmp resilience ***net_addr***

default ipv6 hardware fib ecmp resilience ***net_addr***

Parameters

- ***net_prfx*** IPv6 address prefix managed by command.
- ***nhop_max*** Specifies maximum number of nexthop entries for specified IP address prefix. Value range varies by platform:
  - Helix: <**2** to **64**>
  - Trident: <**2** to **32**>
  - Trident II: <**2** to **64**>
- ***duplicates*** Specifies the redundancy factor. Value ranges from ***1*** to ***128***.

Example

This command configures a hardware ECMP table space of 15 entries for the IPv6 address ***2001:db8:0::/64***. A maximum of five nexthop addresses can be specified for the address. When the table contains five nexthop addresses, each appears in the table three times. When the table contains fewer than five nexthop addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity
 5 redundancy 3
```

13.2.4.11 ipv6 hardware fib nexthop-index

The **ipv6 hardware fib nexthop-index** command deterministically selects the next hop used for ECMP routes. By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command specifies the method of creating an index-offset number that points to the next hop from the list of the route's ECMP next hops.

The index-offset is calculated by adding the next hop index to a prefix offset.

- **Next hop index:** specified in the command.
- **Prefix offset:** the least significant bits of the route's prefix.

The command specifies the number of bits that comprise the prefix offset. The prefix offset is set to the prefix when the command specifies a prefix size larger than the prefix. If the command specifies an prefix size of zero, the prefix-offset is also zero and the index-offset is set to the next hop index.

When the index-offset is greater than the number of next hops in the table, the position of the next hop is the remainder of the division of the index-offset by the number of next hop entries.

The **no ipv6 hardware fib nexthop-index** and **default ipv6 hardware fib nexthop-index** commands remove the specified nexthop used for ECMP routes by removing the **ipv6 hardware fib nexthop-index** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 hardware fib nexthop ***nxthop_index*** [**PREFIX**]

no ipv6 hardware fib nexthop

default ipv6 hardware fib nexthop

Parameters

- ***nxthop_index*** specifies the next hop index. Value ranges from ***0*** to ***32***.
- **PREFIX** Number of bits of the route's prefix to use as the prefix-offset. Value ranges from ***0*** to ***64***.
  - ***no parameter*** The prefix offset is set to zero.
  - **prefix-bits *0 to 64*** Specifies the number bits to use as the prefix-offset.

Example

This command specifies the next hop from the list of ECMP next hops for the route.

```
switch(config)# ipv6 hardware fib nexthop-index 5 prefix-bits 10

switch> show ip
IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10
switch>
```

13.2.4.12 ipv6 nd managed-config-flag

The **ipv6 nd managed-config-flag** command causes the **managed address configuration** flag to be set in IPv6 RA packets transmitted from the configuration mode interface.

The **no ipv6 nd managed-config-flag** and **default ipv6 nd managed-config-flag** commands restore the default setting where the **managed address configuration** flag is not set in IPv6 RA packets transmitted by the interface by removing the corresponding **ipv6 nd managed-config-flag** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd managed-config-flag

no ipv6 nd managed-config-flag

default ipv6 nd managed-config-flag

Example

These commands cause the managed address configuration flag to be set in IPv6 RA packets sent from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd managed-config-flag
switch(config-if-Vl200)#
```

13.2.4.13 ipv6 nd ns-interval

The **ipv6 nd ns-interval** command configures the interval between IPv6 Neighbor Solicitation (NS) transmissions from the configuration mode interface.

The **no ipv6 nd ns-interval** and **default ipv6 nd ns-interval** commands return the IPv6 NS transmission interval for the configuration mode interface to the default value of ***1000*** milliseconds by removing the corresponding **ipv6 nd ns-interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ns-interval ***period*** **no ipv6 nd ns-interval**

default ipv6 nd ns-interval

Parameter

period interval in milliseconds between successive IPv6 neighbor solicitation transmissions. Values range from ***1000*** to ***4294967295***. The default period is ***1000*** milliseconds.

Example

This command configures a neighbor solicitation transmission interval of ***30*** seconds on ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ns-interval 30000
switch(config-if-Vl200)#
```

13.2.4.14 ipv6 nd other-config-flag

The **ipv6 nd other-config-flag** command configures the configuration mode interface to send IPv6 RAs with the **other stateful configuration** flag set.

The **no ipv6 nd other-config-flag** and **default ipv6 nd other-config-flag** commands restore the default setting by removing the corresponding **ipv6 nd other-config-flag** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd other-config-flag

no ipv6 nd other-config-flag

default ipv6 nd other-config-flag

Example

These commands configure the switch to set the other stateful configuration flag in advertisements sent from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

13.2.4.15 ipv6 nd prefix

The **`ipv6 nd prefix`** command configures neighbor discovery Router Advertisements (RAs) prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses are advertised in the interface's RAs. The **`ipv6 nd prefix`** command with the ***no-advertise*** option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one **`ipv6 nd prefix`** command that enables prefix advertising, RAs advertise only prefixes specified through **`ipv6 nd prefix`** commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are ***2,592,000*** (valid) and ***604,800*** (preferred) seconds.

The **`no ipv6 nd prefix`** and **`default ipv6 nd prefix`** commands remove the corresponding **`ipv6 nd prefix`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

`ipv6 nd prefix` ***ipv6_prefix*** **LIFETIME** [**FLAGS**]

`ipv6 nd prefix` ***ipv6_prefix*** no-advertise

`no ipv6 nd prefix` ***ipv6_prefix***

`default ipv6 nd prefix` ***ipv6_prefix***

Parameters

- ***ipv6_prefix*** IPv6 prefix (CIDR notation).
- **no-advertise** Prevents advertising of the specified prefix.
- **LIFETIME** Period that the specified IPv6 prefix is advertised (seconds). Options include:
  - **valid preferred** Two values that set the *valid* and *preferred* lifetime periods.
  - **valid** One value that sets the *valid* lifetime. The *preferred* lifetime is set to the default value.
  - ***no parameter*** The *valid* and *preferred* lifetime periods are set to their default values.

Options for **valid**: ***0*** **to** ***4294967295*** and **infinite**. Default value is ***2592000*** Options for **preferred**: ***0*** **to** ***4294967295*** and **infinite**. The default value is ***604800***. The maximum value (***4294967295***) and **infinite** are equivalent settings.

- **FLAGS** **on-link** and **autonomous address-configuration** flag values in RAs.
  - ***no parameter*** both flags are set.
  - **no-autoconfig** **autonomous address-configuration** flag is reset.
  - **no-onlink** **on-link** flag is reset.
  - **no-autoconfig no-onlink** both flags are reset.
  - **no-onlink no-autoconfig** both flags are reset.

Example

These commands enable neighbor discovery advertising for IPv6 address ***3012:D678::/64***, on ***interface vlan 200***, specifying a valid lifetime of ***1,296,000*** seconds and the default preferred lifetime.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd prefix 3012:D678::/64 1296000
```

13.2.4.16 ipv6 nd ra disabled

The **ipv6 nd ra disabled** command suppress IPv6 Router Advertisement (RA) transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

The **no ipv6 nd ra disabled** and **default ipv6 nd ra disabled** commands restore the transmission of RAs on the configuration mode interface by deleting the corresponding **ipv6 nd ra disabled** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra disabled [**SCOPE**]

no ipv6 nd ra disabled

default ipv6 nd ra disabled

Parameters

SCOPE specifies the RAs that are suppressed.

- ***no parameter*** Periodic unsolicited RAs are suppressed.
- **all** All RAs are suppressed.

Example

This command suppresses all RAs on ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra disabled all
switch(config-vl200)#
```

13.2.4.17 ipv6 nd ra dns-server

The **ipv6 nd ra dns-server** command configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) for the command mode interface to include in its neighbor-discovery Router Advertisements (RAs). Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.

Multiple servers can be configured on the interface by using the command repeatedly. A lifetime value for the RDNSS can optionally be specified with this command, and overrides any default value configured for the interface using the **ipv6 nd ra dns-servers lifetime** command.

The **no ipv6 nd ra dns-server** and **default ipv6 nd ra dns-server** commands remove the corresponding **ipv6 nd ra dns-server** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-server ***ipv6_addr*** **SERVER_LIFE**

no ipv6 nd ra dns-server ***ipv6_addr***

default ipv6 nd ra dns-server ***ipv6_addr***

Parameters

- ***ipv6_addr*** RDNSS address to be included in RAs from the command mode interface.
- **SERVER_LIFE** maximum lifetime value for the specified RDNSS entry. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - ***no parameter*** lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the **ipv6 nd ra interval** command.
  - **lifetime 0** the configured RDNSS is not to be used.
  - **lifetime *1 to 4294967295*** specifies the lifetime period for this RDNSS in seconds.

Example

This command configures the RDNSS at ***2001:0db8:0:1::1*** as a preferred RDNSS for ***interface vlan 200*** to include in its neighbor-discovery route advertisements, and sets its lifetime value to ***300*** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-server 2001:0db8:0:1::1 lifetime
 300
switch(config-if-Vl200)#
```

13.2.4.18 ipv6 nd ra dns-servers lifetime

The **ipv6 nd ra dns-servers lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any Recursive DNS Server (RDNSS) configured on the interface. A lifetime value set for an individual RDNSS overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the RDNSS referenced in the packet may be used for name resolution.

The **no ipv6 nd ra dns-servers lifetime** and **default ipv6 nd ra dns-servers lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-servers lifetime** command from ***running-config***. When there is no default RDNSS lifetime value configured on the interface, an RDNSS without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the RDNSS must not be used for name resolution.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-servers lifetime ***period***

no ipv6 nd ra dns-servers lifetime

default ipv6 nd ra dns-servers lifetime

Parameters

period the RDNSS lifetime value for the configuration mode interface. Options include:

- ***0*** any RDNSS configured on the command mode interface without a custom lifetime value must not be used.
- ***1 to 4294967295*** maximum RDNSS lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-server** command. Should be between the router advertisement interval configured on the interface and two times that interval.

Example

This command sets the default RDNSS maximum lifetime value for ***interface vlan 200*** to ***350*** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-servers lifetime 350
switch(config-if-Vl200)#
```

13.2.4.19 ipv6 nd ra dns-suffix

The **ipv6 nd ra dns-suffix** command creates a DNS Search List (DNSSL) for the command mode interface to include in its neighbor-discovery Router Advertisements as defined in RFC 6106 . The DNSSL contains the domain names of DNS suffixes for IPv6 hosts to append to short, unqualified domain names for DNS queries.

Multiple DNS domain names can be added to the DNSSL by using the command repeatedly. A lifetime value for the DNSSL can optionally be specified with this command, and overrides any default value configured for the interface using the ipv6 nd ra dns-suffixes lifetime command.

The **no ipv6 nd ra dns-suffix** and **default ipv6 nd ra dns-suffix** commands remove the corresponding **ipv6 nd ra dns-suffix** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-suffix ***domain*** **SUFFIX_LIFE**

no ipv6 nd ra dns-suffix ***ipv6_addr***

default ipv6 nd ra dns-suffix ***ipv6_addr***

Parameters

- ***domain*** domain suffix for IPv6 hosts to append to short, unqualified domain names for DNS queries. Suffix must contain only alphanumeric characters, "**.**" and "**-**" and must begin and end with an alphanumeric character.
- **SUFFIX_LIFE** maximum lifetime value for the specified domain suffix. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - ***no parameter*** lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the ipv6 nd ra interval command.
  - **lifetime 0** the configured domain suffix is not to be used.
  - **lifetime *1 to 4294967295*** specifies the lifetime period for this domain suffix in seconds.

Example

These commands create a DNSSL for ***interface vlan 200*** to include in its neighbor-discovery route advertisements, and set its lifetime value to ***300*** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-suffix test.com lifetime 300
switch(config-if-Vl200)#
```

13.2.4.20 ipv6 nd ra dns-suffixes lifetime

The **ipv6 nd ra dns-suffixes lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any DNS Search List (DNSSL) configured on the interface. A lifetime value set for an individual DNSSL overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the DNSSL included in the packet may be used for name resolution.

The **no ipv6 nd ra dns-suffixes lifetime** and **default ipv6 nd ra dns-suffixes lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-suffixes lifetime** command from ***running-config***. When there is no default DNSSL lifetime value configured on the interface, a DNSSL without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the DNSSL must not be used for name resolution.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-suffixes lifetime ***period***

no ipv6 nd ra dns-suffixes lifetime

default ipv6 nd ra dns-suffixes lifetime

Parameters

period the DNSSL lifetime value for the configuration mode interface. Options include:

- ***0*** any DNSSL configured on the command mode interface without a custom lifetime value must not be used.
- ***1 to 4294967295*** maximum DNSSL lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-suffix** command. Should be between the RA interval configured on the interface and two times that interval.

Example

This command sets the default DNSSL maximum lifetime value for ***interface vlan 200*** to ***350*** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-suffixes lifetime 350
switch(config-if-Vl200)#
```

13.2.4.21 ipv6 nd ra hop-limit

The **ipv6 nd ra hop-limit** command sets a suggested hop-limit value to be included in Router Advertisement (RA) packets. The hop-limit value is to be used by attached hosts in outgoing packets.

The **no ipv6 nd ra hop-limit** and **default ipv6 nd ra hop-limit** commands remove the corresponding **ipv6 nd ra hop-limit** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra hop-limit ***quantity***

no ipv6 nd ra hop-limit lifetime

default ipv6 nd ra hop-limit lifetime

Parameters

quantity the hop-limit value to be included in RA packets sent by the configuration mode interface. Options include:

- ***0*** indicates that outgoing packets from attached hosts are to be immediately discarded.
- ***1 to 255*** number of hops. The default value is ***64***.

Example

These commands include a hop-limit value of ***100*** in RA packets sent by ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra hop-limit
switch(config-if-Vl200)#
```

13.2.4.22 ipv6 nd ra interval

The **ipv6 nd ra interval** command configures the interval between IPv6 Router Advertisement transmissions from the configuration mode interface.

The **no ipv6 nd ra interval** and **default ipv6 nd ra interval** commands return the IPv6 RA transmission interval for the configuration mode interface to the default value of ***200*** seconds by removing the corresponding **ipv6 nd ra interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra interval [**SCALE**] ***ra_period*** [***minimum_period***]

no ipv6 nd ra interval

default ipv6 nd ra interval

Parameters

- **SCALE** timescale in which command parameter values are expressed.
  - ***no parameter*** seconds.
  - **msec** milliseconds.
- ***ra_period*** maximum interval between successive IPv6 RA transmissions. The default period is ***200*** seconds.
  - ***4 - 1800*** valid range when **SCALE** is set to default value (seconds).
  - ***500 - 1800000*** valid range when **SCALE** is set to **msec**.
- ***minimum_period*** minimum interval between successive IPv6 RA transmissions. Must be smaller than ***ra_period***. By default, a minimum period is not defined.
  - ***no parameter*** Command does not specify a minimum period.
  - ***3 - 1799*** valid range when **scale** is set to default value (seconds).
  - ***375 - 1799999*** valid range when **scale** is set to **msec**.

Example

These commands configure a RA transmission interval of ***60*** seconds on VLAN interface ***interface vlan 200***, then displays the interface status.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra interval 60
switch(config-if-Vl200)# show active
interface Vlan200
   ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

13.2.4.23 ipv6 nd ra lifetime

The **ipv6 nd ra lifetime** command specifies the value that the switch places in the **router lifetime** field of IPv6 Router Advertisements sent from the configuration mode interface.

If the value is set to ***0***, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than ***0*** indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is ***0***, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

The **no ipv6 nd ra lifetime** and **default ipv6 nd ra lifetime** commands return the IPv6 RA lifetime data entry filed for the configuration mode interface to the default value of ***1800*** seconds by removing the corresponding **ipv6 nd ra lifetime** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra lifetime ***ra_lifetime***

no ipv6 nd ra lifetime

default ipv6 nd ra lifetime

Parameters

ra_lifetime router lifetime period (seconds). Default value is 1800. Options include:

- ***0*** Router should not be considered as a default router.
- ***1 - 65535*** Lifetime period advertised in RAs. Should be greater than or equal to the interval between IPv6 RA transmissions from the configuration mode interface as set by the **ipv6 nd ra interval** command.

Example

This command configures the switch to enter ***2700*** in the router lifetime field of RAs transmitted from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra lifetime 2700
switch(config-if-Vl200)# show active
interface Vlan20
   ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

13.2.4.24 ipv6 nd ra mtu suppress

The **ipv6 nd ra mtu suppress** command suppresses the Router Advertisement (RA) MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the RA MTU option is not suppressed.

The **no ipv6 nd ra mtu suppress** and **default ipv6 nd ra mtu suppress** commands restores the MTU option setting to enabled by for the configuration mode interface by removing the corresponding **ipv6 nd ra mtu suppress** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra mtu suppress

no ipv6 nd ra mtu suppress

default ipv6 nd ra mtu suppress

Example

This command suppresses the MTU option on ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra mtu suppress
switch(config-vl200)#
```

13.2.4.25 ipv6 nd reachable-time

The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of RAs sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

RAs that advertise zero seconds indicate that the router does not specify a reachable time. The default advertisement value is 0 seconds. The switch reachability default period is 30 seconds.

The **no ipv6 nd reachable-time** and **default ipv6 nd reachable-time** commands restore the entry of the default value (***0***) in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd reachable-time** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd reachable-time ***period***

no ipv6 nd reachable-time

default ipv6 nd reachable-time

Parameter

period Reachable time value (milliseconds). Value ranges from ***0 to 4294967295***. Default is ***0***.

Example

These commands configure the entry of ***25000*** (25 seconds) in the reachable time field of RAs sent from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd reachable-time 25000
interface Vlan200
   ipv6 address fd7a:4321::1/64
   ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

13.2.4.26 ipv6 nd router-preference

The **ipv6 nd router-preference** command specifies the value that the switch enters in the Default Router Preference (DRP) field of Router Advertisements (RAs) that it sends from the configuration mode interface. The default field entry value is **medium**.

The **no ipv6 nd router-preference** and **default ipv6 nd router-preference** commands restore the switch to enter the default DRP field value of **medium** in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd router-preference** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd router-preference **RANK**

no ipv6 nd router-preference

default ipv6 nd router-preference

Parameters

RANK Router preference value. Options include:

- **high**
- **low**
- **medium**

Example

This command configures the switch as a medium preference router on RAs sent from ***interface vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd router-preference medium
switch(config-if-Vl200)#
```

13.2.4.27 ipv6 neighbor cache persistent

The **ipv6 neighbor cache persistent** command restores the IPv6 neighbor cache after reboot.

The **no ipv6 neighbor cache persistent** and **default ipv6 neighbor cache persistent** commands remove the ARP cache persistant configuration from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 neighbor cache persistent

no ipv6 neighbor cache persistent

default ipv6 neighbor cache persistent

Example

This command restores the ipv6 neighbor cache after reboot.

```
switch(config)# ipv6 neighbor cache persistent
switch(config)#
```

13.2.4.28 ipv6 neighbor

The **ipv6 neighbor** command creates an IPv6 neighbor discovery cache static entry. The command converts pre-existing dynamic cache entries for the specified address to static entries.

The **no ipv6 neighbor** and **default ipv6 neighbor** commands remove the specified static entry from the IPV6 neighbor discovery cache and delete the corresponding **ipv6 neighbor** command from ***running-config***. These commands do not affect any dynamic entries in the cache.

Command Mode

Global Configuration

Command Syntax

ipv6 neighbor ***ipv6_addr*** **PORT** ***mac_addr***

no ipv6 neighbor ***ipv6_address*** **PORT**

default ipv6 neighbor ***ipv6_addr*** **PORT**

Parameters

- ***ipv6_addr*** Neighbor's IPv6 address.
- **PORT** Interface through which the neighbor is accessed. Options include:
  - **ethernet** ***e_num*** Ethernet interface specified by ***e_num***.
  - **loopback** ***l_num*** Loopback interface specified by ***l_num***.
  - **management** ***m_num*** Management interface specified by ***m_num***.
  - **port-channel** ***p_num*** Port-channel interface specified by ***p_num***.
  - **vlan** ***v_num*** VLAN interface specified by ***v_num***.
  - **vxlan** ***vx_num*** VXLAN interface specified by ***vx_num***.
  - ***mac_addr*** Neighbor's data-link (hardware) address. (48-bit dotted hex notation – H.H.H).

Example

This command will add a static entry to the neighbor discovery cache for the neighbor located at ***3100:4219::3EF2*** with hardware address ***0100.4EA1.B100*** and accessible through ***vlan 200***.

```
switch(config)# ipv6 neighbor 3100:4219::3EF2 vlan 200 0100.4EA1.B100
switch(config)#
```

13.2.4.29 ipv6 route

The **ipv6 route** command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

The command provides these methods of designating the nexthop location:

- **null0:** Traffic to the specified destination is dropped.
- **IPv6 gateway:** Switch identifies egress interface by recursively resolving the next-hop.
- **Egress interface:** Switch assumes destination subnet is directly connected to interface; when routing to any subnet address, the switch sends an ARP request to find the MAC address for the first packet.
- **Combination Egress interface and IPv6 gateway:** Switch does not assume subnet is directly connected to interface; the only ARP traffic is for the nexthop address for the first packet on the subnet. Combination routes are not recursively resolved.

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

The **no ipv6 route** and **default ipv6 route** commands delete static routes by removing the corresponding **ipv6 route** statements from ***running-config***. Commands not including a source delete all statements to the destination. Only statements with parameters that match specified command arguments are deleted. Parameters that are not in the command line are not evaluated.

Command Mode

Global Configuration

Command Syntax

ipv6 route ***dest_prefix*** **NEXTHOP** [**DISTANCE**][**TAG_OPT**][**RT_NAME**]

no ipv6 route ***dest_prefix*** [***nexthop_addr***][**DISTANCE**]

default ipv6 route ***dest_prefix*** [***nexthop_addr***][**DISTANCE**]

Parameters

- ***dest_prefix*** Destination IPv6 prefix (CIDR notation).
- **NEXTHOP** Access method of next hop device. Options include:
  - **null0** Null0 interface – route is dropped.
  - ***nexthop_addr*** IPv6 address of nexthop device.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
  - **ethernet *e_num nexthop_addr*** Combination route (Ethernet interface and gateway).
  - **loopback *l_num nexthop_addr*** Combination route (loopback interface and gateway).
  - **management *m_num nexthop_addr*** Combination route (management interface and gateway).

  - **port-channel *p_num nexthop_addr*** Combination route (port channel interface and gateway).
  - **vlan *v_num nexthop_addr*** Combination route (VLAN interface and gateway).
  - **vxlan *vx_num nexthop_addr*** Combination route (VXLAN interface and gateway).
- **DISTANCE** administrative distance assigned to route. Options include:
  - ***no parameter*** route assigned default administrative distance of one.
  - ***1 to 255*** The administrative distance assigned to route.
- **TAG_OPT** static route tag. Options include:
  - ***no parameter*** assigns default static route tag of ***0***.
  - **tag *0 to 4294967295*** Static route tag value.
- **RT_NAME** Associates descriptive text to the route. Options include:
  - ***no parameter*** No text is associated with the route.
  - **name *descriptive_text*** The specified text is assigned to the route.

Example

This command creates an IPv6 static route.

```
switch(config)# ipv6 route 10:23:31:00:01:32:93/24 vlan 300
```

13.2.4.30 ipv6 unicast-routing

The **ipv6 unicast-routing** command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

The **no ipv6 unicast-routing** and default **ip ipv6 unicast-routing** commands disable IPv6 unicast routing by removing the **ipv6 unicast-routing** command from ***running-config***. Dynamic routes added by routing protocols are removed from the routing table. Static routes are preserved by default; the **delete-static-routes** option removes static entries from the routing table.

IPv6 unicast routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

ipv6 unicast-routing

no ipv6 unicast-routing [**DELETE_ROUTES**]

default ipv6 unicast-routing [**DELETE_ROUTES**]

Parameters

DELETE_ROUTES Resolves routing table static entries when routing is disabled.

- ***no parameter*** Routing table retains static entries.
- **delete-static-routes** Static entries are removed from the routing table.

Example

This command enables IPv6 unicast-routing.

```
switch(config)# ipv6 unicast-routing
switch(config)#
```

13.2.4.31 ipv6 verify

The **ipv6 verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv6 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet's ingress interface.

The **no ipv6 verify** and **default ipv6 verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ipv6 verify** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 verify unicast source reachable-via RPF_MODE

no ipv6 verify unicast

default ipv6 verify unicast

Parameters

RPF_MODE Specifes the uRPF mode. Options include:

- **any** Loose mode.
- **rx** Strict mode.
- **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

Guidelines

The first IPv6 uRPF implementation briefly disables IPv6 unicast routing. Subsequent **ip verify** commands on any interface do not disable IPv6 routing.

Example

This command enables uRPF strict mode on ***interface vlan 100***. When a default route is configured on the interface, all inbound packets are checked as valid.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# ipv6 verify unicast source reachable-via rx
 allow-default
switch(config-if-Vl100)# show active
 interface Vlan100
   ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

13.2.4.32 ipv6 dhcp snooping

The **ipv6 dhcp snooping** command enables DHCP snooping globally on the switch.

The **no ipv6 dhcp snooping** and **default ipv6 dhcp snooping** commands disable global DHCP snooping by removing the ipv6 dhcp snooping command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]

no ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]

default ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]

Parameters

- **remote-id option** configures the remote ID option.
- **vlan** enables IPv6 DHCP snooping for a specific VLAN. Numbers range from 1 to 4094.
- **$** end of range.
- **vlan-range** VLANs based on the snooping enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.

Examples

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)# ipv6 dhcp snooping
switch(config)# ipv6 dhcp snooping remote-id option
switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)# ipv6 dhcp snooping
switch(config)# show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
  2789-2790
DHCPv6 Snooping is operational on following VLANs:
  2789
Insertion of Option-37 is enabled
```

13.2.4.33 pim ipv6 sparse-mode

The **pim ipv6 sparse-mode** command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Note: PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv6 sparse-mode** and **default pim ipv6 sparse-mode** commands restore the default PIM and IGMP (router mode) settings of ***disabled*** on the configuration mode interface by removing the **pim ipv6 sparse-mode** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel

Configuration Interface-VLAN Configuration

Command Syntax

pim ipv6 sparse-mode

no pim ipv6

no pim ipv6 sparse-mode

default pim ipv6

default pim ipv6 sparse-mode

Example

This command enables **pim ipv6 sparse-mode** on ***interface vlan 4*** interface.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv6 sparse-mode
switch(config-if-Vl4)#
```

13.2.4.34 show ipv6 dhcp relay counters

The **show ipv6 dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp relay counters

Example

This command displays the IP DHCP relay counter table.

```
switch> show ipv6 dhcp relay counters
          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago
 All Resp |  277  277    0 |
          |                |
Ethernet4 |  207  148    0 | 4 days, 19:54:24 ago

switch>
```

13.2.4.35 show ipv6 dhcp snooping

The **show ipv6 dhcp snooping** command displays information about the DHCP snooping configuration.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp snooping

Related Commands

- ipv6 dhcp snooping
- show ipv6 dhcp snooping counters
- show ipv6 dhcp snooping hardware
- clear ipv6 dhcp snooping counters

Example

This command displays the switch's DHCP snooping configuration.

```
switch# show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
  2789-2790
DHCPv6 Snooping is operational on following VLANs:
  2789
Insertion of Option-37 is enabled
```

13.2.4.36 show ipv6 dhcp snooping counters

The **show ipv6 dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp snooping counters [**COUNTER_TYPE**]

Parameters

- **COUNTER_TYPE** The type of counter that the command displays.
- ***no parameter*** command displays counters for each VLAN.
- **debug** command displays aggregate counters and drop cause counters.

Examples

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch# show ipv6 dhcp snooping counters

     | Dhcpv6 Request Pkts | Dhcpv6 Reply Pkts |
Vlan |  Rcvd   Fwdd   Drop |  Rcvd  Fwdd  Drop | Last Cleared
-----|------ ------ -------|------ ----- ------|-------------
2789 |     1      1      0 |     1     1     0 |  0:03:09 ago
```

- This command displays the number of DHCP packets sent on the switch.

```
switch# show ipv6 dhcp snooping counters debug

Counter                         Snooping to Relay Relay to Snooping
------------------------------- ----------------- -----------------
Received                                        1                 1
Forwarded                                       1                 1
Dropped - Invalid VlanId                        0                 0
Dropped - Parse error                           0                 0
Dropped - Invalid Dhcp Optype                   0                 0
Dropped - Invalid Remote-ID Option              0                 0
Dropped - Snooping disabled                     0                 0

Last Cleared:  0:04:29 ago
```

13.2.4.37 show ipv6 dhcp snooping hardware

The **show ipv6 dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp snooping hardware

Example

This command displays DHCP snooping hardware status.

```
switch# show ipv6 dhcp snooping hardware
DHCPv6 Snooping is enabled
DHCPv6 Snooping is enabled on following VLANs:
    2789
    Vlans enabled per Slice
        Slice:  Linecard0-0
        2789
        Slice:  Linecard0-1
        2789
        Slice:  Linecard0-2
        2789
        Slice:  Linecard0-3
        2789
```

13.2.4.38 show ipv6 hardware fib aggregate-address

The **show ipv6 hardware fib aggregate-address** command displays the IPv6 prefixes that are restricted from entry into the hardware routing table. The **ipv6 hardware fib aggregate-address** command configures IPv6 prefix restictions.

Command Mode

EXEC

Command Syntax

show ipv6 address fib aggregate-address [**ADDRESS**][**RESTRICTION**]

Parameters

- **ROUTE_FILTER** filters by IPv6 address. Options include:
  - ***no parameter*** Displays all routes.
  - ***ipv6_addr*** Command displays only specified address.
  - ***ipv6_prefix*** Command displays addresses filtered by specified prefix (CIDR notation).
- **RESTRICTION** filters by route restriction.
  - ***no parameter*** displays routes restricted from the hardware routing table.
  - **software-forward** displays routes restricted from the hardware routing table.

Example

This command displays the routes that are restricted from the hardware routing table.

```
switch> show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S  fd77:4890:5313:aaed::/64
S  fd77:4890:5313:ffed::/64

switch>
```

13.2.4.39 show ipv6 interface

The **ipv6 interface** command displays the status of specified routed interfaces that are configured for IPv6.

Command Mode

EXEC

Command Syntax

show ipv6 interface [**INTERFACE_NAME**][**INFO_LEVEL**]

Parameters

- **INTERFACE_NAME** interfaces for which command displays status.
  - ***no parameter*** all routed interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** command displays data block for each specified interface.
  - **brief** command displays table that summarizes IPv6 interface data.

Example

This command displays the status of ***interface vlan 903***.

```
switch> show ipv6 interface vlan 903
Vlan903 is up, line protocol is up (connected)
  IPv6 is enabled, link-local is fe80::21c:73ff:fe01:21e/64
  Global unicast address(es):
    fd7a:629f:52a4:fe10::3, subnet is fd7a:629f:52a4:fe10::/64
  Joined group address(es):
    ff02::1
    ff02::1:ff01:21e
    ff02::1:ff00:3
    ff01::2
switch>
```

13.2.4.40 show ipv6 nd ra internal state

The **ipv6 nd ra internal state** command displays the state of the IPv6 Router Advertisement (RA) daemon for the specified routable interface.

Command Mode

EXEC

Command Syntax

show ipv6 nd ra internal state [**INTERFACE_NAME**]

Parameters

INTERFACE_NAME interfaces for which command displays status.

- ***no parameter*** all routed interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.

Example

This command displays the IPv6 RA daemon for ***vlan 1243***.

```
switch> show ipv6 nd ra internal state vlan 1243
INTERFACE: Vlan3908
                                ifindex : 0x00000021
                                    mtu : 9212
                             numIpv6Addr : 2
                    numPrefixToAdvertise : 0
                     numPrefixToSuppress : 0
                              RaSuppress : 0
                           RsRspSuppress : 0
                      raIntervalMaxMsec : 200000
                      raIntervalMinMsec : 0
                      managedConfigFlag : 0
                        otherConfigFlag : 0
                          raMtuSuppress : 0
                             raLifetime : 1800
                         reacheableTime : 0
                       routerPreference : 0
                              lastRaTime : 2012-05-01 09:22:57.020634
                     lastRsRspSentTime :
                           nextTimeout : 171.474535 (sec)
                  raNotSentIntfNotReady : 0
                               numRaSent : 219
                               numRsRcvd : 0
                        numRsSuppressed : 0
                           numRsRspSent : 0
            numRsDroppedInvalidHopLimit : 0
            numPktDroppedUnexpectedType : 0
                            initialized : 1
switch>
```

13.2.4.41 show ipv6 neighbors

The **`show ipv6 neighbors`** command displays the IPv6 neighbor discovery cache. The command provides filters to restrict the list to a specified IPv6 address or routable interface.

Command Mode

EXEC

Command Syntax

`show ipv6 neighbors` [**PORT**][**SOURCE**][**INFO_LEVEL**]

Parameters

- **PORT** Filters by interface through which neighbor is accessed. Options include:
  - ***no parameter*** all routed interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **SOURCE** Filters by neighbor IPv6 address. Options include:
  - ***no parameter*** all IPv6 neighbors.
  - ***ipv6_addr*** IPv6 address of individual neighbor.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** command displays the discovery cache for the specified interfaces.
  - **summary** command displays summary information only.

Example

This command displays the IPv6 neighbor discovery cache for IPv6 address ***fe80::21c:73ff:fe01:5fe1***.

```
switch> show ipv6 neighbors fe80::21c:73ff:fe01:5fe1
IPv6 Address                              Age Hardware Addr    State Interface
fe80::21c:73ff:fe01:5fe1                    0 001c.d147.8214   REACH Et12
fe80::21c:73ff:fe01:5fe1                    0 001c.d147.8214   REACH Po999

```

13.2.4.42 show ipv6 route

The **show ipv6 route** command displays IPv6 routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays all configured routes.

Command Mode

EXEC

Command Syntax

show ipv6 route [**ADDRESS**][**ROUTE_TYPE**][**INFO_LEVEL**]

Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
  - ***no parameter*** all routing table entries.
  - ***ipv6_address*** routing table entries matching specified IPv6 address.
  - ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (CIDR notation).
- **ROUTE_TYPE** filters routes by specified protocol or origin.
  - ***no parameter*** all routing table entries.
  - **aggregate** entries for BGP aggregate routes.
  - **bgp** entries added through BGP protocol.
  - **connected** entries for routes to networks directly connected to the switch.
  - **kernel** entries appearing in Linux kernel but not added by EOS software.
  - **isis** entries added through IS-IS protocol.
  - **ospf** entries added through OSPF protocol.
  - ***static*** entries added through CLI commands.
- **INFO_LEVEL** Filters entries by next hop connection.
  - ***no parameter*** filters routes whose next hops are directly connected.
  - **detail** displays all routes.

Example

This command displays a route table entry for a specific IPv6 route.

```
switch> show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
     via fe80::21c:73ff:fe00:1319, Vlan3601
     via fe80::21c:73ff:fe00:1319, Vlan3602
     via fe80::21c:73ff:fe00:1319, Vlan3608
     via fe80::21c:73ff:fe0f:6a80, Vlan3610
     via fe80::21c:73ff:fe00:1319, Vlan3611

switch>
```

13.2.4.43 show ipv6 route age

The **show ipv6 route age** command displays the IPv6 route age to the specified IPv6 address or prefix.

Command Mode

EXEC

Command Syntax

show ipv6 route ADDRESS age

Parameters

ADDRESS filters routes by IPv6 address or prefix.

- ***ipv6_address*** routing table entries matching specified address (A:B:C:D:E:F:G:H).
- ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

Example

This command displays the route age for the specified prefix.

```
switch>show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

C 2001::3:0/11 age 00:02:34
switch>
```

13.2.4.44 show ipv6 route host

The **show ipv6 route host** command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix =***/128***). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **A** routes to any neighboring host for which the switch has an ARP entry.
- **R** routes defined because the IP address is an interface address.

Command Mode

EXEC

Command Syntax

show ipv6 route host

Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch> show ipv6 route host
R - receive F - FIB, A - attached

 F  ::1 to cpu
 A  fee7:48a2:0c11:1900:400::1 on Vlan102
 R  fee7:48a2:0c11:1900:400::2 to cpu
 F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
 R  fee7:48a2:0c11:1a00::17 to cpu
 F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
 F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                            via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch>
```

13.2.4.45 show ipv6 route interface

The **show ipv6 route interface** command displays routing table entries on a specified routed port.

Command Mode

EXEC

Command Syntax

show ipv6 route [**ADDRESS**] **interface** **PORT_NAME** [**INFO_LEVEL**]

Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
  - ***no parameter*** all routing table entries.
  - ***ipv6_address*** routing table entries matching specified IPv6 address.
  - ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (CIDR notation).
- **PORT_NAME** interfaces for which command displays status.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **INFO_LEVEL** Filters entries by next hop connection.
  - ***no parameter*** filters routes whose next hops are directly connected.
  - **detail** displays all routes.

Example

This command displays the IPv6 routes in ***interface ethernet 8***.

```
switch> show ipv6 route interface ethernet 8
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

O   fd7a:629f:63af:1232::/64 [150/11]
     via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:4118::/64 [150/11]
     via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:4119::/64 [150/11]
     via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:411a::/64 [150/11]
     via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:fe78::/64 [150/11]
     via fe80::823c:73ff:fe00:3640, Ethernet8
C   fd7a:629f:63af:fe88::/64 [0/1]
     via ::, Ethernet12
O   fd7a:629f:63af:fe8c::/64 [10/20]
     via fe80::21c:73ff:fe00:3640, Ethernet8
C   fe80:0:40::/64 [0/1]
     via ::, Ethernet8
```

13.2.4.46 show ipv6 route match tag

The **show ipv6 route match tag** command displays the route tag assigned to the specified IPv6 address or prefix. Route tags are added to static routes for use by route maps.

Command Mode

EXEC

Command Syntax

show ipv6 route ADDRESS **match tag**

Parameters

ADDRESS filters routes by IPv6 address or prefix.

- ***ipv6_address*** routing table entries matching specified address (A:B:C:D:E:F:G:H).
- ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

Example

This command displays the route tag for the specified prefix.

```
switch> show ipv6 route 2001:0DB8::/64 match tag
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R -
 RIP, A B
- BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP,
 NG -
Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L -
 VRF Leaked

C   2001:0DB8::/64 tag 0

switch>
```

13.2.4.47 show ipv6 route summary

The **show ipv6 route summary** command displays the information about the IPv6 routing table.

Command Mode

EXEC

Command Syntax

show ipv6 route summary

Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch> show ipv6 route summary
Route Source    Number Of Routes
----------------- ----------------
   connected                    2
   static                       0
   ospf                         5
   bgp                          7
   isis                         0
   internal                     1
   attached                     0
   aggregate                    2

   Total Routes                 17
switch>
```

13.2.4.48 show platform fap mroute ipv6

The **`show platform fap mroute ipv6`** command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Command Mode

EXEC

Command Syntax

`show platform`

Example

This command enables PIM sparse mode on ***VLAN 4*** interface.

```
switch# show platform fap mroute ipv6
Jericho0 Multicast Routes:
--------------------------
Location  GroupId Group               Source         IIF      McId    OIF
FLP/TT    FLP/TT  TT                  FLP            FLP      FLP     FLP
-------------------------------------------------------------------------------------------------
4096/2048 1/1     ff33::1:0:0:23/128  101:1::2/128   Vlan1357 21504   Vlan1044(Et7/1) Vlan1123(Et9/1)
                                                                     Vlan1200(Et8/1) Vlan1223(Et2/1)
                                                                     Vlan1226(Et5/1) Vlan1232(Et3/1)
                                                                     Vlan1307(Et6/1) Vlan1337(Et4/1)
```

13.2.4.49 show rib route ipv6

The **show rib route ipv6** command displays a list of IPv6 Routing Information Base (RIB) routes.

Command Mode

EXEC

Command Syntax

show rib route ipv6 [vrf ***vrf_name***] [**PREFIX**][**ROUTE TYPE**]

Parameters

- **vrf *vrf_name*** displays RIB routes from the specified VRF.
- **PREFIX** displays routes filtered by the specified IPv6 information. Options include:
  - ***ipv6_address*** displays RIB routes filtered by the specified IPv6 address.
  - ***ipv6_subnet_mask*** displays RIB routes filtered by the specified IPv6 address and subnet mask.
  - ***ipv6_prefix*** displays RIB routes filtered by the specified IPv6 prefix.
- **ROUTE TYPE** displays routes filtered by the specified route type. Options include:
  - **bgp** displays RIB routes filtered by BGP.
  - **connected** displays RIB routes filtered by connected routes.
  - **dynamicPolicy** displays RIB routes filtered by dynamic policy routes.
  - **host** displays RIB routes filtered by host routes.
  - **isis** displays RIB routes filtered by ISIS routes.
  - **ospf** displays RIB routes filtered by OSPF routes.
  - **ospf3** displays RIB routes filtered by OSPF3 routes.
  - **reserved** displays RIB routes filtered by reserved routes.
  - **route-input** displays RIB routes filtered by route-input routes.
  - **static** displays RIB routes filtered by static routes.

Examples

- This command displays IPv6 RIB BGP routes.

```
switch# show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
 B    2001:10:1::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100::/64 [200/200]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:1::/64 [200/0]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:2::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
switch#
```

- This command displays IPv6 RIB connected routes.

```
switch# show rib route ipv6 connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
```

```
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>C    2001:10:1::/64 [0/1]
         via 2001:10:1::102, Ethernet1
>C    2001:10:2::/64 [0/1]
         via 2001:10:2::102, Ethernet2
>C    2001:10:3::/64 [0/1]
         via 2001:10:3::102, Ethernet3
switch#
```

13.3 Ingress and Egress Per-Port for IPv4 and IPv6 Counters

This feature provides support for per-interface ingress and egress packet and byte counters for both IPv4 and IPv6.

This section describes Ingress and Egress per-port for IPv4 and IPv6 counters, including configuration instructions and command descriptions. Topics covered by this chapter include:

13.3.1 Configuration

IPv4 and IPv6 ingress counters (count **bridged and routed** traffic, supported only on front-panel ports) can be enabled and disabled using the **`hardware counter feature ip in`** command:

```
[no] hardware counter feature ip in
```

For IPv4 and IPv6 ingress and egress counters that include only **routed** traffic (supported on Layer3 interfaces such as routed ports, L3 subinterfaces only):

On the DCS-7300X, DCS-7250X, DCS-7050X, and DCS-7060X platforms, IPv4 and IPv6 **packet** counters for only **routed** traffic do not require any configuration. They are collected by default. Other platforms (DCS-7280SR, DCS-7280CR and DCS-7500-R) need the feature enabled.

```
[no]hardware counter feature ip in layer3
```

```
[no]hardware counter feature ip out layer3
```

13.3.2 Show Commands

Use the **`show interfaces counters ip`** command to display IPv4, IPv6 packets, and octets.

```
switch# show interfaces counters ip
Interface   IPv4InOctets    IPv4InPkts     IPv6InOctets
 IPv6InPkts
Et1/1            0               0               0
 0
Et1/2            0               0               0
 0
Et1/3            0               0               0
 0
Et1/4            0               0               0
 0
...
Interface  IPv4OutOctets  IPv4OutPkts    IPv6OutOctets
 IPv6OutPkts
Et1/1            0               0               0
 0
Et1/2            0               0               0
 0
```

```
Et1/3             0                 0                 0
 0
Et1/4             0                 0                 0
 0
...
```

The output from the **show interfaces counters ip** can also be queried through SNMP via the ARISTA-IP-MIB.

To clear the the IPv4 or IPv6 counters, use the **clear counters** command

```
switch# clear counters
```

13.3.3 Dedicated ARP Entry for TX IPv4 and IPv6 Counters

IPv4/IPv6 egress Layer 3 (**hardware counter feature ip out layer3**) counting on DCS-7280SR, DCS-7280CR and DCS-7500-R platforms work, based on ARP entry of the nexthop. By default, IPv4 next hop and IPv6 next hop both resolve to the same MAC address and interface that have shared ARP entry. To differentiate the counters between IPv4 and IPv6, disable arp entry sharing with following command:

```
ip hardware fib next-hop arp dedicated
```

On the DCS-7280SR, DCS-7280CR and DCS-7500-R platforms, this command is required for IPv4 and IPv6 egress counters to operate.

13.3.4 Limitations

- Packet sizes greater than 9236 bytes are not counted by per-port IPv4 and IPv6 counters.
- Only the DCS-7260X3, DCS-7368, DCS-7300, DCS-7050SX3, DCS-7050CX3, DCS-7280SR, DCS-7280CR and DCS-7500-R platforms support the **hardware counter feature ip in** command.
- Only the DCS-7280SR, DCS-7280CR and DCS-7500-R platforms support the **hardware counter feature ip [in|out] layer3** command.

13.4 ACLs and Route Maps

The switch uses rule-based lists to control packet access to ports and to select routes for redistribution to routing domains defined by dynamic routing protocols. This section describes the construction of Access Control Lists (ACLs), prefix lists, and route maps.

This section includes the following topics:

- ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction
- Access Control Lists
- Service ACLs
- Sub-interface ACLs
- Egress ACL Counters
- RACL Sharing on SVIs
- Route Maps
- Prefix Lists
- Port ACLs with User-Defined Fields
- ACL, Route Map, and Prefix List Commands

13.4.1 ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction

Access Control Lists (ACLs), Service ACLs, route maps, and prefix lists are all processed in order, beginning with the first rule and proceeding until a match is encountered.

An Access Control List (ACL) is a list of rules that control the inbound flow of packets into Ethernet interfaces, subinterfaces, and port channel interfaces or the switch control plane. The switch supports the implementation of a wide variety of filtering criteria including IP and MAC addresses, TCP/UDP ports with include/exclude options without compromising its performance or feature set. Filtering syntax is industry standard.

A Service ACL is an ACL applied by a control-plane process to control connections to, or packets processed by, the agent process.

A route map is a list of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

A prefix list is a list of rules that defines route redistribution access for a specified IP address space. Route maps often use prefix lists to filter routes.

The RACL divergence optimizes the usage of hardware resources occupied on each forwarding ASIC by installing ACLs only on the hardware components corresponding to the member interfaces belonging to the SVIs on which ACL is applied. Hence, saving the hardware resources used and enables RACLs to scale-up to a larger configuration. The show commands are used to display the interface mapping, TCAM entries, and TCAM utilization information.

13.4.2 Access Control Lists

These sections describe access control lists:

- ACL Types
- ACL Configuration
- Applying ACLs

13.4.2.1 ACL Types

The switch supports the following ACL types:

- **IPv4** can match on IPv4 source or destination addresses, with L4 modifiers including protocol, port number, and DSCP value.
- **IPv6** can match on IPv6 source or destination addresses, with L4 modifiers including protocol, port number, etc.
- **Standard IPv4** can match only on source IPv4 address.
- **Standard IPv6** can match only on source IPv6 address.
- **MAC** can match on L2 source and destination addresses..

ACLs can also be made dynamic (not persisting in the EOS), and the **payload** keyword can be used to turn an ACL into a User-Defined Field (UDF) alias for use in other ACLs.

13.4.2.1.1 ACL Structure

An ACL is an ordered list of rules that defines access restrictions for the entities (the control plane, or an interface) to which it is applied. ACLs are also used by route maps to select routes for redistribution into specified routing domains.

ACL rules specify the data to which packet contents are compared when filtering data.

- The interface forwards packets that match all commands in a permit rule.
- The interface drops packets that match all commands in a deny rule.
- The interface drops packets that do not match at least one rule.

Upon its arrival at an interface, a packet's fields are compared to the first rule of the ACL applied to the interface. Packets that match the rule are forwarded (permit rule) or dropped (deny rule). Packets that do not match the rule are compared to the next rule in the list. This process continues until the packet either matches a rule or the rule list is exhausted. The interface drops packets not matching a rule.

The sequence number designates the rule's placement in the ACL.

13.4.2.1.2 ACL Rules

ACL rules consist of a command list that is compared to inbound packet fields. When all of a rule's criteria match a packet's contents, the interface performs the action specified by the rule.

The set of available commands depend on the ACL type and the specified protocol within the rule. The following is a list of commands available for supported ACL types

IPv4 ACL Rule Parameters

All rules in IPv4 ACLs include the following criteria:

- **Protocol**: The packet's IP protocol. Valid rule inputs include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address**: The packet's source IPv4 address. Valid rule inputs include:
  - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - *any* to denote that the rule matches all source addresses.
- **Destination Address**: The packet's destination IP address. Valid rule inputs include:
  - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - *any* to denote that the rule matches all destination addresses.

All rules in IPv4 ACLs ***may*** include the following criteria:

- **Fragment**: Rules filter on the fragment bit.

- **Time-to-live**: Compares the TTL (time-to-live) value in the packet to a specified value. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform. Comparison options include:
  - **Equal:** Packets match if packet value equals statement value.
  - **Greater than:** Packets match if packet value is greater than statement value.
  - **Less than:** Packets match if packet value is less than statement value.
  - **Not equal:** Packets match if packet value does not equal statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports / Destination Ports**: A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  - ***any*** denotes that the rule matches all ports.
  - A list of ports that matches the packet port. Maximum list size is 10 ports.
  - Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
  - Integer (lower bound): The rule matches any port with a number larger than the integer.
  - Integer (upper bound): The rule matches any port with a number smaller than the integer.
  - Range integers: The rule matches any port whose number is between the integers.
- **Flag bits**: Rules filter TCP packets on flag bits.
- **Message type**: Rules filter ICMP type or code.
- **Tracked**: Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

IPv6 ACL Rule Parameters

Note: When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

All rules in IPv6 ACLs include the following criteria:

- **Protocol**: All rules filter on the packet's IP protocol field. Rule input options include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address**: The packet's source IPv6 address. Valid rule inputs include:
  - An IPv6 prefix (CIDR). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - ***any*** to denote that the rule matches all addresses.
- **Destination Address**: The packet's destination IP address. Valid rule inputs include:
  - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - ***any*** to denote that the rule matches all addresses.

All rules in IPv6 ACLs ***may*** include the following criteria:

- **Fragment**: Rules filter on the fragment bit.
- ***HOP*** Compares the packet's hop-limit value to a specified value. Comparison options include:
  - **eq**: Packets match if hop-limit value equals statement value.
  - **gt**: Packets match if hop-limit value is greater than statement value.
  - **lt**: Packets match if hop-limit value is less than statement value.
  - **neq**: Packets match if hop-limit value is not equal to statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports / Destination Ports**: A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:

    - ***any*** denotes that the rule matches all ports.
    - A list of ports that matches the packet port. Maximum list size is 10 ports.
    - Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
    - Integer (lower bound): The rule matches any port with a number larger than the integer.
    - Integer (upper bound): The rule matches any port with a number smaller than the integer.
    - Range integers: The rule matches any port whose number is between the integers.
- **Flag bits**: Rules filter TCP packets on flag bits.
- **Message type**: Rules filter ICMP type or code.
- **Tracked**: Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

Standard IPv4 and IPv6 ACL Rule Parameters

Note: When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

Standard ACLs filter only on the source address.

MAC ACL Rule Parameters

MAC ACLs filter traffic on a packet's layer 2 header. Criteria that MAC ACLs use to filter packets include:

- **Source Address** and **Mask**: The packet's source MAC address. Valid rule inputs include:
    - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
    - ***any*** to denote that the rule matches all source addresses.
- - **Destination Address** and **Mask**: The packet's destination MAC address. Valid rule inputs include:
        - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
        - ***any*** to denote that the rule matches all destination addresses.
    - **Protocol**: The packet's protocol as specified by its EtherType field contents. Valid inputs include:
        - Protocol name for a limited set of common protocols.
        - Assigned protocol number for all protocols.

13.4.2.1.3 Creating and Modifying Lists

The switch provides configuration modes for creating and modifying ACLs. The command that enters an ACL configuration mode specifies the name of the list that the mode modifies. The switch saves the list to the running configuration when the configuration mode is exited.

- ACLs are created and modified in ACL configuration mode.
- Standard ACLs are created and modified in Standard-ACL-configuration mode.
- MAC ACLs are created and modified in MAC-ACL-configuration mode.

Lists that are created in one mode cannot be modified in any other mode.

A sequence number designates the rule's placement in a list. New rules are inserted into a list according to their sequence numbers. A rule's sequence number can be referenced when deleting it from a list.

ACL Configuration describes procedures for configuring ACLs.

13.4.2.1.4 Implementing Access Control Lists

An Access Control List (ACL) is implemented by assigning the list to an Ethernet interface or subinterface, to a port channel interface, or to the control plane. The switch assigns a default ACL to the control plane unless the configuration contains a valid control-plane ACL assignment statement. Ethernet and port channel interfaces are not assigned an ACL by default. Standard ACLs are applied to interfaces in the same manner as other ACLs.

IPv4 and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. The control-plane does not support egress ACLs.

Applying ACLs describes procedures for applying ACLs to interfaces or the control plane.

13.4.2.1.5 ACL Rule Tracking

ACL rule tracking determines the impact of ACL rules on the traffic accessing interfaces upon which they are applied. ACLs provide two tracking mechanisms:

- **ACL logging**: A syslog entry is logged when a packet matches specified ACL rules.
- **ACL counters**: ACL counters increment when a packet matches a rule in specified ACLs.

ACL Logging

ACL rules provide a **log** option that produces a log message when a packet matches the rule. ACL logging creates a syslog entry when a packet matches an ACL rule where logging is enabled. Packets that match a logging-enabled ACL rule are copied to the CPU by the hardware. These packets trigger the creation of a syslog entry. The information provided in the entry depends on the ACL type or the protocol specified by the ACL. Hardware rate limiting is applied to packets written to the CPU, avoiding potential DoS attacks. The rate of logging is also software limited to avoid the creation of syslog lists that are too large for practical use by human operators.

ACL Rule Tracking Configuration describes procedures for configuring and enabling ACL logging.

ACL Counters

An ACL counter is assigned to each ACL rule. The activity of the ACL counters for rules within a list depend on the list's counter state. When the list is in counting state, the ACL counter of a rule increments when the rule matches a packet. When the list is in a non-counting state, the counter does not increment. A list's counter state applies to all rules in the ACL. The default state for new ACLs is non-counting.

When an ACL changes from counting state to non-counting state, or when the ACL is no longer applied to any interfaces that increment counters, counters for all rules in the list maintain their values and do not reset. When the ACL returns to counting mode or is applied to an interface that increments counters, the counter operation resumes from its most recent value.

Counters never decrement and are reset only through CLI commands.

ACL Rule Tracking Configuration describes procedures for configuring and enabling ACL counters.

13.4.2.1.6 Egress ACL Counters

Egress ACL counters count the number of packets matching rules associated with egress ACLs applied to various interfaces in a switch. For 7050 and 7060 series switches, these counters are maintained for every TCAM rule; on these platforms, packet counters greater than zero are always shown by commands such as **`show platform trident tcam`**, **`show platform trident counters`**, and **`show ip access-list`**. For other switches, counters are not enabled by default

and must be configured for each ACL, and the counters can be shown with the **show hardware counter** and **show ip access-list** commands.

13.4.2.1.6.1Configuring Egress ACL Counters

For 7050 and 7060 series switches, egress ACL counters are always enabled, and no configuration is required.

For other platforms, to enable egress ACL counters for a specific ACL, use the **counter per-entry** command in the configuration mode for the ACL.

Example

In the following example, configure the **counters per-entry** command in the ACL configuration mode.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# counters per-entry
```

Enabling Egress Counters Globally

For 7050 and 7060 series switches, egress counters are always enabled.

For other switches, both IPv4 and IPv6 egress ACL counters are enabled in the global configuration mode by using the **hardware counter feature acl out** command.

Example

The following example shows how to enable IPv4 egress ACL counters.

```
switch(config)# hardware counter feature acl out ipv4
switch(config)#
```

The following example shows how to enable IPv6 egress ACL counters.

```
switch(config)# hardware counter feature acl out ipv6
switch(config)#
```

Disabling Egress Counters Globally

For 7050 and 7060 series switches, egress counters cannot be disabled.

For other switches, both IPv4 and IPv6 egress ACL counters are also disabled in the global configuration mode by using the **hardware counter feature acl out** command.

The following example shows how to disable IPv4 egress ACL counters.

```
switch(config)# no hardware counter feature acl out ipv4
switch(config)#
```

The following example shows how to disable IPv6 egress ACL counters.

```
switch(config)# no hardware counter feature acl out ipv6
switch(config)#
```

Egress Counter Roll Over in the Global Mode

The counters roll over when the counter value for an ACL rule exceeds ***2^64***.

Example

In the following example, the **hardware counter feature acl ipv6 out** command is configured using units and packets.

```
switch(config)# hardware counter feature acl ipv6 out units packets
switch(config)#
```

The **clear ip access-lists counters** command clears the counters for all of the IPv4 ACLs or a specific IPv4 ACL, either globally or per-CLI session.

Example

In the following example the ACL list named ***red*** is selected.

```
switch(config)# clear ip access-list counters red session
switch(config)#
```

The IPv6 egress ACL counters do not work in unshared mode.

Example

Use the **hardware access-lists resource sharing vlan ipv6 out** command to enable egress IPv6 ACL sharing.

```
switch(config)#hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

The **clear ipv6 access-list counters** command clears the counters for all of the IPv6 ACLs or a specific IPv6 ACL, either globally or per-CLI session.

Example

In the following example the ACL list named ***green*** is selected.

```
switch(config)# clear ipv6 access-list counters green session
switch(config)#
```

13.4.2.1.6.2Displaying Egress ACL Counters

Use the following show commands to display Egress ACL Counters information.

Use the **show ip access-lists** command to display all the IPv4 ACLs, or a specific IPv4 ACL configured in a switch. The output contains details such as rules in an ACL and respective counter values with each rule.

```
switch(config)# show ip access-list acl1
IP Access List acl1
        counter per-entry
        10 deny ip 11.1.1.0/24 any dscp af11
        20 deny ip any any [match 39080716, 0:00:00 ago]
```

Use the **show ipv6 access-lists** command to display all the IPv6 ACLs or a specific IPv6 ACL configured in a switch. The output contains details such as rules in an ACL and respective counter values with each rule.

```
switch(config)# show ipv6 access-list acl1
IPV6 Access List acl1
        counter per-entry
        10 permit ipv6 any any [match 3450000, 0:00:10 ago]
        20 deny ipv6 any any
```

The counter name **EgressAclDropCounter** in the output of this show command signifies the aggregate counter value for the remaining egress IPv4 ACL. In this example the deny rules, whose per rule counters, are not allocated. The per rule counters is not allocated when the user does not configure the ***counter per-entry*** parameter for the respective ACL.

```
switch(config)# show hardware counter drop
Summary:
Total Adverse (A) Drops: 0
Total Congestion (C) Drops: 0
Total Packet Processor (P) Drops: 250
Type Chip CounterName : Count : First Occurrence : Last Occurrence
------------------------------------------------------------------------
------------
P Fap0 EgressAclDropCounter : 250 : 2015-11-11 22:39:02 : 2015-11-11
 22:51:44
```

13.4.2.2 ACL Configuration

Access Control Lists (ACLs) are created and modified in an ACL-configuration mode. A list can be edited only in the mode where it was created. The switch provides five configuration modes for creating and modifying access control lists:

- **ACL configuration mode** for IPv4 access control lists.
- **IPv6-ACL configuration mode** for IPv6 access control lists.
- **Std-ACL configuration mode** for Standard IPv4 access control lists.
- **Std-IPv6-ACL configuration mode** for Standard IPv6 access control lists.
- **MAC-ACL configuration mode** for MAC access control lists.

These sections describe the creation and modification of ACLs:

- Managing ACLs
- Modifying an ACL
- ACL Rule Tracking Configuration
- Displaying ACLs
- Configuring Per-Port Per-VLAN QoS
- Displaying Per-Port Per-VLAN QoS
- Configuring Mirror Access Control Lists

13.4.2.2.1 Managing ACLs

Creating and Opening a List

To create an ACL, enter one of the following commands, followed by the name of the list:

- ip access-list for IPv4 ACLs.
- ipv6 access-list for IPv6 ACLs.
- ip access-list standard for standard IPv4 ACLs.
- ipv6 access-list standard for standard IPv6 ACLs.
- mac access-list for MAC ACLs.

The switch enters the appropriate ACL configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list (see Modifying an ACL for additional information).

Examples

- This command places the switch in ***ACL*** configuration mode to create an ACL named ***test1***.

```
switch(config)# ip access-list test1
switch(config-acl-test1)#
```

- This command places the switch in Standard-ACL-configuration mode to create a Standard ACL named ***stest1***.

```
switch(config)# ip access-list standard stest1
switch(config-std-acl-stest1)#
```

- This command places the switch in ***MAC-ACL*** configuration mode to create an MAC ACL named ***mtest1***.

```
switch(config)# mac access-list mtest1
switch(config-mac-acl-mtest1)#
```

Saving List Modifications

ACL configuration modes are group-change modes. Changes made in a group-change mode are saved by exiting the mode. To exit the group-change mode, changes can also be discarded using the `abort` command instead of exit.

Examples

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)# permit ip 10.10.10.0/24 any
switch(config-acl-test1)# permit ip any host 10.20.10.1
switch(config-acl-test1)# deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)# show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Because the changes were not yet saved, the ACL remains empty, as shown by show ip access-lists.

```
switch(config-acl-test1)# show ip access-lists test1
switch(config-acl-test1)#
```

To save all current changes to the ACL and exit ACL configuration mode, type **exit**.

```
switch(config-acl-test1)# exit
switch(config)# show ip access-lists test1
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Discarding List Changes

The **abort** command exits ACL configuration mode without saving pending changes.

Examples

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)# permit ip 10.10.10.0/24 any
switch(config-acl-test1)# permit ip any host 10.20.10.1
switch(config-acl-test1)# deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)# show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

To discard the changes, enter **abort**. If the ACL existed before entering ACL-configuration mode, **abort** restores the version that existed before entering ACL-configuration mode. Otherwise, show ip access-lists shows the ACL was not created.

```
switch(config-acl-test1)# abort
switch(config)#
```

13.4.2.2.2 Modifying an ACL

An existing ACL, including those currently applied to interfaces, can be modified by entering the appropriate configuration mode for the ACL as described in Creating and Opening a List. By default, while an ACL is being modified all traffic is blocked on any interface to which the ACL has been applied.

Permit All Traffic During ACL Update

Because blocking ports during ACL modifications can result in packet loss and can interfere with features such as routing and dynamic NAT, 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches can be configured instead to permit all traffic on Ethernet and VLAN interfaces while ACLs applied to those interfaces are being modified. This is done with the hardware access-list update default-result permit command.

These commands add deny rules to the appropriate ACL:

- deny (IPv4 ACL) adds a deny rule to an IPv4 ACL.
- deny (IPv6 ACL) adds a deny rule to an IPv6 ACL.
- deny (Standard IPv4 ACL) adds a deny rule to an IPv4 standard ACL.
- deny (Standard IPv6 ACL) adds a deny rule to an IPv6 standard ACL.
- deny (MAC ACL) adds a deny rule to a MAC ACL.

These commands add permit rules to the appropriate ACL:

- permit (IPv4 ACL) adds a permit rule to an IPv4 ACL.
- permit (IPv6 ACL) adds a permit rule to an IPv6 ACL.
- permit (Standard IPv4 ACL) adds a permit rule to an IPv4 standard ACL.
- permit (Standard IPv6 ACL) adds a permit rule to an IPv6 standard ACL.
- permit (MAC ACL) adds a permit rule to a MAC ACL.

Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ACL configuration mode for the list. The new rule's sequence number is derived by adding ***10*** to the last rule's sequence number.

Examples

- This command configures the switch to permit all traffic during ACL modifications on interfaces to which the ACL has been applied. The rules in modified ACLs are applied after exiting ACL configuration mode, and after the ACL rules have been populated in hardware.

```
switch(config)# hardware access-list update default-result permit
```

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)# permit ip 10.10.10.0/24 any
switch(config-acl-test1)# permit ip any host 10.20.10.1
switch(config-acl-test1)# deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)# show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
```

- This command appends a rule to the ACL. The new rule's sequence number is ***40***.

```
switch(config-acl-test1)# permit ip any any
switch(config-acl-test1)# show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Inserting a Rule

To insert a rule into a ACL, enter the rule with a sequence number between the existing rules' numbers.

Example

This command inserts a rule between the first two rules by assigning it the sequence number ***15***.

```
Switch(config-acl-test1)# 15 permit ip 10.30.10.0/24 host 10.20.10.1
Switch(config-acl-test1)# show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        15 permit ip 10.30.10.0/24 host 10.20.10.1
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Deleting a Rule

To remove a rule from the current ACL, perform one of these commands:

- Enter **no**, followed by the sequence number of the rule to be deleted.

- Enter **no**, followed by the rule be deleted.
- Enter **default**, followed by the rule to be deleted.

Examples

- These equivalent commands remove rule ***20*** from the list.

```
switch(config-acl-test1)# no 20
switch(config-acl-test1)# no permit ip any host 10.20.10.1
switch(config-acl-test1)# default permit ip any host 10.20.10.1
```

- This ACL results from entering one of the preceding commands.

```
switch(config-acl-test1)# show
ip access list test1
        10 permit ip 10.10.10.0/24 any
        15 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Resequencing Rule Numbers

Sequence numbers determine the order of the rules in an access control list. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Resequencing rule numbers changes the sequence number of rules to provide a constant difference between adjacent rules. The resequence (ACLs) command adjusts the sequence numbers of ACL rules.

Example

The resequence (ACLs) command renumbers rules in the test1 ACL. The sequence number of the first rule is ***100***; subsequent rules numbers are incremented by ***20***.

```
switch(config-acl-test1)# show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        25 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        50 permit ip any any
        90 remark end of list
switch(config-acl-test1)# resequence 100 20
switch(config-acl-test1)# show
IP Access List test1
        100 permit ip 10.10.10.0/24 any
        120 permit ip any host 10.20.10.1
        140 deny ip host 10.10.10.1 host 10.20.10.1
        160 permit ip any any
        180 remark end of list
```

13.4.2.2.3 ACL Rule Tracking Configuration

ACL rules provide a **log** option that produces a syslog message about the packets matching packet. ACL logging creates a syslog entry when a packet matches an ACL rule with logging enabled.

This feature is currently available on Arad switches and on 7100 series switches. On 7100 series switches, matches are logged only on ingress, not on egress.

Example

This command creates an ACL rule with logging enabled.

```
switch(config-acl-test1)# 15 permit ip 10.30.10.0/24 host 10.20.10.1 log
switch(config-acl-test1)#
```

The format of the generated Syslog message depends on the ACL type and the specified protocol:

- Messages generated by a TCP or UDP packet matching an IP ACL use this format:

  IPACCESS: list *acl intf filter protocol src-ip*(*src_port*) **->** *dst-ip*(*dst_port*)
- Messages generated by ICMP packets matching an IP ACL use this format:

  IPACCESS: list *acl intf filter* **icmp** *src-ip*(*src-port*) **->** *dst-ip*(*dst-port*) **type=** *n* **code=** *m*
- Messages generated by all other IP packets matching an IP ACL use this format:

  IPACCESS: list *acl intf filter protocol src-ip* **->** *dst-ip*
- Messages generated by packets matching a MAC ACL use this format:

  MACACCESS: list *acl intf filter vlan ether src_mac* **->** *dst_mac*
- Messages generated by a TCP or UDP packet matching a MAC ACL use this format:

  MACACCESS: list *acl intf filter vlan ether ip-prt src-mac src-ip* **:** *src-prt* **->** *dst-mac dst-ip* **:** *dst-prt*
- Messages generated by any other IP packet matching a MAC ACL use this format:

  MACACCESS: list *acl intf filtervlan ether src_mac src_ip* **->** *dst_mac dst_ip*

Variables in the Syslog messages display the following values:

- **acl** Name of ACL.
- **intf** Name of interface that received the packet.
- **filter** Action triggered by ACL (**denied** or **permitted**).
- **protocol** IP protocol specified by packet.
- **vlan** Number of VLAN receiving packet.
- **ether** EtherType protocol specified by packet.
- **src-ip** and **dst-ip** source and destination IP addresses.
- **src-prt** and **dst-prt** source and destination ports.
- **src-mac** and **dst-mac** source and destination MAC addresses.

ACLs provide a command that configures its counter state (counting or non-counting). The counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

The counters per-entry (ACL configuration modes) command places the ACL in counting mode.

This command places the configuration mode ACL in counting mode.

```
switch(config-acl-test1)# counters per-entry
switch(config-acl-test1)#exit
switch(config-acl-test1)#show ip access-list test1
IP Access List test1
        counters per-entry
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
        50 remark end of list
```

The clear ip access-lists counters and clear ipv6 access-lists counters commands set the IP access list counters to zero for the specified IP access list.

This command clears the ACL counter for the test1 ACL.

```
switch(config)# clear ip access-lists counters test1
switch(config)#
```

13.4.2.2.4 Displaying ACLs

ACLs can be displayed by a **show running-config** command. The show ip access-lists also displays ACL rosters and contents, as specified by command parameters.

When editing an ACL, the show (ACL configuration modes) command displays the current or pending list, as specified by command parameters.

Displaying a List of ACLs

To display the roster of ACLs on the switch, enter show ip access-lists with the **summary** option.

Example

This command lists the available access control lists.

```
switch(config)# show ip access-list summary
IPV4 ACL default-control-plane-acl
        Total rules configured: 12
        Configured on: control-plane
        Active on    : control-plane

IPV4 ACL list2
        Total rules configured: 3

IPV4 ACL test1
        Total rules configured: 6

IPV4 ACL test_1
        Total rules configured: 1

IPV4 ACL test_3
        Total rules configured: 0
switch(config)#
```

Displaying Contents of an ACL

These commands display ACL contents.

- show ip access-lists
- show ipv6 access-lists
- show mac access-lists

Each command can display the contents of one ACL or of all ACLs of the type specified by the command:

- To display the contents of one ACL, enter show ip access-lists followed by the name of the ACL.
- To display the contents of all ACLs on the switch, enter the command without any options.

ACLs that are in counting mode display the number of inbound packets each rule in the list matched and the elapsed time since the last match.

Examples

- This command displays the rules in the **default-control-plane-acl** ACL.

```
switch# show ip access-lists default-control-plane-acl
IP Access List default-control-plane-acl [readonly]
        counters per-entry
        10 permit icmp any any
        20 permit ip any any tracked [match 1725, 0:00:00 ago]
        30 permit ospf any any
        40 permit tcp any any eq ssh telnet www snmp bgp https
        50 permit udp any any eq bootps bootpc snmp [match 993, 0:00:29
 ago]
        60 permit tcp any any eq mlag ttl eq 255
        70 permit udp any any eq mlag ttl eq 255
        80 permit vrrp any any
        90 permit ahp any any
        100 permit pim any any
        110 permit igmp any any [match 1316, 0:00:23 ago]
        120 permit tcp any any range 5900 5910
```

- This command displays the rules in all ACLs on the switch.

```
switch# show ip access-lists
IP Access List default-control-plane-acl [readonly]
        counters per-entry
        10 permit icmp any any
        20 permit ip any any tracked [match 1371, 0:00:00 ago]
        30 permit ospf any any
        40 permit tcp any any eq ssh telnet www snmp bgp https
        50 permit udp any any eq bootps bootpc snmp
        60 permit tcp any any eq mlag ttl eq 255
        70 permit udp any any eq mlag ttl eq 255
        80 permit vrrp any any
        90 permit ahp any any
        100 permit pim any any
        110 permit igmp any any [match 1316, 0:00:23 ago]
        120 permit tcp any any range 5900 5910

IP Access List list2
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 permit ip any host 10.20.10.1
        40 deny ip host 10.10.10.1 host 10.20.10.1
        50 permit ip any any

IP Access List test1
Switch(config)#
```

Displaying ACL Modifications

While editing an ACL in ACL-configuration mode, the show (ACL configuration modes) command provides options for displaying ACL contents.

- To display the list, as modified in ACL configuration mode, enter **show** or **show pending**.
- To display the list, as stored in ***running-config***, enter **show active**.
- To display differences between the pending list and the stored list, enter **show diff**.

Examples

The examples in this section assume these ACL commands were previously entered.

These commands are stored in the configuration:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to ***running-config***:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to ***running-config***:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

This command displays the pending ACL, as modified in ***ACL*** configuration mode.

```
switch(config-acl-test_1)# show pending
IP Access List test_1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.10.0.0/16 any
        25 permit tcp 10.10.20.0/24 any
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
        45 deny pim 239.24.124.0/24 10.5.8.4/30
        50 remark end of list
```

This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)#show active
IP Access List test_1
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.21.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
        50 remark end of list
```

This command displays the difference between the saved and modified ACLs.

- Rules added to the pending list are denoted with a plus sign (+).
- Rules removed from the saved list are denoted with a minus sign (-).

```
switch(config-acl-test_1)#show diff

13.4.2.2.5 Configuring Per-Port Per-VLAN QoS

To configure per-port per-VLAN QoS, first, configure the ACL policing for QoS, and then apply the policy-map on a single Ethernet or port-channel interfaces on a per-port per-VLAN basis. The per port per VLAN QoS allows a class-map to match traffic for a single VLAN or for a range of VLANs separated by commas. Per-port per-VLAN works with QoS-based class-maps only.

To configure per-port per-VLAN QoS on DCS-7280(R) and DCS-7500(R), change the TCAM profile to QoS as shown below.

1. Change the TCAM profile to QoS.

```
switch# config
switch(config)# hardware tcam profile qos
```

2. Create an ACL and then match the traffic packets based on the VLAN value and the VLAN mask configured in the ACL.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit vlan 100 0xfff ip any any
switch(config-acl-acl1)# exit
```

3. Similarly, create a class-map and then match the traffic packets based on the range of VLAN values configured in the class-map.

```
switch(config)# class-map match-any class1
switch(config-cmap-qos-class1)# match vlan 20-40, 1000-1250, 2000
switch(config-cmap-qos-class1)# exit
```

13.4.2.2.6 Displaying Per-Port Per-VLAN QoS

The following show commands display the status, traffic hit counts, tcam profile information, and policy-maps configured on an interface.

The **show policy-map** command displays the policy-map information of the configured policy-map.

Examples

-
```
switch# show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

- The **show policy-map interface** command displays the policy-map configured on an interface.

```
switch# show policy-map interface ethernet 1
Service-policy input: p1
Hardware programming status: Successful
Class-map: c2001 (match-any)
Match: vlan 2001 0xfff
set dscp 4
Class-map: c2002 (match-any)
Match: vlan 2002 0xfff
set dscp 8
Class-map: c2003 (match-any)
Match: vlan 2003 0xfff
set dscp 12
```

13.4.2.2.7 Configuring Mirror Access Control Lists

Access Control Lists (ACLs) are configured to permit or deny traffic between source and destination ports on Strata-based platforms. Mirror ACLs are used in mirroring traffic by matching VLAN ID of the configured ACLs. Mirror ACLs are applied for IPv4, IPv6, and MAC ACLs.

Note: Mirror ACLs work in receiving direction only.

Examples

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit vlan 1234 0x0 ip any any
```

- These commands configure monitor session ***sess1*** with ***Ethernet 1*** as source port and ***Ethernet 2*** as destination port for an ingress ip ***acl_1***.

```
switch(config)# monitor session sess1 source ethernet 1 rx ip access-
group acl1
switch(config)# monitor session sess1 destination ethernet 2
```

13.4.2.3 Applying ACLs

Access Control Lists become active when they are assigned to an interface or subinterface or to the control plane. This section describes the process of adding and removing ACL interface assignments.

Applying an ACL to an Interface

The switch must be in interface configuration mode to assign an ACL to an interface or subinterface.

- The ip access-group command applies the specified IP or standard IP ACL to the configuration mode interface or subinterface.
- The ip access-group command applies the specified IP or standard IP ACL to the conntrol-plane traffic.
- The mac access-group command applies the specified MAC ACL to the configuration mode interface.

IPv4, IPv6, and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned with multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. IPv6 egress ACLs have limited availability, and IPv6 egress ACLs applied to routed interfaces or subinterfaces across the same chip on the DCS-7500E and the DCS-7280E series can be shared. In addition to that, the DSCP value can match on IPv6 egress ACLs. This result in a more efficient utilization of system resources, and is particularly useful for environments with few, potentially large, IPv6 egress ACLs applied across multiple routed interfaces.

Examples

- These commands assign ***test1*** ACL to ***interface ethernet 3***, then verify the assignment.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# ip access-group test1 in
switch(config-if-Et3)# show running-config interfaces ethernet 3
interface Ethernet3
   ip access-group test1 in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and applies the ACL assignment to the control-plane traffic.

```
switch(config)# control-plane
switch(config-cp)# ip access-group test_cp in
```

- This command enables shared ACLs.

```
switch(config)# hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- This command disables shared ACLs.

```
switch(config)# no hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- These commands apply an IPv4 ACL named ***test_ACL*** to ingress traffic on ***interface ethernet 5.1***.

```
switch(config)# interface ethernet 5.1
switch(config-if-Et5.1)# ipv4 access-group test_ACL in
switch(config-if-Et5.1)#
```

Removing an ACL from an Interface

The **`no ip access-group`** command removes an IP ACL assignment statement from ***running-config*** for the configuration mode interface. After an ACL is removed, the interface is not associated with an IP ACL.

The **`no mac ip access-group`** command removes a MAC ACL assignment statement from ***running-config*** for the configuration mode interface. After a MAC ACL is removed, the interface is not associated with an MAC ACL.

To remove an ACL from the control plane, enter the **`no ip access-group`** command in control plane configuration mode. Removing the control plane ACL command from ***running-config*** reinstates **default-control-plane-acl** as the control plane ACL.

Examples

- These commands remove the assigned IPv4 ACL from ***interface ethernet 3***.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# no ip access-group test in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and remove the ACL assignment from ***running-config***, restoring **default-control-plane-acl** as the control plane ACL.

```
switch(config)# control-plane
switch(config-cp)# no ip access-group test_cp in
switch(config-cp)#
```

13.4.3 Service ACLs

These sections describe Service ACLs:

- Service Access Control List Description
- Configuring Service ACLs and Displaying Status and Counters

13.4.3.1 Service Access Control List Description

Service ACL enforcement is a feature added to a control plane service (the SSH server, the SNMP server, routing protocols, etc) that allows the switch administrator to restrict the processing of packets and connections by the control plane processes that implement that service. The control plane program run by the control plane process checks already received packets and connections against a user configurable Access Control List (ACL), a Service ACL. The Service ACL contains permit and deny rules matching any of the source address, destination address, and TCP or UDP ports of received packets or connections. After receiving a packet or connection, the control plane process evaluates the packet or connection against the rules of the Service ACL configured for the control plane process, and if the received packet or connection matches a deny rule the control plane process drops or closes it without further processing.

Control Plane Process Enforced Access Control enables the system administrator to restrict which systems on the network can access the services provided by the switch. Each service has its own access control list, giving the system administrator fine grained control over access to the switch's control plane services. The CLI for this uses the familiar pattern of access control lists assigned for a specific purpose, in this case for each control plane service.

13.4.3.2 Configuring Service ACLs and Displaying Status and Counters

13.4.3.2.1 SSH Server

To apply the SSH server Service ACLs for IPv4 and IPv6 traffic, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands in ***mgt-ssh*** configuration mode as shown below.

```
switch(config)# management ssh
switch(config-mgmt-ssh)# ip access-group <acl_name> [vrf
 <vrf_name>] inswitch(config-mgmt-ssh)#ipv6 access-group <acl_name> [vrf
 <vrf_name>] in
```

In ***Release EOS-4.19.0***, all VRFs are required to use the same SSH server Service ACL. The Service ACL assigned without the **vrf** keyword is applied to all VRFs where the SSH server is enabled.

To display the status and counters of the SSH server Service ACLs, use the following commands.

```
switch> show management ssh ip access-list
switch> show management ssh ipv6 access-list
```

13.4.3.2.2 SNMP Server

To apply the SNMP server Service ACLs to restrict which hosts can access SNMP services on the switch, use the snmp-server community command as shown below.

snmp-server community ***community-name*** [view ***viewname***] [ro | rw] ***acl_name***

snmp-server community ***community-name*** [view ***viewname***] [ro | rw] ipv6 ***ipv6_acl_name***

13.4.3.2.3 EAPI

To apply Service ACLs to the EOS application programming interface (EAPI) server, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# vrf <vrf_name>
switch(config-mgmt-api-http-cmds-vrf-<vrf>)# ip access-group <acl_name>
```

```
switch(config-mgmt-api-http-cmds-vrf-<vrf>)# ipv6 access-group
 <ipv6_acl_name>
```

To display the status and counters of the EAPI server Service ACLs, use the following commands.

```
switch> show management api http-commands ip access-list
switch> show management api http-commands ipv6 access-list
```

13.4.3.2.4 BGP

To apply Service ACLs for controlling connections to the BGP routing protocol agent, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
switch(config)# router bgp <asn>
switch(config-router-bgp)# ip access-group <acl_name>
switch(config-router-bgp)# ipv6 access-group <ipv6_acl_name>
switch(config-router-bgp)# vrf <vrf_name>
switch(config-router-bgp-vrf-<vrf>)# ip access-group <acl_name>
switch(config-router-bgp-vrf-<vrf>)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the BGP routing protocol Service ACLs, use the following commands.

```
switch> show bgp ipv4 access-list
switch> show bgp ipv6 access-list
```

13.4.3.2.5 UCMP auto adjust for BGP

UnequalCcost Multi-Path (UCMP) for BGP forwards traffic based on weight assignments for next hops of routes of ECMP traffic. The weights are programmed in the FIB. By disseminating BGP link-bandwidth extended community attribute information with BGP routes, the receiver device of all routes, programs the next hops in the FIB using the received link-bandwidth values. The percentage of interface speed is appended to the received link bandwidth extended community value of the route. The weight ratio of the traffic sent over egress ports is adjusted to forward more traffic towards the peer with higher interface speed.

Configuring UCMP auto adjust for BGP

The following command enables the weight adjustment.

This command configures the adjust auto to ***62.3*** percent.

```
switch(config-router-bgp)# neighbor group1 link-bandwidth adjust
 auto percent 62.3
```

PERCENT is a float value between ***0.0*** to ***100.0*** and is optional.

13.4.3.2.6 OSPF

To apply Service ACLs for controlling packets processed by the OSPF routing protocol agent, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
switch(config)# router ospf <id>
switch(config-router-ospf)# ip access-group <acl_name>
```

```
switch(config-router-ospf)# ipv6 access-group <ipv6_acl_name>
```

When using VRFs, each per-VRF OSPF instance must be assigned its Service ACL explicitly.

To display the status and counters of the OSPF routing protocol Service ACLs, use the following commands.

```
switch> show ospf ipv4 access-list
switch> show ospf ipv6 access-list
```

13.4.3.2.7 PIM

To apply Service ACLs for controlling packets processed by the PIM routing protocol agent, use the **access-group** command as shown below.

```
switch(config)# router pim
switch(config-router-pim)# ipv4
switch(config-router-pim-ipv4)# access-group <acl_name>
switch(config-router-pim-ipv4)# vrf <vrf_name>
switch(config-router-pim-vrf-<vrf>)# ipv4
switch(config-router-pim-vrf-<vrf>-ipv4)# access-group <acl_name>
```

To display the status and counters of the PIM routing protocol Service ACLs, use the following commands.

```
switch> show ip pim access-list
```

13.4.3.2.8 IGMP

To apply Service ACLs for controlling packets processed by the IGMP management protocol agent, use the **ip igmp access-group** command as shown below.

```
switch(config)# router igmp
switch(config-router-igmp)# ip igmp access-group <acl_name>
switch(config-router-igmp)# vrf <vrf_name>
switch(config-router-igmp-vrf-<vrf>)# ip igmp access-group <acl_name>
```

To display the status and counters of the IGMP management protocol Service ACLs, use the following commands.

```
switch> show ip igmp access-list
```

13.4.3.2.9 DHCP Relay

To apply Service ACLs for controlling packets processed by the DHCP relay agent, use the **ip dhcp relay access-group** and **ipv6 dhcp relay access-group** commands as shown below.

```
switch(config)# ip dhcp relay access-group <acl_name> [vrf <vrf_name>]
switch(config)# ipv6 dhcp relay access-group <acl_name> [vrf <vrf_name>]
```

To display the status and counters of the DHCP relay agent Service ACLs, use the following commands.

```
switch> show ip dhcp relay access-list
switch> show ipv6 dhcp relay access-list
```

13.4.3.2.10 LDP

To apply Service ACLs for controlling packets and connections processed by the LDP MPLS label distribution protocol, use the command as shown below.

ip access-group (Service ACLs)

```
switch(config)# mpls ldp
switch(config-mpls-ldp)# ip access-group <acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
switch> show mpls ldp access-list
```

13.4.3.2.11 LANZ

To apply Service ACLs for controlling connections accepted by the LANZ agent, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
switch(config)# queue-monitor streaming
switch(config-qm-streaming)# ip access-group <acl_name>
switch(config-qm-streaming)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
switch> show queue-monitor streaming access-lists
```

13.4.3.2.12 MPLS Ping and Traceroute

To apply Service ACLs for controlling connections accepted by the MPLS Ping agent, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
switch(config)# mpls ping
switch(config-mpls-ping)# ip access-group <acl_name> [vrf <vrf_name>]
switch(config-mpls-ping)# ipv6 access-group <ipv6_acl_name> [vrf
 <vrf_name>]
```

13.4.3.2.13 Telnet Server

To apply Service ACLs to the Telnet server, use the ip access-group (Service ACLs) and ipv6 access-group (Service ACLs) commands as shown below.

```
switch(config)# management telnet
switch(config-mgmt-telnet)# ip access-group <acl_name> [vrf <vrf_name>]
 in
switch(config-mgmt-telnet)# ipv6 access-group <ipv6_acl_name> [vrf
 <vrf_name>] in
```

In ***EOS 4.19.0***, all VRFs are required to use the same Telnet server Service ACL. The Service ACL assigned without the **vrf** keyword is applied to all VRFs where the Telnet server is enabled.

To display the status and counters of the LDP Service ACLs, use the following commands.

```
switch> show management telnet ip access-list
switch> show management telnet ipv6 access-list
```

13.4.4 Sub-interface ACLs

This Sub-interface ACLs feature enables ACL functionality on subinterfaces.

13.4.4.1 Configuring Sub-interface ACLs

Configure the ACLs on subinterfaces, use the following command:

ip|ipv6 access-group ***acl-name*** in | out

To unconfigure the ACLs on subinterfaces, use the following command:

no ip|ipv6 access-group in | out

13.4.4.2 Sub-interface ACLs Limitations

The sub-interface ACLs feature contains the following limitations:

- Egress IPv4 ACLs on subinterfaces are not supported when sharing mode is disabled for Egress IPv4 RACLs.
- Egress IPv6 ACL deny logging is not supported on subinterfaces.
- Blocking traffic while modifying ACLs is not supported on Egress IPv4 ACLs on subinterfaces.

13.4.4.3 Sub-interface ACLs Show Commands

The **show ip|ipv6 access-lists** displays the summary of a configured ACL including the subinterface on which the ACL is configured and active.

show ip|ipv6 access-lists ***acl-name*** summary

Examples

```
switch(config)# show ip access-lists acl1 summary
IPV4 ACL acl1
 Total rules configured: 1
 Configured on Ingress: Et5.1
 Active on Ingress: Et5.1
```

```
switch(config)# show ipv6 access-lists acl1 summary
IPV6 ACL acl1
 Total rules configured: 1
 Configured on Egress: Et5.1
 Active on Egress: Et5.1
```

13.4.5 RACL Sharing on SVIs

13.4.5.1 IPv4 Ingress Sharing

The IPv4 ingress sharing optimizes the utilization of hardware resources by sharing the hardware resources between different VLAN interfaces when they have same ACL attached.

Larger deployments are benefited with this function, where IPv4 ingress sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs and an ingress sharing is applied on all VLANs, it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 ingress sharing is disabled on the switches.

To enable IPv4 Ingress Sharing use **no hardware access-list resource sharing vlan in** command. Note, enabling or disabling the IPv4 ingress sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding. The **no** form of

the command disables the IPv4 ingress sharing on the switch. To display the IPv4 ingress sharing information use **show platform trident** command on the switch.

13.4.5.2 IPv4 Egress Sharing

The IPv4 Egress Sharing optimizes the utilization of hardware resources by sharing TCAM entries for a group of SVIs on which IPv4 ACLs shared. The TCAM entries are shared for all the SVIs per chip, hence, saving a lot of hardware resources and enabling ACLs to scale to a larger configurations.

Larger deployments are benefited, where IPv4 Egress Sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs, and when Egress Sharing is applied on all VLANs it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 Egress Sharing is enabled on the switches. However, both IPv4 Egress Sharing and uRPF cannot be enabled at the same time. Disabling IPv4 RACL sharing will allow uRPF configuration and make sure RACL configuration, non-shared mode, is configured at the same time.

To enable unicast Reverse Path Forwarding (uRPF) on the switche, the IPv4 Egress Sharing must me disabled using the **no hardware access-list resource sharing vlan ipv4 out** command.

To enable IPv4 Egress Sharing if previously disabled from the default configuration, use hardware access-list resource sharing vlan ipv4 out command. Note, enabling or disabling the IPv4 Egress Sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding.

The following **show** commands can be used to verify the IPv4 Egress Sharing information on the switch.

- show ip access-lists
- show vlan
- show platform arad acl tcam
- show ip route
- show platform arad ip route

13.4.5.3 Configuring IPv4 Egress Sharing

Use **hardware access-list resource sharing vlan ipv4 out** command to enable the IPv4 Egress Sharing on the switch. By default, IPv4 Egress Sharing is enabled on the switche.The **no** form of the command disables the IPv4 Egress Sharing on the switch and user is allowed to configure the uRPF on the switch.

13.4.5.4 Displaying IPv4 Egress Sharing Information

Examples

- The show ip access-lists command displays the list of all the configured IPv4 ACLs.

```
switch# show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
 Total rules configured: 17
 Configured on Ingress: control-plane(default VRF)
 Active on Ingress: control-plane(default VRF)

IPV4 ACL ipAclLimitTest
 Total rules configured: 0
 Configured on Egress: Vl2148,2700
 Active on Egress: Vl2148,2700
```

- The **show vlan** command displays the list of all the member interfaces under each SVI.

```
switch# show vlan
VLAN  Name            Status    Ports
----- --------------- --------- -----------------
1     default         active
2148  VLAN2148        active    Cpu, Et1, Et26
2700  VLAN2700        active    Cpu, Et18
```

- The show platform arad acl tcam command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC and the percentage of TCAM utilization per forwarding ASIC.

```
switch# show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries,
 direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
Bank Offset Entries
0         0       1
Fap: Arad1, Shared: true, Interfaces: Vl2148
Bank Offset Entries
0         0       1

switch# show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.
============================================================
Arad0:
============================================================
 Bank   Used                  Used %             Used By
    0      1                       0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
============================================================
Arad1:
============================================================
 Bank   Used                   Used %             Used By
    0      1                        0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
```

- The **show ip route** command displays the unicast ip routes installed in the system.

```
switch# show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel,
 O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
 E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
 N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
 R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary,
 NG - Nexthop Group Static Route

Gateway of last resort is not set
 C 10.1.0.0/16 is directly connected, Vlan2659
 C 10.2.0.0/16 is directly connected, Vlan2148
 C 10.3.0.0/16 is directly connected, Vlan2700
 S 172.17.0.0/16 [1/0] via 172.24.0.1, Management1

13.4.6 Route Maps

A route map is an ordered set of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

13.4.6.1 Route Map Description

Route maps are composed of route map statements, each of which consists of a list of match and set commands.

Route Map Statements

Route map statements are categorized by the resolution of routes that the statement filters.

- Permit statements facilitate the redistribution of matched routes.
- Deny statements prevent the redistribution of matched routes.

Route map statement elements include name, sequence number, filter type, match commands, set commands, and continue commands.

- ***name*** identifies the route map to which the statement belongs.
- ***sequence number*** designates the statement's placement within the route map.
- **filter type** specifies the route resolution. Valid types are **permit** and **deny**.
- **match commands** specify criteria that select routes that the statement is evaluating for redistribution.
- **set commands** modify route parameters for redistributed routes.
- **continue commands** prolong the route map evaluation of routes that match a statement.

Statements filter routes for redistribution. Routes that statements pass are redistributed (permit statements) or rejected (deny statements). Routes that statements fail are filtered by the next statement in the route map.

- When a statement does not contain a **`match`** command, the statement passes all routes.
- When a statement contains a single **`match`** command that lists a single object, the statement passes routes whose parameters match the object.
- When a statement contains a single **`match`** command that lists multiple objects, the statements passes routes whose parameters match at least one object.
- When a statement contains multiple **`match`** commands, the statement passes routes whose parameters match all match commands.

