Chapter 1

Overview

Arista Networks features switches with high-density, non-blocking Ethernet ports that are controlled through an extensible, Linux-based, modular network operating system. The intended audience for this manual is network administrators who configure Arista switches. A working knowledge of network administration is assumed.

New Features

This guide may not describe the features added in the most recent EOS version. For information on undocumented features, consult the TOI documents here: https://www.arista.com/en/support/toi.

Switch Platforms

A list of Arista switches and detailed information about each is available online here: https://www.arista.com/en/products.

Recently released switches may not appear in the list, but can be found in the most recent Release Notes (found under Active Releases here: https://www.arista.com/en/support/software-download).

Open-Source Licenses

Portions of Arista Networks software are covered by open-source licenses including the GNU General Public License (GNU GPL).

See https://www.arista.com/en/support/product-documentation/gpl.

CloudVision

The configuration tasks required for deployment of CloudVision, CVX, and CVP are described in the CloudVision Configuration Guide. The latest version can be found here: https://www.arista.com/en/cg-cv/.

Supported Features

For the complete supported-features list in the latest EOS release, see https://www.arista.com/en/support/product-documentation/supported-features.

For details on a specific release, see the Release Notes (found under Active Releases here: https://www.arista.com/en/support/software-download).

This section contains the following topic:

1.1 Command-Line Interface (CLI)

The command-line interface (CLI) is one tool for controlling the switch and displaying information about its status and configuration. This chapter describes the use of the CLI.

This chapter includes these sections:

- Kernel-based Virtual Machine Commands and Configuration
- Switch Platforms
- Command Modes
- Managing Switch Configuration Settings
- Other Command-Line Interfaces
- Directory Structure
- Command-Line Interface Commands

1.1.1 Accessing the EOS CLI

You can open an EOS CLI session through these connections:

- Ethernet management ports
- console port
- Telnet connections
- Secure Shell (SSH)

The following figure displays the EOS CLI in a Secure Shell connection.

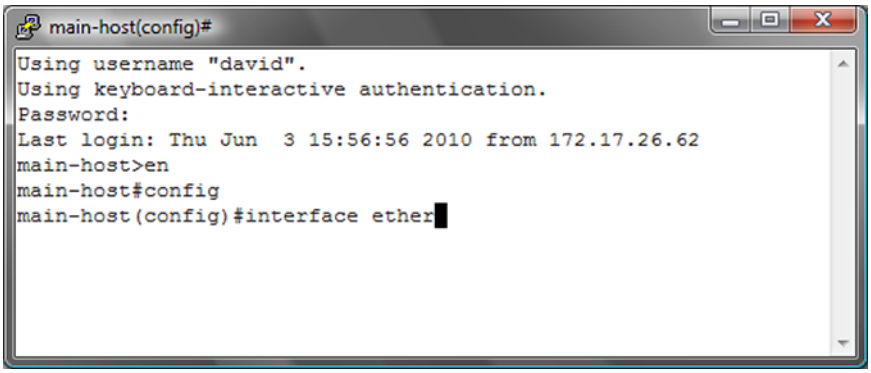

Figure 1: EOS Command-Line Interface

1.1.2 Processing Commands

1.1.2.1 Command Execution

Command keywords are not case-sensitive. The CLI also accepts truncated keywords that uniquely correspond to one command.

- The command abbreviation **con** does not execute a command in Privileged EXEC mode because the names of two commands begin with these letters: **configure** and **connect**.

```
switch# con
% Ambiguous command
```

- The command abbreviation **conf** executes **configure** in Privileged EXEC mode because no other command name begins with **conf**.

```
switch# conf
switch(config)#
```

1.1.2.2 Creating an Alias

The alias command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command.

Example

- This command makes **srie** an alias for the command **show running-config interface ethernet 1-5**.

```
switch(config)# alias srie show running-config interface ethernet 1-5
switch(config)# srie
interface Ethernet1
   switchport access vlan 33
   storm-control broadcast level 1
   spanning-tree portfast
   spanning-tree bpduguard enable
interface Ethernet2
   switchport access vlan 33
   spanning-tree portfast
interface Ethernet3
   switchport access vlan 33
   spanning-tree portfast
   spanning-tree bpduguard enable
interface Ethernet4
interface Ethernet5
   shutdown
```

1.1.2.3 Cursor Movement Keystrokes

EOS supports these cursor movement keystrokes:

- **Ctrl-B** or the **Left Arrow** key: moves cursor to the left.
- **Ctrl-F** or the **Right Arrow** key: moves cursor to the right.
- **Ctrl-A**: moves cursor to beginning of line.
- **Ctrl-E**: moves cursor to end of line.
- **Esc-B**: moves cursor left one word.
- **Esc-F**: moves cursor right one word.

1.1.2.4 History Substitution Keystrokes

The history buffer retains the last 20 commands entered. History substitution keystrokes that access previously entered commands include:

- **Ctrl-P** or the **Up Arrow** key: Recalls the most recent buffered commands. Repeat to recall older commands.
- **Ctrl-N** or the **Down Arrow** key: Recalls more recent commands after using the **Ctrl-P** or the **Up Arrow**. Repeat to recall newer commands.

The **show history** command in Privileged EXEC mode displays the history buffer contents.

```
switch#show history
  en
  config
  exit
  show history
```

1.1.2.5 Command Lists and Syntax Assistance

EOS CLI uses widely followed conventions for providing command lists and syntax assistance. These conventions are available in all command modes.

- To display all commands available at this level, type a question mark (**?**):

```
switchName>?
  clear       Reset functions
  connect     Open a terminal connection
  default     Set a command to its defaults
  disable     Turn off privileged commands
  enable      Turn on privileged commands
  exit        Exit from the EXEC
  logout      Exit from the EXEC
  no          Negate a command or set its defaults
  ping        Send echo messages
  show        Show running system information
  ssh         Open ssh connection
  tcpdump     Monitor packets with tcpdump
  telnet      Open a telnet connection
  terminal    Configure the terminal
  traceroute  Trace route to destination
  watch       Execute a command repeatedly
  who         Display information about terminal lines
  zerotouch   ZeroTouch configuration
```

- To display a list of commands beginning with a specific character sequence, type the sequence followed by a question mark.

```
switch# di?
diff  dir  disable
```

- To display a command's keywords or arguments, type a question mark as an argument.

```
switch> ping ?
WORD  Ping destination address or hostname
ip    IPv4 echo
ipv6  IPv6 echo
mpls  Send echo messages for LSP
vrf   Ping in a VRF
```

- The switch accepts an address-mask or CIDR notation (address-prefix) in commands that require an IP address and mask. For example, these commands are processed identically:

```
switch(config)# ip route 0.0.0.0 255.255.255.255 10.1.1.254
switch(config)# ip route 0.0.0.0/32 10.1.1.254
```

- The switch accepts an address-wildcard or CIDR notation in commands requiring an IP address and wildcard. Wildcards use zeros to mask portions of the IP address and are found in some protocol configuration statements, including OSPF. The switch processes these commands identically:

```
switch(config-router-ospf)# network 10.255.255.1 0.0.0.255 area 15
switch(config-router-ospf)# network 10.255.255.1/24 area 15
```

1.1.2.6 Regular Expressions

A regular expression is a search pattern composed of symbols, letters and numbers. Some CLI parameters are defined as regular expressions for specifying more expressive search criteria. The switch uses regular expression pattern matching in several BGP commands.

The functionality of a regular expression for an AS-Path varies based on BGP regex asn and string mode configurations in the **ip as-path regex-mode** command.

The following tables describe the behavior of special characters in asn and string modes respectively.

Special Characters	Characters Names	Description	Examples
.	Period	Matches any AS number.	'.' matches '200'. '10.20' matches '10 30 20', but does not match '10 20'.
^	Caret	Matches the specified expression at the beginning of an input string. Also used to exclude expressions in brackets while matching.	'^123' matches '123', '123 456', '123 456 789', and so on; but does not match '1234'. '[^12]' matches '1', '2', '3', and so on; but does not match '12'.
*	Asterisk	Matches an entire AS number that appears either zero or more times.	'200_100*_300' matches '200 300', '200 100 300', '200 100 100 300', and so on. '^100*$' matches empty AS path, '100', '100 100', '100 100 100', and so on.
+	Plus sign	Matches an entire AS number appearing either one or more times.	'10_20+_30' matches '10 20 30', '10 20 20 30' and so on; but does not match '10 200 30'.
$	Dollar sign	Matches the specified expression at the end of an input string.	'1_2_3$' matches '1 2 3', but does not match '1 2 3 4'.
[]	Brackets	Matches either an AS number, or a range of AS numbers separated by a hyphen.	'[10_20_30-39]' matches '10', '20', '30', '31',...'39'.
?	Question mark	Matches either zero or one occurrence of the pattern but the previous operand or entire AS number may appear zero or one time.	'100_200?' matches '100' and '100 200'. '100_200?$' does not match with '100 20'.
|	Pipe	Matches the specified AS number on either side of the vertical bar.	'6400|6500' matches either '6400' or '6500'.
( )	Parenthesis	Nests specified AS numbers for matching.	'^(100(200|300))$' matches either '100 200' or '100 300'. '^100_200\|300_400$' matches AS path either "100 200" or "300 400".
_	Underscore	Matches specified AS numbers that are converted into AS number delimiters.	'_123_456_' matches '123 456'. '_333_444_' matches '111 222 {333 444}'.

Note: Precede the question mark (**?**) with **Ctrl+V** sequence to prevent it from being interpreted as a help command.

Special Characters	Characters Names	Description	Examples
.	Period	Matches any single character.	‘1.2’ matches ‘102’.
^	Caret	Matches the specified expression at the beginning of an input string.	‘^123’ matches ‘123’, ‘1234’, ‘12345’, and so on. It also matches ‘123 456’, ‘123 456 789’, and so on.
*	Asterisk	Matches either zero or more sequences of the expression preceding the asterisk.	'^5*$' matches an empty AS path, '5', '55', '555', and so on.
+	Plus sign	Matches either one or more sequences of the expression preceding the plus sign.	‘5+’ matches to ‘5’, ‘55’, ‘555’, and so on.
$	Dollar sign	Matches the expression at the end of an input string.	‘123$’ matches ‘123’, but does not match ‘1234’.
[]	Brackets	Matches either characters or a range of characters separated by a hyphen, within left and right brackets.	‘[025-7]’ matches ‘0’, ‘2’, and digits from ‘5’ to ‘7’; but does not match digits from ‘1’, ‘3’, ‘4’, ‘8’, and ‘9’.
?	Question mark	Matches either zero or one occurrence of the pattern.	'12?3' matches '13' and '123'.
|	Pipe	Matches either one of the expressions or expression patterns on either side of the vertical bar.	‘14(36|75)12’ matches either ‘143612’ or ‘147512’; but does not match ‘1412’, ‘14367512’, ‘14363612’ or ‘14757512’.
( )	Parenthesis	Nests specified expressions for matching.	‘(17)*’ matches any number of the two-character string ‘17’.
_	Underscore	For AS-Path regex, '_' matches curly brackets '{}', the beginning of input string, the end of input string, or space.	‘_1300_’ matches ‘100 {1300 1400}’, ‘100 1300 200’, and so on.
{}	Braces	Matches repetitions of the previous expression with the number of repetitions provided in braces.	'10{2,3}' matches '100' and '1000'.
\	Backslash	Matches the character following the backslash and special characters.	‘\(42’ matches ‘(42’.

Precede the question mark (**?**) with **Ctrl+V** sequence to prevent it from being interpreted as a help command.

1.1.2.7 Scheduling CLI Commands

The **schedule** command facilitates the periodic execution of the specified CLI command. Command parameters configure the time to start script execution, the interval between consecutive execution instances, the maximum time to execute the script, and the maximum number of files log that needs to be created.

The **schedule config** command sets configuration parameters to the CLI scheduler.