`Set` commands modify parameters for redistributed routes. **`Set`** commands are valid in permit statements.

Example

The following route map statement is named ***MAP_1*** with sequence number ***10***. The statement matches all routes from BGP Autonomous System 10 and redistributes them with a local preference set to ***100***. Routes that do not match the statement are evaluated against the next statement in the route map.

```
switch# route-map MAP_1 permit 10
   match as 10
   set local-preference 100
```

Route Maps with Multiple Statements

A route map consists of statements with the same name and different sequence numbers. Statements filter routes in ascending order of their sequence numbers. When a statements passes a route, the

redistribution action is performed as specified by the filter type and all subsequent statements are ignored. When the statement fails the route, the statement with the smallest sequence number that is larger than the current one filters the route.

All route maps have an implied final statement that contains a single deny statement with no match command. This denies redistribution to routes that are not passed by any statement.

Example

The following route map is named ***MAP_1*** with two permit statements. Routes that do not match either statement are denied redistribution into the target protocol domain.

```
switch# route-map MAP_1 permit 10
   match as 10
   set local-preference 100
!
switch# route-map MAP_1 permit 20
   match metric-type type-1
   match as 100
```

Route Map Configuration describes route map configuration procedures.

Route Maps with Multiple Statements and Continue Commands

Route map statements that contain a **continue (route map)** command support additional route map evaluation of routes whose parameters meet the statement's match commands. Routes that match a statement containing a **`continue`** command are evaluated against the statement specified by the **`continue`** command.

When a route matches multiple route map statements, the filter action (deny or permit) is determined by the last statement that the route matches. The **`set`** commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statements containing them.

Example

The following route map is named ***MAP_1*** with a permit statement and a deny statement. The permit statement contains a continue command. Routes that match statement 10 are evaluated against statement 20.

```
route-map MAP_2 permit 10
   match as 10
   continue 20
   set local-preference 100
!
route-map MAP_2 deny 20
   match metric-type type-1
   match as 100
```

The route is redistributed if it passes statement 10 and is rejected by statement 20. The route is denied redistribution in all other instances. The **`continue`** command guarantees the evaluation of all routes against both statements.

13.4.6.2 Route Map Configuration

Route maps are created and modified in route map configuration mode. These sections describe the configuration mode and its commands.

- Route Map Creation and Editing
- Modifying Route Map Components

13.4.6.2.1 Route Map Creation and Editing

Creating a Route Map Statement

To create a route map, enter route-map followed by the map name and filter type (**deny** or **permit**). The default sequence number is assigned to the statement if the command does not include a number.

Example

This command places the switch in ***route map*** configuration mode to create a route map statement named *map1* with a sequence number of ***50***.

```
switch(config)# route-map map1 permit 50
switch(config-route-map-map1)#
```

Editing a Route Map Statement

To edit an existing route map statement, enter route-map with the map's name and statement's number. The switch enters route map configuration mode for the statement. Subsequent match (route-map) and set (route-map) commands add the corresponding commands to the statement.

The **show** command displays contents of the existing route map.

Example

This command places the switch in route map configuration mode to edit an existing route map statement. The **show** command displays contents of all statements in the route map.

```
switch(config)# route-map MAP2
switch(config-route-map-MAP2)#show
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
switch(config-route-map-MAP2)#
```

Saving Route Map Modifications

Route map configuration mode is a group-change mode. Changes are saved by exiting the mode, either with an explicit **exit** command or by switching directly to another configuration mode. This includes switching to the configuration mode for a different route map.

Example

The first command creates the ***map1*** statement with sequence number of 10. The second command is not yet saved to the route map, as displayed by the **show** command.

```
switch(config)# route-map map1 permit
switch(config-route-map-map1)# match as 100
switch(config-route-map-map1)# show

switch(config-route-map-map1)#
```

The **exit** command saves the **match** command.

```
switch(config-route-map-map1)# exit
switch(config)# show route-map map1
route-map map1 permit 10
```

```
  Match clauses:
    match as 100
  Set clauses:
switch(config)#
```

Discarding Route Map Modifications

The **abort** command discards all pending changes and exits route map configuration mode.

Example

The **abort** command discards the pending **match** command and restores the original route map.

```
switch(config)# route-map map1 permit
switch(config-route-map-map1)# match as 100
switch(config-route-map-map1)# abort
switch(config)# show route-map map1
switch(config)#
```

13.4.6.2.2 Modifying Route Map Components

These commands add rules to the configuration mode route map:

- match (route-map) adds a match rule to a route map.
- set (route-map) adds a set rule to a route map.

Inserting a Statement

To insert a new statement into an existing route map, create a new statement with a sequence number that differs from any existing statement in the map.

Example

This command adds statement 50 to the ***Map1*** route map, then displays the new route map.

```
switch(config)# route-map Map1 permit 50
switch(config-route-map-Map1)# match as 150
switch(config-route-map-Map1)#exit
switch(config)#show route-map Map1
route-map Map1 deny 10
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
route-map Map1 permit 50
  Match clauses:
    match as 150
  Set clauses:
switch(config)#
```

Deleting Route Map Components

To remove a component from a route map, perform one of the following:

- To remove a command from a statement, enter **no**, followed by the command to be removed.
- To remove a statement, enter no, followed by the route map with the filter type and the sequence number of the statement to be removed.
- To remove a route map, enter **no** followed by the route map without a sequence number.

13.4.6.3 Using Route Maps

Protocol redistribution commands include a route map parameter that determines the routes to be redistributed into the specified protocol domain.

Example

This command uses ***Map1*** route map to select OSPFv2 routes for redistribution into BGP AS1.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute ospf route-map Map1
switch(config-router-bgp)# exit
switch(config)#
```

13.4.7 Prefix Lists

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rules consists of a filter action (deny or permit), an address space identifier (IPv4 subnet address or IPv6 prefix), and a sequence number.

Prefix lists are referenced by route map match commands when filtering routes for redistribution.

- Prefix List Configuration describes the prefix list configuration process.
- Using Prefix Lists describes the use of prefix lists.
- Static Routes Redistribution into IGPs describes redistribution of routes whose configured next-hops satisfy the route-map policy.

13.4.7.1 Prefix List Configuration

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), a network address (IPv4 subnet or IPv6 prefix), and a sequence number. A rule may also include a alternate mask size.

The switch supports IPv4 and IPv6 prefix lists. The switch is placed in a Prefix-list configuration mode to create and edit IPv4 or IPv6 prefix lists.

13.4.7.1.1 IPv4 Prefix Lists

IPv4 prefix lists are created or modified by adding an IPv4 prefix list rule in the Prefix-list configuration mode. Each rule includes the name of a prefix list, in addition to the sequence number, network address, and filter action. A list consists of all rules that have the same prefix list name.

The ip prefix-list command creates a prefix list or adds a rule to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

Creating an IPv4 Prefix List

To create an IPv4 prefix list, enter the ip prefix-list command, followed by the name of the list. The switch enters ***IPv4 prefix-list*** configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Examples

- This command places the switch in ***IPv4 prefix list*** configuration mode to create an IPv4 prefix list named route-one.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named ***route-one***.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)# seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)# seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)# seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)# seq 40 deny 1.1.1.0/24
```

To view the list, save the rules by exiting the ***Prefix-list*** command mode, then re-enter the configuration mode and type **`show active`**.

```
switch(config-ip-pfx)# exit
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)# show active
ip prefix-list route-one
```

```
   seq 10 deny 10.1.1.0/24
   seq 20 deny 10.1.0.0/16
   seq 30 permit 12.15.4.9/32
   seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)# ip prefix-list route-one
```

IPv4 prefix lists are referenced in match (route-map) command.

13.4.7.1.2 IPv6 Prefix Lists

Creating an IPv6 Prefix List

The switch provides ***IPv6 prefix-list*** configuration mode for creating and modifying IPv6 prefix lists. A list can be edited only in the mode where it was created.

To create an IP ACL, enter the ipv6 prefix-list command, followed by the name of the list. The switch enters ***IPv6 prefix-list*** configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Example

This command places the switch in ***IPv6 prefix list*** configuration mode to create an IPv6 prefix list named ***map1***.

```
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)#
```

Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ***Prefix-List*** configuration mode for the list. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

Example

These commands enter the first two rules into a new prefix list.

```
switch(config-ipv6-pfx)# permit 3:4e96:8ca1:33cf::/64
switch(config-ipv6-pfx)# permit 3:11b1:8fe4:1aac::/64
```

To view the list, save the rules by exiting the ***prefix-list*** command mode, then re-enter the configuration mode and type **`show active`**.

```
switch(config-ipv6-pfx)# exit
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)# show active
ipv6 prefix-list map1
   seq 10 permit 3:4e96:8ca1:33cf::/64
   seq 20 permit 3:11b1:8fe4:1aac::/64
switch(config-ipv6-pfx)#
```

This command appends a rule to the end of the prefix list. The new rule's sequence number is ***30***.

```
switch(config-ipv6-pfx)# permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)# exit
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)# show active
ipv6 prefix-list map1
   seq 10 permit 3:4e96:8ca1:33cf::/64
```

```
   seq 20 permit 3:11b1:8fe4:1aac::/64
   seq 30 permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#
```

Inserting a Rule

To insert a rule into a prefix list, use the **seq (IPv6 Prefix Lists)** command to enter a rule with a sequence number that is between numbers of two existing rules.

Example

This command inserts a rule between the first two rules by assigning it the sequence number ***15***.

```
switch(config-ipv6-pfx)# seq 15 deny 3:4400::/64
switch(config-ipv6-pfx)# exit
switch(config)# show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

Deleting a Rule

To remove a rule from the configuration mode prefix list, enter **no seq** (see **seq (IPv6 Prefix Lists)**), followed by the sequence number of the rule to be removed.

Example

These commands remove rule 20 from the prefix list, then displays the resultant prefix list.

```
switch(config-ipv6-pfx)# no seq 20
switch(config-ipv6-pfx)# exit
switch(config)# show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

13.4.7.2 Using Prefix Lists

Route map match commands include an option that matches a specified prefix list.

Example

The ***MAP_1*** route map uses a match command that references the ***PL_1*** prefix list.

```
switch(config)# route-map MAP_1 permit
switch(config-route-map-MAP_1)# match ip address prefix-list PL_1
switch(config-route-map-MAP_1)# set community 500
switch(config-route-map-MAP_1)# exit
```

13.4.7.3 Static Routes Redistribution into IGPs

Use **match ip next-hop** route-map, while redistributing static routes into IGPs to redistribute the static routes whose **configured** next-hops satisfies the route-map policy.

The following example applies match ip next-hop clause for static routes redistributed into IGPs for multi-agent mode as well. The following configures a static route.

```
switch(config)# ip route 10.20.30.0/24 1.2.3.4
```

The following configures a prefix-list.

```
switch (config)# ip prefix-list prefixListName
switch(config-ip-pfx)# permit 1.2.3.4/32
```

1.2.3.4 is a **configured** next-hop for static route ***10.20.30.0/24***.

The following configures a route map.

```
switch(config)# route-map routeMapName
switch(config-route-map-routeMapName)# match ip next-hop prefix-list
 prefixListName
```

To redistribute static routes with ‘match ip next-hop’ route-map clause in IS-IS.

```
switch(config-router-isis)# redistribute static route-map routeMapName
```

Redistributed routes can be seen using the following show commands. If routes are redistributed into IS-IS then **`show isis database detail`**If routes are redistributed into OSPFv2 then **`show ip ospf database detail`**.

```
switch# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

13.4.8 Port ACLs with User-Defined Fields

Describes the support for specifying User-Defined Fields (UDF) in Port ACLs including IPv4, IPv6, and MAC ACLs. The purpose of the User-Defined Fields feature is to permit or deny packets based on custom offset pattern matching.

User-Defined Fields, or UDFs, are defined as part of an access-list filter and are comprised of an offset, length, pattern match and mask. This describes a single portion of any incoming packet to match the provided value upon.

UDFs may also be defined via aliases. Aliases are a way to save a UDF configuration for reuse in multiple access-lists and or access-list rules. An alias may substitute for a fully defined UDF including the offset, pattern and mask. The pattern or mask may be overridden when the alias is used in an access-list rule.

The behavior, CLI syntax and configuration of UDFs are identical to Traffic Steering UDF and Mirroring ACL UDF.

This section describes port ACLs with user-defined fields, including configuration instructions. Topics covered by this section include:

- Configuring Port ACLs with User-Defined Fields
- Port ACLs with User-Defined Fields Limitations

13.4.8.1 Configuring Port ACLs with User-Defined Fields

User-Defined Fields are specified as part of an access-list. The type of access-list however, dictates the base position of the UDF and the options available. In addition, a TCAM profile must be configured to include UDFs as part of the Port ACL feature's key.

13.4.8.1.1 TCAM Profile

User-Defined Fields are defined as additional fields in the Port ACL feature's key. By default, UDFs are not included in the keys for the Port ACL features. Adding a UDF to the key requires removal of different key fields to fit within the TCAM width restrictions.

Note: Each UDF is either 16 bits wide or 32 bits wide.

Below are example configurations of the TCAM profile.

13.4.8.1.1.1IPv4 Port ACL

The following configurations create a new profile based on the default profile. This new profile replaces the Layer 4 port key fields with one 16-bit UDF and one 32-bit UDF.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile ipv4Udf copy default
switch(config-hw-tcam-profile-ipv4Udf)# feature acl port ip
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# no key field
 l4-ops
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# no key field
 l4-src-port
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# no key field
 l4-dst-port
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# key field
 udf-16b-1
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# key field
 udf-32b-1
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# exit
switch(config-hw-tcam-profile-ipv4Udf)# exit
```

```
switch(config-hw-tcam)# system profile ipv4Udf
```

Example-16-bit IPv4 Header Match

The following configurations match IPv4 packets based on the Identification(ID) field. Packets ingressing into ***interface ethernet 7*** with an ID equal to ***1000*** is forwarded. Packets with an ID different than ***1000*** is dropped.

```
(config)# ip access-list udfAcl
(config-acl-udfAcl)# permit ip any any payload header start offset 1
 pattern 0x03E80000 mask 0x0000FFFF
(config-acl-udfAcl)# deny ip any any
(config-acl-udfAcl)# exit
(config)# interface ethernet 7
(config-if-Et7)#
```

13.4.8.1.1.2IPv6 Port ACL

The following configurations create a new profile based on the default profile. This new profile replaces the destination IPv6 address key field with two 32-bit UDFs.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile ipv6Udf copy default
switch(config-hw-tcam-profile-ipv6Udf)# feature acl port ipv6
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# no key
 field dst-ipv6
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# key field
 udf-32b-1
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# key field
 udf-32b-2
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# exit
switch(config-hw-tcam-profile-ipv6Udf)# exit
switch(config-hw-tcam)# system profile ipv6Udf
```

Example-32-bit IPv6 Payload Match

The following configurations match IPv6 UDP packets based on the first 32 bits of the packet payload. UDP packets ingressing into ***interface ethernet 7*** that starts with ***0x1234567X*** (where X can be any valid hexadecimal) in the payload are forwarded. Any other packets are dropped. The offset is set to 2 (2 x 4-byte words) to skip the UDP header.

```
(config)# ipv6 access-list udfAcl
(config-ipv6-acl-udfAcl)# permit udp any any payload offset 2 pattern
 0x12345670 mask 0x0000000f
(config-ipv6-acl-udfAcl)# deny ipv6 any any
(config-ipv6-acl-udfAcl)# exit
(config)# interface ethernet 7
(config-if-Et7)# ipv6 access-group udfAcl in
```

13.4.8.2 Port ACLs with User-Defined Fields Limitations

User-defined fields consume a limited set of copy resources. For each unique offset, if a pattern is specified that is masked to be > 16 bits wide, then a 32-bit resource is used. If no 32-bit resource is available, then two 16-bit resources are used, if available. Copy resources are dependent upon the number of UDF key fields added to the feature key. Each UDF key field maps to one copy resource. Using the above TCAM profile configurations:

- IPv4: 1 x 16-bit pattern + 1 x 32-bit pattern.
- IPv6: 2 x 32-bit pattern.
- MAC: 1 x 16-bit pattern + 1 x 32-bit pattern.

Other limitations include:

- Maximum offset value is ***31***, which is 31 4-byte words, or 124 bytes.
- UDFs only work on ingress Port ACLs.

13.4.9 ACL, Route Map, and Prefix List Commands

This section describes CLI commands that this chapter references.

ACL Creation and Access Commands

- hardware access-list resource sharing vlan in
- hardware access-list resource sharing vlan ipv4 out
- ip access-list
- ip access-list standard
- ipv6 access-list
- ipv6 access-list standard
- mac access-list
- system profile

ACL Implementation Commands

- ip access-group
- ipv6 access-group
- mac access-group

Service ACL Implementation Commands

- ip access-group (Service ACLs)
- ipv6 access-group (Service ACLs)

ACL Edit Commands

- counters per-entry (ACL configuration modes)
- hardware access-list update default-result permit
- no <sequence number> (ACLs)
- resequence (ACLs)
- show (ACL configuration modes)

ACL Rule Commands

- deny (IPv4 ACL)
- deny (IPv6 ACL)
- deny (MAC ACL)
- deny (Standard IPv4 ACL)
- deny (Standard IPv6 ACL)
- permit (IPv4 ACL)
- permit (IPv6 ACL)
- permit (MAC ACL)
- permit (Standard IPv4 ACL)
- permit (Standard IPv6 ACL)
- remark

ACL List Counter Commands

- clear ip access-lists counters
- clear ipv6 access-lists counters
- hardware counter feature acl out

ACL Display Commands

- show ip access-lists
- show ipv6 access-lists
- show mac access-lists

Prefix List Creation and Access Commands

- ip prefix-list
- ipv6 prefix-list

Prefix List Edit Commands

- deny (IPv6 Prefix List)
- permit (IPv6 Prefix List)
- seq (IPv6 Prefix Lists)

Prefix List Display Commands

- show hardware tcam profile
- show ip prefix-list
- show ipv6 prefix-list
- show platform arad acl tcam
- show platform arad acl tcam summary
- show platform arad mapping
- show platform fap acl
- show platform fap acl tcam
- show platform fap acl tcam hw
- show platform fap acl tcam summary
- show platform trident tcam

Route Map Creation and Access Command

- route-map

Route Map Edit Commands

- continue (route map)
- description (route map)
- match (route-map)
- set (route-map)
- set as-path prepend
- set as-path match
- set community (route-map)
- set extcommunity (route-map)

Route Map Display Commands

- show route-map

13.4.9.1 clear ip access-lists counters

The **clear ip access-lists counters** command sets ACL counters to zero for the specified IPv4 Access Control List (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

Command Mode

Privileged EXEC

Command Syntax

clear ip access-lists counters [**ACL_NAME**][**SCOPE**]

Parameters

- **ACL_NAME** Name of ACL. Options include:
  - ***no parameter*** all ACLs.
  - ***access_list*** name of ACL.
- **SCOPE** Session affected by command. Options include:
  - ***no parameter*** command affects counters on all CLI sessions.
  - **session** affects only current CLI session.

Example

This command resets all IPv4 ACL counters.

```
switch(config)# clear ip access-lists counters
switch(config)#
```

13.4.9.2 clear ipv6 access-lists counters

The **clear ipv6 access-lists counters** command sets ACL counters to zero for the specified IPv6 Access Control List (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 access-lists counters [**ACL_NAME**][**SCOPE**]

Parameters

- **ACL_NAME** name of ACL. Options include:
  - ***no parameter*** all IPv6 ACLs.
  - ***access_list*** name of IPv6 ACL.
- **SCOPE** Session affected by command. Options include:
  - ***no parameter*** command affects counters on all CLI sessions.
  - **session** affects only current CLI session.

Example

This command resets all IPv6 ACL counters.

```
switch(config)# clear ipv6 access-lists counters
switch(config)#
```

13.4.9.3 continue (route map)

The **continue** command creates a route map statement entry that enables additional route map evaluation of routes whose parameters meet the statement's matching criteria.

A statement typically contains a match (route-map) and a set (route-map) command. The evaluation of routes whose settings are the same as **match** command parameters normally ends and the statement's **set** commands are applied to the route. Routes that match a statement containing a **continue** command are evaluated against the statement specified by the continue command.

When a route matches multiple route map commands, the filter action (**deny** or **permit**) is determined by the last statement that the route matches. The **set** commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statement containing them.

The **no continue** and **default continue** commands remove the corresponding **continue** command from the configuration mode *route map* statement by deleting the corresponding command from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

continue NEXT_SEQ

no continue NEXT_SEQ

default continue NEXT_SEQ

Parameters

NEXT_SEQ Specifies next statement for evaluating matching routes. Options include:

- ***no parameter*** Next statement in the route map, as determined by sequence number.
- ***seq_number*** Specifies the number of the next statement. Values range from ***1*** to ***16777215***.

Restrictions

A **continue** command cannot specify a sequence number smaller than the sequence number of its route map statement.

Related Command

route-map command enters ***route map*** configuration mode.

Example

This command creates route map ***map1***, statement ***40*** with a match command, a set command, and a continue command. Routes that match the statement are subsequently evaluated against statement ***100***. The **set local-preference** command is applied to matching routes regardless of subsequent matching operations.

```
switch(config)# route-map map1 deny 40
switch(config-route-map-map1)# match as 15
switch(config-route-map-map1)# continue 100
switch(config-route-map-map1)# set local-preference 50
switch(config-route-map-map1)#
```

13.4.9.4 counters per-entry (ACL configuration modes)

The **counters per-entry** command places the ACL in counting mode. In counting mode, the feature generally displays the number of instances each rule in the list matches an inbound packet and the elapsed time since the last match. However, for certain select platforms, in addition to the packet counter, ACL counters can also be enabled for byte counts when applied to data plane ACLs. A complete list of platforms that support byte count for data plan ACLs are listed below:

Note: Byte counting is supported only for data plane ACLs.

Only the below platforms support ACL byte counting

- CCS-710/720/722/755/758 series
- DCS-7010TX
- DCS-7050SX3/CX3/TX3/CX4/DX4/PX4
- DCS-7060 Series
- DCS-7300X3/7304X3/7308X3/7316/7320X/7324/7328/7358X4/7368/7388

On the FM6000 platform, this command has no effect when used in an ACL that is part of a PBR class map.

The **no counters per-entry** and **default counters per-entry** commands place the ACL in non-counting mode.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

counters per-entry

no counters per-entry

default counters per-entry

Examples

- This command places the ***test1*** ACL in counting mode.

```
switch(config)# ip access-list test1
switch(config-acl-test1)# counters per-entry
switch(config-acl-test1)#
```

- This command displays the ACL, with counter information, for an ACL in counting mode.

```
switch# show ip access-lists
IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 12041 packets, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https [match 11
 packets, 1:41:07 ago]
  50 permit udp any any eq bootps bootpc snmp rip [match 78 packets,
 0:00:27 ago]
  60 permit tcp any any eq mlag ttl eq 255
```

```
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 14 packets, 0:23:27 ago]
  120 permit tcp any any range 5900 5910
  130 permit tcp any any range 50000 50100
  140 permit udp any any range 51000 51100
```

- On the platforms that support byte counting, counter information is displayed as shown below:

```
switch#show ip access-lists
IP Access List default-control-plane-acl [readonly]
        counters per-entry
        10 permit icmp any any [match 30 packets, 0:02:08 ago]
        20 permit ip any any tracked [match 97777 packets, 0:00:00 ago]
        30 permit udp any any eq bfd ttl eq 255
        40 permit udp any any eq bfd-echo ttl eq 254
        50 permit udp any any eq multihop-bfd micro-bfd sbfd
        60 permit udp any eq sbfd any eq sbfd-initiator
        70 permit ospf any any
        80 permit tcp any any eq ssh telnet www snmp bgp https msdp ldp
 netconf-ssh gnmi [match 72 packets, 0:00:00 ago]
        90 permit udp any any eq bootps bootpc snmp rip ntp ldp ptp-
event ptp-general
        100 permit tcp any any eq mlag ttl eq 255
        110 permit udp any any eq mlag ttl eq 255
        120 permit vrrp any any
        130 permit ahp any any
        140 permit pim any any

IP Access List ipCountersTest:The ipCountersTest ACL is applied to the
 data plane. Hence, it displays the byte count information as shown
 below:
        counters per-entry
        10 permit tcp host 10.1.1.1 range 2000 4000 host 10.2.1.1
 [match 486 bytes in 3 packets, 0:00:26 ago]
        20 permit tcp host 10.1.1.1 range 14000 16000 host 10.2.1.1
 [match 486 bytes in 3 packets, 0:00:18 ago]
        30 permit udp host 10.1.1.1 range 62000 64000 host 10.2.1.1
 [match 450 bytes in 3 packets, 0:00:00 ago]
        40 permit tcp host 10.1.1.1 range 50000 52000 host 10.2.1.1
 [match 486 bytes in 3 packets, 0:00:02 ago]
        50 permit tcp host 10.1.1.1 range 38000 40000 host 10.2.1.1
 [match 486 bytes in 3 packets, 0:00:10 ago]
        60 permit tcp host 10.1.1.1 range 26000 28000 host 10.2.1.1
 [match 486 bytes in 3 packets, 0:00:18 ago]
```

13.4.9.5 deny (IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode IPv4 Access Control List (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny PROTOCOL SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][**fragments**][**tracked**][**DSCP_FILTER**][**TTL_FILTER**][log]

no deny PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**][**FLAGS**] [**MESSAGE**][**fragments**][**tracked**][**DSCP_FILTER**][**TTL_FILTER**][log]

default deny PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][**fragments**][**tracked**][**DSCP_FILTER**][**TTL_FILTER**][log]

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding 10 to the number of the ACL's last rule.
  - ***14294967295*** Number assigned to entry.
- **PROTOCOL** protocol field filter. Values include:
  - **ahp** Authentication Header Protocol (51).
  - **icmp** Internet Control Message Protocol (1).
  - **igmp** Internet Group Management Protocol (2).
  - **ip** Internet Protocol v4 (4).
  - **ospf** Open Shortest Path First (89).
  - **pim** Protocol Independent Multicast (103).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User datagram protocol (17).
  - **vrrp** Virtual Router Redundancy Protocol (112).
  - ***protocol_num*** Integer corresponding to an IP protocol. Values range from ***0*** to ***255***.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***network_addr*** Subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

  Subnet addresses support discontiguous masks.
- **SOURCE_PORT** and **DEST_PORT** Source and destination port filters. Options include:
  - **any** All ports.
  - **eq *port-1 port-2*** ... ***port-n*** A list of ports. Maximum list size is 10 ports.
  - **neq *port-1 port-2*** ... ***port-n*** The set of all ports not listed. Maximum list size is 10 ports.
  - **gt *port*** The set of ports with larger numbers than the listed port.
  - **lt *port*** The set of ports with smaller numbers than the listed port.

    - **range *port_1 port_2*** The set of ports whose numbers are between the range.
- **fragments** Filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
    - ***no parameter*** Rule does not use DSCP to filter packets.
    - **dscp *dscp_value*** Packets match if DSCP field in packet is equal to ***dscp_value***.
- **TTL_FILTER** Rule filters packet by its TTL (time-to-live) value. Values include:
    - **ttl eq *ttl_value*** Packets match if **ttl** in packet is equal to ***ttl_value***.
    - **ttl gt *ttl_value*** Packets match if **ttl** in packet is greater than ***ttl_value***.
    - **ttl lt *ttl_value*** Packets match if **ttl** in packet is less than ***ttl_value***.
    - **ttl neq *ttl_value*** Packets match if **ttl** in packet is not equal to ***ttl_value***.
        - Valid in ACLs applied to the control plane.
        - Validity in ACLs applied to data plane varies by switch platform.
- **log** Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops OSPF packets from ***10.10.1.1/24*** to any host.

```
switch(config)# ip access-list text1
switch(config-acl-text1)# deny ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a **deny** statement with the sequence number 65. The **deny** statement drops all PIM packets.

```
switch(config-acl-text1)# 65 deny pim any any
switch(config-acl-text1)#
```

13.4.9.6 deny (IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode IPv6 Access Control List (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny PROT SRC_ADDR** [**SRC_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**] [**MSG**][**hop**] [**tracked**][**DSCP_FILTER**] [log]

no deny PROT SRC_ADDR [**SOURCE_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**][**MSG**][**hop**][**tracked**] [**DSCP_FILTER**][log]

default deny PROT SRC_ADDR [**SOURCE_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**][**MSG**] [**hop**] [**tracked**][**DSCP_FILTER**][log]

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **PROT** Protocol field filter. Values include:
  - **icmpv6** Internet Control Message Protocol for version 6 (58).
  - **ipv6** Internet Protocol IPv6 (41).
  - **ospf** Open Shortest Path First (89).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User Datagram Protocol (17).
  - ***protocol_num*** Integer corresponding to an IP protocol. Values range from ***0*** to ***255***.
- **SRC_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***ipv6_prefix*** IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host *ipv6_addr*** IPv6 host address.
- **SRC_PT** and **DEST_PT** Source and destination port filters. Options include:
  - **any** All ports.
  - **eq *port-1 port-2*** ... ***port-n*** A list of ports. Maximum list size is 10 ports.
  - **neq *port-1 port-2*** ... ***port-n*** The set of all ports not listed. Maximum list size is 10 ports.
  - **gt *port*** The set of ports with larger numbers than the listed port.
  - **lt *port*** The set of ports with smaller numbers than the listed port.
  - **range *port_1 port_2*** The set of ports whose numbers are between the range.
- **HOP** Filters by packet's hop-limit value. Options include:
  - ***no parameter*** Rule does not use hop limit to filter packets.
  - **hop-limit eq *hop_value*** Packets match if **hop-limit** value in packet equals ***hop_value***.
  - **hop-limit gt *hop_value*** Packets match if **hop-limit** in packet is greater than ***hop_value***.

    - **hop-limit lt *hop_value*** Packets match if **hop-limit** in packet is less than ***hop_value***.
    - **hop-limit neq *hop_value*** Packets match if **hop-limit** in packet is not equal to ***hop_value***.
- **FLAG** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MSG** Message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
    - ***no parameter*** Rule does not use DSCP to filter packets.
    - **dscp *dscp_value*** Packets match if DSCP field in packet is equal to ***dscp_value***.
- **log** Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops IPv6 packets from ***3710:249a:c643:ef11::/64*** to any host.

```
switch(config)# ipv6 access-list text1
switch(config-acl-text1)# deny ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-text1)#
```

13.4.9.7 deny (IPv6 Prefix List)

The **deny** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are denied access when they match the prefix that a **deny** statement specifies.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode prefix list. The **no** seq (IPv6 Prefix Lists) command also removes the specified rule from the prefix list.

Command Mode

IPv6-pfx Configuration

Command Syntax

[**SEQUENCE**] **deny** ***ipv6_prefix*** [**MASK**]

Parameters

- **SEQUENCE** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the list's last rule.
  - **seq** ***seq_num*** Number is specified by ***seq_num***. Value ranges from ***0 to 65535***.
- ***ipv6_prefix*** IPv6 prefix upon which command filters routes (CIDR notation).
- **MASK** Range of the prefix to be matched.
  - ***no parameter*** Exact match with the subnet mask is required.
  - **eq** ***mask_e*** Prefix length is equal to ***mask_e***.
  - **ge** ***mask_g*** Range is from ***mask_g*** to ***128***.
  - **le** ***mask_l*** Range is from ***subnet*** mask length to ***mask_l***.
  - **ge** ***mask_l*** **le** ***mask_g*** Range is from ***mask_g*** to ***mask_l***.
  - ***mask_e***, ***mask_land***, and ***mask_g*** range from ***1 to 128***.
  - When **le** and **ge** are specified, ***subnet*** mask ***mask_g mask_l***.

Example

This command appends a **deny** statement at the end of the ***text1*** prefix list. The **deny** statement denies redistribution of routes with the specified prefix.

```
switch(config)# ipv6 prefix-list route-five
switch(config-ipv6-pfx)# deny 3100::/64
switch(config-ipv6-pfx)#
```

13.4.9.8 deny (MAC ACL)

The **deny** command adds a deny rule to the configuration mode MAC Access Control List (ACL). Packets filtered by a deny rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

MAC-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny SOURCE_ADDR DEST_ADDR** [**PROTOCOL**][log]

no deny SOURCE_ADDR DEST_ADDR [**PROTOCOL**][log]

default deny SOURCE_ADDR DEST_ADDR [**PROTOCOL**][log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***mac_address mac_mask*** MAC address and mask.
  - **any** Packets from all addresses are filtered.
  - ***mac_address*** specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - ***mac_mask*** specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - ***0*** bits require an exact match to filter.
  - ***1*** bits filter on any value.
- **PROTOCOL** Protocol field filter. Values include:
  - **aarp** Appletalk Address Resolution Protocol (0x80f3).
  - **appletalk** Appletalk (0x809b).
  - **arp** Address Resolution Protocol (0x806).
  - **ip** Internet Protocol Version 4 (0x800).
  - **ipx** Internet Packet Exchange (0x8137).
  - **lldp** LLDP (0x88cc).
  - **novell** Novell (0x8138).
  - **rarp** Reverse Address Resolution Protocol (0x8035).
  - ***protocol_num*** Integer corresponding to a MAC protocol. Values range from ***0 to 65535***.
- **log** Triggers an informational log message to the console about the matching packet.

Examples

- This command appends a permit statement at the end of the ACL. The deny statement drops all aarp packets from ***10.1000.0000*** through ***10.1000.FFFF*** to any host.

```
switch(config)# mac access-list text1
switch(config-mac-acl-text1)# deny 10.1000.0000 0.0.FFFF any aarp
```

- This command inserts a permit statement with the sequence number ***25***. The deny statement drops all packets through the interface.

```
switch(config-mac-acl-text1)# 25 deny any any
```

13.4.9.9 deny (Standard IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv4 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

Std-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny SOURCE_ADDR** [log]

no deny SOURCE_ADDR [log]

default deny SOURCE_ADDR [log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - **network_addr** Subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

    Subnet addresses support discontiguous masks.
- **log** Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from ***10.10.1.1/24***.

```
switch(config)# ip access-list standard text1
switch(config-std-acl-text1)# deny 10.1.1.1/24
switch(config-std-acl-text1)#
```

13.4.9.10 deny (Standard IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv6 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

Std-IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny SOURCE_ADDR**

no deny SOURCE_ADDR

default deny SOURCE_ADDR

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - ***ipv6_prefix*** IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host *ipv6_addr*** IPv6 host address.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from ***2103::/64***.

```
switch(config)# ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)# deny 2103::/64
switch(config-std-acl-ipv6-text1)#
```

13.4.9.11 description (route map)

The **description** command adds a text string to the configuration mode route map. The string has no functional impact on the route map.

The **no description** and **default description** commands remove the text string from the configuration mode route map by deleting the corresponding **description** command from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

description ***label_text***

no description

default description

Parameters

label_text Character string assigned to the route map configuration.

Related Command

route-map

Example

These commands add description text to the ***XYZ-1*** route map.

```
switch(config)# route-map XYZ-1
switch(config-route-map-XYZ-1)# description This is the first map.
switch(config-route-map-XYZ-1)# exit
switch(config)# show route-map XYZ-1
route-map XYZ-1 permit 10
  Description:
    description This is the first map.
  Match clauses:
  Set clauses:
switch(config)#
```

13.4.9.12 hardware access-list resource sharing vlan in

The **hardware access-list resource sharing vlan in** command enables the IPv4 Ingress Sharing of hardware resources on the switch same ACL is applied on different VLANs.

The **no hardware access-list resource sharing vlan in** command disables the IPv4 Ingress Sharing of hardware resources on the switch.

Command Mode

Global Configuration

Command Syntax

```
hardware access-list resource sharing vlan in

no hardware access-list resource sharing vlan in
```

Guidelines

- This command is compatible only with the DCS-7010 and DCS-7050x series switches.
- Enabling IPv4 Ingress Sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.

Use the **show platform trident** command to verify the Ingress IPv4 Sharing information.

13.4.9.13 hardware access-list resource sharing vlan ipv4 out

The **hardware access-list resource sharing vlan ipv4 out** command enables the IPv4 Egress RACL TCAM sharing on the switch.

The **no hardware access-list resource sharing vlan ipv4 out** command disables the IPv4 Egress RACL TCAM sharing on the switch. By default, the IPv4 Egress RACL sharing is enabled on the switch.

Command Mode

Global Configuration

Command Syntax

hardware access-list resource sharing vlan ipv4 out

no hardware access-list resource sharing vlan ipv4 out

Guidelines

- This command is compatible only with the DCS-7280E and DCS-7500E series switches.
- Disabling IPv4 RACL sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.
- Enabling IPv4 RACL sharing, if previously disabled from the default configuration, requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding. Enabling IPv4 RACL sharing if uRPF is configured will disable uRPF.
- Use the **show running-config all | include sharing** command to verify whether or not sharing for egress IPv4 RACLs is enabled.

Example

This command verifies whether IPv4 RACL sharing is enabled or disabled.

```
switch# show running-config all | include sharing

hardware access-list resource sharing vlan ipv4 out
                          ---->It returns the following output if IPv4 RACL
 sharing is enabled.
```

13.4.9.14 hardware access-list update default-result permit

The **hardware access-list update default-result permit** command configures the switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified. Traffic is permitted when the ACL is available for modification using one of the **ip access-list** commands, and ends when the ACL configuration mode is exited and rules are populated in hardware. This command is disabled by default.

The **no hardware access-list update default-result permit** and **default hardware access-list update default-result permit** commands restore the switch to its default state (blocking traffic during ACL modifications) by removing the corresponding **hardware access-list update default-result permit** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

hardware access-list update default-result permit

no hardware access-list update default-result permit

default hardware access-list update default-result permit

Restrictions

This command is available on the Arista 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches.

This command does not support egress ACLs.

While this command is enabled, static NAT, and ACL-based mirroring are affected during ACL updates.

Example

This command configures a 7150 series switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified.

```
switch(config)# hardware access-list update default-result permit
switch(config)#
```

13.4.9.15 hardware counter feature acl out

The **hardware counter feature acl out** command enables egress ACL hardware counters for IPv4 or IPv6, which count the number of packets hitting rules associated with egress ACLs applied to various interfaces on a switch.

The **no hardware counter feature acl out** and **default hardware counter feature acl out** commands disable or return the egress ACL hardware counters to the default state.

Command Mode

Global Configuration

Command Syntax

hardware counter feature acl out [**OPTIONS**]

no hardware counter feature acl out [**OPTIONS**]

default hardware counter feature acl out [**OPTIONS**]

Parameters

- **OPTIONS** ACL hardware counter options include:
  - **ipv4** Address family IPv4.
  - **ipv6** Address family IPv6.

Examples

- This command enables IPv4 egress ACL hardware counters.

```
switch(config)# hardware counter feature acl out ipv4
switch(config)#
```

- This command disables IPv4 egress ACL hardware counters.

```
switch(config)# no hardware counter feature acl out ipv4
switch(config)#
```

13.4.9.16 ip access-group (Service ACLs)

The **ip access-group** (Service ACLs) command configures a Service ACL to be applied by a control-plane service. The service is specified by the command mod (Service ACLs)e in which the Service ACL is applied.

The **no ip access-group** (Service ACLs) and **default ip access-group** (Service ACLs) commands remove the corresponding **ip access-group** (Service ACLs) command from ***running-config***.

Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

Router-IGMP Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

Command Syntax

ip access-group ***acl_name*** [vrf***vrf_name***][in]

no ip access-group ***acl_name*** [vrf***vrf_name***][in]

default ip access-group ***acl_name*** [vrf***vrf_name***][in]

Parameters

Parameters vary by process.

- ***acl_name*** Name of the Service ACL assigned to control-plane service.
- **vrf** ***vrf_name*** Specifies the VRF in which the Service ACL is to be applied.
- **in** Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

These commands apply the Service ACL ***bgpacl*** to the BGP routing protocol in VRF ***purple***.

```
(config)# router bgp 5
(config-router-bgp)# vrf purple
(config-router-bgp-vrf-purple)# ip access-group bgpacl
```

For additional configuration examples, see **Configuring Service ACLs and Displaying Status and Counters**.

13.4.9.17 ip access-group

The **ip access-group** command applies an IPv4 or standard IPv4 Access Control List (ACL) to the configuration mode interface or subinterface.

The **no ip access-group** and **default ip access-group** commands remove the corresponding **ip access-group** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip access-group *list_name* DIRECTION

no ip access-group *list_name* DIRECTION

default ip access-group *list_name* DIRECTION

Parameters

- ***list_name*** Name of ACL assigned to interface.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
  - **in** Iinbound packets.
  - **out** Outbound packets.

Restrictions

Filtering of outbound packets by ACLs is not supported on Petra platform switches.

Filtering of outbound packets by ACLs on FM6000 switches is supported on physical interfaces only (Ethernet and port channels).

ACLs on sub-interfaces are supported on DCS-7280E, DCS-7500E, DCS-7280R, and DCS-7500R.

Example

These commands apply the IPv4 ACL named ***test2*** to ***interface ethernet 3***.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# ip access-group test2 in
switch(config-if-Et3)#
```

13.4.9.18 ip access-list

The **ip access-list** command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list** and **default ip access-list** commands delete the specified IPv4 ACL.

Command Mode

Global Configuration

Command Syntax

ip access-list ***list_name***

no ip access-list ***list_name***

default ip access-list ***list_name***

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in ACL configuration mode:

- deny (IPv4 ACL)
- no <sequence number> (ACLs)
- permit (IPv4 ACL)
- remark
- resequence (ACLs)
- show (ACL configuration modes)

Related Commands:

- ip access-list standard Enters ***std-acl*** configuration mode for editing standard IP ACLs.
- show ip access-lists Displays IP and standard ACLs.

Examples

- This command places the switch in ACL configuration mode to modify the ***filter1*** IPv4 ACL.

```
switch(config)# ip access-list filter1
switch(config-acl-filter1)#
```

- This command saves changes to ***filter1*** ACL, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)# exit
switch(config)#
```

- This command discards changes to ***filter1***, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)# abort
switch(config)#
```

13.4.9.19 ip access-list standard

The **ip access-list standard** command places the switch in std-ACL configuration mode, which is a group change mode that modifies a standard IPv4 access control list. The command specifies the name of the standard IPv4 ACL that subsequent commands modify, and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list standard** and **default ip access-list standard** commands delete the specified ACL.

Command Mode

Global Configuration

Command Syntax

ip access-list standard ***list_name***

no ip access-list standard ***list_name***

default ip access-list standard ***list_name***

Parameters

list_name Name of standard ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in std-ACL configuration mode:

- deny (Standard IPv4 ACL)
- no <sequence number> (ACLs)
- permit (Standard IPv4 ACL)
- remark
- resequence (ACLs)
- show (ACL configuration modes)

Related Commands

- ip access-list Enters ACL configuration mode for editing IPv4 ACLs.
- show ip access-lists Displays IPv4 and standard IPv4 ACLs.

Examples

- This command places the switch in std-ACL configuration mode to modify the ***filter2*** IPv4 ACL.

```
switch(config)# ip access-list standard filter2
switch(config-std-acl-filter2)#
```

- This command saves changes to ***filter2*** ACL, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)# exit
switch(config)#
```

- This command discards changes to ***filter2***, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)# abort
switch(config)#
```

13.4.9.20 ip prefix-list

The **ip prefix-list** command creates a prefix list or adds an entry to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

A prefix list comprises all prefix list entries with the same label. The sequence numbers of the rules in a prefix list specify the order that the rules are applied to a route that the match command is evaluating.

The **no ip prefix-list** and **default ip prefix-list** commands delete the specified prefix list entry by removing the corresponding **ip prefix-list** statement from ***running-config***. If the **no** or **default ip prefix-list** command does not list a sequence number, the command deletes all entries of the prefix list.

Command Mode

Global Configuration

Command Syntax

ip prefix-list ***list_name*** [**SEQUENCE**] **FILTER_TYPE** ***network_addr*** [**MASK**]

no ip prefix-list ***list_name*** [**SEQUENCE**]

default ip prefix-list ***list_name*** [**SEQUENCE**]

Parameters

- ***list_name*** The label that identifies the prefix list.
- **SEQUENCE** Sequence number of the prefix list entry. Options include:
  - ***no parameter*** Entry's number is ten plus highest sequence number in current list.
  - **seq** ***seq_num*** Number assigned to entry. Value ranges from ***0*** to ***65535***.
- **FILTER_TYPE** Specifies route access when it matches IP prefix list. Options include:
  - **permit** Routes are permitted access when they match the specified subnet.
  - **deny** Routes are denied access when they match the specified subnet.
- ***network_addr*** Subnet upon which command filters routes. Format is CIDR or address-mask.
- **MASK** Range of the prefix to be matched.
  - ***no parameter*** Exact match with the subnet mask is required.
  - **eq** ***mask_e*** Prefix length is equal to ***mask_e***.
  - **ge** ***mask_g*** Range is from ***1*** to ***32***.
  - **le** ***mask_l*** Range is from ***subnet*** mask length to ***mask_l***.
  - **ge** ***mask_l*** **le** ***mask_g*** Range is from ***mask_g*** to ***mask_l***.
  - ***mask_e***, ***mask_l***, and ***mask_g*** range from ***1*** to ***32***. When **le** and **ge** are specified, ***subnet*** **mask** ***mask_g***>***mask_l***.

Example

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named ***route-one***.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named ***route-one***.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)# seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)# seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)# seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)# seq 40 deny 1.1.1.0/24
```

13.4.9.21 ipv6 access-group

The **ipv6 access-group** command applies an IPv6 or standard IPv6 Access Control List (ACL) to the configuration mode interface.

The **no ipv6 access-group** and **default ipv6 access-group** commands remove the corresponding **ipv6 access-group** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 access-group ***list_name*** **DIRECTION**

no ipv6 access-group ***list_name*** **DIRECTION**

default ipv6 access-group ***list_name*** **DIRECTION**

Parameters

- ***list_name*** Name of ACL assigned to interface.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
  - **in** Inbound packets.
  - **out** Outbound packets.

Examples

These commands assign the IPv6 ACL named ***test2*** to the ***interface ethernet 3***.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# ipv6 access-group test2 in
switch(config-if-Et3)#
```

13.4.9.22 ipv6 access-group (Service ACLs)

The **ipv6 access-group** (Service ACLs) command configures an IPv6 or standard IPv6 Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The **no ipv6 access-group** (Service ACLs) and **default ipv6 access-group** (Service ACLs) commands remove the corresponding **ipv6 access-group** (Service ACLs) command from ***running-config***.

Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

Command Syntax

ipv6 access-group ***ipv6_acl_name*** [vrf***vrf_name***][in]

no ipv6 access-group [***ipv6_acl_name***][vrf***vrf_name***][in]

default ipv6 access-group ***ipv6_acl_name*** [vrf ***vrf_name***][in]

Parameters

Parameters vary by process.

- ***ipv6_acl_name*** Name of the IPv6 Service ACL assigned to control-plane service.
- **vrf** ***vrf_name*** Specifies the VRF in which the Service ACL is to be applied.
- **in** Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

These commands apply the IPv6 Service ACL ***bgpacl*** to the BGP routing protocol in VRF ***purple***.

```
(config)# router bgp 5
(config-router-bgp)# vrf purple
(config-router-bgp-vrf-purple)# ipv6 access-group bgpacl
```

For additional configuration examples, see **Configuring Service ACLs and Displaying Status and Counters**.

13.4.9.23 ipv6 access-list

The **ipv6 access-list** command places the switch in ***IPv6-ACL*** configuration mode, which is a group change mode that modifies an IPv6 access control list. The command specifies the name of the IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list** and **default ipv6 access-list** commands delete the specified IPv6 ACL.

Command Mode

Global Configuration

Command Syntax

ipv6 access-list ***list_name***

no ipv6 access-list ***list_name***

default ipv6 access-list ***list_name***

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-ACL configuration mode:

- deny (IPv6 ACL)
- no <sequence number> (ACLs)
- permit (IPv6 ACL)
- remark
- resequence (ACLs)
- show (ACL configuration modes)

Related Commands

- ipv6 access-list standard Enters ***std-ipv6-acl*** configuration mode for editing standard IPv6 ACLs.
- show ipv6 access-lists Displays IPv6 and standard IPv6 ACLs.

Examples

- This command places the switch in IPv6-ACL configuration mode to modify the ***filter1*** IPv6 ACL.

```
switch(config)# ipv6 access-list filter1
switch(config-ipv6-acl-filter1)#
```

- This command saves changes to ***filter1*** ACL, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)# exit
switch(config)#
```

- This command discards changes to ***filter1***, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)# abort
switch(config)#
```

13.4.9.24 ipv6 access-list standard

The **ipv6 access-list standard** command places the switch in std-IPv6-ACL-configuration mode, which is a group change mode that modifies a standard IPv6 access control list. The command specifies the name of the standard IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list standard** and **default ipv6 access-list standard** commands delete the specified ACL.

Command Mode

Global Configuration

Command Syntax

ipv6 access-list standard ***list_name***

no ipv6 access-list standard ***list_name***

default ipv6 access-list standard ***list_name***

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in std-IPv6-ACL configuration mode:

- deny (Standard IPv6 ACL)
- no <sequence number> (ACLs)
- permit (Standard IPv6 ACL)
- remark
- resequence (ACLs)
- show (ACL configuration modes)

Related Commands

- ipv6 access-list Enters IPv6-ACL configuration mode for editing IPv6 ACLs.
- show ipv6 access-lists Displays IPv6 and standard IPv6 ACLs.

Examples

- This command places the switch in Std-IPv6 ACL configuration mode to modify the ***filter2*** ACL.

```
switch(config)# ipv6 access-list standard filter2
switch(config-std-ipv6-acl-filter2)#
```

- This command saves changes to ***filter2*** ACL, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)# exit
switch(config)#
```

- This command discards changes to ***filter2***, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)# abort
switch(config)#
```

13.4.9.25 ipv6 prefix-list

The **`ip prefix-list`** command places the switch in ***IPv6 prefix-list*** configuration mode, which is a group change mode that modifies an IPv6 prefix list. The command specifies the name of the IPv6 prefix list that subsequent commands modify and creates a prefix list if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **`exit`** command saves pending prefix list changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **`abort`** command discards pending changes, returning the switch to global configuration mode.

The **`no ipv6 prefix-list`** and **`default ipv6 prefix-list`** commands delete the specified IPv6 prefix list.

Command Mode

Global Configuration

Command Syntax

`ipv6 prefix-list` ***list_name***

`no ipv6 prefix-list` ***list_name***

`default ipv6 prefix-list` ***list_name***

Parameter

list_name Name of prefix list. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-pfx configuration mode:

- deny (IPv6 Prefix List)
- permit (IPv6 Prefix List)
- seq (IPv6 Prefix Lists)

Examples

- This command places the switch in ***IPv6 prefix-list*** configuration mode to modify the ***route-five*** prefix list.

```
switch(config)# ipv6 prefix-list route-five
switch(config-ipv6-pfx)#
```

- This command saves changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)# exit
switch(config)#
```

- This command saves changes to the prefix list, then places the switch in ***interface-ethernet*** mode.

```
switch(config-ipv6-pfx)# interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)# abort
switch(config)#
```

13.4.9.26 mac access-group

The **mac access-group** command applies a MAC Access Control List (MAC ACL) to the configuration mode interface.

The **no mac access-group** and **default mac access-group** commands remove the specified **mac access-group** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

mac access-group *list_name* DIRECTION

no mac access-group *list_name* DIRECTION

default mac access-group *list_name* DIRECTION

Parameters

- ***list_name*** Name of MAC ACL.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
  - **in** Inbound packets.
  - **out** Outbound packets.

Restrictions

Filtering of outbound packets by MAC ACLs is supported only on Helix, Trident, and Trident II platform switches.

Example

These commands assign the MAC ACL named ***mtest2*** to ***interface ethernet 3*** to filter inbound packets.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# mac access-group mtest2 in
switch(config-if-Et3)#
```

13.4.9.27 mac access-list

The **mac access-list** command places the switch in ***MAC-ACL*** configuration mode, which is a group change mode that modifies a MAC access control list. The command specifies the name of the MAC ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no mac access-list** and **default mac access-list** commands delete the specified list.

Command Mode

Global Configuration

Command Syntax

mac access-list ***list_name***

no mac access-list ***list_name***

default mac access-list ***list_name***

Parameters

list_name Name of MAC ACL. Names must begin with an alphabetic character and cannot contain a space or quotation mark.

Commands Available in MAC-ACL configuration mode:

- deny (MAC ACL)
- no <sequence number> (ACLs)
- permit (MAC ACL)
- remark
- resequence (ACLs)
- show (ACL configuration modes)

Examples

- This command places the switch in ***MAC-ACL*** configuration mode to modify the ***mfilter1*** MAC ACL.

```
switch(config)# mac access-list mfilter1
switch(config-mac-acl-mfilter1)#
```

- This command saves changes to ***mfilter1*** ACL, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)# exit
switch(config)#
```

- This command saves changes to ***mfilter1*** ACL, then places the switch in ***interface-ethernet*** mode.

```
switch(config-mac-acl-mfilter1)# interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to ***mfilter1***, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)# abort
switch(config)#
```

13.4.9.28 match (route-map)

The **match** command creates a route map statement entry that specifies one route filtering command. When a statement contains multiple match commands, the permit or deny filter applies to a route only if its properties are equal to corresponding parameters in each **match** command. When a route properties do not equal the command parameters, the route is evaluated against the next statement in the route map, as determined by sequence number. If all statements fail to permit or deny the route, the route is denied.

The **no match** and **default match** commands remove the **match** command from the configuration mode route map statement by deleting the corresponding command from ***running-config***.

Note: The route map configuration supports only standard ACL.

Command Mode

Route-Map Configuration

Command Syntax

match CONDITION

no match CONDITION

default match CONDITION

Parameters

- **CONDITION** Specifies criteria for evaluating a route. Options include:
  - **aggregate-role** Role in BGP contributor-aggregate relation. Options include:
    - **contributor** BGP aggregate's contributor.
    - **aggregate-attributes** Route map to apply against the aggregate route.
  - **as *1*** to ***4294967295*** BGP Autonomous System number.
  - **as-path *path_name*** BGP Autonomous System path access list.
  - **community NAME** BGP community. Options for **NAME** include:
    - **listname** BGP community.
    - ***listname* exact-match** BGP community; list must match set that is present.
  - **extcommunity *listname*** BGP extended community. Options for **NAME** include:
    - ***listname*** BGP community.
    - ***listname* exact-match** BGP community; list must match set that is present.
  - ***interface* INTF_NAME** Specifies an interface. Options for **INTF_NAME** include:
    - **ethernet *e_num*** Ethernet interface.
    - **loopback *l_num*** Loopback interface.
    - **port-channel *p_num*** Port channel interface.
    - **vlan *v_num*** VLAN interface.

    invert-result Invert sub route map result.
  - **ip address LIST** IPv4 address filtered by an ACL or prefix list. **LIST** options include:
    - ***access-list acl_name*** IPv4 address filtered by access control list (ACL).
    - **prefix-list *plv4_name*** IPv4 address filtered by IP prefix list.
  - **ip next-hop prefix-list *plv4_name*** IPv4 next-hop filtered by IP prefix list.
  - **ip resolved-next-hop prefix-list *plv4_name*** IPv4 resolved nexthop filtered by IP prefix list.
  - **ipv6 address prefix-list *plv6_name*** IPv6 address filtered by IPv6 prefix list.
  - **ipv6 next-hop prefix-list *plv6_name*** IPv6 next-hop filtered by IPv6 prefix list.
  - **ipv6 resolved-next-hop prefix-list *plv6_name*** IPv6 resolved nexthop filtered by IPv6 prefix list.

- **local-preference** ***1*** to ***4294967295*** BGP local preference metric.
- **metric** ***1*** to ***4294967295*** Route metric.
- **metric-type OSPF_TYPE** OSPF metric type. Options include:
  - **type-1** OSPF type 1 metric.
  - **type-2** OSPF type 2 metric.
- **source-protocol** ***protocol_type*** Routing protocol of route's source. Options include:
  - **bgp**
  - **connected**
  - **ospf**
  - **rip**
  - **static**
- **tag** ***1*** to ***4294967295*** Route tag.

Related Command

route-map

Example

This command creates a ***route map*** match rule that filters routes from BGP ***as 15***.

```
switch(config)# route-map map1
switch(config-route-map-map1)# match as 15
switch(config-route-map-map1)#
```

13.4.9.29 no <sequence number> (ACLs)

The **no <sequence number>** command removes the rule with the specified sequence number from the ACL. The **default <sequence number>** command also removes the specified rule.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

no ***line_num***

default ***line_num***

Parameters

line_num Sequence number of rule to be deleted. Values range from ***1 - 4294967295***.

Example

This command removes statement ***30*** from the list.

```
switch(config-acl-test1)# show IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
switch(config-acl-test1)# no 30
switch(config-acl-test1)# show IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

13.4.9.30 permit (IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode IPv4 Access Control List (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes a specified rule from the ACL.

Command Mode

ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit PROTOCOL SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][fragments][tracked][**DSCP_FILTER**][**TTL_FILTER**][log]

no permit PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**][**FLAGS** [**MESSAGE**] [fragments] [tracked][**DSCP_FILTER**][**TTL_FILTER**][log]

default permit PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][fragments][tracked][**DSCP_FILTER**][**TTL_FILTER**][log]

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **PROTOCOL** Protocol field filter. Values include:
  - **ahp** Authentication Header Protocol (51).
  - **gre** Generic Routing Encapsulation.
  - **gtp** GPRS Tunneling Protocol.
  - **icmp** Internet Control Message Protocol (1).
  - **igmp** Internet Group Management Protocol (2).
  - **ip** Any Internet Protocol v4 (4).
  - **ospf** Open Shortest Path First (89).
  - **pim** Protocol Independent Multicast (103).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User datagram protocol (17).
  - **vlan** Enter VLAN number and mask. VLAN value ranges from 1 to 4094; mask value ranges from 0x000-0xFFF .
  - **vrrp** Virtual Router Redundancy Protocol (112).
  - ***protocol_num*** Integer corresponding to an IP protocol. Values range from ***0 to 255***.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***network_addr*** subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

  Source and destination subnet addresses support discontiguous masks.
- **SOURCE_PORT** and **DEST_PORT** Source and destination port filters. Options include:
  - **any** All ports.

    - **eq *port-1 port-2*** ... ***port-n*** A list of ports. Maximum list size is 10 ports.
    - **neq *port-1 port-2*** ... ***port-n*** The set of all ports not listed. Maximum list size is 10 ports.
    - **gt *port*** The set of ports with larger numbers than the listed port.
    - **lt *port*** The set of ports with smaller numbers than the listed port.
    - **range *port_1 port_2*** The set of ports whose numbers are between the range.
- **fragments** Filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** Flags bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
    - ***no parameter*** Rule does not use DSCP to filter packets.
    - ***dscp dscp_value*** Packets match if DSCP field in packet is equal to ***dscp_value***.
- **TTL_FILTER** Rule filters packet by its TTL (time-to-live) value. Values include:
    - **ttl eq *ttl_value*** Packets match if **ttl** in packet is equal to ***ttl_value***.
    - **ttl gt *ttl_value*** Packets match if **ttl** in packet is greater than ***ttl_value***.
    - **ttl lt *ttl_value*** Packets match if **ttl** in packet is less than ***ttl_value***.
    - **ttl neq *ttl_value*** Packets match if **ttl** in packet is not equal to ***ttl_value***.
        - Valid in ACLs applied to the control plane.
        - Validity in ACLs applied to data plane varies by switch platform.
- **log** Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all OSPF packets from ***10.10.1.1/24*** to any host.

```
switch(config)# ip access-list text1
switch(config-acl-text1)# permit ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a **permit** statement with the sequence number ***25***. The **permit** statement passes all PIM packets through the interface.

```
switch(config-acl-text1)# 25 permit pim any any
switch(config-acl-text1)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit vlan 1234 0x0 ip any any
```

13.4.9.31 permit (IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode IPv6 Access Control List (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes a specified rule from the ACL.

Command Mode

IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit PROT SRC_ADDR** [**SRC_PT**] **DEST_ADDR** [**DEST_PT**] [**FLAG**] [**MSG**] [**HOP**] [tracked] [**DSCP_FILTER**] [**FLOW_LABEL**] [log]

no permit PROT SRC_ADDR [**SRC_PT**] **DEST_ADDR** [**DEST_PT**] [**FLAG**] [**MSG**] [**HOP**] [tracked] [**DSCP_FILTER**] [**FLOW_LABEL**] [log]

default permit PROT SRC_ADDR [**SRC_PT**] **DEST_ADDR** [**DEST_PT**] [**FLAG**] [**MSG**] [**HOP**] [tracked] [**DSCP_FILTER**] [**FLOW_LABEL**] [log]

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - *no parameter* Number is derived by adding 10 to the number of the ACL's last rule.
  - *1 - 4294967295* Number assigned to entry.
- **PROT** Protocol field filter. Values include:
  - **icmpv6** Internet Control Message Protocol for v6 (58).
  - **ipv6** Internet Protocol IPv6 (41).
  - **ospf** Open Shortest Path First (89).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User Datagram Protocol (17).
  - **vlan** Enter VLAN number. Value ranges from 1 to 4094.
  - *protocol_num* Integer corresponding to an IP protocol. Values range from 0 to 255.
- **SRC_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - *ipv6_prefix* IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host** *ipv6_addr* IPv6 host address.
- **SRC_PT** and **DEST_PT** Source and destination port filters. Options include:
  - **any** All ports.
  - **eq** *port-1* **port-2** ... *port-n* A list of ports. Maximum list size is 10 ports.
  - **neq** *port-1 port-2* ... *port-n* The set of all ports not listed. Maximum list size is 10 ports.
  - **gt** *port* The set of ports with larger numbers than the listed port.
  - **lt** *port* The set of ports with smaller numbers than the listed port.
  - **range** *port_1 port_2* The set of ports whose numbers are in the range.
- **HOP** The rule filters by packet's hop-limit value. Options include:
  - *no parameter* The rule does not use hop limit to filter packets.

    - **hop-limit eq** *hop_value* Packets match if **hop-limit** value in packet equals *hop_value*.
    - **hop-limit gt** *hop_value* Packets match if **hop-limit** in packet is greater than *hop_value*.
    - **hop-limit lt** *hop_value* Packets match if **hop-limit** in packet is less than *hop_value*.
    - **hop-limit neq** *hop_value* Packets match if **hop-limit** in packet is not equal to *hop_value*.
- **FLAG** Flag bit filters (TCP packets). Use CLI syntax assistance (**?**) to display options.
- **MSG** Message type filters (ICMPv6 packets). Use CLI syntax assistance (**?**) to display options.
- **tracked** The rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** The rule filters packet by its DSCP value. Values include:
    - *no parameter* The rule does not use DSCP to filter packets.
    - **dscp** *dscp_value* Packets match if DSCP field in packet is equal to *dscp_value*.
- **FLOW_LABEL** The rule permits packets with IPv6 flow labels matching an exact value or a pattern based on a mask. Options include:
    - *no parameter* The rule does not use IPv6 flow labels to filter packets.
    - **flow-label eq** *ipv6_flow_label* The IPv6 flow label must exactly match *ipv6_flow_label*. Flow labels can range from 0 to 1048575.
    - **flow-label** *ipv6_flow_label flow_label_mask* The IPv6 flow label must match a pattern defined by *ipv6_flow_label* and *flow_label_mask*. The mask is an inverse mask. Where the mask has a 0 bit, the flow label must match the *ipv6_flow_label* value, and where the mask has a 1 bit, the corresponding bit in the flow label is ignored. For example, if *ipv6_flow_label* is 10 (0b01010 in binary) and *flow_label_mask* is 0x14 (0b10100 in binary), the rule will match flow labels described by 0b.1.10 (where "." is a wildcard and can be either 0 or 1); the flow labels that will match are 10 (0b01010), 14 (0b0110), 26 (0b11010), and 30 (0b1110). Flow labels can range from 0 to 1048575 and flow label masks can range from 0x00000 to 0xfffff.
- **log** Pass an informational log message to the console when a packet matches.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all IPv6 packets with the source address 3710:249a:c643:ef11::/64 and with any destination address.

```
switch(config)#ipv6 access-list acl1
switch(config-acl-acl1)#permit ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-acl1)#exit
switch(config)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl2
switch(config-acl-acl2)#permit ipv6 vlan 1234 0x0 ip any any
switch(config-acl-acl2)#exit
switch(config)#
```

- These commands add a rule to permit all IPv6 packets with flow label 23.

```
switch(config)#ipv6 access-list acl3
switch(config-acl-acl3)#permit ipv6 any any flow-label eq 23
switch(config-acl-acl3)#exit
switch(config)#
```

- These commands create a rule to permit all IPv6 packets matched by the flow label 23 and the mask 0x5678.

```
switch(config)#ipv6 access-list acl4
switch(config-acl-acl4)#permit ipv6 any any flow-label 23 0x5678
switch(config-acl-acl4)#exit
switch(config)#
```

13.4.9.32 permit (IPv6 Prefix List)

The **permit** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are redistributed into the specified domain when they match the prefix that a **permit** statement specifies.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode prefix list. The **no** seq (IPv6 Prefix Lists) command also removes the specified rule from the prefix list.

Command Mode

IPv6-pfx Configuration

Command Syntax

[**SEQUENCE**] **permit** ***ipv6_prefix*** [**MASK**]

Parameters

- **SEQUENCE** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding 10 to the number of the list's last rule.
  - **seq** ***seq_num*** Number is specified by ***seq_num***. Value ranges from ***0 to 65535***.
- ***ipv6_prefix*** IPv6 prefix upon which command filters routes (CIDR notation).
- **MASK** Range of the prefix to be matched.
  - ***no parameter*** Exact match with the subnet mask is required.
  - **eq** ***mask_e*** Prefix length is equal to ***mask_e***.
  - **ge** ***mask_g*** Range is from ***mask_g*** to ***128***.
  - **le** ***mask_l*** Range is from ***subnet*** mask length to ***mask_l***.
  - **ge** ***mask_l*** **le** ***mask_g*** Range is from ***mask_g*** to ***mask_l***.
  - ***mask_e***, ***mask_l*** and ***mask_g*** range from ***1 to 128***.
  - When **le** and **ge** are specified, the prefix list size ***mask_g mask_l***.

Example

This command appends a **permit** statement at the end of the text1 prefix list. The **permit** statement allows redistribution of routes with the specified prefix.

```
switch(config)# ipv6 prefix-list route-five
switch(config-ipv6-pfx)# permit 3100::/64
switch(config-ipv6-pfx)#
```

13.4.9.33 permit (MAC ACL)

The **permit** command adds a permit rule to the configuration mode MAC access control list packets through the interface to which the list is applied. Rule filters include protocol, source, and destination.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

MAC-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit SOURCE_ADDR DEST_ADDR** [**PROTOCOL**][log]

no permit SOURCE_ADDR DEST_ADDR [**PROTOCOL**][log]

default permit SOURCE_ADDR DEST_ADDR [**PROTOCOL**][log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***mac_address mac_mask*** MAC address and mask.
  - **any** Packets from all addresses are filtered.
  - ***mac_address*** Specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - **mac_mask** Specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - ***0*** bits require an exact match to filter.
  - ***1*** bits filter on any value.
- **PROTOCOL** Protocol field filter. Values include:
  - **aarp** Appletalk Address Resolution Protocol (0x80f3).
  - **appletalk** Appletalk (0x809b).
  - **arp** Address Resolution Protocol (0x806).
  - **ip** Internet Protocol Version 4 (0x800).
  - **ipx** Internet Packet Exchange (0x8137).
  - **lldp** LLDP (0x88cc).
  - **novell** Novell (0x8138).
  - **rarp** Reverse Address Resolution Protocol (0x8035).
  - ***protocol_num*** Integer corresponding to a MAC protocol. Values range from ***0 to 65535***.
- **log** Triggers an informational log message to the console about the matching packet.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all aarp packets from ***10.1000.0000*** through ***10.1000.FFFF*** to any host.

```
switch(config)# mac access-list text1
switch(config-mac-acl-text1)# permit 10.1000.0000 0.0.FFFF any aarp
switch(config-mac-acl-text1)#
```

- This command inserts a **permit** statement with the sequence number ***25***. The **permit** statement passes all packets through the interface.

```
switch(config-mac-acl-text1)# 25 permit any any
```

```
switch(config-mac-acl-text1)#
```

13.4.9.34 permit (Standard IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv4 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

Std-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit SOURCE_ADDR** [log]

no permit SOURCE_ADDR [log]

default permit SOURCE_ADDR [log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - ***network_addr*** Subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

    Subnet addresses support discontiguous masks.
- **log** Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all packets with a source address of ***10.10.1.1/24***.

```
switch(config)# ip access-list standard text1
switch(config-std-acl-text1)# permit 10.1.1.1/24
switch(config-std-acl-text1)#
```

13.4.9.35 permit (Standard IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv6 access control list. Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The no <sequence number> (ACLs) command also removes the specified rule from the ACL.

Command Mode

Std-IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit SOURCE_ADDR**

no permit SOURCE_ADDR

default permit SOURCE_ADDR

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - ***ipv6_prefix*** IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host *ipv6_addr*** IPv6 host address.

Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement drops packets with a source address of ***2103::/64***.

```
switch(config)# ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)# permit 2103::/64
switch(config-std-acl-ipv6-text1)#
```

13.4.9.36 remark

The **remark** command adds a non-executable comment statement into the pending ACL. Remarks entered without a sequence number are appended to the end of the list. Remarks entered with a sequence number are inserted into the list as specified by the sequence number.

The **default remark** command removes the comment statement from the ACL.

The **no remark** command removes the comment statement from the ACL. The command can specify the remark by content or by sequence number.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

remark ***text***

line_num **remark** [***text***]

no remark ***text***

default remark ***text***

Parameters

- ***text*** The comment text.
- ***line_num*** Sequence number assigned to the remark statement. Value ranges from ***1 - 4294967295***.

Example

This command appends a comment to the list.

```
switch(config-acl-test1)# remark end of list
switch(config-acl-test1)# show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

13.4.9.37 resequence (ACLs)

The **resequence** command assigns sequence numbers to rules in the configuration mode ACL. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

Maximum rule sequence number is ***4294967295***.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

resequence [***start_num*** [***inc_num***]]

Parameters

- ***start_num*** Sequence number assigned to the first rule. Default is ***10***.
- ***inc_num*** Numeric interval between consecutive rules. Default is ***10***.

Example

The **resequence** command re-numbers the list, starting the first command at number ***100*** and incrementing subsequent lines by ***20***.

```
switch(config-acl-test1)# show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any

```

13.4.9.38 route-map

The **route-map** command places the switch in ***route map*** configuration mode, which is a group change mode that modifies a route map statement. The command specifies the name and number of the route map statement that subsequent commands modify and creates a route map statement if it references a nonexistent statement. All changes in a group change mode edit session are pending until the end of the session.

Route maps define commands for redistributing routes between routing protocols. A route map statement is identified by a name, filter type (**permit** or **deny**), and sequence number. Statements with the same name are components of a single route map; the sequence number determines the order in which the statements are compared to a route.

The **exit** command saves pending route map statement changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no route-map** and **default route-map** commands delete the specified route map statement from ***running-config***.

Note: The route map configuration supports only standard ACL.

Command Mode

Global Configuration

Command Syntax

route-map ***map_name*** [**FILTER_TYPE**] [***sequence_number***]

no route-map ***map_name*** [**FILTER_TYPE**] [***sequence_number***]

default route-map ***map_name*** [**FILTER_TYPE**][***sequence_number***]

Parameters

- ***map_name*** Label assigned to route map. Protocols reference this label to access the route map.
- **FILTER_TYPE** Disposition of routes matching commands specified by route map statement.
  - **permit** Routes are redistributed when they match route map statement.
  - **deny** Routes are not redistributed when they match route map statement.
  - ***no parameter*** Sssigns **permit** as the **FILTER_TYPE**.

When a route does not match the route map criteria, the next statement within the route map is evaluated to determine the redistribution action for the route.

- ***sequence_number*** The route map position relative to other statements with the same name.
  - ***no parameter*** Sequence number of 10 (default) is assigned to the route map.
  - ***1-16777215*** Specifies sequence number assigned to route map.

Commands Available in route map configuration mode:

- continue (route map)
- match (route-map)
- set (route-map)

Examples

- This command creates the route map named ***map1*** and places the switch in route map configuration mode. The route map is configured as a permit map.

```
switch(config)# route-map map1 permit 20
```

```
switch(config-route-map-map1)#
```

- This command saves changes to ***map1*** route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1)# exit
switch(config)#
```

- This command saves changes to ***map1*** route map, then places the switch in interface-Ethernet mode.

```
switch(config-route-map-map1)# interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to ***map1*** route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1)# abort
switch(config)#
```

13.4.9.39 seq (IPv6 Prefix Lists)

The **no seq** command removes the rule with the specified sequence number from the ACL. The **default seq** command also removes the specified rule.

The **seq** keyword is a command option used at the beginning of deny (IPv6 Prefix List) and permit (IPv6 Prefix List) commands that places a new rule between two existing rules.

Command Mode

IPv6-pfx Configuration

Command Syntax

no seq ***line_num***

default seq ***line_num***

Parameters

line_num Sequence number of rule to be deleted. Valid rule numbers range from ***0*** to ***65535***.

Example

These commands remove rule ***20*** from the ***map1*** prefix list, then displays the resultant list.

```
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)# no seq 20
switch(config-ipv6-pfx)# exit
switch(config)# show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
switch(config)#
```

13.4.9.40 set (route-map)

The **set** command specifies modifications to routes that are selected for redistribution by the configuration mode route map.

The **no set** and **default set** commands remove the specified **set** command from the configuration mode route map statement by deleting the corresponding **set** command from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

set CONDITION

no set CONDITION

default set CONDITION

Parameters

- **CONDITION** Specifies the route modification parameter and value. Options include:
  - **as-path prepend** BGP AS number that is prepended to as-path. For details, see the set as-path prepend command.
    - ***1 - 4294967295*** BGP AS number to prepend.
    - **auto** Use peer AS number for inbound and local AS for outbound to prepend.
  - **distance *1 - 255*** Protocol independent administrative distance.
  - **ip next-hop *ipv4_address*** Next hop IPv4 address.
  - **ip next-hop peer-address** Use BGP peering address as next hop IPv4 address.
  - **ipv6 next-hop *ipv6_address*** Next hop IPv6 address.
  - **ipv6 next-hop peer-address** Use BGP peering address as next hop IPv6 address.
  - **local-preference *1 - 4294967295*** BGP local preference metric.
  - **metric *1 - 4294967295*** Route metric.
  - **metric + *1 - 4294967295*** Add specified value to current route metric.
  - **metric - *1 - 4294967295*** Subtract specified value to current route metric.
  - **metric-type OSPF_TYPE** OSPF metric type. Options include:
    - **type-1** OSPF type 1 metric.
    - **type-2** OSPF type 2 metric.
  - **origin O_TYPE** BGP origin attribute. Options for **O_TYPE** include:
    - **egp** Exterior BGP route.
    - **igp** Interior BGP route.
    - **incomplete** BGP route of unknown origin.
  - **tag *1 - 4294967295*** Route tag.
  - **weight *1 - 65535*** BGP weight parameter.

Related Commands

- route-map enters ***route-map*** configuration mode.
- set (route-map) specifies community modifications for the redistributed routes.
- set community (route-map) specifies extended community modifications for the redistributed routes.

Example

This command creates a route map entry that sets the local preference metric to ***100*** on redistributed routes.

```
switch(config)# route-map map1
```

```
switch(config-route-map-map1)# set local-preference 100
switch(config-route-map-map1)#
```

13.4.9.41 set as-path match

The **set as-path match** command configures the **AS_PATH** attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor in the route map configuration mode.

The **no set as-path match** command removes the AS path specified for the BGP prefix.

Command Mode

Route-Map Configuration

Command Syntax

set as-path match all replacement [[none | auto] ***as_path***]

no set as-path match all replacement [[none | auto] ***as_path***]

Parameters

- **none** Replaces the ***AS-Path*** of the matching routes with a null or an empty ***AS-Path***.
- **auto** iF the specific route map is applied as an inbound policy to a corresponding BGP neighbor statement, then replace the **AS_PATH** of the prefixes received from this neighbor with the neighbor's AS number. If this route map is applied as an outbound policy to a corresponding neighbor statement, then replace the **AS_PATH** of the prefixes advertised to this neighbor with the locally configured AS number.
- ***as_path*** Replaces the AS-Path of the matching routes with an arbitrary ***AS-Path***.

Examples

- This command replaces the AS-Path with the **none** option.

```
switch# show ip bgp neighbors 80.80.1.2 advertised-routes

 * > 202.202.1.0/24 80.80.1.1 - - - 200 200 500 600 i
```

The AS-Path of matching prefixes are replaced with the locally configured AS ***200*** and ***500 600***.

13.4.9.42 set as-path prepend

The **set as-path prepend** command adds a **set** statement to a route map to prepend one or more Autonomous System (AS) numbers to the **AS_PATH** attribute of a BGP route.

The **no set as-path prepend** and **default set as-path prepend** commands remove the specified set statements from the route map and update all corresponding routes.

Command Mode

Route-Map Configuration

Command Syntax

set as-path prepend {{auto | ***as_number...*** [auto | ***as_number***]} | last-as ***count***}

no set as-path prepend {{auto | ***as_number...*** [auto | ***as_number***]} | last-as ***count***}

default set as-path prepend {{auto | ***as_number...*** [auto | ***as_number***]} | last-as ***count***}

Parameters

- **auto** Prepends the peer AS number for peer inbound route maps and the local AS number for peer outbound route maps.
- ***as_number*** Prepends the specified AS number. Can be entered in plain notation (values range from ***1-4294967295***) or in asdot notation as described in RFC 5396. In asdot notation, AS numbers from ***1-65535*** are entered in plain notation, and AS numbers from ***65536 to 4294967295*** are entered as two values separated by a dot. The first value is high-order and represents a multiple of ***65536***; the second value is low-order and represents a decimal integer. For example, AS number ***65552*** can be entered as either ***65552*** or 1.16 (i.e., 1*65536+16). However they are entered, AS numbers are stored internally in plain decimal notation and will appear that way in **show** outputs.
- **last-as *count*** Prepends the last AS number in the AS path *count* times. Values range from ***1 to 15***. This is mutually exclusive with the use of the **auto** keyword or the entry of one or more specified AS numbers, and is not supported in multi-agent mode.

Examples

- These commands create a route-map entry that prepends AS number ***64496*** and prepends either the peer or local AS number twice.

```
switch(config)# route-map map1
switch(config-route-map-map1)# set as-path prepend 64496 auto auto
switch(config-route-map-map1)# exit

switch(config)# show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 auto auto
switch(config)#
```

- The commands create a route-map entry that prepends AS numbers ***64496***, ***64498***, and ***65552***.

```
switch(config)# route-map map2
switch(config-route-map-map2)# set as-path prepend 64496 64498 1.16
switch(config-route-map-map2)# exit

switch(config)# show route-map map2
route-map map2 permit 10
  Description:
  Match clauses:
  SubRouteMap:
```

```
  Set clauses:
    set as-path prepend 64496 64498 65552
switch(config)#
```

- These commands create a route map entry that prepends the last AS number ***12*** times.

```
switch(config)# route-map map3
switch(config-route-map-map3)# set as-path prepend last-as 12
switch(config-route-map-map3)# exit

switch(config)# show route-map map3
route-map map3 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
switch(config)#
```

13.4.9.43 set community (route-map)

The **`set community`** command specifies community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **`set community none`** command removes community attributes from the route.

The **`no set community`** and **`default set community`** commands remove the specified community from the configuration mode route map statement by deleting the corresponding statement from the ***running config***.

Command Mode

Route-Map Configuration

Command Syntax

`set community` [**GSHUT** | ***aa:nn*** | ***community-list*** | internet | local-as | no-advertise | no-export | none | ***number***]

`no set community` [**GSHUT** | ***aa:nn*** | additive | ***community-list*** | delete | internet | local-as | no-advertise | no-export | none | ***number***]

`default set community` [**GSHUT** | ***aa:nn*** | additive | ***community-list*** | delete | internet | local-as | no-advertise | no-export | none | ***number***]

Parameters

- **GSHUT** Configures a graceful shutdown in BGP.
- ***aa:nn*** Configures the community AS and network number, separated by colon. Value ranges from ***0:0 to 65535:65535***.
- ***community-list*** A label for community list.
- **internet** Advertises route to the Internet community.
- **local-as** Advertises route only to local peers.
- **no-advertise** Does not advertise route to any peer.
- **no-export** Advertises route only within BGP AS boundary.
- **none** Does not provide any community attributes.
- ***number*** Configures the community number. Value ranges from ***1*** to ***4294967040***.
- **additive** Adds specified attributes to the current community.
- **delete** Removes specified attributes from the current community.

Related Commands

- ip community-list
- route-map
- set (route-map)
- set community (route-map)

Guideline

EOS does not support disabling the process of graceful shutdown community.

Example

This command advertises routes only to local peers.

```
switch(config-route-map-map1)# show active
route-map map1 permit 10
   match community instances <= 50
   set community 0:456 0:2345
switch(config-route-map-map1)# set community local-as
switch(config-route-map-map1)# ip community-list 345 permit 23
switch(config)# route-map map1
switch(config-route-map-map1)# show active
```

```
route-map map1 permit 10
   match community instances <= 50
   set community 0:456 0:2345 local-as
switch(config-route-map-map1)#
```

13.4.9.44 set extcommunity (route-map)

The **`set extcommunity`** command specifies extended community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **`set extcommunity none`** command removes extended community attributes from the route.

The **`no set extcommunity`** and **`default set extcommunity`** commands remove the specified **`set extcommunity`** command from the configuration mode route map statement by deleting the corresponding statement from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

`set extcommunity` **COND_X** [**COND_2**][**COND_N**][**MOD_TYPE**]

`set extcommunity none`

`no set extcommunity`**COND_X**[**COND_2**][**COND_N**][**MOD_TYPE**]

`no set extcommunity none`

`default set extcommunity` **COND_X** [**COND_2**][**COND_N**][**MOD_TYPE**]

`default set extcommunity none`

Parameters

- **COND_X** Specifies extended community route map modification. Command may contain multiple attributes. Options include:
  - **rt *ASN:nn*** Route target attribute (AS:network number).
  - **rt *IP-address:nn*** Route target attribute (IP address: network number).
  - **soo *ASN:nn*** Site of origin attribute (AS:network number).
  - **soo *IP-address:nn*** Site of origin attribute (IP address: network number).
- **MOD_TYPE** Specifies route map modification method. Options include:
  - ***no parameter*** Command replaces existing route map with specified parameters.
  - **additive** Command adds specified parameters to existing route map.
  - **delete** Command removes specified parameters from existing route map.

Related Commands

- route-map enters route map configuration mode.
- set (route-map) specifies attribute modifications for the redistributed routes.

Example

This command creates a route map entry in ***map1*** that sets the route target extended community attribute.

```
switch(config)# route-map map1
switch(config-route-map-map1)# set extcommunity rt 10.13.2.4:100
switch(config-route-map-map1)#
```

13.4.9.45 show (ACL configuration modes)

The **show** command displays the contents of an Access Control List (ACL).

- **show** or **show pending** displays the list as modified in ACL configuration mode.
- **show active** displays the list as stored in running-config.
- **show comment** displays the comment stored with the list.
- **show diff** displays the modified and stored lists, with flags denoting the modified rules.

Exiting the ACL configuration mode stores all pending ACL changes to ***running-config***.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

show

show active

show comment

show diff

show pending

Examples

The examples in this section assume these ACL commands are entered as specified.

These commands are stored in **none**:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to **none**:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to **none**:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

- This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)# show active
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.21.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

- This command displays the pending ACL, as modified in ACL configuration mode.

```
switch(config-acl-test_1)# show pending
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.10.0.0/16 any
  25 permit tcp 10.10.20.0/24 any
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  45 deny pim 239.24.124.0/24 10.5.8.4/30
  50 remark end of list
```

- This command displays the difference between the saved and modified ACLs.
  - Rules added to the pending list are denoted with a plus sign (+).
  - Rules removed from the saved list are denoted with a minus sign (-)

```
switch(config-acl-test_1)# show diff

```

13.4.9.46 show hardware tcam profile

The **show hardware tcam profile** command displays the hardware specific information for the current operational TCAM profile in the running configuration.

This command is applicable to DCS-7280(E/R) and DCS-7500(E/R) series switches only.

Command Mode

EXEC

Command Syntax

show hardware tcam profile

Parameters

- ***tcam*** Specifies the TCAM information.
- ***profile*** Specifies the TCAM profile information.

Example

This command displays the current operational TCAM profile details.

```
switch# show hardware tcam profile
Configuration        Status
FixedSystem          default              default
```

13.4.9.47 show ip access-lists

The **show ip access-list** command displays the contents of IPv4 and standard IPv4 Access Control List (ACLs) on the switch. Use the **summary** option to display only the name of the lists and the number of lines in each list.

Command Mode

Privileged EXEC

Command Syntax

show ip access-list [**LIST**][**SCOPE**]

Parameters

- **LIST** Name of lists to be displayed. Selection options include:
  - ***no parameter*** All IPv4 ACLs are displayed.
  - ***list_name*** Specified IPv4 ACL is displayed.
- **SCOPE** Information displayed. Selection options include:
  - ***no parameter*** All rules in the specified lists are displayed.
  - **summary** The number of rules in the specified lists are displayed.

Examples

- This command displays all rules in ***test1*** IPv4 ACL.

```
switch# show ip access-list list2
IP Access List list2
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
switch#
```

- This command displays the name of, and number of rules in, each list on the switch.

```
switch# show ip access-list summary
IPV4 ACL default-control-plane-acl
        Total rules configured: 12
        Configured on: control-plane
        Active on    : control-plane

IPV4 ACL list2
        Total rules configured: 3

IPV4 ACL test1
        Total rules configured: 6

Standard IPV4 ACL test_1
        Total rules configured: 1

IPV4 ACL test_3
        Total rules configured: 0

switch#
```

- This command displays the summary and lists all the configured IPv4 ACLs.

```
switch # show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
 Total rules configured: 17
 Configured on Ingress: control-plane(default VRF)
 Active on Ingress: control-plane(default VRF)
```

```
IPV4 ACL ipAclLimitTest
 Total rules configured: 0
 Configured on Egress: Vl2148,2700
 Active on Egress: Vl2148,2700
```

13.4.9.48 show ip prefix-list

The **show ip prefix-list** command displays all rules for the specified IPv4 prefix list. The command displays all IPv4 prefix list rules if a prefix list name is not specified.

Command Mode

EXEC

Command Syntax

show ip prefix-list [**DISPLAY_ITEMS**]

Parameters

DISPLAY_ITEMS Specifies the name of prefix lists for which rules are displayed. Options include:

- ***no parameter*** All IPv4 prefix list rules are displayed.
- ***list_name*** Specifies the IPv4 prefix list for which rules are displayed.

Example

This command displays all rules in the route-one IPv4 prefix list.

```
switch(config-ip-pfx)# show ip prefix-list
ip prefix-list route-one
    seq 10 deny 10.1.1.0/24
    seq 20 deny 10.1.0.0/16
    seq 30 permit 12.15.4.9/32
    seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)#
```

13.4.9.49 show ipv6 access-lists

The **show ipv6 access-list** command displays the contents of all IPv6 Access Control List (ACLs) on the switch. Use the **summary** option to display only the name of the lists and the number of lines in each list.

Command Mode

Privileged EXEC

Command Syntax

show ipv6 access-list [**LIST**][**SCOPE**]

Parameters

- **LIST** Name of lists to be displayed. Selection options include:
  - ***no parameter*** All IPv6 ACLs are displayed.
  - ***list_name*** Specified IPv6 ACL is displayed.
- **SCOPE** Information displayed. Selection options include:
  - ***no parameter*** All rules in the specified lists are displayed.
  - **summary** The number of rules in the specified lists are displayed.

Examples

- This command displays all rules in test1 IPv6 ACL.

```
switch# show ipv6 access-list list2
IP Access List list2
        10 permit ipv6 3891:3c58:6300::/64 any
        20 permit ipv6 any host 2fe1:b468:024a::
        30 deny ipv6 host 3411:91c1:: host 4210:cc23:d2de:::
switch#
```

- This command displays the name of, and number of rules in, each list on the switch.

```
switch# show ipv6 access-list summary
IPV6 ACL list2
        Total rules configured: 3

IPV6 ACL test1
        Total rules configured: 6

IPV6 ACL test_1
        Total rules configured: 1

Standard IPV6 ACL test_3
        Total rules configured: 0
switch#
```

13.4.9.50 show ipv6 prefix-list

The **show ipv6 prefix-list** command displays all rules for the specified IPv6 prefix list. The command displays all IPv6 prefix lists if a prefix list name is not specified.

Command Mode

EXEC

Command Syntax

show ipv6 prefix-list [**DISPLAY_ITEMS**]

Parameters

DISPLAY_ITEMS Specifies the name of prefix lists for which rules are displayed. Options include:

- ***no parameter*** All IPv6 prefix lists are displayed.
- ***list_name*** Specifies the IPv6 prefix list for which rules are displayed.

Examples

- This command displays all rules in the map1 IPv6 prefix list:

```
switch> show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
switch>
```

- This command displays all prefix lists:

```
switch> show ipv6 prefix-list
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
ipv6 prefix-list FREDD
ipv6 prefix-list route-five
ipv6 prefix-list map2
seq 10 deny 10:1:1:1::/64 ge 72 le 80
seq 20 deny 10:1::/32
switch>
```

13.4.9.51 show mac access-lists

The **show mac access-list** command displays the contents of all MAC Access Control List (ACLs) on the switch. Use the summary to display only the name of the lists and the number of lines in each list.

Command Mode

Privileged EXEC

Command Syntax

show mac access-lists [**LIST**][**SCOPE**]

Parameters

- **LIST** Name of lists to be displayed. Selection options include:
  - ***no parameter*** Command displays all ACLs.
  - ***list_name*** Command displays ACL specified by parameter.
- **SCOPE** Information displayed. Selection options include:
  - ***no parameter*** Command displays all rules in specified lists.
  - **summary** Command displays the number of rules in specified lists.

Examples

- This command displays all rules in ***mtest2*** MAC ACL.

```
switch# show mac access-list mlist2
IP Access List mlist2
        10 permit 1024.4510.F125 0.0.0 any aarp
        20 permit any 4100.4500.0000 0.FF.FFFF novell
        30 deny any any
switch#
```

- This command displays the number of rules in each MAC ACL on the switch.

```
switch# show mac access-list summary
MAC ACL mlist1
        Total rules configured: 6

MAC ACL mlist2
        Total rules configured: 3

MAC ACL mlist3
        Total rules configured: 1

MAC ACL mlist4
        Total rules configured: 0
switch#
```

13.4.9.52 show platform arad acl tcam summary

The **`show platform arad tcam summary`** command displays the percentage of TCAM utilization per forwarding ASIC.

Command Mode

EXEC

Command Syntax

`show platform arad acl tcam` ***`summary`***

Parameter

summary Displays the ACL TCAM summary.

Example

This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch# show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.

=======================================================
Arad3/0:
=======================================================
 Bank      Used           Used %                Used By
    1         4                0               IP RACLs
Total Number of TCAM lines used is: 4

=======================================================
Arad3/4:
=======================================================
 Bank      Used           Used %                Used By
    1         2                0               IP RACLs
Total Number of TCAM lines used is: 2
```

13.4.9.53 show platform arad acl tcam

The **show platform arad acl tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.

This command is applicable only on DCS-7500E, DCS-7280E series switches.

Command Mode

EXEC

Command Syntax

show platform arad acl tcam [*scope*]

Parameters

scope Specifies the information displayed. Options include:

- **detail** Displays the ACL TCAM details.
- **diff** Displays the difference between hardware and shadow.
- **hw** Displays the ACL entries from hardware.
- **shadow** Displays the ACL entries from shadow.
- **summary** Displays the ACL TCAM summary.

Examples

- This command displays the number of TCAM entries used by Arad0 ASIC. In this example, ACL is applied on two VLANs (***Vl2148*** and ***Vl2700***) but number of TCAM entries occupied is only one.

```
switch# show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries,
 direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
Bank Offset Entries
0         0       1
Fap: Arad1, Shared: true, Interfaces: Vl2148
Bank Offset Entries
0         0       1
```

- This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch# show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.
=========================================================
Arad0:
=========================================================
 Bank   Used                  Used %             Used By
    0      1                       0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
=========================================================
Arad1:
=========================================================
 Bank   Used                   Used %             Used By
    0      1                       0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
```

13.4.9.54 show platform arad mapping

The **show platform arad mapping** command displays the mapping between the interfaces and the forwarding ASICs.

Command Mode

EXEC

Command Syntax

show platform arad ***chip_name*** **mapping**

Parameter

chip_name Specifies the Arad chip name.

Example

This command displays the mapping between the interfaces and the forwarding ASICs on the Arad3/0 chip.

```
switch# show platform arad arad3/0 mapping
Arad3/0  Port                     SysPhyPort    Voq   ( Fap,FapPort)    Xlge     Serdes
-------------------------------------------------------------------------------
         Ethernet3/1/1                    34    288        (0  ,  2)     n/a        (20)
.................................................................................
```

13.4.9.55 show platform fap acl

The **show platform fap acl** command displays the ACL information of Sand platform devices.

Command Mode

Privileged EXEC

Command Syntax

show platform fap acl [ipkgv | l4ops | mirroring | opkgv | pmf | tcam | udf | vsicfg]

Parameters

- **ipkgv** Displays the ACL Ingress Interface Specification (IPKGV) information.
- **l4ops** Displays the ACL Layer 4 Options (L4OPS) information.
- **mirroring** Displays the mirroring ACL information.
- **opkgv** Displays the ACL Egress Interface Specification (OPKGV) information.
- **pmf** Displays the Pmf.
- **tcam** Displays the ACL TCAM information.
- **udf** Displays the ACL UDF information.
- **vsicfg** Displays the ACL Virtual Switch Instance (VSI) CONFIG information.

Guidelines

This command is supported on DCS-7280SE and DCS-7500E series platforms only.

Example

This command displays the brief information of all installed mirroring ACLs.

```
switch(config)# show platform fap acl mirroring

==============
 Aggregate ACLs
==============

  (list2:0->2) type=2; version=0
   - list2 [ prio 0 ] => session 2

  (list1:10->1,list3:20->3) type=0; version=13
   - list3 [ prio 20 ] => session 3
   - list1 [ prio 10 ] => session 1

======================
 Interface-ACL Mapping
======================

   Ethernet1 => (list1:10->1,list3:20->3) [ ipv4 ]
   Ethernet33 => (list2:0->2) [ mac ]
```

13.4.9.56 show platform fap acl tcam

The **show platform fap tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC of Sand platform devices.

Command Mode

Privileged EXEC

Command Syntax

show platform fap acl tcam [detail | diff | hw | shadow | summary]

Parameter

- **detail** Displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.
- **diff** Displays the difference between hardware and shadow.
- **hw** Displays ACL entries from hardware.
- **shadow** Displays ACL entries from shadow.
- **summary** Displays the percentage of TCAM utilization per forwarding ASIC.

Example

This command displays the number of TCAM entries and other ACL TCAM detail.

```
switch# show platform fap acl tcam detail
ip access-list ipAcl0000 (RACL, 1 rules, 2 entries, direction in, state
 success)
 Shared: false
 Interface: Vlan0002
 -------------------
 Fap: Arad3/0
 Bank Offset Entries
 1         0       2
 Interface: Vlan0003
 -------------------
 Fap: Arad3/0
 Bank Offset Entries
 1         2       2
 Fap: Arad3/4
 Bank Offset Entries
 1         0       2
```

13.4.9.57 show platform fap acl tcam hw

The **show platform fap acl tcam hw** command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

Command Mode

EXEC

Command Syntax

show platform fap ***fap_name*** **acl tcam hw**

Parameters

- ***fap_name*** Specifies the switch chip-set name.
- **acl** Specifies the Arad ACL information.
- **tcam** Specifies the Arad TCAM information.
- **hw** Specifies the ACL entries for hardware.

Example

This command displays the TCAM entries configured for each TCAM bank including policy maps and corresponding traffic matches.

```
switch# show platform fap Arad1 acl tcam hw
================================================================================

<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

13.4.9.58 show platform fap acl tcam summary

The **show platform fap acl tcam summary** command displays for each forwarding ASIC, the number of TCAM entries consumed per ACL type, and in which TCAM bank the entries are installed. A mirroring ACL does not consume TCAM resources unless attached to a mirroring source interface, and a mirroring destination is configured. If the mirroring destination is a GRE tunnel, at least one nexthop entry for the tunnel destination must be resolved before a TCAM entry is installed.

Command Mode

EXEC

Command Syntax

show platform fap acl tcam summary

Example

This command displays the number of TCAM entries consumed per ACL type, the bank installed, and ASIC. Three TCAM entries are consumed across two forwarding ASICs, two for IP ACLs, and one for MAC ACLs.

```
switch# show platform fap acl tcam summary
=========================================================
 Arad0:
=========================================================
    Bank   Used Used %    Used By
    0, 1      2      0    IP Mirroring
 Total Number of TCAM lines used is: 4
=========================================================
 Arad1:
=========================================================
   Bank   Used            Used %                 Used By
      2      1                 0           Mac Mirroring
```

13.4.9.59 show platform trident tcam

The **show platform trident tcam** command displays the TCAM entries configured for each TCAM group including policy maps and corresponding hits.

Command Mode

EXEC

Command Syntax

show platform trident tcam [acl | cpu-bound | **detail** | directed-broadcast | entry | mirror | pbr | pipe | qos | shared | summary]

Parameters

- ***no parameters*** Displays TCAM entries for each TCAM group.
- **acl** Displays the trident ACL information.
- **cpu-bound** Displays the trident cpu-bound information.
- **detail** Lists all TCAM entries.
- **directed-broadcast** Allows inbound broadcast IP packets with Source IP address as one of the permitted broadcast host.
- **entry** Displays the TCAM entry information.
- **mirror** Displays the trident Mirroring ACL information.
- **pbr** Displays the trident PBR ACL information.
- **pipe** Allows to specify a pipe for filtering.
- **qos** Displays the trident QOS information.
- **shared** Displays the ACL Sharing information.
- **summary** Displays the TCAM allocation information.

Guidelines

This command is applicable only on DCS-7010, DCS-7050/DCS-7050X, DCS7250X, DCS-7300X series switches.

Examples

- This command displays the Trident mirroring ACL information.

```
switch(config)# show platform trident tcam mirror
=== Mirroring ACLs on switch Linecard0/0 ===

Session: mir-sess2

INGRESS ACL mirAcl2* uses 2 entries
 Assigned to ports: Ethernet32/1
```

- This command displays the allowed IP Destination address from the in coming packets

```
switch# show platform trident tcam directed-broadcast
DirectedBroadcast Feature Tuples.
Src Ip          Dst Ip          Action          Hits
--------------- --------------- ------- ------------

<-------OUTPUT OMITTED FROM EXAMPLE-------->

ck338.22:14:38(config-pmap-qos-policy1)#
```

13.4.9.60 show route-map

The **show route-map** command displays the contents of configured route maps.

Command Mode

EXEC

Command Syntax

show route-map [***map_name***]

Parameters

- ***no parameter*** Displays the content of all configured route maps.
- ***map_name*** Displays the content of the specified route map.

Examples

- This command displays the ***map1*** route map.

```
switch(config)# show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
    set as-path prepend auto auto
```

- This command displays the ***map*** route map.

```
switch> show route-map map
route-map map permit 5
  Match clauses:
    match as 456
Set clauses:
route-map map permit 10
  Match clauses:
match ip next-hop 2.3.4.5
    match as-path path_2
  Set clauses:
    set local-preference 100
```

13.4.9.61 system profile

The **system profile** command creates a new Ternary Content-Addressable Memory (TCAM) profile in the running configuration.

The **default system profile** and **no system profile** commands delete non-default TCAM profiles from the running configuration.

Command Mode

Hardware TCAM

Command Syntax

system profile [***profile_name***| default | mirroring-acl | pbr-match-nexthop-group | qos | tap-aggregation-default | tap-aggregation-extended | tc-counters]

default system profile

no system profile

Parameters

- ***profile_name*** Creates a profile with the specified name.
- **default** Creates a default profile.
- **mirroring-acl** Creates a mirroring-ACL profile.
- **pbr-match-nexthop-group** Creates a pbr-match-nexthop-group profile.
- **qos** Creates a Quality of Service (QoS) profile.
- **tap-aggregation-default** Creates a tap-aggregation-default profile.
- **tap-aggregation-extended** Creates a tap-aggregation-extended profile.
- **tc-counters** Creates a tc-counters profile.

Guideline

These commands are compatible with the DCS-7280SE and DCS-7500E series switches only.

Examples

- These commands create a mirroring-ACL profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile mirroring-acl
switch(config-hw-tcam)# show hardware tcam profile
                     Configuration        Status
FixedSystem          mirroring-acl        mirroring-acl
switch(config-hw-tcam)#
```

- These commands delete non-default TCAM profiles.

```
switch(config)# hardware tcam
switch(config-hw-tcam)#show hardware tcam profile
                     Configuration        Status
Linecard9            mirroring-acl        mirroring-acl
Linecard8            mirroring-acl        mirroring-acl
Linecard3            mirroring-acl        mirroring-acl
Linecard4            mirroring-acl        mirroring-acl
Linecard6            mirroring-acl        mirroring-acl
switch(config-hw-tcam)# default system profile
switch(config-hw-tcam)# show hardware tcam profile
                     Configuration        Status
Linecard9            default              default
Linecard8            default              default
Linecard3            default              default
Linecard4            default              default
Linecard6            default              default
```

```
switch(config-hw-tcam)#
```

- These commands delete TCAM profiles.

```
switch(config-hw-tcam)# show hardware tcam profile
                    Configuration        Status
Linecard9           tc-counters          tc-counters
Linecard8           tc-counters          tc-counters
Linecard3           tc-counters          tc-counters
Linecard4           tc-counters          tc-counters
Linecard6           tc-counters          tc-counters
switch(config-hw-tcam)# no system profile
switch(config-hw-tcam)# show hardware tcam profile
                    Configuration        Status
Linecard9           default              default
Linecard8           default              default
Linecard3           default              default
Linecard4           default              default
Linecard6           default              default
switch(config-hw-tcam)#
```

13.5 VRRP and VARP

A virtual IP (VIP) address is an IP address that does not directly connect to a specific interface. Inbound packets sent to a Virtual IP address are redirected to a physical network interface. VIPs support connection redundancy by assigning the address to multiple switches. If one device becomes unavailable, packets sent to the address are still serviced by the functioning device.

Arista switches support virtual IP addresses through Virtual Router Redundancy Protocol, version 2 (VRRPv2), Virtual Router Redundancy Protocol, version 3 (VRRPv3), and Virtual-ARP (VARP). This chapter describes the Arista switch support of virtual IP addresses and contains these sections:

13.5.1 VRRP and VARP Conceptual Overview

This section review the following topics:

- VRRPv2
- VRRPv3
- VARP

13.5.1.1 VRRPv2

A virtual router, also known as a virtual router group, is defined by a Virtual Router Identifier (VRID) and a virtual IP address. A virtual routers mapping of VRID and IP address must be consistent among all switches implementing the virtual router group. A virtual routers scope is restricted to a single LAN.

A LAN may contain multiple virtual routers for distributing traffic. Each virtual router on a LAN is assigned a unique VRID. A switch may be configured with virtual routers among multiple LANs.

VRRP uses priority ratings to assign Master or Backup roles for each VRRP router configured for a virtual router group. The Master router sends periodic VRRP Advertisement messages along the LAN and forwards packets received by the virtual router to their destination. Backup routers are inactive but are available to assume Master router duties when the current Master fails.

A VRRP can be configured to allow VRRP routers with higher priority to take over Master router duties. Alternatively, the group can be configured to prevent a router from preemptively assuming the Master role. A VRRP router is always assigned the Master of any virtual router configured with the address owned by the VRRP router, regardless of the preemption prevention setting.

On 7280R3, 7500R3 and 7800R3 series, maximally 14 unique VRRP groups can be configured along with VARP and MLAG Peer gateway virtual MAC capabilities.

13.5.1.2 VRRPv3

RFC 5798 defines version 3 of the Virtual Router Redundancy Protocol (VRRP) for both IPv4 and IPv6. It is based on version 2 of VRRP, as defined in ***RFC 3768***.

13.5.1.3 VARP

Virtual VRRP (VARP) allows multiple switches to simultaneously route packets from a common IP address in an active-active router configuration. Each switch is configured with the same set of virtual IP addresses on corresponding VLAN interfaces and a common virtual MAC address. In MLAG configurations, VARP is preferred over VRRP because VARP does not require traffic to traverse the peer-link to the master router as VRRP would.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address.

VARP functions by having each switch respond to ARP and GARP requests for the configured router IP address with the virtual MAC address. The virtual MAC address is only for inbound packets and never used in the source field of outbound packets.

When ip routing is enabled, packets to the virtual MAC address are routed to the next hop destination.

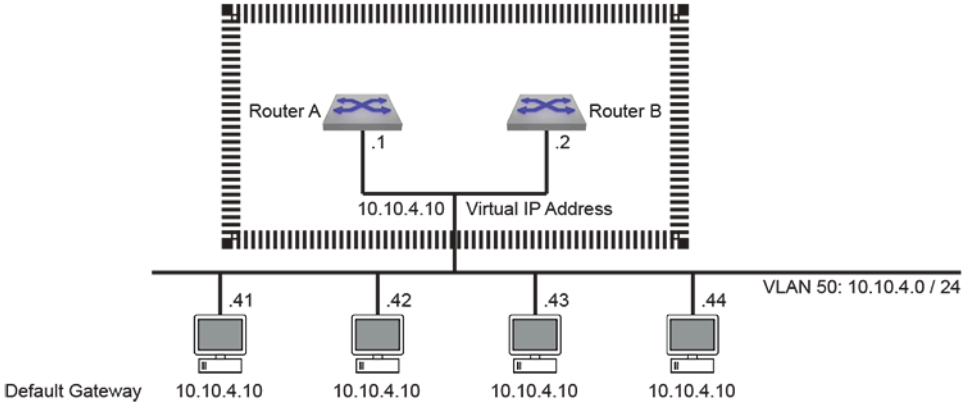

Figure 32: VARP Configuration

The following sections are included in this chapter:

- VRRP and VARP Conceptual Overview
- VRRP and VARP Implementation Procedures
- VRRP and VARP Implementation Examples
- VRRP and VARP Configuration Commands

13.5.2 VRRP and VARP Implementation Procedures

This section contains the following configuration instructions:

- VRRP Configuration for IPv4
- VRRP Configuration for IPv6
- VARP Configuration

13.5.2.1 VRRP Configuration for IPv4

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The **`no vrrp`** command removes all VRRP commands for the specified virtual router from ***running-config***.

13.5.2.1.1 Virtual Router Configuration

Most configuration tasks are optional because all mandatory parameters have a default value. The following virtual router parameters are configurable:

- VRRP version (default = version 2)
- Router priority (default = 100)
- Preemption option (default is enabled)
- Advertisement timer (default = one second)
- Description (optional parameter)
- Peer authentication (optional parameter)
- Secondary IP addresses (optional parameter)

VRRP Version

The **vrrp ipv4 version** command sets the version of VRRP for the corresponding IPv4 virtual router. IPv6 version is not configurable as it only supports version 3. The version selected in a VRRP group can either be same for all group members or independent of each other. By default, Arista switches use VRRP version 2, which supports only IPv4 environments. VRRP version 3 supports both IPv4 and IPv6 environments.

Example

This command causes ***vlan 20*** to use VRRP version 3.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

Master and Backup Router

The VRRP routers within a virtual router group determine the Master router through priority settings. Priority values range from ***254*** (highest priority) to ***1*** (lowest priority). Priority is either set by a CLI command or is assigned the default value of ***100***. A switch specifies priority settings for each of its virtual routers. Once set, VRRP priority level can also be changed by a tracked object. The **vrrp tracked-object** command configures the VRRP client process to track an object created by the **track** command and react if its status changes to ***down***.

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The **vrrp priority-level** command configures the switchs priority setting for the specified virtual router.

Example

This command sets the priority value of ***250*** for the virtual router with ***VRID 15*** on ***VLAN 20***.

```
switch(config-if-vl20)# vrrp 15 priority-level 250
switch(config-if-vl20)#
```

The **vrrp preempt** command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Examples

- This command disables preempt mode for the virtual router ***15*** on ***vlan 20***.

```
switch(config-if-vl20)# no vrrp 15 preempt
switch(config-if-vl20)#
```

- This command enables preempt mode for the virtual router ***30*** on ***vlan 20***.

```
switch(config-if-vl20)#vrrp 30 preempt
switch(config-if-vl20)#
```

The **vrrp preempt delay** command configures a period between an event that elevates a switch to master VRRP router status and the switch's assumption of master VRRP router role. Command options configure delays during normal operation and after a switch reboot.

Advertisement Interval

The Master router sends periodic VRRP Advertisement messages to other VRRP routers. The **vrrp advertisement interval** command specifies the interval between successive advertisement message transmissions.

The advertisement interval also defines the timeout that determines when the switch assumes the Master router role. This timeout interval is three times the advertisement interval.

Example

This command sets the advertisement interval of ***10*** seconds for virtual router ***35*** on ***vlan 100***.

```
switch(config-if-vl100)# vrrp 35 advertisement interval 10
switch(config-if-vl100)#
```

Description

The **vrrp session description** command associates a text string to the specified virtual router. The maximum string length is ***80*** characters. The string has no functional impact on the virtual router.

Example

This command associates the text string ***Laboratory Router*** to virtual router ***15*** on ***vlan 20***.

```
switch(config-if-vl20)# vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```

Peer Authentication

VRRP peer authentication validates VRRP advertisement packets that the switch receives from other VRRP routers in a specified virtual router group. When a virtual router uses authentication, all VRRP routers in the group must use the same authentication parameters.

The **vrrp peer authentication** command configures virtual router authentication parameters for the specified virtual router.

Example

This command implements plain-text authentication, using ***12345*** as the key, for virtual router ***40*** on ***vlan 100***.

```
switch(config-if-vl100)#vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

Secondary Addresses

The **vrrp ipv4 secondary** command assigns a secondary IP address to a virtual router. Secondary addresses are optional; a virtual routers configuration may include more than one secondary address command. The primary and secondary address list must be identical for all switches in a virtual router group.

A primary IP address is assigned to a virtual router with the **vrrp ipv4** command (Virtual Router Enabling and the Primary IP address).

Example

This command assigns the IP address of ***10.2.4.5*** as the secondary IP address for the virtual router ***15*** on ***vlan 20***.

```
switch(config-if-vl20)# vrrp 15 ipv4 10.2.4.5 secondary
switch(config-if-vl20)#
```

13.5.2.1.2 Virtual Router Enabling and the Primary IP address

The **vrrp ipv4** command configures the primary IP address of the specified virtual router and enables the virtual router if the primary address is contained within the configuration mode interfaces IP address subnet. A virtual routers configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands reassign the virtual routers primary IP address.

Example

This command enables virtual router group ***15*** (VRID) on ***vlan 20*** and assigns ***10.1.1.5*** as the virtual routers primary address.

```
switch(config-if-vl20)# vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.2.1.3 Disabling VRRP

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group. The **no vrrp disabled** command changes the switchs virtual router state to **backup** or **master** if the virtual router is properly configured.

VRRP can also be shut down when the status of a tracked object configured by the **vrrp tracked-object** command changes to **down**.

Examples

- This command places the switch in stopped mode for virtual router ***24*** on ***vlan 20***.

```
switch(config-if-vl20)# vrrp 24 disabled
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router ***24*** on ***vlan 20***.

```
switch(config-if-vl20)# no vrrp 24 disabled
switch(config-if-vl20)#
```

- This command configures the switch to enter stopped mode for virtual router ***24*** on ***vlan 20*** if the status of ***tracked-object interfaceE6/48*** changes to **down**.

```
switch(config-if-vl20)# vrrp 24 tracked-object interfaceE6/48 shutdown
switch(config-if-vl20)#
```

The **no vrrp** and **no vrrp ipv4** commands delete the specified virtual IP address from the interface. Additionally, the **no vrrp** command removes all residual VRRP commands for the virtual router.

Examples

- This command removes all VRRP configuration commands for virtual router ***10*** on ***vlan 15***.

```
switch(config-if-vl15)# no vrrp 10
switch(config-if-vl15)#
```

- This command disables virtual router ***25*** on ***vlan20*** and removes the primary IP address from its configuration.

```
switch(config-if-vl20)# no vrrp 25 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.2.2 VRRP Configuration for IPv6

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The **no vrrp** command removes all VRRP commands for the specified virtual router from ***running-config***.

13.5.2.2.1 Configuring VRRP for IPv6

Specify the VRRP Version

The **vrrp ipv4 version** command sets the version of VRRP used on an interface. The version selected in a VRRP group must be the same for all group members. By default, Arista switches use VRRP version 2, which is not compatible with IPv6.

Example

This command causes ***vlan 20*** to use VRRP version 3.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

Create a VRRP Group and Configure a Virtual IPv6 Address

The **vrrp ipv6** command assigns an IPv6 address to the interface being configured and creates a VRRP group.

Example

These commands create VRRP group 3 and configure a virtual IPv6 address for the VRRP group on the ***vlan 20*** interface.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

Configure Tracking

The **vrrp tracked-object** command configures the VRRP client process to track an object created by the **track** command and react if its status changes to ***down***.

Example

This command causes interface ***vlan 20*** to disable VRRP when tracked object ETH8 changes state.

```
switch(config-if-vl20)# vrrp 1 tracked-object ETH8 shutdown
switch(config-if-vl20)#
```

Configure the Priority Level

The **vrrp priority-level** command configures the switchs priority setting for the specified virtual router.

Example

This command sets the priority value of ***250*** for the virtual router with ***VRID 15*** on ***vlan 20***.

```
switch(config-if-vl20)# vrrp 15 priority-level 250
switch(config-if-vl20)#
```

Configure the Preemption Mode

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The **vrrp preempt** command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Example

This command enables preempt mode for the virtual router ***30*** on ***vlan 20***.

```
switch(config-if-vl20)# vrrp 30 preempt
```

Configure the VRRP Advertisement Interval

The **ip virtual-router mac-address advertisement-interval** command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

Example

This command configures a MAC address advertisement interval of one minute (***60*** seconds).

```
switch(config)# interface vlan 20
switch(config-if-vl20)# ip virtual-router mac-address advertisement-
interval 60
switch(config-if-vl20)#
```

13.5.2.2.2 Verify VRRP IPv6 Configurations

Use the following commands to display the VRRP configurations and status.

Show VRRP Group

The **show vrrp** command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface.

Example

This command displays a table of information for VRRP groups on the switch.

```
switch# show vrrp interface vlan 3060 brief
Interface Id  Ver Pri Time  State   VrIps
Vlan3060  1   3   100 3609  Master  2001::2
                                    2001::3
Vlan3060  2   3   100 3609  Master  2002::2
                                    2002::3
switch#
```

13.5.2.3 VARP Configuration

Implementing VARP consists of assigning virtual IP addresses to VLAN interfaces and configuring a virtual MAC address.

Virtual IP Addresses

The **ip virtual-router address** command assigns a virtual IP address to the VLAN interface being configured. Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IPv4 address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IPv4 address in a virtual subnet, the ARP request will use the virtual IPv4 address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for ***VLAN 10***.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 10.0.0.6
switch(config-if-Vl10)# ipv6 address 2001::1/64
switch(config-if-Vl10)# ipv6 virtual-router address 2001::2
switch(config-if-Vl10)# exit
switch(config)#
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv4 address with a subnet for ***vlan 10***. A static route is added to indicate that the virtual subnet is reachable through ***vlan 10***.

```
switch(config)# ip route 192.0.0.0/24 vlan 10
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)# exit
switch(config)#
```

Virtual MAC Address

The **ip virtual-router mac-address** command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source.

When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either though static configuration or learned through a dynamic routing protocol.

Example

This command configures a virtual MAC address.

```
switch(config)# ip virtual-router mac-address 001c.7300.0099
switch(config)#
```

Show Virtual MAC Address

To display the virtual router MAC and IP addresses, enter the **show ip virtual-router** command.

Example

This command displays the virtual router addresses assigned on the switch.

```
switch# show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface  IP Address        Virtual IP Address   Status
 Protocol
Vlan15     10.1.1.3/24       10.1.1.15            up                  up
Vlan15     10.1.1.3/24       10.1.1.16            up                  up
Vlan15     10.1.1.3/24       10.1.1.17            up                  up
Vlan20     10.12.1.6/24      10.1.1.51            up                  up
Vlan20     10.12.1.6/24      10.1.1.53            up                  up
Vlan20     10.12.1.6/24      10.1.1.55            up                  up
switch#
```

Show IPv6 Virtual-Router

The **show ipv6 virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Example

This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch# show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

13.5.3 VRRP and VARP Implementation Examples

This section contains the following example set:

- VRRP Examples
- VARP Example

13.5.3.1 VRRP Examples

This section provides code that implements three VRRP configurations:

- Example 1 configures two switches in a single virtual router group. This implementation protects the LAN against the failure of one router.
- Example 2 configures two switches into two virtual routers within a single LAN. This implementation protects the LAN against the failure of one router and balances traffic between the routers.
- Example 3 configures three switches to implement virtual routers on two LANs. Each LAN contains two virtual routers. One switch is configured into four virtual routers – two on each LAN.

13.5.3.1.1 VRRP Example 1: One Virtual Router on One LAN

The network diagram displays the Example 1 network. Two switches are configured as VRRP routers to form one virtual router.

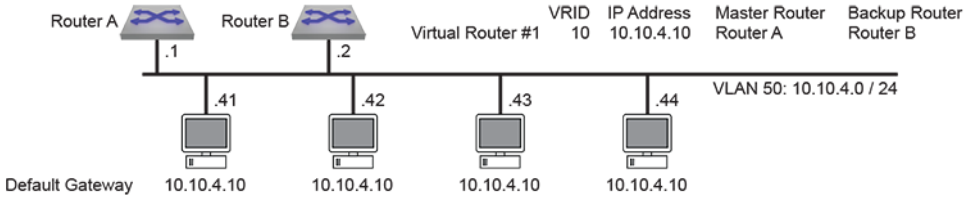

Figure 33: VRRP Example 1 Network Diagram

The following code configures the first switch (***Router A***) as the master router and the second switch (***Router B***) as a backup router for virtual router ***10*** on ***vlan 50***. ***Router A*** becomes the Master virtual router by setting its priority at ***200***; ***Router B*** maintains the default priority of ***100***. The advertisement interval is three seconds on both switches. Priority preemption is enabled by default.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)# interface vlan 50
switch-A(config-if-vl50)# ip address 10.10.4.1/24
switch-A(config-if-vl50)# no vrrp 10
switch-A(config-if-vl50)# vrrp 10 priority 200
switch-A(config-if-vl50)# vrrp 10 advertisement interval 3
switch-A(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)# exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)# interface vlan 50
switch-B(config-if-vl50)# ip address 10.10.4.2/24
switch-B(config-if-vl50)# no vrrp 10
switch-B(config-if-vl50)# vrrp 10 advertisement interval 3
switch-B(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)# exit
```

13.5.3.1.2 VRRP Example 2: Two Virtual Routers on One LAN

The nnetwork diagram displays Example 2. Two switches are configured as VRRP routers to form two virtual routers on one LAN. Using two virtual routers distributes the LAN traffic between the switches.

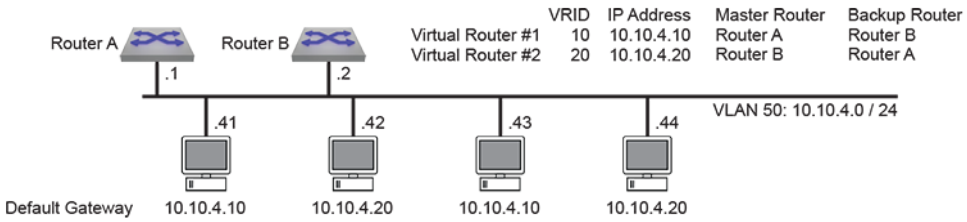

Figure 34: VRRP Example 2 Network Diagram

The following code configures two switches as a master and a backup router for two virtual routers on ***vlan 50***.

- ***Router A*** is the master for virtual router ***10*** and backup for virtual router ***20***.
- ***Router B*** is the master for virtual router ***20*** and backup for virtual router ***10***.
- VRRP advertisement interval is ***3*** seconds on virtual router ***10*** and ***5*** seconds on virtual router ***20***.
- Priority preemption is enabled by default for both virtual routers.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)# interface vlan 50
switch-A(config-if-vl50)# ip address 10.10.4.1/24
switch-A(config-if-vl50)# no vrrp 10
switch-A(config-if-vl50)# vrrp 10 priority 200
switch-A(config-if-vl50)# vrrp 10 advertisement interval 3
switch-A(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)# no vrrp 20
switch-A(config-if-vl50)# vrrp 20 advertisement interval 5
switch-A(config-if-vl50)# vrrp 20 ip 10.10.4.20
switch-A(config-if-vl50)# exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)# interface vlan 50
switch-B(config-if-vl50)# ip address 10.10.4.2/24
switch-B(config-if-vl50)# no vrrp 10
switch-B(config-if-vl50)# vrrp 10 advertisement interval 3
switch-B(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)# no vrrp 20
switch-B(config-if-vl50)# vrrp 20 priority 200
switch-B(config-if-vl50)# vrrp 20 advertisement interval 5
switch-B(config-if-vl50)# vrrp 20 ip 10.10.4.20
switch-B(config-if-vl50)# exit
```

13.5.3.1.3 VRRP Example 3: Two Virtual Routers on Two LANs

The network diagram displays Example 3. Three switches are configured as VRRP routers to form four virtual router groups two groups on each of two LANs.

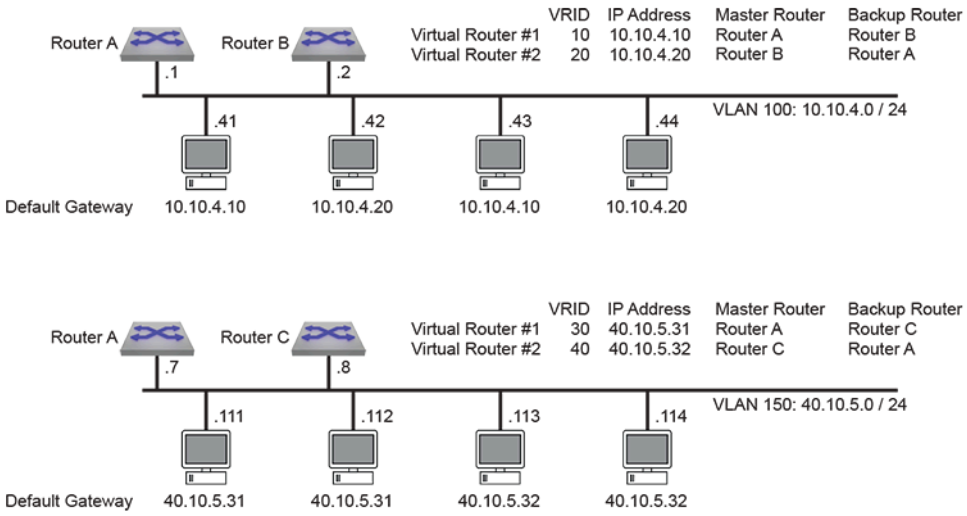

Figure 35: VRRP Example 3 Network Diagram

The following code configures the three switches as follows:

- ***Router A*** is the master for virtual router ***10*** and backup for virtual router ***20*** on ***vlan 100***.
- ***Router A*** is the master for virtual router ***30*** and backup for virtual router ***40*** on ***vlan 150***.
- ***Router B*** is the master for virtual router ***20*** and backup for virtual router ***10*** on ***vlan 100***.
- ***Router C*** is the master for virtual router ***40*** and backup for virtual router ***30*** on ***vlan 150***.
- VRRP advertisement interval is set to one second on all virtual routers.
- Priority preemption is disabled on all virtual routers.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)# interface vlan 100
switch-A(config-if-vl100)# ip address 10.10.4.1/24
switch-A(config-if-vl100)# no vrrp 10
switch-A(config-if-vl100)# vrrp 10 priority 200
switch-A(config-if-vl100)# no vrrp 10 preempt
switch-A(config-if-vl100)# vrrp 10 ip 10.10.4.10
switch-A(config-if-vl100)# vrrp 10 advertisement interval 1
switch-A(config-if-vl100)# no vrrp 20
switch-A(config-if-vl100)# no vrrp 20 preempt
switch-A(config-if-vl100)# vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)# interface vlan 150
switch-A(config-if-vl150)# ip address 40.10.5.7/24
switch-A(config-if-vl150)# no vrrp 30
switch-A(config-if-vl150)# vrrp 30 priority 200
switch-A(config-if-vl150)# no vrrp 30 preempt
switch-A(config-if-vl150)# vrrp 30 ip 40.10.5.31
switch-A(config-if-vl100)# vrrp 30 advertisement interval 1
switch-A(config-if-vl150)# no vrrp 40
switch-A(config-if-vl150)# no vrrp 40 preempt
switch-A(config-if-vl150)# vrrp 40 ip 40.10.5.32
switch-A(config-if-vl150)# exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)# interface vlan 100
switch-B(config-if-vl100)# ip address 10.10.4.2/24
switch-B(config-if-vl100)# no vrrp 10
```

```
switch-B(config-if-vl100)# no vrrp 10 preempt
switch-B(config-if-vl100)# vrrp 10 ip 10.10.4.10
switch-B(config-if-vl100)# no vrrp 20
switch-B(config-if-vl100)# vrrp 20 priority 200
switch-B(config-if-vl100)# no vrrp 20 preempt
switch-B(config-if-vl100)# vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)# vrrp 20 advertisement interval 1
switch-B(config-if-vl100)# exit
```

Switch Code that Implements Router C on the Third Switch

```
switch-C(config)# interface vlan 150
switch-C(config-if-vl150)# ip address 40.10.5.8/24
switch-C(config-if-vl150)# no vrrp 30
switch-C(config-if-vl150)# no vrrp 30 preempt
switch-C(config-if-vl150)# vrrp 30 ip 40.10.5.31
switch-C(config-if-vl150)# no vrrp 40
switch-C(config-if-vl150)# vrrp 40 priority 200
switch-C(config-if-vl150)# no vrrp 40 preempt
switch-C(config-if-vl150)# vrrp 40 ip 40.10.5.32
switch-A(config-if-vl100)# vrrp 40 advertisement interval 1
switch-C(config-if-vl150)# exit
```

13.5.3.2 VARP Example

This section provides code that implements a VARP configuration. The network diagram displays the Example 1 network. Two switches in an MLAG domain are configured as VARP routers.

The following code configures ***10.10.4.10*** as the virtual IP address for ***VLAN 50***, ***10.24.4.1*** as the virtual IP address for ***VLAN 70***, and ***001c.7300.0999*** as the virtual MAC address on both switches.

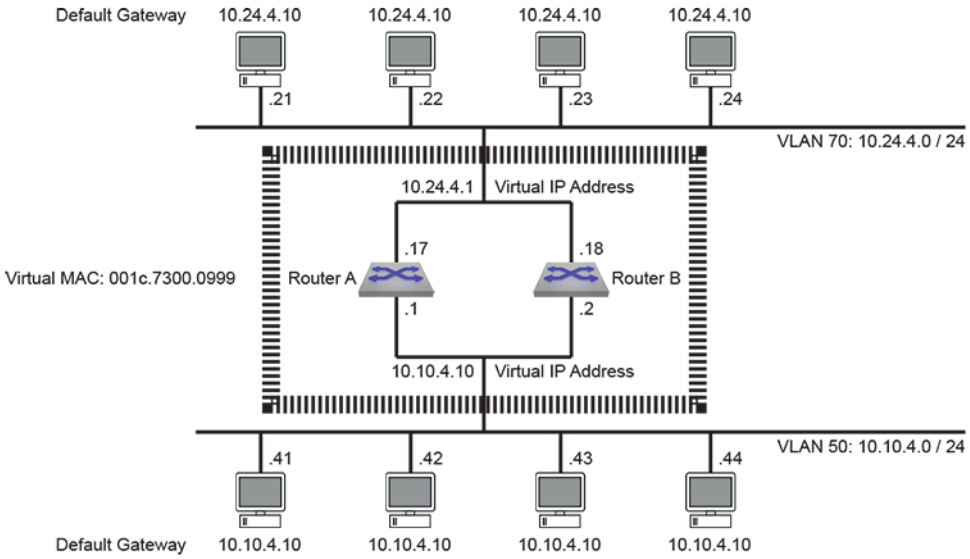

Figure 36: VARP Example Network Diagram

Switch Code that Implements VARP on the First Switch

```
switch-A(config)# ip virtual-router mac-address 001c.7300.0999
switch-A(config)# interface vlan 50
switch-A(config-if-vl50)# ip address 10.10.4.1/24
switch-A(config-if-vl50)# ip virtual-router address 10.10.4.10
```

```
switch-A(config-if-vl50)# interface vlan 70
switch-A(config-if-vl70)# ip address 10.24.4.17/24
switch-A(config-if-vl70)# ip virtual-router address 10.24.4.1
switch-A(config-if-vl70)# exit
```

Switch Code that Implements VARP on the Second Switch

```
switch-B(config)# ip virtual-router mac-address 001c.7300.0999
switch-B(config)# interface vlan 50
switch-B(config-if-vl50)# ip address 10.10.4.2/24
switch-B(config-if-vl50)# ip virtual-router address 10.10.4.10
switch-B(config-if-vl50)# interface vlan 70
switch-B(config-if-vl70)# ip address 10.24.4.18/24
switch-B(config-if-vl70)# ip virtual-router address 10.24.4.1
switch-B(config-if-vl70)# exit
```

13.5.4 VRRP and VARP Configuration Commands

This section contains descriptions of CLI commands that support VRRP and VARP.

Global Configuration Commands

- ip fhrp accept-mode
- ip virtual-router mac-address
- ip virtual-router mac-address advertisement-interval

Interface Configuration Commands Ethernet, Port Channel, and VLAN Interfaces

- ip virtual-router address
- ipv6 virtual-router address
- no vrrp
- vrrp advertisement interval
- vrrp disabled
- vrrp ipv4
- vrrp ipv4 checksum pseudo-header exclude
- vrrp ipv4 secondary
- vrrp ipv4 version
- vrrp ipv6
- vrrp mac-address advertisement-interval
- vrrp peer authentication
- vrrp preempt
- vrrp preempt delay
- vrrp priority-level
- vrrp session description
- vrrp timers delay reload
- vrrp tracked-object

Privileged EXEC Commands

- show ip virtual-router
- show ipv6 virtual-router
- show vrrp

13.5.4.1 ip fhrp accept-mode

The **ip fhrp accept-mode** command configures the switch to permit SSH access to the VRRP Master and VARP Master router. All routers within a VRRP or VARP group should be configured consistently. By default, SSH access to the VRRP and VARP Master routers is not permitted.

The **no ip fhrp accept-mode** and **default ip fhrp accept-mode** commands restores the default SSH access availability by removing the **ip fhrp accept-mode** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip fhrp accept-mode

no ip fhrp accept-mode

default ip fhrp accept-mode

Example

This command configures the switch to permit SSH access to the VRRP and VARP Master routers.

```
switch(config)# ip fhrp accept-mode
switch(config)# show running-config

!
ip fhrp accept-mode
!

switch(config)#
```

13.5.4.2 ip virtual-router address

The **ip virtual-router address** command assigns a virtual IPv4 address to the VLAN interface being configured. (To assign a virtual IPv6 address to a VLAN interface, use the **ipv6 virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IP address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IP address in a virtual subnet, the ARP request will use the virtual IP address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

A maximum of ***500*** virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ip virtual-router address** and **default ip virtual-router address** commands remove the specified virtual IP address from the configuration mode interface by deleting the corresponding **ip virtual-router address** command from ***running-config***. If the command does not specify an address, all virtual IPv4 addresses are removed from the interface.

Command Mode

Interface-VLAN Configuration

Command Syntax

ip virtual-router address *ipv4_addr*

no ip virtual-router address [*ipv4_addr*]

default ip virtual-router address [*ipv4_addr*]

Parameter

ipv4_addr IP address of router. Dotted decimal notation.

Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for ***vlan 10***.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 10.0.0.6
switch(config-if-Vl10)# exit
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address with a subnet for ***vlan 10***. A static route is added to indicate that the virtual subnet is reachable through ***vlan 10***.

```
switch(config)# ip route 192.0.0.0/24 vlan 10
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)# exit
```

13.5.4.3 ip virtual-router mac-address

The **ip virtual-router mac-address** command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source. The virtual router is not configured on the switch until this virtual mac-address is assigned.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG. When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either though static configuration or learned through a dynamic routing protocol.

The **no ip virtual-router mac-address** command removes a virtual MAC address from the interface by deleting the corresponding **ip virtual-router mac-address** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip virtual-router mac-address ***mac_addr***

no ip virtual-router mac address [***mac_addr***]

Parameter

mac_addr MAC IP address (dotted hex notation). Select an address that will not otherwise appear on the switch.

Example

This command configures a virtual MAC address.

```
switch(config)# ip virtual-router mac-address 001c.7300.0099
switch(config)#
```

13.5.4.4 ip virtual-router mac-address advertisement-interval

The **ip virtual-router mac-address advertisement interval** command specifies the period between the transmission of consecutive gratuitous ARP requests that contain the virtual router mac address for each virtual-router IP address configured on the switch. The default period is ***30*** seconds.

The **no ip virtual-router mac-address advertisement-interval** command restores the default period of ***30*** seconds by removing the **ip virtual-router mac-address advertisement-interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip virtual-router mac-address advertisement-interval ***period***

no ip virtual-router mac-address advertisement-interval

default ip virtual-router mac-address advertisement-interval

Parameter

period advertisement interval (seconds). Values range from ***0 to 86400***. Default is ***30***.

Example

This command configures a MAC address advertisement interval of one minute (***60*** seconds).

```
switch(config)# ip virtual-router mac-address advertisement-interval 60
switch(config)#
```

13.5.4.5 ipv6 virtual-router address

The **ipv6 virtual-router address** command assigns a virtual IPv6 address to the VLAN interface being configured. (To assign a virtual IPv4 address to a VLAN interface, use the **ip virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A maximum of ***500*** virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ipv6 virtual-router address** and **default ipv6 virtual-router address** commands remove the specified virtual IPv6 address from the configuration mode interface by deleting the corresponding **ipv6 virtual-router address** command from ***running-config***. If the command does not specify an address, all virtual IPv6 addresses are removed from the interface.

Command Mode

Interface-VLAN Configuration

Command Syntax

ipv6 virtual-router address ***net_addr***

no ipv6 virtual-router address [***net_addr***]

default ipv6 virtual-router address [***net_addr***]

Parameter

net_addr network IPv6 address.

Example

These commands configure a Switch Virtual Interface (SVI) and a virtual IPv6 address for ***vlan 10***.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ipv6 address 2001:0DB8:0:1::1/64
switch(config-if-Vl10)# ipv6 virtual-router address 2001:0DB8:0:1::2
switch(config-if-Vl10)# exit
```

13.5.4.6 no vrrp

The **no vrrp** command removes all VRRP configuration commands for the specified virtual router on the configuration mode interface. The **default vrrp** command also reverts VRRP configuration parameters to default settings by removing the corresponding **vrrp** commands.

Commands removed by the **no vrrp** command include:

- vrrp advertisement interval
- vrrp disabled
- vrrp ipv4
- vrrp ipv4 secondary
- vrrp peer authentication
- vrrp preempt
- vrrp preempt delay
- vrrp priority-level
- vrrp session description

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

no vrrp ***group***

default vrrp ***group***

Parameter

group Virtual Router Identifier (VRID). Values range from ***1 to 255***.

Example

This command removes all VRRP configuration commands for virtual router ***group 10*** on ***vlan 15***.

```
switch(config)# interface vlan 15
switch(config-if-vl15)# no vrrp 10
switch(config-if-vl15)#
```

13.5.4.7 show ip virtual-router

The **show ip virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IP addresses assigned to each VLAN interface.

Command Mode

EXEC

Command Syntax

show ip virtual-router

Messages

- **IP virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IP address** no virtual IP addresses are assigned to any VLAN interfaces.

Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch# show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface  IP Address        Virtual IP Address   Status
 Protocol
Vlan15     10.1.1.3/24       10.1.1.15            up                up
Vlan15     10.1.1.3/24       10.1.1.16            up                up
Vlan15     10.1.1.3/24       10.1.1.17            up                up
Vlan20     10.12.1.6/24      10.1.1.51            up                up
Vlan20     10.12.1.6/24      10.1.1.53            up                up
Vlan20     10.12.1.6/24      10.1.1.55            up                up
switch#
```

- This command generates a response that indicates a virtual MAC address is not assigned to the switch.

```
switch# show ip virtual-router
IP virtual router is not configured
switch#
```

13.5.4.8 show ipv6 virtual-router

The **`show ipv6 virtual-router`** command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Command Mode

EXEC

Command Syntax

`show ipv6 virtual-router`

Messages

- **IPv6 virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IPv6 address** no virtual IPv6 addresses are assigned to any VLAN interfaces.

Example

This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch# show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

13.5.4.9 show vrrp

The **show vrrp** command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface. Parameter options control the amount and formatting of the displayed information.

Command Mode

Privileged EXEC

Command Syntax

show vrrp [**INFO_LEVEL**] [**STATES**]

show vrrp INTF GROUP_NUM [**INFO_LEVEL**] [**STATES**]

show vrrp GROUP_NUM INTF_GROUP [**INFO_LEVEL**] [**STATES**]

Parameters

- **INTF** specifies the VRRP groups for which the command displays status. When the parameter is omitted or specifies only an interface, the group list is filtered by the STATES parameter.
  - ***no parameter*** specified groups on all interfaces.
  - **interface ethernet *e_num*** specified groups on Ethernet interface.
  - **interface loopback *l_num*** specified groups on loopback interface.
  - **interface management *m_num*** specified groups on management interface.
  - **interface port-channel *p_num*** specified groups on port channel interface.
  - **interface vlan *v_num*** specified groups on VLAN interface.
  - **interface vxlan *vx_num*** specified groups on VXLAN interface.
- **GROUP_NUM** the VRRP ID number of the group for which the command displays status.
  - ***no parameter*** all groups on specified interface.
  - ***vrid_num*** Virtual Router Identifier (VRID). Value ranges from ***1*** to ***255***.
- **INFO_LEVEL** Specifies format and amount of displayed information. Options include:
  - ***no parameter*** displays a block of data for each VRRP group.
  - **brief** displays a single table that lists information for all VRRP groups.
- **STATES** Specifies the groups, by VRRP router state, that are displayed. Options include:
  - ***no parameter*** displays data for groups in the **master** or **backup** states.
  - **all** displays all groups, including groups in the **stopped** and **interface down** states.

Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch# show vrrp brief
Interface Id  Ver Pri Time  State   VrIps
Vlan1006  3   2   100 3609  Master  127.38.10.2
Vlan1006  4   3   100 3609  Master  127.38.10.10
Vlan1010  1   2   100 3609  Master  128.44.5.3
Vlan1014  2   2   100 3609  Master  127.16.14.2
switch>
```

- This command displays data blocks for all VRRP groups on ***vlan 46***, regardless of the VRRP state.

```
switch# show vrrp interface vlan 1006 all
Vlan1010 - Group 1
  VRRP Version 2
  State is Stopped
  Virtual IPv4 address is 128.44.5.3
  Virtual MAC address is 0000.5e00.0101
  Mac Address Advertisement interval is 30s
```

```
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 0.0.0.0
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
switch#
```

- This command displays data for all VRRP group ***2*** on ***vlan 1014***.

```
switch# show vrrp interface vlan 1014 group 2
Vlan1006 - Group 2
  VRRP Version 2
  State is Master
  Virtual IPv4 address is 127.38.10.2
  Virtual MAC address is 0000.5e00.0103
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 127.38.10.1 (local), priority is 100
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
switch#
```

13.5.4.10 vrrp advertisement interval

The **vrrp advertisement interval** command configures the interval between successive advertisement messages that the switch sends to VRRP routers in the specified virtual router group. The switch must be the groups Master virtual router to send advertisement messages. The advertisement interval must be configured identically on all physical routers in the virtual router group.

The advertisement interval also influences the timeout interval that defines when the virtual router becomes the master virtual router. When preemption is enabled, the virtual router becomes the master when three times the advertisement interval elapses after the switch detects master router priority conditions.

The **no vrrp advertisement interval** and **default vrrp advertisement interval** commands restore the default advertisement interval of one second for the specified virtual router by removing the corresponding **vrrp advertisement interval** command from ***running-config***. The **no vrrp** command also removes the **vrrp advertisement interval** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **advertisement interval** ***adv_time***

no vrrp ***group*** **advertisement interval**

default vrrp ***group*** **advertisement interval**

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- ***adv_time*** advertisement interval (seconds). Values range from ***1 to 255***. Default value is ***1***.

Example

This command sets the advertisement interval of five seconds for the virtual router ***35*** on ***vlan 100***.

```
switch(config)# interface vlan 100
switch(config-if-vl100)# vrrp 35 advertisement interval 5
switch(config-if-vl100)#
```

13.5.4.11 vrrp disabled

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a ***master*** or ***backup*** router for the virtual router group.

The **no vrrp disabled** and **default vrrp disabled** commands remove the corresponding **vrrp disabled** command from ***running-config***. This changes the switchs virtual router state to ***backup*** or ***master*** if the virtual router is properly configured.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **disabled**

no vrrp ***group*** **disabled**

default vrrp ***group*** **disabled**

Parameter

group Virtual Router IDentifier (VRID). Values range from ***1 to 255***.

Examples

- These commands place the switch in stopped mode for virtual router ***24*** on ***vlan 20***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 24 disabled
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router ***24*** on ***vlan 20***.

```
switch(config-if-vl20)# no vrrp 24 disabled
switch(config-if-vl20)#
```

13.5.4.12 vrrp ipv4

The **vrrp ipv4** command configures the primary IP address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet. A VRRP virtual routers configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands replace the existing primary address assignment.

The **vrrp ipv4 secondary** command assigns a secondary IP address to the VRRP virtual router.

The **no vrrp ipv4**and **default vrrp ipv4** commands disable the VRRP virtual router and deletes the primary IP address by removing the corresponding **vrrp ipv4** statement from ***running-config.*** The **no vrrp** command also removes the **vrrp ipv4** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **ipv4** ***ipv4_address***

no vrrp ***group*** **ipv4** ***ipv4_address***

default vrrp ***group*** **ipv4** ***ipv4_address***

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- ***ipv4_address*** IPv4 address of the virtual router.

Related Command

vrrp ipv4 secondary

Example

This command enables virtual router ***15*** on ***vlan 20*** and designates ***10.1.1.5*** as the virtual routers primary address.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.4.13 vrrp ipv4 checksum pseudo-header exclude

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP group on the configuration mode interface of the switch and supports IPv4 VRRPv3 interoperability.

The **no** form of the command deletes the **`vrrp ipv4 checksum pseudo-header exclude`** configuration from the Ethernet interface on the switch.

The **`exit`** command returns the switch to global configuration mode.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`vrrp` ***group*** **`ipv4 checksum pseudo-header exclude`**

`no vrrp` ***group*** **`ipv4 checksum pseudo-header exclude`**

Parameter

group Virtual Router IDentifier (VRID). Values range from ***1 to 255***.

Example

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on VRRP ***group 1*** on ***interface ethernet 1***.

```
switch(config-if-Et1)# vrrp 1 ipv4 checksum pseudo-header exclude
```

13.5.4.14 vrrp ipv4 secondary

The **vrrp ipv4 secondary** command assigns a secondary IP address to the specified virtual router. Secondary IP addresses are an optional virtual router parameter. A virtual router may contain multiple secondary address commands. The IP address list must be identical for all VRRP routers in a virtual router group.

The virtual router is assigned a primary IP address with the **vrrp ipv4** command.

The **no vrrp ipv4 secondary** and **default vrrp ipv4 secondary** commands remove the secondary IP address for the specified VRRP virtual router by deleting the corresponding **vrrp ipv4 secondary** statement from running-config. The **no vrrp** command also removes all **vrrp ipv4 secondary** commands for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **ipv4*ipv4_addr*** **secondary**

no vrrp ***group*** **ipv4*ipv4_addr*** **secondary**

default vrrp ***group*** **ipv4*ipv4_addr*** **secondary**

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- ***ipv4_addr*** secondary IPv4 address of the virtual router.

Related Command

vrrp ipv4

Example

This command assigns the IP address of ***10.2.4.5*** as the secondary IP address for the virtual router with VRID of ***15*** on ***vlan 20***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 15 ipv4 10.2.4.5 secondary
switch(config-if-vl20)#
```

13.5.4.15 vrrp ipv4 version

The **vrrp ipv4 version** command enables VRRP on the configuration mode interface and configures the VRRP version for the specified VRRP virtual router.

The **no vrrp ipv4 version** and **default vrrp ipv4 version** commands restore the default VRRP version to VRRPv2 by removing the corresponding **vrrp ipv4** version statement from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **ipv4 version** **VERSION_NUMBER**

no vrrp ***group*** **ipv4 version**

default vrrp ***group*** **ipv4 version**

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- **VERSION_NUMBER** Specifies VRRP version that the switch uses. Default value is 2 (VRRPv2) Options include:
  - **2** VRRP v2 supports IPv4 environment.
  - **3** VRRP v3 supports IPv4 and IPv6 environment.

Examples

- This command enables VRRPv3 for IPv6 on ***interface ethernet 3***.

```
switch#(config)# interface ethernet 3
switch#(config-if-Et3)# vrrp 1 ipv4 version 3
```

- This command removes VRRPv3 from ***interface ethernet 3*** and reverts to the default VRRPv2.

```
switch#(config)# interface ethernet 3
switch#(config-if-Et3)# no vrrp 1 ipv4 version
```

13.5.4.16 vrrp ipv6

The **vrrp ipv6** command configures the IPv6 address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet.

The **no vrrp ipv6** and **default vrrp ipv6** commands disable the VRRP virtual router and deletes the IPv6 address by removing the corresponding **vrrp ipv6** statement from ***running-config.*** The **no vrrp** command also removes the **vrrp ipv6** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **ip** ***ipv6_address***

no vrrp ***group*** **ip** ***ipv6_address***

default vrrp ***group*** **ip** ***ipv6_address***

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1*** to ***255***.
- ***ipv6_address*** IPv6 address of the virtual router.

Examples

- This command enables address ***2001:db8:0:1::1*** for IPv6 VRRP on ***vlan 20***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

- This command disables VRRPv3 on ***vlan 20*** from virtual router ***3***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# no vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

13.5.4.17 vrrp mac-address advertisement-interval

The **vrrp mac-address advertisement-interval** command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

The **vrrp mac-address advertisement-interval 0**, **no vrrp mac-address advertisement-interval** and **default vrrp mac-address advertisement-interval** commands disable the feature by removing the **vrrp mac-address advertisement-interval** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **mac-address advertisement-interval** ***period***

no vrrp ***group*** **mac-address**

default vrrp ***group*** **mac-address**

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- ***period*** interval in which the master router sends advertisement packets (seconds). Value ranges from ***0 to 3600***. Selecting ***0*** as the interval disables this feature.

Examples

- This command specifies the interval between advertisement packets sent to the members of VRRP group ***3*** on ***vlan 20***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 3 mac-address advertisement-interval 60
switch(config-if-vl20)#
```

- This command disables the feature on ***vlan 20***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# no vrrp 3 mac-address advertisement-interval
switch(config-if-vl20)#
```

13.5.4.18 vrrp peer authentication

The **vrrp peer authentication** command configures parameters the switch uses to authenticate virtual router packets it receives from other VRRP routers in the group.

The **no vrrp peer authentication** and **default vrrp peer authentication** commands disable VRRP peer authentication of packets from the specified virtual router by removing the corresponding **vrrp peer authentication** command from ***running-config*** . The **no vrrp** command also removes the **vrrp peer authentication** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **peer authentication** **AUTH_PARAMETER**

no vrrp ***group*** **peer authentication**

default vrrp ***group*** **peer authentication**

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- **AUTH_PARAMETER** encryption level and authentication key used by router. Options include:
  - **text** ***text_key*** plain-text authentication, ***text_key*** is text.
  - ***text_key*** plain-text authentication, ***text_key*** is text.
  - **ietf-md5 key-string 0** ***text_key*** IP authentication of MD5 key hash, ***text_key*** is text.
  - **ietf-md5 key-string** ***text_key*** IP authentication of MD5 key hash, ***text_key*** is text.
  - **ietf-md5 key-string 7** ***coded_key*** IP authentication of MD5 key hash, ***coded_key*** is MD5 hash.

Guidelines

This command is applicable to VRRPv2 which supports IPv4 addresses only.

Examples

- This command implements plain-text authentication, using ***12345*** as the key, for virtual router ***40*** on ***vlan 100***.

```
switch(config)# interface vlan 100
switch(config-if-vl100)# vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using ***12345*** as the key.

```
switch(config-if-vl100)# vrrp 40 peer authentication ietf-md5 key-
string 0 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using ***12345*** as the key. The key is entered as the MD5 hash equivalent of the text string.

```
switch(config-if-vl100)# vrrp 40 peer authentication ietf-md5 key-
string 7
EA3TUPxdddFCLYT8mb+kxw==
switch(config-if-vl100)#
```

13.5.4.19 vrrp preempt

The **vrrp preempt** command controls a virtual routers preempt mode setting. When preempt mode is enabled, if the switch has a higher priority it will preempt the current master virtual router. When preempt mode is disabled, the switch can become the master virtual router only when a master virtual router is not present on the subnet, regardless of VRRP priority level settings. By default, preempt mode is enabled.

The **no vrrp preempt**cand **default vrrp preempt**ccommands disable preempt mode for the specified virtual router; the **default vrrp preempt** command stores a corresponding **no vrrp preempt** statement in ***running-config***. The **vrrp preempt** command enables preempt mode by removing the corresponding **no vrrp preempt** statement from running-config.

The **no vrrp** command also enables preempt mode by removing the **no vrrp preempt** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **preempt**

no vrrp ***group*** **preempt**

default vrrp ***group*** **preempt**

Parameter

group Virtual Router IDentifier (VRID). Values range from ***1 to 255***.

Related Command

vrrp preempt delay

Examples

- This command disables preempt mode for virtual router ***20*** on ***vlan 40***.

```
switch(config)# interface vlan 40
switch(config-if-vl40)# no vrrp 20 preempt
switch(config-if-vl40)#
```

- This command enables preempt mode for virtual router ***20*** on ***vlan 40***.

```
switch(config-if-vl40)# vrrp 20 preempt
switch(config-if-vl40)#
```

13.5.4.20 vrrp preempt delay

The **vrrp preempt delay** command specifies the interval between a VRRP preemption event and the point when the switch becomes the master VRRP router. A preemption event is any event that results in the switch having the highest virtual router priority setting while preemption is enabled. The **vrrp preempt** command enables preemption for a specified virtual router.

The command configures two delay periods:

- **minimum** time delays master VRRP takeover when VRRP is fully implemented.
- **reload** time delays master VRRP takeover after VRRP is initialized following a switch reload (boot).

Note: If the switch senses that there are no other active switches in the virtual router group, it will bypass any configured preempt time delay and become the VRRP master after the standard master downtime interval (3*advertisement interval + skew time).

Running-config maintains separate delay statements for **minimum** and **reload** parameters. Commands may list both parameters. Commands that list one parameter do not affect the omitted parameter. Values range from ***0 to 3600*** seconds (one hour). The default delay is zero seconds for both parameters.

The **no vrrp preempt delay** and **default vrrp preempt delay** commands reset the specified delay to the default of zero seconds. Commands that do no list either parameter resets both periods to zero. The **no vrrp** command also removes all **vrrp preempt delay** commands for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **preempt delay** [**MINIMUM_INTERVAL**] [**RELOAD_INTERVAL**]

no vrrp ***group*** **preempt delay** [**DELAY_TYPE**]

default vrrp ***group*** **preempt delay** [**DELAY_TYPE**]

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- **MINIMUM_INTERVAL** period between preempt event and takeover of master VRRP router role.
  - ***no parameter*** minimum delay is not altered by command.
  - **minimum** ***min_time*** delay during normal operation (seconds). Values range from ***0 to 3600***.
- **RELOAD_INTERVAL** period after reboot-VRRP initialization and takeover of master VRRP router role.
  - ***no parameter*** reload delay is not altered by command.
  - **reload** ***reload_time*** delay after reboot (seconds). Values range from ***0 to 3600***.
- **DELAY_TYPE** delay type that is reset to default value.
  - ***no parameter*** reload and minimum delays are reset to default.
  - **minimum** minimum delay is reset to default.
  - **reload** reload delay is reset to default.

(**DELAY_TYPE** parameter is only used in **no vrrp preempt delay** and **default vrrp preempt delay** commands).

Related Command

vrrp preempt

Examples

- This command sets the minimum preempt time of ***90*** seconds for virtual router ***20*** on ***vlan 40***.

```
switch(config)# interface vlan 40
switch(config-if-vl40)# vrrp 20 preempt delay minimum 90
switch(config-if-vl40)#
```

- This command sets the minimum and reload preempt time to ***0*** for virtual router ***20*** on ***vlan 40***.

```
switch(config-if-vl40)# no vrrp 20 preempt delay
switch(config-if-vl40)#
```

13.5.4.21 vrrp priority-level

The **vrrp priority-level** command configures the switchs priority setting for a VRRP virtual router. Priority values range from ***1*** to ***254***. The default value is ***100***.

The router with the highest VRRP priority level setting for a group becomes the master virtual router for that group. The master virtual router controls the IP address and is responsible for forwarding traffic sent. The **vrrp preempt** command controls the time when a switch can become the master virtual router.

The **no vrrp priority-level** and **default vrrp priority-level** commands restore the default priority of 100 to the virtual router on the configuration mode interface by removing the corresponding **vrrp priority-level** command from ***running-config***. The **no vrrp** command also removes the **vrrp priority-level** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **priority-level** ***level***

no vrrp ***group*** **priority-level** ***level***

default vrrp ***group*** **priority-level** ***level***

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- ***level*** priority setting for the specified virtual router. Values range from ***1 to 254***.

Example

This command sets the virtual router priority value of ***250*** for virtual router ***group 45*** on ***vlan 20***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 45 priority-level 250
switch(config-if-vl20)#
```

13.5.4.22 vrrp session description

The **vrrp session description** command associates a text string to a VRRP virtual router on the configuration mode interface. The string has no functional impact on the virtual router. The maximum length of the string is ***80*** characters.

The **no vrrp session description** and **default vrrp session description** commands remove the text string association from the VRRP virtual router by deleting the corresponding **vrrp session description** command from ***running-config***. The **no vrrp** command also removes the **vrrp session description** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **session description** ***label_text***

no vrrp ***group*** **session description**

default vrrp ***group*** **session description**

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1 to 255***.
- ***label_text*** text that describes the virtual router. Maximum string length is ***80*** characters.

Example

This command associates the text string ***Laboratory Router*** to virtual router ***15*** on ***vlan 20***.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```

13.5.4.23 vrrp timers delay reload

The **vrrp timers delay reload** command delays the time for VRRP initialization after a system reboot.

The **no vrrp timers delay reload** and **default vrrp timers delay reload** commands restore the default value of ***0*** by deleting the **vrrp timers delay reload** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp ***group*** **timers delay reload** [**INTERVAL**]

no vrrp ***group*** **timers delay reload**

default vrrp ***group*** **timers delay reload**

Parameters

INTERVAL The number of seconds for the delay (seconds). Options include:

- ***no parameter*** Default value of ***0*** seconds.
- ***0 to 3600*** seconds. Ranges between ***0 to 60*** minutes.

Examples

- These commands configure the VRRP reload delay interval to ***15*** minutes.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# vrrp 2 timers delay reload 900
switch(config-if-Vl100)#
```

- These commands removes the VRRP reload delay interval.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# no vrrp 2 timers delay reload
switch(config-if-Vl100)#
```

13.5.4.24 vrrp tracked-object

The **`vrrp tracked-object`** command configures the VRRP client process on the configuration mode interface to track the specified tracked object and react when its status changes to **down**. The tracked object is created by the **`track`** command.

The **`no vrrp tracked-object`** and **`default vrrp tracked-object`** commands cause the VRRP client process to stop tracking the specified tracked object by removing the corresponding **`vrrp tracked-object`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`vrrp` ***group*** **`tracked-object`** ***object_name*** **ACTION** ***amount***

`no vrrp` ***group*** **`tracked-object`** ***object_name*** **ACTION**

`default vrrp` ***group*** **`tracked-object`** ***object_name*** **ACTION**

Parameters

- ***group*** Virtual Router IDentifier (VRID). Values range from ***1*** to ***255***.
- ***object_name*** name of tracked object.
- ***amount*** amount to decrement VRRP priority level. Values range from ***1*** to ***254***.
- **ACTION** The action that VRRP is to take when the tracked objects status changes to **down**. Options include:
  - **decrement** decrease VRRP priority level by *amount*.
  - **shutdown** shut down VRRP on the configuration mode interface.
  - If both **decrement** and **shutdown** are configured on the same interface for the same VRRP group, then VRRP will be shut down on the interface if the tracked object is down.

Related Commands

track

Example

This command causes ***interface ethernet 5*** to disable VRRP when tracked object ***eth8*** changes state.

```
switch(config-if-Et5)# vrrp 1 tracked-object eth8 shutdown
switch(config-if-Et5)#
```

13.6 DirectFlow

This section describes Arista's DirectFlow implementation. Topics in this section include:

- Introduction
- DirectFlow Configuration
- DirectFlow Feature Interactions
- DirectFlow Commands

13.6.1 Introduction

DirectFlow allows you to define flows consisting of conditions to match, and actions to perform, that are a superset of the OpenFlow 1.0 specification. DirectFlow runs alongside the existing L2/L3 forwarding plane, enabling a network architecture that incorporates new capabilities such as TAP aggregation and custom traffic engineering, alongside traditional forwarding models. DirectFlow does not require a controller or any third party integration, as flows can be installed via the CLI.

DirectFlow exposes the underlying forwarding ASIC's capabilities through a programmable interface like EAPI or the standard CLI.

DirectFlow works in conjunction with all other aspects of standard Layer 2 or Layer 3 bridging or forwarding, and DirectFlow traffic is subject to the standard packet processing pipeline within the ASIC. You can think of DirectFlow as a stage in packet processing that processes traffic after ingress checks and before any egress actions.

DirectFlow enables you to configure flows that consist of matching criteria and actions, and to modify how traffic is processed, by overriding the L2 lookup decision or rewriting a MAC address or VLAN for example.

Features like MAC learning, STP state checks, ingress or egress VLAN membership checks on ports, ACLs, QoS, and others are all respected by DirectFlow. Traffic that does not match any programmed flow is processed normally, while traffic that matches programmed flows is now subject to the actions specified in the flows.

13.6.1.1 DirectFlow Flows

You can define a relative priority between flows and define idle or hard timeouts for the flow. DirectFlow also enables you to insert a flow entry that matches on specified criteria, and define actions to be taken on traffic that matches the specified matching conditions. You can define flows to match on TCP flags, IPv6 source and destination addresses, input ports, and more.

For more information, see:

- DirectFlow Non-persistent Flows
- Supported Matches
- Supported Actions

13.6.1.1.1 DirectFlow Non-persistent Flows

DirectFlow enables you to configure flows that are not visible in the startup or running configurations and do not persist over a reboot. This feature is designed to be used for flows that are configured by a custom agent using the EOS SDK or eAPI and age out (expire) after a specified time period.

For example, if you are using a custom agent that reacts to traffic sent to the CPU (the redirect to CPU action), and you want to use a flow that will drop all matching traffic for ***5*** minutes, the agent can program a non-persistent flow that expires after a hard timeout of ***300*** seconds.

Using a non-persistent flow for this purpose ensures that other administrator actions (for example, saving the configuration) do not result in the flow being resurrected on startup or reverting to the saved configuration. It also removes the need for the agent to delete the expired flow.

Note: By default, all DirectFlow flows are persistent. You must use the **no** persistent command to configure a non-persistent flow.

13.6.1.1.2 Supported Matches

DirectFlow supports all matches on VLAN, ether type, source or destination MAC address, COS, source or destination IP address, IP protocol, IP TOS, L4 source, destination ports, ICMP type, and code.

In addition, DirectFlow also allows matching on:

- TCP flags
- IPv6 source address
- IPv6 destination address
- Traffic injected from the CPU
- Input port

DirectFlow also permits re-using the same flow on multiple input ports, saving valuable TCAM space.

13.6.1.1.3 Supported Actions

DirectFlow supports the following actions:

- Setting the source or destination MAC address
- VLAN
- COS
- IP TOS
- Transmit queue
- Output port list and mirroring traffic pre-modification (ingress mirror) and post-modification (egress mirror)
- Redirect to CPU

The redirect to CPU action is useful in cases in which a custom agent is running on EOS and you want to trap specific traffic (matching traffic) and send the trapped traffic to the agent.

13.6.2 DirectFlow Configuration

Consider the following when using DirectFlow.

- DirectFlow takes effect ONLY after exiting the individual flow configuration sub-mode.
- Match criteria are connected with Boolean AND operators. Therefore they must ***all*** match for the condition to be true and action to be taken.
- CLI is automatically set to match the ethertype to IP if IP fields (such as source or destination address or L4 ports) are chosen as part of other match/ action commands.
- In a single flow, only the following fields can be matched along with IPv4 or IPv6 source and destination addresses:
  - VLAN priority
  - VLAN ID
  - EtherType
  - Source interface
  - Class of Service (CoS)

13.6.2.1 Commands Used to Enable DirectFlow, Configure and Display Flows

A number of different commands are provided for the DirectFlow feature. The different commands enable you to enter the DirectFlow configuration mode, enable DirectFlow, configure flows, and display configured flows.

Note: ALL match criteria specified in a flow definition must match in the packet for the actions specified to be applied to the traffic.

Enter the DirectFlow Configuration Mode

The directflow command places the switch in DirectFlow configuration mode.

```
switch(config)# directflow
switch(config-directflow)#
```

Enable DirectFlow

The shutdown (DirectFlow) command determines if the configuration takes effect or not. To enable DirectFlow, enter the following command.

```
switch(config-directflow)# no shutdown
```

Create the Flow

The flow (DirectFlow) command creates a new flow entry. It must be unique or it will be overwritten by an existing entry.

```
switch(config-directflow)# flow Test-1
switch(config-directflow-Test-1)#
```

Create the DirectFlow Match Criteria

The match (DirectFlow-flow mode) command allows you to configure a rule or a flow which match on L2, L3, L4 fields of a packet and specify a certain action to either modify, drop or redirect the packet.

```
switch(config-directflow-Test-1)# match ethertype ip
switch(config-directflow-Test-1)# match source ip 10.10.10.10
```

Action Set

The action set (DirectFlow-flow mode) command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry.

```
switch(config-directflow-Test-1)# action egress mirror ethernet 7
switch(config-directflow-Test-1)# action set destination mac
 0000.aaaa.bbbb
```

Finalize the Flow

DirectFlow flows do not take effect until you exit the configuration sub-mode for the specified flow. Use the **exit** command to finalize the flow and put it into effect.

```
switch(config-directflow-Test-1)# exit
switch(config-directflow)#
```

Redirect to CPU

The action output interface cpu (DirectFlow-flow mode) command allows you to configure flows so that traffic that matches the matching conditions specified in the flow is redirected to the CPU.

```
switch(config)# directflow
switch(config-directflow)# flow redirect-http-cpu
switch(config-directflow-redirect-http=cpu)# match ip protocol tcp
switch(config-directflow-redirect-http-cpu)# match destination port 80
switch(config-directflow-redirect-http-cpu)# action output interface cpu
```

Configuring a Non-persistent Flow

DirectFlow flows are persistent by default. Use the **no** persistent command to configure non-persistent flows.

```
switch config)# directflow
switch(config-directflow)# flow example-non-persistent
switch(config-directflow-example-non-persistent)# match input interface
 ethernet 25
switch(config-directflow-example-non-persistent)# action drop
switch(config-directflow-example-non-persistent)# no persistent
switch(config-directflow-example-non-persistent)# timeout hard 300
```

Display Details for Configured Flows

The **detail** option of the show directflow flows command enables you to display the details of configured flows. You can use this command to verify that a non-persistent flow is deleted after the timeout period configured for the flow has elapsed.

The following example shows the use of this command to view the configuration of a non-persistent flow before the timeout period has elapsed, and a second time, after the timeout period has expired.

The initial use of the command displays the flow configuration (before the timeout expires).

```
switch(config-directflow)# show directflow flows example-non-persistent
 detail
Flow example-non-persistent: (Flow programmed)
 persistent: False
 priority: 0
 hard timeout: 300
 idle timeout: 0
 match:
  ingress interface:
      Et25
 actions:
  drop
 matched: 0 packets, 0 bytes
```

The second use of the command displays the flow details (after the timeout expires). The output shows that the flow is no longer programmed.

```
switch(config-directflow)# show directflow flows example-non-persistent
 detail
Flow example-non-persistent: (Flow not programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
```

```
  ingress interface:
      Et25
actions:
  drop
matched: 0 packets, 0 bytes
```

13.6.3 DirectFlow Feature Interactions

DirectFlow flow entries can have one of the following actions:

- A set of egress ports for sending a matched packet
- Copy to CPU
- Redirect to CPU
- Drop
- No specified action (in this case, the traffic is output normally).

The only exception is the ingress or egress mirroring action, where the DirectFlow entry causes the packet to be mirrored.

When the ingress or egress packets are mirrored, the original traffic is sent out normally.

Bridging Features

- DirectFlow entries have precedence over all entries in the MAC table, including static MAC entries and static MAC drop entries. Packets that do not match DirectFlow entries are forwarded based on the MAC address table.
- VLANs: DirectFlow entries can modify the VLAN of a packet. MAC learning takes place in the original VLAN for DirectFlow entries that modify the VLAN. The modified packet will be subject to VLAN membership checks on the egress port. If a packet has no VLAN tag, DirectFlow assumes it came in on the native VLAN for the ingress interface. A VLAN override causes the packet to obey the VLAN rules on the egress port.
- **Q-in-Q:** Q-in-Q is supported as DirectFlow entries match only on the outer tag.
- **Counters:** All packets that match DirectFlow entries cause interface counters to increment as usual.

Spanning Tree

DirectFlow runs alongside MSTP, RSTP, and PVST. DirectFlow entries do not match on packets that ingress an STP discarding port. DirectFlow entries that cause a packet to be forwarded out an STP discarding port will result in the packets being dropped on egress.

When STP is enabled, BPDUs will always be trapped to the CPU. When STP is disabled, BPDUs will be subject to DirectFlow entries and not be copied to the CPU by default.

LLDP, LAGs, and LACP

- LLDP packets are always trapped to the CPU. DirectFlow entries can never match LLDP packets.
- LAGs are fully supported, and can be part of a match criteria and part of an output action to an interface.
- LACP packets are always trapped to CPU. DirectFlow entries can never match LACP packets.

sFlow

sFlow is unaffected by DirectFlow.

IGMP Snooping

IGMP control packets are trapped to the CPU when IGMP Snooping is enabled. DirectFlow entries can match IGMP Snooping control traffic and override the trap to CPU.

Link-local-multicast packets are flooded in hardware in the VLAN via a TCAM entry. DirectFlow entries can match link-local-multicast packets and change the flooding behavior. As DirectFlow entries have to specify output interfaces or drop, the action will conflict and so matching DirectFlow entries will get precedence.

When IGMP snooping is enabled, unknown IPV4 multicast packets are flooded to the multicast-router ports in the VLAN. If DirectFlow entries match unknown IPV4 multicast packets, they will override the flooding behavior.

Data packets in groups under IGMP snooping control are sent to the group members through a MAC table entry. Matching DirectFlow entries override the MAC table entries.

ACLs

DirectFlow entries are lower priority than any configured Port ACLs (ingress). Packets coming in on a port that match DirectFlow entries obey any configured ACL on that port, and will only apply to packets that have a **permit** action.

DirectFlow entries are higher priority than any configured RACLs. Packets coming in on an L3 interface that match DirectFlow entries ignore any RACLs configured on that interface.

DirectFlow entries are lower priority than any configured Egress ACLs.

13.6.3.1 Layer Three Features and DirectFlow

DirectFlow runs alongside IP routing. If a packet is routed out a layer three interface using a DirectFlow entry, the actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

Unicast Routing

When unicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have been otherwise been routed. The three exceptions are the ingress mirror, egress mirror and copy-to-CPU actions where the packets will be routed normally in addition to the action being performed. Routed packets that do not match DirectFlow entries are forwarding based on the L3 lookup.

Multicast Routing

When multicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have otherwise been multicast routed. The packets are not replicated based on the hardware multicast tables, but are forwarded strictly according to the actions specified by the DirectFlow entry. The entry can specify a set of output interfaces, which will result in the packet being replicated based on the DirectFlow entry.

13.6.3.2 Displaying DirectFlow Configurations

The show directflow flows command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

- This example shows the status of a default (persistent) flow.

```
switch(config-directflow)# show directflow flows
Flow Test1:
priority: 0
```

```
match:
ingress interface: Ethernet1
   ethertype ip
source ip address: 10.10.10.10
actions:
output mirror: Ethernet2
matched: 0 packets, 0 bytes
switch(config-directflow)#
```

- This example shows the status of a non-persistent flow. The flow will be deleted once ***5*** minutes have elapsed.

```
switch(config-directflow)# show directflow flows example-non-p
ersistent
Flow example-non-persistent:
 persistent: False
 priority: 0
 hard timeout: 300
 idle timeout: 0
 match:
   ingress interface:
       Et25
 actions:
   drop
 matched: 0 packets, 0 bytes
```

13.6.4 DirectFlow Commands

DirectFlow Global Configuration Mode

- directflow

DirectFlow Configuration Commands

- action drop (DirectFlow-flow mode)
- action mirror (DirectFlow-flow mode)
- action output (DirectFlow-flow mode)
- action output interface cpu (DirectFlow-flow mode)
- action set (DirectFlow-flow mode)
- flow (DirectFlow)
- match (DirectFlow-flow mode)
- persistent
- priority (DirectFlow-flow mode)
- shutdown (DirectFlow)
- timeout (DirectFlow-flow mode)

DirectFlow and Clear Commands

- show directflow
- show directflow flows

13.6.4.1 action drop (DirectFlow-flow mode)

The **`action drop`** command configures packets that match an entry to be dropped.

The **`no action drop`** and **`default action drop`** commands remove the statement from the DirectFlow ***configuration mode***.

Command Mode

Directflow-flow Configuration

Command Syntax

`action drop`

`no action drop`

`default action drop`

Example

This command sets the action for packets from ***Test-1*** to be dropped.

```
switch(config-directflow-Test-1)# action drop
switch#
```

13.6.4.2 action mirror (DirectFlow-flow mode)

The **`action mirror`** command can be used to ingress or egress mirror traffic to a mirror destination. This requires a mirror destination to be setup on the switch. If a packet comes in or goes out an interface that is part of another mirror session, then the destination for that destination as well as the DirectFlow destination will receive a copy of the packet.

The **`no action mirror`** and **`default action mirror`** commands remove the statement from DirectFlow ***configuration mode.***

Command Mode

Directflow-flow Configuration

Command Syntax

`action` **DIRECTION** **`mirror`** **INT_NAME**

`no action` **DIRECTION** **`mirror`****INT_NAME**

`default action` **DIRECTION** **`mirror`** **INT_NAME**

Parameters

- **DIRECTION** transmission direction of traffic to be mirrored.
  - **ingress** mirrors before any rewrites.
  - **egress** mirrors after rewrites.
- ***INT_NAME*** Source interface for the mirroring session.
  - **ethernet** ***e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel** ***p_range*** Port channel interfaces specified by ***p_range***.

Example

This command configures mirror traffic to ***ethernet 2***.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)# match ethertype ip
switch(config-directflow-Test1)# match source ip 10.10.10.10
switch(config-directflow-Test1)# action egress mirror ethernet 2
switch(config-directflow-Test1)#
```

13.6.4.3 action output (DirectFlow-flow mode)

The **`action output`** command configures an Ethernet or port channel interface as the output of a specified port mirroring session.

The **`no action output`** and **`default action output`**commands remove the statement from ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

`action output` **DESTINATION**

`no action output` **DESTINATION**

`default action output` **DESTINATION**

Parameters

DESTINATION transmission direction of traffic to be mirrored.

- **all** mirrors transmitted and received traffic.
- **flood** mirrors received traffic only.
- **interface ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
- **interface port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **nexthop vrf *vrf_name ip_addr***. If the next hop is reachable in the default VRF, the default VRF does not need to be specfied.

Examples

- This command configures ***interface ethernet 7*** as the output for the mirroring session.

```
switch(config-directflow-Test1)# action output interface
 ethernet 7
switch(config-directflow-Test1)#
```

- The following commands configure a flow redirecting all traffic from ***10.10.1.2*** to ***e_range*** next hop assuming an appropriately configured TCAM profile.

```
switch(config-directflow)# flow flow-sip-10_10_1_2-redirect-
to-10_30_1_2
switch(config-directflow-Test1)# match ethertype ip
switch(config-directflow-Test1)# match source ip 10.10.1.2
switch(config-directflow-Test1)# action output nexthop
 10.30.1.2
switch(config-directflow-Test1)#
```

13.6.4.4 action output interface cpu (DirectFlow-flow mode)

The **action output interface cpu** command configures the action (other commands are used to define the traffic matching conditions).

The **no action output interface cpu** and **default action output** commands remove the statement from ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

action output **DESTINATION**

no action output **DESTINATION**

default action output **DESTINATION**

Parameters

DESTINATION transmission direction of traffic to be mirrored.

- **all** mirrors transmitted and received traffic.
- **flood** mirrors received traffic only.
- **interface cpu** Ethernet interfaces specified by ***e_range***.

Examples

- This command configures ***interface ethernet 7*** as the output for the mirroring session.

```
switch(config-directflow-Test1)# action output interface
 ethernet 7
switch(config-directflow-Test1)#
```

- These commands configure the action to redirect traffic matching the flow to the CPU and the matching conditions for the flow.

```
switch (config)# directflow
switch(config-directflow)# flow redirect-http-cpu
switch(config-directflow-redirect-http=cpu)# match ip protocol
 tcp
switch{config-directflow-redirect-http-cpu)# match destination
 p cpuort 80
switch(config-directflow-redirect-http-cpu)# action output
 interface
```

13.6.4.5 action set (DirectFlow-flow mode)

The **`action set`** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry. The actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

The **`no action set`** and **`default action set`** commands remove **action set** statement from ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

`action set` **CONDITION**

`no action set` **CONDITION**

`default action set` **CONDITION**

Parameters

CONDITION specifies parameter and value. Options include:

- **cos *0 to 7*** Cost of service.
- **destination mac *mac_addr*** Dotted hex notation.
- **ip tos *0 to 255*** Type of service.
- **source mac *mac_addr*** Dotted hex notation.
- **traffic-class *0 to 7*** Dotted hex notation.
- **vlan *0 to 4094*** Number of VLAN.

The **`no action set`** and **`default action set`** commands require only the CONDITION type without a specific condition value.

Example

These commands change the destination MAC of the frame.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)# action egress mirror ethernet 7
switch(config-directflow-Test1)# action set destination mac
 0000.aaaa.bbbb
```

13.6.4.6 directflow

The **`directflow`** command places the switch in DirectFlow configuration mode.

The **`no directflow`** and **`default directflow`** commands delete the DirectFlow configuration mode statements from ***running-config***.

DirectFlow configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. The **`exit`** command returns the switch to ***global configuration mode***.

Command Mode

Global Configuration

Command Syntax

`directflow`

`no directflow`

`default directflow`

Commands Available in DirectFlow-Flow configuration mode:

- flow (DirectFlow)
- shutdown (DirectFlow)

Examples

- This command places the switch in ***DirectFlow*** configuration mode.

```
switch(config)# directflow
switch(config-directflow)#
```

- This command returns the switch to ***global management*** mode.

```
switch(config-directflow)# exit
switch(config)#
```

13.6.4.7 flow (DirectFlow)

The **`flow`** command places the switch in ***flow*** configuration mode.

The **`flow`** command specifies the name of the flow that subsequent commands modify and creates a newflow definition if it references a nonexistent flow. All changes in a ***flow*** configuration mode edit session are pending until the session ends:

- The **`exit`** command saves pending changes to ***running-config*** and returns the switch to ***DirectFlow*** configuration mode. Changes are also saved by entering a different configuration mode.
- The **`abort`** command discards pending changes, returning the switch to ***DirectFlow*** configuration mode.

The **`no flow`** and **`default flow`** commands delete the specified role by removing the role and its statements from ***running-config***.

Command Mode

DirectFlow Configuration

Command Syntax

`flow` ***flow_name***

`no flow` ***flow_name***

`default flow` ***flow_name***

Parameters

flow_name Name of flow.

Commands Available in DirectFlow-Flow configuration mode:

- action drop (DirectFlow-flow mode)
- action mirror (DirectFlow-flow mode)
- action output (DirectFlow-flow mode)
- action set (DirectFlow-flow mode)
- match (DirectFlow-flow mode)

13.6.4.8 match (DirectFlow-flow mode)

The **match** command allows you to configure a rule or a flow which could match on L2, L3, L4 fields of a packet and specify a certain action to modify, drop or redirect the packet.

All traffic ingressing on the switch will be matched against the flows installed. In cases where none of the packets match, normal switching or routing behavior will take over. When multiple entries match a packet, precedence is given to the entry that was installed first.

The **no match** and **default match** commands remove the **match** statement from the configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

match CONDITION

no match CONDITION

default match CONDITION

Parameters

CONDITION specifies criteria for evaluating a route. Options include:

- **cos *0 to 7*** cost of service.
- **destination ip *ipv4_sub*** destination IPv4 subnet. L3 fields valid only if ethertype is IP (0x0800).
- **destination mac *mac_addr*** Add to the existing community. Dotted hex notation.
- **destination mac *mac_addr* mask *mac_mask*** Add to the sting community. Dotted hex notation.
- **destination port *0 to 65535*** Fields accepted only if protocol is TCP|UDP.
- **ethertype *0 to 65535*** Layer 4 destination port.
- **ethertype ARP** Layer 4 destination port.
- **ethertype IP** Layer 4 destination port.
- **icmp code *0 to 255*** Fields accepted only if protocol is ICMP.
- **icmp type *0 to 255*** Fields accepted only if protocol is ICMP.
- **input interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **input interface port-channel *p_num*** Port channel interface specified by ***p_num***.
- **ip protocol *0 to 255*** Type of service.
- **ip protocol icmp** L3 fields valid only if ethertype is IP (0x0800).
- **ip protocol tcp** L3 fields valid only if ethertype is IP (0x0800).
- **ip protocol udp** L3 fields valid only if ethertype is IP (0x0800).
- **ip tos *0 to 255*** L3 fields valid only if ethertype is IP (0x0800).
- **source ip *ipv4_subnet*** L3 fields valid only if ethertype is IP (0x0800).
- **source mac *mac_addr*** Add to the existing community. Dotted hex notation.
- **source mac *mac_addr* mask *mac_mask*** Add to the sting community. Dotted hex notation.
- **source port *0 to 65535*** Fields accepted only if protocol is TCP| UDP.
- **tcp flag ack** Layer 4 destination port.
- **tcp flag fin** Layer 4 destination port.
- **tcp flag psh** Layer 4 destination port.
- **tcp flag rst** Layer 4 destination port.
- **tcp flag syn** Layer 4 destination port.
- **tcp flag urg** Layer 4 destination port.
- **tcp flag urg** Layer 4 destination port.
- **vlan *1 to 4094* mask *1 to 4095*** Number of VLAN.

The **no match** and **default match** commands require only the **CONDITION** type without a specific condition value.

Example

This command creates the rules to match on Ethertype IP and Source IP ***10.10.10.10***.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)# persistent
switch(config-directflow-Test1)# match ethertype ip
switch(config-directflow-Test1)# match source ip 10.10.10.10
```

13.6.4.9 persistent

DirectFlow flows are persistent by default. Once finalized, they appear in the running configuration, and if saved to ***startup config*** they will persist over a reboot. The **no** form of the **`persistent`** command prevents the flow from showing up in ***running config***, ensuring that it will not persist over a reboot.

Command Mode

Directflow-flow Configuration

Command Syntax

`persistent`

`no persistent`

Example

These commands create and enable a non-persistent DirectFlow flow.

```
switch(config)# directflow
switch(config-directflow)# flow example-non-persistent
switch(config-directflow-example-non-persistent)# match input
 interface ethernet 25
switch(config-directflow-example-non-persistent)# action drop
switch(config-directflow-example-non-persistent)# no persistent
switch(config-directflow-example-non-persistent)# timeout hard
 300
switch(config-directflow-example-non-persistent)# exit
switch(config-directflow)#
```

13.6.4.10 priority (DirectFlow-flow mode)

The **priority** command sets the priority for the flow match rules. Each flow-table entry has an optional priority field, with a higher number indicating a higher priority. Flows with the same priority may be loaded in any order, and the order may be changed at any time. If multiple entries match a packet, precedence is given to the entry that was installed first.

Priority numbers range from ***0 to 65535***. The default is ***0***. The higher priority rules match first.

The **no priority** and **default priority** commands remove **priority** statement from the ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

priority ***priority_value***

no priority

default priority

Parameter

priority_value priority ***xxx***. Value ranges from ***0 to 65535.*** Default is ***0***.

Example

These commands assign the priority of ***150*** to flow ***Test-1***.

```
switch(config-directflow-Test-1)# priority 150
switch(config-directflow-Test-1)#
```

13.6.4.11 show directflow

The **show directflow** command displays summary information for DirectFlow. With the **counters** or **details** options, it displays counters or details for all flows configured on the switch.

Command Mode

EXEC

Command Syntax

show directflow [counters | details]

Examples

- This command displays summary information for DirectFlow.

```
switch# show directflow
DirectFlow configuration: Enabled
Total matched: 0 packets
Total programmed flows: 3 flows
switch#
```

- This command displays counters for all DirectFlow flows configured on the switch.

```
switch# show directflow counters
Flow Name      Source      Matched packets      Matched bytes
---------      ------      ---------------      -------------
test3          config      0                     0
test2          config      0                     0
test1          config      0                     0

Total matched packets: 0
switch>
```

- This command displays details for all DirectFlow flows configured on the switch.

```
switch# show directflow detail
Flow test3: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd
    source IPv6 address: fcaa::/ffff:ffff:ffff:ffff
:ffff:ffff:ffff:ffff
  actions:
    output interfaces:
        Et32
  source: config
  matched: 0 packets, 0 bytes
Flow test2: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
```

```
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
  actions:
    output interfaces:
        Et3/1
  source: config
  matched: 0 packets, 0 bytes
Flow test1: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
  actions:
    output interfaces:
        Et2/1
  source: config
  matched: 0 packets, 0 bytes
Flows: 3 programmed, 0 rejected
switch#
```

13.6.4.12 show directflow flows

The **show directflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters. Including the name of a specific flow limits the output to information about the specified flow.

Command Mode

EXEC

Command Syntax

show directflow flows [***flow_name*** [counters | detail]]

Parameters

- ***flow_name*** name of flow for which to display information. If no flow name is entered, command displays information for all flows.
- **counters** displays DirectFlow counters for the specified flow.
- **detail** displays detailed information for the specified flow.

Examples

- This command displays the contents of the flow table.

```
switch# show directflow flows
Flow test3:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd
    source IPv6 address: fcaa::/ffff:ffff:ffff:ffff
:ffff:ffff:ffff:ffff
  actions:
    output interfaces:
        Et32
  source: config
  matched: 0 packets, 0 bytes
Flow test2:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
  actions:
    output interfaces:
        Et3/1
  source: config
  matched: 0 packets, 0 bytes
Flow test1:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
```

```
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
  actions:
    output interfaces:
        Et2/1
  source: config
  matched: 0 packets, 0 bytes
switch#
```

- This command displays information about flow ***test-1***.

```
switch# show directflow flows test-1
Flow test1:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
  actions:
    output interfaces:
        Et2/1
  source: config
  matched: 0 packets, 0 bytes
switch#
```

- This command displays detailed information for flow ***test-1***.

```
switch# show directflow flows test-1 detail
switch>show directflow flows test1 detail
Flow test1: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
    source Ethernet address: 00:aa:aa:aa:aa:aa/ff:ff:ff
:ff:ff:ff
    VLAN ID: 10
  actions:
    output interfaces:
  copy ingress to mirror dest interfaces: Ethernet1
    forward normally
  source: config
  matched: 0 packets, 0 bytes
switch#
```

- This command displays detailed information for all flows regardless of their status as installed, rejected, configured or others.

```
switch# show directflow detail
Flow test-3: (Flow programmed)
  persistent: False
```

```

switch#
```

- This command displays counters for flow ***test-1***.

```
switch# show directflow flows test-1 counters
Flow Name     Source      Matched packets    Matched bytes
---------     ------      ---------------    -------------
test1         config                    0                0
switch#
```

- This command displays match counters per flow.

```
switch# show directflow counters
Flow Name     Source      Matched packets    Matched bytes
---------     ------      ---------------    -------------
test1         config                    0              146
```

```
Total matched packets: 1
switch#
```

13.6.4.13 shutdown (DirectFlow)

The **shutdown** command, in DirectFlow mode, disables DirectFlow on the switch. DirectFlow is disabled by default.