The **show schedule** command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

Examples

- This command schedules the execution of a script once every ***12*** hours and the script execution is terminated if it exceeds ***40*** minutes. When max-log-files is set to zero, the script output is not logged.

```
switch# schedule ms_1 interval 720 timeout 40 max-log-files 0 command
 bash /mnt/flash/myscript.sh
```

- This command saves the running configuration contents to a log file every hour, terminates the script execution if it exceeds 30 minutes and creates up to ***24*** log files.

```
switch#schedule backup-test interval 60 max-log-files 24 command show
 running-config
```

- This command allows the switch to concurrently execute up to ***2*** scheduled commands.

```
switch(config)#schedule config max-concurrent-jobs 2
switch(config)#
```

- This command lists the commands that are scheduled for periodic execution.

```
switch(config)#schedule config max-concurrent-jobs 3
switch(config)#show schedule summary
Maximum concurrent jobs  3
Prepend host name to logfile: No
Name            At time      Last     Interval   Timeout   Max     Logfile Location               Status
                             time      (mins)     (mins)    log
                                                           files
------------- ------------- ------- ---------- --------- -------- ------------------------------ ------
tech-support       now        00:29      60         30       100     flash:schedule/tech-support/   Success
thelp           12:02:00      00:02      60         40       100     flash:schedule/thelp/          Fail
                06/05/2018
switch(config)#
```

1.1.2.8 Running Bash Shell Commands Automatically with Event Handlers

Event handlers execute a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after ***delay*** seconds.

To create an event handler, use the **event-handler** command. This creates a new event handler and places the CLI in event handler configuration mode for that handler. Use the **action bash** command to configure a Bash command to run when the handler is triggered, and the **trigger** command to specify the trigger. Event handlers can be triggered by various events, including:

- system booting
- a change in a specified interface's operational status or IP address
- a change in the ***startup-config*** file
- a state change in a virtual machine monitored by VM Tracer

To change the delay period between the trigger and the action, use the delay command.

When an action is run, certain information is passed to it through environment variables. For the boot trigger, no variables are set. For the **interface** triggers, the following variables are set and passed to the action:

- ***$INTF*** interface name.
- ***$OPERSTATE*** current operational status of the specified interface.
- ***$IP-PRIMARY*** current primary IP address of the specified interface.

To execute more than one Bash command in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the action bash command.

To display information about all event handlers or about a specific event handler, use the **show event-handler** command.

The **no event-handler** command deletes an event handler.

Examples

- These commands create an event handler named ***eth_4*** which sends an email to a specified address when there is a change in the operational status of ***Ethernet interface 4***:

```
switch(config)# event-handler eth_4
switch(config-event-eth_4)# action bash email x@yz.com -s "Et4
 $OPERSTATE"
switch(config-event-eth_4)# trigger on-intf ethernet 4 operstatus
switch(config-event-eth_4)# delay 60
switch(config-event-eth_4)# exit
switch(config)#
```

  The above handler uses the ***$OPERSTATE*** variable to include the current operational state ("linkup" or "linkdown") in the subject of the email. Note that the action will only function if email has been configured on the switch.
- These commands create an event handler named ***onStartup*** which executes a user-defined script 60 seconds after the system boots.

```
switch(config)# event-handler onStartup
switch(config-event-onStartup)# action bash /mnt/flash/startupScript1
switch(config-event-onStartup)# trigger onboot
switch(config-event-onStartup)# delay 60
switch(config-event-onStartup)# exit
switch(config)#
```

  The above handler will also be executed on exiting from event-handler configuration mode.
- This command displays information about all event handlers configured on the system.

```
switch# show event-handler
Event-handler onStartup
Trigger: onBoot delay 60 seconds
Action: /mnt/flash/startupScript1
Last Trigger Activation Time: 1 minutes 51 seconds ago
Total Trigger Activations: 1
Last Action Time: 51 seconds ago
Total Actions: 1

switch#
```

- This command deletes the event handler named ***onStartup***.

```
switch(config)# no event-handler onStartup
switch(config)#
```

1.1.2.9 Running Adverse Drop Counters Monitor with Event Handlers

A monitoring capability for adverse drop counters can be used as a warning that the system is encountering an abnormal condition. The adverse drop counter monitor runs periodically (with a default of 60 seconds) and performs the following actions:

- Reads the values of adverse drop counters.

- Compares each value to the value read in the previous run.
- If counter values increase more than a certain threshold (with a default of 100), it is considered as a threshold violation.
- If any counter has more than a certain number of threshold violations within a specific time window (with a default of 3 violations within 15 minutes) a syslog message is logged.

No configuration is required to enable adverse drop counters monitor with event handlers. It is enabled by default and can be disabled, and can be customized for duration of time window and threshold levels. To customize the delay, polling interval, and condition for width, violation count, and threshold of this event handler, use the **event-handler DropCountersHandler** command. To display details of this event handler, use the **show event-handler DropCountersHandler** command.

Examples

- These commands customize the delay, polling interval, and condition for width, violation count, and threshold of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

```
switch(config)# event-handler DropCountersHandler
switch(config-DropCountersHandler)# action bash DropCounterLog.py -l
switch(config-DropCountersHandler)# delay 0
switch(config-DropCountersHandler)# trigger on-counters
switch(config-DropCountersHandler-counters)# poll interval 60
switch(config-DropCountersHandler-counters)# condition
bashCmd."DropCounterMonitor.py" -w 800" > 0
switch(config-DropCountersHandler-counters)# condition
bashCmd."DropCounterMonitor.py" -c 5" > 0
switch(config-DropCountersHandler-counters)# condition
bashCmd."DropCounterMonitor.py" -t 200" > 0
switch(config-DropCountersHandler-counters)#
```

- This command disables this event handler.

```
switch(config)# no event-handler DropCountersHandler
switch(config)#
```

- This command displays details of this event-handler.

```
switch(config)# show event-handler DropCountersHandler
Event-handler DropCountersHandler (BUILT-IN)
Trigger: on-counters delay 0 seconds
  Polling Interval: 60 seconds
  Condition: bashCmd."DropCounterMonitor.py" > 0
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: DropCounterLog.py -l
Action expected to finish in less than 20 seconds
Total Polls: 39
Last Trigger Detection Time: 38 minutes 22 seconds ago
Total Trigger Detections: 1
Last Trigger Activation Time: 38 minutes 22 seconds ago
Total Trigger Activations: 1
Last Action Time: Never
Total Actions: 1

switch(config)#
```

1.1.3 Kernel-based Virtual Machine Commands and Configuration

Arista's EOS has leveraged its unmodified Linux kernel, and embraced open source standards-based technology that has brought operating system virtualization to Ethernet switching, utilizing the kernel-based virtual machine (KVM) as follows:

- The hypervisor is the Linux kernel.
- The core virtualization infrastructure is provided by the kernel module.
- The CPU-specific implementation is provided by the processor-specific module (Intel or AMD).
- The generic machine emulator and virtualizer KVM is provided by a Modified Quick Emulator (QEMU), which transforms the Linux kernel into the hypervisor.

The standard Linux kernel is the hypervisor, resulting in changes to the standard kernel (such as memory support and scheduler). Optimizations to these Linux components (such as a new scheduler in the 2.6 kernel) benefit both the hypervisor (host operating system) and Linux guest operating systems. With the kernel acting as the hypervisor, the switch can run other operating systems, such as Windows or Linux.

All components required are pre-installed with the Arista EOS software image, requiring only the download of the image. A few additional configuration steps get the KVM fully operational.

This chapter contains the following sections:

1.1.3.1 KVM Commands

The following table covers KVM commands used throughout the configuration.

Table 1: KVM Commands

Command	Description
comment	Up to 240 character comment for this mode.
default	Set a command to its defaults.
disk-image	Add Virtual Machine disk image.
enable	Enable VM.
exit	Exit from Virtual Machine configuration mode.
memory-size	Set memory size.
no	Negate a command or set its defaults.
show	Show running system information.
virtual-nic	Add virtual NIC.
vnc-port	Set VNC server port.
! !	Append to comment.

1.1.3.1.1 CLI Commands

The following KVN CLI commands are used throughout the configuration.

vm

In **config** mode, the vm CLI command creates or deletes a KVM configuration, or enters **config-vm** mode. A newly created KVM will have an empty config file path and is disabled.

The CLI command syntax is as follows:

```
[no] vm NAME
```

config-file

In **config-vm** mode, the **config-file** CLI command sets the path of the **libvirt** config file, using standard file syntax (e.g. **flash:vm/NetscalerVPX.xml** or **sata1:vm/NetscalerVPX.xml** or **/mnt/sata1/vm/NetscalerVPX.xml**). Changing this value does not affect the state of a currently enabled KVM. To use the new file, the user must disable and then re-enable the KVM.

The CLI command syntax is as follows:

```
config-file [PATH]
```

enabled

In **config-vm** mode, the **enabled** CLI command allows enabling a currently disabled VM, causing it to start up immediately. If a VM is enabled in the **startup-config**, it starts up automatically when EOS boots (or when **VirtAgent** starts).

The CLI command syntax is as follows:

```
[no] enabled
```

Disabling a currently enabled VM initiates a shutdown process in the following sequence:

- Attempt to shut down the VM politely if the guest OS supports ACPI.
- If the VM is still running after 30 seconds, terminate it.

show vm

In **enable** mode, the **show vm** CLI command prints information about the configuration and status of a KVM, or of all KVMs if **NAME** is omitted, as follows:

- Configuration: Name, config file path, and enabled.
- Status: PID, log file path, and serial console pty path.
- Current resource usage: RES, CPU%.
- (Detailed only) contents of the log file.

(Detailed only) contents of the config file.

The CLI command syntax is as follows:

```
show vm [detailed] [NAME]
```

attach vm

In **enable** mode, the **attach vm** CLI command connects to a KVM's serial console pty (using virsh console).

Note: Press **Ctrl-]** to exit to the CLI.

The CLI command syntax is as follows:

```
attach vm [NAME]
```

show tech-support

The CLI command syntax is as follows:

show tech-support [detailed] [NAME]

reload

In **enable** mode, the **reload** CLI command is executed before restarting the system, and will shut down currently enabled KVMs using the same process as the **no enabled** command in **config-vm** mode.

The CLI command syntax is as follows:

reload

1.1.3.2 KVM Configuration

Arista EOS enables kernel-based virtual machine (KVM) instances by running KVM on the control-plane CPU of the switch. KVM instances can be defined from the CLI.

To configure a KVM, you must download the virtual machine image and configure the EOS.

This section contains the following topics:

- Configuring a KVM
- Configuring a Guest KVM

1.1.3.2.1 Configuring a KVM

To configure a KVM, perform the following steps:

1. Download the Virtual Machine Image to **/mnt/flash**
2. Name the virtual machine: **switch(config)# virtual-machine [kvm_name]**

   Example:

   ```
   switch(config)# virtual-machine foo
   ```

3. Provide a pointer to the image: **switch(config-vm-foo)# disk-image [file:[path] image-format [format]**

   Example:

   ```
   switch(config-vm-foo)# disk-image file:/mnt/flash/fedora.img image-format qcow2
   ```

4. Define the amount of memory allocated: **switch(config-vm-foo)#memory-size [size in bytes]**
5. Bind the virtual NIC to an SVI (or management interface): **switch(config-vm-foo)#virtual-nic 1 vlan [1-4] switch(config-vm-foo)# virtual-nic 1 management [1-4]**
6. Create the VNC server's tcp port (display): **switch(config-vm-foo)# vnc-port [vnc-port number]**
7. Enable the virtual machine: **switch(config-vm-foo)# enable**

   Optionally attach to the virtual machine via VNC client pointed to the switch's IP address. However, if Kernel **hair-pinning** is currently not enabled, preventing communication directly with the local switch, all traffic must have a destination on another networked device (such as a router, switch, or server).

For specifics about KVM visit http://www.linux-kvm.org/.

Note: In the Real VNC Viewer for **Options**, **Expert**, and **ColorLevel**, if the default value is ***pal8***, establishing a session may fail. If this occurs, set this value to **full** and **reconnect**.