The **no shutdown** command re-enables DirectFlow.

Command Mode

Directflow Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands enable DirectFlow on the switch.

```
switch(config)# directflow
switch(config-directflow)# no shutdown
switch(config-directflow)#
```

- This command disables DirectFlow Flow.

```
switch(config-directflow-Test1)# shutdown
```

13.6.4.14 timeout (DirectFlow-flow mode)

The **`timeout`** command, in ***DirectFlow*** mode, command configures the connection timeout period for connection sessions. The connection timeout period defines the interval between a users most recently entered command and an automatic connection shutdown. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

Command Mode

Directflow-flow Configuration

Command Syntax

`no timeout` ***hard***

`no timeout` ***idle***

Parameters

- ***idle*** session idle timeout length.
  - ***0*** Automatic connection timeout is disabled.
  - ***1-4294967295*** Automatic timeout period (seconds).
- ***hard*** session hard timeout length.
  - ***0*** Automatic connection timeout is disabled.
  - ***1-4294967295***

Example

- These commands enable a hard timeout period of ***5*** seconds on the switch.

```
switch(config)# directflow
switch(config-directflow-Test1)# timeout hard 5
switch(config-directflow-Test1)#
```

- These commands enable DirectFlow on the switch.

```
switch(config)# directflow
switch(config-directflow-Test1)# no timeout hard
switch(config-directflow-Test1)#
```

13.7 Decap Groups

These sections describe the Decap groups:

- Decap Groups Description
- Decap Groups Configuration
- Decap Commands

13.7.1 Decap Groups Description

The decap group is a data structure that receives encapsulated packets and extracts the payload. The switch then processes or forwards the extracted payload as required. Although packets cannot be transmitted through decap groups, nexthop groups can be used to create a packet's reverse path. Decap groups support payload extraction of packets received from Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

The decap capabilities are further enhanced to support the Generic UDP Encapsulation (GUE). GUE is a general method for encapsulating packets of random IP protocols within a UDP tunnel. GUE provides an extensible header format with optional data.

The switch identifies a GUE packet based on the outer UDP destination port. Then it terminates the tunnel based on the outer destination IP and removes the outer IP/UDP encapsulation. The outer UDP destination port is also used to determine if the inner payload is IP or MPLS. For IP payloads, the first nibble of the inner payload is used to distinguish between IPv4 vs IPv6. The decapsulated packet is then either IP or MPLS forwarded based on the inner payload.

Decap groups have these limitations:

- Tunnels are terminated using destination IP address; source IP address has no influence.
- Packets matching a decap group are not processed through their ingress interface and VLAN.
- During a tunnel termination, ingress ACL filter each decap group packet’s inner header.
- Packet counters are not available.
- VRF is not supported.

The decap support over GUE has the following limitaions:

- Outer UDP checksum validation is not supported.
- Outer IP options handling is not supported.
- Outer IP TTL check is not performed.
- No exception handling on inner IP packet. Specifically, packets with inner IP TTL=1 or IP options will simply be attempted to be forwarded in HW.
- VXLAN is not supported along with GUE decap option on DCS-7020, DCS-7280R, DCS-7280R2, DCS-7500R, and DCS-7500R2 switch series.
- When GUE is enabled with outer IP hashing, inner IP fields are not included in the load balance key of MPLS over GRE packets in tc-counters TCAM profile on DCS-7020, DCS-7280R, DCS-7280R2, DCS-7500R, and DCS-7500R2 switch series.

Decap groups are defined by their tunnel type and decap IP address:

- **Tunnel type** specifies the tunnel protocol that the switch uses to extract payload.
- **Decap IP address** specifies the IP address where the switch receives decap group packets.

Decap groups support Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

13.7.1.1 Generic UDP Encapsulation (GUE) Decap Configuration

The **ip decap-group** configuration is used to specify GUE tunnel termination as follows:

```
switch(config)# ip decap-group test
```

```
switch(config-dg-test)# tunnel type UDP
switch(config-dg-test)# tunnel decap-ip 2.2.2.2
switch(config-dg-test)# tunnel decap-interface et1
```

The global UDP destination port to payload type mapping is configured as follows:

```
switch(config)# ip decap-group type udp destination port 6080 payload ip
switch(config)# ip decap-group type udp destination port 5555 payload
 mpls
```

Note: Note that each payload type can be mapped to only one UDP port. Otherwise, the following error will be shown:

```
switch(config)# ip decap-group type udp destination port 6081
 payload ip
% There can be only one UDP destination port per payload type
```

MPLSoverGUE Decap-group Configuration

The MPLSoGUE decap-group requires the following platform configurations. First, the **mpls-over-gre** must be enabled since this supports the mpls-over-gre support in hardware:

```
switch(config)# platform fap mpls-over-gre
```

Second, outer IP hashing must be enabled as follows:

```
(config)# load-balance policies
switch(config-load-balance-policies)# load-balance sand profile default
! profile default is a reserved profile
! profile default is the current global profile
switch(config-sand-load-balance-profile-default)# packet-type gue outer-
ip
```

Note: The above platform configurations are not required on DCS-7280R3, DCS-7500R3, and DCS-7800R3.

13.7.2 Decap Groups Configuration

Decap groups are configured in ***decap-group*** configuration mode. The ***decap-group*** configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. However, when exiting, the ***decap-group*** configuration mode does not affect running-config. The **exit** command returns the switch to ***global*** configuration mode.

- The static CLI entry for the incoming label is specified by the mpls static command.
- The tunnel type is specified by the tunnel type (Decap Group) command.
- The Decap IP address is specified by the tunnel decap-ip (Decap Group) command.
- The locally configured IP addresses are added to the Layer 3 interfaces using the tunnel decap-interface (Decap Group) command for a specified decap group.

Decap groups do not define a default destination address or tunnel type and is not functional until both parameters are configured. A decap group can contain multiple **tunnel decap-ip** statements.

Examples

- This command defines a static CLI entry for the incoming-label.

```
switch(config)# mpls static top-label 3400 ethernet 3/3/3
 10.14.4.4 pop payload-type ipv4
```

- This command creates a decap group named ***DC-1*** and configures the group to terminate packets from GRE tunnel packets with the destination IP address of ***10.14.3.2***.

```
switch(config)# ip decap-group DC-1
switch(config-dg-DC-1)# tunnel type gre
switch(config-dg-DC-1)# tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)# show active
 ip decap-group DC-1
   tunnel type gre
   tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)# end
switch(config)#
```

13.7.3 Decap Commands

Decap Configuration Commands

- ip decap-group
- tunnel decap-interface (Decap Group)
- tunnel decap-ip (Decap Group)
- tunnel type (Decap Group)

Decap Show Command

- show ip decap-group

13.7.3.1 ip decap-group

The **`ip decap-group`** command places the switch in ***decap-group*** configuration mode, through which decap groups are created or modified. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

The ***decap-group*** configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. Exiting the ***decap-group*** configuration mode does not affect ***running-config***. The **`exit`** command returns the switch to ***global*** configuration mode.

The **`no ip decap-group`** and **`default ip decap-group`** commands delete previously configured commands in the specified **decap-group** mode.

Command Mode

Global Configuration

Command Syntax

`ip decap-group` ***group_name***

`no ip decap-group` ***group_name***

`default ip decap-group` ***group_name***

Parameters

group_name Decap group name.

Commands Available in Decap-group Configuration Mode

- tunnel decap-ip (Decap Group) Specifies the IP address of packets handled by the decap group.
- tunnel type (Decap Group) Specifies the tunnel protocol for extracting payload.
- show ip decap-group

Examples

- This command creates a decap group named ***DC-1***.

```
switch(config)# ip decap-group DC-1
switch(config-dg-DC-1)#
```

- This command exits the ***decap-group*** mode for the ***DC-1*** decap group.

```
switch(config-dg-DC-1)# exit
switch(config)#
```

- This command delete the decap group named ***DC-1***.

```
switch(config)# no ip decap-group DC-1
switch(config)#
```

13.7.3.2 show ip decap-group

The **show ip decap-group** command displays the IP decap groups that are available in the switch.

Command Mode

Global Configuration

Command Syntax

show ip decap-group [**decap-group name** | **dynamic**]

Parameters

- ***decap-group name*** The decap group name.
- **dynamic** Displays the dynamic entries only.

Related Commands

- show ip decap-group
- tunnel decap-ip (Decap Group)
- tunnel type (Decap Group)

Examples

- This command displays the IP decap groups that are available in a switch.

```
switch(config)# show ip decap-group
NOTE: "D" column indicates dynamic entries
D | Name                | Type       | Info             | Version | Addr Type
--|---------------------|------------|------------------|---------|--------
* | d1                  | GRE        | 1.2.3.4          |         |
* | d2                  | IP-in-IP   | Ethernet12/3     | IPv4    | primary
  | gre-with-intf       | GRE        |                  |         |
  | ipip-with-decapall  | IP-in-IP   | all              | IPv4    | all
  | ipip-with-decapall  | IP-in-IP   | all              | IPv6    | all
  | ipip-with-intf      | IP-in-IP   | Ethernet11/3     | IPv6    | all
  | ipip-with-intf      | IP-in-IP   | Ethernet11/3     | IPv4    | primary
* | ipip-with-ip        | IP-in-IP   | 1001::1          | IPv6    |
* | ipip-with-ip        | IP-in-IP   | 1.1.1.1          | IPv4    |
  | p1                  | GRE        | 100.100.100.100  |         |
  | p2                  | UNKNOWN    |                  |         |
```

- This command displays the UDP decap groups that are available in a switch.

```
switch(config)# show ip decap-group
NOTE: "D" column indicates dynamic entries
D | Name    | Type  | Info       | Version | Address  | UDP Dest | Payload
  |         |       |            |         | Type     | Port     | Type
--|---------|-------|------------|---------|----------|----------|----------
  | foo     | UDP   | Ethernet1  | IPv4    |  primary | 6080     | ip
  |         |       |            |         |          | 5555     | mpls
  | bar     | UDP   | 2.2.2.2    | IPv4    |          | 6080     | ip
  |         |       |            |         |          | 5555     | mpls
```

- The following command displays the decap-groups configured in HW:

```
switch(config)# show platform fap decap-group
DecapIp                                        LIF
---------------------------------------------   ----------
2.2.2.2                                       |   0
3.3.3.3                                       |   1
```

13.7.3.3 tunnel decap-interface (Decap Group)

The **tunnel decap-interface** command adds all locally configured IP addresses to the specific Layer 3 interface per decap group.

The **no tunnel decap-interface** command and the **default tunnel decap-interface** command restores the default state by removing the locally added IP addresses from the decap group.

Command Mode

Decap-Group Configuration

Command Syntax

tunnel decap-interface{ Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}

no tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}

default tunnel decap-interface{Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}

Parameters

- **Ethernet *e_num*** Ethernet interface specified by ***e_num***. The Ethernet port number ranges from ***1*** to ***36***.
- **Loopback *l_num*** Loopback interface specified by ***l_num***. The loopback interface number ranges from ***0*** to ***1000***.
- **Management *m_num*** Management interface specified by ***m_num***. The management port number ranges from ***1*** to ***1***.
- **Port-channel *p_num*** Port-channel interface specified by ***p_num***. Options include:
  - **Port-channel** interface number. The port-channel interface number ranges from ***1*** to ***2000***.
  - **Port-channel** sub interface number. The port-channel sub interface number ***1-2000***,***1-4094***.
- **tunnel *t_num*** Tunnel interface specified by ***t_num***. The tunnel interface number ranges from ***0*** to ***255***.
- **vlan *v_num*** VLAN interface specified by ***v_num***. The VLAN interface number ranges from ***1*** to ***4094***.
- **vxlan *vx_num*** VXLAN interface specified by ***vx_num***. The VXLAN tunnel interface number ranges from ***1*** to ***1***.
- **all *address-family*** This parameter configures all L3 interfaces as a decap interface.

Related Commands

- ip decap-group
- tunnel type (Decap Group)
- show ip decap-group

Example

These commands add locally configured IP addresses to the ***interface ethernet 1/1*** for the ***dg1*** decap group.

```
switch(config)# ip decap-group dg1
switch(config-dg-dg1)# tunnel decap-interface Ethernet1/1

switch(config-dg-dg1)# show active
ip decap-group dg1
   tunnel type ipip
   tunnel decap-interface Ethernet1/1
```

```
    tunnel decap-interface all address-family ipv6 address all
```

13.7.3.4 tunnel decap-ip (Decap Group)

The **`tunnel decap-ip`** command specifies the IP address of packets that are handled by the configuration mode decap group. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not define a default decap-ip address. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode

Decap-Group Configuration

Command Syntax

`tunnel decap-ip` ***ipv4_address***

Parameters

ipv4_addr An IPv4 address.

Related Commands

- The ip decap-group command places the switch in ***decap-group*** configuration mode.
- The tunnel type (Decap Group) command specifies the tunnel protocol for extracting payload.
- The show ip decap-group command.

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

These commands configure ***10.14.3.2*** as the decap-IP address for the ***DC-1*** decap group.

```
switch(config)# ip decap-group DC-1
switch(config-dg-DC-1)# tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)# show active
 ip decap-group DC-1
   tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#
```

13.7.3.5 tunnel type (Decap Group)

The **`tunnel type`** command specifies the tunnel protocol for extracting payload from encapsulated packets that arrive on the IP address specified for the configuration mode decap group. Supported tunnel protocols include General Routing Encapsulation (GRE) and IP-in-IP.

Decap groups do not define a default tunnel type. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode

Decap-group Configuration

Command Syntax

`tunnel type gre`

Related Commands

- The ip decap-group command places the switch in ***decap-group*** configuration mode.
- The tunnel decap-ip (Decap Group) command specifies the IP address of packets handled by the decap group.
- The show ip decap-group command.

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

This command configures decap group ***DC-1*** to terminate packets from GRE tunnel packets.

```
switch(config)# ip decap-group DC-1
switch(config-dg-DC-1)# tunnel type gre
switch(config-dg-DC-1)# show active
 ip decap-group DC-1
   tunnel type gre
switch(config-dg-DC-1)#
```

13.8 Nexthop Groups

These sections describe the Nexthop groups:

13.8.1 Nexthop Group Description

Each routing table entry provides the next hop address to its specified destination. A nexthop address is the address of the next device on the path to the entry's specified destination.

A nexthop group is a data structure that defines a list of nexthop addresses and a tunnel type for packets routed to the specified address. When an IP route statement specifies a nexthop group as the nexthop address, the switch configures a static route with a nexthop group member as the nexthop address and encapsulates packets forwarded to that address as required by the group's tunnel type.

The nexthop group size is a configurable parameter that specifies the number of entries that the group contains. Group entries that are not explicitly configured are filled with drop routes. The switch uses ECMP hashing to select the address within the nexthop group when forwarding packets. When a packet's hash selects a drop route, the packet is dropped.

Nexthop groups are supported on Trident platform switches and subject to the following restrictions:

- Each switch can support 512 IPv4 or IPv6 Tunnels
- Nexthop groups can contain 256 nexthops.
- The switch supports 1024 nexthop groups.
- Multiple routes can share a tunnel.
- Tunnels do not support IP multicast packets.

Nexthop groups support IP-in-IP tunnels. The entry IP address family within a particular nexthop group cannot be mixed, i.e. either they are all IPv4 or they are all IPv6 entries.

13.8.2 Nexthop Group Configuration

Nexthop groups are configured and modified in nexthop-group configuration mode. After a group is created, it is associated to a static route through an ip route nexthop-group statement.

These tasks are required to configure a nexthop group and apply it to a static route.

Creating and Editing Nexthop Groups

Nexthop groups are created by a nexthop-group command that specifies a group that isn't already configured. The switch enters ***nexthop-group*** configuration mode for the new group. ***Nexthop-group*** mode is also accessible for modifying existing groups. When in ***nexthop-group*** configuration mode, the **`show active`** command displays the group's configuration.

- This command creates a nexthop group named ***NH-1***.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)#
```

- These commands enter ***nexthop-group*** configuration mode for the group named ***NH3***, then displays the previously configured group parameters.

```
switch(config)# nexthop-group NH3
switch(config-nexthop-group-NH3)#show active
 nexthop-group NH3
   size 4
   ttl 10
   entry 0 tunnel-destination 10.14.21.3
   entry 1 tunnel-destination 10.14.21.5
   entry 2 tunnel-destination 10.14.22.5
   entry 3 tunnel-destination 10.14.22.6
switch(config-nexthop-group-NH3)#
```

Configuring a Group's Encapsulation Parameters

Packets in static routes that are associated with the nexthop group are encapsulated to support the group's tunnel type. Nexthop groups support IP-in-IP tunnels. The group also defines the source IP address and TTL field contents that are included in the packet encapsulation.

- This command configures the TTL setting to ***32*** for nexthop group ***NH-1*** encapsulation packets.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# ttl 32
switch(config-nexthop-group-NH-1)# show active
 nexthop-group NH-1
   size 128
   ttl 32
switch(config-nexthop-group-NH-1)#
```

  The address is inserted in the encapsulation source IP fields is specified by tunnel-source (Nexthop Group).

- These commands create ***interface loopback 100***, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group ***NH-1***.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.1.1.1/32
switch(config-if-Lo100)# exit
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# tunnel-source intf loopback
 100
switch(config-nexthop-group-NH-1)# show active
 nexthop-group NH-1
   size 256
   ttl 32
   tunnel-source intf Loopback100
```

```
switch(config-nexthop-group-NH-1)#
```

Configuring IP-in-IP Encapsulation

Through IP-in-IP encapsulation, IP packets matching a static Nexthop-Group route are encapsulated within an IP-in-IP tunnel and forwarded.

This command configures a static Nexthop-Group route and an IP-in-IP Nexthop-Group for IP-in-IP encapsulation.

```
switch(config)# ip route 124.0.0.1/32 nexthop-group abc
switch(config)# nexthop-group abc type ip-in-ip
switch(config-nexthop-group-abc)# size 512
switch(config-nexthop-group-abc)# tunnel-source 1.1.1.1
switch(config-nexthop-group-abc)# entry 0 tunnel-destination
 1.1.1.2
switch(config-nexthop-group-abc)# entry 1 tunnel-destination
 10.1.1.1
switch(config-nexthop-group-abc)# ttl 64
switch(config-nexthop-group-abc)#
```

Configuring the Group's Size

The group's size specifies the number of entries in the group. A group can contain up to ***256*** entries, which is the default size. The group's size is specified by size (Nexthop Group).

This command configures the nexthop group ***NH-1*** to contain ***128*** entries.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 128
switch(config-nexthop-group-NH-1)# show active
 nexthop-group NH-1
   size 128
   ttl 64
switch(config-nexthop-group-NH-1)#
```

Creating Nexthop Group Entries

Each entry specifies a nexthop address that is used to forward packets. A nexthop group contains one entry statement for each nexthop address. The group's size specifies the number of entry statements the group may contain. Each entry statement is assigned an index number to distinguish it from other entries within the group; entry index numbers range from zero to the group size minus one.

Nexthop group entries are configured by entry (Nexthop Group).

- These commands set the nexthop group size at four entries, then create three entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 4
```

```
switch(config-nexthop-group-NH-1)# entry 0 tunnel-destination
 10.13.4.4
switch(config-nexthop-group-NH-1)# entry 1 tunnel-destination
 10.15.4.22
switch(config-nexthop-group-NH-1)# entry 2 tunnel-destination
 10.15.5.37
switch(config-nexthop-group-NH-1)# show active
 nexthop-group NH-1
   size 4
   ttl 64
   entry 0 tunnel-destination 10.13.4.4
   entry 1 tunnel-destination 10.15.4.22
   entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```

- These commands configure a nexthop group with three IPv6 nexthop entries.

```
switch(config)# nexthop-group nhg-v6-mpls type ip
switch(config-nhg-v6-mpls)# size 3
switch(config-nhg-v6-mpls)# entry 0 nexthop 2002::6401:1
switch(config-nhg-v6-mpls)# entry 1 nexthop 2002::6404:1
switch(config-nhg-v6-mpls)# entry 2 nexthop 2002::6404:2
switch(config-nhg-v6-mpls)#
```

- These commands configure an IPv4 route to point to the nexthop group **nhg-v6-mpls**. (Both IPv4 routes and IPv6 routes can point to this nexthop group.)

```
switch# ip route 100.5.0.0/16 Nexthop-Group nhg-v6-mplsp
switch#
```

Displaying Nexthop Groups

The show nexthop-group command displays a group's configured parameters.

This command displays the properties of the nexthop group named ***NH-1***.

```
switch> show nexthop-group NH-1
Name              Id       type     size   ttl    sourceIp
NH-1              4        ipInIp   256    64     0.0.0.0
switch>
```

Applying a Nexthop Group to a Static Route

The ip route nexthop-group associates a nexthop group with a specified destination address and configures the encapsulation method for packets tunneled to that address.

This command creates a static route in the default VRF, using the nexthop group of ***NH-1*** to determine the next hop address.

```
switch(config)# ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```

The **show ip route** command displays the routing table for a specified VRF. Routes that utilize a nexthop group entry are noted with a route type code of ***NG***.

This command displays a routing table that contains a static route with its nexthop specified by a nexthop group.

```
switch> show ip route
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF
 Summary,
       NG - Nexthop Group Static Route

Gateway of last resort is not set

 C      10.3.3.1/32 is directly connected, Loopback0
 C      10.9.1.0/24 is directly connected, Ethernet51/3
 C      10.10.10.0/24 is directly connected, Ethernet51/1
 S      10.20.0.0/16 [20/0] via 10.10.10.13, Ethernet51/1
 C      10.10.11.0/24 is directly connected, Ethernet3
 NG     10.10.3.0/24 [1/0] via ng-test1, 5
 C      10.17.0.0/20 is directly connected, Management1
 S      10.17.0.0/16 [1/0] via 10.17.0.1, Management1
 S      10.18.0.0/16 [1/0] via 10.17.0.1, Management1
 S      10.19.0.0/16 [1/0] via 10.17.0.1, Management1
 S      10.20.0.0/16 [1/0] via 10.17.0.1, Management1
 S      10.22.0.0/16 [1/0] via 10.17.0.1, Management1

switch>
```

13.8.3 Support for IPv6 Link-Local Addresses in Nexthop Groups Entries

IPv6 Link-local addresses in Nexthop Groups entries support IPv6 link-local nexthops belonging to a Nexthop Group. Only the MPLS Nexthop Group supports IPv6 and because of this, IPv6 is limited to getting support only by the Nexthop Group of MPLS. An advantage is that you can use these devices even when they are not configured with globally routable IPv4 or IPv6 addresses.

13.8.3.1 Configuration

An MPLS next-hop group with IPv6 address now accepts an interface if the IPv6 address is a link-local. Note the use of percentages between the IPv6 address and the interface.

```
switch(config)# nexthop-group nhg1 type mpls
switch(config-nexthop-group-nhg1)# entry 0 push label-stack 606789
 nexthop fe80::fe80:2%Ethernet2
switch(config-nexthop-group-nhg1)# entry 1 push label-stack 204164
 nexthop fe80::fe80:2%Ethernet3
```

13.8.3.2 Show Commands

Use the **show nexthop-group** command to display the current status of the nexthop-groups.

```
switch# show nexthop-group
nhg1
```

```
Id               1
Type             mpls
Size             12
Entries (left most label is the top of the stack)
  0  push label-stack 606789   nexthop fe80::fe80:2
       Tunnel destination directly connected, Ethernet2
       00:d4:27:77:e9:77, Ethernet2
  1  push label-stack 204164   nexthop fe80::fe80:2
       Tunnel destination directly connected, Ethernet3
       00:79:21:32:0f:32, Ethernet3
```

13.8.3.3 Limitations

Review the following limitations for the support of IPv6 link-local address in nexthop group entries:

- Only the nexthop-group of MPLS supports an IPv6 address. Therefore, link-local IPv6 addresses are only supported for this type of nexthop-group.
- Nexthop-groups are configured and exist in the default VRF. The link-local IPv6 addresses for nexthop-group entries can only be resolved for interfaces in the default VRF.

13.8.4 Nexthop Group Commands

Nexthop Commands

- entry (Nexthop Group)
- ip route nexthop-group
- nexthop-group
- size (Nexthop Group)
- ttl (Nexthop Group)
- tunnel-source (Nexthop Group)

Nexthop Show Command

- show nexthop-group

13.8.4.1 entry (Nexthop Group)

The **entry** command defines a nexthop entry in the ***nexthop group*** configuration mode . Each nexthop entry specifies a nexthop IP address for static routes to which the nexthop group is assigned. The group size (size (Nexthop Group)) specifies the quantity of entries a group contains. Each entry is created by an individual command. Entries within a group are distinguished by an index number.

The **no entry** and **default entry** commands delete the specified nexthop group entry, as referenced by index number, by removing the corresponding **entry** statement from ***running-config.***

Command Mode

Nexthop-group Configuration

Command Syntax

entry ***index*** tunnel-destination ***ipv4_address***

no entry ***index***

default entry ***index***

Parameters

- ***index*** Entry index. Values range from **0** to **group-size – 1**.
- ***ipv4_address*** Nexthop IPv4 address.

group-size is the group's entry capacity, as specified by the size (Nexthop Group) command.

Example

These commands sets the nexthop group size at four entries, then creates three nexthop entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 4
switch(config-nexthop-group-NH-1)# entry 0 tunnel-destination
 10.13.4.4
switch(config-nexthop-group-NH-1)# entry 1 tunnel-destination
 10.15.4.22
switch(config-nexthop-group-NH-1)# entry 2 tunnel-destination
 10.15.5.37
switch(config-nexthop-group-NH-1)# show active
 nexthop-group NH-1
   size 4
   ttl 64
   entry 0 tunnel-destination 10.13.4.4
   entry 1 tunnel-destination 10.15.4.22
   entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```

13.8.4.2 ip route nexthop-group

The **ip route nexthop-group** command creates a static route. The destination is a network segment. The nexthop address is one of the IP addresses that comprise the specified nexthop group. Packets forwarded as a result of this command are encapsulated as specified by the tunnel-type parameter of the specified nexthop group.

When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence. When a route created through this command has the same administrative distance as another static route (ECMP), the route that was created earliest has preference; ***running-config*** stores static routes in the order that they are created.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

The **no ip route nexthop-group** and **default ip route nexthop-group** commands delete the specified route by removing the corresponding **ip route nexthop-group** command from ***running-config***. **Ip route nexthop-group** statements for an IP address in multiple VRFs must be removed separately.

A **no ip route** or **default ip route** command without a nexthop parameter deletes all corresponding **ip route nexthop-group** statements. Deleting a user-defined VRF also deletes its static routes.

Command Mode

Global Configuration

Command Syntax

ip route [**VRF_INST** ***dest_net*** **nexthop-group** ***nhgp_name*** [***dist***][**TAG_OPTION**][**RT_NAME**]

no ip route [**VRF_INST**] ***dest_net*** [**nexthop-group** ***nhgroup_name***][***distance***]

default ip route [**VRF_INST**] ***dest_net*** [**nexthop-group** ***nhgroup_name***][***distance***]

Parameters

- **VRF_INST** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf** ***vrf_name*** Changes are made to the specified VRF.
- ***dest_net*** Destination IPv4 subnet (CIDR or address-mask notation).
- ***nhgp_name*** Name of nexthop group.
- ***dist*** Administrative distance assigned to route. Options include:
  - ***no parameter*** Route assigned default administrative distance of one.
  - **1-255** The administrative distance assigned to route.
- **TAG_OPTION** Static route tag. Options include:
  - ***no parameter*** Assigns default static route tag of ***0***.
  - **tag** ***t_value*** Static route tag value. ***t_value*** ranges from **0** to **4294967295**.
- **RT_NAME** Associates descriptive text to the route. Options include:
  - ***no parameter*** No text is associated with the route.
  - **name** ***descriptive_text*** The specified text is assigned to the route.

Related Commands

The **ip route** command creates a static route that specifies the nexthop address without using nexthop groups.

Example

This command creates a static route in the default VRF, using the nexthop group of ***NH-1*** to determine the next hop address.

```
switch(config)# ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```

13.8.4.3 nexthop-group

The **nexthop-group** command places the switch in ***nexthop-group*** configuration mode, through which nexthop groups are created or modified. The command also specifies the tunnel protocol for extracting payload from encapsulated packets that arrive through an IP address upon which the group is applied.

A nexthop group is a data structure that defines a list of nexthop addresses and the encapsulation process for packets routed to the specified address. The command either accesses an existing ***nexthop group*** configuration or creates a new group if it specifies a non-existent group. Supported tunnel protocols include IP ECMP and IP-in-IP.

The ***nexthop-group*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***nexthop-group*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to ***global*** configuration mode.

The **no nexthop-group** and **default nexthop-group**commands delete previously configured commands in the specified **nexthop-group** mode. When the command does not specify a group, it removes all nexthop-groups. When the command specifies a tunnel type without naming a group, it removes all nexthop-groups of the specified type.

Command Mode

Global Configuration

Command Syntax

nexthop-group ***group_name*** type **TUNNEL_TYPE**

no nexthop-group [***group_name***][type **TUNNEL_TYPE**]

default nexthop-group [***group_name***][type**TUNNEL_TYPE**]

Parameters

- ***group_name*** Nexthop group name.
- **TUNNEL_TYPE** Tunnel protocol of the nexthop-group. Options include:
  - **ip** ECMP nexthop.
  - **ip-in-ip** IP in IP tunnel.
  - **gre** Encapsules the Layer 3 protocols overs IP networks.
  - **mpls-over-gre** Tunnels MPLS over a non-MPLS network.
    - **entry** Nexthop Group Entry Configuration.
    - **size** Nexthop Group Entry Size.
    - **tos** Tunnel encapsulation IP type of service.
    - **ttl** Tunnel encapsulation TTL value.
    - **tunnel-source** Source Interface or Address.

Commands Available in Nexthop-group Configuration Mode

- entry (Nexthop Group)
- size (Nexthop Group)
- ttl (Nexthop Group)
- tunnel-source (Nexthop Group)

Restrictions

Tunnel type availability varies by switch platform.

Examples

- This command creates a nexthop group named ***NH-1*** that specifies ECMP nexthops.

```
switch(config)# nexthop-group NH-1 type ip
```

```
switch(config-nexthop-group-NH-1)#
```

- This command exits nexthop-group mode for the ***NH-1*** nexthop group.

```
switch(config-nexthop-group-NH-1)# exit
switch(config)#
```

- These commands creates a nexthop group ***NH-2*** of type MPLS over GRE.

```
switch(config)# nexthop-group NH-2 type mpls-over-gre
switch(config-nexthop-group-NH-2)# tunnel-source 11.1.1.1
switch(config-nexthop-group-NH-2)# ttl 32
switch(config-nexthop-group-NH-2)# tos 20
switch(config-nexthop-group-NH-2)# entry 0 push label-stack 16000
 tunnel-destination 11.1.1.2
switch(config)# ip route 100.1.1.1/32 Nexthop-Group NH-2

Counters for nexthop group may be enabled using the following command
switch(config)# hardware counter feature nexthop
```

13.8.4.4 show nexthop-group

The **show nexthop-group** command displays properties of the specified nexthop group.

Command Mode

EXEC

Command Syntax

show nexthop-group ***nhgroup_name*** [**VRF_INST**]

Parameters

- ***nhgroup_name*** Name of the group displayed by command.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf** ***vrf_name*** Specifies the name of VRF instance. System default VRF is specified by **default**.

Related Commands

The show nexthop-group command places the switch in the ***nexthop-group*** configuration mode to create a new group or modify an existing group.

Example

This command displays the nexthop group information.

```
switch(config)# show nexthop-group
  Id          107
  Type        mplsOverGre
  Size        1  (auto size enabled, programmed size 1)
  TTL         32
  Source IP   11.1.1.1
  Entries (left most label is the top of the stack)
    0  push label-stack 16000   tunnel-destination 11.1.1.2
         Tunnel destination directly connected, Ethernet1
         00:00:aa:aa:aa:aa, Ethernet1

With nexthop group counter enabled
switch(config)# show nexthop-group
  Id          1
  Type        mplsOverGre
  Size        1  (auto size enabled, programmed size 1)
  TTL         64
  Source IP   0.0.0.0
  Entries (left most label is the top of the stack)
    0  push label-stack 16000   tunnel-destination 1.1.1.2
         Tunnel destination directly connected, Ethernet1
         00:00:aa:aa:aa:aa, Ethernet1
         0 packets, 0 bytes

switch(config)#show nexthop-group summary
Number of Nexthop Groups configured: 1
Number of unprogrammed Nexthop Groups: 0

  Nexthop Group Type   Configured
--------------------- ------------
       MPLS over GRE             1

  Nexthop Group Size   Configured
--------------------- ------------
                    1             1
```

13.8.4.5 size (Nexthop Group)

The **size** command configures the quantity of nexthop entries in the ***nexthop group*** configuration mode . Each entry specifies a nexthop IP address for static routes to which the group is assigned. Entries are configured with the **entry (Nexthop Group)** command. The default size is ***256*** entries.

The **no size** and **default size** commands restore the size of the configuration mode nexthop group to its default of ***256*** by removing the corresponding **size** command from ***running-config***.

Command Mode

Nexthop-group Configuration

Command Syntax

size ***entry_size***

no size ***entry_size***

default size ***entry_size***

Parameter

entry_size Group size (entries). Value ranges from **1** to **255**. Default value is **256**.

Example

This command configures the nexthop group ***NH-1*** to contain ***128*** entries.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 128
switch(config-nexthop-group-NH-1)# show active
 nexthop-group NH-1
   size 128
   ttl 64
switch(config-nexthop-group-NH-1)#
```

13.8.4.6 ttl (Nexthop Group)

The **ttl** command specifies the number entered into the TTL (time to live) encapsulation field of packets that are transmitted to the address designated by the configuration mode nexthop group. The default TTL value is ***64***.

The **no ttl** and **default ttl** commands restore the default TTL value written into TTL fields for the ***nexthop group*** configuration mode by deleting the corresponding **ttl** command from ***running-config***.

Command Mode

Nexthop-group Configuration

Command Syntax

ttl ***hop_expiry***

no ttl ***hop_expiry***

default ttl ***hop_expiry***

Parameters

hop_expiry Period that the packet remains valid (seconds or hops) Value ranges from **1** to **64**.

Restrictions

This command is available only to Nexthop groups for tunnels of type **IP-in-IP**, **GRE**, **MPLS**, and **MPLS over GRE**.

Related Commands

The nexthop-group command places the switch in the ***nexthop-group*** configuration mode.

Examples

- This command configures the **ttl** setting to ***32*** for nexthop group ***NH-1*** packets.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# ttl 32
switch(config-nexthop-group-NH-1)# show active
 nexthop-group NH-1
   size 128
   ttl 32
switch(config-nexthop-group-NH-1)#
```

- This command restores the **no ttl** setting for nexthop group ***NH-1*** packets.

```
switch(config-nexthop-group-NH-1)# no ttl
switch(config-nexthop-group-NH-1)# show active nexthop-group
 NH-1
   size 128
   ttl 64
switch(config-nexthop-group-NH-1)#
```

13.8.4.7 tunnel-source (Nexthop Group)

The **`tunnel-source`** command specifies the address that is entered into the source IP address encapsulation field of packets that are transmitted as designated by the ***nexthop group*** configuration mode . The command may directly specify an IP address or specify an interface from which an IP address is derived. The default source address IP address is ***0.0.0.0***.

The **`no tunnel-source`** and **`default tunnel-source`** commands remove the source IP address setting from the configuration mode nexthop group by deleting the **`tunnel-source`** command from ***running-config***.

Command Mode

Nexthop-group Configuration

Command Syntax

`tunnel-source` **SOURCE**

`no tunnel-source` **SOURCE**

`default tunnel-source` **SOURCE**

Parameters

SOURCE IP address or derivation interface. Options include:

- ***ipv4_addr*** An IPv4 address.
- **intf ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **intf loopback *l_num*** Loopback interface specified by ***l_num***.
- **intf management *m_num*** Management interface specified by ***m_num***.
- **intf port-channel *p_num*** Port-channel interface specified by ***p_num***.
- **intf vlan *v_num*** VLAN interface specified by ***v_num***.

Restrictions

This command is available only to Nexthop groups for tunnels of type **ip-in-ip**.

Related Commands

The nexthop-group command places the switch in the ***nexthop-group*** configuration mode.

Example

These commands create **`interface loopback 100`**, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group ***NH-1***.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.1.1.1/32
switch(config-if-Lo100)# exit

switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# tunnel-source intf loopback
 100
switch(config-nexthop-group-NH-1)# show active nexthop-group NH-1
   size 256
   ttl 64
   tunnel-source intf Loopback100
switch(config-nexthop-group-NH-1)# show nexthop-group NH-1
Name             Id       type     size   ttl    sourceIp
NH-1             2        ipInIp   256    64     10.1.1.1
```

```
switch(config-nexthop-group-NH-1)#
```

13.9 Global Knob to Set MTU for all Layer 3 Interfaces

- Global Layer 3 Maximum Transfer Unit (MTU) feature provides a CLI command to set the MTU value for all Layer 3 interfaces.
- The default value for global Layer 3 MTU and for each interface Layer 3 MTU is ***1500***.
- Any interface which has an MTU configured is not affected by the global L3 MTU.
- When the global L3 MTU is changed, any existing interfaces which are using the default are updated to use the new MTU. Any additional interfaces which are configured in the future will also use the new default MTU.

The related sections are:

- Global Knob to Set MTU for all Layer 3 Interfaces Configuration
- Show Commands
- Limitations

13.9.1 Global Knob to Set MTU for all Layer 3 Interfaces Configuration

The global L3 **`mtu`** command is under ***interface-defaults*** sub-mode. In this example, the MTU value is set to ***1600***.

```
(config)# interface defaults
(config-interface-defaults)# mtu 1600
```

13.9.2 Limitations

The following are limitations for the Global knob to set MTU for all Layer 3 interfaces feature:

- Only Ethernet, Port-Channel, and VLAN interfaces are supported.
- Other interface types, such as Management, Loopback, VXLAN, and Tunnel, are not supported.

13.9.3 Show Commands

Use the **`show interface`** command to display the current MTU value applied on the selected interface. In the following example, ***interface ethernet1***, ***interface ethernet2***, and ***interface ethernet3*** are selected for display.

```
(config)# interface ethernet3
(config-if-Et3)# no switchport
(config-if-Et3)# mtu 1600
(config-if-Et3)# interface defaults
(config-interface-defaults)# mtu 1700
(config-interface-defaults)# show interfaces ethernet1
  ...
  IP MTU 1700 bytes (default) , BW 10000000 kbit
  ...
(config-interface-defaults)# show interfaces ethernet2
  ...
  IP MTU 1700 bytes (default) , BW 10000000 kbit
  ...
(config-interface-defaults)# show interfaces ethernet3
  ...
```

```
   IP MTU 1600 bytes , BW 10000000 kbit
   ...
```

In this example,

- Switch ***interface ethernet3*** from Layer 2 to Layer 3 and explicitly set its MTU to ***1600***.
- Enter the ***interface-defaults sub-mode***, set global L3 MTU to ***1700***.
- The **`show interface`** command states ***interface ethernet1*** and ***interface ethernet2*** are using global L3 MTU value, while ***interface ethernet3*** are using its local MTU value.
- The **`default`** in the output indicates whether or not the interface is using global L3 MTU.

13.10 Support for Layer 3 MTU on 7280R3/7500R3/7800R3

Support for Layer 3 Maximum Transmission Unit (MTU) on 7280R3/7500R3/7800R3 switches includes the following:

- Enforces the MTU for Layer 3 packets on 7280R3/7500R3/7800R3 switches. The MTU can be set on any SVI and the MTU of that specific SVI is enforced when the packets egress out of a trunk port. This behavior is not supported on 7280E/R/R2 and 7500E/R/R2 line cards.
- MTU enforcement is done after adding all of the encapsulation headers in the Egress packet. For example, if an interface is configured with an MTU value of ***1500*** and the packet size is larger than ***1500*** with all encapsulation headers added, the packet is considered MTU violated. In 7280E/R/R2 and 7500E/R/R2 line cards, MTU is enforced before adding encapsulation headers.
- Actual MTU configured in hardware is MTU configured in the CLI + ***18*** bytes. ***18*** bytes is added to accommodate the L2 header. If the outgoing packet is untagged, the actual MTU configured in hardware is the MTU configured in the CLI + four (***4***) bytes.

13.10.1 Layer 3 MTU Configuration

You can configure Layer 3 MTU on Layer 3 interfaces and SVI's using the **`mtu`** command within interface configuration mode.

This command sets the MTU size of ***1492*** bytes on ***interface ethernet 1/1***.

```
(config)# interface ethernet 1/1
(config-if-Et1/1)# mtu 1492
```

MTU is independently configurable on all routable interfaces. The switch supports MTU sizes ranging from ***68*** to ***9214*** bytes. The default MTU size is ***1500*** bytes.

The **`no mtu`** and **`default mtu`** commands restore the interface's MTU to the default value by removing the corresponding **`mtu`** command from ***running-config***.

13.10.2 Layer 3 MTU Show Commands

The **`show interfaces`** command displays the MTU configured on the L3 interface. In this example, ***ethernet 1/1*** interface is selected to display. **`IP MTU`** represents the Layer 3 MTU of the interface.

```
switch(config-if-Et9/1)# show interfaces ethernet 1/1
...
  IP MTU 1600 bytes , BW 100000000 kbit
  Full-duplex, 100Gb/s over 4 lanes, auto negotiation: off, uni-
link: n/a
...
```

13.10.3 L3 MTU Limitations

The following limitations apply to support of Layer 3 MTU:

- Only three (3) unique MTU values can be configured on a switch. If the number of unique MTU values exceeds three (3), additional unique MTU definitions will not be enforced on an interface.

    - When the number of unique MTU values becomes less than three (3) (after unconfiguring MTU on some interfaces), MTU on interfaces that are previously unprogrammed, are not reprogrammed automatically. CLI commands **no mtu** followed by **mtu** must be called to program MTU on an interface.
- When the startup configuration has more than three (3) unique MTU values defined on different interfaces of the switch, there is no guarantee which unique MTU values will be active when the switch is rebooted.
- L3 MTU is not enforced on Multicast packets for Jericho2 based platforms.

13.11 Segment Security

13.11.1 Overview of MSS-Group

Hosts and networks can be grouped into segments based on their prefixes; the MSS-Group feature (also called Segment Security) allows policies to be applied to segments rather than to interfaces or subnets. Policies define inter-segment and intra-segment rules; for example, segment A is allowed to communicate with segment B, or hosts in segment B are not allowed to communicate with each other.

By default, traffic directed to a segment is dropped; an explicit allow policy is required to allow communication. The two directions of traffic are handled independently; to allow traffic between two segments, forward policy must be configured in both segments.

13.11.2 Configuring MSS-Group

To configure MSS-Group (segment security) to control groups of IPv4 and/or IPv6 addresses (called “segments”), define one or more match lists, create segments based on those match lists, create policies governing traffic to individual segments, define default policy for all segments, and enable the MSS-Group feature. Up to 60 segments can be defined across all VRFs. Traffic to and from VLANs with no SVI configured are considered part of the default VRF, and are subject to the policies defined in the default VRF. This feature does not require routing to be enabled on the switch, even though the mode name starts with the word “router.”

Define Match Lists

Use the **`match-list input`** command to define an IPv4 or IPv6 subnet list. Each match list must contain only one type of prefix, either IPv4 or IPv6. It cannot contain a mixture. Each match list name of a given type must be unique, but an IPv4 match list and an IPv6 match list can have the same name.

Example

- The following commands define two IPv4 match lists named camera-prefixes and admin-prefixes and two IPv6 match lists also named camera-prefixes and admin-prefixes, and add a total of seven prefixes.

```
switch(config)# match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-
ipv4 69.89.31.200/32
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-
ipv4 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-
ipv4 70.89.31.0/24
switch(config-match-list-prefix-ipv4-camera-prefixes)# exit
switch(config)# match-list input prefix-ipv6 camera-prefixes
switch(config-match-list-prefix-ipv6-camera-prefixes)# match prefix-
ipv6 2001:0:9d38:6ab8::/64
switch(config-match-list-prefix-ipv6-camera-prefixes)# match prefix-
ipv6 2002:0:9d38:6ab8::3/128
switch(config-match-list-prefix-ipv6-camera-prefixes)# exit
switch(config)# match-list input prefix-ipv4 admin-prefixes
```

```
switch(config-match-list-prefix-ipv4-admin-prefixes)# match prefix-ipv4
 80.80.0.0/16
switch(config-match-list-prefix-ipv4-admin-prefixes)# exit
switch(config)# match-list input prefix-ipv6 admin-prefixes
switch(config-match-list-prefix-ipv6-admin-prefixes)# match prefix-ipv6
 2003:0:9d38:6ab8::/64
switch(config-match-list-prefix-ipv6-admin-prefixes)# exit
switch(config)#
```

Define Segments using Match Lists

Use the **segment** command to define a segment. A segment contains one or two match lists, one of type IPv4 and the other of type IPv6.

Example

- The following commands define segments using the match lists configured above.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment camera
switch(config-router-seg-sec-vrf-segment-camera)# definition
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv4
 camera-prefixes
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv6
 camera-prefixes
switch(config-router-seg-sec-vrf-segment-def)# exit
switch(config-router-seg-sec-vrf-segment-camera)# exit
switch(config-router-seg-sec-vrf-default)# segment secure-admin
switch(config-router-seg-sec-vrf-segment-secure-admin)# definition

switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv4 admin-
prefixes
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv6 admin-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#  exit
switch(config-router-seg-sec-vrf-segment-secure-admin) exit
switch(config-router-seg-sec-vrf-default)# exit
switch(config-router-seg-sec)# exit
switch(config)#
```

Define Policies Between Segments

Use the **policies** command to drop or forward traffic to a segment from specific other segments. Two built-in policies are available: policy-forward-all to forward traffic between segments, and policy-drop-all to drop traffic between segments. By default, the drop-all policy is enabled.

Example

- The following commands allow bidirectional traffic between the two segments defined above.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment camera
switch(config-router-seg-sec-vrf-segment-camera)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from secure-admin
 policy policy-forward-all
switch(config-router-seg-sec-vrf-segment-policies)# exit
switch(config-router-seg-sec-vrf-segment-camera)# exit
switch(config-router-seg-sec-vrf-default)# segment secure-admin
switch(config-router-seg-sec-vrf-segment-secure-admin)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from secure-admin
 policy policy-forward-all
```

```
switch(config-router-seg-sec-vrf-segment-policies)# exit
switch(config-router-seg-sec-vrf-segment-secure-admin)# exit
switch(config-router-seg-sec-vrf-default)# exit
switch(config-router-seg-sec)# exit
switch(config)#
```

Enable MSS-Group

By default, MSS-Group is not enabled. Use the **no shutdown** command to enable it. Use the **shutdown** command to disable it.

Examples

- The following commands enable MSS-Group.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# no shutdown
switch(config-router-seg-sec)# exit
switch(config)#
```

- The following commands disable MSS-Group.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# shutdown
switch(config-router-seg-sec)# exit
switch(config)#
```

Configuring Default Forward/Drop Behavior

By default, when MSS-Group is first enabled, all traffic to nodes in a segment is dropped unless explicitly allowed by a "forward-all" policy as shown above. This includes traffic within the segment. Use the **no segment policy** command to change this behavior to allow intra-segment traffic.

Example

- The following commands allow all traffic within each segment as well as between segments.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# no segment policy policy-drop-all
 default
switch(config-router-seg-sec)# exit
switch(config)#
```

You can modify the policy for each segment and in greater detail with the **policies** command.

Example

- The following commands prevent nodes in the **camera** segment from communicating with each other.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment camera
switch(config-router-seg-sec-vrf-segment-camera)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from camera policy
 policy-drop-all
switch(config-router-seg-sec-vrf-segment-policies)# exit
switch(config-router-seg-sec-vrf-segment-camera)# exit
switch(config-router-seg-sec-vrf-default)# exit
switch(config-router-seg-sec)# exit
switch(config)# exit
```

13.11.3 Limitations

- Multicast and Link Local prefixes are not supported.
- Traffic disruption during prefix and policy configuration is expected. We do not support atomicity during segment and prefix configuration.
- MSS-Group and URPF feature interaction is not supported. If both features are configured (misconfiguration), the platform gives URPF higher priority and removes any existing segment configurations from hardware.
- Prefixes entries failed to get installed in hardware (because of insufficient hardware resources) are retried periodically till resources become available and prefixes are successfully installed. However, the same is not true for policy entries. There is no retry mechanism implemented for failed policy entries. The user needs to free up hardware resources and re-enable the MSS-Group feature after removing it once.
- Custom policies can not be configured. Clients can choose from two built-in policies ‘policy-drop-all’ and ‘policy-forward-all’.
- A given prefix can only be part of a single segment in VRF. Attempting to configure the same prefix in more than one segment leads to undefined traffic forwarding behavior.
- The same prefix can not be configured in both MSS-Group and MSS-L3 configurations.
- SSU can be performed with MSS-Group configured but the traffic flows for MSS-Group configuration will not be hitless.
- DHCP discovery packets with broadcast destination IP of ***255.255.255.255*** will only match ***0.0.0.0/0*** prefix.
- All traffic sourced from and/or destined to switch owned IPs are allowed regardless of MSS-Group configuration.
- Due to source and destination IP lookup being required, the capacity of the LPM table is halved when MSS-G is enabled. The host table capacity is unchanged as the source and destination lookup is always enabled by default.

13.11.4 Show Commands

The `show` commands available to examine the configuration and status of MSS-Group include:

- **show segment-security [vrf *<vrf-name>*][segment *<seg-name>*]**

```
switch# show segment-security
VRF : default
  Segment      Interfaces Prefix IPv4     Prefix IPv6     From Segment
 Policy
  ------------ ---------- --------------- --------------- ------------
 ------------------
  camera                  camera-prefixes camera-prefixes secure-admin
 policy-forward-all
  secure-admin            admin-prefixes  admin-prefixes  camera
 policy-forward-all
```

- **show match-list {prefix-ipv4 | prefix-ipv6}[*<list-name>*]**
-

```
switch# show match-list prefix-ipv4
Name            Prefix
--------------- ---------------
admin-prefixes  80.80.0.0/16
camera-prefixes 69.89.31.200/32
                69.89.31.201/32
                70.89.31.0/24

switch# show match-list prefix-ipv6
Name            Prefix
--------------- ----------------------
admin-prefixes  2003:0:9d38:6ab8::/64
```

```
camera-prefixes 2001:0:9d38:6ab8::/64
                2002:0:9d38:6ab8::3/128
```

- **show segment-security hardware summary [vrf*<vrf-name>*][segment*<seg-name>*]**

  This command shows the hardware ID, number of prefixes, and number of successfully programmed prefixes for each VRF and segment specified. By default, all VRFs and segments are shown.

```
switch# show segment-security hardware summary
VRF: default
Segment              Hardware ID     Prefixes   Programmed
-------------------- --------------- ---------- ---------------
camera               63              5          5
secure-admin         62              2          2
```

- **show segment-security hardware detail [vrf*<vrf-name>*][segment*<seg-name>*]**

  This command shows the hardware ID assigned to each segment, the prefixes in each segment, and the adjacency index for each prefix (as determined from L3 hardware tables).

```
switch# show segment-security hardware detail
VRF: default
Segment              Hardware ID     Prefixes
      Adj Index
-------------------- --------------- --------------------------
------------ ---------------
camera               63              69.89.31.200/32
      1
                                     69.89.31.201/32
      1
                                     70.89.31.0/24
      1
                                     2001:0:9d38:6ab8::/64
      2
                                     2002:0:9d38:6ab8::3/128
      2
secure-admin         62              80.80.0.0/16
      1
                                     2003:0:9d38:6ab8::/64
      2
```

- **show segment-security hardware routes [vrf*<vrf-name>*][segment*<seg-name>*]**

  Since MSS Group prefixes use L3 hardware tables, the prefixes can overlap with FIB routes. So each prefix is assigned a route type. There are three possible classifications for a prefix:

  1. The prefix does not overlap with an FIB route. This prefix has route type 'S'.
  2. The prefix is also configured in the FIB. If a segment prefix is identical to an FIB prefix, it is given the route type 'S,F'.
  3. The prefix overlaps with an FIB entry but there is no exact match in the FIB. This prefix has the route type 'F'.

  The following command shows the route types for prefixes in hardware.

```
switch# show segment-security hardware routes
Codes: S - Segment prefix
       F - FIB route
       S,F - Segment prefix which is also present in FIB
VRF: default
Segment              Hardware ID     Routes
      Route Type
-------------------- --------------- --------------------------
------------ ----------
```

```
camera                63              69.89.31.200/32
      S
                                      69.89.31.201/32
      S
                                      70.89.31.0/24
      S,F
                                      2001:0:9d38:6ab8::/64
      S
                                      2002:0:9d38:6ab8::3/128
      S
secure-admin          62              80.80.0.0/16
      S
                                      2003:0:9d38:6ab8::/64
      S
```

- **show segment-security hardware counters[vrf*<vrf-name>*]**

  This command displays the counters for policies in each segment, including the default policies. For each policy configured between two segments, the Hit counter shows all hits, whether the packets were dropped or forwarded. The Drop counter shows which of those hits were dropped. There are also lines for the default policy of each segment, and the Drop counter includes packets which do not match a configured policy but are dropped by these default policies.

```
switch# show segment-security hardware counters
VRF: default
Policy               Hit        Drop
-------------------- ---------- ----------
policy-drop-all      6          6
policy-forward-all   13         0
Dest Segment         Source Segment       Policy               Hit
 Drop
-------------------- -------------------- -------------------- ----------
 ----------
camera               *                    n/a                  0
 3
camera               camera                                    6
 6
camera               secure-admin                              4
 0
secure-admin         *                    n/a                  0
 12
secure-admin         camera                                    9
 0
```

- **clear segment-security hardware counters**

  This command clears the Hit and Drop counters for each policy, setting them to ***0***.

13.11.5 Segment Security Commands

Global Configuration Commands

- match-list input
- router segment-security

Match-List Input Configuration Commands

- match (match-list input)

Router Segment-Security Configuration Commands

- segment policy policy-drop-all default
- shutdown (router segment-security)
- vrf (router segment-security)

Router Segment-Security VRF Configuration Commands

- segment

Router Segment-Security VRF Segment Configuration Commands

- definition (segment)
- policies (segment)

Router Segment-Security VRF Segment Policies Configuration Commands

- from (segment policies)

Router Segment-Security VRF Segment Definition Configuration Commands

- match (segment definition)

Segment-Security Clear and Show Commands

- clear segment-security hardware counters
- show match-list
- show segment-security
- show segment-security hardware counters
- show segment-security hardware detail
- show segment-security hardware routes
- show segment-security hardware summary

13.11.5.1 clear segment-security hardware counters

The **clear segment-security hardware** command clears the MSS-Group (segment security) Hit and Drop counters for all hits, and the hits and drops for each separate segment's policy. All MSS-Group counters are set to 0.

Command Mode

Privileged EXEC

Command Syntax

clear segment-security hardware counters

Examples

- This command clears all counters for MSS-Group.

```
switch# clear segment-security hardware counters
switch#
```

13.11.5.2 definition (segment)

The **definition** command enters Router Segment-Security VRF Segment Definition Configuration mode. This is not a group change mode. Changes are applied to ***running-config*** immediately. The **exit** command does not affect the configuration.

The **no definition** and **default definition** commands clear the segment definitions from ***running-config***.

Command Mode

Router Segment-Security VRF Segment Configuration

Command Syntax

definition

no definition

default definition

Commands Available in Router Segment-Security VRF Segment Definition Configuration Mode

match (segment definition)

Example

- These commands enter Router Segment-Security VRF Segment Definition mode for the segment "admin".

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# definition
switch(config-router-seg-sec-vrf-segment-def)#
```

13.11.5.3 from (segment policies)

The **from** command adds a policy to a segment in order to filter traffic from a specified segment (the same segment or a different segment). The policy can be either policy-drop-all or policy-forward-all. The default is policy-drop-all. Therefore, for a segment to allow traffic among its own members, it requires a policy-forward-all policy for itself. You can add any number of policies.

The **no from** and **default from** commands clear the segment policy from the ***running-config***.

Command Mode

Router Segment-Security VRF Segment Policies Configuration

Command Syntax

from ***segment_name*** **policy** ***policy_type***

no from ***segment_name*** [**policy** ***policy_type***]

default from ***segment_name*** [**policy** ***policy_type***]

Parameters

policy_type The type of policy. The possible values are "policy-drop-all" and "policy-forward-all". The default is "policy-drop-all".

segment_name The name of the segment to filter. This can be the segment currently being configured, to give you control over traffic within the segment.

Related Command

segment policy policy-drop-all default

Example

These commands add three policies to the segment ***admin***. One policy allows traffic within the ***admin*** segment itself. The second policy drops all traffic from segment ***seg1***. The third policy forwards all traffic from ***seg2***.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from admin policy
 policy-forward-all
switch(config-router-seg-sec-vrf-segment-policies)# from seg1 policy
 policy-drop-all
switch(config-router-seg-sec-vrf-segment-policies)# from seg2 policy
 policy-forward-all
switch(config-router-seg-sec-vrf-segment-policies)#
```

13.11.5.4 match-list input

The **match-list input** command enters Match List Configuration mode for the specified match list, creating one if it does not exist. The commands in this mode apply changes to ***running-config*** immediately. The **exit** command is not needed to save the changes to the configuration.

The **no match-list input** and **default match-list input** commands remove the specified match list from ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

match-list input {**prefix-ipv4|prefix-ipv6**} ***match_list_name***

no match-list input {**prefix-ipv4|prefix-ipv6**} ***match_list_name***

no match-list input {**prefix-ipv4|prefix-ipv6**} ***match_list_name***

Parameters

- prefix-ipv4 This match list has IPv4 prefixes only.
- prefix-ipv6 This match list has IPv6 prefixes only.
- ***match_list_name*** The name of the match-list to add to. If it does not exist it will be created.

Examples

- The following command creates an IPv4 match list called **camera-prefixes** and enters Match List Configuration mode.

```
switch(config)# match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-admin-prefixes)#
```

- The following command removes the IPv4 match list **camera-prefixes** from ***running-config***.

```
switch(config)# no match-list input prefix-ipv4 camera-prefixes
switch(config)#
```

13.11.5.5 match (match-list input)

The **match** command adds an entry to a match list. Each entry in a given match list must be of the same type, either IPv4 or IPv6. This command updates ***running-config*** immediately. It is not necessary to use the **exit** command to save changes.

The **no match** and **default match** commands remove the specified match list entry from the match list in ***running-config***.

Command Mode

Match List inpur Configuration Mode

Command Syntax

match {prefix-ipv4|prefix-ipv6} ***ip_address_prefix***

no match {prefix-ipv4|prefix-ipv6} ***ip_address_prefix***

default match {prefix-ipv4|prefix-ipv6} ***ip_address_prefix***

Parameters

- prefix-ipv4 This prefix is IPv4. You cannot mix prefix types in a single match list.
- prefix-ipv6 This prefix is IPv6. You cannot mix prefix types in a single match list.
- ***ip_address_prefix*** The prefix to add. For IPv4, it is of the form **A.B.C.D/E**. For IPv6, it is of the form **A:B:C:D:E:F:G:H/I**.

Examples

- The following commands add two IPv4 entries to the match list **camera-prefixes**.

```
switch(config)# match-list input prefix-ipv5 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-
ipv4 69.89.31.200/32
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-
ipv4 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)#
```

- The following command removes one entry from the **camera-prefixes** match list.

```
switch(config)# match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)# no match prefix-
ipv4 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)#
```

13.11.5.6 match (segment definition)

The **match** command adds a match list to a segment definition. The match list cannot contain both IPv4 and IPv6 prefixes. One match list of each type can be added. The segment definition is updated in ***running-config*** immediately.

The **no match** command removes the specified match list from the segment definition in ***running-config***.

The **default match** command removes the specified match list from the segment definition in ***running-config***.

Command Mode

Router Segment-Security VRF Segment Definition Configuration

Command Syntax

match {prefix-ipv4|prefix-ipv6} ***match_list_name***

no match {prefix-ipv4|prefix-ipv6} ***match_list_name***

default match {prefix-ipv4|prefix-ipv6} ***match_list_name***

Parameters

prefix-ipv4 The match list contains IPv4 prefixes.

prefix-ipv6 The match list contains IPv6 prefixes.

match_list_name The name of the match list.

Examples

These commands add two match lists to the segment ***admin***, an IPv4 match list named **admin-prefixes** and an IPv6 match list also named **admin-prefixes**.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# definition
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv4 admin-
prefixes
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv6 admin-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#
```

13.11.5.7 policies (segment)

The **policies** command places the switch in Router Segment Security VRF Segment Policies Configuration mode. In this mode, the command **from** creates a policy for the segment. A segment can contain multiple policies.

The **no policies** command clears the segment policies from ***running-config***.

The **default policies** command clears the segment policies from ***running-config***.

Command Mode

Router Segment-Security VRF Segment Configuration

Command Syntax

policies

no policies

default policies

Examples

This command places the switch in Router Segment-Security VRF Segment Policies configuration mode for the segment ***admin***.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# policies
switch(config-router-seg-sec-vrf-segment-policies)#
```

13.11.5.8 router segment-security

The **router segment-security** command enters Router Segment-Security Configuration Mode. This mode is required to enable or disable MSS-Group (segment security), and to enter the Router Segment-Security VRF configuration mode to create segments from match lists and to configure MSS-Group.

The **no router segment-security** command removes the MSS-Group configuration from ***running-config.***

The **default router segment-security** command removes the MSS-Group configuration from ***running-config.***

Command Mode

Global Configuration Mode

Command Syntax

router segment-security

no router segment-security

default router segment-security

Commands Available In Router Segment-Security Configuration Mode

segment

shutdown

vrf

Examples

- The following command enters Router Segment-Security configuration Mode.

```
switch(config)# router segment-security
switch(config-router-seg-sec)#
```

- The following command disables MSS-Group and removes the MSS-Group configuration from the ***running-config.***

```
switch(config)# no router segment-security
switch(config)#
```

13.11.5.9 segment

The **segment** command enters Router Segment-Security VRF Segment Configuration mode, creating a segment if one does not exist. The commands in this mode apply changes to ***running-config*** immediately. The **exit** command does not affect the configuration.

The **no segment** command and the **default segment** command clear the segment from ***running-config***.

Command Mode

Router Segment-Security VRF Configuration

Command Syntax

segment ***segment_name***

no segment ***segment_name***

default segment ***segment_name***

Parameters

- ***segment_name*** the name of the segment.

Commands Available in Router Segment-Security VRF Segment Configuration Mode

- **definition**
- **policies**

Example

The following command creates a new segment called ***admin*** and enters Segment Configuration mode.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)#
```

13.11.5.10 segment policy policy-drop-all default

The **segment policy policy-drop-all default** command configures the switch to drop all traffic to all segments. This is the default.

The **no segment policy policy-drop-all default** command allows segments to receive traffic. This is necessary to allow traffic within a segment.

The **default segment policy policy-drop-all default** command restores the default, so that all traffic to all segments is dropped.

Command Mode

Router Segment-Security Configuration

Command Syntax

segment policy policy-drop-all default

no segment policy policy-drop-all default

default segment policy policy-drop-all default

Example

This command removes the policy-drop-all policy from the general segment security configuration.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# no segment policy policy-drop-all default
switch(config-router-seg-sec)#
```

13.11.5.11 show match-list

The **show match-list** command displays match lists of type IPv4 or IPv6.

Command Mode

Privileged EXEC

Command Syntax

show match-list {prefix-ipv4 | prefix-ipv6} [*list-name*]

Parameters

- **prefix-ipv4** IPv4 prefix list.
- **prefix-ipv6** IPv6 prefix list.
- ***list-name*** match list name.

Examples

- The following command displays all the IPv4 match lists and their contents.

```
switch# show match-list prefix-ipv4
Name            Prefix
--------------- ---------------
admin-prefixes  80.80.0.0/16
camera-prefixes 69.89.31.200/32
                69.89.31.201/32
                70.89.31.0/24

switch#
```

- The following command displays the contents of the IPv6 match list camera-prefixes.

```
switch# show match-list prefix-ipv6 camera-prefixes
Name            Prefix
--------------- ----------------------
camera-prefixes 2001:0:9d38:6ab8::/64
                2002:0:9d38:6ab8::3/128

switch#
```

13.11.5.12 show segment-security

The **show segment-security** command shows the status and configuration of MSS-Group (segment security).

Command Mode

Privileged EXEC

Command Syntax

show segment-security [{[**vrf** ***vrf_name***] [**segment** ***seg_name***] | **application** [***application_name***] | **policy** [***policy_name***] | **segment** ***segment_name*** | **sessions** [**vrf** ***vrf_name***] | **status** [**vrf** ***vrf_name***] [**segment** ***seg_name***]}]

Parameters

- **vrf** Show information for a particular VRF. By default, all VRFs are shown.
  - ***vrf_name*** VRF name to show. The default VRF instance is named "default".
- **segment** Show information for a particular segment. By default, all segments are shown.
  - ***segment_name*** The name of the segment to show.
- **application** Show status and configuration for applications. By default, no application information is shown.
  - ***application_name*** The name of the application to show. If this is omitted, all applications are shown.
- **policy** Show information about policies.
  - ***policy_name*** The name of the policy to show. If this is omitted, all policies are shown.
- **sessions** Show information about sessions.
  - **vrf** Show session information about a particular VRF.
    - ***vrf_name*** The VRF for which to show session information. The default VRF is named "default".
- **status** Show status information.

Guidelines

If both ***vrf*** and ***segment*** parameters are specified, the ***vrf*** parameter must precede the ***segment*** parameter. Command syntax such as **show segment-security hardware detail segment** ***segment_name*** **vrf** ***vrf_name*** is not valid.

Examples

- This command displays the MSS-Group configuration for all VRF instances and all segments.

```
switch# show segment-security
VRF : default
  Segment      Interfaces Prefix IPv4     Prefix IPv6     From Segment
 Policy
  ------------ ---------- --------------- --------------- ------------
 ------------------
  camera                  camera-prefixes camera-prefixes secure-admin
 policy-forward-all
  secure-admin            admin-prefixes  admin-prefixes  camera
 policy-forward-all

switch#
```

- This command shows the MSS-Group configuration for the default VRF instance only.

```
switch# show segment-security vrf default
VRF : default
```

```
  Segment      Interfaces Prefix IPv4     Prefix IPv6     From Segment
 Policy
  ------------ ---------- --------------- --------------- ------------
 ------------------
  camera                  camera-prefixes camera-prefixes secure-admin
 policy-forward-all
  secure-admin            admin-prefixes  admin-prefixes  camera
 policy-forward-all

switch#
```

- This command shows the MSS-Group configuration for the **camera** segment.

```
switch# show segment-security segment camera
VRF : default
  Segment      Interfaces Prefix IPv4     Prefix IPv6     From Segment
 Policy
  ------------ ---------- --------------- --------------- ------------
 ------------------
  camera                  camera-prefixes camera-prefixes secure-admin
 policy-forward-all

switch#
```

- This command shows information for all applications.

```
switch# show segment-security applications
application: app-match-all
   protocol: all
switch#
```

- This command shows information for the policy **policy-drop-all**.

```
switch# show segment-security policy policy-drop-all
policy: policy-drop-all [readonly]
   10 application app-match-all action drop stateless
switch#
```

13.11.5.13 show segment-security hardware counters

The **show segment-security hardware counters** command displays the counters for policies in each segment, including the default policies. For each policy configured between two segments, the Hit counter shows all hits, whether the packets were dropped or forwarded. The Drop counter shows which of those hits were dropped. There are also lines for the default policy of each segment, and the Drop counter includes packets which do not match a configured policy but are dropped by these default policies. To clear the Hit and Drop counters for each policy, setting them to 0, use the **clear segment-security hardware counters** command.

Command Mode

Privileged EXEC

Command Syntax

show segment-security hardware counters [vrf ***vrf_name***]

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- ***vrf_name*** The VRF to show. To show the default VRF, specify "default".

Example

This command displays the policy and counters for policies configured for all segments in VRF ***site_b***.

```
switch# show segment-security hardware counters vrf site_b
VRF: site_b
Policy               Hit        Drop
-------------------- ---------- ----------
policy-drop-all      6          6
policy-forward-all   13         0

Dest Segment         Source Segment       Policy               Hit
 Drop
-------------------- -------------------- -------------------- ----------
 ----------
camera               *                    n/a                  0
 3
camera               camera                                    6
 6
camera               secure-admin                              4
 0
secure-admin         *                    n/a                  0
 12
secure-admin         camera                                    9
 0
switch#
```

13.11.5.14 show segment-security hardware detail

The **`show segment-security hardware detail`** command displays the hardware ID allocated to each segment, the prefixes programmed in hardware for each segment, and the adjacency index used by each prefix (as determined from L3 hardware tables).

Command Mode

Privileged EXEC

Command Syntax

`show segment-security hardware detail` [**vrf** ***vrf_name***][**segment** ***seg_name***]

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- ***vrf_name*** The name of the VRF to show details for. To show details for the default VRF, you must specify "default".
- **segment** Show details for a specific segment. If this parameter is omitted, details for all segments are shown.
- ***seg_name*** The name of the segment to show details for.

Guidelines

If both **vrf** and **segment** parameters are specified, the **vrf** parameter must come first. The command syntax **`show segment-security hardware detail`** **segment** ***segment_name*** **vrf** ***vrf_name*** is not valid.

Example

This command displays the hardware IDs allocated to each segment in vrf ***site_a***, the prefixes in each segment, and the adjacency index for each prefix (as determined from L3 hardware tables).

```
switch# show segment-security hardware detail vrf site_a
VRF: site_a
Segment         Hardware ID     Prefixes                 Adj Index
--------------- --------------- ------------------------ ---------------
camera          63              69.89.31.200/32           1
                                69.89.31.201/32           1
                                70.89.31.0/24             1
                                2001:0:9d38:6ab8::/64     2
                                2002:0:9d38:6ab8::3/128   2
secure-admin    62              80.80.0.0/16              1
                                2003:0:9d38:6ab8::/64     2
switch#
```

13.11.5.15 show segment-security hardware routes

The **show segment-security hardware routes** command displays the route and type for each programmed prefix in hardware. Since MSS-Group prefixes use L3 hardware tables, the prefixes can overlap with FIB routes, so each prefix is assigned a route type. There are three possible classifications for a prefix:

1. The prefix does not overlap with an FIB route. This prefix has route type S.
2. The prefix is also configured in the FIB. If a segment prefix is identical to an FIB prefix, it is given the route type S,F.
3. The prefix overlaps with an FIB entry but there is no exact match in the FIB. This prefix has the route type F.

Command Mode

Privileged EXEC

Command Syntax

show segment-security hardware routes [**vrf** *vrf-name*][**segment *seg-name***]

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- ***vrf_name*** The name of the VRF to show details for. To show details for the default VRF, you must specify "default".
- **segment** Show details for a specific segment. If this parameter is omitted, details for all segments are shown.
- ***seg_name*** The name of the segment to show details for.

Guidelines

If both **vrf** and **segment** parameters are specified, the **vrf** parameter must come first. The command syntax **show segment-security hardware detail segment *segment_name* vrf *vrf_name*** is not valid.

Example

This command displays the route and type for programmed prefixes in hardware for the VRF named ***site_a*** and the segment ***camera***.

```
switch# show segment-security hardware routes vrf site_a segment camera
Codes: S - Segment prefix
       F - FIB route
       S,F - Segment prefix which is also present in FIB

VRF: site_a
Segment       Hardware ID   Routes                      Route Type
------------- ------------- --------------------------- ----------
camera        63            69.89.31.200/32              S
                            69.89.31.201/32              S
                            70.89.31.0/24                S,F
                            2001:0:9d38:6ab8::/64        S
                            2002:0:9d38:6ab8::3/128      S
switch#
```

13.11.5.16 show segment-security hardware summary

The **show segment-security hardware summary** command displays the hardware ID, number of prefixes, and number of successfully programmed prefixes for each VRF and segment specified. By default, all VRFs and segments are shown.

Command Mode

Privileged EXEC

Command Syntax

show segment-security hardware summary [vrf ***vrf-name***][segment ***seg-name***]

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- ***vrf_name*** The name of the VRF to show details for. To show details for the default VRF, you must specify "default".
- **segment** Show details for a specific segment. If this parameter is omitted, details for all segments are shown.
- ***seg_name*** The name of the segment to show details for.

Guidelines

If both **vrf** and **segment** parameters are specified, the **vrf** parameter must come first. The command syntax **show segment-security hardware detail segment *segment_name* vrf *vrf_name*** is not valid.

Example

This command displays the hardware ID allocated to each configured segment, the number of prefixes configured, and the number of prefixes successfully programmed in hardware for all VRFs and all segments.

```
switch# show segment-security hardware summary

VRF: default
Segment              Hardware ID     Prefixes   Programmed
-------------------- --------------- ---------- ---------------
camera               63              5          5
secure-admin         62              2          2
switch#
```

13.11.5.17 shutdown (router segment-security)

The **shutdown** command disables MSS-Group (segment security) in the switch. This is the default. The **no shutdown** and **default shutdown** commands enable MSS-Group.

Command Mode

Router Segment-Security Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Example

This command enables MSS-Group in the switch.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# no shutdown
switch(config-router-seg-sec)#
```

13.11.5.18 vrf (router segment-security)

The **vrf** command enters Router Segment-Security VRF Configuration mode, creating a VRF instance if necessary, to create and configure MSS-Group segments.

Command Mode

Router Segment-Security Configuration

Command Syntax

vrf ***vrf_instance***

Parameters

- ***vrf_instance*** The name of the VRF instance. To configure MSS-Group for the default VRF instance, specify "default".

Commands Available in Router Segment-Security VRF Configuration Mode

- **segment**

Example

The following command enters Router Segment-Security VRF Configuration mode for the default VRF instance.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)#
```

Chapter 14

IP Services

The Internet Protocol Services (IP Services) chapter contains the following section(s):

- CloudVision eXchange (CVX)

14.1 CloudVision eXchange (CVX)

CloudVision eXchange (CVX) provides a single access point for real-time provisioning, orchestration and integration with third-party controllers. CVX aggregates and distributes operational state information across a set of EOS switches to support applications that provide network services. See the *CloudVision User Guide*, https://www.arista.com/en/support/product-documentation, for additional information.

Topics in this section include:

- Upgrading CVX
- CVX Overview
- CVX Services
- Deploying CVX
- CVX Configuration
- CVX Secure out-of-band Connection
- CVX High Availability
- CVX VIP
- CVX Commands

14.1.1 Upgrading CVX

You can upgrade CVX from a previous version to the current version by performing a few simple tasks. You can use the following procedure to upgrade any previous version of CVX to the current version.

Requirements

Make sure you follow these requirements during the upgrade process.

- If you have CVP, CVX and client switches in your environment, make sure you upgrade each component in the following order:
  - Upgrade CVP first.
  - Upgrade the CVX cluster.
  - Upgrade the client switches. The reason for this is to ensure backward compatibility.
  - You must upgrade the CVX cluster before you upgrade the client switches.
  - If the CVX cluster is a three node cluster, make sure that only one node of the cluster is down at any one time during the upgrade process. (The order in which you upgrade the nodes does not matter.)

Pre-requisites

Before you begin the upgrade, make sure that:

- You perform a backup to ensure that you can restore data if needed.
- You download the latest version of CVX from Arista's Software Download page (https://www.arista.com/en/support/software-download).

Complete the following steps to upgrade CVX.

1. Login to the cluster to be upgraded. (You can login to any node.)
2. Upgrade the node. You must deploy a new image to perform the upgrade.
3. Wait for the node you are upgrading to rejoin the cluster. Once the node has rejoined, go to the next step. (The node automatically rejoins the cluster as a follower node.)
4. Repeat steps 1 through 3 to upgrade the two remaining nodes one node at a time. It does not matter the order in which you upgrade the remaining nodes.

14.1.2 CVX Overview

A CVX deployment includes CVX and a set of CVX clients to which CVX provides services. CVX is not part of the data plane, nor does it receive data-path traffic. All CVX components exist as agents that run on EOS instances.

For more information, see:

- System Requirements
- CVX Infrastructure
- CVX Features
- CVX Clients

14.1.2.1 System Requirements

Certain hardware and software is required to be able to use CloudVision eXchange in your CloudVision virtual appliance implementation.

The CloudVision eXchange should be installed on a single system along with CloudVision Portal.

The following table lists the minimum hardware and software required to use CloudVision eXchange.

Required Hardware

The hardware required to use the CloudVision eXchange are:

- CPU: 4 cores (base), 8 cores (recommended)
- RAM: 4G (base), 8G (recommended)
- Disk: 4G

Required Software

The software required to use the CloudVision eXchange are:

- EOS switches: Recommend 4.16.8M or later

  Note: It is a best practice and highly recommended that the version of CVX should match the version running on the switches.
- CloudVision Portal: version 2016.1

  (CloudVision Portal software is required if you want to use it in conjunction with CloudVision eXchange. If you plan to use only CloudVision eXchange, CloudVision Portal software is not required.)

  Note: CVX supports live vMotion.

14.1.2.2 CVX Infrastructure

CVX provides a single integration point into network-wide services running across CVX clients. CVX is typically deployed as an EOS instance running on a VM (vEOS). The CVX infrastructure consists of a CVX instance functioning as a server and a set of CVX clients. The CVX server uses a heartbeat keepalive (KA) mechanism to maintain contact with its clients.

When de-configuring or shutting down CVX, client services should be shut down first.

14.1.2.3 CVX Features

CVX manages communications among the network CVX clients, and provides an integration point for services to those clients. CVX also discovers the physical network topology by aggregating topology information it receives from its client devices.

14.1.2.4 CVX Clients

CVX client is the agent that allows a switch to interact with a CVX server to access CVX services. Enabling the CVX client includes providing the IP address or host name of the device running CVX. The CVX client can then access services that are enabled on the CVX server.

The CVX client must be enabled to access the CVX server and the services it offers. Individual services may require additional configuration statements.

Services should be shut down or de-configured on clients before shutting down or de-configuring CVX. CVX-controlled switch features may continue to run after shutting down CVX if they are not explicitly shut down or de-configured prior to shutting down CVX.

14.1.3 CVX Services

CVX services are applications that run on top of the CVX infrastructure, and are accessed by CVX clients through the CVX server. All CVX services are maintained by version level; client switches negotiate the version they use when connecting to the server. This allows multiple switches that run different EOS versions to connect to the same CVX server.

The following sections briefly describe some of the services available to CVX clients through CVX:

- OpenStack Service
- VXLAN Control Service
- Hardware Switch Controller (HSC) Service
- Network Topology Service
- Static Topology Service

14.1.3.1 OpenStack Service

The OpenStack service on CVX allows the networking component of an OpenStack deployment (also known as Neutron) to share state with CVX.

When deployed, this integration allows CVX to send state about the logical networks created in the OpenStack cloud to the CVX clients that configure the network.

More information on OpenStack software can be found in its online documentation at http://docs.openstack.org/. .

14.1.3.2 VXLAN Control Service

The VXLAN control service allows hardware VXLAN Tunnel End Points (VTEPs) to share state with each other in order to establish VXLAN tunnels without the need for a multicast control plane. Configuration is required both on the client switches and in CVX.

14.1.3.3 Hardware Switch Controller (HSC) Service

Traffic between virtual machines which share a physical host (or between virtual machines and the rest of the network) is forwarded by virtual switches. The management and configuration of virtual switches uses the Open VSwitch DataBase (OVSDB) management protocol, as described in *RFC 7047*.

The Hardware Switch Controller (HSC) service provides an integration point between OVSDB controllers and the VXLAN control service, allowing exchange of state information among virtual and hardware switches.

14.1.3.4 Network Topology Service

The network topology service gathers information from CVX clients to provide a view of the physical topology of the network. Aggregated information gathered by the network topology service is used by other CVX services, and can be viewed on the CVX server.

14.1.3.5 Static Topology Service

Static Topology addresses cases where the deployment infrastructure in an OpenStack setup that manages Virtual Machines and Bare Metal servers does not enable LLDP on interfaces connecting hosts to switches. As a result, the topology information does not appear on CVX.

An example of this case is some deployments of OpenStack that do not enable LLDP for DPDK interfaces. Even with the manual configuration of LLDP on hypervisors, the configuration does not persist after OpenStack redeployment.

Static Topology enables the topology configuration statically using the **`service topology`** command on CVX without running LLDP on the servers connected to switches.

To view the aggregated topology information, use the **`show network physical-topology`** command on the switch running the CVX server instance.

14.1.4 Deploying CVX

CloudVision Exchange (CVX) can be deployed on KVM and ESXi. The required EOS version and Aboot version vary depending on whether you are deploying CVX on KVM or ESXi.

For the detailed steps to use to deploy CVX, see:

- Deploying CVX on Kernel-based Virtual Machine (KVM).
- Deploying CVX on VMware ESXi.

14.1.4.1 Deploying CVX on Kernel-based Virtual Machine (KVM)

Complete the following steps to install CVX on Ubuntu/KVM. Once the installation is complete, you can begin the CVX configuration process.

Note: Make sure you select versions of EOS and Aboot that meet the minimum requirements for CVX. The supported versions are:

- EOS (version ***4.16.8M*** or later).
- **`Aboot-veos-serial-8.0.0.iso`** (located in the vEOS section of the download).

Pre-requisites

Before you begin the procedure, make sure that:

- Install **`qemu-kvm`**, **`libvirt*`**, and all related dependencies using yum (RHEL7/CentOS7) and apt-get (Ubuntu).
- Two bridges are configured for use by the KVM VM, and that you have the names of the bridges. (Steps are included in the procedure to add bridges, if they are not already configured.)

Note: The bridges must be configured to persist (**brctl** commands do no persist across reboots). You can use Network Manager (or another application available to you) to complete this configuration.

- You have both **generateXmlForKvm.py** and **cvpTemplate.xml**. They are required to complete the procedure. You can find them in the CVP tarball for Ubuntu.

Complete the following steps to install CVX.

1. Download the Aboot and EOS files from: https://www.arista.com/en/support/software-download/.
2. Use **sudo su** to acquire superuser privileges, which are required to complete some of the installation steps.
3. Confirm that KVM is running on the server by entering the following command:

   virsh -c qemu:///system listAb

   The command output should match this example:

   ```
   Id    Name     State
   ------------------------------
     $
   ```

4. If the output does not look correct (previous step) go to for additional assistance: https://help.ubuntu.com/community/KVM/Installation.
5. Use the following command to convert the **vmdk** file to qcow2: **qemu-img convert EOS_4_16_8M.vmdk -O qcow2 EOS.qcow2**.

   Note: Step **6** and **7** are required if you do not already have 2 bridges defined in different subnets. If the bridges exist, go directly to step **8**.
6. Use ***brctl*** to add bridges for the KVM VM to use (br1 and br2 can be any names you choose).

   ```
   brctl addbr br1
   brctl addbr br2
   ```

   ifconfig can be used to identify Ethernet ports to be bridged. Once you identify the ports, add them to the bridges.

   Example

   brctl addif br1 enx803f5d086eae
7. Confirm that the bridges are up using **brctl show**.
   - Enter: **ifconfig br1 up**
   - And: **ifconfig br2 up**

     Note: The following step uses a number of input parameters (the number required vary depending on your server setup). To ensure the command executes successfully, we recommend that you type it into a scratch pad and edit as needed before typing it into the Linux Terminal.
   - Use the following command to generate **cvx.xml**, which will be used to setup the CVX VM.

     generateXmlForKvm.py

     Example

     ```
     python generateXmlForKvm.py -n cvx --device-bridge br1 --cluster-bri
     dge br2 -e /usr/bin/kvm -i cvpTemplate.xml -c /home/myname/Downloads/
     Aboot-veos-serial-8.0.0.iso -x /home/myname/Downloads/EOS.qcow2 -b
      8192 -p 2 -t

      -n cvx: VM name.
      --device-bridge br1: This is the name you gave the bridge - br1 or
      anything else.
     ```

```
--cluster-bridge br2: Cluster bridge if clustering servers.
-i cvpTemplate.xml: Path to XML file input template.
-k: VM ID number used by virsh. If not entered, a random number is
assigned.
-b 8192: 8G of RAM.
-p 2: # of CPU cores.
-c: Path to Aboot file.
-x: Path to qcow2 file created in step 3.
-t: This parameter indicates the file defined by -x is for CVX.
-e â€˜/usr/bin/kvm: Ubuntu path to KVM.
(for RHEL KVM this is: -e â€˜usr/libexec/qemu-kvm)
-o: XML file used by virsh to define the KVM VM.
```

8. Run the following commands:

```
virsh define cvx.xml
virsh start cvx
virsh console cvx
```

9. (Optional) To configure CVX to start automatically, enter:

```
virsh autostart cvx
```

You are now ready to begin the CVX configuration (see CVX Configuration).

14.1.4.2 Deploying CVX on VMware ESXi

Complete the following steps to install CVX on ESXi. Once the installation is complete, you can begin the CVX configuration process.

Note: Make sure you select versions of EOS that meet the minimum requirements for CVX. The supported version is EOS (version ***4.21.0*** or later).

Complete the following steps to install CVX.

1. Go to: https://www.arista.com.
2. Select **Support** > **Software Download**.
3. From the software download page, expand **Active Releases** > **4.21** > **EOS-4.21.0F** to download **`EOS-4.21.0F.vmdk`**.
4. Load the files you downloaded into a filestore location within the VMware vSphere environment.

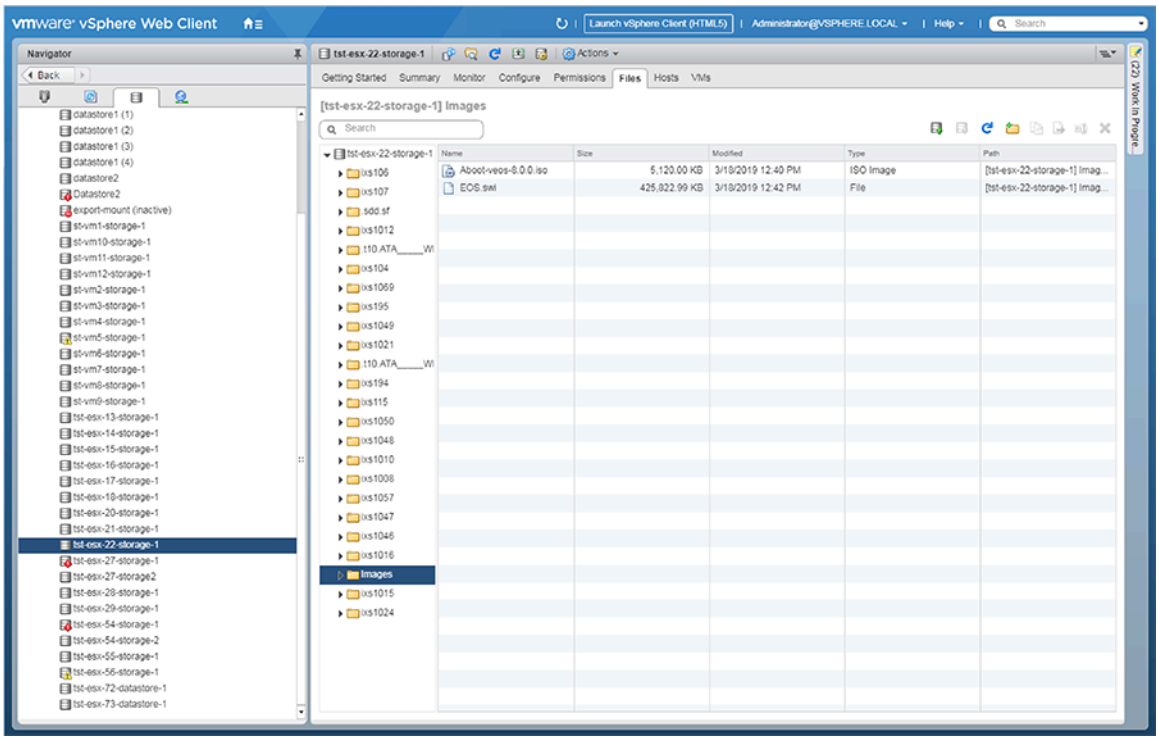

Figure 37: Loading the Files into the VMware vSphere Environment

5. Right-click the **filestore location** you selected, and choose **New Virtual Machine**.

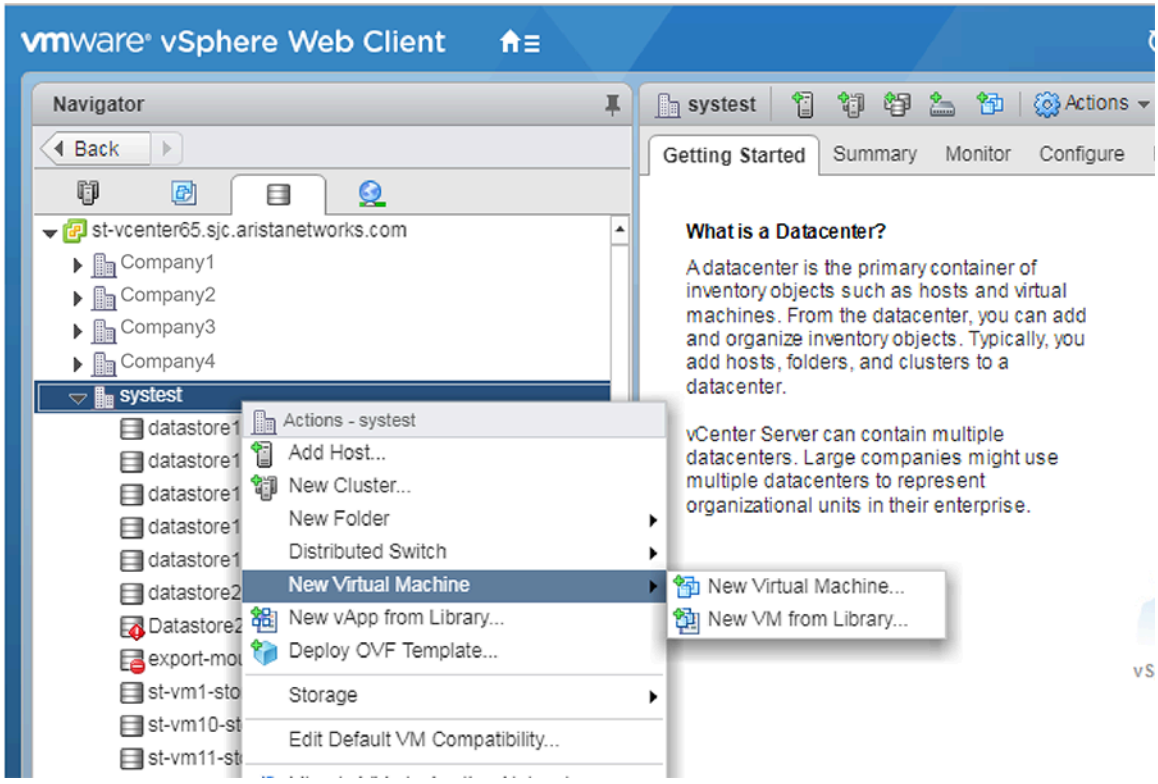

Figure 38: Selecting New Virtual Machine

The New Virtual Machine dialog appears.

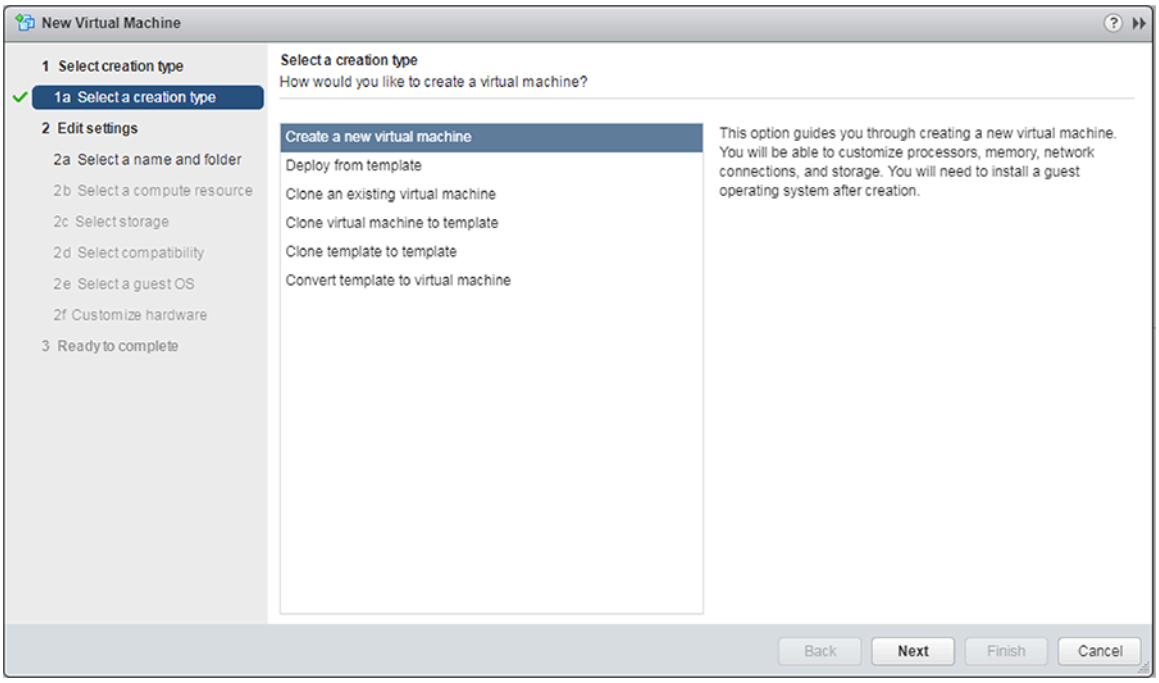

Figure 39: New Virtual Machine Dialog

6. In the New Virtual Machine dialog, select **Create a new virtual machine**, then click **Next**.

   The dialog refreshes, showing options for the new Virtual Machine.

   New Virtual Machine dialog (naming and selecting the location).

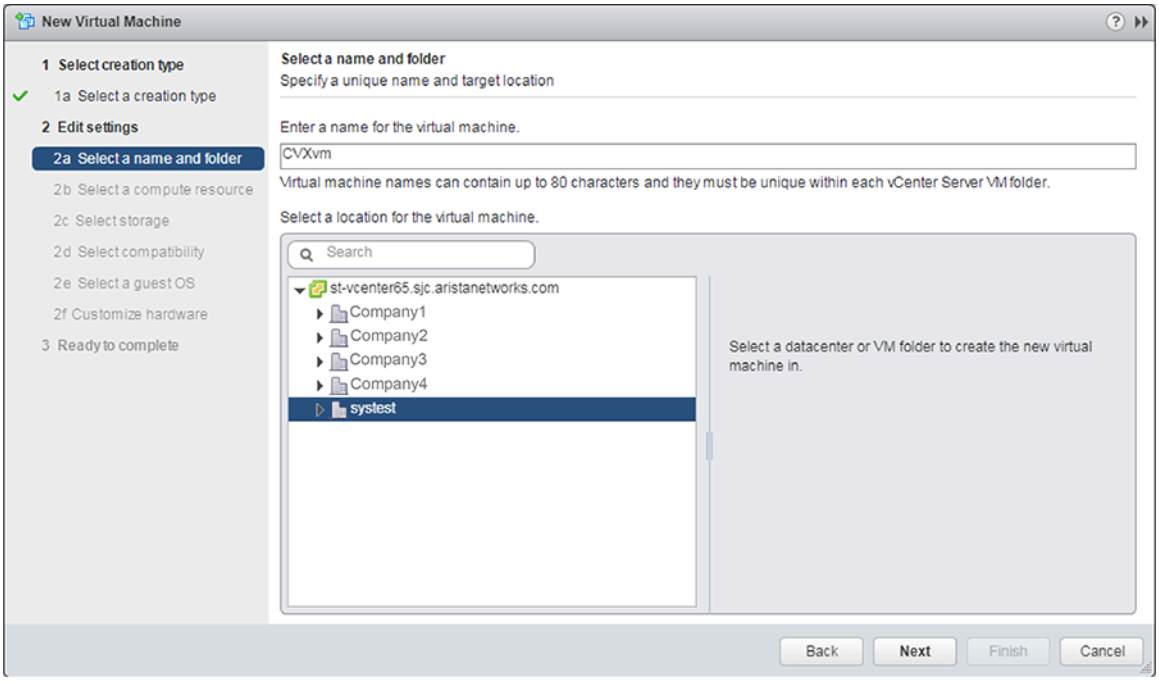

Figure 40: New Virtual Machine Dialog (Naming and Selecting the Location)

7. The dialog refreshes, showing options for selecting the datastore.
8. Enter a **name** for the new Virtual Machine.
9. Select a **location** for the new Virtual Machine, then click **Next**.

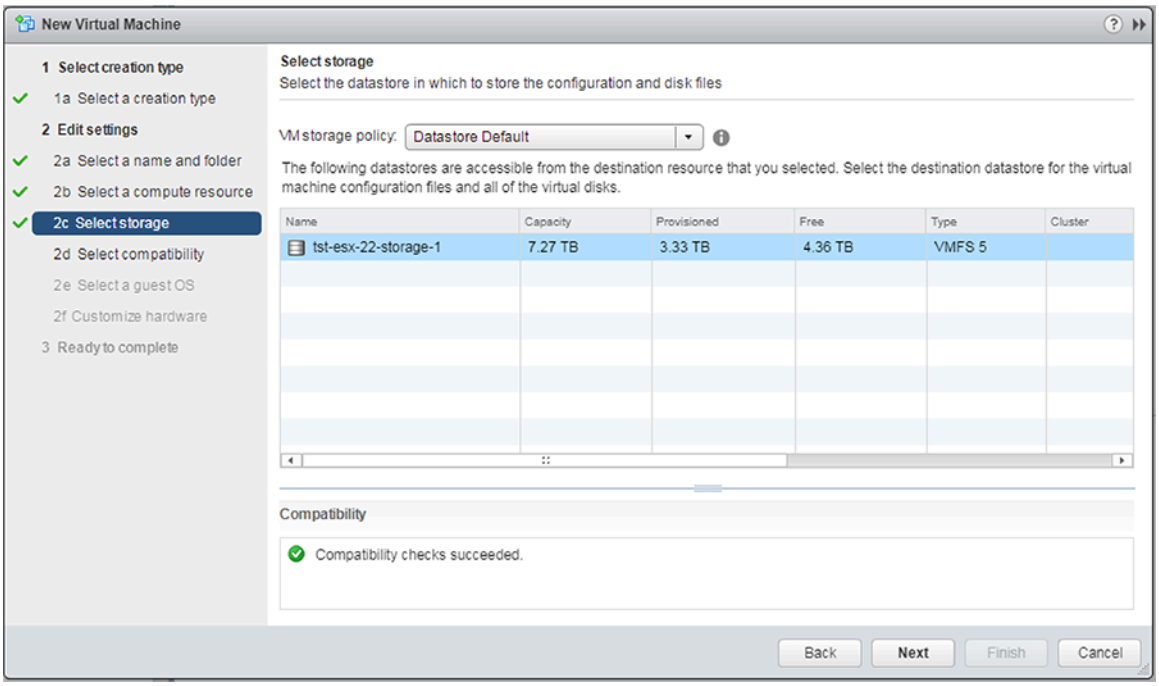

Figure 41: New Virtual Machine Dialog (Selecting the Datastore)

10. Select the **datastore** for the new Virtual Machine configuration files and all of the virtual disks. Click **Next**. The dialog refreshes, showing operating system selection options.
11. Click **Next**. The dialog refreshes, showing compatibility options.

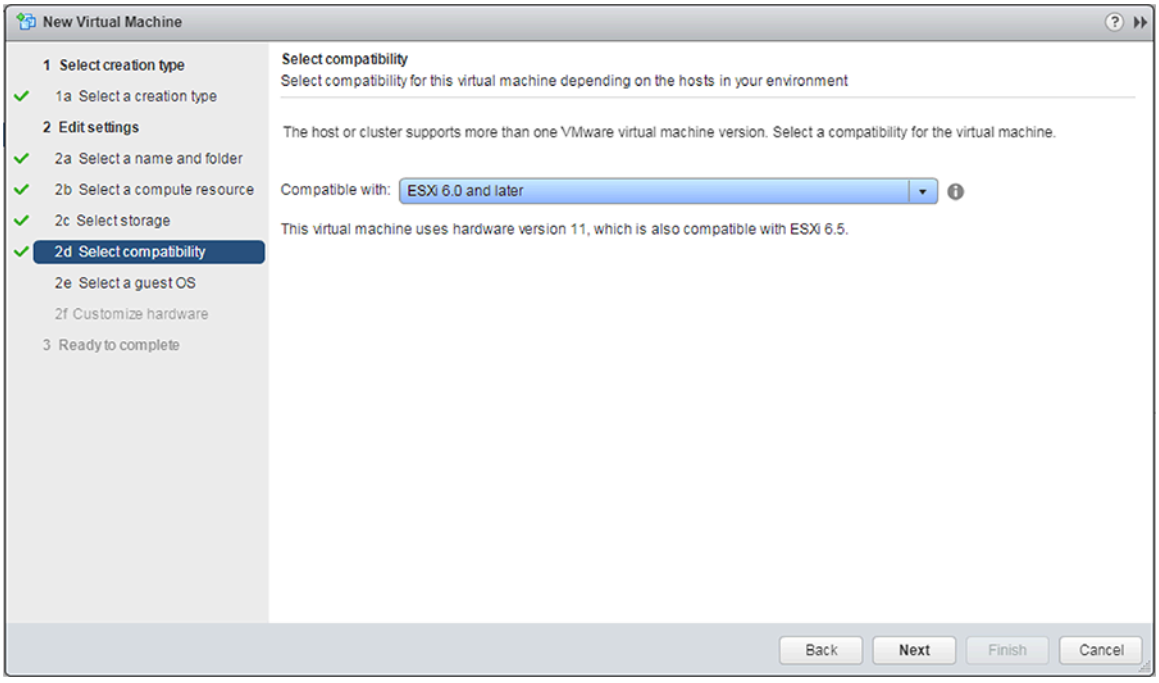

Figure 42: New Virtual Machine Dialog (Compatibility Options)

12. Using the Compatible with menu, select the **ESXi compatibility** for the new Virtual Machine.

Note: When adding the VMDK to ESX6, it treats this as sparse by default, whereas in ESX 5 it is thick. Converting the vEOS VMDK file from thin to thick would allow it to boot properly in ESX6: **`vmkfstools -i vEOS-lab-4.18.5M.vmdk -d eagerzeroedthick vEOS-lab-4.18.5M-thick.vmdk`**.

Go to https://arista.my.site.com/AristaCommunity/s/ and refer to the following topics for the issue and solution:

- Tip for Arista vEOS on VMware ESX 6..
- Common Issues When Deploying CVX.
- ***4.18.2F*** on vCenter 6 or 6.5.

Note: If the VM keeps rebooting and showing â€œThis is not a bootable disk. Insert a bootable floppy and press any key to try again", then go to https://arista.my.site.com/AristaCommunity/s/ and refer to the **Common Issues When Deploying CVX 4.18.2F on vCenter 6 or 6.5** topic.

13. Click **Next**. The dialog refreshes, showing operating system selection options.

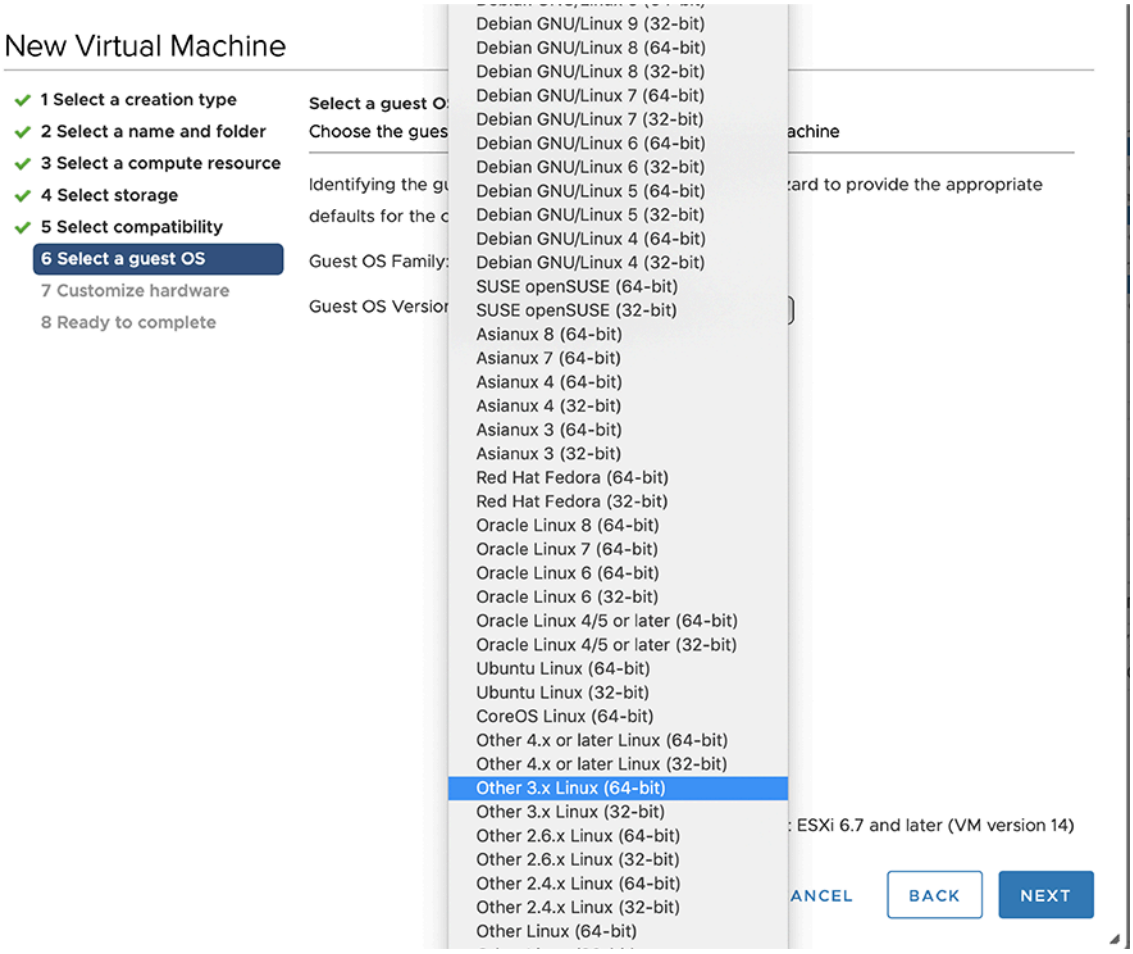

Figure 43: New Virtual Machine Dialog (Operating System Options)

14. Using the Guest OS Family menu, choose **Linux**.
15. Using the Guest OS Version menu, choose **Other Linux (64-Âbit)**.
16. Click **Next**.

    The dialog refreshes, showing options for customizing hardware.

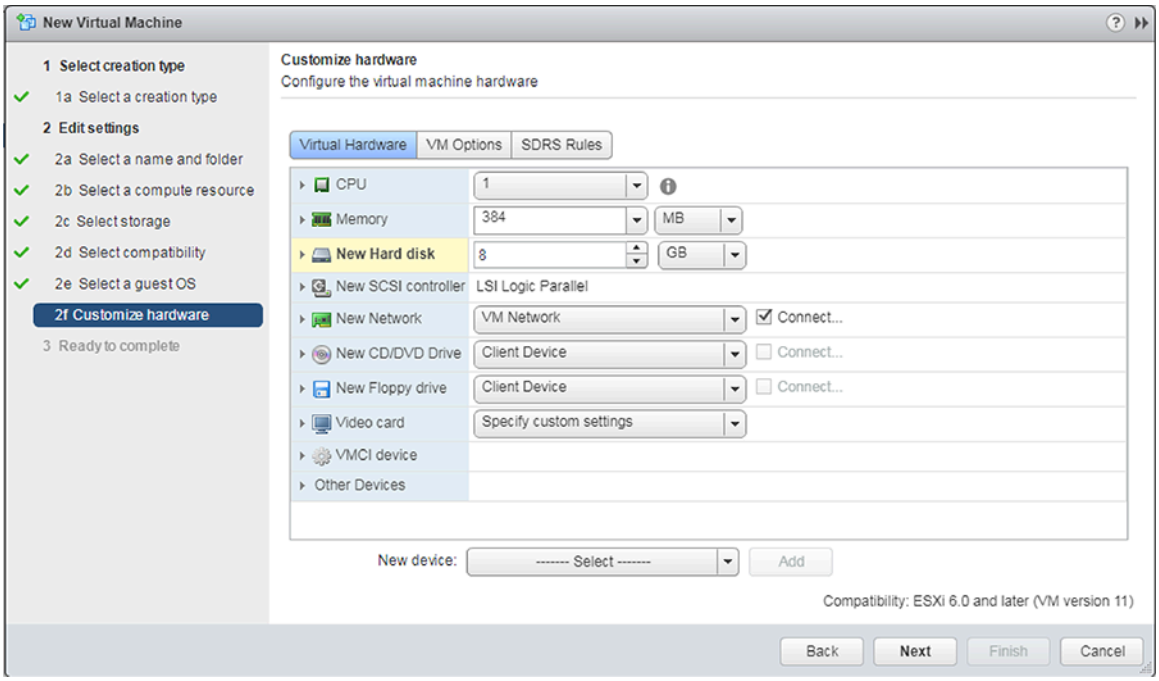

Figure 44: New Virtual Machine Dialog (Hardware Configuration Options)

17. Change the default settings for the following options:

CPU	Set to **4** (number of CPUs)
Memory	Set to **8 GB**
New Hard Disk	Delete the current setting (leave this option empty).
New Network	Specify connection to Network LAN segment with connectivity to CVX client devices (the Management LAN). Choose VMXNET3 network adapter type. This connection is used for CVX client / server communications.
Existing Hard Disk	Specify the **EOS-4.21.0F.vmdk** you downloaded in step 3.

18. (Optional) Delete the floppy drive and SCSI controller.
19. Click **Next**. You are now ready to begin the CVX configuration (seeCVX Configuration).

14.1.5 CVX Configuration

CVX, its clients, and its services, are independently configured. These sections describe configuration processes for each:

- Ports Used by CVX.
- CVX Server Configuration.
- CVX Client Configuration.
- CVX Client Services Configuration.

14.1.5.1 Ports Used by CVX

CVX uses the following ports:

- Controller database (Controllerdb): ***Port 9979.***
- Client-server out-of-band connection: ***Port 50003***.
- CVX cluster peer out-of-band connection: ***Port 50004.***

Note: All of these connections are TCP.

14.1.5.2 CVX Server Configuration

Enabling CVX on the CVX Server

CVX parameters for the server infrastructure are configured in ***CVX*** configuration mode. CVX configuration mode is not a group-change mode; ***running-config*** is changed when commands are entered, and exiting the mode does not modify ***running-config***. The **cvx** command places the switch in ***CVX*** configuration mode.

CVX is disabled by default. The **no shutdown (CVX)** command enables CVX on the switch.

Example

These commands enter CVX-configuration mode and enable CVX.

```
switch(config)# cvx
switch(config-cvx)# no shutdown
switch(config-cvx)#
```

CVX Heartbeat Configuration

CVX synchronizes with its client devices by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period determine when a client's access to the server is disrupted.

The interval between heartbeat messages that the server transmits is specified by the **heartbeat-interval (CVX)** command. The CVX timeout period is specified by the **heartbeat-timeout (CVX)** command. When CVX does not receive a subsequent heartbeat message from a CVX client before the timeout expiry, the server discontinues CVX services to that client.

Best practices dictate that CVX and its client applications configure identical heartbeat interval and heartbeat timeout values.

Example

These commands configure a CVX heartbeat interval of 30 seconds and a server heartbeat timeout period of 90 seconds.

```
switch(config-cvx)# heartbeat-interval 30
switch(config-cvx)# heartbeat-timeout 90
switch(config-cvx)#
```

Disabling CVX on the CVX Server

Note: Before disabling or de-configuring CVX on the CVX server, CVX client services should be explicitly disabled or shut down. Failure to disable or de-configure services prior to disabling or de-configuring CVS may result in CVX features continuing to run after CVX shutdown.

When disabling the CVX service, service VXLAN configuration may be retained or erased. Be sure to disable or shut down client services prior to disabling the CVX service.

Examples

- These commands shut down the CVX service while retaining the CLI configuration for service VXLAN.

```
localhost(config)# cvx
localhost(config-cvx)# service vxlan
```

```
localhost(config-cvx-vxlan)# shutdown
```

- These commands shut down the CVX service and also erase service VXLAN CLI configuration.

```
localhost(config-cvx-vxlan)#
localhost(config)# cvx
localhost(config-cvx)# no service vxlan
```

14.1.5.3 CVX Client Configuration

This section describes the CVX client configuration and commands that enable CVX services. Most commands for the configuration of the CVX client infrastructure are accessed in Management-CVX configuration mode.

- **Enabling CVX on the CVX Client**

  CVX client parameters are configured in ***Management-CVX*** configuration mode. Management-CVX configuration mode is not a group-change mode; running-config is changed when commands are entered, and exiting the mode does not modify running-config. The **`management cvx`** command places the switch in ***Management-CVX*** configuration mode.

  CVX client is disabled by default. The **`no shutdown`** **(Management-CVX)** command enables CVX client on the switch.

  For the CVX network topology service to create an inventory of all CVX clients, ensure that LLDP is enabled on each client switch using the **`lldp run`** command.

  Example

  These commands enter ***Management-CVX-configuration*** mode and enable the CVX client.

```
switch(config)#lldp run
switch(config)#management cvx
switch(config-mgmt-cvx)#no shutdown
switch(config-mgmt-cvx)#
```

- **CVX Client Heartbeat Configuration**

  A CVX client synchronizes and maintains contact with CVX by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period define when communication with CVX will be considered down.

  The interval between heartbeat messages that the CVX client transmits is configured by the **`heartbeat-interval`** **(Management-CVX)** command.

  The CVX client timeout period is specified by the **`heartbeat-timeout`** **(Management-CVX)** command. When a CVX client does not receive a subsequent heartbeat message from CVX within this timeout period, the client assumes that services provided by CVX are no longer available.

  Best practices dictate that a CVX client's heartbeat interval and heartbeat timeout values are identical to those of the CVX server to which it connects.

  Example

  This command configures a CVX client heartbeat interval of ***30*** seconds and client timeout period of ***90*** seconds.

```
switch(config-mgmt-cvx)# heartbeat-interval 30
switch(config-mgmt-cvx)# heartbeat-timeout 90
switch(config-mgmt-cvx)#
```

- **Connecting the CVX Client to a Server**

The **server host (Management-CVX)** command identifies the location of the CVX server that the client accesses. The **source-interface (Management-CVX)** command specifies the interface from which the client derives the IP address it uses as the source in CVX packets that it transmits. And the **no shutdown (Management-CVX)** command enables CVX on the client switch.

Example

These commands configure the switch as a CVX client, connecting to a CVX server at IP address ***10.1.1.14*** and using IP address ***10.24.24.1*** as the source address for its outbound packets.

```
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.24.24.1/24
switch(config-if-Lo5)# management cvx
switch(config-mgmt-cvx)# server host 10.1.1.14
switch(config-mgmt-cvx)# source-interface loopback 5
switch(config-mgmt-cvx)# no shutdown
switch(config-mgmt-cvx)#
```

14.1.5.4 CVX Client Services Configuration

Switches running EOS must be configured as CVX clients to access the network services running on CVX. Individual services may require additional configuration.

Refer to the following for information regarding the services available to a CVX client.

- Configuring OpenStack Service.
- Configuring VXLAN Control Service.
- Configuring Hardware Switch Controller Service (HSC).
- Configuring Network Topology Service.
- Configuring Static Topology Service.

14.1.5.4.1 Configuring OpenStack Service

The OpenStack service is enabled from CVX-OpenStack configuration mode, which is accessed by the **service openstack** command. The **no shutdown (CVX-OpenStack)** command enables CVX OpenStack services on the CVX server. Additional configuration is necessary to deploy OpenStack (http://docs.openstack.org/).

Example

These commands enable the CVX-OpenStack service.

```
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# no shutdown
switch(config-cvx-openstack)#
```

14.1.5.4.2 Configuring VXLAN Control Service

The VXLAN control service is enabled on CVX by the **no shutdown (CVX-VXLAN)** command and on the client switches by enabling CVX and configuring the VXLAN as a controller client. When VXLAN control service is enabled, CVX functions as a VXLAN controller for its clients.

For information about configuring VXLAN on the client switch, see the VXLAN chapter of the *User Manual* .

Examples

- These commands enable VXLAN control service on the CVX server.

```
switch(config-cvx)# service vxlan
```

```
switch(config-cvx-vxlan)# no shutdown
switch(config-cvx-vxlan)#
```

- These commands enable VXLAN Control Service on the CVX client. (This example assumes that the VXLAN has already been configured on the client switch. For information about configuring VXLAN, see the VXLAN chapter of the *User Manual*).

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan controller-client
```

14.1.5.4.3 Configuring Hardware Switch Controller Service (HSC)

Certificate Requirements for CVX Interoperability with VMware NSX 6.2.2 and Higher

The HSC service is enabled on the CVX server by the **no shutdown (CVX-HSC)** command.

The certificate type needs to be changed from MD5 to SHA512 for use with VMware NSX ***6.2.2***. Complete the following steps to make the change.

1. At the EOS prompt of CVX, use the following commands.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# shut
```

2. Acquire superuser privileges and edit the default.

```
switch(config)# bash
switch(config)# sudo su
switch(config)# vi /usr/bin/ovs-pki
```

3. Find and replace **default_md** with ***sha512*** (from **md5**).

```
default_md =md5
default_md =sha512
```

4. Delete all files and folders from **/persist/secure/openvswitch/**.

```
cd /persist/secure/openvswitch/bash-4.1#sudo rm -r *
```

5. Generate the new certificate.

```
[admin@CVX ~]$ exit
logout
CVX(config-cvx-hsc)#no shutdown
CVX(config-cvx-hsc)#end
```

6. Verify the change using the command.

```
CVX# show nsx status
```

Example

These commands enable the CVX-HSC service.

```
switch(config)# cvx
switch(config-cvx)# no shutdown
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# no shutdown
```

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any replication), and the flood list sent by the HSC service is a list of replication nodes. Other controllers (such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the VTEP (CVX-HSC) command.

Example

This command configures the CVX-HSC service to connect to an OVSDB controller at IP address ***192.168.2.5***, using the default port ***6632***.

```
switch(config-cvx-hsc)# manager 192.163.2.5
switch(config-cvx-hsc)#
```

Example

This command configures the CVX-HSC service to use send-to-any replication.

```
switch(config-cvx-hsc)# vtep flood list type all
switch(config-cvx-hsc)#
```

Having established a connection to the OVSDB controller, the HSC service will publish the inventory of switches managed by CVX to OVSDB. For the inventory to succeed, LLDP must be enabled on each CVX client switch with the **`lldp run`** command.

Note: HSC also makes use of the VXLAN control service; ensure that VXLAN control service is enabled and properly configured (see VXLAN Control Service for details).

Note: LLDP is enabled by default on Arista switches.

Example

This command enables LLDP.

```
switch(config)# lldp run
switch(config)#
```

14.1.5.4.4 Configuring Network Topology Service

A network topology agent runs on each Arista switch whether or not the switch is connected to a CVX server. It requires no configuration. The network topology service on the CVX server is also enabled by default and requires no configuration.

To view the aggregated topology information, use the **`show network physical-topology`** command on the switch running the CVX server instance.

Examples

- This command displays all visible hosts.

```
switch# show network physical-topology hosts
Unique Id            Hostname
-------------------- ------------------------------
001c.7385.be69       cvx287.sjc.aristanetworks.com
0000.6401.0000       cvc1
0000.6402.0000       cvc2
```

```
0000.6403.0000       cvc3
0000.6404.0000       cvc4
bcf6.85bd.8050       dsj14-rack14-tor1
```

- This command displays all connections in the topology.

```
switch# show network physical-topology neighbors
cvx287.sjc.aristanetworks.com
Interface          Neighbor Intf      Neighbor Host
------------------ ------------------ --------------------
Ethernet1          Ethernet7          cvc4
Ethernet2          Ethernet7          cvc2
Ethernet9          Ethernet7          cvc1
Ethernet10         Ethernet7          cvc3
Management1        27                 dsj14-rack14-tor1

OUTPUT OMITTED FROM EXAMPLE
  dsj14-rack14-tor1

Interface     Neighbor Intf      Neighbor Host
------------- ------------------ ----------------------
27            Management1        cvx287.sjc.aristanetwork
```

14.1.5.4.5 Configuring Static Topology Service

Use the **service topology** command to configure the topology statically on CVX without running LLDP on the servers connected to switches. It is configured under CVX configuration mode.

Example

- The following command configures topology statically on the switch.

```
switch# config
switch(config)# cvx
switch(config-cvx)# service topology
```

- The topology information can be specified using the following command:

```
switch(config-cvx-topology)# network physical-topology switch SWITCH
 interface INTERFACE neighbor NEIGHBOR-HOST neighbor-interface
 NEIGHBOR-INTERFACE
```

The format of the hostname in this command could depend on services running on the host. As an example, in OpenStack use cases, it should match the hostname used by openstack services (For example, neutron server and agents) which is an FQDN format. The hostname in the command is case sensitive.

Optional Parameter

The neighbor interface is an optional parameter in the above configuration however setting it helps to understand the physical network connectivity between switches and hosts. It also helps in troubleshooting any issue that may arise in the network.

Limitations

To avoid mis-configuration in a topology consisting of a switch with a connected host, where LLDP is enabled and static topology is used to configure the physical topology it is recommended to use only one source of configuration, not both. As a mismatch in the configuration can cause wrong configuration on the switch by a feature consuming the topology information.

14.1.6 CVX Secure out-of-band Connection

This feature adds support for securing out-of-band connection between CVX server and CVX clients by SSL/TLS transport protocol. SSL/TLS is an application-layer protocol that provides secure transport between client and server through a combination of authentication, encryption and data integrity. SSL/TLS uses certificates and private-public key pairs to provide this security. We will use the term SSL to mean SSL/TLS.

By default, CVX server and CVX clients communicate over insecure transport (there is no authentication and encryption between CVX server and CVX clients). This poses the possibility of security risks, such as communicating with untrusted CVX server and CVX clients, or eavesdropping CVX server/client communications. This feature can be used to secure the out-of-band connection between CVX server and CVX clients.

Note: The CVX client-server out-of-band connection uses port 50003. The CVX cluster peer out-of-band connection uses port 50004. These are TCP ports.

For more information, see Show Commands

s

14.1.6.1 Configuring the CVX Secure out-of-band Connection

This feature uses SSL certificate and key management infrastructure for managing certificates, keys and SSL profiles. For more information regarding this infrastructure see *SSL Certificate and Key Management* in the *Arista User's Guide.*

1. On CVX server, copy the server certificate and key and also the CA certificate to verify CVX clients.

```
switch(config)# !Copy the PEM encoded certificate and RSA key files for
 CVX server
switch(config)# !Lets call them server.crt and server.key
switch(config)# copy <url> certificate:server.crt
switch(config)# copy <url> sslkey:server.key
switch(config)# !Copy the PEM encoded CA certificate to verify the
 certificate of CVX clients.Lets call it ca.crt
switch(config)# copy <url> certificate:ca.crt
```

2. On CVX server, configure SSL profile with the certificates and key as below. Lets call the SSL profile as ***serverssl***.

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile serverssl
switch(config-mgmt-sec-ssl-profile-serverssl)# certificate server.crt
 key server.key
switch(config-mgmt-sec-ssl-profile-serverssl)# !You can trust multiple
 CA certificates
switch(config-mgmt-sec-ssl-profile-serverssl)# trust certificate ca.crt
```

Note: If you are using intermediate certificates to build a 'Chain of Trust' (such as **`server.crt -> intermediate1.crt -> intermediate2.crt -> ca.crt`**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-serverssl)# chain certificate
 intermediate1.crt
switch(config-mgmt-sec-ssl-profile-serverssl)# chain certificate
 intermediate2.crt
```

3. On CVX server, configure to use the serverssl SSL profile. With this configuration, the CVX server starts listening on a secure port. The CVX server will continue to listen on the default port. i.e.,

the CVX server will accept connections from CVX clients over both SSL and default non-SSL transports. During a SSL negotiation, the CVX server will authenticate itself to the CVX clients by presenting server.crt and it verifies the authenticity of the CVX client by checking if the CVX client certificate is signed by the trusted certificate ca.crt.

```
switch(config)# cvx
switch(config-cvx)# ssl profile serverssl
```

4. On CVX client, copy the client certificate and key and also the CA certificate to verify CVX server.

```
switch(config)# !Copy PEM encoded certificate and RSA key files for CVX
 client
switch(config)# !Lets call them client.crt and client.key
switch(config)# copy <url> certificate:client.crt
switch(config)# copy <url> sslkey:client.key
switch(config)# !Copy PEM encoded CA certificate used to verify the
switch(config)# !certificate of CVX server. Lets call it ca.crt
switch(config)# copy <url> certificate:ca.crt
```

Note: If you are using intermediate certificates to build a 'Chain of Trust' (such as **client.crt -> intermediate1.crt -> intermediate2.crt -> ca.crt**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-clientssl)# chain certificate
 intermediate1.crt
switch(config-mgmt-sec-ssl-profile-clientssl)# chain certificate
 intermediate2.crt
```

5. On CVX client, configure SSL profile with the certificates and key as below. Lets call the SSL profile as clientssl.

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile clientssl
switch(config-mgmt-sec-ssl-profile-clientssl)# certificate client.crt
 key client.key
switch(config-mgmt-sec-ssl-profile-clientssl)# !You can trust multiple
 CA certificates
switch(config-mgmt-sec-ssl-profile-clientssl)# trust certificate ca.crt
```

6. On CVX client, configure to use the SSL profile clientssl. With this configuration, the CVX client will connect to the secure port of the CVX server over SSL transport. During SSL negotiation, the CVX client will authenticate itself to the CVX server by presenting client.crt and it verifies the authenticity of the CVX server by checking if the CVX server certificate is signed by the trusted certificate ca.crt.

```
switch(config)# management cvx
switch(config-mgmt-cvx)# ssl profile clientssl
```

14.1.6.2 Show Commands

For information regarding show commands of SSL certificate, key and profile, please refer to *SSL Certificate and Key Management*.

To show the SSL profile status on CVX server, use the **`show cvx`** command.

```
switch# show cvx

CVX Server
 Status: Enabled
 UUID: beb19142-dfaa-11e4-b996-001c73105347
 Heartbeat interval: 20.0
```

```
 Heartbeat timeout: 60.0
 SSL profile: serverssl
  Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled for CVX server and the CVX clients can connect to CVX server over SSL transport. If there are any errors, then the status will show Disabled and the reason will be listed. In Disabled state, the CVX clients wont be able to connect to CVX server over SSL transport.

To show the SSL connection status of CVX clients on CVX server, use the show cvx connections command.

```
switch# show cvx connections

Switch 00:1c:73:10:53:48
 Hostname: sq302
 Status: up
Last heartbeat sent: 0:00:04 ago
Last heartbeat received: 0:00:10 ago
Clock offset: -0.00201620385865
Out-of-band connection: SSL secured
In-band connection: Not secured (SSL not supported)
```

The out-of-band connection shows as SSL secured, which means that the CVX client has connected to CVX server over SSL transport. The in-band connection is another connection between CVX server and CVX client. The SSL is not yet supported for this connection and hence it shows as SSL not supported. There is already some level of protection for the in-band connection. The CVX server and CVX client opens up the access to in-band connection only if the out-of-band connection is successful. Since the out-of-band connection is configured to use SSL, the in-band connection access is granted only for authentic CVX client and CVX server.

To show SSL profile status and connection status on CVX client, use the show management cvx command.

```
switch# show management cvx

CVX Client
 Status: Enabled
 Last connected time: 2015-04-14 11:16:19
 Connection status: Connected
  Out-of-band connection: SSL secured
  In-band connection: Not secured (SSL not supported)
 Negotiated version: 2
 Controller UUID: 0e7dee2e-e2cf-11e4-880f-001c73105347
 Controller: 127.0.0.1
  Last heartbeat sent: 0:00:00 ago
  Last heartbeat received: never
  Clock offset: 0.0
 SSL profile: clientssl
  Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled and the CVX client can connect to CVX server over SSL transport. If there are any errors, then the status will show as Disabled and the reason will be listed. In Disabled state, the CVX client wont be able to connect to the CVX server.

Similar to the CVX server, the out-of-band connection shows as SSL secured and the SSL is not yet supported for in-band connection.

The possible reasons for Disabled SSL status on CVX server and CVX client are:

- **SSL profile does not exist:** If the SSL profile configured under CVX server/client is not configured under management security, you will see this message. Configure the SSL profile with required certificates and key under management security.
- Invalid SSL profile: If the SSL profile configured under CVX server/client is in invalid state, you will see this message. Check **`show management security ssl profile <name>`** command to see the errors on the SSL profile and fix them.
- **Trusted certificates not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have trusted certificates configured, you will see this message. Configure trusted CA certificates in the SSL profile.
- **Certificate not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have certificate key pair configured, you will see this message. Please configure certificate and key pair in the SSL profile.

Diffie-Hellman parameters not yet ready: When EOS is booted, a Diffie-Hellman parameters file is auto generated by the system if one does not exist. This Diffie-Hellman parameters file is used for symmetric key exchange during SSL negotiation. Only the CVX server uses this file and hence this message can be seen only on **`show cvx`** command output. If the file is not yet generated, you will see this message. When the file is ready, this message automatically goes away and the SSL profile will become enabled.

14.1.7 CVX High Availability

CVX provides high availability by enabling you to use multiple (redundant) CVX Controllers in the same cluster. Each Controller in the cluster has its own dedicated machine so that if a Controller fails, the failure is isolated to a single machine.

Within a cluster, one of the Controllers is a primary (leader), and the other Controllers are backup (follower) Controllers. If the primary Controller fails, one of the backup Controllers automatically assumes the role of the primary Controller.

CVX high availability does not prevent or compromise the detection of software failures or link failures that may cause Controllers to be unreachable on the network.

The configuration that is required to ensure CVX is set up for high availability involves:

- Configuring the CVX cluster.
- Configuring the CVX clients.

For more information, see:

- CVX Clusters.
- Handling of CVX Controller Failures.
- CVX Support for EOS Failure Modes.
- Client Interaction.
- Service Agents Interaction.
- Leader Election.
- Configuring CVX Clusters for High Availability.
- Configuring CVX Clients for High Availability.

14.1.7.1 CVX Clusters

CVX clusters are sets of CVX Controllers (usually 3 Controllers). Within a cluster, each Controller runs on its own dedicated machine, and all of the Controllers run the same version of CVX. Each Controller in the cluster functions as either the primary (leader) Controller, or a backup (follower) Controller.

One of the CVX Controllers is elected by the group of Controllers to be the primary Controller. Once a Controller is elected to be the primary, the other Controllers in the cluster are automatically assigned the role of backup Controllers. Cluster members maintain an out-of-band connection amongst themselves, which is used for the leader election protocol.

CVX Controllers in a cluster that are not the primary Controller always function as backup Controllers. Within the same cluster, only one CVX Controller can assume the role of a primary at any time.

For more information, see:

- Required Number of Controllers to Support High Availability
- Cluster Configuration Options

14.1.7.1.1 Required Number of Controllers to Support High Availability

A cluster must have enough Controllers so that in the case of a failure of the primary Controller, there are enough remaining Controllers for the election process to be completed. The election process is used by clusters to select a new primary Controller in the case of failure.

Note: The number of Controllers for a cluster is **3** (one primary and two backup Controllers).

Examples

In a cluster with only **two** Controllers (one primary and one backup), a simple majority of backup Controllers does not exist after a failure of the primary Controller. A simple majority of two backup Controllers is required for the leader election process.

14.1.7.1.2 Cluster Configuration Options

You can configure the cluster for high availability using either of the following modes:

- Cold followers mode - Only the Controllerdb of the primary (leader) CVX Controller mounts from the client switches.
- Warm followers mode - The Controllerdb of every (all) CVX Controllers in the cluster mount from the client switches.

Advantages and Disadvantages of the Modes

The advantage of the warm follower mode is that if the primary CVX Controller fails, the switchover to the new primary is faster than a switchover in cold follower mode. The reason for this is that the state of the new primary does not have to be rebuilt from scratch. The disadvantage of the warm follower mode is that serialization from the switch is slower compared to cold follower mode.

14.1.7.2 Handling of CVX Controller Failures

CVX Controllers can fail because of hardware or software faults. Because EOS agents are designed to be software fault-tolerant, an agent that fails is automatically restarted and resumes operation statefully. The most recent saved state in Sysdb for the agent is used to restore the state of the agent.

Unlike software failures, hardware failures are not handled by EOS. CVX handles hardware failures through the use of redundant backup (follower) CVX Controllers that run on their own dedicated machine. Within a cluster, any backup Controller can assume the role of the primary (leader) Controller.

Note: In the event of a network partition, the partition with a majority of the Controllers elects a leader from its Controllers, and the minority partition relinquishes any leadership it might have had.

14.1.7.3 CVX Support for EOS Failure Modes

CVX supports both EOS failure modes that apply when a CVX Controller fails. The EOS failure modes are:

- Fail-stop
- Fail-recover

Because CVX supports both EOS failure modes, a failed CVX Controller can rejoin the cluster if the following failures occur:

- A crash of the agent or machine running CVX.
- The CVX controller or dedicated machine it runs on is removed (partitioned) from the cluster.

14.1.7.4 Client Interaction

Client switches maintain an out-of-band connection to all members of the cluster. The connection is used to determine liveness and for communications. The connection is also used to signal a change in leadership (switchover) to the client switches. Switchovers that are changes in leadership within a cluster are executed similarly to CVX Graceful Reboot switchovers.

The ControllerClient agent on the switch is responsible for maintaining liveness with the Controllers and for exchanging metadata. The ControllerClient agent registers with all cluster members. Each Controller's ControllerStatus has an additional flag to record whether the Controller is a leader within the cluster.

If there is more than one leader, the switch automatically waits until only one Controller is designated as the leader in the cluster. Once a single Controller is designated as the leader, the switch executes a graceful switchover to the new leader Controller.

14.1.7.5 Service Agents Interaction

One change to Service Agents is required to support CVX high availability. Service Agents must be modified to include the leader flag (this flag identifies the leader CVX Controller in the cluster). On a leader switchover, Service Agents are deactivated on the old leader Controller and activated on the new leader Controller. The client switches will perform a graceful switchover to the new leader Controller.

14.1.7.6 Leader Election

Leader election is an internal, system-run process that is essential to CVX high availability. The leader election process is used to safely elect a new leader Controller within a cluster following the failure of the current leader Controller, or a network configuration change that results in the loss of the current leader Controller in the cluster.

The leader election process is designed to ensure stability of leader Controllers within clusters. The process is based on an algorithm that provides the mechanism for the backup (follower) Controllers to elect (by consensus), the new leader Controller in the cluster.

14.1.7.7 Configuring CVX Clusters for High Availability

Configuring CVX clusters for high availability is a simple process that involves pointing each cluster member to the other cluster members using the peer host command. The objective of this task is to successfully register each cluster member with the other cluster members. Successful registration of the cluster members with each other ensures that the members can communicate with each other to elect a new leader member if the original leader member fails.

Once you complete the process, the cluster members will be successfully registered with each other. In addition, the cluster members will automatically elect a leader member and assign the leader to that member. The non-leader members are automatically assigned the role of follower.

Requirements

The requirements for setting up clusters for high availability are:

- The number of CVX Controllers in a cluster is ***3***.
- An **odd number** of CVX instances (CVX Controllers) are required to form a cluster.

Note: If an even number of CVX Controllers are configured in a cluster, a CVX instance will automatically refuse to participate in the cluster.

- All cluster members must point to each other. This is essential for clusters to operate normally. (The steps required to complete this task are included in the following procedure.)

Procedure

Note: This procedure provides configuration examples for each step. The example cluster used throughout the procedure contains 3 cluster members (named ***cvs1***, ***cvs2***, and ***cvs3***). The IP addresses of the cluster members are:

- ***cvs1*** (***10.0.0.1***)
- ***cvs2*** (***10.0.0.2***)
- ***cvs3*** (***10.0.0.3***).

Complete the following steps to configure clusters for high availability.

1. Using the peer host command, configure one of the cluster members to point to every other cluster member. This example shows the configuration of cluster member ***cvs1*** to point to the other cluster members (***cvs2*** and ***cvs3***).

```
cvs1(config-cvx)# peer host 10.0.0.2 (connects cvs1 to cvs2)
cvs1(config-cvx)#peer host 10.0.0.3 (connects cvs1 to cvs3)
```

2. Use the **`show cvx`** command to check the **Mode** and **Peer registration state** status values for cluster member ***cvs1***. The status values should be:

   - **Mode** = *Cluster*
   - **Peer registration state** = *Connecting*

   Note: Mode automatically changes from Standalone to Cluster when configuring a CVX cluster. This is because the presence of multiple CVX peers causes the Mode to change to Cluster. **Peer registration state** remains in Connecting status after you configure the first cluster member. This is because the two peers must register with each other for the registration of the two members to be successful.

3. Using the peer host command, configure peer cluster member ***cvs2*** to point to every other cluster member. This example shows the configuration of cluster member ***cvs2*** to point to the other cluster members (***cvs1*** and ***cvs3***).

```
cvs2(config-cvx)# peer host 10.0.0.1 (connects cvs2 to cvs1)
cvs2(config-cvx)# peer host 10.0.0.3 (connects cvs2 to cvs3)
```

4. Use the **`show cvx`** command to check the **Peer registration state** settings for ***cvs1***. This is done to verify that peers ***cvs1*** and ***cvs2*** are successfully registered with each other.

```
cvs1(config-cvx)# show cvx
```

Example

This example shows the output of the **`show cvx`** command for ***cvs1***. The **Peer registration state** setting of Registration Complete for peer ***cvs2*** *indicates a successful registration between* ***cvs1*** *and* ***cvs2***.

```
cvs1(config-cvx)#show cvx

CVX Server
 Status: Enabled
 UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
 Mode: Cluster
 Heartbeat interval: 20.0
 Heartbeat timeout: 60.0
```

```
 Cluster Status
  Name: default
  Role: Standby
  Leader: 10.0.0.2
  Peer timeout: 10.0
  Last leader switchover timestamp: 0:00:03 ago
  Peer Status for 10.0.0.3
   Peer registration state: Connecting
   Peer service version compatibility : Version mismatch
  Peer Status for 10.0.0.2
   Peer Id : 02-01-63-02-00-00
   Peer registration state: Registration complete
   Peer service version compatibility : Version ok
```

5. Using the peer host command, configure peer cluster member ***cvs3*** to point to every other cluster member. This example shows the configuration of cluster member ***cvs3*** to point to the other cluster members (***cvs1*** and ***cvs2***).

```
cvs3(config-cvx)# peer host 10.0.0.1 (connects cvs3 to cvs1)
cvs3(config-cvx)# peer host 10.0.0.2 (connects cvs3 to cvs2)
```

6. Use the **`show cvx`** command to check the **Peer registration state** settings for ***cvs1***. This is done to verify that peers ***cvs1*** and ***cvs3*** are successfully registered with each other.

```
cvs1(config-cvx)# show cvx
```

Example

This example shows the output of the **`show cvx`** command for *cvs1*. The **Peer registration state** setting of Registration Complete for peer ***cvs3*** *indicates a successful registration between* ***cvs1*** and ***cvs3***.

```
cvs1(config-cvx)# sh cvx

CVX Server
 Status: Enabled
 UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
 Mode: Cluster
 Heartbeat interval: 20.0
 Heartbeat timeout: 60.0
 Cluster Status
  Name: default
  Role: Standby
  Leader: 10.0.0.2
  Peer timeout: 10.0
  Last leader switchover timestamp: 0:05:37 ago
  Peer Status for 10.0.0.3
   Peer Id : 02-01-63-03-00-00
   Peer registration state: Registration complete
   Peer service version compatibility : Version ok
  Peer Status for 10.0.0.2
   Peer Id : 02-01-63-02-00-00
   Peer registration state: Registration complete
   Peer service version compatibility : Version ok
```

Next Step

You are now ready to configure the CVX clients for high availability (see Configuring CVX Clients for High Availability).

14.1.7.8 Configuring CVX Clients for High Availability

Configuring CVX clients for high availability is a simple process that involves pointing each CVX client to every CVX cluster member using the server host command. The objective of this task is to successfully establish connections between each CVX client and every CVX cluster member. The connections are essential to ensure that the CVX clients are aware of the current status of each cluster member.

Note: If a CVX client is not pointing to every cluster member, or if it is pointing to a CVX instance (Controller) that is not part of the cluster, the client may not be aware of leadership changes in the cluster, or may become confused about which cluster member is currently the leader. Either of these scenarios can result in unexpected errors.

Once you complete the process, the CVX clients will have established connections with each cluster member (the Connection status for each Controller should be Established). In addition, the clients will be aware of which CVX instance (Controller) is currently the leader in the cluster.

Procedure

Note: This procedure provides configuration examples for each step. The example CVX client used throughout the procedure is named cvc1. The IP addresses of the cluster members are: ***10.0.0.1*** (***cvs1***), ***10.0.0.2*** (***cvs2***), and ***10.0.0.3*** (***cvs3***).

Complete the following steps to configure CVX clients for high availability.

1. Using the server host command, configure each of the CVX clients to point to every cluster member. This example shows the configuration of client ***cvc1*** to point to all of the cluster members (the addresses of the cluster members are ***10.0.0.1***, ***10.0.0.2***, and ***10.0.0.3***).

```
cvc1(config-mgmt-cvx)# server host 10.0.0.1 (connects cvc1 to cluster
 member 10.0.0.1)
cvc1(config-mgmt-cvx)# server host 10.0.0.2 (connects cvc1 to cluster
 member 10.0.0.2)
cvc1(config-mgmt-cvx)# server host 10.0.0.3 (connects cvc1 to cluster
 member 10.0.0.3)
```

2. Use the **show man cvx** command to check the status of client ***cvc1***. The Connection status for each cluster member should be Established. In addition, the client is also aware that cluster member ***10.0.0.3*** is the current Master.

```
cvc1(config-mgmt-cvx)#show man cvx

CVX Client
 Status: Enabled
 Source interface: Inactive (Not configured)
 Controller cluster name: default
  Controller status for 10.0.0.1
   Connection status: established
    Out-of-band connection: Not secured
    In-band connection: Not secured (SSL not supported)
   Negotiated version: 2
   Controller UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
   Last heartbeat sent: 0:00:07 ago
   Last heartbeat received: 0:00:07 ago

 Last heartbeat sent: 0:00:05 ago
 Last heartbeat received: 0:00:05 ago
```

14.1.8 CVX VIP

CVX VIP provides the virtual IP address that actively follows the master controller of the CVX cluster.

The virtual IP address of the CVX HA Cluster is configured on a macvlan interface setup on top of a physical management interface of the master controller. The virtual IP and virtual MAC needs to be provided by the customer as part of the controller configuration. This information is available to all controllers as each cluster member has to be configured manually by the user on all controllers.

The macvlan interface created should be designated as `***Management0***`. `***Management0***` is currently used for the ManagementActive interface on modular switches. Without explicit configuration of VIP and VMAC, CVX VIP functionality will not work in the CVX HA cluster.

Customers can pick the VMAC from a pool of MAC addresses reserved for use with CVX clusters. The OUI pool, 00:1C:73:00:00:AA “ 00:1C:73:00:00:FF has been reserved for this purpose.

The macvlan interface is setup if all of the following conditions are met:

- VMAC is configured by the user
- The controller instance is a leader
- There are more than one controller instances
- The controller is not being run on a modular system

- CVX VIP
- Data Replication
- SSH Host Key Tagging

14.1.8.1 Configuring VIP

All CLI commands applicable to the management interface of the controller will be allowed on ***Management0***, with the exception of Layer 1 / phy level commands. So auto-negotiation or flow control cannot be configured on the ***Management0*** interface. Instead these commands can only be run on the physical management interfaces. This makes sense as the phy-level configuration really depends on what the interface is physically wire.

To configure VMAC/VIP :

```
CVX(config)# interface management 0
CVX(config-if-Ma0)# mac-address 00:1C:72:00:00:FF
CVX(config-if-Ma0)# ip address 10.0.0.2
```

14.1.8.2 Data Replication

At EOS boot time, SSH host keys and Diffie-Hellman parameters are automatically generated and persistently stored on each controller. Multiple SSL profiles / keys / certificates might also be created and used by various agents on the controllers. Since these information contribute to the identity of the master, they will need to follow the master controller for all time.

In case of a controller switchover, the newly elected master controller will need to use the same SSH host keys & SSL profiles / keys / certificates to retain its identity and prevent any kind of network security alarms from being tripped. For example, if an SSH client notices that the host key has

changed, it will normally flag an error warning the user of a possible man-in-the-middle type attack. Hence, this data will be replicated from the master to slaves.

14.1.8.3 SSH Host Key Tagging

SSH host keys are tagged with the chassis MAC address to deal with key regeneration issues when a supervisor module is moved from one chassis to another. This behavior will cause regeneration issues if we replicate the SSH host keys across the cluster resulting in the key fingerprint seen by management tools to be different.

To mitigate this, in addition to the chassis MAC address, the host keys would now be tagged with VMAC of the CVX HA cluster. If CVX VIP and VMAC are configured, SshHostKeysAgent will not regenerate keys if tagged VMAC and configured VMAC are the same, even if there is a mismatch between the chassis MAC and tagged MAC.

14.1.9 CVX Commands

CVX Server Commands

- cvx
- heartbeat-interval (CVX)
- heartbeat-timeout (CVX)
- port (CVX)
- show cvx
- shutdown (CVX)

CVX Client Commands

- management cvx
- heartbeat-interval (Management-CVX)
- heartbeat-timeout (Management-CVX)
- server host (Management-CVX)
- source-interface (Management-CVX)
- shutdown (Management-CVX)

CVX OpenStack Commands

- name-resolution force (CVX-OpenStack)
- name-resolution interval (CVX-OpenStack)
- service openstack
- shutdown (CVX-OpenStack)

CVX VXLAN Control Service Commands

- resync-period
- service vxlan
- shutdown (CVX-VXLAN)
- vtep (CVX-VXLAN)

CVX Hardware Switch Controller (HSC) Commands

- manager
- ovsdb-shutdown
- service hsc
- shutdown (CVX-HSC)
- vtep (CVX-HSC)

CVX Network Topology Service Commands

- lldp run

CVX Static Topology Service Commands

- service topology
- show network physical-topology

14.1.9.1 cvx

CVX (CloudVision eXtension) aggregates and shares status across a network of physical switches running EOS. CVX services provide visibility and coordinate activities across a network of switches that are configured as CVX clients.

The **cvx** command enters CVX configuration mode. CVX configuration mode is not a group-change mode; ***running-config*** is changed immediately upon entering commands. Exiting CVX configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

The **no cvx** and **default cvx** commands restore all CVX server defaults by deleting all CVX configuration mode statements from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

cvx

no cvx

default cvx

Commands Available in CVX Configuration Mode

- **port (CVX)**
- **service openstack**
- **service vxlan**
- **shutdown (CVX)**
- **heartbeat-interval (CVX)**
- **heartbeat-timeout (CVX)**

Example

These commands enter the CVX-configuration mode and displays the CVX configuration.

```
switch(config)# cvx
switch(config-cvx)# show active all

 cvx
  shutdown
  port 9979
  heartbeat-interval 20
  heartbeat-timeout 60
  no service vxlan
  service openstack
   shutdown
   name-resolution interval 21600
switch(config-cvx)#
```

14.1.9.2 heartbeat-interval (CVX)

The **heartbeat-interval** command configures the interval between heartbeat messages that the switch sends as a CVX server. Heartbeat messages are part of the keepalive mechanism between CVX and the CVX clients to which it connects.

The **no heartbeat-interval** and **default heartbeat-interval** commands restore the heartbeat interval to the default setting by removing the **heartbeat-interval** command from *running-config*.

Command Mode

CVX Configuration

Command Syntax

heartbeat-interval period

no heartbeat-interval

default heartbeat-interval

Parameters

period Interval duration (seconds). Value ranges from ***5*** through ***60***. Default value is ***20***.

Related Commands

- **cvx**.
- **heartbeat-timeout (CVX)**

Guidelines

Heartbeat messages flow independently in both directions between CVX and clients. When a client stops receiving heartbeat messages from the server within a specified period, the client assumes that the CVX server is no longer functioning.

Best practices dictate that CVX and its client applications configure identical heartbeat interval values.

Example

This command configures a CVX server heartbeat interval of ***30*** seconds:

```
switch(config)# cvx
switch(config-cvx)# heartbeat-interval 30
switch(config-cvx)#
```

14.1.9.3 heartbeat-interval (Management-CVX)

The **heartbeat-interval** command configures the interval between heartbeat messages that the switch sends as a CVX client. Heartbeat messages are part of the keepalive mechanism between the CVX client and the CVX server to which it connects.

The **no heartbeat-interval** and **default heartbeat-interval** commands revert the heartbeat interval to the default setting by removing the **heartbeat-interval** command from ***running-config***.

Command Mode

Mgmt-CVX Configuration

Command Syntax

heartbeat-interval period

no heartbeat-interval

default heartbeat-interval

Parameters

period: Interval duration (seconds). Value ranges from **5** through **60**. Default value is **20**.

GuidelinesHeartbeat messages flow independently in both directions between CVX and clients. When the server stops receiving heartbeat messages from a client within a specified period, the server assumes that the device it is no longer functioning as a CVX client.

Best practices dictate that the CVX client's heartbeat interval value is identical to that of its CVX server.

Related Commands

heartbeat-timeout (Management-CVX) specifies the CVX client timeout interval.

Example

These commands configure a CVX client heartbeat interval of ***30*** seconds:

```
switch(config)# management cvx
switch(config-mgmt-cvx)# heartbeat-interval 30
switch(config-mgmt-cvx)#
```

14.1.9.4 heartbeat-timeout (CVX)

The **heartbeat-timeout** command specifies the CVX timeout period. When a CVX server does not receive consecutive heartbeat messages from a CVX client within the heartbeat timeout period, the server discontinues providing CVX services to the client device. The default timeout period is ***60*** seconds.

The **no heartbeat-timeout** and **default heartbeat-timeout-timeout** commands restore the heartbeat timeout to the default setting by removing the heartbeat-timeout command from ***running-config***.

Command Mode

CVX Configuration

Command Syntax

heartbeat-timeout period

no heartbeat-timeout

default heartbeat-timeout

Related Commands

- cvx places the switch in CVX configuration mode.
- heartbeat-interval (CVX) specifies the CVX heartbeat interval.

Parameters

period heartbeat timeout interval (seconds). Value ranges from ***15*** to ***10800***. Default value is ***60***.

Guidelines

Best practices dictate that CVX and its client applications configure identical heartbeat timeout values.

Examples

These commands set the CVX timeout period to ***90*** seconds.

```
switch(config)# cvx
switch(config-cvx)# heartbeat-timeout 90
switch(config-cvx)#
```

14.1.9.5 heartbeat-timeout (Management-CVX)

The **heartbeat-timeout** command specifies the CVX client timeout period. When a CVX client does not receive consecutive heartbeat messages from a CVX server within the period specified by this command, the client assumes that its connection to CVX is disrupted. The default timeout period is ***60*** seconds.

The **no heartbeat-timeout** and **default heartbeat-timeout** commands restore the CVX client heartbeat timeout to the default setting by removing the **heartbeat-timeout** command from ***running-config***.

Command Mode

Mgmt-CVX Configuration

Command Syntax

heartbeat-timeout period

no heartbeat-timeout

default heartbeat-timeout

Parameters

period heartbeat timeout interval (seconds). Value ranges from ***15*** to ***10800***. Default value is ***60***.

Guidelines

Best practices dictate that the CVX client's heartbeat timeout value is identical to that of its CVX server.

Related Command

heartbeat-interval (Management-CVX) specifies the CVX client heartbeat interval.

Example

These commands set the CVX client timeout period to ***90*** seconds.

```
switch(config)# management cvx
switch(config-mgmt-cvx)# heartbeat-timeout 90
switch(config-mgmt-cvx)#
```

14.1.9.6 lldp run

The **lldp run** command enables LLDP on the Arista switch.

Command Mode

Global Configuration

Command Syntax

lldp run

no lldp run

default lldp run

Examples

- This command enables LLDP globally on the Arista switch.

```
switch(config)# lldp run
switch(config)#
```

- This command disables LLDP globally on the Arista switch.

```
switch(config)# no lldp run
switch(config)#
```

14.1.9.7 management cvx

The **management cvx** command places the switch in ***mgmt-CVX*** configuration mode to configure CVX client parameters.

Mgmt-CVX configuration mode is not a group-change mode; ***running-config*** is changed immediately upon entering commands. Exiting ***mgmt-CVX*** configuration mode does not affect the ***running-config***. The **exit** command returns the switch to global configuration mode.

The **no management cvx** and **default management cvx** commands delete all mgmt-CVX configuration mode statements from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

management cvx

no management cvx

default management cvx

exit

Commands Available in Mgmt-CVX Configuration Mode

- **heartbeat-interval (Management-CVX)**
- **heartbeat-timeout (Management-CVX)**
- **server host (Management-CVX)**
- **source-interface (Management-CVX)**
- **shutdown (Management-CVX)**

Examples

- This command places the switch in mgmt-CVX configuration mode.

```
switch(config)# management cvx
switch(s1)(config-mgmt-cvx)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-cvx)# exit
switch(config)#
```

14.1.9.8 manager

The **manager** command configures the IP address of the OVSDB controller for the HSC service, allowing CVX to connect to the controller.

The **no manager** and **default manager** commands remove the HSC manager configuration from ***running-config***.

Command Mode

CVX-HSC Configuration

Command Syntax

manager ip_address [port]

Parameters

- ***ip_address*** IP address of the HSC manager.
- **port connection port**. Values range from ***1*** to ***65535***; default value is ***6632***.

Related Commands

service hsc places the switch in CVX-HSC configuration mode.

Example

These commands point the HSC service to a controller at IP address ***192.168.2.5*** using the default port ***6632***.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# manager 192.163.2.5
switch(config-cvx-hsc)#
```

14.1.9.9 name-resolution force (CVX-OpenStack)

The **name-resolution force** command initiates an OpenStack controller function that communicates with the OpenStack Keystone and Nova services to update names of VMs and tenants mapped by the local OpenStack instance.

The OpenStack controller accesses the Keystone and Nova services in response to various triggering events (such as the creation of a new tenant, network or VM), and also at a regular interval configured by the **name-resolution interval (CVX-OpenStack)** command (default interval 6 hours). The **name-resolution force** command is used to force an immediate update without waiting for a triggering event.

Command Mode

CVX-OpenStack Configuration

Command Syntax

name-resolution force

Related Commands

- **service openstack** places the switch in CVX-OpenStack configuration mode.
- **name-resolution interval (CVX-OpenStack)** sets the interval for automatic Keystone updates.

Example

These commands update the OpenStack instance immediately with data from the Keystone service.

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# name-resolution force
switch(config-cvx-openstack)#
```

14.1.9.10 name-resolution interval (CVX-OpenStack)

The **name-resolution interval** command specifies the period between consecutive requests that the OpenStack controller sends to the Keystone service for VM and tenant name updates. Keystone is OpenStack's authentication and authorization service.

The default period is ***21600*** seconds (six hours).

The **name-resolution force (CVX-OpenStack)** command performs an immediate update, as opposed to waiting for the periodic update.

Command Mode

CVX-OpenStack Configuration

Command Syntax

name-resolution interval period

Parameters

period Keystone identity service polling interval (seconds).

Related Command

service openstack places the switch in **CVX-OpenStack** configuration mode.

Example

These commands set the name resolution interval period at ***18000*** (five hours).

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# name-resolution interval 18000
switch(config-cvx-openstack)#
```

14.1.9.11 ovsdb-shutdown

The **ovsdb-shutdown** command shuts down the OVSDB server.

The **no ovsdb-shutdown** and **default ovsdb-shutdown** commands enable the OVSDB server by removing the **ovsdb-shutdown** command from the ***running-config***.

Command Mode

CVX-HSC Configuration

Command Syntax

ovsdb-shutdown

no ovsdb-shutdown

default ovsdb-shutdown

Related Command

The **service hsc** command places the switch in the ***CVX-HSC*** configuration mode.

Example

These commands shut down the OVSDB server used by the HSC service.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# ovsdb-shutdown
switch(config-cvx-hsc)#
```

14.1.9.12 port (CVX)

The **port** command specifies the TCP port number the CVX server listens on. The default port number is ***9979***.

The **no port** and **default port** commands restore the default port number by removing the port statement from ***running-config***.

Command Mode

CVX Configuration

Command Syntax

port ***port_number***

no port

default port

Parameter

port_number TCP port number. Value ranges from ***1*** to ***65535***.

Related Command

cvx places the switch in the ***CVX*** configuration mode.

Examples

- These commands configure ***9500*** as the CVX server port.

```
switch# config
switch(config)# cvx
switch(config-cvx)# port 9500
switch(config-cvx)#
```

- These commands restore the default port (***9979***) as the CVX server port.

```
switch(config-cvx)# no port
switch(config-cvx)#
```

14.1.9.13 resync-period

The **resync-period** command configures the grace period for completion of synchronization between the VXLAN control service and clients after a CVX restart. Arista recommends leaving the grace period set to its default of ***300*** seconds.

The **no resync-period** command disables VXLAN control service graceful restart. The **default resync-period** command resets the grace period to its default of ***300*** seconds.

Command Mode

CVX-VXLAN Configuration

Command Syntax

resync-period ***seconds***

no resync-period

default resync-period

Parameter

seconds synchronization grace period in seconds. Values range from ***30*** to ***4800***; default is ***300***.

Example

These commands reset the VXLAN control service synchronization grace period to ***300*** seconds.

```
switch(config)# cvx
switch(config-cvx)# service vxlan
switch(config-cvx-vxlan)# default resync-period
switch(config-cvx-vxlan)#
```

14.1.9.14 server host (Management-CVX)

The **server host** command configures the IP address or host name of the CVX server to which the CVX client device connects. The configuration of this address is required for the switch to function as a CVX client. By default, no CVX host address is specified.

The **no server host** and **default server host** commands remove the CVX host address assignment by removing the server host statement from the ***running-config***.

Command Mode

Mgmt-CVX Configuration

Command Syntax

server host host

no server host

default server host

Parameter

host IPv4 address (in dotted decimal notation) or FQDN host name of the CVX server.

Example

This command specifies ***10.1.1.14*** as the address of the server to which the CVX client connects.

```
switch(config)# management cvx
switch(config-mgmt-cvx)# server host 10.1.1.14
switch(config-mgmt-cvx)#
```

14.1.9.15 service hsc

The **service hsc** command enters the ***CVX-HSC*** configuration mode where the HSC service is enabled and configured.

CVX-HSC configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. Exiting the ***CVX-HSC*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

service hsc

Commands Available in CVX-HSC Configuration Mode

- **manager**
- **ovsdb-shutdown**
- **shutdown (CVX-HSC)**

Related Command

cvx places the switch into the CVX configuration mode.

Example

These commands enter the ***CVX-HSC*** configuration mode.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)#
```

14.1.9.16 service openstack

The service openstack command places the switch in CVX-OpenStack configuration mode.

In order to integrate Arista switches into an OpenStack managed cloud network, OpenStack needs to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to hosts where the VMs reside.

CVX-OpenStack configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. Exiting the ***CVX-OpenStack*** configuration mode does not affect the ***running-config***. The **`exit`** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

`service openstack`

Commands Available in CVX-OpenStack Configuration Mode

- **`name-resolution force` (CVX-OpenStack)**
- **`name-resolution interval` (CVX-OpenStack)**
- **`shutdown` (CVX-OpenStack)**

Related Command

`cvx` places the switch into the CVX configuration mode.

Example

These commands places the switch into the ***CVX-OpenStack*** configuration mode.

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)#
```

14.1.9.17 service topology

The **service topology** command configures the topology statically on CVX without running LLDP on the servers connected to switches.

The **no service topology** command removes the static topology configuration from the ***running-config***.

Command Mode

CVX Configuration Mode

Command Syntax

service topology

no service topology

Example

- The following command configures topology statically on the switch.

```
switch# config
switch(config)# cvx
switch(config-cvx)# service topology
switch(config-cvx-topology)#
```

14.1.9.18 service vxlan

The **service vxlan** command enters the ***CVX-VXLAN*** configuration mode where the VXLAN control service is enabled and configured.

The CVX-VXLAN configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***CVX-VXLAN*** configuration mode does not affect the ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

service vxlan

Commands Available in CVX-VXLAN Configuration Mode

- **resync-period**
- **shutdown (CVX-VXLAN)**
- **vtep (CVX-VXLAN)**

Related Command

The **cvx** command places the switch into the CVX configuration mode.

Example

These commands enters the ***CVX-VXLAN*** configuration mode.

```
switch(config)# cvx
switch(config-cvx)# service vxlan
switch(config-cvx-vxlan)#
```

14.1.9.19 show cvx

The **show cvx** command displays the enable status and current configuration of CVX.

Command Mode

EXEC

Command Syntax

show cvx

Example

This command displays the status and configuration of CVX.

```
switch(config)# cvx
 cvx
 no shutdown
 heartbeat-interval 30
 heartbeat-timeout 90
switch(config-cvx)# dis
switch> show cvx
CVX Server
 Status: Enabled
 UUID: 75ce27ce-cc04-11e4-a404-233646319a2c
 Heartbeat interval: 30.0
 Heartbeat timeout: 90.0
switch>
```

14.1.9.20 show network physical-topology

The **show network physical-topology** command displays the network topology discovered through CVX.

Command Mode

EXEC

Command Syntax

show network physical-topology ***hosts***|***neighbors***

Parameters

- ***hosts*** Displays all hosts visible in the topology.
- ***neighbors*** Displays all connections in the network topology. Table is sorted by host name, and can be optionally filtered by host.

Example

- This command displays all visible hosts.

```
switch# show network physical-topology hosts

Unique Id            Hostname
-------------------- ------------------------------
001c.7385.be69       cvx287.sjc.aristanetworks.com
0000.6401.0000       cvc1
0000.6402.0000       cvc2
0000.6403.0000       cvc3
0000.6404.0000       cvc4
bcf6.85bd.8050       dsj14-rack14-tor1
```

- This command displays all connections in the topology.

```
switch# show network physical-topology neighbors

cvx287.sjc.aristanetworks.com

Interface          Neighbor Intf      Neighbor Host
------------------ ------------------ ----------------------
Ethernet1          Ethernet7          cvc4

```

14.1.9.21 shutdown (CVX)

The **shutdown** command, in cvx mode, disables or enables the switch as a CVX server. By default, CVX is disabled on the switch.

The **no shutdown** command enables the switch as a CVX server. The **shutdown** and **default shutdown** commands disable the switch as a CVX server by removing the **no shutdown** command from ***running-config***.

Note: Be sure to de-configure or shut down all CVX client services before disabling CVX; failure to do so may result in CVX client services continuing to run after CVX has been disabled.

Command Mode

CVX Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Command

The **cvx** command places the switch in CVX configuration mode.

Examples

- These commands enable the switch as a CVX server.

```
switch# config
switch(config)# cvx
switch(config-cvx)# no shutdown
switch(config-cvx)#
```

- This command disables CVX on the switch.

```
switch(config-cvx)# shutdown
switch(config-cvx)#
```

14.1.9.22 shutdown (CVX-HSC)

The **shutdown** command, in ***CVX-HSC*** configuration mode, disables or enables the CVX service on the switch. HSC is disabled by default.

When a CVX server enables HSC, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the HSC service; the **shutdown** and **default shutdown** commands disable the HSC service.

Command Mode

CVX-VXLAN Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Command

The **service hsc** command places the switch into the CVX-HSC configuration mode.

Examples

- These commands enable the HSC service.

```
switch(config)# cvx
switch(config-cvx)# service hsx
switch(config-cvx-hsc)# no shutdown
switch(config-cvx-hsc)#
```

- These commands disable the HSC service.

```
switch(config)# cvx
switch(config-cvx)# service hsx
switch(config-cvx-hsc)# shutdown
switch(config-cvx-hsc)#
```

14.1.9.23 shutdown (Management-CVX)

The **shutdown** command, in the ***mgmt-cvx*** mode, disables or enables CVX client services on the switch. CVX services are disabled by default.

The **no shutdown** command enables CVX client services. The **shutdown** and **default shutdown** commands disable CVX client services by removing the corresponding no shutdown command from the **running-config**.

Command Mode

Mgmt-CVX Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands enable CVX client services.

```
switch(config)# management cvx
switch(config-mgmt-cvx)# no shutdown
switch(config-mgmt-cvx)#
```

- This command disables CVX client services.

```
switch(config-mgmt-cvx)# shutdown
switch(config-mgmt-cvx)#
```

14.1.9.24 shutdown (CVX-OpenStack)

The **shutdown** command, in the ***cvx-openstack*** configuration mode, disables or enables CVX-OpenStack on the switch. CVX-OpenStack is disabled by default.

When a CVX server enables OpenStack services, its clients are accessible to the OpenStack network controller (Neutron). Integrating Arista switches into an OpenStack-managed cloud network requires OpenStack to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to the hosts where the VMs reside.

The **no shutdown** command enables CVX-OpenStack. The **shutdown** and **default shutdown** commands disable CVX-OpenStack by removing the corresponding no shutdown command from the ***running-config***.

Command Mode

CVX-OpenStack Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Command

service openstack places the switch in ***CVX-OpenStack*** configuration mode.

Examples

- These commands enable CVX-OpenStack.

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# no shutdown
switch(config-cvx-openstack)#
```

- These commands disable CVX-OpenStack.

```
switch(config-cvx-openstack)#
switch(config-cvx-openstack)# shutdown
switch(config-cvx-openstack)#
```

14.1.9.25 shutdown (CVX-VXLAN)

The **shutdown** command, in ***CVX-VXLAN*** configuration mode, disables or enables the CVX VXLAN control service on the switch. VXLAN control service is disabled by default.

When a CVX server enables VXLAN control service, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the VXLAN control service. The **shutdown** and **default shutdown** commands disable the VXLAN control service.

Command Mode

CVX-VXLAN Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Command

The **service vxlan** command places the switch in CVX-VXLAN configuration mode.

Examples

- These commands enable VXLAN control service.

```
switch(config)# cvx
switch(config-cvx)# service vxlan
switch(config-cvx-vxlan)# no shutdown
switch(config-cvx-vxlan)#
```

- These commands disable VXLAN control service.

```
switch(config)# cvx
switch(config-cvx)# service vxlan
switch(config-cvx-vxlan)# shutdown
switch(config-cvx-vxlan)#
```

14.1.9.26 source-interface (Management-CVX)

The **source-interface** command specifies the interface from where the IPv4 address is derived for use as the source for outbound CVX packets that the switch sends as a CVX client. There is no default source interface assignment.

The **no source-interface** and **default source-interface** commands remove the source interface assignment for the CVX client by deleting the source-interface statement from the ***running-config***.

Command Mode

Mgmt-CVX Configuration

Command Syntax

source-interface INT_NAME

no source-interface

default source-interface

Parameters

INT_NAME: Interface type and number. Options include:

- **ethernet *e_num***: Ethernet interface specified by ***e_num***.
- **loopback *l_num***: Loopback interface specified by ***l_num***.
- **management *m_num***: Management interface specified by ***m_num***.
- **port-channel *p_num***: Port-Channel Interface specified by ***p_num***.
- **vlan *v_num***: VLAN interface specified by ***v_num***.

Example

These commands configure the CVX client to use the IP address ***10.24.24.1*** as the source address for its outbound packets.

```
switch# config
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.24.24.1/24
switch(config-if-Lo5)# exit
switch(config)# management cvx
switch(config-mgmt-cvx)# source-interface loopback 5
switch(config-mgmt-cvx)#
```

14.1.9.27 vtep (CVX-HSC)

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any replication), and the flood list sent by the HSC service is a list of replication nodes. Other controllers (such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the **vtep** command in the ***CVX-HSC*** configuration mode.

Command Mode

CVX-HSC Configuration

Command Syntax

vtep flood ***list type*** all | any

no vtep flood ***list type***

default vtep flood ***list type***

Parameters

- **all**: send-to-all replication; flood list is the list of VTEPs.
- **any**: send-to-any replication; flood list is a list of replication nodes. This is the default setting.

Example

These commands configure the HSC to use send-to-all replication.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# vtep flood list type all
switch(config-cvx-hsc)#
```

14.1.9.28 vtep (CVX-VXLAN)

The OVSDB management protocol includes provisions for control-plane MAC learning, which allows MAC addresses to be distributed among VTEPs without using the data plane. Some controllers (such as VMware NSX) take advantage of this facility; others (such as Nuage VSP) do not. By default, CVX uses control-plane MAC learning.

To switch to data plane MAC learning, use the **vtep** command in the CVX-VXLAN configuration mode, as shown below.

Command Mode

CVX-VXLAN Configuration

Command Syntax

vtep mac-learning [control-plane|data-plane]

Related Command

The **service vxlan** command places the switch into the ***CVX-VXLAN*** configuration mode.

Example

These commands configure CVX to use data-plane MAC address learning.

```
switch(config)# cvx
switch(config-cvx)# service vxlan
switch(config-cvx-vxlan)# vtep mac-learning data-plane
switch(config-cvx)#
```

Chapter 15

Routing Protocols

The Routing Protocols chapter contains the following sections:

15.1 Routing Information Protocol (RIP)

This chapter contains the following sections.

- RIP Conceptual Overview
- Running RIP on the Switch
- Configuring RIP on Multiple VRFs
- RIP Commands

15.1.1 RIP Conceptual Overview

Routing Information Protocol (RIP) is a routing protocol typically used as an Interior Gateway Protocol (IGP). RIP uses hop counts only to determine the shortest path to a destination. To avoid loops, RIP limits its paths to a maximum of ***15*** hops, making it an ineffective protocol for large networks. RIP Version 2 supports Classless Inter-Domain Routing (CIDR) and uses IP multicast at address ***224.0.0.9*** to share the routing table with adjacent routers.

RIP sends updates whenever there is a change in the network topology and periodic updates when there are no changes. Receiving switches update their routing table whenever the update includes topology changes. Because RIP transmits the entire routing table every ***30*** seconds, RIP updates can generate heavy traffic loads in large or complicated networks.

Each switch also sends a list of distance-vectors to each of its neighbors periodically. The distance-vector is the metric RIP uses to express the cost of a route, and it describes the number of hops required to reach a destination. Each hop is typically assigned a hop count value of ***1***, and the router adds ***1*** to the metric when it receives a routing update and adds the network to its routing table.

To remove dead routes from its routing table, RIP marks a route for deletion if the router does not receive an advertisement for it within the expiration interval, then removes it from the routing table after the deletion interval.

15.1.2 Running RIP on the Switch

15.1.2.1 Accessing RIP Configuration Mode and Enabling RIP

15.1.2.1.1 RIP Configuration Mode

The router rip command places the switch in router-RIP configuration mode to configure Routing Information Protocol (RIP) routing.

Example

This command places the switch in router-RIP configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```

Using the router rip command puts the switch in router-RIP configuration mode, but does not enable RIP on the switch.

15.1.2.1.2 Enabling RIP

Routing Information Protocol (RIP) is disabled on the switch by default. The **no** shutdown (RIP) command in router-RIP configuration mode will enable RIP.

Example

This command enables RIP on the switch.

```
switch(config-router-rip)#no shutdown
switch(config-router-rip)#
```

Issuing this command enables RIP, but to send and receive RIP route updates and to route packets via RIP you must also specify interfaces on which RIP will run by using the network (RIP) command.

15.1.2.1.3 Disabling RIP

You can disable RIP in two ways. The shutdown (RIP) command disables RIP on the switch but maintains all user-entered router-RIP configuration statements in the ***running-config***. The **no** router rip command disables RIP and removes all user-entered router-RIP configuration statements from the ***running-config***.

Examples

- This command disables RIP on the switch and removes all user-entered router-RIP configuration.

```
switch(config)#no router rip
switch(config)#
```

- This command disables RIP on the switch, but preserves all user-entered router-RIP configuration.

```
switch(config-router-rip)#shutdown
switch(config-router-rip)#
```

15.1.2.2 Configuring RIP

Issuing the **no** shutdown (RIP) command in router-RIP configuration mode enables RIP, but to run RIP on an interface you must specify a RIP network by using the network (RIP) command.

You can also configure the redistribution of routes learned from other protocols, set the default metric and administrative distance for redistributed routes, configure the timing of various RIP events, and configure specific interfaces to send RIP update packets by broadcast instead of multicast.

15.1.2.2.1 Specifying RIP Networks

The network (RIP) command identifies networks on which RIP will run and also specifies which routes RIP will accept into its routing table. You can issue the network (RIP) command multiple times to build up a list of RIP networks. No RIP networks are configured by default, so in order to route packets and send and receive RIP updates you must specify one or more RIP networks.

To disable RIP on a specific network, use the **`no network (RIP)`** command.

Examples

- This command enables RIP on ***10.168.1.1/24***.

```
switch(config-router-rip)network 10.168.1.1/24
switch(config-router-rip)#
```

- This command disables RIP on ***10.168.1.1/24***.

```
switch(config-router-rip)#no network 10.168.1.1/24
switch(config-router-rip)#
```

15.1.2.2.2 Redistributing Routes Learned from Other Protocols into RIP

To enable route import from a specified protocol into RIP, use the redistribute (RIP) command. Additionally, you can apply a route map to the incoming routes to filter which routes are added to the RIP routing table. All connected routes are redistributed into RIP by default.

Example

This command redistributes all routes learned from OSPF into RIP.

```
switch(config-router-rip)#redistribute OSPF
switch(config-router-rip)#
```

15.1.2.2.3 Configuring RIP Timers

When RIP is running on the switch, it sends unsolicited route updates and deletes expired routes at regular intervals. To configure the timing of those events, use the timers (RIP) command. The command takes three parameters: the update interval, the route expiration time, and the route deletion time.

The update interval is the amount of time in seconds that the switch waits between sending unsolicited RIP route updates to its neighbors. The route expiration time is how long the switch waits before marking an unadvertised route for deletion (the counter resets whenever an advertisement for the route is received). And the route deletion time is how long the switch waits between marking a route for deletion and removing it from the routing table. During the deletion interval, the switch continues to forward packets on the route.

Example

This command sets the update interval to ***60*** seconds, expiration time to ***90*** seconds, and deletion time to ***150*** seconds.

```
switch(config-router-rip)#timers 60 90 150
switch(config-router-rip)#
```

15.1.2.2.4 Configuring an Interface to Transmit Broadcast RIP Updates

By default, the switch uses RIP version 2 and multicasts RIP update packets from all participating interfaces. To reconfigure a specific interface to send updates as broadcast packets, use the rip v2 multicast disable command in the configuration mode for the interface.

Example

The following commands configure RIP version 2 broadcasting on ***interface ethernet5***.

```
switch(config)#interface ethernet5
switch(config-if-Et5)#rip v2 multicast disable
switch(config-if-Et5)#exit
switch(config)#
```

15.1.2.3 Displaying RIP Information

15.1.2.3.1 Displaying RIP Routes

To see a listing of the RIP routes in the switch's routing table, use the show ip rip database command. (You can also display similar information using the RIP option in the show ip route command.)

Examples

- This command displays all active rip routes.

```
switch>show ip rip database
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

-
```
switch>show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

  This command submits a query for RIP route information for a network.

15.1.2.3.2 Displaying RIP Route Gateways

To see information about the switch's RIP route gateways, use the show ip rip neighbors command. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Example

This command displays information about all the gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway     Last-Heard   Bad-Packets   Bad-Routes   Flags
10.2.12.33  00:00:15                                SRC, TRSTED,
                                                    ACCPTED, RJCTED,
                                                    Q_RJCTED, AUTHFAIL
```

15.1.3 Configuring RIP on Multiple VRFs

VRF support for Routing Information Protocol (RIP) allows instances of RIP on multiple non-default VRFs on the same router. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The **vrf instance** and **vrf (Interface mode)** commands configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The router rip vrf command places the switch in router-RIP configuration mode to configure a RIP routing instance in a non-default VRF.

Examples

- These commands configure a non-default VRF and enable unicast routing in it.

```
switch(config)# vrf instance test
switch(config-vrf-test)# exit
switch(config)# ip routing vrf test
switch(config)#
```

- This command configures a RIP instance in a non-default VRF.

```
switch(config)# router rip vrf test
switch(config-router-rip-router-rip-vrf-test)# no shutdown
switch(config-router-rip)# exit
switch(config)#
```

- This command configures an interface as part of a non-default VRF by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

```
switch(config)# interface Ethernet 3 / 1
switch(config-if-Et3/1)# no switchport
switch(config-if-Et3/1)# ip address 1.0.0.1/24
switch(config-if-Et3/1)# vrf test
switch(config-if-Et3/1)# network 1.0.0.1
switch(config-if-Et3/1)# exit
switch(config)#
```

15.1.4 RIP Commands

Global Configuration Commands

- router rip
- router rip vrf

Interface Configuration Commands

- rip v2 multicast disable

Router-RIP Configuration Mode

- distance (RIP)
- distribute-list (RIP)
- metric default
- network (RIP)
- redistribute (RIP)
- shutdown (RIP)
- timers (RIP)

Display Commands – EXEC Mode

- show ip rip database
- show ip rip neighbors

15.1.4.1 distance (RIP)

The **distance** command assigns an administrative distance to routes that the switch learns through RIP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from ***1 to 255***; lower distance values correspond to higher reliability. The default RIP distance value is ***120***.

The **no distance** and **default distance** commands restore the administrative distance default value of ***120*** by removing the **distance** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

distance ***distance_value***

no distance

default distance

Parameter

distance_value distance assigned to RIP routes. Values range from ***1*** to ***255***.

Example

These commands assign an administrative distance of ***75*** to RIP routes.

```
switch(config)# router rip
switch(config-router-rip)# distance 75
switch(config-router-rip)#
```

15.1.4.2 distribute-list (RIP)

The **distribute-list** command allows users to filter out routes that are received or sent out. The distribute-list command influences which routes the router installs into its routing table and advertises to its neighbors.

Configuration Notes:

- Only one inbound distribute-list is allowed per interface.
- Only one outbound distribute-list is allowed per interface.
- Only one globally-defined inbound distribute-list is allowed.
- Only one globally-defined outbound distribute-list is allowed.
- Not all match clauses in a route-map are supported using RIP routes filtering. These match clauses for distribute-lists are supported:
  - **match ip address access-list**
  - **match ip address prefix-list**
- The **distribute-list** command does not enforce the specified route-map to contain only supported match clauses.
- Permit or deny can be specified in both prefix/access list and route-map configurations. The following rules apply when filtering routes:
  - Routes permitted by the prefix/access lists are treated as matched.
  - Matched routes are filtered based on the permit or deny option configured for the route-map clause.
  - Unmatched routes are further evaluated by the next route-map clause.
  - If a route does not match any clause in a route-map, it is denied.
  - If the route-map given in the **distribute-list** command is not configured, then all routes are permitted.
  - When multiple inbound (or outbound) distribute-lists are configured, only the most specific one is applied.

The **no distribute-list** and **default distribute-list** commands remove the corresponding **distribute-list** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

distribute-list DIRECTION MAP [**INTF**]

no distribute-list DIRECTION MAP [**INTF**]

default distribute-list DIRECTION MAP [**INTF**]

Parameters

- **DIRECTION** direction specifies if distribute-list is applied on inbound or outbound traffic. Valid options include:
  - **in** specifies inbound as the direction the distribute-list is applied.
  - **out** specifies outbound as the direction the distribute-list is applied.
- **MAP** specifies route map that assigns attribute values to the network. Options include:
  - ***no parameter*** attributes are not assigned through a route map.
  - **route-map *map_name*** attributes listed by specified route map are assigned to the network.
- **INTF** interface to be configured. Options include:
  - **ethernet *e_num*** Ethernet interface.
  - **loopback *l_num*** Loopback interface.

- **port-channel *p_num*** Port channel interface.
- **vlan *v_num*** VLAN interface.

Examples

- The following commands demonstrate that an **access-list** or **prefix-list** can be used within a ***route-map*** for use in a **distribute-list**.

```
switch(config)# ip prefix-list 8to24 seq 5 permit 0.0.0.0/0 ge 8 le 24
switch(config)# route-map myRouteMap permit 10
switch(config-route-map-myRouteMap)# match ip address prefix-list 8to24
switch(config-route-map-myRouteMap)# exit
switch(config)#
switch(config)# router rip
switch(config-router-rip)# distribute-list in route-map myRouteMap
switch(config-router-rip)#
```

- These commands suppress routes advertised on a particular interface.

```
switch(config)# ip prefix-list 2 seq 10 deny 30.1.1.0/24
switch(config)# route-map myRmOut permit 10
switch(config-route-map-myRmOut)# match ip address prefix-list 2
switch(config-route-map-myRouteMap)# exit
switch(config)# router rip
switch(config-router-rip)# distribute-list out route-map myRmOut
```

15.1.4.3 metric default

The **metric default** command specifies the metric value assigned to RIP routes learned from other protocols. All routes imported into RIP receive the default metric unless a matching route-map exists for the route. The route metric of ***0*** is assigned to redistributed connected and static routes. The default metric values range from ***0*** to ***16*** with a default value of ***1***.

The **no metric default** and **default metric default** commands remove the **metric default** command from ***running-config*** and returns the metric value to its default value of ***1***.

Command Mode

Router-RIP Configuration

Command Syntax

metric default ***metric_value***

no metric default

default metric default

Parameter

metric_value default metric value assigned. Values range from ***0 to 16***; default is ***1***.

Example

This command sets the default metric value to ***5***.

```
switch(config)# router rip
switch(config-router-rip)# metric default 5
switch(config-router-rip)#
```

15.1.4.4 network (RIP)

The **network** command specifies which network the switch runs Routing Information Protocol (RIP), and also specifies which routes will be accepted into the RIP routing table. Multiple network commands can be issued to create a network list on which RIP runs.

The switch enables RIP on all interfaces in the specified network.

The **no network** and **default network** commands disable RIP on the specified network by removing the corresponding **network** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

network NETWORK_ADDRESS

no network NETWORK_ADDRESS

default network NETWORK_ADDRESS

Parameters

NETWORK_ADDRESS network IP address. Entry formats include the following:

- ***ipv4_subnet*** IPv4 subnet (CIDR notation).
- ***ipv4_addr* mask *wildcard_mask*** IP address and wildcard-mask.

Examples

- This command enables RIP on ***10.168.1.1/24***.

```
switch(config)# router rip
switch(config-router-rip)# network 10.168.1.1/24
switch(config-router-rip)#
```

- This command also enables RIP on ***10.168.1.1/24***.

```
switch(config-router-rip)# network 10.168.1.1 mask 0.0.0.255
switch(config-router-rip)#
```

15.1.4.5 redistribute (RIP)

The **redistribute** command enables the importing of routes from a specified routing domain to RIP.

- **connected** by default, RIP redistributes all connected routes that are established when IP is enabled on an interface. The route-map parameter facilitates the exclusion of connected routes from redistribution by specifying a route map that denies the excluded routes.
- **BGP**, **OSPF**, and **IP static routes** by default, routes are not redistributed. The **redistribute** command without the route-map parameter facilitates the redistribution of all routes from the specified source.

The **no redistribute** and **default redistribute** commands reset the default route redistribution setting by removing the **redistribute** statement from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

redistribute connected **ROUTE_MAP**

redistribute **ROUTE_TYPE** [**ROUTE_MAP**]

no redistribute connected **ROUTE_MAP**

no redistribute **ROUTE_TYPE**

default redistribute connected **ROUTE_MAP**

default redistribute **ROUTE_TYPE**

Parameters

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - **BGP** routes from a BGP domain.
  - **OSPF** routes from an OSPF domain.
  - **OSPF match external** routes external to RIP, but imported from OSPF.
  - **OSPF match internal** OSPF routes that are internal to the AS.
  - **static** IP static routes.
- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - ***no parameter*** all routes are redistributed.
  - **route-map** ***map_name*** only routes in the specified route map are redistributed.

Example

These commands redistribute OSPF routes into RIP.

```
switch(config)# router rip
switch(config-router-rip)# redistribute OSPF
switch(config-router-rip)#
```

15.1.4.6 rip v2 multicast disable

The **rip v2 multicast disable** command specifies the transmission of Routing Information Protocol (RIP) Version 2 update packets from the configuration mode interface as broadcast to ***255.255.255.255***.