Example

```
switch#copy http://berrange.fedorapeople.org/images/2012-02-
29/f16-x86_64-openstack-sda.qcow2
(http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-
openstack-sda.qcow2) flash:
...
switch(config)# virtual-machine foo
switch(config-vm-foo)# disk-image file:/mnt/flash/fedora.img image-format
 qcow2
switch(config-vm-foo)# memory-size 512
switch(config-vm-foo)# virtual-nic 1 vlan 1
switch(config-vm-foo)# virtual-nic 2 management 1
switch(config-vm-foo)# vnc-port 5900
switch(config-vm-foo)# enable
```

1.1.3.2.2 Configuring a Guest KVM

To configure a guest KVM, perform the following steps:

1. Download the Virtual Machine Image to **/mnt/flash**
2. Name the virtual machine: **switch(config)# virtual-machine [guest_name]**

   Example

   ```
   switch(config)# virtual-machine guest123
   ```

3. Provide a pointer to the image: **switch(config-vm-guest123)# disk-image [file: [path] image-format [format]**

   Example

   ```
   switch(config-vm-guest123)# disk-image flash:f16-x86_64-openstack-
   sda.qcow2 image-format ?
   iso iso image format   qcow qcow image format   qcow2 qcow2 image format
      raw raw image format
   vmdk vmdk image format
   switch(config-vm-guest123)# disk-image
   flash:f16-x86_64-openstack-sda.qcow2 image-format qcow2
   ```

4. Define the amount of memory allocated: **switch(config-vm-guest123)#memory-size [size in bytes]**
5. Bind the virtual NIC to an SVI (or management interface): **switch(config-vm-guest123)# virtual-nic 1 vlan [1-4] switch(config-vm-guest123)# virtual-nic 2 management [1-4]**
6. Create the VNC server's tcp port (display): **switch(config-vm-guest123)# vnc-port [vnc-port number]**
7. Enable the virtual machine: **switch(config-vm-guest123)# enable**

   Example

   ```
   switch#copy http://berrange.fedorapeople.org/images/2012-02-
   29/f16-x86_64-openstack-sda.qcow2
   (http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-
   openstack-sda.qcow2) flash:
   ...
   switch# config terminal
   switch(config)# virtual-machine ?
   ```

```
    WORD Virtual Machine name
switch(config)# virtual-machine foo
switch(config-vm-foo)# disk-image flash:f16-x86_64-openstack-sda.qcow2

1.1.4 Switch Platforms

Features and CLI commands vary by switch platform. CLI options may also vary by switch platform for commands that are available on all platforms. Command descriptions in this manual describe feature availability and command parameters on the basis of switch platform, noting exceptions that exist among models that use a common platform.

- https://www.arista.com/en/products/switches lists the Arista switches and platforms upon which they operate.
- https://www.arista.com/en/support/product-documentation/supported-features lists Arista switch feature availability by switch platform. For the latest features, also consult the Release Notes, available at https://www.arista.com/en/support/software-download.

These sections describe the following topics:

- Viewing the Model Number
- Modular System Platforms – 7500 and 7500E Series Switches
- Viewing Modules on 7300 Series Modular Switches
- Multi-Chip Devices

1.1.4.1 Viewing the Model Number

To view the switch's model number through the CLI, enter the **show version** command.

Example

This command displays the model number, serial number, system MAC address, and manufacturing information of a DCS-7150S-64 switch.

```
switch> show version
Arista DCS-7150S-64-CL-F
Hardware version:    01.01
Serial number:       JPE13120819
System MAC address:  001c.7326.fd0c

Software image version: 4.13.2F
Architecture:           i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:      eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:                 16 hours and 39 minutes
Total memory:           4017088 kB
Free memory:            1348228 kB

switch>
```

1.1.4.2 Modular System Platforms – 7500 and 7500E Series Switches

Modular switch platforms depend on their installed modules along with the fabric and forwarding software modes. The **show module** command displays the fabric modules in the switch. System performance in switches containing both module types is based on first-generation fabric capabilities. Best practice is to avoid switch configurations with mixed fabric modules.

These sections describe modular switch components and software modes that program their capacities.

1.1.4.2.1 Fabric Modules and Fabric Mode – 7500 and 7500E Series Switches

Each modular switch fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

Fabric mode determines the switch's fabric performance capabilities. This mode must match the fabric modules in the switch. Fabric mode settings include:

- **fe600**: Supports first-generation fabric modules.
- **fe1600**: Supports E-Series fabric modules.

E-series fabric modules can operate in **fe600** mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in **fe1600** mode. Switches containing both types of modules must be set to **fe600** mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

1. Switches reloading in **petraA** forwarding compatibility mode (Linecard Modules and Forwarding Compatibility Mode – 7500 and 7500E Series) also reload in **fe600** fabric mode.
2. As specified by the platform sand fabric mode (7500 and 7500E Series) statement in ***running-config***.

3. The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in **fe600** mode because first generation modules are usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

Example

This command configures the switch to reload in **fe1600** fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```
switch(config)#platform sand fabric mode fe1600
switch(config)#exit
switch#show platform sand compatibility
                    Configuration        Status
Forwarding mode     None                 Arad
Fabric mode         Fe1600               Fe600
switch#
```

1.1.4.2.2 Determining a Switch's Operating Platform

FM6000 Platforms

To determine the operating platform on switch, display **`platform`** command options from Global Configuration command mode.

This command displays the operating platform of a switch operating on the FM6000 platform (7150 Series switches).

```
switch(config)# platform ?
  fm6000  FM6000 chip

switch(config)#platform
```

Arad and Petra Platforms

The **platform ? command** displays the same options on Arad and Petra platform switches. Refer to Viewing the Model Number to determine the switch's model number.

- Fixed system switches (DCS-7048 Series) operate on the Petra platform.
- Modular switches (DCS-7500 Series) operate on Arad and Petra platforms. Modular System Platforms – 7500 and 7500E Series Switches describe platform usage on these switches.

Arad and Petra platform switch typically utilize multiple chips. Multi-Chip Devices describe methods of determining the port distribution on multi-chip platforms.

Example

These commands display platform options of a switch operating on either Petra or Arad platforms.

```
switch(config)# platform ?
  arad    Arad switch chip
  fe1600  Fe1600 chip
  fe600   Fe600 fabric chip
  petraA  PetraA switch chip
  ptp     Precision Time Protocol
  sand    Sand platform
```

```
switch(config)#platform
```

Trident and Trident II Platforms

The **platform ?** command returns **trident** on switches that operate on Trident or Trident II platforms. Trident II platform switches include options that configure the forwarding and routing tables. To determine the Trident platform that a switch uses, display **platform trident** options.

These commands indicate that the switch is operating on the Trident II platform:

```
switch(config)# platform ?
  ptp      Precision Time Protocol
  trident  Trident chip

switch(config)# platform trident ?
  fabric            Fabric configuration
  forwarding-table  Forwarding table configuration
  mmu               Trident MMU configuration
  routing-table     Routing table configuration

switch(config)#platform trident
```

Fixed and Modular switches are available that operate on the Trident II platform. Refer to Viewing the Model Number to determine the switch's model number. Viewing Modules on 7300 Series Modular Switches displays the modules on a Trident II platform modular switch.

Trident II platform switches typically utilize multiple chips. Multi-Chip Devices describes methods of determining port distribution on multi-chip platforms.

1.1.4.2.3 Linecard Modules and Forwarding Compatibility Mode – 7500 and 7500E Series

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecard modules support all basic switch functions.
- E-Series linecard modules support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the switch's performance capabilities when forwarding data between linecard interfaces. Forwarding compatibility mode settings include:

- **PetraA**: Supports first-generation linecard modules.
- **Arad**: Supports E-Series linecard modules.

Forwarding compatibility mode determines the operational capacity of installed linecards. The following table lists the affect of the forwarding compatibility mode on linecard module types.

Table 2: Linecard Module and Forwarding Mode Performance

Linecard Module Type	Forwarding Compatibility Mode	Linecard Operating Capacity
First-generation	petraA	First-generation performance capacity.
First-generation	arad	Linecard is powered-down.
E-Series	petraA	First-generation performance capacity.
E-Series	arad	E-series performance capacity.

Note: Switches must contain E-Series fabric modules to operate at E-Series performance capacities.

The forwarding compatibility mode is configured by the **platform sand forwarding mode (7500 and 7500E Series)** command. This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards.

Without a **platform sand forwarding mode (7500 and 7500E Series)** command, forwarding compatibility mode is determined by the first linecard that is operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards. Switches with a mixed set of modules are typically reloaded in **petraA** mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a **platform sand forwarding mode** command.

Example

This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

```
switch(config)# platform sand forwarding mode arad
switch(config)#
```

1.1.4.2.4 Viewing Modules – 7500 and 7500E Series

The **show module** command displays the model number of all installed modules.

- This command displays the modules of a 7504 switch that contains first-generation modules.

```
switch> show module
Module    Ports Card Type                          Model           Serial No.
--------- ----- ---------------------------------- --------------- -----------

Fabric4                                           00.00           Ok
switch>
```

1.1.4.4 Multi-Chip Devices

Trident II, Petra, and Arad platform switches and linecards utilize multiple chips, with Ethernet ports evenly distributed among the chips. Creating multi-port data structures (including port channels) that include ports from multiple chips protects against the failure of an individual chip on a device.

The following sections describe methods of determining port distribution on various switch platforms

Petra Fixed Switches

7048-Series switches are Petra platform devices that distribute ports among two PetraA chips. The **`show platform petraA port-info routing`** command displays the ports that are controlled by each chip.

Example

This command displays the following Ethernet port distribution on a DCS-7048-T switch:

- ***Petra0*** chip controls ***Ethernet 1*** through ***Ethernet 32***.
- ***Petra1*** chip controls ***Ethernet 33*** through ***Ethernt 52***.

```

Petra Modular Switches

Linecards on 7500-Series modular switches distribute Ethernet ports among multiple petraA chips. The **`show platform petraA port-info routing`** command displays the ports that are controlled by each chip on all PetraA linecards or on a single linecard.

Example

This command displays the following Ethernet port distribution on ***linecard 4*** of a DCS-7504 switch:

- ***Petra4/0*** chip controls ***Ethernet 4/1*** through ***Ethernet 4/8***.
- ***Petra4/1*** chip controls ***Ethernet 4/9*** through ***Ethernet 4/16***.
- ***Petra4/2*** chip controls ***Ethernet 4/17*** through ***Ethernet 4/24***.
- ***Petra4/3*** chip controls ***Ethernet 4/25*** through ***Ethernet 4/32***.
- ***Petra4/4*** chip controls ***Ethernet 4/33*** through ***Ethernet 4/40***.
- ***Petra4/5*** chip controls ***Ethernet 4/41*** through ***Ethernet 4/48***.

```

1.1.5 Command Modes

Command modes define the user interface state. Each mode is associated with commands that perform a specific set of network configuration and monitoring tasks.

- Mode Types lists the available modes.

- Navigating Through Command Modes lists mode entry and exit commands.
- Command Mode Hierarchy describes the mode structure.
- Group-Change Configuration Modes describes editing aspects of these modes.

1.1.5.1 Mode Types

The switch includes these command modes:

- EXEC: EXEC mode commands display system information, perform basic tests, connect to remote devices, and change terminal settings. When logging into EOS, you enter EXEC mode.

  EXEC mode prompt: `switch>`
- **Privileged EXEC**: Privileged EXEC mode commands configure operating and global parameters. The list of Privileged EXEC commands is a superset of the EXEC command set. You can configure EOS to require password access to enter Privileged EXEC from EXEC mode.

  Privileged EXEC mode prompt: `switch#`
- **Global Configuration**: Global Configuration mode commands configure features that affect the entire system, such as system time or the switch name.

  Global Configuration mode prompt: `switch(config)#`
- **Interface Configuration**: Interface configuration mode commands configure or enable Ethernet, VLAN, and Port-Channel interface features.

  Interface Configuration mode prompt: `switch(config-if-Et24)#`
- **Protocol specific mode**: Protocol specific mode commands modify global protocol settings. Protocol specific mode examples include **ACL Configuration** and **Router BGP Configuration**.

  The prompt indicates the active command mode. For example, the Router BGP command prompt is `switch(config-router-bgp)#`

1.1.5.2 Navigating Through Command Modes

To change the active command mode, perform one of these actions:

- To enter EXEC mode, log into the switch.
- To enter Privileged EXEC mode from EXEC, type **`enable`** (or **`en`**) followed, if prompted, by the **enable** password:

```
switch>en
Password:
switch#
```

- To enter Global Configuration mode from Privileged EXEC, type **`configure`** (or **`config`**):

```
switch#config
switch(config)#
```

- To enter Interface Configuration mode from Global Configuration, type **`interface`** and the name of the interface to be modified:

```
switch(config)#interface Et24
switch(config-if-Et24)#
```

- To enter a protocol specific configuration mode from Global Configuration, type the required command for the desired mode.

```
switch(config)#router bgp 100
switch(config-router-bgp)#
```

- To return one level from any configuration mode, type **exit**.

```
switch(config)#exit
switch#
```

- To return to Privileged EXEC mode from any configuration mode, type **end** or **Ctrl-Z**.

```
switch(config-if-Et24)#<Ctrl-z>
switch#
```

- To return to EXEC mode from Privileged EXEC mode, type **disable** (or **dis**).

```
switch#dis
switch>
```

- To exit EOS and log out of the CLI, type **exit** from EXEC mode or Privileged EXEC mode.

```
switch#exit

login:
```

1.1.5.3 Command Mode Hierarchy

Command modes are hierarchical. The parent mode of a specified command mode is the mode that contains the command that enters the specified mode.