The **no rip v2 multicast disable** and **default rip v2 multicast disable** commands specify the transmission of update packets as multicast to ***224.0.0.9*** if the configuration mode interface is multicast capable. Updates are broadcast if the interface is not multicast capable.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

rip v2 multicast disable

no rip v2 multicast disable

default rip v2 multicast disable

Example

The following example configures version 2 broadcasting on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# rip v2 multicast disable
switch(config-if-Et5)# exit
switch(config)#
```

15.1.4.7 router rip vrf

The **router rip** command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

The **no router rip vrf** and **default router rip vrf** commands disable an RIP routing instance in the non-default VRF, and remove all user-entered **router-rip** configuration statements from ***running-config***. To disable RIP without removing configuration statements, use the shutdown (RIP) command.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

router rip vrf [**RIP_INSTANCE**]

no router rip vrf [**RIP_INSTANCE**]

default router rip vrf [**RIP_INSTANCE**]

Parameter

RIP_INSTANCE configure a RIP VRF instance in the non-default VRF.

Examples

- This command configures a RIP instance in the non-default VRF.

```
switch(config)# router rip vrf test
switch(config-router-rip-router-rip-vrf-test)# no shutdown
switch(config-router-rip)# exit
switch(config)#
```

- This command disables a RIP instance in the non-default VRF.

```
switch(config)# no router rip vrf test
switch(config)#
```

15.1.4.8 router rip

The **`router rip`** command places the switch in ***router-rip*** configuration mode to configure the Routing Information Protocol (RIP) routing process. Router-rip configuration mode is not a group change mode; ***running-config*** is changed immediately upon command entry. The **`exit`** command does not affect ***running-config***.

The **`no router rip`** and **`default router rip`** commands disable RIP and remove all user-entered **router-rip** configuration statements from ***running-config***. To disable RIP without removing configuration statements, use the **`shutdown (RIP)`** command.

The **`exit`** command returns the switch to the ***global*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`router rip`

`no router rip`

`default router rip`

Commands Available in router-rip Configuration Mode

- distance (RIP)
- network (RIP)
- redistribute (RIP)
- shutdown (RIP)
- timers (RIP)

Example

This command places the switch in the ***router-rip*** configuration mode.

```
switch(config)# router rip
switch(config-router-rip)#
```

15.1.4.9 show ip rip database

The **show ip rip database** command displays information about routes in the Routing Information Base. The default command displays active routes and learned routes not used in deference to higher priority routes from other protocols.

This command has the following forms:

- **default (no arguments):** information about all RIP routes.
- **IPv4 address and mask:** information about the referenced addresses.
- **active:** information about routes not superseded by routes from other protocols.

Command Mode

EXEC

Command Syntax

show ip rip database [**FILTER**]

Parameters

FILTER routing table entries that the command displays. Values include :.

- ***no parameter*** displays all routing table entries.
- **active** displays all active routing table entries.
- ***net_addr*** subnet address (CIDR or address-mask). Command displays entries in this subnet.

Examples

- This command displays all active rip routes.

```
switch> show ip rip database active
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

- This command submits a query for RIP route information for a network.

```
switch> show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

- This command returns information for all RIP routes.

```
switch> show ip rip database
10.1.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.2.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.3.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, inactive
10.212.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, active
10.214.0.0/255.255.255.0
[1] via 10.8.12.17, 00:00:30, Et4, active
```

15.1.4.10 show ip rip neighbors

The **show ip rip neighbors** command displays information about all RIP route gateways. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Command Mode

EXEC

Command Syntax

show ip rip neighbors

Example

The **show ip rip neighbors** command displays information about all gateways of RIP routes.

```
switch> show ip rip neighbors
Gateway     Last-Heard      Bad-Packets     Bad-Routes    Flags
10.2.12.33  00:00:15                                      SRC, TRSTED,
                                                          ACCPTED, RJCTED,
                                                          Q_RJCTED, AUTHFAIL
```

15.1.4.11 shutdown (RIP)

The **shutdown** command disables RIP on the switch without modifying the RIP configuration. RIP is disabled by default.

The **no shutdown** command enables RIP. The **default shutdown** command disables RIP.

Command Mode

Router-RIP Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- This command disables RIP on the switch.

```
switch(config)# router rip
switch(config-router-rip)# shutdown
switch(config-router-rip)#
```

- This command enables RIP on the switch.

```
switch(config-router-rip)# no shutdown
switch(config-router-rip)#
```

15.1.4.12 timers (RIP)

The **timers** command configures the update interval, the expiration time, and the deletion time for routes received and sent through RIP. The command requires value declaration of all values.

- The update time is the interval between unsolicited route responses.
- The expiration time is initialized when a route is established and any time an update is received for the route.
- The deletion time is initialized when the expiration time elapses and the route is invalid. It is retained in the routing table until deletion time expiry.

The **no timers** and **default timers** commands return the timer values to their default values by removing the **timers** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

timers ***update_time expire_time deletion_time***

no timers

default timers

Parameters

- ***update_time*** Default is ***30*** seconds.
- ***expire_time*** Default is ***180*** seconds.
- ***deletion_time*** Default is ***120*** seconds.

Parameter values are in seconds and range from ***5 to 2147483647***.

Example

This command sets the update (***60*** seconds), expiration (***90*** seconds), and deletion (***150*** seconds) times.

```
switch(config)# router rip
switch(config-router-rip)# timers 60 90 150
switch(config-router-rip)#
```

15.2 Open Shortest Path First – Version 2

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 2 is defined by ***RFC 2328***.

This section contains the following topics:

15.2.1 OSPFv2 Introduction

This section contains the following topics:

15.2.1.1 Supported Features

Arista switches support the following OSPFv2 functions:

- A single OSPFv2 instance.
- Intra- and inter-area routing.
- Type 1 and 2 external routing.
- Broadcast and P2P interfaces.
- Stub areas.
- Not so stubby areas (NSSA) (***RFC 3101***).
- MD5 Authentication.
- Redistribution of static, IP, and BGP routes into OSPFv2 with route map filtering.
- Opaque LSAs (***RFC 2370***).
- Graceful restart (***RFC 3623***).
- OSPF Routes over GRE Tunnels

15.2.1.2 Features Not Supported

The following OSPFv2 functions are not supported in the current version:

- NBMA, demand circuit, and P2MP interfaces
- OSPFv2 MIB support

15.2.2 OSPFv2 Conceptual Overview

This section contains the following topics:

15.2.2.1 Storing Link States

OSPFv2 is a dynamic, link-state routing protocol, where links represent interfaces or routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A Link State Advertisement (LSA) is an OSPFv2 packet that communicates a router's topology to other routers. The Link State DataBase (LSDB) stores an areas topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

15.2.2.2 Topology

An Autonomous System (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv2, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv2 defines these routers:

- Internal Router (IR) a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area Border Router (ABR) a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous System Boundary Router (ASBR) a gateway router connecting the OSPFv2 domain to external routes, including static routes and routes from other autonomous systems.
- **OSPFv2 Router Types** displays the OSPFv2 router types.

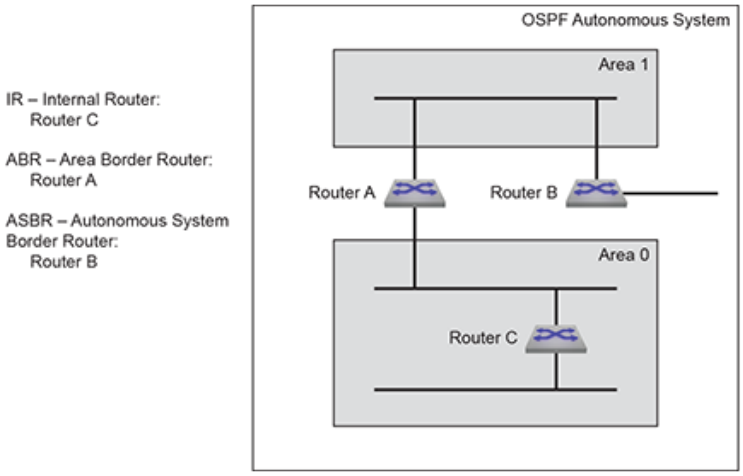

Figure 45: OSPFv2 Router Types

OSPFv2 areas are assigned a number between ***0*** and ***4,294,967,295*** (2321). Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv2 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.

- Not-So-Stubby-Area (NSSA) may import external routes from an ASBR, does not receive external routes from the backbone, and does not propagate external routes to other areas.

15.2.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A routers hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

OSPFv2 Neighbors illustrates OSPFv2 neighbors.

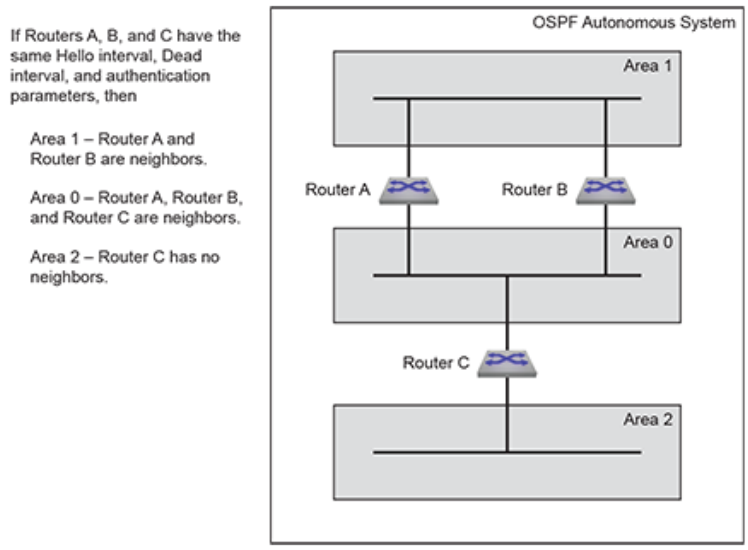

Figure 46: OSPFv2 Neighbors

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv2 routers distribute LSAs by sending them on all of their active interfaces. The router generates an LSA for a network defined and active on a passive interface but will not transmit this LSA on the passive interface as no adjacencies are formed.

When a routers LSDB is changed by an LSA, it sends the changes to the DR and BDR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routers use Dijkstras algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

15.2.2.4 OSPFv2 Route Redistribution Instance

OSPFv2 Route Redistribution is used for redistributing OSPFv2 leaked and non-leaked routes from one instance to another when multiple OSPFv2 instances are configured. The OSPFv2 Route Redistribution is supported on all platforms in the multi-agent routing mode.

15.2.2.5 OSPFv2 and BFD Sessions for Adjacencies in any State

- BFD sessions are only established for OSPFv2 adjacencies that are in the FULL state. In a LAN environment this results in BFD sessions not being established for OSPFv2 adjacencies with DR Other neighbors.
- This feature provides configuration that enables the establishment of BFD sessions for OSPFv2 adjacencies that are in any state. This results in the BFD sessions being established for OSPFv2 adjacencies with DR Other neighbors.

15.2.2.6 OSPFv2 Multiple Instances Support

EOS Release 4.22.1F adds support for multiple OSPFv2 instances to be configured in the default VRF. OSPFv2 Multiple Instances Support provides isolation and allows segregating and dividing the link state database based on the interface.

Basic OSPFv2 functionality along with redistribution of OSPFv2 routes (all instances) into BGP and default information originate always is available forward from the ***EOS Release 4.22.1F***.

Support for graceful restart and BFD with multiple OSPFv2 instances was added in the ***EOS Release 4.23.1***.

15.2.2.6.1 OSPFv2 Multiple Instances Support Platform Compatibility

OSPFv2 Multiple Instances Support is supported on all platforms.

15.2.2.7 OSPF Routes over GRE Tunnels

This feature introduces the support for OSPF routes over GRE tunnels under default as well as non-default VRFs. The feature is disabled by default.

15.2.2.7.1 Limitations

The platform does not support any arbitrarily created TCAM profile. When the TCAM profile cannot be programmed, the show command prints **ERROR** in the status column.

15.2.3 Configuring OSPFv2

These sections describe basic OSPFv2 configuration steps:

- Configuring the OSPFv2 Instance
- Configuring OSPFv2 Areas
- Support for OSPFv2 dn-bit-ignore
- OSPFv2 Area Filter by Prefix-List
- IPv4 Unnumbered Interfaces
- Configuring Interfaces for OSPFv2
- Enabling OSPFv2
- OSPFv2 Multiple Instances Support Configuration
- OSPF Routes over GRE Tunnels Configuration
- Displaying OSPFv2 Status

15.2.3.1 Configuring the OSPFv2 Instance

15.2.3.1.1 Entering OSPFv2 Configuration Mode

The **router ospf** command places the switch in router-ospf configuration mode and creates an OSPFv2 instance if one was not previously created. The switch only supports one OSPFv2 instance and all OSPFv2 configuration commands apply to this instance.

When an OSPFv2 instance is already configured, the command must specify its process ID. Any attempt to define additional instances will fail and generate errors.

The process ID is local to the router and is used to identify the running OSPFv2 process. Neighbor OSPFv2 routers can have different process ID's.

Example

This command places the switch ***in router-ospf*** configuration mode and, if not previously created, creates an OSPFv2 instance with a process ID of ***100***.

```
switch(config)# router ospf 100
switch(config-router-ospf)#
```

15.2.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv2. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address, if a loopback interface is active on the switch.
3. The highest IP address on the router.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The router-id (OSPFv2) command configures the router ID for an OSPFv2 instance.

Example

This command assigns ***10.1.1.1*** as the OSPFv2 router ID.

```
switch(config-router-ospf)# router-id 10.1.1.1
switch(config-router-ospf)#
```

15.2.3.1.3 Global OSPFv2 Parameters

These router-ospf configuration mode commands define OSPFv2 behavior.

LSA Overload

The **max-lsa (OSPFv2)** command specifies the maximum number of LSAs allowed in an LSDB database and configures the switch behavior when the limit is approached or exceeded. An LSA overload condition triggers these actions:

- **Warning**: the switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown**: when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period (the default is ***5*** minutes).

- **Permanent shutdown**: the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is ***5***). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

OSPFv2 is re-enabled with a **`router ospf`** command.

The LSDB size restriction is removed by setting the LSA limit to zero.

Note: if OSPFv2 has entered permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2, and will disable overload protection.

Example

- This command configures the OSPFv2 maximum LSA count to ***20000*** and triggers these actions:
  - The switch logs an **`OSPF MAXLSAWARNING`** if the LSDB has ***8000*** LSAs (***40%*** of ***20000***).
  - The switch temporarily disables OSPFv2 for ***10*** minutes if the LSDB contains ***20000*** LSAs.
  - The switch permanently disables OSPFv2 after four temporary OSPFv2 shutdowns.
  - The shutdown counter resets if the LSDB contains less than 20,000 LSAs for ***20*** minutes.

```
switch(config-router-ospf)# max-lsa 20000 40 ignore-time 10 ignore-
count 4 reset-time 20
switch(config-router-ospf)#
```

Logging Adjacency Changes

The **`log-adjacency-changes (OSPFv2`** command configures the switch to log OSPFv2 link-state changes and transitions of OSPFv2 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv2 neighbors into the up or down state.

```
switch(config-router-ospf)# log-adjacency-changes
switch(config-router-ospf)#
```

- This command configures the switch to log all OSPFv2 link-state changes.

```
switch(config-router-ospf)# log-adjacency-changes detail
switch(config-router-ospf)#
```

OSPF RFC Compatibility

RFC 2328 and ***RFC 1583*** specify different methods for calculating summary route metrics. The compatible (OSPFv2) command allows the selective disabling of compatibility with ***RFC 2328***.

Example

This command sets the OSPF compatibility list with ***RFC 1583***.

```
switch(config)# router ospf 6
switch(config-router-ospf)# compatible rfc1583
switch(config-router-ospf)#
```

Administrative Distance

The **`distance ospf (OSPFv2)`** command configures the administrative distance for intra-area, inter-area, or external OSPF routes. To configure the administrative distance for multiple route types,

the command must be entered multiple times. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for all routes is ***110***.

Note: OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether it is adjusted by entering the **`distance ospf`** command directly through the CLI or by applying a configuration file that contains the command.

Example

This command configures an administrative distance of **`95`** for OSPFv2 intra-area routes, and will cause links to flap if issued while OSPF is running.

```
switch(config-router-ospf)# distance ospf intra-area 95
switch(config-router-ospf)#
```

Passive Interfaces

The **`passive-interface (OSPFv2)`** command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Passive interfaces send LSAs but do not receive them. The router does not send or process OSPFv2 packets received on passive interfaces. The router advertises the passive interface in the router LSA.

The **`no passive-interface`** command re-enables OSPFv2 processing on the specified interface.

Examples

- This command configures ***vlan 2*** as a passive interface.

  ```
  switch(config-router-ospf)# passive-interface vlan 2
  switch(config-router-ospf)#
  ```

- This command configures ***vlan 2*** as an active interface.

  ```
  switch(config-router-ospf)# no passive-interface vlan 2
  switch(config-router-ospf)#
  ```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

Example

The **`redistribute (OSPFv2) connected`** command converts connected routes to OSPFv2 external routes.

```
switch(config-router-ospf)# redistribute connected
switch(config-router-ospf)#
```

Redistributing Static Routes

Redistributing static routes causes the OSPFv2 instance to advertise all static routes on the switch as external OSPFv2 routes. The switch does not support redistributing individual static routes.

Examples

- The **`redistribute (OSPFv2)`** static command converts the static routes to OSPFv2 external routes.

  ```
  switch(config-router-ospf)# redistribute static
  ```

```
switch(config-router-ospf)#
```

- The **no** **redistribute (OSPFv2)** command stops the advertising of the static routes as OSPFv2 external routes.

```
switch(config-router-ospf)# no redistribute static
switch(config-router-ospf)#
```

Filtering Routes with Distribute Lists

An OSPF distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs; this filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. An OSPF router instance can have one distribute list configured.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **distribute-list in** command specifies the filter to be used and applies it to the OSPF instance.

Example

These commands configure a prefix-list named ***dist_list1*** in OSPF instance ***5*** to filter certain routes from incoming OSPF LSAs.

```
switch(config)# router ospf 5
switch(config-router-ospf)# distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#
```

15.2.3.1.4 Configuring OSPFv2 Route Redistribution

Use the **redistribute ospf instance** command to redistribute either the non-leaked routes, or both leaked and non-leaked routes. This command is configured under the ***router-ospf*** mode.

Examples

- The **leaked** clause includes both internal annd external routes.

```
switch(config-router-ospf)# redistribute ospf instance include leaked
<cr>
Options:
  include    Include leaked routes
  match      Routes learned by the OSPF protocol
  route-map  Specify which route map to use
```

- The **match** clause allows matching on the different OSPFv2 route types.

```
switch(config-router-ospf)# redistribute ospf instance match external
<cr>
Options:
  external       OSPF routes learned from external sources
  internal       OSPF routes learned from internal sources
  nssa-external  OSPF routes learned from external NSSA sources
```

- The following command redistributes the OSPFv2 external routes from all other OSPFv2 instances in the same VRF into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance match external
```

- The following command redistributes the OSPFv2 internal leaked and non-leaked routes from all other instances in all VRFs into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance include leaked
 match internal
```

- Matching based on the OSPFv2 instance ID is supported in the route-map.

```
switch(config)# route-map rm1 permit 10
switch(config-route-map-rm1)# match ospf instance 3
```

- The following command redistributes the OSPFv2 external routes from the OSPFv2 instance with ***ID 3*** in the same VRF into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance match external
 route-map rm1
```

Show Commands

- The **`show ip ospf database external`** command is used to verify if the AS-External LSAs are created in the instance for the redistributed route and advertised into the OSPFv2 domain.
- The **`show route-map`** command is used to display the details of a configured route-map.

15.2.3.2 Configuring OSPFv2 Areas

OSPFv2 areas are configured through area commands. The switch must be in ***router-ospf*** configuration mode, as described in **Entering OSPFv2 Configuration Mode**, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv2 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

15.2.3.2.1 Configuring the Area Type

The **`area (OSPFv2)`** commands specifies the area type, refer **OSPFv2 Commands** section for the **`area`** commands. The switch supports three area types:

- **Normal area:** Area that accepts intra-area, inter-area, and external routes. The backbone area (area ***0***) is a normal area.
- **Stub area:** Area that does not advertise external routes. External routes are reached through a default summary route (***0.0.0.0***). Networks with no external routes do not require stub areas.
- **Not So Stubby Area (NSSA):** ASBRs advertise external LSAs directly connected to the area. External routes from other areas are not advertised and are reached through a default summary route.

The default area type is normal.

Examples

- This command configures area ***45*** as a stub area.

```
switch(config-router-ospf)# area 45 stub
switch(config-router-ospf)#
```

- This command configures area ***10.92.148.17*** as an NSSA.

```
switch(config-router-ospf)# area 10.92.148.17 NSSA
switch(config-router-ospf)#
```

15.2.3.2.2 Blocking All Summary Routes from Flooding the NSSA

The area nssa no-summary (OSPFv2) command configures the router to not import type-3 summary LSAs into the Not-So-Stubby Area (NSSA) and injects a default summary route (***0.0.0.0/0***) into the NSSA to reach the inter-area prefixes.

Example

This command directs the device not to import type-3 summary LSAs into the NSSA area and injects a default summary route (***0.0.0.0/0***) into the NSSA area.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#
```

15.2.3.2.3 Assigning Network Segments to the Area

Assigning Routes to an Area

The **network area (OSPFv2)** command assigns the specified network segment to an OSPFv2 area. The network can be entered in CIDR notation or by an address and wildcard mask.

The switch zeroes the host portion of the specified network address e.g. ***1.2.3.4/24*** converts to ***1.2.3.0/24*** and ***1.2.3.4/16*** converts to ***1.2.0.0/16***.

Example

Each of these equivalent commands assign the network segment ***10.1.10.0/24*** to area ***0***.

```
switch(config-router-ospf)# network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf)# network 10.1.10.0/24 area 0
```

In each case, ***running-config*** stores the command in CIDR (prefix) notation.

Summarizing Routes

By default, ABRs create a summary LSA for each route in an area and advertise them to adjacent routers. The **area range (OSPFv2)** command aggregates routing information, allowing the ABR to advertise multiple routes with one LSA. The **area range (OSPFv2)** command can be used to suppress route advertisements.

Examples

- Two **network area** command assigns subnets to an area. The **area range (OSPFv2)** command summarizes the addresses, which the ABR advertises in a single LSA.

  ```
  switch(config-router-ospf)# network 10.1.25.80 0.0.0.240 area 5
  switch(config-router-ospf)# network 10.1.25.112 0.0.0.240 area 5
  switch(config-router-ospf)# area 5 range 10.1.25.64 0.0.0.192
  switch(config-router-ospf)#
  ```

- The **network area** command assigns a subnet to an area, followed by an **area range (OSPFv2)** command that suppresses the advertisement of that subnet.

  ```
  switch(config-router-ospf)# network 10.12.31.0 0.0.0.255 area 5
  switch(config-router-ospf)# area 5 range 10.12.31.0 0.0.0.255 not-
  advertise
  switch(config-router-ospf)#
  ```

15.2.3.2.4 Configuring Area Parameters

These router-ospf configuration mode commands define OSPFv2 behavior in a specified area.

Default Summary Route Cost

The **area default-cost (OSPFv2)** command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination.

Example

This command configures a cost of ***15*** for the default summary route in area ***23***.

```
switch(config-router-ospf)# area 23 default-cost 15
switch(config-router-ospf)#
```

Filtering Type 3 LSAs

The area filter (OSPFv2) command prevents an area from receiving Type 3 (Summary) LSAs from a specified subnet. Type 3 LSAs are sent by ABRs and contain information about one of its connected areas.

Example

This command prevents the switch from entering Type 3 LSAs originating from the ***10.1.1.2/24*** subnet into its ***area 2*** LSDB.

```
switch(config-router-ospf)# area 2 filter 10.1.1.2/24
switch(config-router-ospf)#
```

15.2.3.3 Support for OSPFv2 dn-bit-ignore

The OSPFv2 **dn-bit-ignore** command allows enabling or disabling the inclusion of LSAs having “Down” (DN) bit set in SPF calculations. The DN Bit is a loop prevention mechanism that implements when using OSPF as a CE - PE IGP protocol.

OSPFv2 only honors the DN-bit in **type-3** LSAs in non-default VRFs. Starting with ***Release EOS-4.25.0F***, OSPFv2 honors the DN-bit in **type-5** and **type-7** LSAs in non-default VRFs. This means that the type-3/5/7 LSAs with DN-bit set are not in SPF calculation, and any routes that carry LSAs are not installed in the routing table. This behavior changes when using the **dn-bit-ignore lsa type-5 type-7** command.

15.2.3.3.1 Configuration

OSPFv2

Use the command **dn-bit-ignore** to ignore the DN-bit in type-3/5/7 LSAs.

Use the command **dn-bit-ignore lsa type-5 type-7** to include only type-5, and type-7 LSAs having their DN-bit set in the SPF calculation. The commands **no dn-bit-ignore lsa type-5 type-7** or **default dn-bit-ignore lsa type-5 type-7** are configured to revert the behavior back to default. This command is available in **router ospf PROCESS_ID vrf VRF_NAME** configuration mode.

Note: This command is not available in the default VRF.

This command is for backwards compatibility to revert the behavior seen prior to Release ***EOS-4.25.0*** where the type-5 and type-7 LSAs with DN-bit set would get included in the SPF calculations.

```
(config)# router ospf 1 vrf red
(config-router-ospf-vrf-red)#?
...
 dn-bit-ignore             Disable DN-bit check for Type-3, Type-5 and
 Type-7 LSAs in non-default VRFs
...
(config-router-ospf-vrf-red)#dn-bit-ignore ?
  lsa   Disable DN-bit check only for Type-5 and Type-7 LSAs in non-
default VRFs
  <cr>
(config-router-ospf-vrf-red)#dn-bit-ignore lsa type-5 type-7
```

OSPFv3

Use the command **dn-bit-ignore** to include type-3/5/7 LSAs having their DN-bit set in the SPF calculation.

Use the commands **dn-bit-ignore** or **default dn-bit-ignore** to revert the behavior back to default. This command is available in **ipv6 router ospf PROCESS_ID vrf VRF_NAME** configuration mode and **router ospfv3 vrf <VRF_NAME>** configuration mode. Note that this command is not available in the default VRF, and that both configuration styles are captured below.

router ospfv3 Configuration Style

The **dn-bit-ignore** command is available under the **router ospfv3 vrf VRF_NAME** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
(config)# router ospfv3 vrf red
(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

ipv6 router ospf Configuration Style

The **dn-bit-ignore** command is also available under the **ipv6 router ospf PROCESS_ID vrf VRF_NAME** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
(config)# ipv6 router ospf 1 vrf red
(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

15.2.3.3.2 Show Commands

Use the **show running-config** command to verify whether the **dn-bit-ignore** command is configured.

15.2.3.4 OSPFv2 Area Filter by Prefix-List

The **ospf area <area_id> filter** command configures the set of prefixes to be filtered for multi-agent routing and the ribd routing protocols. Area filters are used to prevent specific prefixes from being announced by an area as Type 3 summary LSAs or as Type 4 ABSR summary LSAs in an OSPFv2 Area Border Router (ABR).

Examples

The following configures a prefix-list filter to permit two prefixes and deny all others.

```
switch(config)# ip prefix-list type3Permit
switch(config-ip-pfx)# ip seq 10 permit 10.0.1.0/24
switch(config-ip-pfx)# ip seq 20 permit 10.0.2.0/24
switch(config-ip-pfx)# ip seq 30 deny 10.0.0.0/0
switch(config-ip-pfx)# exit
```

The following applies the filter to the backbone area.

```
switch(config)# router ospf 1
switch(config-router-ospf)# area 0 filter prefix-list type3Permit
```

The following configures a prefix-list to deny a list of prefixes and permit all others.

```
switch(config)# ip prefix-list type3Deny
switch(config-ip-pfx)# ip seq 10 deny 10.0.1.0/24
switch(config-ip-pfx)# ip seq 20 deny 10.0.2.0/24
switch(config-ip-pfx)# exit
```

The following applies the filter.

```
switch(config)# router ospf 1
switch(config-router-ospf)# area 1.1.1.1 filter prefix-list type3Deny
```

Show commands

The following displays the output of **`show ip ospf`** with the area filter listed.

```
switch# show ip ospf
Area 3.3.3.3
 Number of interface in this area is 2
   It is a normal area
   Traffic engineering is disabled
   Area has None authentication
   SPF algorithm executed 1 times
   Number of LSA 1. Checksum Sum 53568
   Number of opaque link LSA 0. Checksum Sum 0
   Number of opaque area LSA 0. Checksum Sum 0
   Area ranges are
      3.3.0.0/16 Cost 0 Advertise
      3.30.0.0/16 Cost 0 Advertise
   Area filter prefix-list type3Permit
```

15.2.3.5 IPv4 Unnumbered Interfaces

The **`ip address unnumbered`** command specifies a lending interface from which many interfaces may borrow the same address, reducing the number of unique IPv4 addresses needed. A lending interface is a loopback interface. Only one borrowing interface is referenced to one lender at a time even though multiple loopbacks may be used as lending interfaces. Unnumbered interfaces may reference the same or different lending interfaces. Any IPv4 routed interface is configurable as unnumbered interface and is referenced to one lending interface.

The following configures an unnumbered borrowing interface.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# ip address unnumbered Loopback1
```

OSPF configuration

To enable OSPF on an unnumbered interface, configure the area and set the network type to point-to-point under the ***interface*** config mode.

```
switch(config-if-Et1)# ip ospf area 1
switch(config-if-Et1)# ip ospf network point-to-point
```

Note: The **network** command under ***router ospf configuration mode*** is not supported for the configuration of unnumbered interfaces. You must specify the area and **network point-to-point** command in the configuration context of the unnumbered interface.

Enabling OSPF on the lending interface in the same area as the borrowing interfaces is recommended. For different unnumbered interfaces in different areas, configure them to use different loopbacks.

```
switch(config)# interface loopback 1
switch(config-if-Lo1)# ip address 1.1.1.1/32
switch(config-if-Lo1)# ip ospf area 1
```

ISIS configuration

To enable ISIS on an unnumbered interface, configure the area and set the network type to point-to-point under the ***interface*** config mode.

```
switch(config-if-Et1)# isis enable inst1
switch(config-if-Et1)# isis network point-to-point
```

Enabling ISIS on the lending interface in the same area as the borrowing interfaces is recommended.

```
switch(config)# interface loopback 1
switch(config-if-Lo1)# ip address 1.1.1.1/32
switch(config-if-Et1)# isis enable inst1
switch(config-if-Et1)# isis network point-to-point
```

Show commands

The same IP address that may be in use on multiple interfaces at the same time, and is displayed as shown below.

The following displays the output of show ip interface brief. In this example, Ethernet ***2-5*** are all unnumbered and borrowing from ***loopback1***.

```
switch(config-if-Et2)# show ip interface brief
Address
Interface    IP Address   Status  Protocol   MTU    Owner
-----------  -----------  ------- ---------  -------  -------
Ethernet1    1.1.2.1/24   up       up        1500
Ethernet2    1.1.1.1/32   up       up        1500    Lo1
Ethernet3    1.1.1.1/32   up       up        1500    Lo1
Ethernet4    1.1.1.1/32   up       up        1500    Lo1
Ethernet5    1.1.1.1/32   up       up        1500    Lo1
Loopback1    1.1.1.1/32   up       up        65535
```

The following displays OSPF with two adjacencies with the same peer via ***Ethernet 2*** and ***Ethernet 3***. The same **Neighbor ID** is listed for both interfaces. IS-IS behaves similarly.

```
switch(config-if-Et2)#show ip ospf neighbor
Neighbor ID   Instance VRF      Pri State    Dead Time  Address  Interface
2.2.1.1       1        default  0   FULL     00:00:36   2.2.1.1  Ethernet3
```

```
2.2.1.1         1          default  0    FULL     00:00:34    2.2.1.1  Ethernet2
```

Limitations

- Configuring the addresses on the lending loopbacks as ***/32*** is recommended. In order to resolve routes via an unnumbered peer, the***/32*** address is required. Configuring a lending loopback as ***/32*** and enabling OSPF/ISIS on it propagates that prefix.
- Use only loopback interfaces as a lending interface.
- Enable only one IGP on a lending loopback interface. For multiple IGPs enable each on a different loopback.
- Configure only one BFD multi-hop session per loopback.
- SSO is not supported for BFD multihop sessions over unnumbered interfaces.
- OSPFv3 does not support unnumbered interface addressing.

15.2.3.6 Configuring Interfaces for OSPFv2

OSPFv2 interface configuration commands specify transmission parameters for routed ports and SVIs that handle OSPFv2 packets.

15.2.3.6.1 Configuring Authentication

OSPFv2 authenticates packets through passwords configured on VLAN interfaces. Interfaces connecting to the same area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

OSPFv2 supports simple password and message digest authentication:

- Simple password authentication: A password is assigned to an area. Interfaces connected to the area can authenticate packets by enabling authentication and specifying the area password.
- Message digest authentication: Each interface is configured with a key (password) and key-id pair. When transmitting a packet, the interface generates a string, using the MD5 algorithm, based on the OSPFv2 packet, key, and key ID, then appends that string to the packet.

Message digest authentication supports uninterrupted transmissions during key changes by allowing each interface to have two keys with different key IDs. When a new key is configured on an interface, the router transmits OSPFv2 packets for both keys. Once the router detects that all neighbors are using the new key, it stops sending the old one.

Implementing authentication on an interface is a two step process:

1. Enabling authentication.
2. Configuring a key (password).

To configure simple authentication on a VLAN interface:

1. Enable simple authentication with the **`ip ospf authentication`** command.

```
switch(config-if-vl12)# ip ospf authentication
```

2. Configure the password with the **`ip ospf authentication-key`** command.

```
switch(config-if-vl12)# ip ospf authentication-key 0 code123
```

The ***running-config*** stores the password as an encrypted string, using a proprietary algorithm.To configure Message-Digest authentication on a VLAN interface:

1. Enable Message-Digest authentication with the **`ip ospf authentication`** command.

```
switch(config-if-vl12)# ip ospf authentication message-digest
```

2. Configure the key ID and password with the **ip ospf message-digest-key** command.

```
switch(config-if-vl12)# ip ospf message-digest-key 23 md5 0 code123
```

The ***running-config*** stores the password as an encrypted string, using a proprietary algorithm. The key ID (***23***) is between keywords **message-digest-key** and **md5**.

15.2.3.6.2 Configuring Intervals

Interval configuration commands determine OSPFv2 packet transmission characteristics for the specified VLAN interface and are entered in ***interface-vlan*** configuration mode.

Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv2 neighbor should specify the same hello interval, which should not be longer than any neighbors dead interval.

The ip ospf hello-interval command configures the hello interval for the configuration mode interface. The default is ***10*** seconds.

Example

This command configures a hello interval of ***30*** seconds for ***VLAN 2***.

```
switch(config-if-Vl2)# ip ospf hello-interval 30
switch(config-if-Vl2)#
```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv2 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv2 neighbors and be longer than the hello interval of any neighbor.

The **ip ospf dead-interval** command configures the dead interval for the configuration mode interface. The default is ***40*** seconds.

Example

This command configures a dead interval of ***120*** seconds for ***vlan 4***.

```
switch(config-if-Vl4)# ip ospf dead-interval 120
switch(config-if-Vl4)#
```

Retransmit Interval

Routers that send OSPFv2 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmit interval specifies the period between retransmissions.

The **ip ospf retransmit-interval** command configures the LSA retransmission interval for the configuration mode interface. The default retransmit interval is ***5*** seconds.

Example

This command configures a retransmit interval of ***15*** seconds for ***vlan 3***.

```
switch(config-if-Vl3)# ip ospf retransmit-interval 15
switch(config-if-Vl3)#
```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv2 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor. The default transmission delay is one second.

The **ip ospf transmit-delay** command configures the transmission delay for the configuration mode interface.

Example

This command configures a transmission delay of ***5*** seconds for ***vlan 6***.

```
switch(config-if-Vl6)# ip ospf transmit-delay 5
switch(config-if-Vl6)#
```

15.2.3.6.3 Configuring Interface Parameters

Interface Cost

The OSPFv2 interface cost (or metric) reflects the overhead of sending packets across the interface. The cost is typically inversely proportional to the bandwidth of the interface. The default cost is ***10***.

The **ip ospf cost** command configures the OSPFv2 cost for the configuration mode interface.

Example

This command configures a cost of ***15*** for ***vlan 2***.

```
switch(config-if-Vl2)# ip ospf cost 15
switch(config-if-Vl2)#
```

Router Priority

Router priority determines preference during Designated Router (DR) and Backup Designated Router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The ip ospf priority command configures router priority for the configuration mode interface. The default priority is 1.

Examples

- This command configures a router priority of ***15*** for ***vlan 8***.

```
switch(config-if-Vl8)# ip ospf priority 15
switch(config-if-Vl8)#
```

- This command restores the router priority of ***1*** for ***vlan 7***.

```
switch(config-if-Vl7)# no ip ospf priority
switch(config-if-Vl7)#
```

15.2.3.7 Enabling OSPFv2

15.2.3.7.1 Disabling OSPFv2

The switch can disable OSPFv2 operations without disrupting the OSPFv2 configuration.

- **shutdown (OSPFv2)** disables all OSPFv2 activity.
- **ip ospf disabled** disables OSPFv2 activity on a VLAN interface.

The **no shutdown** and **no ip ospf disabled** commands resume OSPFv2 activity.

Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config-router-ospf)# shutdown
switch(config-router-ospf)#
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf)# no shutdown
switch(config-router-ospf)#
```

- This command disables OSPFv2 activity on VLAN 5.

```
switch(config-if-Vl5)# ip ospf disabled
switch(config-if-Vl5)#
```

15.2.3.7.2 IPv4 Routing

OSPFv2 requires that IPv4 routing is enabled on the switch. When IP routing is not enabled, entering OSPFv2 configuration mode generates a message.

Examples

- This message is displayed if, when entering the ***router-ospf*** configuration mode, IP routing is not enabled.

```
switch(config)# router ospf 100
! IP routing not enabled
switch(config-router-ospf)#
```

- This command enables IP routing on the switch.

```
switch(config)# ip routing
switch(config)#
```

15.2.3.8 OSPFv2 Multiple Instances Support Configuration

The existing OSPFv2 configuration commands remain unchanged and are used for configuring multiple OSPFv2 instances. Each OSPFv2 instance in the default VRF is identified by a unique instance ID.

router ospf *id* [vrf | general]

15.2.3.8.1 Redistribute Configuration

Configuring the **redistribute ospf** command under the ***config-router-bgp*** mode with multiple OSPFv2 instances configured redistributes routes from all OSPFv2 instances into BGP.

These commands redistribute OSPFv2 routes into the BGP domain.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute OSPF
switch(config-router-bgp)#
```

15.2.3.8.2 Special Cases

Route Selection in case of Ties between Instances

When the same prefix happens to be learned in multiple instances with the same metric, route-type are used as the first criteria to tie break:

O > O IA > N1 > N2 > E1 > E2

```
Codes: O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2
```

When routes have identical route-type as well, the route with the lowest nexthop IP address is selected.

Note: An ECMP route is not created in this case.

Overlapping Network Statements Configured

The CLI does not guard against overlapping network statements configured in different instances. This state is a misconfiguration.

15.2.3.8.3 OSPFv2 Multiple Instances Limitations

- OSPFv2 Multiple Instances is available only with the multi-agent routing protocol model.
- Only one interface can only have one instance of OSPFv2 running at any point in time.
- All the OSPFv2 instances must be in the default VRF.
- Multiple OSPFv2 instances can not be connected to the same network or configured with interfaces in the same area. In particular, multiple OSPFv2 instances may not be connected to the same instance on another router, in the same area.
- The following features are not supported with multiple OSPFv2 instances:
  - Redistributing routes from a specific OSPFv2 instance into BGP.
  - Redistribution of routes into an OSPFv2 instance.
  - Per interface area configuration.
  - Passive interface configuration.
  - SNMP.
  - Summary address.
  - Service ACL.
  - Max Metric with **`on-startup`** configuration.

15.2.3.9 OSPF Routes over GRE Tunnels Configuration

The following commands may be employed in the router OSPF mode:

- tunnel routes
- **`no tunnel routes`**
- **`default tunnel routes`**

To enable OSPFv2 over GRE tunnels, use the following commands:

```
switch(config)# router ospf 6
switch(config-router-ospf)# tunnel routes
switch(config-router-ospf)#
```

To disable OSPFv2 routes over GRE tunnels, use the following commands:

```
switch(config)# router ospf 6
switch(config-router-ospf)# no tunnel routes
switch(config-router-ospf)#
```

To enable the default OSPFv2 routes over GRE tunnels, use the following commands:

```
switch(config)# router ospf 6
switch(config-router-ospf)# default tunnel routes
switch(config-router-ospf)#
```

15.2.3.9.1 TCAM Profile Configuration

On DCS-7020, DCS-7280R/R2, or DCS-7500R/R2 enabling OSPF routes over GRE tunnels requires the system TCAM profile to have “Tunnel IPv4” feature enabled so that control packets such as OSPF hellos received over GRE tunnel interfaces are appropriately classified. This can be achieved by creating a user defined TCAM profile as described below.

The user defined TCAM profile can be created either manually from scratch or by copying from an existing TCAM profile. The system TCAM profile must have the feature **tunnel ipv4** for the OSPFv2 over GRE tunnel interfaces to work. This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

15.2.3.9.2 User Defined PMF (or TCAM) Profiles

This section describes a set of CLI commands to create user defined PMF (or TCAM) profile. The profile is composed of a set of TCAM features, with each feature having customized lookup key, actions and packet types to hit.

All TCAM profile CLIs are under **hardware tcam** mode.

```
(config)# hardware tcam
(config-hw-tcam)#
```

There are two ways to create a TCAM profile. The recommended way is to create a profile based on an existing one. In this example, a copy of the profile ***newprofile1*** is created.

```
(config)# hardware tcam
(config-hw-tcam)# profile newprofile1 copy default
(config-hw-tcam-profile-newprofile1)#
```

The other way is to create one profile from scratch. In this example, the profile ***newprofile2*** is created.

```
(config)# hardware tcam
(config-hw-tcam)# profile newprofile2
(config-hw-tcam-profile-newprofile2)#
```

To remove a profile, use the **no profile** command similar to the following. In this example, the profile ***newprofile2*** is removed.

```
(config)# hardware tcam
(config-hw-tcam)# no profile newprofile2
```

Features can be turned on and off in the new profile. In this example, the feature **acl port ipv6** is turned on.

```
(config-hw-tcam-profile-<profile>)# feature acl port ipv6
```

Features can be turned on and off in the new profile. In this example, the feature **acl port ipv6** is turned off.

```
(config-hw-tcam-profile-<profile>)# no feature acl port ipv6
```

The features are described by hierarchical CLI tokens. For example, IPv4 port ACL is represented by **feature acl port ip** and IPv6 port ACL is represented by **`feature acl port ipv6`**. Under each feature mode, there are various fields that can be modified.

- **`packet`**

  This describes packet types that the feature will be applied on.

  `packet` ***packet header tokens*** **forwarding [bridged | routed | mpls][multicast][decap]**

  `no packet` ***packet header tokens*** **forwarding [bridged | routed | mpls][multicast][decap]**

  The packet header is described a series of CLI packet header tokens after **packet** token. It starts from the outer most header after Ethernet. For example, a regular IPv4 packet is ***packet ipv4*** and a vxlan packet is ***packet ipv4 vxlan eth ipv4***. The **forwarding** token indicates the forwarding type of the packet. **multicast** indicates if the packet is a multicast packet. Lastly, **decap** indicates if the packet is decapsulated after a tunnel.
- **`key field`**

  This describes the TCAM key format for the feature. The CLI can add or delete fields that are used to build the key.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)
  # [no]keyfield field
  ```

  All supported key fields can be found with **`key field ?`**
- **`key size`**

  This describes the TCAM key size limit. If too many key fields are added to the feature so that the key size goes beyond the limit, a Syslog will be issued. The default key size limit is ***320***.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)# [no]key size
   limit size
  ```
- **`action`**

  This describes the action to take if a TCAM entry is hit.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)# [no]action action
  ```

  The supported actions can be found through **`action ?`**.
- **`sequence`**

  This describes the programming order of each feature. Changing the order may affect the programming status of a profile. The default sequence is ***0***.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)
  # [no]sequence sequence
  ```

  The profile is saved after exiting the feature mode. To use the newly defined profile, a CLI is available to apply the profile to the system globally.

  ```
  (config)# hardware tcam
  (config-hw-tcam)# system profile newprofile1
  ```

15.2.3.10 Displaying OSPFv2 Status

This section describes OSPFv2 **show** commands that display OSPFv2 status. General switch methods that provide OSPFv2 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

15.2.3.10.1 OSPFv2 Summary

The **show ip ospf** command displays general OSPFv2 configuration information and operational statistics.

Example

This command displays general OSPFv2 information.

```
switch# show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPFs 5000 msecs
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

The output lists configuration parameters and operational statistics and status for the OSPFv2 instance, followed by a brief description of the areas located on the switch.

15.2.3.10.2 Viewing OSPFv2 on the Interfaces

The **show ip ospf interface** command displays OSPFv2 information for switch interfaces configured for OSPFv2. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

Examples

- This command displays complete OSPFv2 information for ***vlan 1***.

```
switch# show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
Internet Address 10.168.0.1/24, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500
switch#
```

The display indicates the switch is an ABR by displaying a neighbor count, the Designated Router (DR), and Backup Designated Router (BDR).

- This command displays a summary of interface information for the switch.

```
switch# show ip ospf interface brief
InterfacePIDAreaIP AddressCostStateNbrs
Loopback010.0.0.010.168.103.1/2410DR0
Vlan110.0.0.010.168.0.1/2410BDR1
Vlan210.0.0.210.168.2.1/2410BDR1
Vlan310.0.0.310.168.3.1/2410DR0
switch#
```

Configuration information includes the Process ID (PID), area, IP address, and cost. OSPFv2 operational information includes the Designated Router status and number of neighbors.

15.2.3.10.3 Viewing the OSPFv2 Database

The **`show ip ospf database <link state list>`** command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

Examples

- This command displays LSDB contents for ***area 2***.

```
switch# show ip ospf 1 2 database

switch#
```

15.2.3.10.4 Viewing OSPFv2 Neighbors

The **show ip ospf neighbor** command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors for all areas and interfaces on the switch. The command also allows the display of neighbors for individual interfaces or areas. The ***adjacency-changes*** option displays the interfaces adjacency changes.

Examples

- This command displays the switchs neighbors.

```
switch# show ip ospf neighbor
Neighbor IDPriStateDead TimeAddressInterface
10.168.104.21FULL/DR00:00:3510.168.0.2Vlan1
10.168.104.28FULL/BDR00:00:3110.168.2.2Vlan2
switch#
```

- This command displays details about the neighbors to ***vlan 2***.

```
switch# show ip ospf neighbor vlan 2 detail
 Neighbor 10.168.104.2, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2
Neighbor priority is 8, State is FULL, 13 state changes

[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
```

```
switch#
```

The **show ip ospf neighbor state** command displays the state information for OSPF neighbors on a per-interface basis.

Example

This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch# show ip ospf neighbor state full
Neighbor ID     VRF     Pri   State            Dead Time   Address         Interface
Test1           default     1   FULL/BDR         00:00:35    10.17.254.105  Vlan3912
Test2           default     1   FULL/BDR         00:00:36    10.17.254.29   Vlan3910
Test3 default     1   FULL/DR 00:00:35 10.25.0.1      Vlan101
Test4           default     1   FULL/DROTHER     00:00:36    10.17.254.67   Vlan3908
Test5           default     1   FULL/DROTHER     00:00:36    10.17.254.68   Vlan3908
Test6           default     1   FULL/BDR         00:00:32    10.17.254.66   Vlan3908
Test7           default     1   FULL/DROTHER     00:00:34    10.17.36.4     Vlan3036
Test8           default     1   FULL/BDR         00:00:35    10.17.36.3     Vlan3036
Test9           default     1   FULL/DROTHER     00:00:31    10.17.254.13   Vlan3902
Test10          default     1   FULL/BDR         00:00:37    10.17.254.11   Vlan3902
Test11          default     1   FULL/DROTHER     00:00:33    10.17.254.163  Vlan3925
Test12          default     1   FULL/DR          00:00:37    10.17.254.161  Vlan3925
Test13          default     1   FULL/DROTHER     00:00:31    10.17.254.154  Vlan3923
Test14          default     1   FULL/BDR         00:00:39    10.17.254.156  Vlan3923
Test15          default     1   FULL/DROTHER     00:00:33    10.17.254.35   Vlan3911
Test16          default     1   FULL/DR          00:00:34    10.17.254.33   Vlan3911
Test17 default     1   FULL/DR          00:00:36    10.17.254.138  Ethernet12
Test18          default     1   FULL/DR          00:00:37    10.17.254.2    Vlan3901
switch>
```

The **show ip ospf neighbor summary** command displays a single line of summary information for each OSPFv2 neighbor.

Example

This command displays the summary information for the OSPFv2 neighbors.

```
switch# show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START
switch>
```

15.2.3.10.5 Viewing OSPFv2 Routes

The **show ip routes** command provides an OSPFv2 option.

Examples

- This command displays all of a switchs routes.

```
switch# show ip route
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

Gateway of last resort:
S0.0.0.0/0 [1/0] via 10.255.255.1
C10.255.255.0/24 is directly connected, Management1
C10.168.0.0/24 is directly connected, Vlan1
C10.168.2.0/24 is directly connected, Vlan2
O10.168.3.0/24 [110/20] via 10.168.0.1
O10.168.103.0/24 [110/20] via 10.168.0.1
```

```
C10.168.104.0/24 is directly connected, Loopback0
switch#
```

- This command displays the switchs OSPFv2 routes.

```
switch# show ip route ospf
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

O10.168.3.0/24 [110/20] via 10.168.0.1
O10.168.103.0/24 [110/20] via 10.168.0.1
switch#
```

Use the **ping** command to determine the accessibility of a route.

Example

This command pings an OSPFv2 route.

```
switch# ping 10.168.0.1
PING 10.168.0.1 (10.168.0.1) 72(100) bytes of data.
80 bytes from 10.168.0.1: icmp_seq=1 ttl=64 time=0.148 ms
80 bytes from 10.168.0.1: icmp_seq=2 ttl=64 time=0.132 ms
80 bytes from 10.168.0.1: icmp_seq=3 ttl=64 time=0.136 ms
80 bytes from 10.168.0.1: icmp_seq=4 ttl=64 time=0.137 ms
80 bytes from 10.168.0.1: icmp_seq=5 ttl=64 time=0.136 ms

--- 10.168.0.1 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 7999ms
rtt min/avg/max/mdev = 0.132/0.137/0.148/0.015 ms
switch#
```

15.2.3.10.6 Viewing OSPFv2 SPF Logs

The **show ip ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPF.

Example

This command displays the SPF information for OSPF.

```
switch# show ip ospf spf-log
OSPF Process 172.26.0.22
When      Duration(msec)
13:01:34  1.482
13:01:29  1.547
13:01:24  1.893
13:00:50  1.459
13:00:45  1.473
13:00:40  2.603
11:01:49  1.561
11:01:40  1.463
11:01:35  1.467
11:01:30  1.434
11:00:54  1.456
11:00:49  1.472
11:00:44  1.582
15:01:49  1.575
15:01:44  1.470
15:01:39  1.679
15:01:34  1.601
15:00:57  1.454
15:00:52  1.446
15:00:47  1.603
```

```
switch>
```

15.2.3.10.7 Viewing OSPFv2 multiple Instances Support

The **show ip ospf** commands will take an instance ID filter to get the information for a particular OSPFv2 instance. If no instance ID is specified in the show query, information for all the active OSPFv2 instances are shown.

The **show ip ospf** commands will also display instance ID along with router ID either in the output headers or as a separate column.

Sample output for the **show ip ospf** command with two OSPFv2 instances with ***ID 1*** and ***ID 2***.

```
switch# show ip ospf
OSPF instance 1 with ID 1.1.1.1 VRF default
 Supports opaque LSA
Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
 It is not an autonomous system boundary router and is not an
 area border router
 ...
OSPF instance 2 with ID 2.2.2.2 VRF default
 Supports opaque LSA
Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
 It is not an autonomous system boundary router and is not an
 area border router
...
```

Sample output for the **show ip ospf** command with Graceful Restart enabled for two OSPFv2 instances with ID ***10*** and ***11***.

```
switch# show ip ospf
 OSPF instance 10 with ID 2.2.2.2 VRF default
 Supports opaque LSA
Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
...
 Graceful-restart is configured, grace-period 120 seconds
   State: In progress, expires in 113 seconds
 Graceful-restart-helper mode is enabled
...
 OSPF instance 11 with ID 3.3.3.3 VRF default
 Supports opaque LSA
Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
...
 Graceful-restart is configured, grace-period 120 seconds
   State: In progress, expires in 113 seconds
 Graceful-restart-helper mode is enabled
```

```
...
```

Sample output for the **show ip ospf neighbor detail** command.

```
switch# show ip ospf neighbor
Neighbor ID   Instance  VRF      Pri  State      Dead Time   Address   Interface
2.2.2.2       1         default  1    FULL/DR    00:00:38    10.1.1.2   Ethernet1
4.4.4.4       2         default  1    FULL/DR    00:00:36    40.1.1.2   Ethernet4

switch# show ip ospf neighbor 2.2.2.2 detail
Neighbor 2.2.2.2, instance 1, VRF default, interface address 10.1.1.1

  In area 0.0.0.0 interface Ethernet1

  Neighbor priority is 1, State is FULL, 7 state changes

  Adjacency was established 00:38:48 ago

  Current state was established 00:38:48 ago

  DR IP Address 10.1.1.2 BDR IP Address 10.1.1.1

  Options is E

  Dead timer is due in 00:00:35

  Inactivity timer deferred 0 times

  LSAs retransmitted 1 time to this neighbor

  Graceful-restart-helper mode is Inactive

  Graceful-restart attempts: 0
```

Sample output for **show ip ospf neighbor detail** with BFD enabled.

```
switch# show ip ospf neighbor 2.2.2.2 detail
Neighbor 3.3.3.3, instance 10, VRF default, interface address
 1.0.0.1
  In area 1.2.3.4 interface Ethernet1
  Neighbor priority is 1, State is FULL, 7 state changes
  Adjacency was established 22:03:05 ago
  Current state was established 22:03:05 ago
  DR IP Address 1.0.0.1 BDR IP Address 1.0.0.2
  Options is E
  Dead timer is due in 00:00:34
  Inactivity timer deferred 0 times
  LSAs retransmitted 1 time to this neighbor
  Bfd request is sent and the state is Down
  Graceful-restart-helper mode is Inactive
  Graceful-restart attempts: 0
Neighbor 6.6.6.6, instance 10, VRF default, interface address
 1.0.1.1
  In area 1.2.3.4 interface Ethernet5
  Neighbor priority is 1, State is FULL, 7 state changes
  Adjacency was established 22:03:10 ago
  Current state was established 22:03:10 ago
  DR IP Address 1.0.1.1 BDR IP Address 1.0.1.2
  Options is E
  Dead timer is due in 00:00:30
  Inactivity timer deferred 0 times
```

```
  LSAs retransmitted 2 times to this neighbor
  Bfd request is sent and the state is Down
  Graceful-restart-helper mode is Inactive
  Graceful-restart attempts: 0
Neighbor 4.4.4.4, instance 12, VRF default, interface address
 1.0.3.1
  In area 1.2.3.4 interface Ethernet2
  Neighbor priority is 1, State is FULL, 7 state changes
  Adjacency was established 22:03:10 ago
  Current state was established 22:03:10 ago
  DR IP Address 1.0.3.1 BDR IP Address 1.0.3.2
  Options is E
  Dead timer is due in 00:00:32
  Inactivity timer deferred 0 times
  LSAs retransmitted 1 time to this neighbor
  Graceful-restart-helper mode is Inactive
  Graceful-restart attempts: 0
```

The CAPI outputs for OSPFv2 show commands are already indexed by instance ID and remains unchanged.

The **`show ip route`** and **`show ip route ospf`** commands show routes from all OSPFv2 instances with no mention of instance ID. For example,

11.1.1.0/24 is learned from instance ***100*** and ***12.1.1.0/24*** from instance ***200***.

```
switch# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control
 Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

Gateway of last resort is not set

 O E2    11.1.1.0/24 [110/1] via 20.1.1.2, Ethernet3
 C       10.1.1.0/24 is directly connected, Ethernet1
 C       20.1.1.0/24 is directly connected, Ethernet3
 O       12.1.1.0/24 [110/20] via 10.1.1.2, Ethernet1

switch# show ip route ospf

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control
 Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked
```

```
 O E2    11.1.1.0/24 [110/1] via 20.1.1.2, Ethernet3

   dynamic policy                                             0

   Total Routes                                              14

Number of routes per mask-length:
   /8: 2         /24: 3        /32: 9
```

15.2.3.10.8 Displaying OSPF Routes over GRE Tunnel Status

A show command is available to list the TCAM profile status on each linecard.

```
(config)# show hardware tcam profile
Configuration  Status FixedSystem  newprofile1  newprofile1
```

If the profile cannot be programmed, the Status column will print **ERROR**. See **Limitations** for additional information. The content of a PMF profile can be displayed with

```
(config)# show hardware tcam profile detail
```

Example

```
(config-hw-tcam)# show hardware tcam profile newprofile1 detail
Profile newprofile1 [ FixedSystem ]
 Feature         mpls
 --------------- ----------------------------------------------------
 Key size        160
 Actions         drop, redirect, set-ecn
```

```
 Packet type     ipv4 mpls ipv4 forwarding mpls decap
                 ipv4 mpls ipv6 forwarding mpls decap
                 mpls ipv4 forwarding mpls
                 mpls ipv6 forwarding mpls
                 mpls non-ip forwarding mpls

 Feature         acl vlan ipv6
 --------------- ----------------------------------------------------
 Key size        320
 Key fields      dst-ipv6, ipv6-next-header, l4-dst-port, l4-src-port,
                 src-ipv6-high, src-ipv6-low, tcp-control
 Actions         count, drop, mirror, redirect
 Packet type     ipv6 forwarding routed
...
```

Note that the profile contains all the features that are untouched after copying from the base profile.

Example

This example demonstrates how to create a new profile to match on **vlan** field in MAC ACL.

```
(config-hw-tcam)# profile macvlan copy default
(config-hw-tcam-profile-macvlan)# feature acl port mac
(config-hw-tcam-profile-macvlan-feature-acl-port-mac)# key field
 vlan
(config-hw-tcam-profile-macvlan-feature-acl-port-mac)# exit
(config-hw-tcam-profile-macvlan)# exit
Saving new profile 'macvlan'
(config-hw-tcam)# system profile macvlan
```

15.2.4 OSPFv2 Configuration Examples

This section describes the commands required to configure three OSPFv2 topologies.

- OSPFv2 Configuration Example 1
- OSPFv2 Configuration Example 2
- OSPFv2 Configuration Example 3

15.2.4.1 OSPFv2 Configuration Example 1

The OSPF Autonomous System in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two subnets.

15.2.4.1.1 Example 1 Topology

OSPFv2 Example 1 displays the Example 1 topology. Two ABRs connect area ***0*** and area ***1 Router A*** and ***Router B***. ***Router C*** is an internal router that connects two subnets in area ***0***.

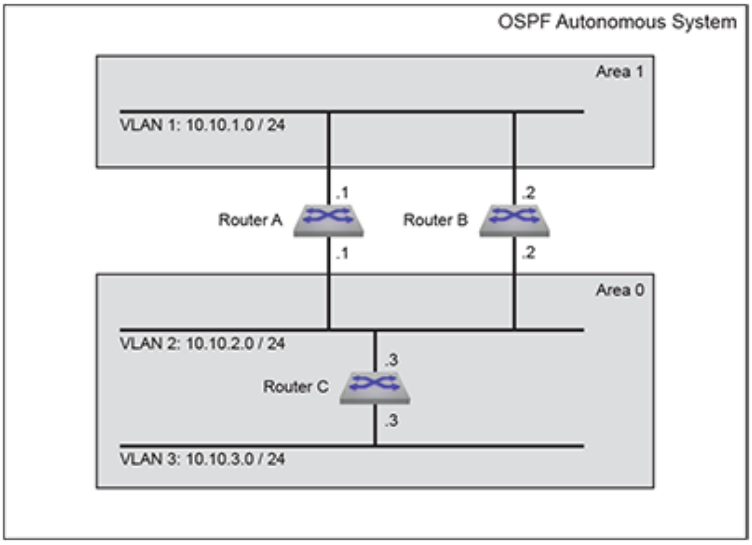

Figure 47: OSPFv2 Example 1

Area 1 Configuration

Area 1 contains one subnet that is accessed by ***Router A*** and ***Router B***.

- ***Router A***: The subnet ***10.10.1.0/24*** is accessed through ***VLAN 1***.
- ***Router B***: The subnet ***10.10.1.0/24*** is accessed through ***VLAN 1***.
- Each router uses simple authentication, with password ***abcdefgh***.
- Designated Router (DR): ***Router A***.
- Backup Designated Router (BDR): ***Router B***.
- Each router defines an interface cost of ***10***.
- Router priority is not specified for either router on area ***1***.

Area 0 ABR Configuration

Area 0 contains one subnet that is accessed by ABRs ***Router A*** and ***Router B***.

- ***Router A***: The subnet ***10.10.2.0/24*** is accessed through ***VLAN 2***.
- ***Router B***: The subnet ***10.10.2.0/24*** is accessed through ***VLAN 2***.
- Designated Router (DR): ***Router B***.
- Backup Designated Router (BDR): ***Router A***.
- Each router uses simple authentication, with password ***ijklmnop***.
- Each router defines an interface cost of ***20***.
- Each router defines a retransmit-interval of ***10***.
- Each router defines a transmit-delay of ***2***.
- Router priority is specified such that ***Router B*** will be elected as the Designated Router.

Area 0 IR Configuration

Area ***0*** contains one internal router that connects two subnets.

- ***Router C***: The subnet ***10.10.2.0/24*** is accessed through ***VLAN 2***.
- ***Router C***: The subnet ***10.10.3.0/24*** is accessed through ***VLAN 3***.
- The subnet ***10.10.2.0/24*** link is configured as follows:
  - Interface cost of ***20***.
  - Retransmit-interval of ***10***.
  - Transmit-delay of ***2***.

- The subnet ***10.10.3.0/24*** link is configured as follows:
  - Interface cost of ***20***.
  - Dead interval of ***80*** seconds.

15.2.4.1.2 Example 1 Code

This code configures the OSPFv2 instances on the three switches.

1. Configure the interface addresses.
   a. Router A interfaces:

```
switch-A(config)# interface vlan 1
switch-A(config-if-vl1)# ip address 10.10.1.1/24
switch-A(config-if-vl1)# interface vlan 2
switch-A(config-if-vl2)# ip address 10.10.2.1/24
```

   b. Router B interfaces:

```
switch-B(config)# interface vlan 1
switch-B(config-if-vl1)# ip address 10.10.1.2/24
switch-B(config-if-vl1)# interface vlan 2
switch-B(config-if-vl2)# ip address 10.10.2.2/24
```

   c. Router C interfaces:

```
switch-C(config)# interface vlan 2
switch-C(config-if-vl2)# ip address 10.10.2.3/24
switch-C(config-if-vl2)# interface vlan 3
switch-C(config-if-vl3)# ip address 10.10.3.3/24
```

2. Configure the interface OSPFv2 parameters.
   a. Router A interfaces:

```
switch-A(config-if-vl2)# interface vlan 1
switch-A(config-if-vl1)# ip ospf authentication-key abcdefgh
switch-A(config-if-vl1)# ip ospf cost 10
switch-A(config-if-vl1)# ip ospf priority 6
switch-A(config-if-vl1)# interface vlan 2
switch-A(config-if-vl2)# ip ospf authentication-key ijklmnop
switch-A(config-if-vl2)# ip ospf cost 20
switch-A(config-if-vl2)# ip ospf retransmit-interval 10
switch-A(config-if-vl2)# ip ospf transmit-delay 2
switch-A(config-if-vl2)# ip ospf priority 4
```

   b. Router B interfaces:

```
switch-B(config-if-vl2)# interface vlan 1
switch-B(config-if-vl1)# ip ospf authentication-key abcdefgh
switch-B(config-if-vl1)# ip ospf cost 10
switch-B(config-if-vl1)# ip ospf priority 4
switch-B(config-if-vl1)# interface vlan 2
switch-B(config-if-vl2)# ip ospf authentication-key ijklmnop
switch-B(config-if-vl2)# ip ospf cost 20
switch-B(config-if-vl2)# ip ospf retransmit-interval 10
switch-B(config-if-vl2)# ip ospf transmit-delay 2
switch-B(config-if-vl2)# ip ospf priority 6
```

   c. Router C interfaces:

```
switch-C(config-if-vl3)# interface vlan 2
```

```
switch-C(config-if-vl2)# ip ospf cost 20
switch-C(config-if-vl2)# ip ospf retransmit-interval 10
switch-C(config-if-vl2)# ip ospf transmit-delay 2
switch-C(config-if-vl2)# interface vlan 3
switch-C(config-if-vl3)# ip ospf cost 20
switch-C(config-if-vl3)# ip ospf dead-interval 80
```

3. Attach the network segments to the areas.
   a. Router A interfaces:

```
switch-A(config-if-vl2)# router ospf 1
switch-A(config-router-ospf)# router-id 169.10.0.1
switch-A(config-router-ospf)# network 10.10.1.0/24 area 1
switch-A(config-router-ospf)# network 10.10.2.0/24 area 0
```

   b. Router B interfaces:

```
switch-B(config-if-vl2)# router ospf 1
switch-B(config-router-ospf)# router-id 169.10.0.2
switch-B(config-router-ospf)# network 10.10.1.0/24 area 1
switch-B(config-router-ospf)# network 10.10.2.0/24 area 0
```

   c. Router C interfaces:

```
switch-C(config-if-vl3)# router ospf 1
switch-C(config-router-ospf)# router-id 169.10.0.3
switch-C(config-router-ospf)# network 10.10.2.0/24 area 0
switch-C(config-router-ospf)# network 10.10.3.0/24 area 0
```

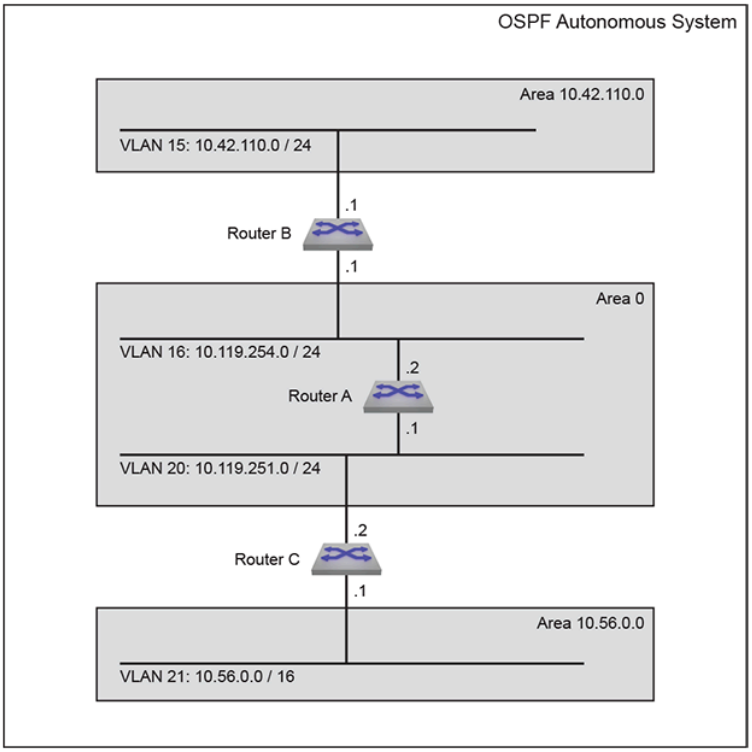
15.2.4.2 OSPFv2 Configuration Example 2

The AS in Example 2 contains three areas. Area ***0*** connects to the other areas through different routers. The backbone area contains an internal router that connects two subnets. Area ***0*** is normal; the other areas are stub areas.

15.2.4.2.1 Example 2 Topology

OSPFv2 Example 2 displays the Example 2 topology. One ABR (***Router B***) connects area ***0*** and area ***10.42.110.0***; another ABR (***Router C***) connects area ***0*** and area ***36.56.0.0***. ***Router A*** is an internal router that connects two subnets in area ***0***.

Figure 48: OSPFv2 Example 2



Area 10.42.110.0 Configuration

Area ***10.42.110.0*** contains one subnet that is accessed by ***Router B***.

- ***Router B***: The subnet ***10.42.110.0*** is accessed through ***VLAN 15***.
- ***Router B*** uses simple authentication, with password ***abcdefgh***.
- Each router defines a interface cost of ***10***.

Area 10.56.0.0 Configuration

Area ***10.56.0.0*** contains one subnet that is accessed by ***Router C***.

- ***Router C***: The subnet ***10.56.0.0*** is accessed through ***VLAN 21***.
- ***Router C*** uses simple authentication, with password ***ijklmnop***.
- Each router defines a interface cost of ***20***.

Area 0 ABR Configuration

Area ***0*** contains two subnets. ABR ***Router B*** connects one subnet to area ***10.42.110.0***. ABR ***Router C*** connects the other subnet to area ***10.56.0.0***.

- ***Router B***: The subnet ***10.119.254.0/24*** is accessed through ***VLAN 16***.
- ***Router C***: The subnet ***10.119.251.0/24*** is accessed through ***VLAN 20***.
- Designated Router (DR): ***Router B***.
- Backup Designated Router (BDR): ***Router C***.
- Each ABR uses simple authentication, with password ***ijklmnop***.
- Each router defines an interface cost of ***20***.
- Each router defines a retransmit-interval of ***10***.
- Each router defines a transmit-delay of ***2***.

Area 0 IR Configuration

Area ***0*** contains two subnets connected by an internal router.

- ***Router A***: The subnet ***10.119.254.0/24*** is accessed through ***VLAN 16***.
- ***Router A***: The subnet ***10.119.251.0/24*** is accessed through ***VLAN 20***.
- The subnet ***10.42.110.0*** is configured as follows:
  - Interface cost of ***10***.
- The subnet ***10.56.0.0/24*** is configured as follows:
  - Interface cost of ***20***.
  - Retransmit-interval of ***10***.
  - Transmit-delay of ***2***.

15.2.4.2.2 Example 2 Code

1. Configure the interface addresses.
   a. Router A interfaces:

```
switch-A(config)# interface vlan 16
switch-A(config-if-vl16)# ip address 10.119.254.2/24
switch-A(config-if-vl16)# interface vlan 20
switch-A(config-if-vl20)# ip address 10.119.251.1/24
```

   b. Router B interfaces:

```
switch-B(config)# interface vlan 15
switch-B(config-if-vl15)# ip address 10.42.110.1/24
switch-B(config-if-vl15)# interface vlan 16
switch-B(config-if-vl16)# ip address 10.119.254.1/24
```

   c. Router C interfaces:

```
switch-C(config)# interface vlan 20
switch-C(config-if-vl20)# ip address 10.119.251.2/24
switch-C(config-if-vl20)# interface vlan 21
switch-C(config-if-vl21)# ip address 10.56.0.1/24
```

2. Configure the interface OSPFv2 parameters.
   a. Router A interfaces:

```
switch-A(config-if-vl20)# interface vlan 16
switch-A(config-if-vl16)# ip ospf cost 10
switch-A(config-if-vl16)# interface vlan 20
switch-A(config-if-vl20)# ip ospf cost 20
switch-A(config-if-vl20)# ip ospf retransmit-interval 10
switch-A(config-if-vl20)# ip ospf transmit-delay 2
```

   b. Router B interfaces:

```
switch-B(config-if-vl16)# interface vlan 15
switch-B(config-if-vl15)# ip ospf authentication-key abcdefgh
switch-B(config-if-vl15)# ip ospf cost 10
switch-B(config-if-vl15)# interface vlan 16
switch-B(config-if-vl16)# ip ospf authentication-key ijklmnop
switch-B(config-if-vl16)# ip ospf cost 20
switch-B(config-if-vl16)# ip ospf retransmit-interval 10
switch-B(config-if-vl16)# ip ospf transmit-delay 2
switch-B(config-if-vl16)# ip ospf priority 6
```

c. Router C interfaces:

```
switch-C(config-if-vl21)# interface vlan 20
switch-C(config-if-vl20)# ip ospf authentication-key ijklmnop
switch-C(config-if-vl20)# ip ospf cost 20
switch-C(config-if-vl20)# ip ospf retransmit-interval 10
switch-C(config-if-vl20)# ip ospf transmit-delay 2
switch-C(config-if-vl20)# ip ospf priority 4
switch-C(config-if-vl20)# interface vlan 21
switch-C(config-if-vl21)# ip ospf authentication-key ijklmnop
switch-C(config-if-vl21)# ip ospf cost 20
switch-C(config-if-vl21)# ip ospf dead-interval 80
```

3. Attach the network segments to the areas.

a. Router A interfaces:

```
switch-A(config-if-vl20)# router ospf 1
switch-A(config-router-ospf)# router-id 10.24.1.1
switch-A(config-router-ospf)# network 10.119.254.0/24 area 0
switch-A(config-router-ospf)# network 10.119.251.0/24 area 0
switch-A(config-router-ospf)# area 0 range 10.119.251.0 0.0.7.255
```

b. Router B interfaces:

```
switch-B(config-if-vl16)# router ospf 1
switch-B(config-router-ospf)# router-id 10.24.1.2
switch-B(config-router-ospf)# area 10.42.110.0 stub
switch-B(config-router-ospf)# network 10.42.110.0/24 area 10.42.110.0
switch-B(config-router-ospf)# network 10.119.254.0/24 area 0
```

c. Router C interfaces:

```
switch-C(config-if-vl21)# router ospf 1
switch-C(config-router-ospf)# router-id 10.24.1.3
switch-C(config-router-ospf)# area 10.56.0.0 stub 0
switch-C(config-router-ospf)# network 10.119.251.0/24 area 0
switch-C(config-router-ospf)# network 10.56.0.0/24 area 36.56.0.0
```

15.2.4.3 OSPFv2 Configuration Example 3

The AS in Example 3 contains two areas that connect through one ABR.

- ***Area 0***: Backbone area contains two internal routers that connect three subnets, one ASBR, and one ABR that connects to ***Area 1***.
- ***Area 1***: NSSA contains one internal router, one ASBR, and one ABR that connects to the backbone.

15.2.4.3.1 Example 3 Topology

OSPFv2 Example 3 displays the Example 3 topology. One ABR connects area ***0*** and area ***1***. ***Router C*** is an ABR that connects the areas. ***Router A*** is an internal router that connects two subnets in area ***1***. ***Router D*** and ***Router E*** are internal routers that connect subnets in area ***0***. ***Router B*** and ***Router F*** are ASBRs that connect static routes outside the AS to area ***1*** and area ***0***, respectively.

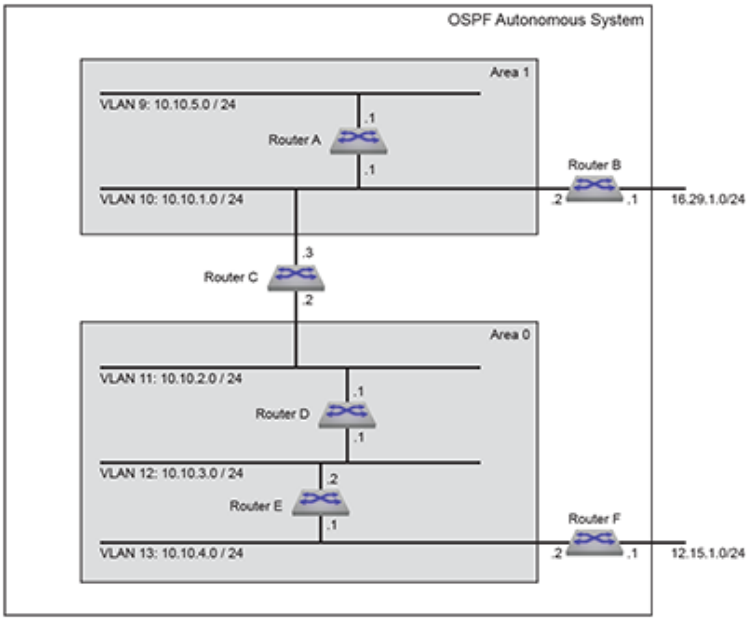


Figure 49: OSPFv2 Example 3

Area 0 ABR Configuration

ABR ***Router C*** connects one area ***0*** subnet to an area ***1*** subnet.

- ***Router C***: The subnet ***10.10.2.0/24*** is accessed through ***VLAN 11***.
- Authentication is not configured on the interfaces.
- All interface OSPFv2 parameters are set to their default values.

Area 0 IR Configuration

Area ***0*** contains two internal routers, each of which connects two of the three subnets in the area.

- ***Router D***: The subnet ***10.10.2.0/24*** is accessed through ***VLAN 11***.
- ***Router D***: The subnet ***10.10.3.0/24*** is accessed through ***VLAN 12***.
- ***Router E***: The subnet ***10.10.3.0/24*** is accessed through ***VLAN 12***.
- ***Router E***: The subnet ***10.10.4.0/24*** is accessed through ***VLAN 13***.
- All interface OSPFv2 parameters are set to their default values.

Area 0 ASBR Configuration

ASBR ***Router F*** connects one area ***0*** subnet to an external subnet.

- ***Router F***: The subnet ***10.10.4.0/24*** is accessed through ***Router F***.
- ***Router F***: The subnet ***12.15.1.0/24*** is accessed through ***VLAN 14***.
- All interface OSPFv2 parameters are set to their default values.

Area 1 ABR Configuration

ABR ***Router C*** connects one area ***0*** subnet to area ***1***.

- ***Router C***: The subnet ***10.10.1.0/24*** is accessed through ***VLAN 10***.
- Authentication is not configured on the interface.
- All interface OSPFv2 parameters are set to their default values.

Area 1 IR Configuration

Area ***1*** contains one internal router that connects two subnets in the area.

- ***Router A***: The subnet ***10.10.1.0/24*** is accessed through ***VLAN 10***.
- ***Router A***: The subnet ***10.10.5.0/24*** is accessed through ***Router A***.
- All interface OSPFv2 parameters are set to their default values.

Area 1 ASBR Configuration

ASBR ***Router B*** connects one area ***1*** subnet to an external subnet.

- ***Router B***: The subnet ***10.10.1.0/24*** is accessed through ***VLAN 10***.
- ***Router B***: The subnet ***16.29.1.0/24*** is accessed through ***VLAN 15***.
- All interface OSPFv2 parameters are set to their default values.

15.2.4.3.2 Example 3 Code

1. Configure the interfaces.
   a. Router A interfaces:

```
switch-A(config)# interface vlan 10
switch-A(config-if-vl10)# ip address 10.10.1.1/24
switch-A(config-if-vl10)# interface vlan 9
switch-A(config-if-vl11)# ip address 10.10.5.1/24
```

   b. Router B interfaces:

```
switch-B(config)# interface vlan 10
switch-B(config-if-vl10)# ip address 10.10.1.2/24
switch-B(config-if-vl10)# interface vlan 15
switch-B(config-if-vl18)# ip address 16.29.1.1/24
```

   c. Router C interfaces:

```
switch-C(config)# interface vlan 10
switch-C(config-if-vl10)# ip address 10.10.1.3/24
switch-C(config-if-vl10)# interface vlan 11
switch-C(config-if-vl11)# ip address 10.10.2.2/24
```

   d. Router D interfaces:

```
switch-D(config)# interface vlan 11
switch-D(config-if-vl11)# ip address 10.10.2.1/24
switch-D(config)# interface vlan 12
switch-D(config-if-vl12)# ip address 10.10.3.1/24
```

   e. Router E interfaces:

```
switch-E(config)# interface vlan 12
switch-E(config-if-vl12)# ip address 10.10.3.2/24
switch-E(config)# interface vlan 13
switch-E(config-if-vl13) #ip address 10.10.4.1/24
```

   f. Router F interfaces:

```
switch-F(config)# interface vlan 13
switch-F(config-if-vl13)# ip address 10.10.4.2/24
switch-F(config)# interface vlan 14
switch-F(config-if-vl14)# ip address 12.15.1.1/24
```

2. Attach the network segments to the areas.

   a. Router A interfaces:

```
switch-A(config-if-vl10)# router ospf 1
switch-A(config-router-ospf)# router-id 170.21.0.1
switch-A(config-router-ospf)# area 1 NSSA
switch-A(config-router-ospf)# network 10.10.1.0/24 area 1
```

   b. Router B interfaces:

```
switch-B(config-if-vl10)# router ospf 1
switch-B(config-router-ospf)# router-id 170.21.0.2
switch-B(config-router-ospf)# area 1 NSSA
switch-B(config-router-ospf)# network 10.10.1.0/24 area 1
```

   c. Router C interfaces:

```
switch-C(config-if-vl11)# router ospf 1
switch-C(config-router-ospf)# router-id 170.21.0.3
switch-C(config-router-ospf)# area 1 NSSA
switch-C(config-router-ospf)# network 10.10.1.0/24 area 1
switch-C(config-router-ospf)# network 10.10.2.0/24 area 0
```

   d. Router D interfaces:

```
switch-D(config-if-vl12)# router ospf 1
switch-D(config-router-ospf)# router-id 170.21.0.4
switch-D(config-router-ospf)# network 10.10.2.0/24 area 0
switch-D(config-router-ospf)# network 10.10.3.0/24 area 0
```

   e. Router E interfaces:

```
switch-E(config-if-vl13)# router ospf 1
switch-E(config-router-ospf)# router-id 170.21.0.5
switch-E(config-router-ospf)# network 10.10.3.0/24 area 0
switch-E(config-router-ospf)# network 10.10.4.0/24 area 0
```

   f. Router F interfaces:

```
switch-F(config-if-vl14)# router ospf 1
switch-F(config-router-ospf)# router-id 170.21.0.6
switch-F(config-router-ospf)# network 10.10.4.0/24 area 0
switch-F(config-router-ospf)# redistribute static
```

15.2.5 OSPFv2 Commands

Global Configuration Mode

- ip ospf router-id output-format hostnames
- line system
- router ospf

Interface Configuration Mode

- interface Tunnel
- ip ospf area
- ip ospf authentication
- ip ospf authentication-key
- ip ospf cost
- ip ospf dead-interval
- ip ospf disabled
- ip ospf hello-interval
- ip ospf message-digest-key
- ip ospf network point-to-point
- ip ospf priority
- ip ospf retransmit-interval
- ip ospf transmit-delay
- tunnel routes

Router-OSPFv2 Configuration Mode

- adjacency exchange-start threshold (OSPFv2)
- area default-cost (OSPFv2)
- area filter (OSPFv2)
- area nssa (OSPFv2)
- area nssa default-information-originate (OSPFv2)
- area nssa no-summary (OSPFv2)
- area not-so-stubby lsa type-7 convert type-5 (OSPFv2)
- area range (OSPFv2)
- area stub (OSPFv2)
- auto-cost reference-bandwidth (OSPFv2)
- compatible (OSPFv2)
- default-information originate (OSPFv2)
- distance ospf (OSPFv2)
- dn-bit-ignore (OSPFv2)
- log-adjacency-changes (OSPFv2)
- max-lsa (OSPFv2)
- max-metric router-lsa (OSPFv2)
- maximum-paths (OSPFv2)
- network area (OSPFv2)
- no area (OSPFv2)
- passive-interface default (OSPFv2)
- passive-interface (OSPFv2)
- point-to-point routes (OSPFv2)
- redistribute (OSPFv2)

- redistribute ospf instance
- router-id (OSPFv2)
- shutdown (OSPFv2)
- summary-address
- timers lsa rx min interval (OSPFv2)
- timers lsa tx delay initial (OSPFv2)
- timers spf delay initial (OSPFv2)

TCAM Profile Configuration Mode

- packet
- system profile

Display and Clear Commands

- clear ip ospf neighbor
- show hardware tcam profile
- show ip ospf
- show ip ospf border-routers
- show ip ospf database database-summary
- show ip ospf database <link state list>
- show ip ospf database <link-state details>
- show ip ospf interface
- show ip ospf interface brief
- show ip ospf lsa-log
- show ip ospf neighbor
- show ip ospf neighbor adjacency-changes
- show ip ospf neighbor state
- show ip ospf neighbor summary
- show ip ospf request queue
- show ip ospf retransmission queue
- show ip ospf spf-log
- show line system dom thresholds
- show line system status

15.2.5.1 auto-cost reference-bandwidth (OSPFv2)

The **auto-cost reference-bandwidth** command is a factor in the formula that calculates the default OSPFv2 cost for Ethernet interfaces.

OSPFv2-cost = (auto-cost value * ***1*** Mbps) / interface bandwidth.

The switch uses a minimum OSPFv2-cost of ***1***. The switch rounds down all non-integer results.

On a 10G Ethernet interface:

- if auto-cost = ***100***, then OSPFv2-cost = ***100*** Mbps / 10 Gbps = ***0.01***, and the default cost is set to ***1***.
- if auto-cost = ***59000***, then OSPFv2-cost = ***59000*** Mbps / 10 Gbps = ***5.9***, and the default cost is set to ***5***.

The **no auto-cost reference-bandwidth** and **default auto-cost reference-bandwidth** command removes the **auto-cost reference-bandwidth** command from ***running-config***. When this parameter is not set, the default cost for Ethernet interfaces is the default **ip ospf cost** value of 10.

Command Mode

Router-OSPF Configuration

Command Syntax

auto-cost reference-bandwidth ***rate***

no auto-cost reference-bandwidth ***rate***

default auto-cost reference-bandwidth ***rate***

Parameter

rate Values range from ***1 to 4294967***. Default is ***100***.

Example

To configure a default cost of ***20*** on 10G Ethernet interfaces:

1. Calculate the required auto-cost value:
   auto-cost = (OSPFv2-cost*interface bandwidth)/1 Mbps = (***20*******10000*** Mbps) / ***1*** Mbps = ***200000***
2. Configure this value as the auto-cost reference-bandwidth.

```
switch(config)# router ospf 6
switch(config-router-ospf)# auto-cost reference-bandwidth 200000
switch(config-router-ospf)#
```

15.2.5.2 adjacency exchange-start threshold (OSPFv2)

The **adjacency exchange-start threshold** command sets the exchange-start options for an OSPF instance.

The **no adjacency exchange-start threshold** and **default adjacency exchange-start threshold** command resets the default by removing the corresponding a **adjacency exchange-start threshold** command from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

default adjacency exchange-start threshold

adjacency exchange-start threshold ***peers***

no adjacency exchange-start threshold

Parameter

peers Value ranges from ***1- 4294967295***. Default value is ***10***.

Example

This command sets the adjacency exchange start threshold to ***20045623***.

```
switch(config)# router ospf 6
switch(config-router-ospf)# adjacency exchange-start threshold 20045623
switch(config-router-ospf)#
```

15.2.5.3 area default-cost (OSPFv2)

The **`area default-cost`** command specifies the cost for the default summary routes sent into a specified area. The default-cost is set to ***10***.

The **`no area default-cost`** and **`default area default-cost`** command resets the default-cost value of the specified area to ***10*** by removing the corresponding **`area default-cost`** command from **running-config**. The no area (OSPFv2) command removes all area commands for the specified area from ***running-config***, including the **`area default-cost`** command.

Command Mode

Router-OSPF Configuration

Command Syntax

`area` ***area_id*** **`default-cost`** ***def_cost***

`no area` ***area_id*** **`default-cost`** ***def_cost***

`default area` ***area_id*** **`default-cost`** ***def_cost***

Parameters

- ***area_id*** Area number: ***0 to 4294967295*** or ***0.0.0.0*** to **`255.255.255.255`** ***running-config*** stores value in dotted decimal notation.
- ***def_cost*** Value ranges from ***1*** to ***65535***. Default value is ***10***.

Example

This command configures a cost of ***15*** for default summary routes that an ABR sends into area ***23***.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 23 default-cost 15
switch(config-router-ospf)#
```

15.2.5.4 area filter (OSPFv2)

The **area filter** command prevents an area from receiving Type 3 Summary LSAs and Type 4 APSR Summary LSAs from a specified subnet.

The **no area filter** and **default area filter** commands remove the specified **area filter** command from ***running-config***. The **no area** command (see no area (OSPFv2) removes all area commands for the specified area from ***running-config***, including **area filter** commands.

Command Mode

Router-OSPF Configuration

Command Syntax

area ***area_id*** **filter** ***net_addr***

no area ***area_id*** **filter** ***net_addr***

default area ***area_id*** **filter** ***net_addr***

Parameters

- ***area_id*** Area number. ***0*** to ***4294967295*** or ***0.0.0.0*** to ***255.255.255.255***. ***running-config*** stores value in dotted decimal notation.
- ***net_addr*** Network IP address. Entry formats include address-prefix (CIDR) and address-mask. ***running-config*** stores value in CIDR notation.

Example

This command prevents the switch from entering Type 3 LSAs and Type 4 LSAs originating from the ***10.1.1.0/24*** subnet into its area ***2*** LSDB.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 2 filter 10.1.1.0/24
switch(config-router-ospf)#
```

15.2.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv2)

The **area not-so-stubby lsa type-7 convert type-5** command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

The **no area not-so-stubby lsa type-7 convert type-5** and **no area not-so-stubby lsa type-7 convert type-5** commands allow LSAs to be translated dynamically by removing the **no area not-so-stubby lsa type-7 convert type-5** command from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

area ***area_id*** **not-so-stubby lsa type-7 convert type-5**

no area ***area_id*** **not-so-stubby lsa type-7 convert type-5**

default area ***area_id*** **not-so-stubby lsa type-7 convert type-5**

Parameters

area_id Area number.

- Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
- Area ***0*** (or ***0.0.0.0***) is not configurable; it is always **normal**.
- ***running-config*** stores value in dotted decimal notation.

Example

This command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

```
switch(config-router-ospf)# area 3 not-so-stubby lsa type-7 convert
 type-5
switch(config-router-ospf)#
```

15.2.5.6 area nssa (OSPFv2)

The **area nssa** command configures an OSPFv2 area as a Not-So-Stubby Area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

area ***area_id*** **nssa** [**TYPE**]

no area ***area_id*** **nssa** [**TYPE**]

default area ***area_id*** **nssa** [**TYPE**]

Parameters

- ***area_id*** All parameters except ***area_id*** can be placed in any order.
  - Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
  - Area ***0*** (or ***0.0.0.0***) is not configurable; it is always **normal**.
  - ***running-config*** stores value in dotted decimal notation.
- **TYPE** Area type. Values include:
  - ***no parameter***
  - **nssa-only**

Example

This command configures area ***3*** as a NSSA area.

```
switch(config-router-ospf)# area 3 nssa nssa-only
switch(config-router-ospf)#
```

15.2.5.7 area nssa default-information-originate (OSPFv2)

The **`default area nssa default-information-originate`** command sets default route origination for the Not-So-Stubby Area (NSSA), allowing the redistribute policy to advertise a default route if one is present. The resulting OSPF behavior depends on the presence of an installed static default route and on whether static routes are redistributed in OSPF (using the redistribute (OSPFv2) command). The **`no area nssa default-information-originate`** command disables advertisement of the default route for the NSSA regardless of the redistribute policy. See Advertisement of Default Route for details.

Areas are **normal** by default; area type configuration is required only for stub and NSSA areas. Area ***0*** is always a normal area and cannot be configured through this command.

Default route origination is configured differently for different area types and supports three area types:

- Normal areas: advertisement of the default route is configured for all normal areas using the default-information originate (OSPFv2) command.
- Stub areas: the default route is automatically advertised in stub areas and cannot be configured.
- Not So Stubby Areas (NSSAs): advertisement of the default route is configured per area using the area nssa default-information-originate (OSPFv2) or area nssa no-summary (OSPFv2) command.