Example

EXEC mode contains the **enable** command, which enters Privileged EXEC mode. Therefore, EXEC is the parent mode of Privileged EXEC.

Commands that are executable in a specified command mode include all commands available in the specified mode plus all commands executable from its parent mode.

Example

EXEC mode includes the **ping** command. EXEC mode is the parent mode of Privileged EXEC mode. Therefore, Privileged EXEC mode includes **ping**.

Additionally, Privileged EXEC is the parent mode of Global Configuration mode. Therefore, Global Configuration mode also includes **ping**.

Executing a configuration mode command from a child mode may change the active command mode.

Example

Global Configuration mode contains **interface ethernet** and **ip access-list** commands, which enter Interface Configuration and Access Control List (ACL) Configuration modes, respectively. When the switch is in Interface Configuration mode, the **ip access-list** command is available and changes the active mode to ACL Configuration.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#ip access-list master-list
switch(config-acl-master-list)#
```

The **exit** command changes the active command mode to its parent mode. When executed from Privileged EXEC or EXEC modes, the exit command terminates the session.

Example

- This command exits Global Configuration mode to Privileged EXEC mode.

```
switch(config)#exit
switch#
```

- This command terminates the user session.

```
switch#exit
```

1.1.5.4 Group-Change Configuration Modes

Group-change modes apply all changes made during an edit session only after exiting the mode. Changes are stored when the user exits the mode, either through an **exit** or **end** command or through a command that enters a different configuration mode.

The **abort** command discards all changes not previously applied.

Access Control List (ACL) and Multiple Spanning Tree (MST) configuration modes are examples of group-change modes.

1.1.6 Managing Switch Configuration Settings

1.1.6.1 Verifying Settings for the Current Mode

To display only the lines of ***running-config*** that affect the current mode, use the **active** option of the **show (various configuration modes)** command. This command option is available in all configuration modes except global configuration.

Example

Type **show active** to display the content of ***running-config*** that affects the current mode. To include default settings in the display, type **show active all**.

```
switch(config-router-ospf3)#show active all
ipv6 router ospf 9
   router-id 0.0.0.0
   default-metric 10
   distance ospf intra-area 10
   area 0.0.0.200 default-cost 10
   area 0.0.0.200
   no log-adjacency-changes
   timers spf 5
switch(config-router-ospf3)#
```

To display any comments associated with the current mode, use the **comment** option of the **show (various configuration modes)** command.

Example

Type **show comment** to display any comments attached to the current mode.

```
switch(config-router-ospf3)#show comment
Comment for router-ospf3:
    Consult Thomas Morton before making changes to the OSPF configuration
.
switch(config-router-ospf3)#
```

1.1.6.2 Verifying the Running Configuration Settings

The **running-config** command is the virtual file that stores the operating configuration. The **show running-config** command displays the **running-config**. The command is supported in Privileged EXEC mode.

Example

Type **show running-config** in Privileged EXEC mode. The response in the example is truncated to display only the ip route configured.

```
switch#show running-config
! Command: show running-config

!
ip route 0.0.0.0/0 192.0.2.1
!

end
switch#
```

1.1.6.3 Adding a Comment to a Configuration Mode

To add a comment to most switch configuration modes, use the **comment (various configuration modes)** command. Comments cannot be modified, but can be replaced by entering the **comment** command again and entering new text. Comments cannot be added to global configuration mode

To append to an existing comment, enter !! followed by additional comment text. To display comments for the active mode, use the **show comment** command. The **no comment** and **default comment** commands remove the comment from **running-config**.

Examples

- These commands enter a comment in Router OSPF3 Mode.

```
switch(config-router-ospf3)#comment
Enter TEXT message. Type 'EOF' on its own line to end.
Consult Thomas Morton before making changes to the OSPF configuration.
EOF
switch(config-router-ospf3)#
```

- These commands append additional information to the comment entered above.

```
switch(config-router-ospf3)#!! x2735
switch(config-router-ospf3)#show comment
Comment for router-ospf3:
    Consult Thomas Morton before making changes to the OSPF
 configuration.
    x2735
switch(config-router-ospf3)#
```

1.1.6.4 Saving the Running Configuration Settings

startup-config is the file, stored in internal flash memory, that the switch loads when it boots. Configuration changes that are not saved to **startup-config** are lost the next time the switch is booted.

The **write** and **copy running-config startup-config** commands store the operating configuration to **startup-config**. Both commands are supported in Privileged EXEC mode.

Example

These equivalent commands save the current operating configure to the startup-config file.

```
switch#write

switch#copy running-config startup-config
```

The **show startup-config** command displays the startup configuration file. The command is supported in Privileged EXEC mode.

Example

Type **show startup-config** to display the startup configuration file. The response in the example is truncated to display only the ip route configured in Admin Username.

```
switch#show startup-config
! Command: show startup-config
! Startup-config last modified at  Wed Feb 19 08:34:31 2014 by admin
!

!
ip route 0.0.0.0/0 192.0.2.1
!

end
switch#
```

1.1.7 Other Command-Line Interfaces

EOS can access other CLIs that provide switch commands, files, and services.

- Aboot Command-Line Interface describes the boot-loader CLI.
- Bash Shell describes the Bash shell CLI.

1.1.7.1 Aboot Command-Line Interface

Aboot is the switch boot loader. It reads a configuration file from the internal flash or a USB flash drive and attempts to boot a software image.

The switch opens an Aboot shell if the switch does not find a software image, the configuration is corrupted, or the user terminates the boot process. The Aboot shell provides a CLI for manually booting a software image, recovering the internal flash to its default factory state, running hardware diagnostics, and managing files.

1.1.7.2 Bash Shell

The switch provides a Linux Bash shell for accessing the underlying Linux operating system and extensions. The Bash shell is accessible in all command modes except EXEC. Mode Types describes EOC command modes.

- To enter the Bash, type **bash** at the prompt.

```
switch#bash

Arista Networks EOS shell

[admin@Switch ~]$
```

- To exit the Bash, type **logout**, **exit**, or **Ctrl-D** at the Bash prompt.

```
[admin@Switch ~]$ logout
switch#
```

1.1.8 Directory Structure

EOS operates from a flash drive root mounted as the **/mnt/flash** directory on the switch. The EOS CLI supports these file and directory commands:

- **delete**: Delete a file or directory tree.
- **copy**: Copy a file.
- **more**: Display the file contents.
- **diff**: Compares the contents of files located at specified URLs.
- **rename**: Rename a file.
- **cd**: Change the current working directory.
- **dir**: Lists directory contents, including files and subdirectories.
- **mkdir**: Create a directory.
- **rmdir**: Remove a directory.
- **pwd**: Display the current working directory.

Verify flash memory space before copying a file. When a file is copied to flash, it is first written to a temporary file and then renamed to the destination rather than directly overwriting the destination file. This protects the integrity of the existing file if the **copy** command is interrupted, but requires more free space to complete the process.

Switch directory files are accessible through the Bash shell and Aboot. When entering the Bash shell from the switch, the working directory is located in **/home** and has the name of the user name from which Bash was entered.

Example

These commands were entered from the user name john:

```
switch#bash
[john@switch ~]$ pwd
/home/john
[john@switch ~]$
```

In this instance, the working directory is **/home/john**

When a flash drive is inserted in the USB flash port, flash drive contents are accessible through **/mnt/usb1**.

When entering Aboot, the working directory is the root directory of the boot.

1.1.9 Command-Line Interface Commands

Mode Navigation Commands

- alias
- bash
- configure (configure terminal)
- copy running-config
- daemon
- disable
- enable
- end
- exit

File Transfer Commands

- ip ftp client source-interface
- ip http client local-interface
- ip ssh client source-interface
- ip tftp client source-interface

File Management Commands

- configure checkpoint
- configure network
- copy running-config
- dir
- pwd

Modular Switch Platform Commands

- platform arad lag mode
- platform sand fabric mode (7500 and 7500E Series)
- platform sand forwarding mode (7500 and 7500E Series)
- platform sand lag hardware-only
- show platform sand compatibility
- show platform sand lag hardware-only

CLI Scheduling Commands

- schedule
- schedule config
- show schedule

Event Handler Commands

- action bash
- delay
- event-handler
- event-handler DropCountersHandler
- show event-handler
- show event-handler DropCountersHandler
- trigger

Terminal Parameter Commands

- terminal length
- terminal monitor

Display and Comment Commands

- comment (various configuration modes)
- show (various configuration modes)
- show module
- show version

1.1.9.1 action bash

The **`action bash`** command specifies a Bash shell command to be run when an event handler is triggered. When an event handler is triggered, execution of the associated shell command is delayed by a configurable period set by the delay command. Only a single Bash command may be configured for an event handler, but the command may have multiple arguments. If more than one Bash command must be executed in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the **action bash** command.

To specify the event that will trigger the action, use the trigger command.

If the event handler uses an **`on-intf`** trigger, the following environment variables are passed to the action and can be used as arguments to the Bash command:

- ***$INTF*** interface name.
- ***$OPERSTATE*** current operational status of the specified interface.
- ***$IP-PRIMARY*** current primary IP address of the specified interface.

Event-Handler Configuration

Command Syntax

`action bash` *command*

Parameters

command Bash shell command to be executed when the event handler is triggered.

Examples

- This command configures the event handler “onStartup” to run a script on the flash drive.

```
switch(config-handler-onStartup)#action bash /mnt/flash/myScript1
switch(config-handler-onStartup)#
```

- This command configures the event handler “eth_4” to send email to the specified address when there is a change in the operational status of ***Ethernet interface 4***.

```
switch(config-event-eth_4)#action bash email x@yz.com -s "Et4
 $OPERSTATE"
switch(config-event-eth_4)#
```

  The above action uses the ***$OPERSTATE*** variable to include the current operational state (“linkup” or “linkdown”) in the subject of the email. Note that the action will only function if email has been configured on the switch.

1.1.9.2 alias

The **alias** command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command. Once created, an alias is accessible in all modes and all user sessions, but is subject to all the restrictions of the original command.

When using a command alias, no tokens may precede the alias except the no and default keywords. However, an alias can incorporate positional parameters.

In online help, aliases are preceded by an asterisk (*****) in this format:

*alias_name=command_name

The **no alias** and **default alias** commands remove the specified alias.

Command Mode

Global Configuration

Command Syntax

`alias` *alias_name command_name*

`no alias` *alias_name*

`default alias` *alias_name*

Parameters

- ***alias_name*** the string which is to be substituted for the original command. The string can include letters, numbers, and punctuation, but no spaces. If the alias_name string is identical to an existing command, the alias will supercede the original command.
- ***command_name*** the command which is to be executed when the alias is entered in the CLI. If the original command requires additional parameters, they must be included in the *command_name* string in the following manner:

  Positional parameters are of the form “%n” and must be whitespace-delimited. The first parameter is represented by “%1” and any additional parameters must be numbered sequentially. When executing the alias a value must be entered for each parameter or the CLI will display the error “% incomplete command”.

Examples

- This command makes **e** an alias for the command **enable.**

```
switch(config)#alias e enable
```

- This command makes **srie** an alias for the command **show running-config interface ethernet 1-6.**

```
switch(config)#alias srie show running-config interface ethernet 1-6
```

- These commands make **ss** an alias for the command **show interfaces ethernet <range> status** with a positional parameter for the port range, then use the alias to display the status of ports 4/1-4/5.

```
switch(config)#alias ss show interfaces ethernet %1 status
switch(config)#ss 4/1-4/5
Port      Name            Status       Vlan       Duplex  Speed Type
Et4/1                     connected    in Po1       full  10000 10GBASE-SRL
Et4/2                     notconnect   in Po1       full  10000 10GBASE-SRL
Et4/3                     notconnect   1            full  10000 10GBASE-SRL
Et4/4                     notconnect   1            full  10000 10GBASE-SRL
Et4/5                     notconnect   1            full  10000 10GBASE-SRL
```

1.1.9.3 bash

The **bash** command starts the Linux Bash shell. The Bash shell gives you access to the underlying Linux operating system and system extensions.

To exit the Bash, type **logout**, **exit**, or **Ctrl-D** at the Bash prompt.

Command Mode

Privileged EXEC

Command Syntax

```
bash
```

Examples

- This command starts the Bash shell.

```
switch#bash

Arista Networks EOS shell

[admin@switch ~]$
```

- This command, executed within Bash, exits the Bash shell.

```
[admin@switch ~]$ logout
switch#
```

1.1.9.4 comment (various configuration modes)

The **comment** command adds a comment for the active configuration mode to ***running-config***. Comments cannot be modified, but can be replaced by entering the **comment** command again and entering new text. To append to an existing comment, enter **!!** followed by additional comment text. To display comments, use the **comment** option of the show (various configuration modes) command.

The **no comment** and **default comment** commands remove the comment from ***running-config***.

Comments cannot be added to the global configuration mode through the EOS.

Command Mode

All configuration modes except Global Configuration

Command Syntax

`comment` *comment_text* EOF

`no comment`

`default comment` !! *comment_text*

Parameters

- ***comment_text*** To create a comment, enter a message when prompted. The message may span multiple lines.
- **EOF** To end a comment, type EOF on its own line (case sensitive) and press **enter**.

Examples

- This command adds a comment to the active configuration mode.

```
switch(config-sg-radius-RAD-SV1)#comment
Enter TEXT message. Type 'EOF' on its own line to end.
Consult Thomas Morton before making changes to the RADIUS configuration
.
EOF
switch(config-sg-radius-RAD-SV1)#
```

- This command appends a line to the comment for the active configuration mode.

```
switch(config-sg-radius-RAD-SV1)#!! x3452
switch(config-sg-radius-RAD-SV1)#
```

1.1.9.5 configure (configure terminal)

The **configure** command places the switch in the Global Configuration mode to configure features at the system level. You can move to Interface Configuration mode and protocol-specific mode from the ***Global Configuration*** mode. The command may also be entered as configure terminal.

Command Mode

Privileged EXEC

Command Syntax

`configure` [terminal]

Example

This command places the switch in the Global Configuration mode.

```
switch>enable
switch#configure
switch(config)#
```

1.1.9.6 configure checkpoint

The **`configure checkpoint`** command saves the running configuration to a checkpoint file. This checkpoint file can be used for restoring the current running configuration in future, if required.

Command Mode

Privileged EXEC

Command Syntax

`configure checkpoint` {restore *checkpoint_name* | **save** [*checkpoint_name*]}

Parameters

- **restore *checkpoint_name*** restores the running configuration from the specified checkpoint file.
- **save *checkpoint_name*** saves running configuration to the specified checkpoint file.

Guidelines

If the filename already exists, EOS overwrites the filename. If the command is entered without a checkpoint name, the switch automatically saves the checkpoint under the name ckp-date-number where date is the date in YYYYMMDD format and number increments by one for each automatically named checkpoint file.

Examples

- This command saves ***running-config*** to the ***ca_test*** checkpoint file.

```
switch#configure checkpoint save ca_test
```

- This command restores the ***running-config*** from the ***ca_test*** checkpoint file.

```
switch#configure checkpoint restore ca_test
! Preserving static routes. Use 'no ip routing delete-static-routes' to
 clear
them.
```

- This command saves ***running-config*** to the ***13Aug2018*** checkpoint file. The **`dir`** command shows the contents of the checkpoint directory.

```
switch#configure checkpoint save
switch#dir checkpoint:
Directory of checkpoint:/
       -rw-        7426           Aug 13 12:00  ckp-20180813-17
       -rw-        7588           Aug 13 12:10  ckp-20180813-18
       -rw-        8499           Aug 13 12:13  ckp-20180813-19
       -rw-        8499           Aug 13 12:13  ckp-20180813-20
```

1.1.9.7 configure convert

The **`configure convert`** command converts the current configuration syntax to the specified syntax.

Command Mode

Privileged EXEC

Command Syntax

`configure convert` new-syntax

Parameter

new-syntax converts ***running-config*** to the current version of EOS.

Example

This command converts running-config to the current version of EOS.

```
switch#configure convert new-syntax

WARNING!
Converting existing configuration to new syntax will lose backward
 compatibility.
Make sure you won't downgrade to releases that only support the old
 syntaxes.

Proceed [ y/n ]
```

1.1.9.8 configure network

The **`configure network`** command is deprecated. Use the **`copy`** <*url*> ***running-config*** command to configure the switch from a local file or network location.

1.1.9.9 copy running-config

The current operating configuration of the switch is stored in a virtual file called running-config. The copy running-config command saves the contents of the running-config virtual file to a new location.

Command Mode

Privileged EXEC

Command Syntax

`copy running-config` **DESTINATION**

Parameters

- **DESTINATION** destination for the contents of the running-config file. Values include:
  - **startup-config** the configuration file that the switch loads when it boots.
- The **`copy running-config`**, **`startup-config`**, and **`write`** commands are equivalent.
  - **`file`**: a file in the switch file directory.
  - **`flash`**: a file in flash memory.
  - **`url`** any valid URL.

The **`copy running-config url`** and **`write network url`** commands are equivalent.

Examples

- This command copies running-config to the startup-config file.

```
switch#copy running-config startup-config
switch#
```

- This command copies running-config to a file called ***rc20110617*** in the dev subdirectory of the switch directory.

```
switch#copy running-config file:dev/rc20110617
switch#
```

1.1.9.10 daemon

The **daemon** command accesses daemon configuration mode for adding or removing external daemons and scripts, which are then managed by ProcMgr.

The **no daemon** and **default daemon** commands delete the deamon by removing the corresponding **daemon** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`daemon` *daemon_name*

`no daemon` *daemon_name*

`default daemon` *daemon_name*

Parameters

daemon_name label that references the daemon configuration mode.

Example

These commands enters daemon configuration mode and initiates the daemon script.

```
switch(config)#daemon process1
switch(config-daemon-process1)#command process-script -i -m
switch(config-daemon-process1)#
```

1.1.9.11 delay

The **`delay`** command specifies the time in seconds the system will delay between a triggering event and the execution of an event handler action. The default delay is ***20*** seconds.

Command Mode

Event-Handler Configuration

Command Syntax

`delay` *seconds*

Parameters

seconds number of seconds to delay before executing the action. The default is 20.

Example

This command configures the event handler Eth5 to delay 10 seconds before executing.

```
switch(config-handler-Eth5)#delay 10
switch(config-handler-Eth5)#
```

1.1.9.12 dir

The **dir** command displays a list of files on a file system.

Command Mode

Privileged EXEC

Command Syntax

dir [**SCOPE**][**FILE TYPE**]

Parameters

- **SCOPE** the files to display. Options include:
  - ***no parameter*** lists normal files in current directory.
  - **/all** list all files, including hidden files.
  - **/recursive** list files recusively.
- **FILE TYPE** The options include:
  - ***no parameter*** lists undeleted files.
  - **all_filesystems** list files on all filesystems including deleted files, undeleted files, and files with errors.
  - **extensions** directory or file name.
  - **file** directory or file name.
  - **flash** directory or file name.
  - **supervisor-peer** directory or file name.
  - **usb1** directory or file name.
  - **system** directory or file name.

Example

This command displays the flash directory.

```
switch# dir flash:
Directory of flash:/

       -rwx   293409892           Oct 23 08:55  EOS-4.11.0.swi
       -rwx   221274543            Sep 6 13:37  EOS-4.7.5.swi
       -rwx   271453650            Sep 4 19:13  EOS_4.10.1-SSO.swi
       -rwx      135168           Dec 31  1979  FSCK0000.REC
       -rwx          26           Oct 23 13:51  boot-config
       -rwx        8570           Sep 10 12:22  cfg_sso_mst
       -rwx        5642           Sep 20 10:35  config.reset
       drwx        4096           Oct 23 13:59  debug
       -rwx          12           Oct 23 13:56  kernel-params
       drwx        4096           Oct 23 14:59  persist
       drwx        4096            Sep 6 14:50  schedule
       -rwx        5970           Oct 23 13:53  startup-config
switch#
```

1.1.9.13 disable

The **disable** command exchanges the session's current command mode with the specified privilege level.

Command Mode

Privileged EXEC

Command Syntax

disable [**PRIVILEGE_LEVEL**]

Parameters

PRIVILEGE_LEVEL Session's new privilege level. Value ranges from ***0*** to ***15***. Levels ***2*** through ***15*** place the switch in Privileged EXEC mode. Values of ***0*** or ***1*** leave the switch in EXEC mode.

- ***no parameter*** Session is assigned default level of ***1***.
- <**0** to **15**> Specifies session level.

Restrictions

New privilege level must be less than the session's current level.

Example

This command exits Privileged EXEC mode level of 15 to enter EXEC mode level 1.

```
switch# disable
switch>
```

1.1.9.14 enable

The **enable** command places the switch in Privileged EXEC mode. If an **enable** password is set, the CLI displays a password prompt when a user enters the **enable** command. If the user enters an incorrect password three times, the CLI displays the EXEC mode prompt.

To set a local **enable** password, use the **enable** password command.

Command Mode

EXEC

Command Syntax

`enable` [**PRIVILEGE_LEVEL**]

Parameters

- **PRIVILEGE_LEVEL** Session's privilege level. Values range from ***0*** to ***15***. Values of ***0*** or ***1*** places the switch in EXEC mode. Any level above ***1*** leaves the switch in Privileged EXEC mode.
  - ***no parameter*** Session is assigned default level of ***15***.
  - <**0** to **15**> Specifies session level.

Example

This command places the switch in Privileged EXEC mode with the default privilege level of ***15***.

```
switch>enable
switch#
```

1.1.9.15 end

The **end** command exits to Privileged Exec mode from any Configuration mode. If the switch is in a group-change mode (such as ACL-Configuration mode or MST-Configuration mode), the **end** command also saves all pending changes made in that mode to ***running-config***.

Command Mode

All configuration modes

Command Syntax

```
end
```

Example

This command exits to Privileged Exec mode.

```
switch(config-if-Et25)#end
switch#
```

1.1.9.16 event-handler DropCountersHandler

The **event-handler DropCountersHandler** command enables the adverse drop counters monitor with event handlers. The DropCountersHandler event handler is enabled by default, and can be customized for duration of time window and threshold levels.

The **no event-handler DropCountersHandler** command disables the adverse drop counters monitor with event handlers. The **default event-handler DropCountersHandler** command resets the DropCountersHandler event handler to the system default.

Command Mode

Global Configuration

Command Syntax

```
event-handler DropCountersHandler

no event-handler DropCountersHandler

default event-handler DropCountersHandler
```

Examples

- These commands customize the delay, polling interval, and condition for width (-w), violation count (-c), and threshold (-t) of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

```
switch(config)#event-handler DropCountersHandler
switch(config-DropCountersHandler)#action bash DropCounterLog.py -l
switch(config-DropCountersHandler)#delay 0
switch(config-DropCountersHandler)#trigger on-counters
switch(config-DropCountersHandler-counters)#poll interval 60
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -w 800" > 0
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -c 5" > 0
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -t 200" > 0
switch(config-DropCountersHandler-counters)#
```

- This command disables this event handler.
-

```
switch(config)#no event-handler DropCountersHandler
switch(config)#
```

1.1.9.17 event-handler

An event handler executes a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after ***delay*** seconds.

The **`event-handler`** command places the switch in event-handler configuration mode for the specified event handler. If the named event handler does not already exist, this command creates it. Event-handler configuration mode is a group change mode that configures event handlers.

Changes made in a group change mode are saved by leaving the mode through the **`exit`** command or by entering another configuration mode.

These commands are available in event-handler configuration mode:

- action bash
- delay
- trigger

The **`no event-handler`** and **`default event-handler`** commands delete the specified event handler by removing it from ***running config***.

Command Mode

Global Configuration

Command Syntax

`event-handler` *name*

`no event-handler` *name*

`default event-handler` *name*

Parameters

name name of the event handler to be configured. If the named event handler does not already exist, this command will create it.

Example

This command places the switch in event-handler configuration mode for an event handler called ***Eth_5***.

```
switch(config)#event-handler Eth_5
switch(config-handler-Eth_5)#
```

1.1.9.18 exit

The exit command places the switch in the parent of the command mode from which the exit command was entered.

- When used in Global configuration, the switch enters ***Privileged EXEC mode***.
- When used in ***EXEC*** or ***Privileged EXEC mode***, the **`exit`** command terminates the user session.
- When the command is used in a group-change mode (such as ***ACL-Configuration mode*** or ***MST-Configuration mode***), the **`exit`** command also applies all pending changes made in that mode.

Command Mode

All modes

Command Syntax

`exit`

Examples

- This command exits Global Configuration mode to ***Privileged EXEC*** mode.