Table 70: Advertisement of Default Route

Static Default Route Installed	Redistribute Static	Command Form	Advertise in ABR	Advertise in ASBR
no	no	**default** or **no**	no	no
no	no	standard	yes	no
no	yes	**default**	yes	yes
no	yes	**no**	no	no
no	yes	standard	yes	no
yes	no	**default** or **no**	no	no
yes	no	standard	yes	yes
yes	yes	**default**	yes	yes
yes	yes	**no**	no	no
yes	yes	standard	yes	yes

Command Mode

Router-OSPF Configuration

Command Syntax

`area` ***area_id*** **`nssa default-information-originate`** [**VALUE**][**TYPE**][**EXCL**]

`no area` ***area_id*** **`nssa default-information-originate`**

`default area` ***area_id*** **`nssa default-information-originate`**

Parameters

- ***area_id*** All parameters except ***area_id*** can be placed in any order.
  - Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
  - Area ***0*** (or ***0.0.0.0***) is not configurable; it is always **normal**.
  - ***running-config*** stores value in dotted decimal notation.
- **VALUE** Values include:

    - ***no parameter*** Default value of ***1***.
    - **metric *1-65535***.
- **TYPE** Values include:
    - ***no parameter***.
    - **metric-type *1-2***.
- **EXCL** Values include:
    - ***no parameter***.
    - **nssa-only**.

Example

This command configures area ***3*** as an NSSA and generates a type 7 default LSA within the NSSA.

```
switch(config-router-ospf)# area 3 nssa default-information-originate
 nssa-only
switch(config-router-ospf)#
```

15.2.5.8 area nssa no-summary (OSPFv2)

The **area nssa no-summary** command configures the switch stop importing type-3 summary LSAs into the not-so-stubby area and sets the default summary route into the Not-So-Stubby Area (NSSA) in order to reach the inter-area prefixes.

The **no area nssa no-summary** and **default area nssa no-summary** commands allow type-3 summary LSAs into the NSSA area.

The **no area nssa** and **default area nssa** commands configure the specified area as a normal area.

Command Mode

Router-OSPF Configuration

Command Syntax

area ***area_id*** **nssa no-summary**

no area ***area_id*** **nssa no-summary**

default area ***area_id*** **nssa no-summary**

Parameters

area_id Area number.

- Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
- Area ***0*** (or ***0.0.0.0***) is not configurable; it is always **normal**.
- ***running-config*** stores value in dotted decimal notation.

Examples

- This command directs the device not to import type-3 summary LSAs into the NSSA area

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#
```

- This command directs the device to import type-3 summary LSAs into the NSSA area.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#
```

15.2.5.9 area range (OSPFv2)

The **area range** command configures OSPF Area Border Routers (ABRs) to consolidate or summarize routes, to set the cost setting routes, and to suppress summary route advertisements.

The no area (OSPFv2) command removes all area commands for the specified area from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

area ***area_id*** **range** ***net_addr*** [**ADVERTISE_SETTING**][**COST_SETTING**]

no area ***area_id*** **range** ***net_addr*** [**ADVERTISE_SETTING**][**COST_SETTING**]

default area ***area_id*** **range** ***net_addr*** [**ADVERTISE_SETTING**][**COST_SETTING**]

Parameters

- ***area_id*** Area number. ***0*** to ***4294967295*** or ***0.0.0.0*** to ***255.255.255.255 running-config*** stores value in dotted decimal notation.
- ***net_addr***.
- **ADVERTISE_SETTING** Values include:
  - ***no parameter***
  - **advertise**
  - **not-advertise**
- Values include:
  - ***no parameter***
  - **cost** ***range_cost*** Value ranges from ***1 to 65535***.

Examples

- The **network area** command assigns two subnets to an area. The **area range** command summarizes the addresses, which the ABR advertises in a single LSA.

```
switch(config)# router ospf 6
switch(config-router-ospf)# network 10.1.25.80 0.0.0.240 area 5
switch(config-router-ospf)# network 10.1.25.112 0.0.0.240 area 5
switch(config-router-ospf)# area 5 range 10.1.25.64 0.0.0.192
switch(config-router-ospf)#
```

- The **network area** command assigns a subnet to an area, followed by an **area range** command that suppresses the advertisement of that subnet.

```
switch(config-router-ospf)# network 10.12.31.0/24 area 5
switch(config-router-ospf)# area 5 range 10.12.31.0/24 not-advertise
switch(config-router-ospf)#
```

15.2.5.10 area stub (OSPFv2)

The **area stub** command sets the area type of an OSPF area to **stub**. All devices in an Area Stub (AS) must specify the same area type for identically numbered areas.

The **no area stub** command remove the specified stub area from the OSPFv2 instance by deleting all **area stub** commands from ***running-config*** for the specified area.

The **no area stub** command configures the specified area as a normal area.

Command Mode

Router-OSPF Configuration

Command Syntax

area ***area_id*** **stub** [summarize]

no area ***area_id*** **stub** [summarize]

default area ***area_id*** **stub** [summarize]

Parameters

- ***area_id*** Area number.
  - Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
  - Area ***0*** **(or** ***0.0.0.0***) is not configurable; it is always normal.
  - ***running-config*** stores value in dotted decimal notation.
- **summarize** Area type. Values include:
  - ***no parameter***
  - **no-summary**

Examples

- These commands configure area ***45*** as a stub area.

```
switch(config)# router ospf 3
switch(config-router-ospf)# area 45 stub
switch(config-router-ospf)#
```

- This command configures area ***10.92.148.17*** as a stub area.

```
switch(config-router-ospf)# area 10.92.148.17 stub
switch(config-router-ospf)#
```

15.2.5.11 clear ip ospf neighbor

The **clear ip ospf** command clears the neighbors statistics per interface.

Command Mode

Privileged EXEC

Command Syntax

clear ip ospf [**PROCESS_ID**] **neighbor** [**LOCATION**][**VRF_INSTANCE**]

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - ***no parameter***
  - ***1 to 65535***.
- **LOCATIONIP** Address or interface peer group name. Values include:
  - ***** clears all OSPF IPv4 neighbors.
  - ***ipv4_addr***
  - **ethernet *e_num***
  - **loopback *l_num***
  - **port-channel *p_num***
  - ***vlan v_num***
- **VRF_INSTANCE** Specifies the VRF instance.
  - **vrf *vrf_name*** configures the ***vrf_name*** instance.

Examples

- This command resets all OSPF neighbor statistics.

```
switch# clear ip ospf neighbor *
switch#
```

- This command resets the OSPF neighbor statistics for the specified ***ethernet 3*** interface.

```
switch# clear ip ospf neighbor ethernet 3
switch#
```

15.2.5.12 compatible (OSPFv2)

The **compatible** command allows the selective disabling of compatibility with ***RFC 2328.***

The **no compatible** and **default compatible** commands reverts OSPF to ***RFC 2328*** compatible and removes the compatible statement from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

compatible rfc1583

no compatible rfc1583

default compatible rfc1583

Examples

- This command sets the OSPF compatibility list with ***RFC 1583***.

```
switch(config)# router ospf 6
switch(config-router-ospf)# compatible rfc1583
switch(config-router-ospf)#
```

- This command disables ***RFC 1583*** compatibility.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no compatible rfc1583
switch(config-router-ospf)#
```

15.2.5.13 default-information originate (OSPFv2)

The **`default-information originate`** command enables default route origination for normal areas. The user user may configure the metric value and metric type used in LSAs. The always option will cause the ASBR to create and advertise a default route whether or not one is configured.

The **`no default-information originate`** command prevents the advertisement of the default route. The **`default default-information originate`** command enables default route origination with default values (metric type 2, metric=1).

Command Mode

Router-OSPF Configuration

Command Syntax

`default-information originate` [**FORCE**][**VALUE**][**TYPE**][**MAP**]

`no default-information originate`

`default default-information originate`

Parameters

All parameters can be placed in any order.

- **FORCE** Advertisement forcing option. Values include:
  - ***no parameter***
  - **always**
- **VALUE** Values include:
  - ***no parameter***
  - **metric *1-65535***
- **TYPE** Values include:
  - ***no parameter***
  - **metric-type *1-2***
- **MAP** Sets attributes in the LSA based on a route map. Values include:
  - ***no parameter***
  - **route-map *map_name***.

Examples

- These commands always advertise the OSPFv2 default route regardless of whether the switch has a default route configured.

```
switch(config)# router ospf 1
switch((config-router-ospf)# default-information originate always
switch(config-router-ospf)# show active
router ospf 1
   default-information originate always
```

- These commands advertise a default route with a metric of ***100*** and an external metric type of ***1*** if a default route is configured.

```
switch(config)# router ospf 1
switch((config-router-ospf)# default-information originate metric 100
 metric-type 1
```

15.2.5.14 distance ospf (OSPFv2)

The **`distance ospf`** command specifies the administrative distance for intra-area, inter-area, or external OSPF routes. The command must be issued separately for each route type being configured. The default administrative distance for all routes is ***110***.

The **`no distance ospf`** and **`default distance ospf`** commands remove the corresponding **`distance ospf`** command from ***running-config***, returning the OSPFv2 administrative distance setting for the specified route type to the default value of ***110***.

Note: OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether it is adjusted by entering the **`distance ospf`** command directly through the CLI or by applying a configuration file that contains the command.

Command Mode

Router-OSPF Configuration

Command Syntax

`distance ospf` [external | inter-area | intra-area]

`no distance ospf` [external | inter-area | intra-area]

`default distance ospf` [external | inter-area | intra-area]

Parameters

- **external** Sets administrative distance for external routes.
- **inter-area** Sets administrative distance for inter-area routes.
- **intra-area** sSets administrative distance for intra-area routes.
- ***distance*** Values range from ***1 to 255***. Default value is ***110*** for all types.

Example

This command configures an administrative distance of ***85*** for all OSPFv2 intra-area routes on the switch. If issued while OSPF is running, this command will cause OSPF links to flap.

```
switch(config)# router ospf 6
switch(config-router-ospf)# distance ospf intra-area 85
switch(config-router-ospf)#
```

15.2.5.15 distribute-list in

A distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs. Filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. The **`distribute-list in`** command creates a distribute list in the configuration mode OSPF instance.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **`no distribute-list in`** and **`default distribute-list in`** commands remove the **`distribute-list in`** command from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

`distribute-list` {prefix-list | route-map} *list_name* **`in`**

`no distribute-list` {prefix-list | route-map}

`default distribute-list` {prefix-list | route-map}

Parameters

- **prefix-list** Specifies a prefix-list as the filter.
- **route-map** Specifies a route-map as the filter.
- ***list_name*** The name of the prefix-list or route-map used to filter routes from incoming LSAs.

Related Commands

- area filter (OSPFv2)
- redistribute (OSPFv2)

Example

These commands configure a prefix list named ***dist_list1*** in OSPF instance ***5*** to filter certain routes from incoming OSPF LSAs.

```
switch(config)# router ospf 5
switch(config-router-ospf)# distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#
```

15.2.5.16 dn-bit-ignore (OSPFv2)

The **dn-bit-ignore** command results in the DN bit in Type 3 Summary LSAs to be ignored during the Shortest Path First (SPF) calculations.

The **no dn-bit-ignore** and **default dn-bit-ignore** commands result in the DN bit in Type 3 Summary LSAs to not be ignored during SPF calculations.

Command Mode

Router-OSPF Configuration

Command Syntax

dn-bit-ignore

no dn-bit-ignore

default dn-bit-ignore

Examples

- This command ignores the DN bit.

```
switch(config)# router ospf 6
switch(config-router-ospf)# dn-bit-ignore
switch(config-router-ospf)#
```

- This command causes the DN bit not to be ignored.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no dn-bit-ignore
switch(config-router-ospf)#
```

15.2.5.17 interface Tunnel

OSPF packets by default are sent with Time to Live (TTL) value ***1***. This may not work in tunnel scenarios where the peer tunnel end point could be more than one hop away. It is recommended to explicitly configure TTL on the tunnel interface. TTL configuration is allowed only if **path-mtu-discovery** is configured.

Command Mode

Configuration mode

Command Syntax

`interface Tunnel` ***Tunnel No***

Parameters

Tunnel No Tunnel number.

Example

```
(config)# interface Tunnel 5
(config-if-Tu0)# tunnel path-mtu-discovery
(config-if-Tu0)# tunnel ttl 5
```

15.2.5.18 ip ospf area

The **ip ospf area** command enables OSPFv2 on an interface and associates the area to the interface.

The **no ip ospf area** and **default ip ospf area** commands disable OSPFv2 on the configuration mode interface and remove the configured area from the system.

Note: The per interface configuration has precedence over the OSPF Configuration mode. In other words, the area configured by the ip ospf area command has precedence over the area configured by the network area command.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf area ***area_id***

no ip ospf area ***area_id***

default ip ospf area ***area_id***

Parameters

area_id The area ID. The valid values are ***0*** to ***4294967295*** or a decimal range between ***0.0.0.0*** and ***255.255.255.255***.

Example

These commands enable OSPFv2 on the ***et2*** interface and associates area identifier ***1.1.1.1*** to the interface.

```
switch(config)# Interface ethernet 2
switch(config-if-Et2)# ip address 1.0.0.1/24
switch(config-if-Et2)# ip ospf area 1.1.1.1
router ospf 1
```

15.2.5.19 ip ospf authentication

The **ip ospf authentication** command enables OSPFv2 authentication for the configuration mode interface..

The **no ip ospf authentication** and **default ip ospf authentication** commands disable OSPFv2 authentication on the configuration mode interface by removing the corresponding **ip ospf authentication** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf authentication [**METHOD**]

no ip ospf authentication

default ip ospf authentication

Parameters

METHOD OSPFv2 authentication method. Options include:

- ***no parameter***
- **message-digest**

Examples

- This command enables simple authentication on ***vlan 12***.

```
switch(config)# interface vlan 12
switch(config-if-vl12)# ip ospf authentication
switch(config-if-vl12)#
```

- This command enables message-digest authentication on ***vlan 12***.

```
switch(config-if-vl12)# ip ospf authentication message-digest
switch(config-if-vl12)#
```

15.2.5.20 ip ospf authentication-key

The **ip ospf authentication-key** command configures the OSPFv2 authentication password for the configuration mode interface.

The **no ip ospf authentication-key** and **default ip ospf authentication-key** commands removes the OSPFv2 authentication password from the configuration mode interface by removing the corresponding **ip ospf authentication-key** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf authentication-key [**ENCRYPT_TYPE**] ***key_text***

no ip ospf authentication-key

default ip ospf authentication-key

Parameters

- **ENCRYPT_TYPE** Encryption level of the ***key_text*** parameter. Values include:
  - ***no parameter*** the ***key_text*** is in clear text.
  - ***0 key_text*** is in clear text. Equivalent to ***no parameter***.
  - ***7 key_text*** is MD5 encrypted.
- ***key_text*** the authentication-key password.

Example

This command specifies a password in clear text.

```
switch(config)# interface vlan 12
switch(config-if-Vl12)# ip ospf authentication-key 0 code123
switch(config-if-Vl12)# show active
interface Vlan12
   ip ospf authentication-key 7 baYllFzVbcx4yHq1IhmMdw==
switch(config-if-Vl12)#
```

The ***running-config*** stores the password as an encrypted string.

15.2.5.21 ip ospf cost

The **ip ospf cost** command configures the OSPFv2 cost for the configuration mode interface. The default cost depends on the interface type:

- Ethernet: determined by the **auto-cost reference-bandwidth (OSPFv2)** command.
- Port channel: ***10***.
- VLAN: ***10***.

The **no ip ospf cost** and **default ip ospf cost** commands restore the default OSPFv2 cost for the configuration mode interface by removing the corresponding **ip ospf cost** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf cost ***interface_cost***

no ip ospf cost

default ip ospf cost

Parameters

interface_cost Value ranges from ***1 to 65535***; default is ***10***.

Example

This command configures a cost of ***15*** for ***vlan 2***.

```
switch(config)# interface vlan 2
switch(config-if-Vl2)# ip ospf cost 15
switch(config-if-Vl2)#
```

15.2.5.22 ip ospf dead-interval

The **`ip ospf dead-interval`** command configures the dead interval for the configuration mode interface.

The **`no ip ospf dead-interval`** and **`default ip ospf dead-interval`** commands restore the default dead interval of ***40*** seconds on the configuration mode interface by removing the corresponding **`ip ospf dead-interval`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`ip ospf dead-interval` ***time***

`no ip ospf dead-interval`

`default ip ospf dead-interval`

Parameters

time Value ranges from ***1 to 8192***; default is ***40***.

Example

This command configures a dead interval of ***120*** seconds for ***vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip ospf dead-interval 120
switch(config-if-Vl4)#
```

15.2.5.23 ip ospf disabled

The **ip ospf disabled** command disables OSPFv2 on the configuration mode interface without disrupting the OSPFv2 configuration. When OSPFv2 is enabled on the switch, the it is also enabled by default on all interfaces.

The OSPFv2 instance is disabled on the entire switch with the **shutdown (OSPFv2)** command.

The **no ip ospf disabled** and **default ip ospf disabled** commands enable OSPFv2 on the configuration mode interface by removing the corresponding **ip ospf disabled** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf disabled

no ip ospf disabled

default ip ospf disabled

Examples

- This command shuts down OSPFv2 activity on ***vlan 5***.

```
switch(config)# interface vlan 5
switch(config-if-Vl5)# ip ospf disabled
switch(config-if-Vl5)#
```

- This command resumes OSPFv2 activity on ***vlan 5***.

```
switch(config-if-Vl5)# no ip ospf disabled
switch(config-if-Vl5)#
```

15.2.5.24 ip ospf hello-interval

The **ip ospf hello-interval** command configures the OSPFv2 hello interval for the configuration mode interface.

The same hello interval should be specified for Each OSPFv2 neighbor, and should not be longer than any neighbors dead interval.

The **no ip ospf hello-interval** and **default ip ospf hello-interval** commands restore the default hello interval of ***10*** seconds on the configuration mode interface by removing the **ip ospf hello-interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf hello-interval ***time***

no ip ospf hello-interval

default ip ospf hello-interval

Parameter

time Hello interval (seconds). Values range from ***1 to 8192***; default is ***10***.

Example

This command configures a hello interval of ***30*** seconds for ***vlan 2***.

```
switch(config)# interface vlan 2
switch(config-if-Vl2)# ip ospf hello-interval 30
switch(config-if-Vl2)#
```

15.2.5.25 ip ospf message-digest-key

The **ip ospf message-digest-key** command configures a message digest authentication key for the configuration mode interface.

The **no ip ospf message-digest-key** and **default ip ospf message-digest-key** commands remove the message digest authentication key for the specified key ID on the configuration mode interface by deleting the corresponding **ip ospf message-digest-key** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf message-digest-key ***key_id*** md5 **ENCRYPT_TYPE** ***key_text***

no ip ospf message-digest-key ***key_id***

default ip ospf message-digest-key ***key_id***

Parameters

- ***key_id*** Key ID number. Value ranges from ***1 to 255***.
- **ENCRYPT_TYPE** Encryption level of the ***key_text*** parameters. Values include:
  - ***no parameter***
  - ***0 key_text***
  - ***7 key_text***
- ***key_text*** message key (password).

Example

This command configures ***code123*** as the MD5 key with a corresponding key ID of ***23***.

```
switch(config)# interface vlan 12
switch(config-if-vl12)# ip ospf message-digest-key 23 md5 0 code123
switch(config-if-vl12)#
```

The ***running-config*** stores the password as an encrypted string.

15.2.5.26 ip ospf network point-to-point

The **ip ospf network point-to-point** command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The **no ip ospf network** and **default ip ospf network** commands set the configuration mode interface as a broadcast link by removing the corresponding **ip ospf network**command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf network point-to-point

no ip ospf network

default ip ospf network

Examples

- These commands configure ethernet interface ***10*** as a point-to-point link.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# ip ospf network point-to-point
switch(config-if-Et10)#
```

- This command restores ethernet interface ***10*** as a broadcast link.

```
switch(config-if-Et10)# no ip ospf network
switch(config-if-Et10)#
```

15.2.5.27 ip ospf retransmit-interval

The **`ip ospf retransmit-interval`** command configures the link state advertisement retransmission interval for the interface.

The **`no ip ospf retransmit-interval`** and **`default ip ospf retransmit-interval`** commands restore the default retransmission interval of ***5*** seconds on the configuration mode interface by removing the corresponding **`ip ospf retransmit-interval`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`ip ospf retransmit-interval` ***period***

`no ip ospf retransmit-interval`

`default ip ospf retransmit-interval`

Parameters

period Retransmission interval (seconds). Value ranges from ***1 to 8192***; default is ***5***.

Example

This command configures a retransmission interval of ***15*** seconds for ***vlan 3***.

```
switch(config)# interface vlan 3
switch(config-if-Vl3)# ip ospf retransmit-interval 15
switch(config-if-Vl3)#
```

15.2.5.28 ip ospf router-id output-format hostnames

The **ip ospf router-id output-format hostnames** command causes the switch to display DNS names in place of numeric OSPFv2 router IDs in all OSPFv2 show commands, including:

- **show ip ospf**
- **show ip ospf border-routers**
- **show ip ospf database <link state list>**
- **show ip ospf database database-summary**
- **show ip ospf database <link-state details>**
- **show ip ospf interface**
- **show ip ospf neighbor**
- **show ip ospf request queue**
- **show ip ospf retransmission queue**

The **no ip ospf router-id output-format hostnames** and **default ip ospf router-id output-format hostnames** commands remove the **ip ospf router-id output-format hostnames** command from ***running-config***, restoring the default behavior of displaying OSPFv2 router IDs by their numeric value.

Command Mode

Global Configuration

Command Syntax

ip ospf router-id output-format hostnames

no ip ospf router-id output-format hostnames

default ip ospf router-id output-format hostnames

Example

This command programs the switch to display OSPFv2 router IDs by the corresponding DNS name in subsequent show commands.

```
switch(config)# ip ospf router-id output-format hostnames
switch(config)#
```

15.2.5.29 ip ospf transmit-delay

The **ip ospf transmit-delay** command configures the transmission delay for OSPFv2 packets over the configuration mode interface.

The **no ip ospf transmit-delay** and **default ip ospf transmit-delay** commands restore the default transmission delay (***1*** second) on the configuration mode interface by removing the corresponding **ip ospf transmit-delay** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf transmit-delay ***trans***

no ip ospf transmit-delay

default ip ospf transmit-delay

Parameters

trans LSA transmission delay (seconds). Value ranges from ***1 to 8192***; default is ***1***.

Example

This command configures a transmission delay of ***5*** seconds for ***vlan 6***.

```
switch(config)# interface vlan 6
switch(config-if-Vl6)# ip ospf transmit-delay 5
switch(config-if-Vl6)#
```

15.2.5.30 ip ospf priority

The **ip ospf priority** command configures OSPFv2 router priority for the configuration mode interface..

The **no ip ospf priority** and **default ip ospf priority** commands restore the default priority (***1***) on the configuration mode interface by removing the corresponding **ip ospf priority** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration Interface-Port-Channel Configuration Interface-VLAN Configuration

Command Syntax

ip ospf priority ***priority_level***

no ip ospf priority

default ip ospf priority

Parameter

priority_level priority level. Value ranges from ***0 to 255***. Default value is ***1***.

Examples

- This command configures a router priority of ***15*** for ***vlan 8***.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# ip ospf priority 15
switch(config-if-Vl8)#
```

- This command restores the router priority of ***1*** for ***vlan 7***.

```
switch(config)# interface vlan 7
switch(config-if-Vl7)# no ip ospf priority
switch(config-if-Vl7)#
```

15.2.5.31 line system

The **`line system`** command places the switch in the OSPF - Line System configuration mode.

The **`no line system`** command removes the Line System configurations from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

`line system`

`no line system`

Parameters

The following paramaters are allowed to be configured under LS mode.

- **port *number*** Transceiver slot number. Value ranges from ***1 - 66***.
  - The following parameters are allowed under **LS port mode**:
    - booster Booster settings
    - pre-amp Pre-amp settings

Example

This command places the switch in the OSPF Line System configuration mode.

```
switch# config
switch(config)# line system
switch(config-ls)#
```

15.2.5.32 log-adjacency-changes (OSPFv2)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv2 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from ***running-config***.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in ***running-config***.

The **no log-adjacency-changes** disables link state change syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

log-adjacency-changes detail

no log-adjacency-changes

default log-adjacency-changes

Examples

- This command configures the switch to send a syslog message when a neighbor goes up or down.

```
switch(config)# router ospf 6
switch(config-router-ospf)# log-adjacency-changes
switch(config-router-ospf)#
```

  - After entering the command, **show active** does not display a **log-adjacency-changes** statement.

```
switch(config-router-ospf)# show active router ospf 1
switch(config-router-ospf)#
```

- This command configures the switch to send a Syslog message when it detects any link state change.

```
switch(config-router-ospf)# log-adjacency-changes detail
switch(config-router-ospf)#
```

  - After entering the command, **show active** displays a **log-adjacency-changes detail** command.

```
switch(config-router-ospf)# show active router ospf 1
switch(config-router-ospf)# log-adjacency-changes detail
switch(config-router-ospf)#
```

15.2.5.33 maximum-paths (OSPFv2)

The **maximum-paths** command controls the number of parallel routes that OSPFv2 supports. The default maximum is ***16*** paths.

The **no maximum-paths** and **default maximum-paths** commands restore the maximum number of parallel routes that OSPFv2 supports on the switch to the default value of 16 by placing the **maximum-paths** ***16*** statement in ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

maximum-paths ***paths***

no maximum-paths

default maximum-paths

Parameters

paths Maximum number of parallel routes.

Value ranges from ***1*** to the number of interfaces available per ECMP group, which is platform dependent.

- **Arad:** Value ranges from ***1 to 128***. Default value is ***128***.
  - **FM6000:** Value ranges from ***1 to 32***. Default value is ***32***.
  - **PetraA:** Value ranges from ***1 to 16***. Default value is ***16***.
  - **Trident:** Value ranges from ***1 to 32***. Default value is ***32***.
  - **Trident II:** Value ranges from ***1 to 128***. Default value is ***128***.

Example

This command configures the maximum number of OSPFv2 parallel paths to ***12***.

```
switch(config)# router ospf 6
switch(config-router-ospf)# maximum-paths 12
switch(config-router-ospf)#
```

15.2.5.34 max-lsa (OSPFv2)

The **max-lsa** command specifies the maximum number of LSAs allowed in the LSDB. Setting the limit to zero removes the LSDB restriction and disables LSA overload actions. Actions triggered by LSDB overload conditions include:

- **Warning**: the switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown**: when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period (the default is five minutes).
- **Permanent shutdown**: the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is ***5***). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

The **no max-lsa** and **default max-lsa** commands restore all LSA overload parameters to their default settings.

Note: if OSPFv2 has entered permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2, and will disable overload protection.

Command Mode

Router-OSPF Configuration

Command Syntax

max-lsa ***lsa_num*** [**WARNING**] [**IGNORE_TIME**][**IGNORE_COUNT**][**RESET**]

no max-lsa

default max-lsa

Parameters

- ***lsa_num*** Maximum number of LSAs. Value ranges from ***0 to 100,000***.
  - ***0*** Disables overload protection.
  - ***1 to 100000*** Specifies maximum value; default value is ***12,000***.
- **WARNING** Warning threshold, as a percentage of the maximum number of LSAs (% of ***lsa_num***).
  - ***no parameter*** Default of ***75%***.
  - ***percent*** Ranges from ***25 to 99***.
- **IGNORE_TIME** Temporary shutdown period (minutes). Options include:
  - ***no parameter*** Default value of ***5*** minutes.
  - **ignore-time *period*** Value ranges from ***1 to 60***.
- **IGNORE_COUNT** Number of temporary shutdowns required to trigger a permanent shutdown.
  - ***no parameter*** Default value of ***5***.
  - **ignore-count *episodes*** Ranges from ***1 to 20***.
- **RESET** Period of not exceeding LSA limit required to reset temporary shutdown counter to zero.
  - ***no parameter*** Default value of ***5*** minutes.
  - **reset-time *r_period*** Ranges from ***1 to 60***.

Example

This command defines an LSA limit of ***8000*** and other parameters.

```
switch(config-router-ospf)# max-lsa 8000 40 ignore-time 6 ignore-count 3
 reset-time 20
switch(config-router-ospf)#
```

15.2.5.35 max-metric router-lsa (OSPFv2)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

Command Mode

Router-OSPF Configuration

Command Syntax

max-metric router-lsa [**EXTERNAL**][**STUB**][**STARTUP**][**SUMMARY**]

no max-metric router-lsa [**EXTERNAL**][**STUB**][**STARTUP**][**SUMMARY**]

default max-metric router-lsa [**EXTERNAL**][**STUB**][**STARTUP**][**SUMMARY**]

Parameters

All parameters can be placed in any order.

- **EXTERNAL** Advertised metric value. Values include:
  - ***no parameter*** Default value of ***1***.
  - **external-lsa** Range: ***1 to 16777215***. Default value is ***0xFF0000***.
- **STUB** Advertised metric type. Values include:
  - ***no parameter*** Default value of ***2***.
  - **include-stub**
- **STARTUP** Limit scope of LSAs. Values include:
  - ***no parameter***
  - **on-startup**
  - **on-startup wait-for-bgp**
  - **on-startup** Range: ***5 to 86400***.
- **wait-for-bgp** or an **on-start** time value is not included in ***no*** and **default** commands.
- **SUMMARY** Advertised metric value. Values include:
  - ***no parameter***
  - **summary-lsa**
  - **summary-lsa** Range: ***1 to 16777215***.

Example

This command configures OSPF to to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf)# max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf)#
```

15.2.5.36 network area (OSPFv2)

The **network area** command assigns the specified IPv4 subnet to an OSPFv2 area.

The **no network area** and **default network area** commands delete the specified network area assignment by removing the corresponding **network area** command from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

network ***ipv4_subnet*** **area** ***area_id***

no network ***ipv4_subnet*** **area** ***area_id***

default network ***ipv4_subnet*** **area** ***area_id***

Parameters

- ***ipv4_subnet*** IPv4 subnet. Entry formats include address-prefix (CIDR) or address-wildcard mask. The ***running-config*** stores value in CIDR notation.
- ***area_id*** Area number. ***0*** to ***4294967295*** or ***0.0.0.0*** to ***255.255.255.255***. The ***running-config*** stores value in dotted decimal notation.

Example

These equivalent commands each assign the subnet ***10.1.10.0/24*** to area ***0***.

```
switch(config-router-ospf)# network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf)# network 10.1.10.0/24 area 0
switch(config-router-ospf)#
```

15.2.5.37 no area (OSPFv2)

The **no area** command removes the corresponding **area** command from the ***running-config*:**

- **no/default area not-so-stubby lsa type-7 convert type-5** commands remove the **translate type7 always** parameter without changing the area type.
- **no/default area nssa**, **no/default area stub**, and **no/default area stub no-summary** commands restore the areas type to **normal**.
- The **no/default area default-information-originate** command removes all area commands for the specified area from ***running-config***.
- The **no/default area** command removes all area commands for the specified area from the ***running-config***.
- The **no/default area** command removes all area commands for the specified area from the ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

no area ***area_id*** [**TYPE**]

default area ***area_id*** [**TYPE**]

Parameters

- ***area_id*** area number.
  - Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
  - Area ***0*** (or ***0.0.0.0***) is not configurable; it is always **normal**.
  - The ***running-config*** stores value in dotted decimal notation.
- **TYPE** Area type. Values include:
  - **nssa**
  - **nssa translate type7 always**
  - **stub**
  - **stub no-summary**

Examples

- These commands remove area ***1*** from the running configuration.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no area 1
switch(config-router-ospf)#
```

- These commands remove area ***10.92.148.17*** as an NSSA.

```
switch(config-router-ospf)# no area 10.92.148.17 nssa
switch(config-router-ospf)#
```

15.2.5.38 packet

This describes packet types that the feature is applied on.

Command Mode

system-feature-source-profile **(config-hw-tcam-profile-*profile*-feature-*feature*)**

Command Syntax

packet *packet header tokens* forwarding<[bridged | routed | mpls][multicast][decap]

Parameters

- ***packet header tokens*** The packet header is described as a series of CLI packet header tokens after the **packet** token. It starts from the outer most header after Ethernet. For example, a regular IPv4 packet is **packet ipv4** and a VXLAN packet is **packet ipv4 vxlan eth ipv4**.
- **forwarding** The **forwarding** token indicates the forwarding type of the packet.
  - **bridged**
  - **routed**
  - **mpls**
    - **multicast** Indicates if the packet is a multicast packet.
    - **decap** Indicates if the packet is decapsulated after a tunnel.

Guidelines

On DCS-7020, DCS-7280R/R2 or DCS-7500R/R2, enabling OSPF routes over GRE tunnels requires the system TCAM profile to have “Tunnel IPv4” feature enabled so that control packets such as OSPF hellos received over GRE tunnel interfaces are appropriately classified. This can be achieved by creating a user defined TCAM profile.

The user defined TCAM profile may be created either manually from scratch or by copying from an existing TCAM profile. The system TCAM profile must have the feature **tunnel ipv4** for OSPFv2 over GRE tunnel interfaces to work.This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

To create a user defined TCAM profile.

```
(config)# hardware tcam
(config-hw-tcam)# profile profilename copy default
(config-hw-tcam-profile-profile)# feature tunnel ipv4 copy system-featur
e-source-profile
```

The following steps are optional if the feature is added by copying from system-feature-source-profile.

- Set the packet types for the feature as follows to match GRE tunnelled ipv4 routed unicast and multicast packets.

```
(config-hw-tcam-profile-profile-feature-feature)# packet ipv4 non-vxlan
 forwarding routed decap
(config-hw-tcam-profile-profile-feature-feature)# packet ipv4 non-vxlan
 forwarding routed multicast decap
```

- Specify the qualifiers to match on.

```
(config-hw-tcam-profile-profile-feature-feature)# key field inner-dst-
ip inner-ip-protocol inner-l4-dst-port inner-l4-src-port inner-ttl
```

- Set the key size limit to ***160***.

```
(config-hw-tcam-profile-profile-feature-feature)#key size limit 160
(config-hw-tcam-profile-profile-feature-feature)#exit
```

It maybe necessary to disassociate some features which are not applicable to GRE encapsulated packets from the GRE TCAM program to make room for the **tunnel ipv4** feature.

Related Commands

- system profile
- interface Tunnel
- show hardware tcam profile

15.2.5.39 passive-interface default (OSPFv2)

The **passive-interface default** command configures all interfaces as OSPFv2 passive by default. The switch advertises the passive interface as part of the router LSA.

The **passive-interface (OSPFv2)** configures the OSPFv2 active-passive status for a specific interface:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface** statements in ***running-config***.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface** statements in ***running-config***.

The **no passive-interface** and **default passive-interface** commands configures all interfaces as OSPFv2 active by default by removing the **passive-interface default** statement from ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

passive-interface default

no passive-interface default

default passive-interface default

Examples

- This command configures the default interface setting as OSPFv2 passive. This command also removes all **passive-interface** statements from the ***running-config***.

```
switch(config)# router ospf 6
switch(config-router-ospf)# passive-interface default
switch(config-router-ospf)#
```

- This command configures the default interface setting as OSPFv2 active. This command also removes all **no passive-interface** statements from the ***running-config***.

```
switch(config-router-ospf)# no passive-interface default
switch(config-router-ospf)#
```

15.2.5.40 passive-interface (OSPFv2)

The **passive-interface** command disables OSPFv2 on an interface range. The switch advertises the passive interface as part of the LSA.

The default OSPFv2 interface activity is configured by the **passive-interface default (OSPFv2)** command:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface** statements in the ***running-config***.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface** statements in the ***running-config***.

The **no passive-interface** command enables OSPFv2 on the specified interface range. The **default passive-interface** command sets the interface to the default interface activity setting by removing the corresponding **passive-interface** or **no passive-interface** statement from the ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

passive-interface **INTERFACE_NAME**

no passive-interface **INTERFACE_NAME**

default passive-interface **INTERFACE_NAME**

Parameters

- **INTERFACE_NAME** Interface to be configured. Options include:
  - **ethernet *e_range***
  - **port-channel *p_range***
  - **vlan *v_range***
  - **vxlan *vx_range***

Examples

- These commands configure Ethernet interfaces ***2*** through ***5*** as passive interfaces.

```
switch(config)# router ospf 6
switch(config-router-ospf)# passive-interface ethernet 2-5
switch(config-router-ospf)#
```

- This command configures VLAN interfaces ***50-54***, ***61***, ***68***, and ***102-120*** as passive interfaces.

```
switch(config-router-ospf)# passive-interface vlan 50-54,61,68,102-120
switch(config-router-ospf)#
```

- This command configures ***vlan 2*** as an active interface.

```
switch(config-router-ospf)# no passive-interface vlan 2
switch(config-router-ospf)#
```

15.2.5.41 point-to-point routes (OSPFv2)

The **point-to-point routes** command enables the switch to maintain a local Routing Information Base (RIB) to store information it learns from its neighbors.

The **no point-to-point routes** and **default point-to-point routes** commands program the switch to include point-to-point links in its RIB by removing the **point-to-point routes** command from the ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

point-to-point routes

no point-to-point routes

default point-to-point routes

Examples

- This command configures the switch to optimize the local RIB by not including point-to-point routes.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no point-to-point routes
switch(config-router-ospf)#
```

- This command configures the switch to include point-to-point routes.

```
switch(config-router-ospf)# point-to-point routes
switch(config-router-ospf)#
```

15.2.5.42 redistribute (OSPFv2)

The **redistribute** command enables the advertising of all specified routes on the switch into the OSPFv2 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from the ***running-config***, disabling route redistribution for the specified route type.

Command Mode

Router-OSPF Configuration

Command Syntax

redistribute ROUTE_TYPE [**ROUTE_MAP**]

no redistribute ROUTE_TYPE [**ROUTE_MAP**]

default redistribute ROUTE_TYPE [**ROUTE_MAP**]

Parameters

- **ROUTE_TYPE** Source from which routes are redistributed. Options include:
  - **connected** routes that are established when IPv4 is enabled on an interface.
  - **BGP** routes from a BGP domain.
  - **RIP** routes from a RIP domain.
  - **static** IP static routes.
- **ROUTE_MAP** Route map that determines the routes that are redistributed. Options include:
  - ***no parameter***
  - **route-map *map_name***

Examples

- The **redistribute static** command starts the advertising of static routes as OSPFv2 external routes.

```
switch(config)# router ospf 6
switch(config-router-ospf)# redistribute static
switch(config-router-ospf)#
```

- The **no redistribute bgp** command stops the advertising of BGP routes as OSPFv2 external routes.

```
switch(config-router-ospf)# no redistribute bgp
switch(config-router-ospf)#
```

15.2.5.43 redistribute ospf

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

Command Mode

config-router-bgp

Command Syntax

`redistribute ospf` [include [leaked] | match [external | internal | nssa-external] | route-map ***word***]

`no redistribute ospf` [match [external | internal | nssa-external]

`default redistribute ospf` [match [external | internal | nssa-external]

Parameters

- **include** Include following routes while redistributing.
  - **leaked** Include leaked routes of this protocol while redistributing.
- **match** Routes learned by the OSPF protocol.
  - **external** OSPF routes learned from external sources.
  - **internal** OSPF routes learned from internal sources.
  - **nssa-external** OSPF routes learned from external NSSA sources.
- **route-map** Name a router map.
  - ***word*** Route map name.

Example

Use the following commands to redistribute OSPFv2 routes into the BGP domain.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute OSPF
switch(config-router-bgp)#
```

15.2.5.44 redistribute ospf instance

The **redistribute ospf instance** command redistributes either the non-leaked routes, or both leaked and non-leaked routes. The **exit** command returns the switch to the ***global*** configuration mode.

Command Mode

Router-OSPF Configuration

Command Syntax

redistribute ospf instance [**OPTIONS**]

Parameters

- **include** Include leaked routes.
  - ***leaked*** OSPF leaked routes.
- **match** Routes learned by the OSPF protocol.
  - **external** OSPF routes learned from external sources.
  - **internal** OSPF routes learned from internal sources.
  - **nssa-external** OSPF routes learned from external NSSA sources.

Examples

- This command redistributes the OSPFv2 external routes from all other OSPFv2 instances in the same VRF into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance match external
```

- This command redistributes the OSPFv2 internal leaked and non-leaked routes from all other instances in all VRFs into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance include leaked
 match internal
```

15.2.5.45 router ospf

The **`router ospf`** command places the switch in router-ospf configuration mode. The switch will create a process ID for the new instance if one does not already exist. The **`exit`** command returns the switch to the ***global*** configuration mode.

The **`show ip ospf`** command displays the process ID of the OSPFv2 instances configured on the switch.

The **`no router ospf`** and **`default router ospf`** commands delete the specified OSPFv2 instance.

The ***router-ospf*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting ***router-ospf*** configuration mode does not affect ***running-config***. The **`exit`** command returns the switch to the ***global*** configuration mode.

Refer to the Router-OSPFv2 Configuration Mode for a list of commands available in ***router-ospf*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`router ospf` ***process_id*** [**VRF_INSTANCE**]

`no router ospf` ***process_id*** [**VRF_INSTANCE**]

`default router ospf` ***process_id*** [**VRF_INSTANCE**]

Parameters

- ***process_id*** OSPFv2 process ID. Values range from ***1 to 65535***.
- **VRF_INSTANCE**
  - ***no parameter*** Configures the default VRF instance.
  - **vrf** ***vrf_name*** Configures the vrf_name instance.

Examples

- This command creates an OSPFv2 instance with process ID ***145*** in the main VRF.

```
switch(config)# router ospf 145
switch(config-router-ospf)#
```

- This command deletes the specified OSPFv2 instance.

```
switch(config)# no router ospf 145
switch(config)#
```

15.2.5.46 router-id (OSPFv2)

The **router-id** command assigns a router ID for an OSPFv2 instance. This number uniquely identifies the router within an Autonomous System. Status commands use the router ID to identify the switch.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address, if a loopback interface is configured on the switch.
3. The highest IP address present on the router.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **no router-id** and **default router-id** commands remove the router ID command from the ***running-config***; the switch uses the loopback or highest address as the router ID.

Command Mode

Router-OSPF Configuration

Command Syntax

router-id [***identifier***]

no router-id [***identifier***]

default router-id [***identifier***]

Parameters

identifier Value ranges from ***0.0.0.0*** to ***255.255.255.255***.

Example

This command assigns ***10.5.4.2*** as the router ID for the OSPFv2 instance.

```
switch(config)# router ospf 6
switch(config-router-ospf)# router-id 10.5.4.2
switch(config-router-ospf)#
```

15.2.5.47 show hardware tcam profile

Use the **show hardware tcam profile** command to verify that the user-defined-tcam profile is applied correctly without errors on the DCS-7020, DCS-7280R/R2, or DCS-7500R/R2 platforms.

This command is applicable the following platforms:

- DCS-7280E
- DCS-7280R
- DCS-7280R2
- DCS-7020R
- DCS-7500E
- DCS-7500R
- DCS-7500R2

Command Mode

EXEC

Command Syntax

show hardware tcam profile [***profile***] detail

Parameters

- **tcam** Specifies the TCAM information.
- **profile** ***profile*** Specifies the TCAM profile information.
- **detail** Displays detailed tcam profile information.

Example

This example displays the detailed tcam profile information for profile named ***newprofile1***.

```
(config-hw-tcam)# show hardware tcam profile newprofile1 detail
Profile newprofile1 [ FixedSystem ]
 Feature         mpls
 --------------- ----------------------------------------------------
 Key size        160
 Actions         drop, redirect, set-ecn
 Packet type     ipv4 mpls ipv4 forwarding mpls decap
                 ipv4 mpls ipv6 forwarding mpls decap

```

15.2.5.48 show ip ospf border-routers

The **show ip ospf border-routers** command displays the internal OSPFv2 routing table entries to Area Border Routers (ABRs) and Autonomous System Boundary Routers (ASBRs) for each of the OSPFv2 areas.

Command Mode

EXEC

Command Syntax

show ip ospf border-routers [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Specifies the VRF instance.

- ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
- **vrf *vrf_name*** displays information from the specified VRF.

Example

This command displays the ABRs and ASBRs.

```
switch# show ip ospf border-routers
OSPF Process 10.17.0.42, VRF default

Router ID       Area            Type
10.17.0.1      0.0.0.0         ASBR
switch>
```

15.2.5.49 show ip ospf database database-summary

The **show ip ospf database database-summary** command displays the number of link state advertisements in the OSPFv2 database.

Command Mode

EXEC

Command Syntax

show ip ospf [**AREA**] **database database-summary** [**VRF_INSTANCE**]

Parameters

- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.
- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - ***no parameter***
  - ***process_id***
  - ***process_id area_id***
  - ***process_id*** input range: ***1 to 65535***.
  - ***area_id*** input range: ***0 to 4294967295*** or ***0.0.0.0 to 255.255.255.255***.

Example

This command displays the LSDB content summary for area ***0***.

```
switch# show ip ospf 1 0 database database-summary

  LSA Type      Count
  Router        18
  Network       21
  Summary Net   59
  Summary ASBR  4
  Type-7 Ext    0
  Opaque Area   0
  Type-5 Ext    4238
  Opaque AS     0
  Total         4340

switch>
```

15.2.5.50 show ip ospf database <link state list>

The **show ip ospf database <link state list>** command displays the OSPFv2 link state advertisements that originate on a specified switch.

Command Mode

EXEC

Command Syntax

show ip ospf [**AREA**] **database**[**ROUTER**] [**VRF_INSTANCE**]

Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - ***no parameter***
  - ***process_id***
  - ***process_id area_id***
  - ***process_id*** value ranges from ***1 to 65535***.
  - ***area_id*** is entered in decimal or dotted decimal notation.
- **ROUTER** Router or switch for which the command provides data. Options include:
  - ***no parameter***
  - **adv-router** [***a.b.c.d***]
  - **self-originate**
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.

Example

This command displays OSPFv2 LSAs that originate at the router with a router ID of ***10.26.0.31***.

```
switch# show ip ospf database adv-router 10.26.0.31

OSPF Router with ID(10.26.0.23) (Process ID 1) (VRF default)

switch>
```

15.2.5.51 show ip ospf database <link-state details>

The **show ip ospf database** command displays details of the specified link state advertisements.

Command Mode

EXEC

Command Syntax

show ip ospf [**AREA**] **database** **LINKSTATE_TYPE** ***linkstate_id*** [**ROUTER**] [**VRF_INSTANCE**]

Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - ***no parameter***
  - ***process_id***
  - ***process_id area_id***
  - ***process_id*** input range: ***1 to 65535***.
  - ***area_id*** input range: ***0 to 4294967295*** or ***0.0.0.0 to 255.255.255.255***.
- **LINKSTATE_TYPE** Link state types. Parameter options include:
  - **detail** Displays all link states.
  - **router**
  - **network**
  - **summary**
  - **asbr-summary**
  - **external**
  - **nssa-external**
  - **opaque-link**
  - **opaque-area**
  - **opaque-as**
- ***linkstate_id*** Network segment described by the LSA (dotted decimal notation).

  Value depends on the LSA type.
- **ROUTER** Router or switch for which the command provides data. Options include:
  - ***no parameter***
  - **adv-router** [***a.b.c.d***]
  - **self-originate**
- **VRF_INSTANCE** Parameter has no effect; this command displays information about the specified process and area regardless of VRF.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.

Examples

- This command displays the router link states contained in the area ***2*** LSDB.

```
switch# show ip ospf 1 2 database router

OSPF Router with ID(10.168.103.1) (Process ID 1) (VRF default)

15.2.5.52 show ip ospf interface brief

The **show ip ospf interface brief** command displays a summary of OSPFv2 information.

Command Mode

EXEC

Command Syntax

show ip ospf [**PROCESS_ID**] **interface brief** [**VRF_INSTANCE**]

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - ***no parameter***
  - ***1 to 65535***
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.

Related Command

show ip ospf interface

Example

This command displays a summary of interface information for the switch.

```
switch# show ip ospf interface brief
InterfacePIDAreaIP AddressCostStateNbrs
Loopback010.0.0.010.168.103.1/2410DR0

Vlan310.0.0.310.168.3.1/2410DR0
switch>
```

15.2.5.53 show ip ospf interface

The **show ip ospf interface** command displays interface information that is related to OSPFv2.

Command Mode

EXEC

Command Syntax

show ip ospf [**PROCESS_ID**] **interface** [**INTERFACE_NAME**][**VRF_INSTANCE**]

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - ***no parameter***
  - ***1 to 65535***
- **INTERFACE_NAME** Interface type and number. Values include:
  - ***no parameter***
  - **ethernet *e_num***
  - **loopback *l_num***
  - **port-channel *p_num***
  - **vlan *v_num***
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.

Related Command

show ip ospf interface brief

Example

This command displays complete OSPFv2 information for ***vlan 1***.

```
switch# show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
Internet Address 10.168.0.1/24, VRF default, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500
switch>
```

15.2.5.54 show ip ospf lsa-log

The **show ip ospf lsa-log** command displays log entries when LSA update messages are sent or received for OSPF.

Command Mode

EXEC

Command Syntax

show ip ospf [**PROCESS_ID**] **ospf-log**

Parameters

PROCESS_ID OSPFv2 process ID. Values include:

- ***no parameter***
- ***1 to 65535***

Example

This command displays log entries when LSA update messages are sent or received for OSPF.

```
switch# show ip ospf lsa-log
OSPF Process 3.3.3.3, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new
 hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold

 hold value 1000 msecs
switch#
```

15.2.5.55 show ip ospf neighbor adjacency-changes

The **show ip ospf neighbor adjacency-changes** command displays the OSPFv2 neighbor adjacency change log for specified interfaces.

Command Mode

EXEC

Command Syntax

show ip ospf neighbor [**INTERFACE_NAME**][**NEIGHBOR**] **adjacency-changes** [**VRF_INSTANCE**]

Parameters

- **INTERFACE_NAME** Interface type and number. Values include:
  - ***no parameter***
  - **ethernet *e_num***
  - **loopback *l_num***
  - **port-channel *p_num***
  - **vlan *v_num***
- **NEIGHBOR** OSPFv2 neighbor. Options include:
  - ***no parameter***
  - ***ipv4_addr***
  - ***host_name***
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.

Example

This command displays the adjacency changes to ***vlan 2***.

```
switch# show ip ospf neighbor vlan 2 adjacency-changes
[08-04 08:55:32] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:58:51] 10.168.104.2, interface Vlan2 adjacency dropped:
 interface went down
[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped:
 interface went down
[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did
 not
list our router ID
[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
switch>
```

15.2.5.56 show ip ospf neighbor state

The **show ip ospf neighbor state** command displays the state information on OSPF neighbors on a per-interface basis.

Command Mode

EXEC

Command Syntax

show ip ospf neighbor state **STATE_NAME** [**VRF_INSTANCE**]

Parameters

- **STATE_NAME** Output filtered by the devices OSPF state. Options include valid OSPF states:
  - **2-ways**
  - **attempt**
  - **down**
  - **exch-start**
  - **exchange**
  - **full**
  - **graceful-restart**
  - **init**
  - **loading**
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.

Example

This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch# show ip ospf neighbor state full
Neighbor ID     VRF      Pri   State            Dead Time   Address         Interface

Test18          default    1   FULL/DR          00:00:37    10.17.254.2     Vlan3901
switch>
```

15.2.5.57 show ip ospf neighbor summary

The **show ip ospf neighbor** summary command displays a single line of summary information for each OSPFv2 neighbor.

Command Mode

EXEC

Command Syntax

show ip ospf [**PROCESS_ID**] **neighbor summary** [**VRF_INSTANCE**]

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - ***no parameter***
  - ***1 to 65535***
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name*** displays information from the specified VRF.

Example

This command displays the summary information for the OSPFv2 neighbors.

```
switch# show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START
switch>
```

15.2.5.58 show ip ospf neighbor

The **show ip ospf neighbor** command displays OSPFv2 neighbor information for specified interfaces.

Command Mode

EXEC

Command Syntax

show ip ospf [**PROCESS_ID**] **neighbor** [**INTERFACE_NAME**] [**NEIGHBOR**] [**DATA**] [**VRF_INSTANCE**]

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - ***no parameter***
  - ***1 to 65535***
- **INTERFACE_NAME** Interface type and number. Values include:
  - ***no parameter***
  - **ethernet *e_num***
  - **loopback *l_num***
  - **port-channel *p_num***
  - **vlan *v_num***
- **NEIGHBOR** OSPFv2 neighbor. Options include:
  - ***no parameter***
  - ***ipv4_addr***
- **DATA** Type of information the command displays. Values include:
  - ***no parameter***
  - **detail**
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
  - **vrf *vrf_name***displays information from the specified VRF.

Examples

- This command displays the switchs neighbors.

```
switch# show ip ospf neighbor
Neighbor IDVRFPriStateDead TimeAddressInterface
10.168.104.2default1FULL/DR00:00:3510.168.0.2Vlan1
10.168.104.2default8FULL/BDR00:00:3110.168.2.2Vlan2
switch>
```

- This command displays details about the neighbors to ***vlan 2***.

```
switch# show ip ospf neighbor vlan 2 detail
Neighbor 10.168.104.2, VRF default, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2

```

15.2.5.59 show ip ospf request queue

The **show ip ospf request queue** command displays a list of all OSPFv2 Link State Advertisements (LSAs) requested by a router.

Command Mode

EXEC

Command Syntax

show ip ospf request queue [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Specifies the VRF instance.

- ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
- **vrf *vrf_name*** displays information from the specified VRF.

Example

This command displays an LSA request list.

```
switch# show ip ospf request queue
Neighbor 10.168.104.2 vrf default interface: 10.168.0.2 address vlan1
Type LS ID ADV RTR Seq No Age Checksum
Neighbor 10.168.104.2 vrf default interface: 10.168.2.2 address vlan2
Type LS ID ADV RTR Seq No Age Checksum
switch>
```

15.2.5.60 show ip ospf retransmission queue

The **show ip ospf retransmission queue** command displays a list of all OSPFv2 Link State Advertisements (LSAs) waiting to be re-sent.

Command Mode

EXEC

Command Syntax

show ip ospf retransmission queue [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Specifies the VRF instance.

- ***no parameter*** displays information from all VRFs, or from context-active VRF if set.
- **vrf *vrf_name*** displays information from the specified VRF.

Example

This command displays an empty retransmission list.

```
switch# show ip ospf retransmission queue
Neighbor 10.168.104.2 vrf default interface vlan1 address 10.168.0.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum
Neighbor 10.168.104.2 vrf default interface vlan2 address 10.168.2.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum
switch>
```

15.2.5.61 show ip ospf spf-log

The **show ip ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPF.

Command Mode

EXEC

Command Syntax

show ip ospf [**PROCESS_ID**] **ospf-log**

Parameters

PROCESS_ID OSPFv2 process ID. Values include:

- ***no parameter***
- ***1 to 65535***

Example

This command displays the SPF information for OSPF.

```
switch# show ip ospf spf-log
OSPF Process 172.26.0.22
When      Duration(msec)
13:01:34  1.482
13:01:29  1.547
13:01:24  1.893
13:00:50  1.459
13:00:45  1.473
13:00:40  2.603
11:01:49  1.561
11:01:40  1.463
11:01:35  1.467
11:01:30  1.434
11:00:54  1.456
11:00:49  1.472
11:00:44  1.582
15:01:49  1.575
15:01:44  1.470
15:01:39  1.679
15:01:34  1.601
15:00:57  1.454
15:00:52  1.446
15:00:47  1.603
switch>
```

15.2.5.62 show ip ospf

The **`show ip ospf`** command displays OSPFv2 routing information

Command Mode

EXEC

Command Syntax

`show ip ospf` **[PROCESS_ID][VRF_INSTANCE]**

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
  - ***no parameter***
  - ***1 to 65535***
- **VRF_INSTANCE** Specifies the VRF instance.
  - ***no parameter*** configures the default VRF instance.
  - **vrf *vrf_name*** configures the ***vrf_name*** instance.

Example

This command displays configuration parameters, operational statistics, status of the OSPFv2 instance, and a brief description of the areas on the switch.

```
switch# show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1 VRF default
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPFs 5000 msecs
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

15.2.5.63 show line system dom thresholds

The **show line system dom thresholds** command reports DOM information reported by the OSFP-LS module. This includes standard fields such as temperature and voltage. In addition to standard DOM fields, the OSFP-LS also monitors the laser temperature for each of its amplifiers. The reported RX power reflects the total RX power seen on that path. TX bias current monitoring is not supported on these modules and should be ignored.

Command Mode

EXEC

Command Syntax

show line system [[port **RANGE**] **dom thresholds**]

Example

This command displays the DOM information reported by the OSFP-LS module.

```
switch# show line system port 10 dom thresholds
Ch: Channel, mA: milliamperes, dBm: decibels (milliwatts),
C: Celsius, V: Volts, NA or N/A: not applicable.

```

15.2.5.64 show line system status

The **show line system status** command displays module status. The OSFP-LS is compliant to the Common Management Interface Specification (CMIS), and implements various CMIS-defined status flags. Data path 1 reflects the outgoing booster path and data path 2 reflects the incoming pre-amp path.

Command Mode

EXEC

Command Syntax

show line system [port **RANGE**] **status**

Example

This command displays the displays module status.

```
switch(config-ls-port10,19)# show line system status

```

Some lines of output do not apply to the OSFP-LS modules (For example, **`Operational speed`**, **`RX CDR LOL`**). These lines of output should be ignored. The fields of interest are Module state, **`Data`**

path 1 state, and Data path 2 state. Under normal operating conditions, **Module state** will read ready and the **Data path state** fields will read either **initialized or activated**. Initialized means that the module is ready to operate but is receiving no signal to amplify. Activated means that the amplifier is active.

15.2.5.65 shutdown (OSPFv2)

The **shutdown** command disables OSPFv2 on the switch. OSPFv2 is disabled on individual interfaces with the **shutdown (OSPFv2)** command.

The **no shutdown** and **default shutdown** commands enable the OSPFv2 instance by removing the **shutdown** statement from the OSPF block in ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config)# router ospf 6
switch(config-router-ospf)# shutdown
switch(config-router-ospf)#
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf)# no shutdown
switch(config-router-ospf)#
```

15.2.5.66 summary-address

The **summary-address** command allows aggregation of external routes advertised by an OSPF ASBR. It is used to aggregate AS External and NSSA External LSAs.

The **default summary-address** and **no summary-address** commands delete the current **summary-address** configurations.

Command Mode

Router Configuration Mode

Command Syntax

summary-address {***ip_address subnet_mask*** | ***ip_prefix***} [***attribute_map WORD*** | ***not_advertise*** | tag]

default summary-address {***ip_address summary_mask*** | ***ip_prefix***}

no summary-address {***ip_address summary_mask*** | ***ip_prefix***}

Parameters

- ***ip_address subnet_mask*** IPv4 subnet in dotted decimal notation.
- ***ip_prefix*** IPv4 subnet in CIDR notation.
- ***attribute_map WORD*** allows using a route-map to set the attributes to be advertised in the LSA. Options include:
  - set metric
  - set metric-type
  - set tag
- ***not_advertise*** suppresses the advertisement of contributing external prefixes by the router.
- **tag** allows setting the tag in the advertised external LSA. The tag value ranges from ***0 to 4294967295***. The default value is ***0***.

Guidelines

This feature reduces the size of External LSDB in OSPF, does not impact inter area and intra area LSAs. This command installs a Null0 route in FIB when at least one contributor is present.

Restriction

Only OSPF redistributed routes are aggregated.

Example

This command advertises an external LSA for ***50.0.0.0/16*** prefix if at least one BGP contributing route is present which falls in the subnet ***50.0.0.0/16***.

Note: The **show** commands display aggregation of BGP prefixes ***50.0.0.0/24*** and ***50.0.1.0/24*** into one OSPF AS External LSA for ***50.0.0.0/16*** prefix. A route-map is to set metric and tag for the advertised LSA.

```
switch(config)# router ospf 5
switch(config-router-ospf)# redistribute bgp
switch(config-router-ospf)# summary-address 50.0.0.0/16 attribute-
map BGP_AGGR
switch(config-router-ospf)# exit
switch(config)# show ip route bgp

15.2.5.67 system profile

Use the **`system profile`** command to apply the user defined TCAM profile to the system.

Command Mode

hardware tcam mode

Command Syntax

`system profile` ***profilename***

Parameter

profilename Name of the selected system profile.

Example

```
(config-hw-tcam)# system profile profilename
```

15.2.5.68 timers lsa rx min interval (OSPFv2)

The **`timers lsa rx min interval`** command sets the minimum interval for acceptance of identical Link State Advertisements (LSAs) from OSPFv2 neighbors.

The **`no timers lsa rx min interval`** and **`default timers lsa rx min interval`** commands restore the minimum interval to the default of ***1*** second by removing the **`timers lsa rx min interval`** command from the ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

`timers lsa rx min interval` ***lsa_time***

`no timers lsa rx min interval`

`default timers lsa rx min interval`

Parameter

lsa_time Minimum time (in milliseconds) after which the switch will accept an identical LSA from OSPFv2 neighbors. Default is ***1000*** (***1*** second).

Example

This command sets the minimum LSA arrival interval to ***10*** milliseconds.

```
switch(config)# router ospf 6
switch(config-router-ospf)# timers lsa rx min interval 10
switch(config-router-ospf)#
```

15.2.5.69 timers lsa tx delay initial (OSPFv2)

The **`timers lsa tx delay initial`** command sets the rate-limiting values for OSPF link-state advertisement generation.

The **`no timers lsa tx delay initial`** and **`default imers throttle lsa all`** commands restore the defaults by removing the **`timers lsa tx delay initial`** command from the ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

`timers lsa tx delay initial` [***initial_delay*** | ***min_hold*** | ***max_wait***]

`no timers lsa tx delay initial`

`default timers lsa tx delay initial`

Parameters

- ***initial_delay*** Value ranges from ***0 to 600000*** (ms). Default is ***1000***.
- ***min_hold*** Value ranges from ***0 to 600000*** (ms). Default is ***5000***.
- ***max_wait*** Value ranges from ***0 to 600000*** (ms). Default is ***5000***.

Example

This command sets the rate-limiting values for OSPF link-state advertisemen to ***10*** milliseconds.

```
switch(config)# router ospf 6
switch(config-router-ospf)# timers lsa tx delay initial 10
switch(config-router-ospf)#
```

15.2.5.70 timers spf delay initial (OSPFv2)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The **`timers spf delay initial`** command controls the intervals at which the switch will perform SPF calculations. The command sets three values:

- Initial delay: how long the switch waits to perform an SPF calculation after a topology change in a network that has been stable throughout the hold interval. Because a topology change often causes several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch performs an SPF calculation. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the expiration of the initial delay period and no other change is made to the throttle timers.
- Hold interval: this is an additional wait timer which scales to slow SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur at the expiration of the hold interval. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the expiration of the hold interval, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.
- Maximum interval: the maximum time the switch will wait after a topology change before performing an SPF calculation.

The **`no timers spf delay initial`** and **`default timers spf delay initial`** commands restore the default OSPFv2 SPF calculation intervals by removing the **`timers spf delay initial`** command from the ***running-config***.

Command Mode

Router-OSPF Configuration

Command Syntax

`timers spf delay initial` [***initial_delay*** | ***hold_interval*** | ***max_interval***]

`no timers spf`

`default timers spf`

Parameters

- ***initial_delay*** Initial delay between a topology change and SPF calculation. Value ranges from ***0 to 65535000*** (ms). Default is ***0*** (ms).
- ***hold_interval*** Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from ***0 to 65535000*** (ms). Default is ***5000*** (ms).
- ***max_interval*** Maximum hold interval before the switch will perform an SPF calculation. Value ranges from ***0 to 65535000*** (ms). Default is ***5000*** (ms).

Example

These commands set the SPF timers on the switch.

```
switch(config)# router ospf 6
switch(config-router-ospf)# timers spf 5 100 20000
switch(config-router-ospf)#
```

15.2.5.71 tunnel routes

Use the **tunnel routes** command or the **default** form of the command to enable OSPFv2 routes over GRE tunnels. The tunnel routes are enabled, by default. Use the **no** form of the command to disable the tunnel routes.

Command Mode

Router OSPF configuration (config-router-ospf)

Command Syntax

tunnel routes

no tunnel routes

default tunnel routes

Examples

- To enable OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6
switch(config-router-ospf)# tunnel routes
switch(config-router-ospf)#
```

- To disable OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no tunnel routes
switch(config-router-ospf)#
```

- To enable the default OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6
switch(config-router-ospf)# default tunnel routes
switch(config-router-ospf)#
```

15.3 Open Shortest Path First – Version 3

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 3 is defined by ***RFC 5340***.

This chapter contains the following sections.

15.3.1 OSPFv3 Introduction

OSPFv3 is based on OSPFv2 and includes enhancements that utilize IPv6 features. However, OSPFv3 is configured and operates independently of any implementation of OSPFv2 on the switch. OSPFv2 features that OSPFv3 implements include:

- Packet types
- Neighbor discovery and adjacency formation mechanisms
- LSA aging and flooding
- SPF calculations
- DR election procedure
- Multiple area support
- Router-ID (32 bits)

The following list describes the OSPFv3 differences and enhancements from OSPFv2:

- IPv6 128-bit addresses
- Use of link-local addresses
- OSPFv3 runs over links instead of subnets
- Support flood pacing

Arista switches support the following OSPFv3 functions:

- A single OSPFv3 instance for each VRF
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Redistribution of static and connected routes into OSPFv3

15.3.2 OSPFv3 Conceptual Overview

This section contains the following topics:

15.3.2.1 Storing Link States

OSPFv3 is a dynamic, link-state routing protocol, where links represent routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A Link State Advertisement (LSA) is an OSPFv3 packet that communicates a router's topology to other routers. The Link State DataBase (LSDB) stores an area's topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

15.3.2.2 Topology

An Autonomous System (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv3, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

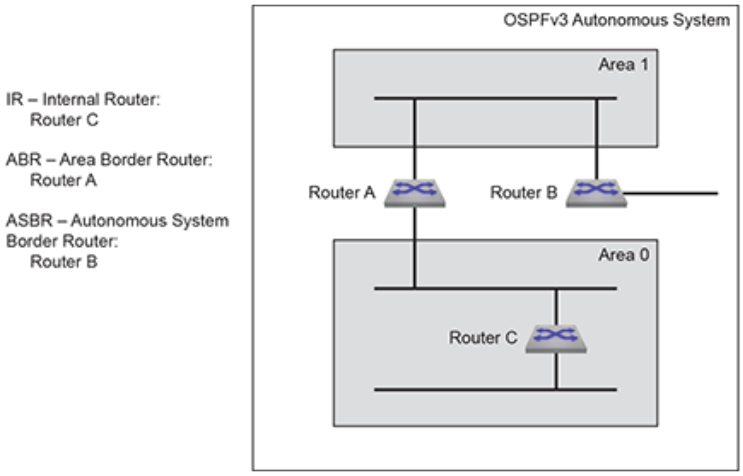
An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv3 defines these routers:

- **Internal Router (IR):** a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- **Area Border Router (ABR):** a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- **Autonomous System Boundary Router (ASBR):** a gateway router connecting the OSPFv3 domain to external routes, including static routes and routes from other autonomous systems.

OSPFv3 Router Types displays the OSPFv3 router types.

Figure 50: OSPFv3 Router Types



OSPFv3 areas are assigned a number between ***0*** and ***4,294,967,295***. Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area ***0***, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv3 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.

15.3.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A routers hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

OSPFv3 Neighbors illustrates OSPFv3 neighbors.

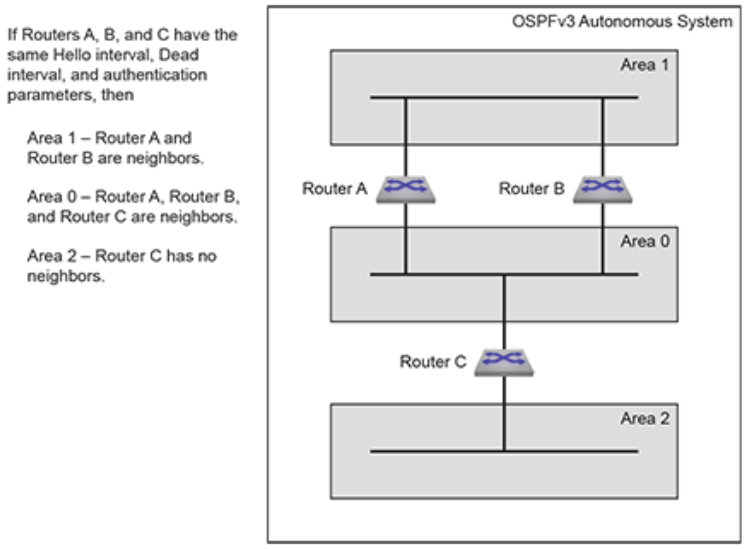


Figure 51: OSPFv3 Neighbors

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv3 routers distribute LSAs by sending them on all of their active interfaces. The router does not send hello packets from passive interfaces preventing adjacencies. The router does not process any OSPFv2 packets received on a passive interface.

When a routers LSDB is changed by an LSA, it sends the changes to the BDR and DR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routing devices use Dijkstras algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

15.3.2.4 OSPFv3 Security

The OSPFv3 protocol relies on the IPsec Authentication Header (AH) and Encapsulating Security Payload (ESP) header to provide data integrity, authentication and confidentiality. Transport mode provides IPsec to OSPFv3 packets.

The IPsec SA has Security Policy Index (SPI), HMAC algorithm, and a secret key as parameters. These parameters are used to compute Integrity Check Value (ICV), that is used to authenticate peers. When authentication is enabled, all corresponding peers must use same SA parameters to clear OSPFv3 ICV verification. SA can be configured at both area and interface levels.

Note: On the same area or interface, EOS allows security configuration with either AH or ESP but not both. We can have one area or interface configured with AH and another with ESP.

15.3.2.4.1 OSPFv3 Authentication

While sending OSPFv3 packets, the HMAC-MD5 or SHA algorithm hash is inserted in the IPsec header and the packet is sent over the wire for peer authentication.

While receiving OSPFv3 packets, the computed hash is verified with the one present in the IPsec header. If it fails, OSPFv3 packets are discarded.

15.3.2.4.2 OSPFv3 Encryption

ESP provides confidentiality to OSPFv3 packets. When confidentiality is enabled, ESP encrypts the sent data and decrypts the received data. OSPFv3 packets that are not encapsulated with security payload are discarded.

OSPFv3 encryption uses algorithms of Triple Data Encryption Standard (3DES) and Advanced Encryption Standard (AES). 3DES uses a ***192*** bit key, whereas the AES key length varies by ***128***, ***192*** and ***256*** bits.

15.3.2.5 Flood Pacing

OSPFv3 flood pacing allows configuring the minimum interval between the transmission of consecutive Link State (LS) update packets in a network. Flood pacing provides the following benefits:

- Prevents the rapid drain of flood queue by sending consecutive LSU packets with a delay.
- Helps mitigate high CPU or socket buffer utilization issues that occur when a switch instantly floods a large number of LSAs.
- When LSDB is updated frequently, an incremented flood pacing interval scales down LSA flooding.

Note: A high flood pacing interval may lead to convergence delays in large OSPF LSDBs.

15.3.2.6 OSPFv3 BFD Sessions for Adjacencies in any State

- BFD sessions are only established for OSPFv3 adjacencies that are in the FULL state. In a LAN environment this results in BFD sessions not being established for OSPFv3 adjacencies with DR Other neighbors.
- This feature provides configuration that enables the establishment of BFD sessions for OSPFv3 adjacencies that are in any state. This results in the BFD sessions being established for OSPFv3 adjacencies with DR Other neighbors.

15.3.2.7 Support for OSPFv3 dn-bit-ignore

The OSPFv3 **`dn-bit-ignore`** command allows enabling or disabling the inclusion of LSAs having “Down” (DN) bit set in SPF calculations. The DN Bit is a loop prevention mechanism that implements when using OSPF as a CE - PE IGP protocol.

The DN-bit usage in OSPFv3 is explained in ***RFC6565***. With ***Release EOS-4.25.0F***, OSPFv3 honors the DN-bit in **type-3**, **type-5**, or **type-7** LSAs in non-default VRFs. LSAs are not used in SPF calculation, and are not installed in the routing table. Using the **`dn-bit-ignore`** command changes this behavior. It is recommended to understand the entire topology before configuring the **`dn-bit-ignore`** command as it may lead to forwarding loops.

15.3.3 Configuring OSPFv3

These sections describe basic OSPFv3 configuration steps:

- Configuring an OSPFv3 Instance
- Configuring OSPFv3 Areas
- Configuring Interfaces for OSPFv3
- Enabling OSPFv3
- Configuring OSPFv3 Security
- Configuring OSPFv3 Flood Pacing
- Configurating OSPv3 dn-bit-ignore
- Displaying OSPFv3 Status

15.3.3.1 Configuring an OSPFv3 Instance

15.3.3.1.1 Entering OSPFv3 Configuration Mode

OSPFv3 configuration commands apply to the specified OSPFv3 instance. To perform OSPFv3 configuration commands, the switch must be in router-OSPFv3 configuration mode. The **ipv6 router ospf** command places the switch in router-OSPFv3 configuration mode, creating an OSPFv3 instance if OSPFv3 was not previously instantiated on the switch. If no VRF is specified, the OSPFv3 instance is in the default VRF. To instantiate or configure OSPFv3 on a non-default VRF, specify that VRF when using the **ipv6 router ospf** command.

The process ID identifies the OSPFv3 instance and is local to the router. Neighbor OSPFv3 routers can have different process IDs. OSPFv3 instances configured in different VRFs on the switch must have different process IDs.

The switch supports one OSPFv3 instance for each VRF. When an OSPFv3 instance already exists, the **ipv6 router ospf** command must specify its process ID (and VRF, if it is not configured in the default VRF). Attempts to define additional instances in the same VRF will generate errors. The **show ipv6 ospf** command displays information about OSPFv3 instances, including their process IDs.

Example

This command places the switch in router-OSPFv3 configuration mode for the default VRF. If OSPFv3 was not previously instantiated in the default VRF, the command creates an OSPFv3 instance in the default VRF with a process ID of ***9***.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

15.3.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv3. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID. When configuring OSPFv3 instances in multiple VRFs, each should have a different router ID.

Note: A router ID is required to run OSPF, and Arista recommends setting the router ID manually for the following reasons:

1. If there are no IPv4 addresses configured on the switch, a manually configured router ID is required.
2. The router ID also does not change if the interface status or IP address changes, which can cause confusion if the ID has been selected automatically.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IPv6 address, if a loopback interface is active on the switch.
3. The highest IPv6 address on the router.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **router-id (OSPFv3)** command configures the router ID for an OSPFv3 instance.

Example

This command assigns ***15.1.1.1*** as the OSPFv3 router ID.

```
switch(config-router-ospf3)# router-id 15.21.4.9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   router-id 15.21.4.9
switch(config-router-ospf3)#
```

15.3.3.1.3 Global OSPFv3 Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior for the OSPFv3 instance under which they are used.

Logging Adjacency Changes

The **log-adjacency-changes (OSPFv3)** command configures the switch to log OSPFv3 link-state changes and transitions of OSPFv3 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv3 neighbors into the up or down state.

```
switch(config-router-ospf3)# log-adjacency-changes
switch(config-router-ospf3)#
```

- This command configures the switch to log all OSPFv3 link-state changes.

```
switch(config-router-ospf3)# log-adjacency-changes detail
switch(config-router-ospf3)#
```

Intra-Area Distance

The **distance ospf intra-area (OSPFv3)** command configures the administrative distance for routes contained in a single OSPFv3 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is ***10***.

Example

This command configures an administrative distance of ***90*** for OSPFv3 intra-area routes.

```
switch(config-router-ospf3)# distance ospf intra-area 90
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   distance ospf intra-area 90
switch(config-router-ospf3)#
```

Passive Interfaces

The **passive-interface (OSPFv3)** command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Although passive interfaces do not send or receive LSAs, other interfaces may generate LSAs for the network segment. The router does not send OSPFv3 packets from a passive interface or process OSPFv3 packets received on a passive interface. The router advertises the passive interface in the router LSA.

The **no passive-interface** command re-enables OSPFv3 processing on the specified interface.

Examples

- This command configures ***vlan 200*** as a passive interface.

```
switch(config-router-ospf3)# passive-interface vlan 200
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   passive-interface Vlan200
switch(config-router-ospf3)#
```

- This command configures ***vlan 200*** as an active interface.

```
switch(config-router-ospf3)# no passive-interface vlan 200
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv3 instance to advertise all connected routes on the switch as external OSPFv3 routes. Connected routes are routes that are established when IPv6 is enabled on an interface.

Example

The **redistribute (OSPFv3)** **connected** command converts connected routes to OSPFv3 external routes.

```
switch(config-router-ospf3)# redistribute connected
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   redistribute connected
switch(config-router-ospf3)#
```

Redistributing Static Routes

Redistributing static routes causes the OSPFv3 instance to advertise all static routes on the switch as external OSPFv3 routes. The switch does not support redistributing individual static routes.

Example

The **redistribute (OSPFv3)** **static** command converts static routes to OSPFv3 external routes.

```
switch(config-router-ospf3)# redistribute static
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   redistribute static
switch(config-router-ospf3)#
```

15.3.3.2 Configuring OSPFv3 Areas

OSPFv3 areas are configured through area commands. The switch must be in router-OSPFv3 configuration mode, as described in Entering OSPFv3 Configuration Mode, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv3 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

15.3.3.2.1 Configuring the Area Type

The **no area (OSPFv3)** command specifies the area type. The switch supports three area types:

- **Normal area**: Area that accepts intra-area, inter-area, and external routes. The backbone area (area ***0***) is a normal area.
- **Stub area**: Area where external routes are not advertised. External routes are reached through a default summary route (***0.0.0.0***) inserted into stub areas. Networks with no external routes do not require stub areas.

The default area type is normal.

Example

These commands configures area ***200*** as a NSSA area and ***300*** as a stub area.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 200 nssa
switch(config-router-ospf3)# area 300 stub
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 0.0.0.200
   area 0.0.1.44 stub
switch(config-router-ospf3)#
```

15.3.3.2.2 Configuring Area Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior in a specified area.

Default Summary Route Cost

The **area default-cost (OSPFv3)** command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination. When the **area default-cost** command is not configured for an area, the default-cost of that area is set to ***10***.

Example

This command configures a cost of ***25*** for the default summary route in area ***0.0.1.194 (450)***.

```
switch(config-router-ospf3)# area 450 default-cost 25
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 0.0.1.194 default-cost 25
```

Area Stub

The **area stub (OSPFv3)** command configures the area type of an OSPFv3 area. All routers in an AS must specify the same area type for identically numbered areas.

Stub areas are areas in which external routes are not advertised. To reach these external routes, the stub area uses a default summary route (***0.0.0.0***). Networks without external routes do not require stub areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area ***0*** is always a normal area and cannot be configured through this command.

Examples

- This command configures area ***45*** as a stub area.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 45 stub
switch(config-router-ospf3)#
```

- This command configures area ***10.92.148.17*** as a stub area.

```
switch(config-router-ospf3)# area 10.92.148.17 stub
switch(config-router-ospf3)#
```

Area Range

The **area range (OSPFv3)** command is used by OSPFv3 Area Border Routers (ABRs) to consolidate or summarize routes, to configure a cost setting for those routes, and to suppress summary route advertisements.

By default, an ABR creates a summary LSA for each route in an area and advertises that LSA to adjacent areas. The **area range (OSPFv3)** command aggregates routing information on area boundaries, allowing the ABR to use one summary LSA to advertise multiple routes.

Examples

- These commands consolidate and summarize routes at an area boundary ***1***.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3)#
```

- These commands change the address range status to DoNotAdvertise. Neither one of the individual intra-area routes falling under range or the ranged prefix is advertised as summary LSA.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64 not-
advertise
switch(config-router-ospf3)#
```

15.3.3.3 Configuring Interfaces for OSPFv3

OSPFv3 interface configuration commands enable OSPFv3 on an interface, assign the interface to an area, and specify transmission parameters for routed ports and SVIs that handle OSPFv3 packets.

15.3.3.3.1 Assigning an Interface to an Area

The **ipv6 ospf area** command enables OSPFv3 on the configuration mode interface and associates the specified area to the interface. Each routed interface can be associated with one OSPFv3 area; subsequent **ipv6 ospf area** commands that designate a different area on an interface replace any existing command for the interface.

Example

These commands enable OSPFv3 instance ***9*** on ***interface vlan 200*** and associate area ***0*** to the interface.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 ospf 9 area 0
switch(config-if-Vl200)# show active
interface Vlan200
   ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```

15.3.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv3 packet transmission characteristics for a specified VLAN interface. Interval configuration commands are entered in vlan-interface configuration mode.

Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv3 neighbor should specify the same hello interval, which should not be longer than any neighbors dead interval.

The **`ospfv3 hello-interval`** command configures the hello interval for the configuration mode interface. The default is ***10*** seconds.

Example

These commands configure a hello interval of ***45*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 hello-interval 45
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 hello-interval 45
switch(config-if-Vl200)#
```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv3 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv3 neighbors and be longer than the hello interval of any neighbor.

The **`ospfv3 dead-interval`** command configures the dead interval for the configuration mode interface. The default is ***40*** seconds.

Example

This command configures a dead interval of ***75*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 dead-interval 75
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 dead-interval 75
switch(config-if-Vl200)#
```

Retransmission Interval

Routers that send OSPFv3 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmission interval specifies the period between retransmissions.

The **ospfv3 ipv6 retransmit-interval** command configures the LSA retransmission interval for the configuration mode interface. The default retransmission interval is ***5*** seconds.

Example

This command configures a retransmission interval of ***25*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)#
```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv3 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor.

The **ospfv3 transmit-delay** command configures the transmission delay for the configuration mode interface. The default transmission delay is one second.

Example

his command configures a transmission delay of ***10*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 transmit-delay 10
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 transmit-delay 10
switch(config-if-Vl200)#
```

15.3.3.3.3 Configuring Interface Parameters

Interface Cost

The OSPFv3 interface cost reflects the overhead of sending packets across the interface. The cost is typically assigned to be inversely proportional to the bandwidth of the interface. The **ospfv3 cost** command configures the OSPFv3 cost for the configuration mode interface. The default cost is ***10***.

Example

This command configures a cost of ***50*** for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 cost 50
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 cost 50
switch(config-if-Vl200)#
```

Router Priority

Router priority determines preference during Designated Router (DR) and Backup Designated Router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The **ospfv3 priority** command configures router priority for the configuration mode interface. The default priority is ***1***.

Example

This command configures a router priority of ***128*** for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 priority 128
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 priority 128
switch(config-if-Vl200)#
```

15.3.3.4 Enabling OSPFv3

15.3.3.4.1 IP Routing

OSPFv3 requires that IPv6 unicast routing is enabled on the switch. When IP routing is not enabled, entering OSPFv3 configuration mode generates a message.

Examples

- This message is displayed if, when entering router-OSPFv3 configuration mode, IPv6 unicast routing is not enabled.

```
switch(config)# ipv6 router ospf 9
! IPv6 routing not enabled
switch(config-router-ospf3)#
```

- This command enables IP routing on the switch.

```
switch(config)# ipv6 unicast-routing
```

15.3.3.4.2 Disabling OSPFv3

The **shutdown (OSPFv3)** disables OSPFv3 operations on the switch without disrupting the OSPFv3 configuration. To disable OSPFv3 on an interface, remove the **ipv6 ospf area** statement for the corresponding interface.

The **no shutdown** command resumes OSPFv3 activity.

Examples

- This command disables OSPFv3 activity on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# shutdown
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   shutdown
switch(config-router-ospf3)#
```

- This command resumes OSPFv3 activity on the switch.

```
switch(config-router-ospf3)# no shutdown
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

15.3.3.5 Configuring OSPFv3 Security

You can configure OSPFv3 security for either an area or an interface, or both, using either an Authentication Header (AH) or an Encapsulating Security Payload (ESP).

When OSPFv3 security is configured on an area, the configured settings apply to all interfaces in that area. Interface-specific configuration overrides configuration on the area to which the interface belongs.

15.3.3.5.1 Configuring OSPFv3 Authentication

Configuring OSPFv3 Authentication for Areas

The **area authentication ipsec spi** command configures OSPFv3 authentication on an area.

Example

This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 authentication ipsec spi 34 md5
 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQl1cz
qdvKAzKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#
```

Configuring OSPFv3 Authentication for Interfaces

The **ospfv3 authentication ipsec spi** command configures OSPFv3 authentication on an interface.

Example

This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config-if-Et9)# ospfv3 authentication ipsec spi 3456 md5 0
 8FD6158BFE81ADD961241D8E4169D411
switch(config-if-Et9)# show active
interface Ethernet9
   no switchport
   ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
OjKcjsrYuv6dx1O+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#
```

15.3.3.5.2 Configuring OSPFv3 Encryption

Configuring OSPFv3 Encryption for Areas

The **area encryption ipsec spi** command configures OSPFv3 security on an area.

Example

This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 encryption ipsec spi 5678 esp
 3des-cbc md5 passphrase 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
$1$cNpcrQl1czqdvKAzKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch (config-router-ospf3)#
```

Configuring OSPFv3 Encryption for Interfaces

The **ospfv3 encryption ipsec spi** command configures OSPFv3 security on an interface.

Example

This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1
 passphrase 0 2fd4e1c67a2d28fced849ee1bb76e7391b93eb12
switch(config-if-Et9)# show active
interface Ethernet9
   no switchport
   ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

15.3.3.6 Configuring OSPFv3 Flood Pacing

Flood pacing can be configured for global OSPFv3 instances and address families. The **timers pacing flood** command configures OSPFv3 flood pacing.

Examples

- This command configures OSPFv3 flood pacing timer to ***50*** ms in the global OSPFv3 instance.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# timers pacing flood 50
switch(config-router-ospf3)# show ipv6 ospf
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF
 default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
 border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFs 5000 msecs
  Current hold time between two consecutive SPFs 5000 msecs
  Maximum wait time between two consecutive SPFs 5000 msecs
  SPF algorithm last executed 21d19h ago
  No scheduled SPF
```

```
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

- This command configures OSPFv3 flood pacing timer to ***50*** ms for ipv4 address family.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)# address-family ipv4
switch(config-router-ospfv3-af)# timers pacing flood 50
switch(config-router-ospfv3-af)# show ospfv3
OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
 border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFs 5000 msecs
  Current hold time between two consecutive SPFs 5000 msecs
  Maximum wait time between two consecutive SPFs 5000 msecs
  SPF algorithm last executed 00:01:05 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

15.3.3.7 Configurating OSPv3 dn-bit-ignore

OSPFv3

Use the command **`dn-bit-ignore`** to include type-3/5/7 LSAs having their DN-bit set in the SPF calculation.

Use the commands **`dn-bit-ignore`** or **`default dn-bit-ignore`** to revert the behavior back to default. This command is available in ***ipv6 router ospf vrf*** configuration mode and the ***router ospfv3 vrf*** configuration mode. Note that this command is not available in the default VRF, and that both configuration styles are captured below.

router ospfv3 Configuration Style

The **dn-bit-ignore** command is available under the ***router ospfv3 vrf*** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
switch(config)# router ospfv3 vrf red
switch(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

ipv6 router ospf Configuration Style

The **dn-bit-ignore** command is also available under the ***ipv6 router ospf vrf*** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
switch(config)# ipv6 router ospf 1 vrf red
switch(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

15.3.3.8 Displaying OSPFv3 Status

This section describes OSPFv3 **show** commands that display OSPFv3 status. General switch methods that provide OSPFv3 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

15.3.3.8.1 OSPFv3 Summary

The **show ipv6 ospf** command displays general OSPFv3 configuration information, operational statistics and status for the OSPFv3 instance, followed by a brief description of the areas configured on the switch.

Example

This command displays OSPFv3 routing process information.

```
switch(config-router-ospf3)#show ipv6 ospf
Routing Process "ospfv3 1" with ID 1.1.1.1 and Instance 0 VRF default
  It is not an autonomous system boundary router and is not an area
 border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  ...
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
```

15.3.3.8.2 Viewing OSPFv3 on the Interfaces

The **show ipv6 ospf interface** command displays OSPFv3 information for switch interfaces configured for OSPFv3. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

Example

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch#show ipv6 ospf interface
Ethernet17 is up
```

```
  Interface Address fe80::48c:73ff:fe00:1319%Ethernet12, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.37
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan31 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan31, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.22
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan32 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan32, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State DR Other, Priority 1
  Designated Router is 10.37.0.11
  Backup Designated Router is 10.37.0.22
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 2
switch#
```

15.3.3.8.3 Viewing the OSPFv3 Database

The **show ipv6 ospf database <link state list>** command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

Example

This command displays the OSPFv3 database of Link State Advertisements (LSAs).

```
switch#show ipv6 ospf database
Routing Process "ospf 9":

  AS Scope LSDB

Type        Link ID     ADV Router  Age       Seq#   Checksum
 AEX        0.0.0.5    10.37.0.37   15 0x80000005   0x00be82
 AEX        0.0.0.9    10.37.0.22 1747 0x8000002b   0x00df56
 AEX        0.0.0.3    10.37.0.46  599 0x8000002d   0x00651d

Area 0.0.0.0 LSDB

Type        Link ID     ADV Router  Age       Seq#   Checksum
 RTR        0.0.0.0    10.37.0.32  234 0x80000031   0x00585a
 NTW       0.0.0.26    10.37.0.32  271 0x80000005   0x005609
 NAP       0.0.0.26    10.37.0.32  274 0x80000005   0x00964c

Interface vlan3911 LSDB

Type        Link ID     ADV Router  Age       Seq#   Checksum
 LNK       0.0.0.38    10.37.0.22  267 0x80000005   0x00a45a
 LNK       0.0.0.23    10.37.0.23  270 0x8000002c   0x005b7e

  Interface vlan3902 LSDB

Type        Link ID     ADV Router  Age       Seq#   Checksum
```

```
 LNK       0.0.0.17    10.37.0.11 1535 0x8000002b   0x007120
 LNK       0.0.0.37    10.37.0.22    7 0x8000002b   0x00ce23
 LNK       0.0.0.22    10.37.0.23  250 0x8000002d   0x00c350

switch#
```

15.3.3.8.4 Viewing OSPFv3 Neighbors

The **show ipv6 ospf neighbor** command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors to all areas and interfaces on the switch. The command also allows for the display of neighbors to individual interfaces or areas. The **adjacency-changes** option displays the interfaces adjacency changes.

Example

This command displays the switch's neighbors.

```
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 priority is 1, state is Full
  In area 0.0.0.0 interface et12
  DR is 10.37.0.37 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 37 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3911
  DR is 10.37.0.22 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3902
  DR is 10.37.0.11 BDR is 10.37.0.22
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3908
  DR is 10.37.0.22 BDR is 10.37.0.21
  Options is 0
  Dead timer is due in 39 seconds

switch#
```

15.3.3.8.5 Viewing OSPFv3 Routes

The **show ipv6 routes** command provides an OSPFv3 option.

Example

This command displays the switch's OSPFv3 routes.

```
switch# show ipv6 route ospf
IPv6 Routing Table - 43 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

O   fd7a:3279:81a4:1112::/64 [150/11]
     via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1114::/64 [150/11]
     via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1124::/64 [10/20]
```

```
     via fe80::21c:41ff:fe01:5fe1, Vlan3901
     via fe80::21c:41ff:fe01:5fe1, Vlan3902
     via fe80::21c:41ff:fe01:5fe1, Vlan3908
O   fd7a:3279:81a4:1a00::25/128 [150/11]
     via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1a00::28/128 [150/11]
     via fd7a:3279:81a4:fe40::5, Vlan3908
```

15.3.3.8.6 Viewing OSPFv3 dn-bit-ignore

Use the **`show running-config`** command to verify whether the **`dn-bit-ignore`** command is configured.

15.3.4 OSPFv3 Configuration Examples

This section describes the commands required to configure three OSPFv3 topologies.

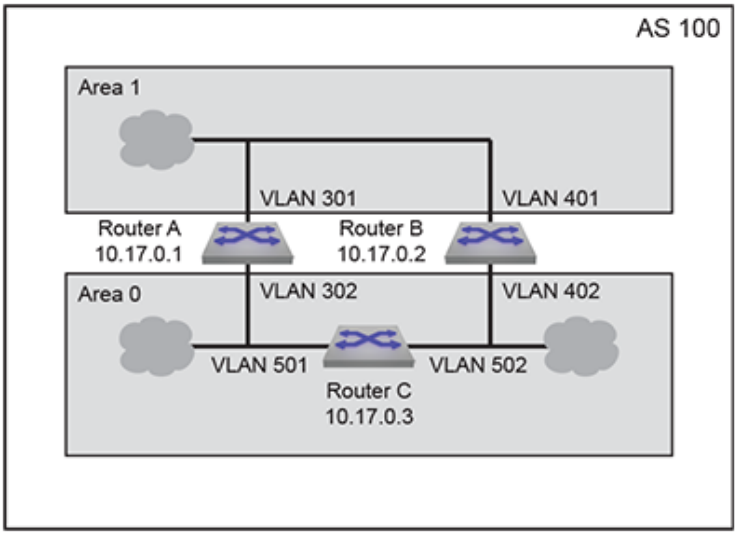
15.3.4.1 OSPFv3 Configuration Example 1

The AS in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two links.

15.3.4.1.1 Example 1 Topology

OSPFv3 Example 1 displays the Example 1 topology. Two ABRs connect area ***0*** and area ***1*** ***Router A*** and ***Router B***. ***Router C*** is an internal router that connects two links in area ***0***. Area ***0*** is normal; area ***1*** is stub.

Figure 52: OSPFv3 Example 1



Area 1 Configuration

Area ***1*** contains links to ABRs ***Router A*** and ***Router B***.

- ***Router A*** is accessed through ***VLAN 301***.
- ***Router B*** is accessed through ***VLAN 401***.
- Designated Router (DR): ***Router A***.
- Backup Designated Router (BDR): ***Router B***.
- Each router defines an interface cost of ***10***.
- Router priority is not specified for either router on area ***1***.

Area 0 ABR Configuration

Area 0 contains links to ABRs ***Router A*** and ***Router B***.

- ***Router A*** is accessed through ***VLAN 302***.
- ***Router B*** is accessed through ***VLAN 402***.
- Designated Router (DR): ***Router B***.
- Backup Designated Router (BDR): ***Router A***.
- Each router defines an interface cost of ***20***.
- Each router defines a retransmit-interval of ***10***.
- Each router defines a transmit-delay of **2**.
- Router priority is specified such that ***Router B*** will be elected as the Designated Router.

Area 0 IR Configuration

Area ***0*** contains two links to an internal router.

- ***Router C*** is accessed through ***VLAN 501*** and ***VLAN 502***.
- ***VLAN 501*** is configured as follows:
  - Interface cost of ***20***.
  - Retransmit-interval of ***10***.
  - Transmit-delay of ***2***.
- ***VLAN 502*** is configured as follows:
  - Interface cost of ***20***.
  - Dead interval of ***80*** seconds.

15.3.4.1.2 Example 1 Code

This code configures the OSPFv3 instances on the three switches.

1. Configure the areas and router IDs.
   a. Router A OSPFv3 instance configuration:

```
switch-A(config)# ipv6 router ospf 100
switch-A(config-router-ospfv3)# area 1 stub
switch-A(config-router-ospfv3)# router-id 10.17.0.1
```

   b. Router B OSPFv3 instance configuration:

```
switch-B(config)# ipv6 router ospf 100
switch-B(config-router-ospfv3)# area 1 stub
switch-B(config-router-ospfv3)# router-id 10.17.0.2
```

   c. Router C OSPFv3 instance configuration: interfaces:

```
switch-C(config)# ipv6 router ospf 100
switch-C(config-router-ospfv3)# router-id 10.17.0.3
```

2. Configure the interface OSPFv3 area and transmission parameters.
   a. ***Router A*** interfaces:

```
switch-A(config)# interface vlan 301
switch-A(config-if-Vl301)# ipv6 ospf 100 area 1
switch-A(config-if-Vl301)# ospfv3 cost 10
switch-A(config-if-Vl301)# ospfv3 priority 6
switch-A(config-if-Vl301)# exit
switch-A(config)# interface vlan 302
```

```
switch-A(config-if-Vl302)# ipv6 ospf 100 area 0
switch-A(config-if-Vl302)# ospfv3 cost 20
switch-A(config-if-Vl302)# ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl302)# ospfv3 transmit-delay 2
switch-A(config-if-Vl302)# ospfv3 priority 4
```

b. ***Router B*** interfaces:

```
switch-B(config)# interface vlan 401
switch-B(config-if-Vl401)# ipv6 ospf 100 area 1
switch-B(config-if-Vl401)# ospfv3 cost 10
switch-B(config-if-Vl401)# ospfv3 priority 4
switch-B(config-if-Vl401)# exit
switch-B(config)# interface vlan 402
switch-B(config-if-Vl402)# ipv6 ospf 100 area 0
switch-B(config-if-Vl402)# ospfv3 cost 20
switch-B(config-if-Vl402)# ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl402)# ospfv3 transmit-delay 2
switch-B(config-if-Vl402)# ospfv3 priority 6
```

c. ***Router C*** interfaces:

```
switch-C(config)# interface vlan 501
switch-C(config-if-Vl501)# ipv6 ospf 100 area 0
switch-C(config-if-Vl501)# ospfv3 cost 20
switch-C(config-if-Vl501)# ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl501)# ospfv3 transmit-delay 2
switch-C(config-if-Vl501)# exit
switch-C(config)# interface vlan 502
switch-C(config-if-Vl502)# ipv6 ospf 100 area 0
switch-C(config-if-Vl502)# ospfv3 cost 20
switch-C(config-if-Vl502)# ospfv3 dead-interval 80
```

15.3.4.2 OSPFv3 Configuration Example 2

The AS in Example 2 contains three areas. Area ***0*** connects to the other areas through different routers and contains an internal router connecting two links. Area ***0*** is normal; the other areas are stub areas.

15.3.4.2.1 Example 2 Topology

OSPFv3 Example 2 displays the Example 2 topology. One ABR (***Router B***) connects area ***0*** and area ***1***; another ABR (***Router C***) connects area ***0*** and area ***2***. ***Router A*** is an internal router that connects two links in area ***0***.

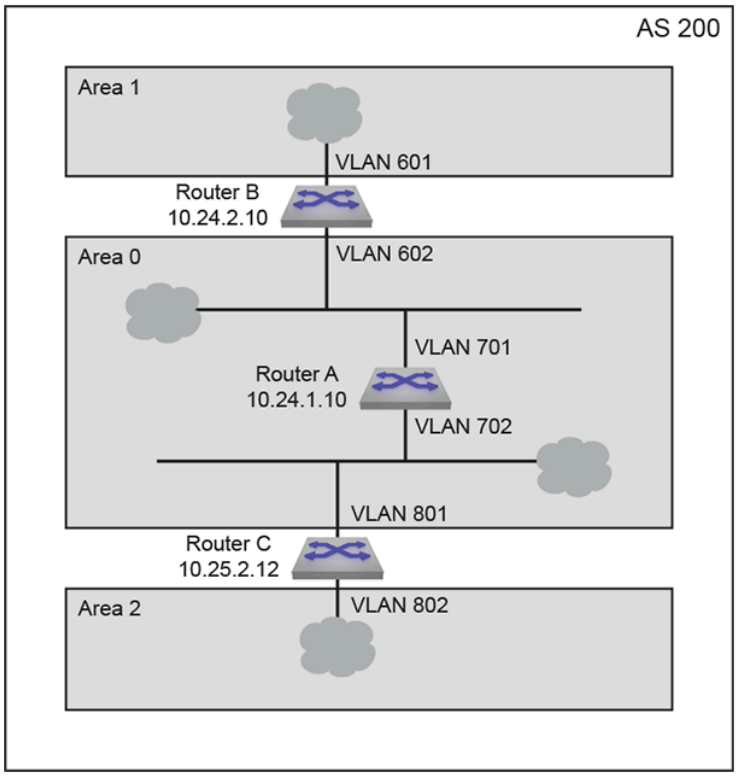


Figure 53: OSPFv3 Example 2

Area 1 Configuration

Area ***1*** contains one link that is accessed by ***Router B***.

- ***Router B*** is accessed through ***VLAN 601***.
- The router defines a interface cost of ***10***.

Area 2 Configuration

Area ***2*** contains one link that is accessed by ***Router C***.

- ***Router C*** is accessed through ***VLAN 802***.
- The router defines a interface cost of ***20***.

Area 0 ABR Configuration

One ABR ***Router B*** link connects area ***1*** to area ***0***. One ABR ***Router C*** link connects area ***0*** to area ***2***.

- ***Router B*** is accessed through ***VLAN 602***
- ***Router C*** is accessed through ***VLAN 801***.
- Designated Router (DR): ***Router B***.
- Backup Designated Router (BDR): ***Router C***.
- Each router defines an interface cost of ***20***.
- Each router defines a retransmit-interval of ***10***.
- Each router defines a transmit-delay of ***2***.

Area 0 IR Configuration

Area ***0*** contains links connected by an internal router.

- Router A is accessed through ***vlan 701*** and ***vlan 702***.

- The ***vlan 701*** link is configured as follows:
  - Interface cost of ***10***.
- The ***vlan 702*** link is configured as follows:
  - Interface cost of ***20***.
  - Retransmit-interval of ***10***.
  - Transmit-delay of ***2***.

15.3.4.2.2 Example 2 Code

1. Configure the areas and router IDs.
   a. Router A OSPFv3 instance configuration:

```
switch-A(config)# ipv6 router ospf 200
switch-A(config-router-ospfv3)# router-id 10.24.1.10
```

   b. Router B OSPFv3 instance configuration:

```
switch-B(config)# ipv6 router ospf 200
switch-B(config-router-ospfv3)# area 1 stub
switch-B(config-router-ospfv3)# router-id 10.24.2.10
```

   c. Router C OSPFv3 instance configuration:

```
switch-C(config)# ipv6 router ospf 200
switch-C(config-router-ospfv3)# area 1 stub
switch-C(config-router-ospfv3)# router-id 10.25.2.12
```

2. Configure the interface OSPFv3 area and transmission parameters.
   a. ***Router A*** interfaces:

```
switch-A(config)# interface vlan 701
switch-A(config-if-Vl701)# ipv6 ospf 200 area 0
switch-A(config-if-Vl701)# ospfv3 cost 10
switch-A(config-if-Vl701)# exit
switch-A(config)# interface vlan 702
switch-A(config-if-Vl702)# ipv6 ospf 200 area 0
switch-A(config-if-Vl702)# ospfv3 cost 20
switch-A(config-if-Vl702)# ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl702)# ospfv3 transmit-delay 2
```

   b. ***Router B*** interfaces:

```
switch-B(config)# interface vlan 601
switch-B(config-if-Vl601)# ospfv3 200 area 1
switch-B(config-if-Vl601)# ospfv3 cost 10
switch-B(config-if-Vl601)# exit
switch-B(config)# interface vlan 602
switch-B(config-if-Vl602)# ospfv3 200 area 0
switch-B(config-if-Vl602)# ospfv3 cost 20
switch-B(config-if-Vl602)# ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl602)# ospfv3 transmit-delay 2
switch-B(config-if-Vl602)# ospfv3 priority 6
```

   c. ***Router C*** interfaces:

```
switch-C(config)# interface vlan 801
switch-C(config-if-Vl801)# ospfv3 200 area 0
switch-C(config-if-Vl801)# ospfv3 cost 20
```

```
switch-C(config-if-Vl801)# ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl801)# ospfv3 transmit-delay 2
switch-C(config-if-Vl801)# exit
switch-C(config)# interface vlan 802
switch-C(config-if-Vl802)# ospfv3 200 area 2
switch-C(config-if-Vl802)# ospfv3 cost 20
switch-C(config-if-Vl802)# ospfv3 dead-interval 80
```

15.3.4.3 OSPFv3 Configuration Example 3

The AS in Example 3 contains two areas that connect through one ABR. Each area also contains an ASBR that connects static routes to the AS.

15.3.4.3.1 Example 3 Topology

OSPFv3 Example 3 displays the Example 3 topology. One ABR connects area ***0*** and area ***1***. ***Router C*** is an ABR that connects the areas. ***Router A*** is an internal router that connects two links in area ***1***. ***Router D*** and ***Router E*** are internal routers that connect links in area ***0***. ***Router B*** and ***Router F*** are ASBRs that connect static routes outside the AS to area ***1*** and area ***0***, respectively.

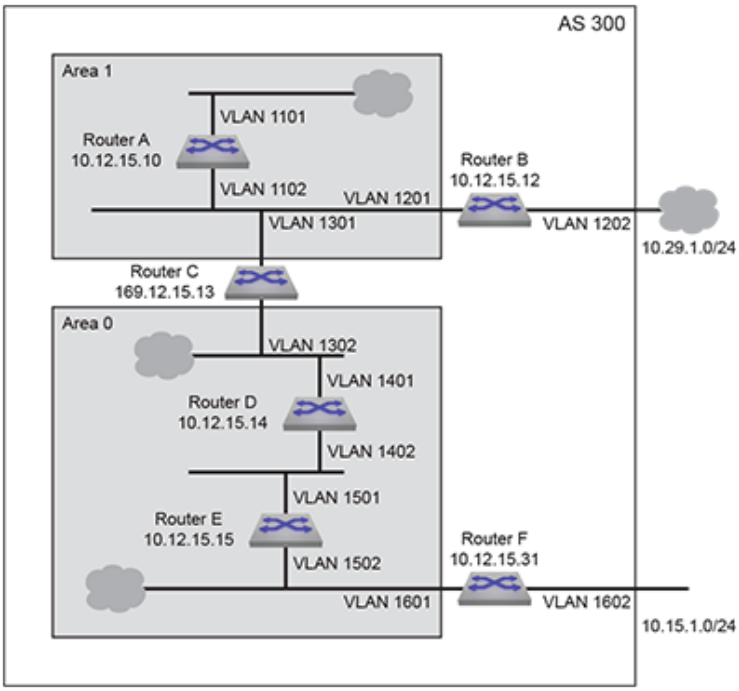

Figure 54: OSPFv3 Example 3

Area 0 ABR Configuration

ABR ***Router C*** connects one area ***0*** link to an area ***1*** link.

- ***Router C*** is accessed through ***VLAN 1302***.
- All interface OSPFv3 parameters are set to their default values.

Area 0 IR Configuration

Area ***0*** contains two internal routers, each of which connects two of the three links in the area.

- ***Router D*** is accessed through ***VLAN 1401*** and ***VLAN 1402***.
- ***Router E*** is accessed through ***VLAN 1501*** and ***VLAN 1502***.
- All interface OSPFv3 parameters are set to their default values.

Area 0 ASBR Configuration

ASBR ***Router F*** connects one area ***0*** link to an external link.

- ***Router F*** is accessed through ***VLAN 1601***.
- ***Router F*** connects to the external AS through ***VLAN 1602***.
- All interface OSPFv3 parameters are set to their default values.

Area 1 ABR Configuration

ABR ***Router C*** connects one area ***0*** link to an area ***1*** link.

- ***Router C*** is accessed by area ***1*** through ***VLAN 1301***.
- ***Router C*** is accessed by area ***0*** through ***VLAN 1302***.
- All interface OSPFv3 parameters are set to their default values.

Area 1 IR Configuration

Area ***1*** contains one internal router that connects two links in the area.

- ***Router A*** is accessed through ***VLAN 1101*** and ***VLAN 1102***.
- All interface OSPFv3 parameters are set to their default values.

Area 1 ASBR Configuration

ASBR ***Router B*** connects one area ***1*** link to an external link.

- ***Router B*** is access through ***VLAN 1201***.
- ***Router B*** connects to the external AS through ***VLAN 1202***.
- All interface OSPFv3 parameters are set to their default values.

15.3.4.3.2 Example 3 Code

1. Configure the areas and router IDs.
   a. ***Router A*** OSPFv3 instance configuration:

```
switch-A(config)# ipv6 router ospf 300
switch-A(config-router-ospfv3)# router-id 10.12.15.10
switch-A(config-router-ospfv3)# area 1 stub
```

   b. ***Router B*** OSPFv3 instance configuration:

```
switch-B(config)# ipv6 router ospf 300
switch-B(config-router-ospfv3)# router-id 10.12.15.12
switch-B(config-router-ospfv3)# area 1 stub
```

   c. ***Router C*** OSPFv3 instance configuration:

```
switch-C(config)# ipv6 router ospf 300
switch-C(config-router-ospfv3)# router-id 10.12.15.13
switch-C(config-router-ospfv3)# area 1 stub
```

   d. ***Router D*** OSPFv3 instance configuration:

```
switch-D(config)# ipv6 router ospf 300
switch-D(config-router-ospfv3)# router-id 10.12.15.14
```

   e. ***Router E*** OSPFv3 instance configuration:

```
switch-E(config)# ipv6 router ospf 300
```

```
switch-E(config-router-ospfv3)# router-id 10.12.15.15
```

f. ***Router F*** OSPFv3 instance configuration:

```
switch-F(config)# ipv6 router ospf 300
switch-F(config-router-ospfv3)# router-id 10.12.15.31
```

2. Configure the interfaces.

a. ***Router A*** interfaces:

```
switch-A(config)# interface vlan 1101
switch-A(config-if-Vl1101)# ospfv3 300 area 1
switch-A(config-if-Vl1101)# exit
switch-A(config)# interface vlan 1102
switch-A(config-if-Vl1102)# ospfv3 300 area 1
```

b. ***Router B*** interfaces:

```
switch-B(config)# interface vlan 1201
switch-B(config-if-Vl1201)# ospfv3 300 area 1
switch-B(config-if-Vl1201)# exit
```

c. ***Router C*** interfaces:

```
switch-C(config)# interface vlan 1301
switch-C(config-if-Vl1301)# ospfv3 300 area 1
switch-C(config-if-Vl1301)# exit
switch-C(config)# interface vlan 1302
switch-C(config-if-Vl1302)# ospfv3 300 area 0
```

d. ***Router D*** interfaces:

```
switch-D(config)# interface vlan 1401
switch-D(config-if-Vl1401)# ospfv3 300 area 0
switch-D(config-if-Vl1401)# exit
switch-D(config)# interface vlan 1402
switch-D(config-if-Vl1402)# ospfv3 300 area 0
```

e. ***Router E*** interfaces:

```
switch-E(config)# interface vlan 1501
switch-E(config-if-Vl1501)# ospfv3 300 area 0
switch-E(config-if-Vl1501)# exit
switch-E(config)# interface vlan 1502
switch-E(config-if-Vl1502)# ospfv3 300 area 0
```

f. ***Router F*** interfaces:

```
switch-F(config)# interface vlan 1601
switch-F(config-if-Vl1601)# ospfv3 300 area 0
switch-F(config-if-Vl1601)# exit
```

15.3.5 OSPFv3 Commands

Global Configuration Mode

- clear ospfv3 ipv6 force-spf
- ipv6 router ospf

Interface Configuration Mode

- ipv6 ospf area
- ospfv3 authentication ipsec spi
- ospfv3 cost
- ospfv3 dead-interval
- ospfv3 encryption ipsec spi
- ospfv3 hello-interval
- ospfv3 ipv6 retransmit-interval
- ospfv3 network
- ospfv3 priority
- ospfv3 transmit-delay

Router-OSPFv3 Configuration Mode

- adjacency exchange-start threshold (OSPFv3)
- area authentication ipsec spi
- area default-cost (OSPFv3)
- area encryption ipsec spi
- area nssa (OSPFv3)
- area nssa default-information-originate (OSPFv3)
- area not-so-stubby lsa type-7 convert type-5 (OSPFv3)
- area range (OSPFv3)
- area stub (OSPFv3)
- default-information originate (OSPFv3)
- default-metric (OSPFv3)
- distance ospf intra-area (OSPFv3)
- log-adjacency-changes (OSPFv3)
- max-metric router-lsa (OSPFv3)
- maximum-paths (OSPFv3)
- no area (OSPFv3)
- passive-interface (OSPFv3)
- redistribute (OSPFv3)
- router-id (OSPFv3)
- shutdown (OSPFv3)
- timers
- timers lsa rx min interval (OSPFv3)
- timers lsa tx delay initial (OSPFv3)
- timers spf delay initial (OSPFv3)

Display Commands

- show ipv6 ospf
- show ipv6 ospf border-routers
- show ipv6 ospf database

- show ipv6 ospf database<link-state details>
- show ipv6 ospf database <link state list>
- show ipv6 ospf database link
- show ipv6 ospf database link if-name
- show ipv6 ospf database link if-type
- show ipv6 ospf interface
- show ipv6 ospf lsa-log
- show ipv6 ospf neighbor
- show ipv6 ospf neighbor state
- show ipv6 ospf neighbor summary
- show ipv6 ospf spf-log
- show ospfv3

15.3.5.1 adjacency exchange-start threshold (OSPFv3)

The **`adjacency exchange-start threshold`** command sets the exchange-start options for an OSPF instance.

The **`no adjacency exchange-start threshold`** and **`default adjacency exchange-start threshold`** command resets the default by removing the corresponding **`adjacency exchange-start threshold`** command from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

`adjacency exchange-start threshold` ***peers***

`no adjacency exchange-start threshold`

`default adjacency exchange-start threshold`

Parameters

peers Value ranges from ***1 - 4294967295***. Default value is ***10***.

Example

This command sets the adjacency exchange start threshold to ***156923***.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# adjacency exchange-start threshold 156923
switch(config-router-ospf3)#
```

15.3.5.2 area authentication ipsec spi

The **area authentication ipsec spi** command configures OSPFv3 authentication on an area.

The **default area authentication** and **no area authentication** commands delete the OSPFv3 authentication on an area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

area ***area_id*** **authentication ipsec spi** ***spi_value*** {md5|sha1} passphrase {***0 unencrypted_key*** | ***7 hidden_key*** | ***LINE***}

no area ***area_id*** **authentication ipsec spi** ***spi_value*** {md5| sha1} passphrase {***0 unencrypted_key*** | ***7 hidden_key*** | ***LINE***}

default area ***area_id*** **authentication ipsec spi** ***spi_value*** {md5| sha1} passphrase {***0 unencrypted_key*** | ***7 hidden_key*** | ***LINE***}

Parameters

- **area** ***area_id*** configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from ***0 to 4294967295***.
- **spi** ***spi_value*** configures the IPsec Security Parameter Index. The value ranges from ***0 to 4294967295***.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- ***0 unencrypted_key*** configures either a ***192*** bit 3DES key or ***128/192/256*** bit AES key in an unencrypted format.
- ***7 encrypted_key*** configures either a ***192*** bit 3DES key or ***128/192/256*** bit AES key in an encrypted format.
- ***KEY*** configures either a ***128*** bit MD5 key or a ***140*** bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - ***0 unencrypted_passphrase*** configures an unencrypted key.
  - ***7 encrypted_passphrase*** configures an encrypted key.
  - ***LINE*** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- **ospfv3 authentication ipsec spi**
- **area encryption ipsec spi**

Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

Examples

- This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 authentication ipsec spi 34
 md5 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
```

```
   area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQl1cz
qdvKAzKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#
```

- This command configures OSPFv3 authentication on an area with SHA1 algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 authentication ipsec spi 5789
 sha1 passphrase 7 $1$Ab754G0OHbGllIKqlCl7lyUKscUlpFTpvcQxQIhjJm1OUzGJD
h4bLWxSdKHvWMo6
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G0OHbGllIKqlCl7lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3)#
```

- This command deletes the OSPFv3 authentication on an area.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQl1czqdv
KAzKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
   area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G0OHbGllIKqlCl7lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3)#no area 0.0.0.0 authentication
switch(config-router-ospf3)#show active
ipv6 router ospf 9
   area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQl1czqdv
KAzKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#
```

15.3.5.3 area default-cost (OSPFv3)

The **area default-cost** command sets the cost for the default summary routes sent into an area. When the **area default-cost** command is not configured for an area, the default-cost of that area is set to ***10***.

The **no area default-cost** and **default area default-cost** command resets the default-cost value of the specified area to ***10*** by removing the corresponding **area default-cost** command from ***running-config***. The **no area (OSPFv3)** command removes all area commands for the specified area from ***running-config***, including the **area default-cost** command.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

area ***area_id*** **default-cost** ***def_cost***

no area ***area_id*** **default-cost**

default area ***area_id*** **default-cost**

Parameters

- ***area_id*** area number. ***0*** to ***4294967295*** or ***0.0.0.0*** to ***255.255.255.255***. ***Running-config*** stores value in dotted decimal notation.
- ***def_cost*** Values range from ***1 to 65535***.

Example

These commands configure a cost of ***15*** for default summary routes that an ABR sends into area ***100***.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 100 default 15
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 0.0.0.100 default-cost 15
switch(config-router-ospf3)#
```

15.3.5.4 area encryption ipsec spi

The **area encryption ipsec spi** command configures OSPFv3 security on an area.

The **default area encryption** and **no area encryption** commands delete the OSPFv3 security on an area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

area ***area_id*** **encryption ipsec spi** ***spi_value*** esp{3des-cbc| aes-128-cbc | aes-192-cbc | aes-256-cbc}{ 0 ***unencrypted_key*** | 7 ***encrypted_key***}{ md5| sha1} { 0 ***unencrypted_key*** | 7 ***encrypted_key*** | ***KEY***}

area ***area_id*** **encryption ipsec spi** ***spi_value*** esp null{md5 | sha1} { 0 ***unencrypted_key*** | 7 ***encrypted_key*** | ***KEY***}

area ***area_id*** **encryption ipsec spi** ***spi_value*** esp{3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | null} {md5 | sha1} { 0 ***unencrypted_key*** | 7 ***encrypted_key*** | ***LINE***}

no area ***area_id*** **encryption**

default area ***area_id*** **encryption**

Parameters

- **area** ***area_id*** configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from ***0 to 4294967295***.
- **spi** ***spi_value*** configures the value for IPsec Security Parameter Index. The value ranges from ***0 to 4294967295***.
- **3des-cbc** configures ESP with 3DES-CBC encryption.
- **aes-128-cbc** configures ESP with AES-128-CBC encryption.
- **aes-192-cbc** configures ESP with AES-192-CBC encryption.
- **aes-256-cbc** configures ESP with AES-256-CBC encryption.
- **null** configures ESP with null encryption.
- ***0 unencrypted_key*** configures either a ***192*** bit 3DES key or ***128/192/256*** bit AES key in an unencrypted format.
- ***7 encrypted_key*** configures either a ***192*** bit 3DES key or ***128/192/256*** bit AES key in an encrypted format.
- ***KEY*** configures either a ***128*** bit MD5 key or a ***140*** bit SHA1 key.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - ***0 unencrypted_passphrase*** configures an unencrypted key.
  - ***7 encrypted_passphrase*** configures an encrypted key.
  - ***LINE*** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- **area authentication ipsec spi**
- **ospfv3 encryption ipsec spi**

Guidelines

Passphrase and ***key*** values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase.

Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

Examples

- This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 encryption ipsec spi 5678 esp
 3des-cbc md5 passphrase 0
8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase

switch(config-router-ospf3)#
```

15.3.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv3)

The **area not-so-stubby lsa type-7 convert type-5** command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

The **no area not-so-stubby lsa type-7 convert type-5** and **no area not-so-stubby lsa type-7 convert type-5** commands allow LSAs to be translated dynamically by removing the **no area not-so-stubby lsa type-7 convert type-5** command from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

area ***area_id*** **not-so-stubby lsa type-7 convert type-5**

no area ***area_id*** **not-so-stubby lsa type-7 convert type-5**

default area ***area_id*** **not-so-stubby lsa type-7 convert type-5**

Parameters

area_id

- Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
- Area ***0*** (or ***0.0.0.0***) is not configurable; it is always normal.
- The ***running-config*** stores value in dotted decimal notation.

Example

These commands configure the switch to always translate ***Type-7*** Link-State Advertisement (LSAs) to ***Type-5*** LSAs.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 3 not-so-stubby lsa type-7 convert
 type-5
switch(config-router-ospf)#
```

15.3.5.6 area nssa (OSPFv3)

The **area nssa** command configures an OSPFv3 area as a Not-So-Stubby Area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area ***0*** is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

area ***area_id*** **nssa** [**TYPE**]

no area ***area_id*** **nssa** [**TYPE**]

default area ***area_id*** **nssa** [**TYPE**]

Parameters

- ***area_id***
  - Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
  - Area ***0*** (or ***0.0.0.0***) is not configurable; it is always normal.
  - The ***running-config*** stores value in dotted decimal notation.
- **TYPE**

  Values include:

  - ***no parameter***.
  - **nssa-only**

Example

This command configures area ***3*** as a NSSA area.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 3 nssa nssa-only
switch(config-router-ospf3)#
```

15.3.5.7 area nssa default-information-originate (OSPFv3)

The **area nssa default-information-originate** command sets an area as an NSSA and the generation of a type 7 default LSA is created if a default route exists in the routing table.

The switch supports three area types:

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area ***0*** is always a normal area and cannot be configured through this command.

The **no area**and **default area** commands remove the specified area from the OSPFv3 instance by deleting all **area** commands from the ***running-config*** for the specified area, including the **area default-cost (OSPFv3)** command.

The **no area stub** and **default area stub** commands configure the specified area as a normal area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

area ***area_id*** **nssa default-information-originate** [**VALUE**][**TYPE**][**EXCL**]

no area ***area_id*** **nssa default-information-originate** [**VALUE**][**TYPE**][**EXCL**]

default area ***area_id*** **nssa default-information-originate** [**VALUE**][**TYPE**][**EXCL**]

Parameters

All parameters except ***area_id*** can be placed in any order.

- ***area_id*.**
  - Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
  - Area ***0*** (or ***0.0.0.0***) is not configurable; it is always normal.
  - ***Running-config*** stores value in dotted decimal notation.
- **VALUE** Values include:
  - ***no parameter***.
  - **metric** ***1-65535***.
- **TYPE** Values include:
  - ***no parameter***.
  - **metric-type** ***1-2***.
- **EXCL** Values include:
  - ***no parameter***.
  - **nssa-only**.

Examples

- These commands sets area ***1*** as NSSA only and generates a ***type 7*** default LSA if a default route exists in the routing table.

```
switch(config-router-ospf3)# area 3 nssa default-information-originate
 nssa-only
switch(config-router-ospf3)#
```

- These commands generates a ***type 7*** default route.

```
switch(config-router-ospf3)# area 3 nssa default-information-originate
switch(config-router-ospf3)#
```

15.3.5.8 area range (OSPFv3)

The **area range** command is used by OSPFv3 area border routers to summarize routes.

The **no area range** and **default area range** commands remove the area-range by deleting the corresponding **area range** command from the ***running-config***.

Command Mode

Router-OSPFv3 Configuratio

Command Syntax

area ***area_id*** **range** ***net_addr*** [**ADVERTISE_SETTING**][**COST_SETTING**]

no area ***area_id*** **range** ***net_addr*** [**ADVERTISE_SETTING**][**COST_SETTING**]

default area ***area_id*** **range** ***net_addr*** [**ADVERTISE_SETTING**][**COST_SETTING**]

Parameters

- ***area_id 0*** to ***4294967295*** or ***0.0.0.0*** to ***255.255.255.255***.
- ***net_addr***
- **ADVERTISE_SETTING** specifies the LSA advertising activity. Values include:
  - ***no parameter***
  - **advertise**
  - **not-advertise**
- **COST_SETTING** Values include:
  - ***no parameter***
  - **cost** ***range_cost*** Value ranges from ***1 to 65535***.

Examples

- These commands summarize routes at an area boundary ***1***.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3)#
```

- These commands modify the address range status to DoNotAdvertise.

```
switch(config)# ipv6 router ospf 1
switch(config-ospf6-router)# area 1 range 2001:0DB8:0:1::/64 not-
advertise
switch(config-ospf6-router)#
```

15.3.5.9 area stub (OSPFv3)

The **area stub** command configures the area type of an OSPFv3 area.

Areas are **normal** by default.

The **no area stub** command configures the specified area as a normal area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

area ***area_id*** **stub**

no area ***area_id*** **stub**

default area ***area_id*** **stub**

Parameters

area_id

- Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
- Area ***0*** (or ***0.0.0.0***) is not configurable; it is always **normal**.
- The ***running-config*** stores value in dotted decimal notation.

Examples

- This command configures area ***45*** as a stub area.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 45 stub
switch(config-router-ospf3)#
```

- This command configures area ***10.92.148.17*** as a stub area.

```
switch(config-router-ospf3)# area 10.92.148.17 stub
switch(config-router-ospf3)#
```

15.3.5.10 clear ospfv3 ipv6 force-spf

The **clear ospfv3 ipv6 force-spf** command starts the SPF algorithm without clearing the OSPF database.

Command Mode

Privileged EXEC

Command Syntax

clear ospfv3 ipv6 force-spf [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Values include:

- ***no parameter*** Action is performed in the default VRF.
- **vrf *vrf_name*** Action is performed in the specified VRF.

Example

This command restarts the SPF algorithm in the default VRF without first clearing the OSPFv3 database.

```
switch(config)# clear ospfv3 ipv6 force-spf
switch(config)#
```

15.3.5.11 default-information originate (OSPFv3)

The **default-information originate** command generates a default external route into an OSPF domain.

The **no default-information originate** and **default default-information originate** command removes the configuration from the the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

default-information originate [**DURATION**][**VALUE**][**TYPE**][**MAP**]

no default-information originate

default default-information originate

Parameters

All parameters can be placed in any order.

- **DURATION** Values include:
  - ***no parameter***.
  - **always**.
- **VALUE** Values include:
  - ***no parameter***.
  - **metric** ***1-65535***.
- **TYPE** Values include:
  - ***no parameter***.
  - **metric-type** ***1-2***.
- **MAP** Values include:
  - ***no parameter***.
  - **route-map** ***map_name***.

Examples

- These commands will advertise the OSPFv3 default route regardless of whether the switch has a default route configured.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# default-information originate always
switch(config-router-ospf3)# show active
ipv6 router ospf 1
   default-information originate always
```

- These commands configures OSPF area ***1*** as metric of ***100*** for the default route with an external metric type of ***Type 1***.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# default-information originate metric 100
 metric-type 1
switch(config-router-ospf3)# show active
ipv6 router ospf 1
   default-information originate metric 100 metric-type 1
switch(config-router-ospf3)#
```

15.3.5.12 default-metric (OSPFv3)

The **default-metric** command sets default metric value for routes redistributed into the OSPFv3 domain.

The **no default-metric** and **default default-metric** commands restores the default metric to its default value of ***10*** by removing the **default-metric** command from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

default-metric ***def_metric***

no default-metric

default default-metric

Parameter

def_metric Values range from ***1 to 65535***. Default value is ***10***.

Example

These commands configure a default metric of ***30*** for routes redistributed into OSPFv3.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# default-metric 30
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   default-metric 30
switch(config-router-ospf3)#
```

15.3.5.13 distance ospf intra-area (OSPFv3)

The **`distance ospf intra-area`** command sets the administrative distance for routes in a single OSPFv3 area. The default is ***110***.

The **`no distance ospf intra-area`** and **`default distance ospf intra-area`** commands remove the **`distance ospf intra-area`** command from the ***running-config***, returning the OSPFv3 intra-area distance setting to the default value of ***110***

Command Mode

Router-OSPFv3 Configuration

Command Syntax

`distance ospf intra-area` ***distance***

`no distance ospf intra-area`

`default distance ospf intra-area`

Parameter

distance Values range from ***1 to 255***. Default is ***110***.

Example

This command configures a distance of ***90*** for all OSPFv3 intra-area routes on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# distance ospf intra-area 90
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   distance ospf intra-area 90
switch(config-router-ospf3)#
```

15.3.5.14 ipv6 ospf area

The **ipv6 ospf area** command enables OSPFv3 on the interface and associates the area to the interface.

OSPFv3 areas are configured in by **no area (OSPFv3)** commands in ***router-OSPFv3*** configuration mode.

The **no ipv6 ospf area** and **default ipv6 ospf area** commands disable OSPFv3 on the configuration mode interface by removing the corresponding **ipv6 ospf area** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 ospf ***process_id*** [**area** ***area_id***]

no ipv6 ospf ***process_id*** [**area** ***area_id***]

default ipv6 ospf ***process_id*** [**area** ***area_id***]

Parameters

- ***process_id*** Values range from ***1 to 65535***.
- ***area_id***.
  - Valid formats: integer ***0*** to ***4294967295*** or dotted decimal ***0.0.0.0*** to ***255.255.255.255***.
  - ***Running-config*** stores value in dotted decimal notation.

Example

These commands enable OSPFv3 on VLAN interface ***200*** and associates area ***0*** to the interface.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 ospf 9 area 0
switch(config-if-Vl200)# show active
interface Vlan200
   ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```

15.3.5.15 ipv6 router ospf

The **ipv6 router ospf** command places the switch in router-OSPFv3 configuration mode and creates and OSPFv3 instance if one does not already exist. Note that each OSPFv3 instance on the switch must have a unique process ID. A router ID for the new instance will be created if one does not already exist.

The **show ipv6 ospf** command displays the router ID of each OSPFv3 instance configured on the switch.

The **no ipv6 router ospf** and **default ipv6 router ospf** commands delete the OSPFv3 instance.

Refer to the **Router-OSPFv3 Configuration Mode** command for a list of commands available in router-OSPFv3 configuration mode.

Command Mode

Global Configuration

Command Syntax

ipv6 router ospf ***process_id*** [**VRF_INSTANCE**]

no ipv6 router ospf ***process_id*** [**VRF_INSTANCE**]

default ipv6 router ospf ***process_id*** [**VRF_INSTANCE**]

Parameters

- ***process_id*** Values range from ***1 to 65535***.
- **VRF_INSTANCE** Values include:
  - ***no parameter*** OSPF instance is in the default VRF.
  - **vrf** ***vrf_name*** OSPF instance is the specified VRF.

Examples

- This command creates an OSPFv3 instance in the default VRF with process ID ***9***.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

- This command deletes the OSPFv3 instance.

```
switch(config)# no ipv6 router ospf 9
switch(config)#
```

15.3.5.16 log-adjacency-changes (OSPFv3)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv3 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from the ***running-config***.

The default option (sending a message only when a neighbor goes up or down) is active when the ***running-config*** does not contain any form of the command. Entering the command in any form replaces the previous command state in the ***running-config***.

The **no log-adjacency-changes** disables link state change Syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

log-adjacency-changes [**INFO_LEVEL**]

no log-adjacency-changes

default log-adjacency-changes

Parameters

INFO_LEVEL Options include:

- ***no parameter*** Sends messages when a neighbor goes up or down.
- **detail** Sends messages for all neighbor state changes.

Example

This command configures the switch to send a Syslog message when a neighbor state changes.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# log-adjacency-changes
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   log-adjacency-changes
switch(config-router-ospf3)#
```

15.3.5.17 maximum-paths (OSPFv3)

The **maximum-paths** command sets the maximum number of parallel routes that OSPFv3 supports on the switch.

The **no maximum-paths** command restores the maximum number of parallel routes that OSPFv3 supports on the switch to the default value of ***16*** by removing the **maximum-paths** command from ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

maximum-paths ***paths***

no maximum-paths

default maximum-paths

Parameters

paths Value range is platform dependent:

- **Arad:** Value ranges from ***1 to 128***. Default value is ***128***.
- **FM6000:** Value ranges from ***1 to 32***. Default value is ***32***.
- **PetraA:** Value ranges from ***1 to 16***. Default value is ***16***.
- **Trident:** Value ranges from ***1 to 32***. Default value is ***32***.
- **Trident II:** Value ranges from ***1 to 128***. Default value is ***128***.

Example

This command configures the maximum number of OSPFv3 parallel paths to ***12***.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# maximum-paths 12
switch(config-router-ospf3)#
```

15.3.5.18 max-metric router-lsa (OSPFv3)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

max-metric router-lsa [**EXTERNAL**][**STUB**][**STARTUP**][**SUMMARY**]

no max-metric router-lsa [**EXTERNAL**][**STUB**][**STARTUP**][**SUMMARY**]

default max-metric router-lsa [**EXTERNAL**][**STUB**][**STARTUP**][**SUMMARY**]

Parameters

All parameters can be placed in any order.

- **EXTERNAL** Values include:
  - ***no parameter*** Default value of ***1***.
  - **external-lsa** Range: ***1 to 16777215***. The default value is ***0xFF0000***.
- **STUB** Values include:
  - ***no parameter*** Default value of ***2***.
  - **include-stub**.
- **STARTUP** Values include:
  - ***no parameter***
  - **on-startup**
  - **on-startup wait-for-bgp**
  - **on-startup** Range: ***5 to 86400***.

    wait-for-bgp or an **on-start** time value is not included in **no** and **default** commands.
- **SUMMARY** Values include:
  - ***no parameter*** Metric is set to the default value of ***1***.
  - **summary-lsa**.
  - **summary-lsa** Range: ***1 to 16777215***.

Example

This command configures OSPFv3 to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf3)# max-metric router-lsa on-startup wait-for-
bgp
switch(config-router-ospf3)#
```

15.3.5.19 no area (OSPFv3)

The **no area** command removes all area configuration commands for the specified OSPFv3 area. Commands removed by the **no area** command include:

- area
- nssa
- range
- stub

Area settings can be removed individually; refer to the command description page of the desired command for details.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

no area ***area_id*** [***TYPE***]

default area ***area_id*** [***TYPE***]

Parameters

- ***area_id*** area number.
  - Valid formats: integer ***1*** to ***4294967295*** or dotted decimal ***0.0.0.1*** to ***255.255.255.255***.
  - Area ***0*** (or ***0.0.0.0***) is not configurable; it is always **normal**.
  - The ***running-config*** stores value in dotted decimal notation.
- **TYPE** area type. Values include:
  - **nssa**.
  - **nssa translate type7 always**.
  - **stub**.
  - **stub no-summary**.

Example

This command remove the area ***1*** stub configuration.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# no area 1 stub
switch(config-router-ospf3)#
```

15.3.5.20 ospfv3 transmit-delay

The**ospfv3 transmit-delay** command configures the transmission delay for OSPFv3 packets.

The **no ospfv3 transmit-delay** and **default ospfv3 transmit-delay** commands restore the default transmission delay of ***1*** second on the configuration mode interface by removing the corresponding **ospfv3 transmit-delay** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ospfv3 transmit-delay ***trans***

no ospfv3 transmit-delay

default ospfv3 transmit-delay

Parameter

trans Value ranges from ***1 to 65535***; default is ***1***.

Guideline

Arista devices also support the legacy **ipv6 ospf transmit-delay** command in certain software releases of the EOS.

Example

This command configures a transmission delay of ***10*** seconds for ***VLAN 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 transmit-delay 10
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 transmit-delay 10
switch(config-if-Vl200)#
```

15.3.5.21 ospfv3 authentication ipsec spi

The **ospfv3 authentication ipsec spi** command configures OSPFv3 authentication on an interface.

The **default ospfv3 authentication** and **no ospfv3 authentication** commands delete the OSPFv3 authentication on an interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ospfv3 authentication ipsec spi ***spi_value*** {md5 | sha1}{***0 unencrypted_key*** | ***7 hidden_key*** | ***KEY***}

ospfv3 authentication ipsec spi ***spi_value*** {md5 | sha1} passphrase{***0 unencrypted_passphrase*** | ***7 hidden_passphrase*** | ***LINE***}

no ospfv3 authentication

default ospfv3 authentication

Parameters

- **spi** ***spi_value*** configures IPsec Security Parameter Index. The value ranges from ***0 to 4294967295***.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- ***0 unencrypted_key*** configures either a ***192*** bit 3DES key or ***128/192/256*** bit AES key in an unencrypted format.
- ***7 encrypted_key*** configures either a ***192*** bit 3DES key or ***128/192/256*** bit AES key in an encrypted format.
- ***KEY*** configures either a ***128*** bit MD5 key or a ***140*** bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - ***0 unencrypted_passphrase*** configures an unencrypted passphrase.
  - ***7 encrypted_passphrase*** configures an encrypted passphrase.
  - ***LINE*** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- **area authentication ipsec spi**
- **ospfv3 encryption ipsec spi**

Guidelines

Passphrase and ***key*** values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase. Arista devices also support the legacy **ipv6 ospf authentication ipsec spi** command in certain software releases of the EOS.

Restriction

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

Examples

- This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 authentication ipsec spi 3456 md5 0
 8FD6158BFE81ADD961241D8E4169D411
switch(config-if-Et9)# show active
```

```
interface Ethernet9
   no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
OjKcjsrYuv6dx1O+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#
```

- This command configures OSPFv3 authentication on an interface with SHA1 algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 authentication ipsec spi 987 sha1 7
 $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)# show active
interface Ethernet9
   no switchport
ospfv3 authentication ipsec spi 987 sha1 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

- This command deletes the OSPFv3 authentication on an interface.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# show active
interface Ethernet9
   no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
OjKcjsrYuv6dx1O+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#no ospfv3 authentication
switch(config-if-Et9)#show active
interface Ethernet9
   no switchport
switch(config-if-Et9)#
```

15.3.5.22 ospfv3 cost

The **ospfv3 cost** command sets the OSPFv3 cost for the interface. The default OSPFv3 cost is ***10***.

The **no ospfv3 cost** and **default ospfv3 cost** commands restore the default cost of ***10*** for the configuration mode interface by removing the corresponding **ospfv3 cost** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ospfv3 cost ***interface_cost***

no ospfv3 cost

default ospfv3 cost

Parameters

interface_cost Value ranges from ***1 to 65535***; default is ***10***.

Guideline

Arista devices also support the legacy **ipv6 ospf cost** command in certain software releases of the EOS.

Example

This command configures a cost of ***50*** for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 cost 50
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 cost 50
switch(config-if-Vl200)#
```

15.3.5.23 ospfv3 dead-interval

The **ospfv3 dead-interval** command sets the OSPFv3 dead interval.

The **no ospfv3 dead-interval** and **default ospfv3 dead-interval** commands restore the default dead interval of ***40*** seconds on the configuration mode interface by removing the corresponding **ospfv3 dead-interval** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ospfv3 dead-interval ***time***

no ospfv3 dead-interval

default ospfv3 dead-interval

Parameter

time Value ranges from ***1 to 65535***; default is ***40***.

Guideline

Arista devices also support the legacy **ipv6 ospf dead-interval** command in certain software releases of the EOS.

Example

This command configures a dead interval of ***75*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 dead-interval 75
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 dead-interval 75
switch(config-if-Vl200)#
```

15.3.5.24 ospfv3 encryption ipsec spi

The **ospfv3 encryption ipsec spi** command configures OSPFv3 security on an interface.

The **default ospf3 encryption** and **no ospfv3 encryption** commands delete the OSPFv3 security on an interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ospfv3 encryption ipsec spi ***spi_value*** esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc}{***0 unencrypted_key*** | 7 ***encrypted_key}*** {md5 | sha1}{***0 unencrypted_key*** | ***7 encrypted_key*** | ***KEY***}

ospfv3 encryption ipsec spi ***spi_value*** esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc}{***0 unencrypted_key*** | ***7 encrypted_key***}{md5 | sha1} passphrase {***0 unencrypted_passphrase*** | ***7 encrypted_passphrase*** | ***LINE***}

ospfv3 encryption ipsec spi ***spi_value*** esp null {md5 | sha1}{***0 unencrypted_key*** | ***7 encrypted_key*** | ***KEY***}

ospfv3 encryption ipsec spi ***spi_value*** esp {md5 | sha1} passphrase {***0 unencrypted_passphrase*** | ***7 encrypted_passphrase*** | ***LINE***}

default ospfv3 encryption

no ospf3 encryption

Parameters

- **spi** ***spi_value*** configures the value for IPsec Security Parameter Index. The value ranges from ***0 to 4294967295***.
- **3des-cbc** configures ESP with 3DES-CBC encryption.
- **aes-128-cbc** configures ESP with AES-128-CBC encryption.
- **aes-192-cbc** configures ESP with AES-192-CBC encryption.
- **aes-256-cbc** configures ESP with AES-256-CBC encryption.
- **null** configures ESP with null encryption.
- ***0 unencrypted_key*** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- ***7 encrypted_key*** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- ***KEY*** configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - ***0 unencrypted_passphrase*** configures an unencrypted passphrase.
  - ***7 encrypted_passphrase*** configures an encrypted passphrase.
  - ***LINE*** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- **area encryption ipsec spi**
- **ospfv3 authentication ipsec spi**

Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase. Arista devices also support the legacy **ipv6 ospf encryption ipsec spi** command in certain software releases of the EOS.

Restrictions

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

Examples

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and **SHA1** algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc
 sha1 passphrase 0 2fd4e1c67a2d28fced849ee1bb76e7391b93eb12
switch(config-if-Et9)# show active
interface Ethernet9
   no switchport
ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and **MD5** hash algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc
 md5 passphrase 7 $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5
VvXTfBaVYbgCkWU
switch(config-if-Et9)# show active
interface Ethernet9
   no switchport
ospfv3 encryption ipsec spi 345 esp 3des-cbc md5 passphrase 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

- This command deletes the OSPFv3 security on an interface.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# show active
interface Ethernet9
   no switchport
ospfv3 encryption ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
OjKcjsrYuv6dx1O+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#no ospfv3 encryption
switch(config-if-Et9)#show active
interface Ethernet9
   no switchport
switch(config-if-Et9)#
```

15.3.5.25 ospfv3 hello-interval

The **ospfv3 hello-interval** command sets the OSPFv3 hello interval. The hello interval is the period between the transmission of consecutive hello packets.

Each OSPFv3 neighbor should be the same hello interval and should not be longer than any neighbors dead interval.

The **no ospfv3 hello-interval** and **default ospfv3 hello-interval** commands restore the default hello interval of ***10*** seconds on the configuration mode interface by removing the **ospfv3 hello-interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ospfv3 hello-interval ***time***

no ospfv3 hello-interval

default ospfv3 hello-interval

Parameter

time Values range from ***1 to 65535***; default is ***10***.

Guideline

Arista devices also support the legacy **ipv6 ospf hello-interval** command in certain software releases of the EOS.

Example

This command configures a hello interval of ***45*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 hello-interval 45
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 hello-interval 45
switch(config-if-Vl200)#
```

15.3.5.26 ospfv3 ipv6 retransmit-interval

The **ospfv3 ipv6 retransmit-interval** command configures the link state advertisement retransmission interval.

The **no ospfv3 ipv6 retransmit-interval** and **default ospfv3 ipv6 retransmit-interval** commands restore the default retransmission interval of ***5*** seconds on the configuration mode interface by removing the corresponding **ospfv3 ipv6 retransmit-interval** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ospfv3 ipv6 retransmit-interval ***period***

no ospfv3 ipv6 retransmit-interval

default ospfv3 ipv6 retransmit-interval

Parameter

period Value ranges from ***1 to 65535***; default is ***5***.

Example

This command configures a retransmission interval of ***25*** seconds for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)#
```

15.3.5.27 ospfv3 network

The **ospfv3 network** command sets the configuration mode interface as a point-to-point link. By default, interfaces are set as broadcast links.

The **no ospfv3 network** and **default ospfv3 network** commands set the configuration mode interface as a broadcast link by removing the corresponding **ospfv3 network** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ospfv3 network point-to-point

no ospfv3 network

default ospfv3 network

Guideline

Arista devices also support the legacy **ipv6 ospf network** command in certain software releases of the EOS.

Examples

- This command configures ***interface vlan 200*** as a point-to-point link.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 network point-to-point
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 network point-to-point
switch(config-if-Vl200)#
```

- This command restores ***interface ethernet 10*** as a broadcast link.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# no ospfv3 network
switch(config-if-Vl200)# show active
interface Vlan200
switch(config-if-Vl200)#
```

15.3.5.28 ospfv3 priority

The **ospfv3 priority** command configures the OSPFv3 router priority.

The **no ospfv3 priority** and **default ospfv3 priority** commands restore the default priority (***1***) on the interface by removing the corresponding **ospfv3 priority** command from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ospfv3 priority ***priority_level***

no ospfv3 priority

default ospfv3 priority

Parameter

priority_level Settings range from ***0 to 255***.

Guideline

Arista devices also support the legacy **ipv6 ospf priority**command in certain software releases of the EOS.

Example

This command configures a router priority of ***128*** for ***vlan 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 priority 128
switch(config-if-Vl200)# show active
interface Vlan200
   ospfv3 priority 128
switch(config-if-Vl200)#
```

15.3.5.29 passive-interface (OSPFv3)

The **passive-interface** command disables OSPF on an interface range. All interfaces are active by default.

The **no passive-interface** and **default passive-interface** commands enable OSPFv3 on the specified interface range by removing the corresponding **passive-interface** statements from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

passive-interface INTERFACE_NAME

no passive-interface INTERFACE_NAME

default passive-interface INTERFACE_NAME

Parameters

- **INTERFACE_NAME** Options include:
  - **ethernet *e_range***
  - **loopback *l_range***
  - **management *m_range***
  - **port-channel *p_range***
  - **vlan *v_range***
  - **vxlan *vx_range***
  - **default**

Valid ***e_range***, ***l_range***, ***m_range***, ***p_range v_range***, and ***vx_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command configures VLAN interfaces ***101*** through ***103*** as passive interfaces.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# passive-interface vlan 101-103
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   passive-interface Vlan101
   passive-interface Vlan102
   passive-interface Vlan103
switch(config-router-ospf3)#
```

15.3.5.30 redistribute (OSPFv3)

The **redistribute** command enables the advertising of all specified routes into the OSPFv3 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from the ***running-config***, disabling route redistribution for the specified route type.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

redistribute ROUTE_TYPE ROUTE_MAP

no redistribute ROUTE_TYPE

default redistribute ROUTE_TYPE

Parameters

- **ROUTE_TYPE** Options include:
  - **BGP**
  - **connected**
  - **static**
- **ROUTE_MAP** Options include:
  - **route-map *map_name***

Example

The **redistribute static** command starts the advertising of static routes as OSPFv3 external routes.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# redistribute static
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   redistribute connected
   redistribute static
switch(config-router-ospf3)#
```

15.3.5.31 router-id (OSPFv3)

The **router-id** command assigns the router ID for an OSPFv3 instance. The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address.
3. The highest IP address present on the device.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **no router-id** and **default router-id** commands remove the router ID command from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

router-id ***identifier***

no router-id

default router-id

Parameters

identifier Value ranges from ***0.0.0.0 to 255.255.255.255*** (dotted decimal notation).

Example

This command assigns ***10.10.1.4*** as the router ID for the OSPFv3 instance.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# router-id 10.10.1.4
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   router-id 15.10.1.4
switch(config-router-ospf3)#
```

15.3.5.32 show ipv6 ospf border-routers

The **show ipv6 ospf border-routers** command displays the OSPF routing table entries.

Command Mode

EXEC

Command Syntax

show ipv6 ospf border-routers [**VRF_INSTANCE**]

Parameters

- **VRF_INSTANCE** Values include:
  - ***no parameter*** Displays information for all VRFs.
  - **vrf *vrf_name*** Displays information for the specified VRF.

Example

This command displays the ABRs and ASBRs configured in the switch in all VRFs.

```
switch# show ipv6 ospf border-routers
Routing Process "ospf 9", VRF default
 Router 10.37.0.32 area 0.0.0.0 ASBR
 Router 10.37.0.18 area 0.0.0.0 ASBR
 Router 10.37.0.22 area 0.0.0.0 ASBR ABR
 Router 10.37.0.31 area 0.0.0.0 ASBR ABR
 Router 10.37.0.58 area 0.0.0.0 ASBR
 Router 10.37.0.37 area 0.0.0.0 ASBR
 Router 10.37.0.22 area 0.0.0.2 ASBR ABR
 Router 10.37.0.31 area 0.0.0.2 ASBR ABR
switch>
```

15.3.5.33 show ipv6 ospf database link if-name

The **show ipv6 ospf database link** command displays link state advertisement details. The switch can return link state data about a single area or for all areas on the switch.

Command Mode

EXEC

Command Syntax

show ipv6 ospf database link if-name [**INTF_ID**][**LS_ID**][**ROUTER**][**DATA_LEVEL**]

Parameters

- **INTF_ID** Options include:
  - **ethernet *e_range*** Ethernet interface list.
  - **loopback *l_range*** Loopback interface list.
  - **management *m_range*** Management interface list.
  - **port-channel *p_range*** Channel group interface list.
  - **vlan *v_range*** VLAN interface list.
  - **vxlan *vx_range*** VXLAN interface list.

    Valid ***range*** formats include number, range, or comma-delimited list of numbers and ranges.
- **LS_ID** Options include:
  - ***no parameter***
  - ***A.B.C.D***
- **ROUTER** Options include:
  - ***no parameter***
  - **adv-router *a.b.c.d***
  - **self-originate**
- **DATA_LEVEL** Options include:
  - ***no parameter***
  - **detail**

Example

This command displays information for ***ethernet 4/1*** link state advertisements.

```
switch# show ipv6 ospf database link if-name ethernet 4/1
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 1":

switch>
```

15.3.5.34 show ipv6 ospf database link if-type

The **show ipv6 ospf database link** command displays information of the link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

Command Mode

EXEC

Command Syntax

show ipv6 ospf database link if-type [**INTF_TYPE**][**LS_ID**][**ROUTER**][**DATA_LEVEL**]

Parameters

- **INTF_TYPE**
  - **broadcast**
  - **nbma**
  - **p2mp**
  - **p2p**
- **LS_ID** Options include:
  - ***no parameter***
  - ***A.B.C.D***
- **ROUTER** Options include:
  - ***no parameter***
  - **adv-router *a.b.c.d***
  - **self-originate**
- **DATA_LEVEL** Options include:
  - ***no parameter***
  - **detail**

Example

This command displays LSA information for the interfaces configured for broadcast transmissions.

```
switch# show ipv6 ospf database link if-type broadcast
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 1":

15.3.5.35 show ipv6 ospf database <link state list>

The **show ipv6 ospf database** command displays the OSPF link state advertisements that originate on a switch.

Command Mode

EXEC

Command Syntax

show ipv6 ospf database [**FILTER**][**LINKSTATE_ID**][**ROUTER**][**DATA_LEVEL**]

Parameters

- **FILTER** Filters the output of the command by specifying areas. Options include:
  - ***no parameter***
  - **area *A.B.C.D***
  - **area backbone**
  - **as**
  - **as external**
- **LINKSTATE_ID** Options include:

```

15.3.5.36 show ipv6 ospf database link

The **show ipv6 ospf database link** command displays details of the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

Command Mode

EXEC

Command Syntax

show ipv6 ospf database link [**LINKSTATE_ID**][**ROUTER**][**DATA_LEVEL**]

Parameters

- **LINKSTATE_ID** Options include:
  - ***no parameter***
  - ***A.B.C.D***
- **ROUTER** Options include:
  - ***no parameter***
  - **adv-router *a.b.c.d***
  - **self-originate**
- **DATA_LEVEL** Options include:
  - ***no parameter***
  - **detail**

Example

This command displays information about the Open Shortest Path First (OSPF).

```
switch# show ipv6 ospf database link
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 9":

switch>
```

15.3.5.37 show ipv6 ospf database

The **show ipv6 ospf database** command displays data from the OSPF database. The switch can return link state data for a single VRF or for all VRFs on the switch.

Command Mode

EXEC

Command Syntax

show ipv6 ospf database [**VRF_INSTANCE**]

Parameters

- **VRF_INSTANCE** Values include:
  - ***no parameter*** Displays information for all VRFs.
  - **vrf *vrf_name*** Displays information for the specified VRF.

Example

This command displays OSPF database information for VRF blue.

```
switch# show ipv6 ospf database vrf blue
Codes: AEX - AS External, GRC - Grace,
 IAP - Inter Area Prefix, IAR - Inter Area Router,

switch>
```

15.3.5.38 show ipv6 ospf database <link-state details>

The **show ipv6 ospf database <link-state details>** command displays detailed information about the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

Command Mode

EXEC

Command Syntax

show ipv6 ospf database [**FILTER**][**LINK_TYPE**][**LINKSTATE_ID**][**ROUTER**][**DATA_LEVEL**]

Parameters

- **FILTER** Filters the output of the command by specifying areas. Options include:
  - **area *A.B.C.D***
  - **area backbone**
- **LINK_TYPE** Parameter options include:
  - **router**
  - **network**
  - **inter-area-prefix**
  - **inter-area-router**
  - **intra-area-prefix**
  - **nssa**
- **LINKSTATE_ID** Options include:
  - ***no parameter***
  - ***A.B.C.D***
- **ROUTER** Options include:
  - ***no parameter***
  - **adv-router *a.b.c.d***
  - **self-originate**
- **DATA_LEVEL** Options include:
  - ***no parameter***
  - **detail**

Example

This command displays the OSPF database summary.

```
switch# show ipv6 ospf database detail
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

```

15.3.5.39 show ipv6 ospf interface

The **`show ipv6 ospf interface`** command displays OSPFv3 information on interfaces where OSPFv3 is enabled.

Command Mode

EXEC

Command Syntax

`show ipv6 ospf interface` **[VRF_INSTANCE]**

Parameters

- **VRF_INSTANCE** Values include:
  - ***no parameter*** Displays information for all VRFs.
  - **vrf *vrf_name*** Displays information for the specified VRF.

Example

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch# show ipv6 ospf interface
Ethernet17 is up
 Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State Backup DR, Priority 1
 Designated Router is 10.37.0.37
 Backup Designated Router is 10.37.0.23
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 1
 Options are R E V6
Vlan31 is up
 Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State Backup DR, Priority 1
 Designated Router is 10.37.0.22
 Backup Designated Router is 10.37.0.23
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 1
 Options are R E V6
Vlan32 is up
 Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State DR Other, Priority 1
 Designated Router is 10.37.0.11
 Backup Designated Router is 10.37.0.22
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 2
 Options are R E V6
switch>
```

15.3.5.40 show ipv6 ospf lsa-log

The **show ipv6 ospf lsa-log** command displays log entries when LSA update messages are sent or received for OSPFv3.

Command Mode

EXEC

Command Syntax

show ipv6 ospf [**PROCESS_ID**] **lsa-log** [**VRF_INSTANCE**]

Parameters

- **PROCESS_ID** OSPFv3 process ID. Values include:
  - ***no parameter*** Displays information for all process IDs.
  - ***1 to 65535*** Displays information for the specified process ID.
- **VRF_INSTANCE** Values include:
  - ***no parameter*** Displays information for all VRFs.
  - vrf ***vrf_name*** Displays information for the specified VRF.

Example

This command displays log entries when LSA update messages are sent or received for OSPFv3.

```
switch# show ipv6 ospf lsa-log
OSPF3 Process 3.3.3.3, VRF default, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new
 hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 3000 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed,
 new hold value 3000
msecs
/* Here the maxwait value was changed to 3000 from earlier 32000, this is
 not part of the log */
[04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 32000 msecs
[04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 32000 msecs
[04:19:54] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 16000 msecs
[04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 8000 msecs
[04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 4000 msecs
[04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
 value 2000 msecs
[04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new
 hold value 900 msecs
[04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by
 995 msecs
[04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new
 hold value 1000 msecs
switch>
```

15.3.5.41 show ipv6 ospf neighbor state

The **show ipv6 ospf neighbor state** command displays the state information on OSPF neighbors on a per-interface basis.

Command Mode

EXEC

Command Syntax

show ipv6 ospf neighbor state **STATE_NAME** [**VRF_INSTANCE**]

Parameters

- **STATE_NAME** Values include:
  - **2-ways**
  - **attempt**
  - **down**
  - **exch-start**
  - **exchange**
  - **full**
  - **restart**
  - **init**
  - **loading**
- **VRF_INSTANCE** Values include:
  - ***no parameter*** Displays information for all VRFs.
  - **vrf *vrf_name*** Displays information for the specified VRF.

Example

This command displays OSPF information for neighboring devices that are adjacent.

```
switch# show ipv6 ospf neighbor state full
Routing Process "ospf 3":
switch>
```

15.3.5.42 show ipv6 ospf neighbor summary

The **show ipv6 ospf neighbor** summary command displays a single line of state information for each OSPFv3 neighbor.

Command Mode

EXEC

Command Syntax

show ipv6 ospf neighbor summary [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Values include:

- ***no parameter*** Displays information for all VRFs.
- **vrf *vrf_name*** Displays information for the specified VRF.

Example

This command shows the summary information for the OSPFv3 neighbors.

```
switch# show ipv6 ospf neighbor summary
Routing Process "ospf 1":
      3 neighbors are in state Down
      3 neighbors are in state Full
      5 neighbors are in state Init
      0 neighbors are in state Loading
      0 neighbors are in state Attempt
      3 neighbors are in state Restarting
      0 neighbors are in state Exchange
      3 neighbors are in state 2 Ways
      0 neighbors are in state Exch Start
switch>
```

15.3.5.43 show ipv6 ospf neighbor

The **show ipv6 ospf neighbor** command displays OSPFv3 neighbor information.

Command Mode

EXEC

Command Syntax

show ipv6 ospf neighbor [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Values include:

- ***no parameter*** Displays information for all VRFs.
- **vrf *vrf_name*** Displays information for the specified VRF.

Example

This command displays the switch's neighbors.

```
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 VRF default priority is 1, state is Full
 In area 0.0.0.0 interface et12

 Dead timer is due in 39 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
 In area 0.0.0.2 interface vlan3992
 DR is 10.37.0.22 BDR is 10.37.0.23
 Options is 0
 Dead timer is due in 39 seconds
switch>
```

15.3.5.44 show ipv6 ospf spf-log

The **show ipv6 ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPFv3.

Command Mode

EXEC

Command Syntax

show ipv6 ospf [**PROCESS_ID**] **spf-log** [**VRF_INSTANCE**]

Parameters

- **PROCESS_ID** OSPFv3 process ID. Values include:
  - ***no parameter*** Displays information for all process IDs.
  - ***1 to 65535*** Displays information for the specified process ID.
- **VRF_INSTANCE** Values include:
  - ***no parameter*** Displays information for all VRFs.
  - **vrf *vrf_name*** Displays information for the specified VRF.

Example

This command displays the SPF information for OSPFv3 in all VRFs.

```
switch# show ipv6 ospf spf-log
OSPF3 Process 172.26.0.22, VRF default
TIME          EVENT                     REASON
04:54:52.070  SPF ran for 0.70 ms
04:54:52.070  Scheduled after 0 ms     Router LSA generation
04:54:39.151  SPF ran for 0.71 ms
04:54:39.151  Scheduled after 0 ms     Router LSA generation
04:54:12.071  SPF ran for 0.56 ms
04:54:12.070  Scheduled after 0 ms     Router LSA generation
04:54:04.153  SPF ran for 0.29 ms
04:53:59.153  Scheduled after 4999 ms  Router LSA generation
04:53:59.153  SPF ran for 0.25 ms
04:53:59.151  Scheduled after 0 ms     Router LSA generation
04:53:33.081  SPF ran for 0.3 ms
04:53:33.081  Scheduled after 0 ms     ECMP max nexthop cfg change
switch>
```

15.3.5.45 show ipv6 ospf

The **`show ipv6 ospf`** command displays information about OSPFv3 routing.

Command Mode

EXEC

Command Syntax

`show ipv6 ospf` [access-list | border-routers | database | interface | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf] ***Process ID***

Parameters

- ***no parameters*** displays the complete configuration of OSPFv3 address family and routing process.
- **access-list** displays the information of configured OSPFv3 access-list. Options include:
  - ***no parameters*** displays the information of all configured OSPFv3 access lists.
  - **WORD** displays the information of the specified access list.
  - **summary** displays the summary of all configured access lists.
- **border-routers** displays the information of configured OSPFv3 border and boundary routers. Options include:
  - ***no parameters*** displays the information of all configured OSPFv3 borders and boundary routers.
  - **vrf** displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- **database** displays the summary of database. Options include:
  - ***no parameters*** displays the complete summary of database.
  - **ipv4** displays the database information of link state ID.
  - **adv-router** displays the database information of advertising router link states.
  - **area** displays the database information filtered by area scope LSAs.
  - **as** displays the database information filtered by AS scope LSAs.
  - **database-summary** displays the count of LSAs in OSPFv3 database.
  - **detail** displays the detailed information of LSA.
  - **link** displays the database information filtered by link scoped LSAs.
  - **self-originate** displays the database information of self-originated link states.
  - **vrf** displays the VRF information in OSPFV3 database.
- **interface** displays the information of OSPFv3 interfaces. Options include:
  - ***no parameters*** displays the information of all OSPFv3 interfaces.
  - **Ethernet *eth_num*** displays the information of the specified Ethernet interface. The value ranges from ***1 to 24***.
  - **Loopback *lb_num*** displays the information of the specified loop back interface. The value ranges from ***0 to 1000***.
  - **Port-Channel *pc_num*** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from ***1-1000*** and ***1-2000***. ***1-4094*** respectively.
  - **Tunnel *t_num*** displays the information of the specified tunnel. The value ranges from ***0 to 255***.
  - **Vlan *vlan_num*** displays the information of the specified VLAN interface. The value ranges from ***1 to 4094***.
  - **vrf *vrf_name*** displays the information of the specified VRF.
- **lsa-log** displays the log entries of OSPFv3 LSA updates.
- **neighbor** displays the list of OSPFv3 neighbors.
- **request-list** displays the list of all OSPFv3 LSAs requested by a router.
- **retransmission-list** displays the list of all OSPFv3 LSAs waiting to be re-sent.

- **spf-log** displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
- **vrf *vrf_name*** displays the information of specified VRF.
- ***Process ID*** displays the OSPFv3 configuration of the specified process ID. The value ranges from ***1 to 65535***.

Examples

- This command displays OSPFv3 routing information for all VRFs.

```
switch# show ipv6 ospf
Routing Process "ospfv3 0" with ID 11.1.11.1 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
 border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 0. 0 normal, 0 stub, 0 nssa
  Number of LSAs 0
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFs 5000 msecs
  Current hold time between two consecutive SPFs 5000 msecs
  Maximum wait time between two consecutive SPFs 5000 msecs
  SPF algorithm last executed 00:07:13 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
```

- This command displays the log entries of OSPFv3 LSA updates.

```
switch# show ipv6 ospf lsa-log

```

15.3.5.46 show ospfv3

The **`show ospfv3`** command displays the OSPFv3 configuration of OSPFv3 address family and routing process.

Command Mode

EXEC **Command Syntax**

`show ospfv3` [access-list | border-routers | database | interface | ipv4 | ipv6 | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf]

Parameters

- ***no parameters*** displays the complete configuration of OSPFv3 address family and routing process.
- **access-list** displays the information of configured OSPFv3 access-list. Options include:
  - ***no parameters*** displays the information of all configured OSPFv3 access lists.
  - **WORD** displays the information of the specified access list.
  - **summary** displays the summary of all configured access lists.
- **border-routers** displays the information of configured OSPFv3 border and boundary routers. Options include:
  - ***no parameters*** displays the information of all configured OSPFv3 borders and boundary routers.
  - **vrf** displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- **database** displays the summary of database. Options include:
  - ***no parameters*** displays the complete summary of database.
  - **ipv4** displays the database information of link state ID.
  - **adv-router** displays the database information of advertising router link states.
  - **area** displays the database information filtered by area scope LSAs.
  - **as** displays the database information filtered by AS scope LSAs.
  - **database-summary** displays the count of LSAs in OSPFv3 database.
  - **detail** displays the detailed information of LSA.
  - **link** displays the database information filtered by link scoped LSAs.
  - **self-originate** displays the database information of self-originated link states.
  - **vrf** displays the VRF information in OSPFV3 database.
- **interface** displays the information of OSPFv3 interfaces. Options include:
  - ***no parameters*** displays the information of all OSPFv3 interfaces.
  - **Ethernet *eth_num*** displays the information of the specified Ethernet interface. The value ranges from ***1 to 24***.
  - **Loopback *lb_num*** displays the information of the specified loop back interface. The value ranges from ***0 to 1000***.
  - **Port-Channel *pc_num*** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from ***1-1000*** and ***1-2000***. ***1-4094*** respectively.
  - **Tunnel *t_num*** displays the information of the specified tunnel. The value ranges from ***0 to 255***.
  - **Vlan *vlan_num*** displays the information of the specified VLAN interface. The value ranges from ***1 to 4094***.
  - **vrf *vrf_name*** displays the information of the specified VRF.
- **ipv4** displays the IPv4 address family information.
- **ipv6** displays the IPv6 address family information.
- **lsa-log** displays the log entries of OSPFv3 LSA updates.
- **neighbor** displays the list of OSPFv3 neighbors.

- **request-list** displays the list of all OSPFv3 LSAs requested by a router.
- **retransmission-list** displays the list of all OSPFv3 LSAs waiting to be re-sent.
- **spf-log** displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
- **vrf *vrf_name*** displays the information of specified VRF.

Examples

- This command displays the complete configuration of OSPFv3 address family and routing process.

```
switch# show ospfv3
OSPFv3 address-family ipv6
Routing Process "ospfv3" with ID 13.13.13.13 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
 border router
  Minimum LSA arrival interval 1000 msecs
  Initial LSA throttle delay 1000 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
  Interface flood pacing timer 50 msecs
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msecs
  Minimum hold time between two consecutive SPFs 5000 msecs
  Current hold time between two consecutive SPFs 5000 msecs
  Maximum wait time between two consecutive SPFs 5000 msecs
  SPF algorithm last executed 3d23h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

- This command displays the count of LSAs in OSPFv3 database.

```

15.3.5.47 shutdown (OSPFv3)

The **shutdown** command disables OSPFv3 on the switch.

OSPFv3 is disabled by default on individual interfaces and enabled through **ipv6 ospf area** commands.

The **no shutdown** and **default shutdown** commands enable the OSPFv3 instance by removing the **shutdown** statement from the OSPFv3 block in ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Example

This command disables OSPFv3 activity on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# shutdown
switch(config-router-ospf3)# show active
ipv6 router ospf 9
   shutdown
switch(config-router-ospf3)#
```

15.3.5.48 timers lsa rx min interval (OSPFv3)

The **`timers lsa rx min interval`** command sets the minimum interval for accepting identical Link-State Advertisements (LSAs) from OSPFv3 neighbors.

The **`no timers lsa rx min interval`** and **`default timers lsa rx min interval`** commands restore the minimum interval to the default value of one second by removing the **`timers lsa rx min interval`** command from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

Command Syntax

`timers lsa rx min interval` ***lsa_time***

`no timers lsa rx min interval`

`default timers lsa rx min interval`

Parameter

lsa_time Minimum time (in milliseconds) after which the switch accepts an identical LSA from OSPFv3 neighbors. Value ranges from ***0 to 600000*** (ms). Default value is ***1000*** milliseconds (***1*** second).

Example

This command sets the minimum LSA arrival interval to ***10*** milliseconds.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)# timers lsa rx min interval 10
switch(config-router-ospfv3)#
```

15.3.5.49 timers lsa tx delay initial (OSPFv3)

The **`timers lsa tx delay initial`** command sets the rate-limiting values for OSPFv3 Link-State Advertisement (LSA) generation.

The **`no timers lsa tx delay initial`** and **`default timers lsa tx delay initial`** commands restore the default LSA rate-limiting values by removing the **`timers lsa tx delay initial`** command from the ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

Command Syntax

`timers lsa tx delay initial` ***initial_delay min_hold max_wait***

`no timers lsa tx delay initial`

`default timers lsa tx delay initial`

Parameters

- ***initial_delay*** Initial delay in milliseconds to generate the first instance of LSAs. Value ranges from ***0 to 600000*** (ms). The default value is ***1000*** ms.
- ***min_hold*** Minimum hold interval availed in milliseconds between the generation of same LSA. Value ranges from ***1 to 600000*** (ms). The default interval is ***5000*** ms.
- ***max_wait*** Maximum hold interval availed in milliseconds between the generation of same LSA. Value ranges from ***1 to 600000*** (ms). The default interval is ***5000*** ms.

Example

These commands set the LSA transmission timers on the switch.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)#timers lsa tx delay initial 5 100 20000
switch(config-router-ospfv3)#
```

15.3.5.50 timers spf delay initial (OSPFv3)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The **`timers spf delay initial`** command controls the intervals of SPF calculations in a switch. The command sets three values:

- **Initial delay:** Initial wait by a switch to calculate SPF after a topology change in a network that has been stable throughout the hold interval. Because a topology change often requires several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch calculates SPF. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the initial delay period has expired and no other change is made to the throttle timers.
- **Hold interval:** This is an additional wait timer that reduces the frequency of SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur when the hold interval expires. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.
- **Maximum interval:** The maximum wait time of a switch after a topology change before performing an SPF calculation.

The **`no timers spf delay initial`** and **`default timers spf delay initial`** commands restore the default OSPFv3 SPF calculation intervals by removing the **`timers spf delay initial`** command from ***running-config***.

Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

Command Syntax

`timers spf delay initial` ***initial_delay hold_interval max_interval***

`no timers spf`

`default timers spf`

Parameters

- ***initial_delay*** Initial delay between a topology change and SPF calculation. Value ranges from ***0 to 65535000*** (ms). The default value is ***0*** ms.
- ***hold_interval*** Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from ***0 to 65535000*** (ms). The default value is ***5000*** ms.
- ***max_interval*** The maximum hold interval before a switch calculates SPF. Value ranges from **`0 to 65535000`** (ms). The default value is ***5000*** ms.

Example

These commands set the SPF timers on the switch.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#timers spf delay initial 5 100 20000
switch(config-router-ospfv3)#
```

15.3.5.51 timers

The **timers** command configures the minimum interval between the transmission of consecutive LS update packets in a network.

The **no timers** and **default timers** commands set the configured timer value to its default.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

timers {lsa | out-delay| pacing | throttle}

no timers {lsa | out-delay| pacing | throttle}

deault timers {lsa | out-delay| pacing | throttle}

Parameters

- **lsa** configures threshold for the retransmission of LSA. Option includes:
  - **arrival** configures the OSPF LSA arrival timer.
- **out-delay** configures the delay to flood router LSA in milliseconds. Option includes:
  - ***out-delay_time*** minimum interval in milliseconds between accepting the same LSAs. The value ranges from ***0 to 65000*** milliseconds. The default value is ***0***.
- **pacing** configures the OSPF packet pacing. Option includes:
  - **flood** configures the OSPF flood pacing.
- **throttle** configures OSPF throttle timers. Options include:
  - **lsa** configures threshold for the retransmission of LSA.
  - **spf** configures the time between SPF calculations.

Examples

- This command configures OSPFv3 flood pacing timer to ***50*** ms in the global OSPFv3 instance.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# timers pacing flood 50
switch(config-router-ospf3)# show ospfv3
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF
 default

```

15.4 IS-IS

Intermediate System-to-Intermediate System (IS-IS) intra-domain routing information exchange protocol is designed by the International Organization for Standardization to support connectionless networking. This protocol is a dynamic routing protocol.

This chapter contains the following sections.

15.4.1 IS-IS Introduction

IS-IS is a link-state protocol, which uses the Shortest Path First (SPF) algorithm. IS-IS and the OSPF protocol are similar in many aspects. As an Interior Gateway Protocol (IGP), IS-IS runs inside an Autonomous System (AS).

To enable IS-IS, you must instantiate an IS-IS routing instance and assign it to an interface. Arista IS-IS support includes IS-IS segment routing and IS-IS graceful restart.

15.4.2 IS-IS Segment Routing

Segment Routing (SR) provides a mechanism to simplify the definition of end-to-end paths within IGP topologies by encoding paths as sequences of topological sub-paths, called segments. The IS-IS protocol advertises these segments in four different ways: node segments, prefix segments, proxy-node segments, and adjacency segments.

Node segments represent a node in an IGP topology. A proxy segment are generally associated with an IP(v6) address received from a router that does not support IS-IS SR. Prefix segments represent an ECMP-aware shortest path to a prefix (or a node), as per the state of the IGP topology. Adjacency segments represent a hop over a specific adjacency between two nodes in IGP.

15.4.2.1 TI-LFA FRR using IS-IS Segment-Routing

Topology Independent Fast Reroute, or TI-LFA, uses IS-IS SR to build loop-free alternate paths along the post-convergence path. These loop-free alternates provide fast convergence in the range of sub-50 ms.

This section describes TI-LFA FRR using II-IS SR, including configuration instructions and command descriptions. Topics covered by this chapter include:

The (Point of Local Repair (PLR)- the router where TI-LFA is configured) PLR switches to these loop-free alternate backup paths in the event of a link down (link-protection) or BFD neighbor down (node-protection) event, protecting traffic destined to IS-IS SR node segments, adjacency segments, and anycast segments while the IGP converges and the post-convergence paths are computed. Anycast segment protection is restricted to those segments which are attached to prefixes with host mask (***/32*** for V4 address and ***/128*** for v6 address).

Note: Unlike node segments, anycast segments do not have the ‘N’ flag set described in section ***2.1.1.2*** of ***RFC8667***.

The following enhancements are available by release:

- ***EOS Release 4.22.1F*** adds support for TI-LFA backup paths that protect IS-IS SR labeled traffic corresponding to a node segment or adjacency segment on a transit router.
- ***EOS Release 4.23.1F*** adds support for TI-LFA backup paths that protect IS-IS SR tunnels.
- ***EOS Release 4.24.1*** adds support for protecting IS-IS SR labeled traffic corresponding to anycast segments.
- ***EOS Release 4.24.2F*** adds support for calculating TI-LFA backup paths that exclude the SRLG configured on the failing link.

Backup paths are only installed for IS-IS SR labeled routes and tunnels corresponding to node segments, adjacency segments, and anycast segments. When requesting node-protection, and no node-protecting LFAs are available, a link-protecting LFA is computed instead. TI-LFA FRR using IS-IS Segment-Routing is available with the multi-agent routing protocol model and the ribd routing protocol model.

Other traffic that resolves over IS-IS SR tunnels, such as LDP pseudowires, BGP LU tunnels, BGP IP routes, L2 EVPN, MPLS L3 VPN, and so on, are also protected by the TI-LFA tunnel that protects the resolving IS-IS SR tunnel.

15.4.2.1.1 TI-LFA FRR using IS-IS Segment-Routing Configuration

The following configuration tasks can be performed by Topology Independent Fast Reroute (TI-LFA FRR) using IS-IS Segment-Routing.

- Configuring Link or Node Protection on a Specific Interface
- Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments
- Making Locally-originated Adjacency Segments Backup Eligible
- Enabling SRLG Protection
- show ip route

15.4.2.1.2 TI-LFA FRR using IS-IS SR Commands

TI-LFA FRR using IS-IS SR Show Commands

- show ip route
- show isis interface
- show isis local-convergence-delay
- show isis segment-routing prefix-segments
- show isis segment-routing adjacency-segments
- show isis segment-routing tunnel
- show isis ti-lfa path
- show isis ti-lfa tunnel
- show mpls lfib route
- show tunnel fib

15.4.2.1.3 Limitations

- Backup paths are not computed for prefix segments that do not have a host mask (***/32*** for v4 and ***/128*** for v6).
- When TI-LFA is configured, the number of anycast segments generated by a node cannot exceed ***10***.
- Computing TI-LFA backup paths for proxy node segments is not supported.
- Backup paths are not computed for node segments corresponding to multi-homed prefixes. The multi-homing could be the result of them being anycast node segments, loopback interfaces on

different routers advertising SIDs for the same prefix, node segments leaked between levels, and thus being seen as originated from multiple L1-L2 routers.
- Backup paths are only computed for segments that are non-ECMP.
- Only IS-IS interfaces that are using the point-to-point network type are eligible for protection.
- Link/node protection is only supported in the default VRF owing to the lack of non-default VRF support for IS-IS segment-routing.
- Backup paths are computed in the same IS-IS level topology as the primary path.
- Even with IS-IS GR configured, SSU, SSO, agent restart are not hitless events for IS-IS SR LFIB routes or tunnels being protected by backup paths.

15.4.3 IS-IS Graceful Restart

IS-IS Graceful Restart (GR) is a mechanism to prevent routing protocol re-convergence during a processor switchover or device downtime. Normally, when a router restarts, all the neighboring routers associated with that router detect that the device has gone down and remove routes from that neighbor. When the router restarts, the session is re-established and data transfer continues. During the restart, the removal and re-insertion of routes will result in data loss. This can be prevented by configuring graceful restart on the device.

When IS-IS is used as the interior gateway protocol (IGP), the following EOS features require nonstop forwarding (NSF) and support for the graceful restart from IS-IS:

- Smart Software Upgrade (SSU).
- planned Stateful SwitchOver (SSO) initiated by an operator for maintenance, or unplanned SSO due to failures on the active supervisor.
- RIB agent restart due to software failures.

With IS-IS Graceful Restart (GR) configured, a redundancy switchover from active to standby supervisor, or SSU, or restart of the IS-IS software (the RIB agent) should be a hitless event if the GR completes successfully. Neighboring routers will continue to forward traffic to the restarting router and traffic forwarding through the restarting router continues without loss. If GR is successful, the failure of a router should be completely transparent to network applications.

ISIS Graceful Restart (GR) is compatible with the following platforms:

- IS-IS GR with unplanned software restart is supported on all platforms.
- IS-IS GR with SSO is supported on modular dual-supervisor platforms.
- IS-IS GR with SSU is supported on platforms that support SSU.

15.4.4 IS-IS Dynamic Flooding

Dynamic Flooding allows IS-IS to scale to large, dense topologies such as Leaf-Spine topologies. In such topologies, legacy IS-IS can exhibit a congestive collapse due to the control plane load created by excessively redundant flooding.

The concept in Dynamic Flooding is to dynamically compute a restricted topology for flooding (the **flooding topology**). Since this can be much smaller than the full physical topology, this can reduce the redundancy seen by each node, thereby reducing the control plane load and avoiding a congestive collapse.

To do this, first select one node within the IS-IS area as the **area leader**. Leverage the Designated Intermediate System (DIS) election algorithm for this, except instead of applying it to the neighbors on an interface, compute it across all of the nodes within the area.

The area leader is responsible for computing the flooding topology. This is distributed to the other nodes in the area through the Area System IDs TLV and the Flooding Path TLV.

All nodes within the area then flood only on the flooding topology.

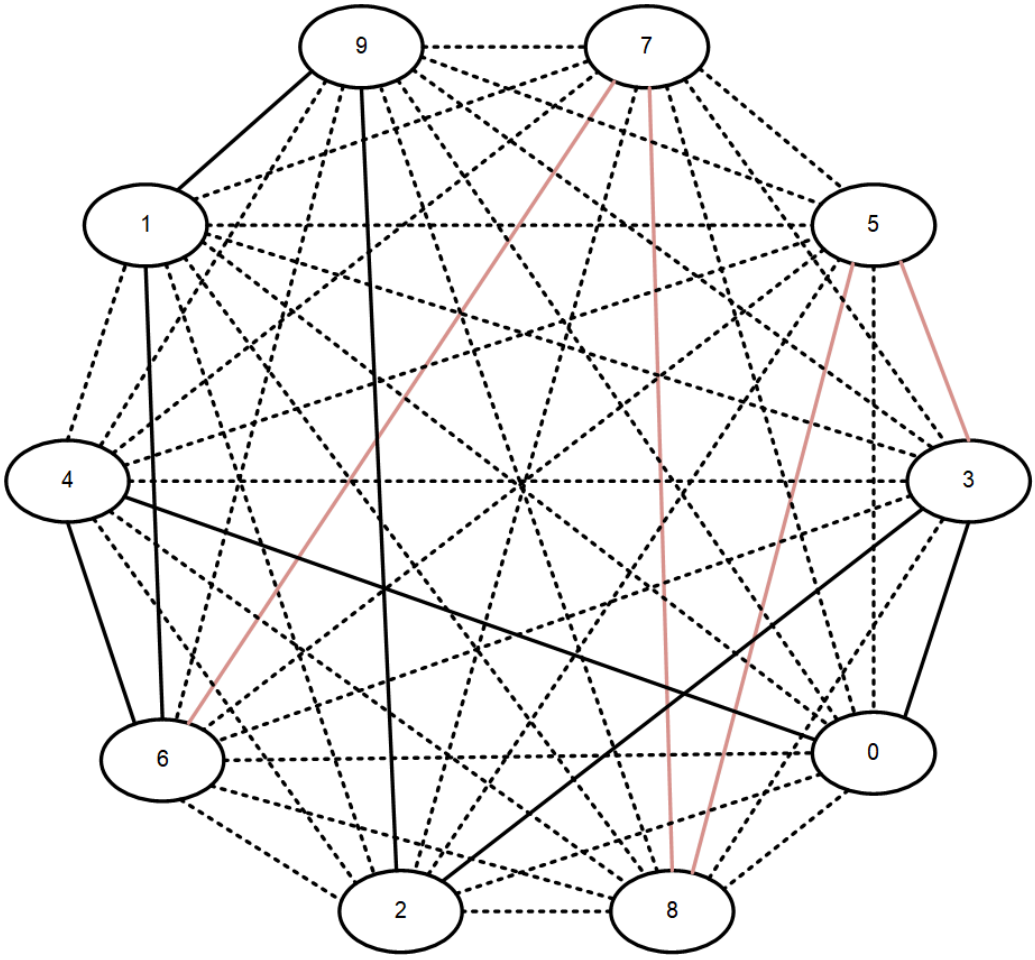

Figure 55: Flooding Topology

A flooding topology on a dense graph. The flooding topology is shown by the solid lines. Dotted lines indicate non-flooding links.

In a dense topology, this can reduce the amount of flooding by an order of magnitude or more, with a resulting increase in scalability.

15.4.5 IS-IS Configuration

These sections describe IS-IS configuration tasks:

- Enabling IS-IS
- Configuring IS-IS Optional Global Parameters
- Configuring Optional IS-IS Interface Parameters
- Configuring IS-IS Segment Routing
- Configuring Redistribution of DHCP for IS-IS Agent (IPv6)
- Disabling IS-IS
- Configuring IS-IS Graceful Restart (GR)
- TI-LFA FRR using IS-IS Segment-Routing Configuration
- IS-IS Dynamic Flooding Configuration
- Relax Address-Family Check for IS-IS Adjacency
- Displaying IS-IS Information

15.4.5.1 Enabling IS-IS

To enable IS-IS, each of the following tasks must be performed.

- Enabling IS-IS Globally and Specifying an IS-IS Instance
- Configuring the Network Entity Title (NET)
- Setting the Address Family Configuration
- Enabling IS-IS on a Specified Interface

15.4.5.1.1 Enabling IS-IS Globally and Specifying an IS-IS Instance

The switch supports only one IS-IS routing instance per VRF. The routing instance uniquely identifies the switch to other devices. IS-IS configuration commands apply globally to the IS-IS instance.

The switch must be in router IS-IS configuration mode to run IS-IS configuration commands. The **`router isis`** command places the switch in router IS-IS configuration mode.

Example

These commands create an IS-IS routing instance named Osiris in the default VRF and place the switch in IS-IS configuration mode for that instance.

```
switch(config)# router isis Osiris
switch(config-router-isis)#
```

15.4.5.1.2 Configuring the Network Entity Title (NET)

After creating an IS-IS routing instance, configure the Network Entity Title (NET) with the **`net`** command. The NET defines the IS-IS area address and the system ID of the device.

Example

These commands configure the NET by specifying the IS-IS area address and the system ID of the device.

```
switch(config)# router isis Osiris
switch(config-router-isis)# net 49.0001.1010.1040.1030.00
```

15.4.5.1.3 Setting the Address Family Configuration

The **`address-family`** command enables the address families that IS-IS will route and places the switch in the configuration mode for that address family. The address families supported are IPv4 unicast and IPv6 unicast.

Example

These commands enable and enter the address family mode for IPv4 unicast.

```
switch(config)# router isis Osiris
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af)#
```

15.4.5.1.4 Enabling IS-IS on a Specified Interface

After enabling IS-IS globally, enable it on an interface with the **`isis enable`** command.

Example

These commands enable IS-IS on ***interface ethernet 4***.

```
switch(config-router-isis)# interface ethernet 4
switch(config-if-Eth4)#isis enable Osiris
```

15.4.5.2 Configuring IS-IS Optional Global Parameters

After globally enabling IS-IS, the following global parameters may be configured.

- Setting the Router Type
- Configuring Redistribution of Connected or Static Non-ISIS Routes
- Configuring Redistribution of Connected or Static non-ISIS Routes into Level-1 or Level-2
- Configuring Redistribution of BGP Routes into ISIS
- Setting the Overload Bit
- Configuring IS-IS MD5 Authentication
- Setting the SPF Interval
- Configuring IS-IS Segment Routing Global Adjacency-SID
- Enabling Logging for Peer Changes
- Setting the IS-IS hostname
- Configuring IS-IS Multi-Topology

15.4.5.2.1 Setting the Router Type

The **`is-type`** command sets the routing level for an IS-IS instance.

Example

These commands specify Level-2 for the IS-IS instance.

```
switch(config)# router isis Osiris
switch(config-router-isis)# is-type level-2
switch(config-router-isis)#
```

15.4.5.2.2 Configuring Redistribution of Connected or Static Non-ISIS Routes

The **`redistribute (IS-IS)`** command configures redistribution of connected or static non-ISIS routes.

Example

These commands redistribute connected routes into the IS-IS domain.

```
switch(config)# router isis Osiris
switch(config-router-isis)# redistribute connected
switch(config-router-isis)#
```

15.4.5.2.3 Configuring Redistribution of Connected or Static Non-ISIS Routes into Level-1 or Level-2

Non-ISIS routes can be exported into Level-1, Level-2, or both using a route map. By default, the routes are exported only to Level-2; to export to Level-1 or to both levels, configure the route map using the **`set isis level`** command. The Level-1 or Level-2 routes can also be filtered using the route maps match statement. The route map is then used when redistributing routes in ISIS with the **`redistribute (IS-IS)`** command.

Use the **`show isis database detail`** command to make sure that the route shows up in the exported level.

Examples