```
switch(config)#exit
switch#
```

- This command terminates the user session.

```
switch#exit
```

1.1.9.19 ip ftp client source-interface

By default, the FTP (File Transfer Protocol) source IP address is selected by the switch (the IP address of the source interface if one is assigned). The **ip ftp client source-interface** command allows the user to override the default FTP source address.

The **ip ftp client source-interface** and **ip ftp source-interface** commands are functionally equivalent. In each case, **ip ftp client source-interface** is stored in ***running-config***.

The **no ip ftp client source-interface** and **default ip ftp client source-interface** commands restore default behavior by removing the **ip ftp client source-interface** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip ftp` [*client*] **source-interface INTERFACE** [**vrf** *vrf_name*]

`no ip ftp` [*client*] *source-interface*

`default ip ftp` [*client*] *source-interface*

Parameters

- ***client*** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **tunnel *t_num*** Tunnel interface specified by ***t_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vrf *vrf_name*** Uses the specified user-defined VRF.

Examples

- These commands configure the ***10.10.121.15*** as the source IP address the switch uses when communicating with FTP servers.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#ip address 10.10.121.15/24
switch(config-if-Et17)#ip ftp client source-interface ethernet 17
switch(config)#
```

- This command configures the switch to use ***interface tunnel 45*** and ***vrf vrf01*** when communicating with FTP servers.

```
switch(config)#ip ftp client source-interface tunnel 45 vrf vrf01
switch(config)#
```

1.1.9.20 ip http client local-interface

The **ip http client local-interface** command specifies the source IP address for hypertext transfer protocol (HTTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The **no ip http client local-interface** and **default ip http client local-interface** commands restore default behavior by removing the **ip http client local-interface** statement from ***running-config*** .

Command Mode

Global Configuration

Command Syntax

`ip http client local-interface` **INTERFACE** [**vrf** *vrf_name*]

`no ip http client local-interface`

`default ip http client local-interface`

Parameters

- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vrf *vrf_name*** Uses the specified user-defined VRF.

Examples

- These commands configure the ***10.15.17.9*** as the source IP address the switch uses when communicating with HTTP servers.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.15.17.9/24
switch(config-if-Vl10)#ip http client local-interface vlan 10
switch(config)#
```

- This command configures the switch to use ***interface tunnel 45*** and ***vrf vrf01*** when communicating with HTTP servers.

```
switch(config)#ip http client local-interface tunnel 45 vrf vrf01
switch(config)#
```

1.1.9.21 ip ssh client source-interface

The **ip ssh client source-interface** command specifies the source IP address for secure shell (SSH) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The **ip ssh client source-interface** and **ip ssh source-interface** commands are functionally equivalent. In each case, **ip ssh client source-interface** is stored in ***running-config***.

The **no ip ssh client source-interface** and **default ip ssh client source-interface** commands restore default behavior by removing the **ip ssh client source-interface** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip ssh` [client] `source-interface` **INTERFACE** [**vrf** *vrf_name*]

`no ip ssh` [client] `source-interface`

`default ip ssh` [client] `source-interface`

Parameters

- **client** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vrf *vrf_name*** Uses the specified user-defined VRF.

Examples

- These commands configure the ***10.17.17.9*** as the source IP address the switch uses when communicating with SSH servers.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.17.17.9/24
switch(config-if-Vl10)#ip ssh client source-interface vlan 10
switch(config)#
```

- This command configures the switch to use ***interface tunnel 45*** and ***vrf vrf01*** when communicating with SSH servers.

```
switch(config)#ip ssh client source-interface tunnel 45 vrf vrf01
switch(config)#
```

1.1.9.22 ip tftp client source-interface

The **ip tftp client source-interface** command specifies the source IP address for Trivial File Transfer Protocol (TFTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The **ip tftp client source-interface** and **ip tftp source-interface** commands are functionally equivalent. In each case, **ip tftp client source-interface** is stored in ***running-config***.

The **no ip tftp client source-interface** and **default ip tftp client source-interface** commands restore default behavior by removing the **ip tftp client source-interface** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ip tftp` [client] `source-interface` **INTERFACE** [vrf *vrf_name*]

`no ip tftp` [client] `source-interface`

`default ip tftp` [client] `source-interface`

Parameters

- **client** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vrf *vrf_name*** Uses the specified user-defined VRF.

Examples

- These commands configure the ***10.15.17.9*** as the source IP address the switch uses when communicating with TFTP servers.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.15.17.9/24
switch(config-if-Vl10)#ip tftp client source-interface vlan 10
switch(config)#
```

- This command configures the switch to use ***interface tunnel 45*** and ***vrf vrf01*** when communicating with TFTP servers.

```
switch(config)#ip tftp client source-interface tunnel 45 vrf vrf01
switch(config)#
```

1.1.9.23 platform arad lag mode

The **platform arad lag mode** command allows configuration of LAGs with more than 16 members.

Command Mode

Global Configuration

Command Syntax

platform arad lag mode [**1024x16** | **256x64** | **512x32**]

Examples

- This command configures 1024 LAGs with 16 members each.

```
switch(config)#platform arad lag mode 1024x16
! Change will take effect only after switch reboot.
switch(config)#
```

- This command configures 256 LAGs with 64 members each.

```
switch(config)#platform arad lag mode 256x64
! Change will take effect only after switch reboot.
switch(config)#
```

- This command configures 512 LAGs with 32 members each.

```
switch(config)#platform arad lag mode 512x32
! Change will take effect only after switch reboot.
switch(config)#
```

1.1.9.24 platform sand fabric mode (7500 and 7500E Series)

The **`platform sand fabric mode`** command specifies the fabric mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

The fabric mode determines the modular switch's fabric performance capabilities and must be compatibile with the installed fabric modules. Fabric mode settings include:

- **fe600**: Supports first-generation fabric modules.
- **fe1600**: Supports E-Series fabric modules.

Note: Switches that reload in **petraA** forwarding compatibility mode (platform sand forwarding mode (7500 and 7500E Series)) also reload in fe600 fabric mode regardless of the presence of a **`platform sand fabric mode`** statement in ***running-config***.

The switch's fabric mode setting must match the capabilities of its installed fabric modules. Reloading the switch in a different mode may be required after exchanging fabric modules for a different module type. The show module command displays the fabric modules in the switch.

Each fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

E-series fabric modules can operate in **fe600** mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in **fe600** mode. Switches containing both types of modules must be set to **fe600** mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

1. Switches reloading in **petraA** forwarding compability mode also reload in **fe600** fabric mode .
2. As specified by the **platform sand fabric mode** statement in ***running-config***.
3. The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in **fe600** mode because first generation modules are usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

The **`no platform sand fabric mode`** and **`default platform sand fabric mode`** commands remove the **`platform sand fabric mode`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform sand fabric mode` [**MODE_SETTING**]

`no platform sand fabric mode`

`default platform sand fabric mode`

Parameters

- **MODE_SETTING** Specifies the switch's fabric mode. Options include:
  - **fe16000** E-Series fabric mode.
  - **fe600** First-generation fabric mode.

Example

This command configures the switch to reload in **fe1600** fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```
switch(config)#platform sand fabric mode fe1600
switch(config)#exit
switch#show platform sand compatibility
                    Configuration        Status
Forwarding mode     None                 Arad
Fabric mode         Fe1600               Fe600
switch#
```

1.1.9.25 platform sand forwarding mode (7500 and 7500E Series)

The **`platform sand forwarding mode`** command specifies the forwarding compatibility mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

Forwarding compatibility mode specifies switch forwarding capabilities and configures performance capacity of installed linecards. Forwarding compatibility modes settings include:

- **petraA**: Supports first-generation fabric modules.
- **arad**: Supports E-Series fabric modules.

Note: Switches that reload in **petraA** forwarding compatibility mode also reload in **fe600** fabric mode regardless of the presence of a platform sand fabric mode (7500 and 7500E Series) statement in ***running-config***.

This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards. The show module command displays the linecard modules in the switch.

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecards support all basic switch functions.
- E-Series linecards support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the operational capacity of installed linecards. The following table lists the affect of the forwarding compatibility mode on all linecard module types.

Table 3: Linecard Module and Forwarding Mode Performance

Linecard Module Type	Forwarding Software Mode	Linecard Operating Capacity
First-generation	petraA	Linecard performs at first-generation performance capacity.
First-generation	arad	Linecard is powered-down.
E-Series	petraA	Linecard performs at first-generation performance capacity.
E-Series	arad	Linecard performs at E-series performance capacity.

Note: Linecards operate at E-Series performance capacities only on switches that contain E-Series fabric modules and have a fabric mode setting of **fe1600** fabric mode (platform sand fabric mode (7500 and 7500E Series)).

Without a platform sand fabric mode (7500 and 7500E Series) command, forward compatibility mode is determined by the first linecard that becomes operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards. Switches with a mixed set of modules are typically reloaded in **petraA** mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a **`platform sand forwarding mode`** command.

The **`no platform sand forwarding mode`** and **`default platform sand forwarding mode`** commands restore the **platform sand forwarding mode** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform sand forwarding mode` [**MODE_SETTING**]

`no platform sand forwarding mode`

`default platform sand forwarding mode`

Parameters

- **MODE_SETTING** Specifies the switch's software forwarding mode. Options include:
  - **arad** the switch supports E-Series linecard capabilities.
  - **petraA** the switch supports first-generation linecard capabilities.

Example

This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

```
switch(config)#platform sand forwarding mode arad
switch(config)#
```

1.1.9.26 platform sand lag hardware-only

The **platform sand lag hardware-only** command specifies that all LAGs will use hardware resources including single member LAGs. Hardware resource allocation and deallocation traffic disruption occurs on the first member addition or deletion, rather than the second member addition or deletion.

The **no platform sand lag hardware-only** and **default platform sand lag hardware-only** commands specify that LAGs are not required to be implemented in hardware, and therefore some LAGs may be implemented in software. Permitting both hardware and software LAGs may increase the total number of port-channels because we have no resource limit on the number of software LAGs.

Command Mode

Global Configuration

Command Syntax

```
platform sand lag hardware-only

no platform sand lag hardware-only

default platform sand lag hardware-only
```

Examples

- This command configures all LAGs to use hardware resources. All existing one member LAGs will be allocated hardware resources, when available.

```
switch(config)#platform sand lag hardware-only
switch(config)#
```

- This command allows certain LAGs (single member LAGs) to not consume hardware resources. All existing one member LAGs will release their hardware resources.

```
switch(config)#no platform sand lag hardware-only
switch(config)#
```

1.1.9.27 pwd

The **pwd** command displays the working directory.

Command Mode

Privileged EXEC

Command Syntax

```
pwd
```

Example

This command shows that the working is Flash.

```
switch# pwd
flash:/
switch#
```

1.1.9.28 schedule config

The schedule config command sets configuration parameters to the CLI scheduler.

The **no schedule config max-concurrent-jobs** and **default schedule config max-concurrent-jobs** commands reset the limit of maximum concurrent jobs to the default value of 1 by removing the corresponding schedule config max-concurrent-jobs statement from running-config.

The **no schedule config prepend-hostname-logfile** and **default schedule config prepend-hostname-logfile** commands reset the log filenames to the default state.

Command Mode

Global Configuration

Command Syntax

`schedule config`{max-concurrent-jobs *limit* | prepend-hostname-logfile}

`no schedule config` {max-concurrent-jobs *limit* | prepend-hostname-logfile}

`default schedule config` {max-concurrent-jobs *limit* | prepend-hostname-logfile}

Parameters

- **max-concurrent-jobs *limit*** specifies the maximum number of concurrent commands that can run on the switch. The maximum concurrent jobs ranges from ***1*** to ***4***. The default value is ***1***.
- **prepend-hostname-logfile** enables prepending hostnames to log filenames. By default, this option is enabled.

Examples

- This command configures to concurrently run a maximum of three commands on the switch.

```
switch(config)#schedule config max-concurrent-jobs 3
switch(config)#show schedule summary
Maximum concurrent jobs  3
Prepend host name to logfile: No
Name            At time      Last    Interval   Timeout   Max     Logfile Location
Status
                             time     (mins)    (mins)    log
                                                         files
------------- ------------- ------- ---------- -------- -------- --------------------------------
 ------
tech-support      now        00:29      60        30      100     flash:schedule/tech-support/
 Success
thelp           12:02:00     00:02      60        40      100     flash:schedule/thelp/
Fail
                06/05/2018
switch(config)#
```

- This command enables prepending the hostname to log filenames.

```
switch(config)#schedule config prepend-hostname-logfile
switch(config)#show schedule summary
Maximum concurrent jobs  3
Prepend host name to logfile: Yes
Name            At time      Last    Interval   Timeout   Max     Logfile Location
Status
                             time     (mins)    (mins)    log
                                                         files
------------- ------------- ------- ---------- -------- -------- --------------------------------
 ------
tech-support      now        00:29      60        30      100     flash:schedule/tech-support/
 Success
thelp           12:02:00     00:02      60        40      100     flash:schedule/thelp/
Fail
                06/05/2018
switch(config)#
```

1.1.9.29 schedule

The schedule command facilitates the periodic execution of a specified CLI command. Command parameters configure the start time of periodic execution, the interval between consecutive execution instances, the maximum time allotted for command execution, and the maximum number of log files that can be created.

The **`no schedule`** and **`default schedule`** commands disable execution of the specified command.

Command Mode

Global Configuration

Command Syntax

`schedule` *schedule_name* **PERIOD** {max-log-files *count* | timeout *timeout_interval*}{command *cmd* | logging verbose | loglocation *flash:*}

`no schedule` *schedule_name*

`default schedule` *schedule_name*

Parameters

- ***schedule_name*** Label associated with the scheduled command.
- **PERIOD** Start time for execution and interval between consecutive execution instances. The interval ranges from ***2*** to ***1440*** minutes. The default interval while scheduling the **`show tech-support`** command is ***60*** minutes. Options include:
  - **at** Start time for execution. Options include:
    - ***hh:mm:ss*** **interval** ***interval*** The command execution starts at the specified time and repeats at the specified interval.
    - ***hh:mm:ss mm/dd/yyyy*** **interval** ***interval*** The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - ***hh:mm:ss*** **once** The command execution starts at the specified time and does not repeat.
    - ***hh:mm:ss mm/dd/yyyy*** **once** The command execution starts at the specified time on the specified day and does not repeat.
    - ***hh:mm:ss yyyy-mm-dd*** **interval** ***interval*** The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - ***hh:mm:ss yyyy-mm-dd*** **once** The command execution starts at the specified time on the specified day and does not repeat.
  - **interval** ***interval*** The command execution starts immediately and repeats at the specified interval.
  - **now interval** ***hh:mm:ss*****interval** ***interval******hh:mm:ss mm/dd/yyyy*****interval** ***interval*****once*****hh:mm:ss*****hh:mm:ss mm/dd/yyyy*****once*****hh:mm:ss yyyy-mm-dd*****interval** ***interval*****once*****hh:mm:ss yyyy-mm-dd*****interval** ***interval*****now interval** ***interval*** The command execution starts immediately and repeats at the specified interval.
- **max-log-files** ***count*** Maximum number of log files command generates for command output. The count of maximum log files ranges from ***1*** to ***10000***. The default count of maximum log files while scheduling the **`show tech-support`** command is ***100***.
- **timeout** ***timeout_interval*** Maximum time allotted for the script execution. The timeout interval ranges from ***1*** to ***480*** minutes. The default timeout is ***30*** minutes.

  Note: The command execution is terminated if it exceeds the specified timeout interval. The timeout allotted for the scheduled command must not be greater than the corresponding interval.
- **command** ***cmd*** The command that needs to be executed.
- **logging verbose** Sets the logging level to “verbose.” A syslog entry is added after the execution of the scheduled command, regardless of whether the scheduled command has succeeded or

failed. In the absence of **logging verbose**, the syslog entry is added only if the execution of the scheduled command fails with an error.

- **loglocation *destination*** The flash destination for scheduled command output files.

Guidelines

Log files created by the command are stored in the **flash:/schedule/ *scheduled_name* /** directory. Empty log files are created for commands that do not generate any output.

Examples

- This command saves the running configuration contents to the log file every hour with immediate effect and creates a maximum of 24 log files.

```
switch(config)#schedule backup-test interval 60 max-log-files 24
 command show running-config
```

- This command starts the script execution at 12:00:00 and repeats every 720 minutes. The script execution is terminated if it exceeds 20 minutes. It generates a maximum of one log file because the specified bash command does not have an output.

```
switch(config)#schedule ms1 at 12:00:00 interval 720 timeout 20 max-
log-files 1 command bash /mnt/flash/myscript.sh
```

- The show schedule command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

```
switch#show schedule summary
Maximum concurrent jobs  1
Prepend host name to logfile: Yes

Name At time Last  Interval Timeout  Max    Logfile Location    Status
             time  (mins)   (mins)   log
                                     files
---- ------- ----- -------- -------- ------ -------------------  -------
ms1   now    23:03   720       20      1    flash:/schedule/ms1 Success

switch#
```

1.1.9.30 show (various configuration modes)

The **show** command, when executed within a configuration mode, can display data in ***running-config*** for the active configuration mode.

Command Mode

All configuration modes except Global Configuration

Command Syntax

`show` [**DATA_TYPE**]

Parameters

- **DATA_TYPE** Specifies display contents. Values include:
  - **active** Displays ***running-config*** settings for the configuration mode.
  - **active all** Displays ***running-config*** plus defaults for the configuration mode.
  - **active all detail** Displays ***running-config*** plus defaults for the configuration mode.
  - **comment** Displays comment entered for the configuration mode.

Related Commands

The **show** commands in ACL-configuration mode and MST-configuration mode include the **active** and **comment** options along with additional mode-specific options.

Example

This command shows the server-group-TACACS+ configuration commands in ***running-config***.

```
switch(config-sg-tacacs+-TAC-GR)#show active
   server TAC-1
   server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR)#
```

1.1.9.31 show event-handler DropCountersHandler

The show event-handler command displays details of the DropCountersHandler event handler.

Command Mode

Privileged EXEC

Command Syntax

```
show event-handler DropCountersHandler
```

Example

This command displays details of this event handler.

```
switch(config)#show event-handler DropCountersHandler
Event-handler DropCountersHandler (BUILT-IN)
Trigger: on-counters delay 0 seconds
  Polling Interval: 60 seconds
  Condition: bashCmd."DropCounterMonitor.py" > 0
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: DropCounterLog.py -l
Action expected to finish in less than 20 seconds
Total Polls: 39
Last Trigger Detection Time: 38 minutes 22 seconds ago
Total Trigger Detections: 1
Last Trigger Activation Time: 38 minutes 22 seconds ago
Total Trigger Activations: 1
Last Action Time: Never
Total Actions: 1

switch(config)#
```

1.1.9.32 show event-handler

The show event-handler command displays the contents and activation history of a specified event handler or all event handlers.

Command Mode

Privileged EXEC

Command Syntax

`show event-handler` [*handler_name*]

Parameters

handler_name optional name of an event handler to display. If no parameter is entered, the command displays information for all event handlers configured on the system.

Example

This command displays information about an event handler called “*eth_5*”.

```
switch#show event-handler Eth_5
Event-handler Eth_5
Trigger: on-intf Ethernet5 on ip delay 20 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: :
Device-health Action: None
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: 15 days 2 hours 19 minutes ago
Total Trigger Detections: 1
Last Trigger Activation Time: 15 days 2 hours 19 minutes ago
Total Trigger Activations: 1
Last Action Time: 15 days 2 hours 19 minutes ago
Total Actions: 1
switch#
```

1.1.9.33 show module

The **show module** command displays information that identifies the supervisor, fabric, and linecard modules in a modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

Command Mode

EXEC

Command Syntax

`show module` [**MODULE_NAME**]

Parameters

- **MODULE_NAME** Specifies modules for which data is displayed. Options include:
  - ***no parameter*** All modules (identical to **all** option).
  - **fabric *fab_num*** Specified fabric module. Number range varies with switch model.
  - **linecard *line_num*** Linecard module. Number range varies with switch model.
  - **supervisor *super_num*** Supervisor module. Number range varies with switch model.
  - ***mod_num*** Supervisor (1 to 2) or linecard (3 to 18) module.
  - **all** All modules.

Related Command

show version displays model and serial numbers of modular system components.

Examples

- This command displays information about all installed modules on a DCS-7504 switch.

```
switch#show module

```

1.1.9.34 show platform sand compatibility

The **`show sand platform compatibility`** command displays the fabric and forwarding modes. These modes determine switch forwarding capabilities and programs performance capacity of installed linecards

sinformation that identifies the supervisor, fabric, and linecard modules in the modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

Command Mode

Privileged EXEC

Command Syntax

```
show platform sand compatibility
```

Related Commands

- platform sand fabric mode (7500 and 7500E Series) specifes the fabric software mode.
- platform sand forwarding mode (7500 and 7500E Series) specifes the forwarding software mode.

Example

This command indicates that the switch is in Fe600 fabric mode and PetraA forwarding mode.

```
switch#show platform sand compatibility
                    Configuration        Status
Forwarding mode     None                 PetraA
Fabric mode         None                 Fe600
switch#
```

1.1.9.35 show platform sand lag hardware-only

The **show platform sand lag hardware-only** command displays whether or not LAGs are hardware-only.

Command Mode

Privileged EXEC

Command Syntax

```
show platform sand lag hardware-only
```

Examples

- This command indicates that LAGs are hardware-only.

```
switch(config)#platform sand lag hardware-only
switch(config)#exit
switch#show platform sand lag hardware-only
Hardware resources are used for all LAGs: True
switch#
```

- This command indicates that LAGs are not hardware-only.

```
switch(config)#no platform sand lag hardware-only
switch(config)#exit
switch#show platform sand lag hardware-only
Hardware resources are used for all LAGs: False
switch#
```

1.1.9.36 show schedule

The **show schedule** command displays logging output on the terminal during the current terminal session. This command affects only the local monitor. The no terminal monitor command disables direct monitor display of logging output for the current terminal session.

The **show schedule** command displays the list of active scheduled commands and the summary of specified scheduled command.

Command Mode

Global Configuration

Command Syntax

`show schedule` {*schedule_name* | summary}

Parameters

- ***schedule_name*** displays the summary of the specified scheduled command.
- **summary** displays the list of active scheduled commands.

Examples

- This command displays the summary of the ***thelp*** schedule.

```
switch(config)#show schedule thelp
The last CLI command failed with exit status 1
CLI command "show THelp" is scheduled next at "02:02:35 06/19/2018", interval is
60 minutes
Timeout is 40 minutes
Maximum of 100 log files will be stored
Verbose logging is off
100 log files currently stored in flash:/schedule/thelp

Start time                 Size          Filename
-------------------------- ------------- ----------------------------------
Jun 19 2018 01:02       60.0 bytes       ro301_thelp_2018-06-19.0102.log.gz
Jun 19 2018 00:02       60.0 bytes       ro301_thelp_2018-06-19.0002.log.gz
Jun 18 2018 23:02       60.0 bytes       ro301_thelp_2018-06-18.2302.log.gz
Jun 18 2018 22:02       60.0 bytes       ro301_thelp_2018-06-18.2202.log.gz
Jun 18 2018 21:02       60.0 bytes       ro301_thelp_2018-06-18.2102.log.gz

switch(config)#
```

- This command displays the summary of scheduled commands.

```
switch(config)#show schedule summary
Maximum concurrent jobs  1
Prepend host name to logfile: Yes
Name            At time      Last    Interval   Timeout   Max     Logfile Location
Status
                             time     (mins)    (mins)    log
                                                         files
------------- ------------- ------- ---------- -------- -------- --------------------------------
 ------
tech-support      now        00:29      60        30      100     flash:schedule/tech-support/
 Success
thelp           12:02:00     00:02      60        40      100     flash:schedule/thelp/
Fail
                06/05/2018
switch(config)#
```

1.1.9.37 show version

The **`show version`** command displays information that identifies the switch, including its model number, serial number, and system MAC address. The command also provides hardware and software manufacturing information, along with the available memory and elapsed time from the most recent reload procedure.

Command Mode

EXEC

Command Syntax

`show version` [**INFO_LEVEL**]

Parameters

INFO_LEVEL Specifies information the command displays. Options include:

- ***no parameter*** Model and serial numbers, manufacturing data, uptime, and memory.
- **detail** Data listed ***no parameter*** option plus version numbers of internal components.

Related Command

show module displays model and serial numbers of modular system components.

Example

This command displays the switch's model number, serial number, hardware and software manufacturing information, uptime, and memory capacity.

```
switch>show version
Arista DCS-7150S-64-CL-F
Hardware version:    01.01
Serial number:       JPE13120819
System MAC address:  001c.7326.fd0c

Software image version: 4.13.2F
Architecture:           i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:      eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:                 1 hour and 36 minutes
Total memory:           4017088 kB
Free memory:            1473280 kB

switch>
```

1.1.9.38 terminal length

The terminal length command overrides automatic pagination and sets pagination length for all show commands on a terminal. If the output of a show command is longer than the configured terminal length, the output will be paused after each screenful of output, prompting the user to continue.

To disable pagination for an SSH session, set terminal length to 0. By default, all console sessions have pagination disabled.

The no terminal length and **`default terminal length`** commands restore automatic pagination by removing the terminal length command from ***running-config***.

The pagination setting is persistent if configured from Global Configuration mode. If configured from EXEC mode, the setting applies only to the current CLI session. Pagination settings may also be overridden when you adjust the size of the SSH terminal window, but can be reconfigured by running the terminal length command again.

Command Mode

EXEC

Command Syntax

```
terminal length lines

no terminal length

default terminal length
```

Parameters

lines number of lines to be displayed at a time. Values range from ***0*** through ***32767***. A value of ***0*** disables pagination.

Examples

- This command sets the pagination length for the current terminal session to 10 lines.

```
switch#terminal length 10
Pagination set to 10 lines.
```

- This command configures the switch to paginate terminal output automatically based on screen size for the current terminal session.

```
switch#no terminal length
```

- These commands disable pagination globally.

```
switch#configure
switch(config)#terminal length 0
Pagination disabled.
```

1.1.9.39 terminal monitor

The terminal monitor command enables the display of logging output on the terminal during the current terminal session. This command affects only the local monitor. The no terminal monitor command disables direct monitor display of logging output for the current terminal session.

Command Mode

Privileged EXEC

Command Syntax

```
terminal monitor

no terminal monitor

default terminal monitor
```

Example

This command enables the display of logging to the local monitor during the current terminal session.

```
switch#terminal monitor
switch#
```

1.1.9.40 trigger

The **`trigger`** command specifies what event will trigger the event handler. Handlers can be triggered either by the system booting or by a change in a specified interface's IP address or operational status.

To specify the action to be taken when the handler is triggered, use the action bash command.

Command Mode

Event-Handler Configuration

Command Syntax

`trigger` **EVENT**

Parameters

- **EVENT** event which will trigger the configuration mode event handler. Values include:
  - **onboot** triggers when the system reboots, or when you exit event-handler configuration mode. This option takes no further arguments, and passes no environment variables to the action triggered.
    - on-intf **INTERFACE CHANGE** triggers when a change is made to the specified interface.
    - on-startup-config triggers when a change is made to the ***startup-config*** file.
    - vm-tracer vm triggers when a virtual machine monitored by VM Tracer changes state.
- **INTERFACE** the triggering interface. Values include:
  - **ethernet *number*** Ethernet interface specified by ***number***.
  - **loopback *number*** loopback interface specified by ***number***.
  - **management *number*** management interface specified by ***number***.
  - **port-channel *number*** channel group interface specified by ***number***.
  - **vlan *numver*** VLAN interface specified by ***number***.
- **CHANGE** the change being watched for in the triggering interface. Values include:
  - **ip** triggers when the IPv4 address of the specified interface is changed.
  - **ip6** triggers when the IPv6 address of the specified interface is changed.
  - **operstatus** triggers when the operational status of the specified interface changes.

Examples

- This command configures the event handler ***Eth5*** to be triggered when there is a change in the operational status or IP address of ***Ethernet interface 5***.

```
switch(config-handler-Eth5)#trigger on-intf Ethernet 5 operstatus ip
switch(config-handler-Eth5)#
```

- This command configures the event handler "onStartup" to be triggered when the system boots, or on exiting ***event-handler configuration mode***.

```
switch(config-handler-onStartup)#trigger onboot
switch(config-handler-onStartup)#
```

Chapter 2

Booting the Switch

This chapter describes the switch boot process, describes configuration options, and lists the components it requires, including the boot loader, the boot loader shell, and other configuration files.

This chapter includes the following sections:

2.1 Boot Loader Aboot

Aboot is the boot loader for Arista switches. In addition to booting the switch EOS, Aboot provides a shell for changing boot parameters, restoring default switch settings, diagnosing hardware problems, and managing switch files. Aboot Shell describes the Aboot shell.

The boot process loads an EOS image file, initiates switch processes, performs self tests, restores interface settings, and configures other network parameters. The replacement image file can be in the switch's flash or on a device in the flash drive port. Configuration files stored in flash memory specify boot parameters.

Aboot supports most available USB flash drive models. The flash drive must be formatted with the FAT or VFAT file system. Windows NT File System (NTFS) is not supported.

Aboot initiates a system reboot upon a **`reload`** command or by restoring power to the switch. Before loading the EOS image file, Aboot provides an option to enter the Aboot shell. The user can either enter the shell to modify boot parameters or allow the switch to boot.

The boot process can be monitored through a terminal connected to the console port. The console port is configured to interact with the terminal by configuration file settings.

2.2 Configuration Files

Three files define boot and running configuration parameters.

- ***boot-config***: contains the location and name of the image to be loaded.
- ***running-config***: contains the current switch configuration.
- ***startup-config***: contains the switch configuration that is loaded when the switch boots.

The ***running-config*** and ***startup-config*** are different from one another when configuration changes have not been saved since the last boot.

2.2.1 boot-config

The ***boot-config*** file is an ASCII file that Aboot uses to configure console communication settings, locate the EOS flash image, and specify initial network configuration settings.

Aboot attempts to boot the EOS flash software image (with the extension .swi) referenced by ***boot-config*** if the user does not interrupt the boot process. See Aboot Shell describes how Aboot uses ***boot-config***.

You can view and edit the ***boot-config*** file contents. Viewing and editing options include:

- View ***boot-config*** file contents with the `more boot-config` command:

```
switch(config)#more boot-config
SWI=flash:/EOS.swi
CONSOLESPEED=2400
Aboot password (encrypted): $1$A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
switch(config)#
```

- View ***boot-config*** settings with the `show boot-config` command:

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: 2400
Aboot password (encrypted): $1$A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
Memory test iterations: (not set)
switch(config)#
```

- Modify file settings from the command line with EOS `boot` commands.

  See Programming boot-config from the Programming boot-config from the CLI for a list of `boot` commands.
- Edit the file directly by using vi from the Bash shell.

See boot-config Command Line Content for a list of ***boot-config*** parameters.

2.2.1.1 boot-config File Structure

Each line in the ***boot-config*** file specifies a configuration setting and has this format:

NAME=VALUE

- NAME is the parameter label.
- VALUE indicates the parameter's bootup setting.

The NAME and VALUE fields cannot contain spaces.

Aboot ignores blank lines and lines that begin with a # character.

2.2.1.2 boot-config Command Line Content

Aboot configuration commands that ***boot-config*** files can contain include:

- SWI specifies the location and file name of the EOS image file that Aboot loads when booting, using the same format as the boot command to designate a local or network path.

  Example

```
SWI=flash:EOS.swi             <---flash drive location
SWI=usb1:/EOS1.swi            <---USB drive location
SWI=file:/tmp/EOSexp.swi      <---switch directory location
SWI=/mnt/flash/EOS.swi
SWI=http://foo.com/images/EOS.swi
SWI=ftp://foo.com/images/EOS.swi
SWI=tftp://foo.com/EOS.swi
SWI=nfs://foo.com/images/EOS.swi
```

- CONSOLESPEED specifies the console baud rate. To communicate with the switch, the connected terminal must match the specified rate. Baud rates options include ***1200***, ***2400***, ***4800***, ***9600***, ***19200***, ***38400***, ***57600***, and ***115200***. The default baud rate is ***9600***.

  Example

  ```
  CONSOLESPEED=19200
  ```

- PASSWORD (ABOOT) specifies the Aboot password, as described in Accessing the Aboot Shell. If ***boot-config*** does not contain a **PASSWORD** command, the Aboot shell does not require a password.

  Example

  ```
  PASSWORD=$1$CdWp5wfe$pzNtE3ujBoFEL8vjcq7jo/
  ```

- NET commands are used by Aboot during switch booting to configure the network interface that will be used for switch configuration. These commands can also be entered manually in Aboot.

  NETDEV indicates which network interface is being configured. If ***boot-config*** does not contain a **NETDEV** command, the booting process does not attempt to configure a network interface. Other **NET** commands specify settings that Aboot uses to configure the interface.

Examples

- This **NETDEV** command specifies ***management port 1*** as the network interface to be configured by ***boot-config***:

  ```
  NETDEV=ma1
  ```

- This **NETAUTO** command instructs the switch to configure the network interface through a DHCP server, ignoring other NET settings:

  ```
  NETAUTO=dhcp
  ```

- These **NET** commands configure the network interface:

  ```
  NETIP=10.12.15.10
  NETMASK=255.255.255.0
  NETGW=10.12.15.24
  NETDOMAIN=mycompany.com
  NETDNS=10.12.15.13
  ```

2.2.1.3 Programming boot-config from the CLI

The switch CLI provides **boot** commands for editing ***boot-config*** contents. The **boot** commands are not accessible from a console port CLI. Parameters not configurable from a **boot** command can be modified by directly editing the ***boot-config*** file.

Commands that configure boot parameters include **boot system**, **boot secret**, and **boot console**.

boot system

The **boot system** command provides the EOS image file location to Aboot.

Examples

- This command specifies EOS1.swi on USB flash memory as the software image load file.

  ```
  switch(config)#boot system usb1:EOS1.swi
  switch(config)#
  ```

- The **boot system** command above adds this line to ***boot-config***.

```
SWI=usb1:/EOS1.swi
```

- This command designates EOS.swi, on the switch flash, as the EOS software image load file.

```
switch(config)#boot system flash:EOS.swi
switch(config)#
```

- The **boot system** command above adds this line to ***boot-config***:

```
SWI=flash:/EOS.swi
```

boot secret

The **boot secret** command sets the Aboot password.

Examples

- These equivalent commands set the Aboot password to xr19v.

```
switch(config)#boot secret xr19v
switch(config)#
```

```
switch(config)#boot secret 0 xr19v
switch(config)#
```

- This command shows the password that has been set.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): $1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
switch(config)#
```

The **boot secret** commands above add this line to **boot-config**:

```
PASSWORD=$1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
```

The user must enter xr19v at the login prompt to access the Aboot shell.

- This command sets the Aboot password to xr123. The encrypted string was previously generated with xr123 as the clear-text seed.

```
switch(config)#boot secret 5 $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#
```

- This command shows the password that has been set.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#
```

- The **boot secret** command above adds this line to ***boot-config***:

```
PASSWORD=$1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
```

The user must enter xr123 at the login prompt to access the Aboot shell.

- This command removes the Aboot password; subsequent Aboot access is not authenticated.

```
switch(config)#no boot secret
switch(config)#
```

- This command shows that there is now no Aboot password.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): (not set)
switch(config)#
```

boot console

The **boot console** command sets console settings for attaching devices.

Examples

- This command sets the console speed to ***4800*** baud:

```
switch(config)#boot console speed 4800
switch(config)#
```

- This command shows the console speed.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: 4800
Aboot password (encrypted): (not set)
switch(config)#
```

- The **boot console** command above adds this line to ***boot-config***:

```
CONSOLESPEED=4800
```

install bios source

The **install bios source** command loads an Aboot Update File (AUF) to provide a signed method of upgrading Aboot.

Examples

- This command installs the file *update.auf* stored in **/mnt/flash**:

```
switch#install bios source flash:/update.auf
switch(config)#
```

- This command performs a reboot directly after the installation:

```
switch#install bios source flash:/update.auf reload
switch(config)#
```

- This command skips the prompts and performs the installation automatically:

```
switch#install bios source flash:/update.auf now
switch(config)#
```

- This command performs the installation only on the standby suprvisor:

```
switch#install bios source flash:/update.auf standby
switch(config)#
```

Note: On a modular system with two supervisors, Aboot gets upgraded on both by default.

2.2.2 running-config

The ***running-config*** is a virtual file that contains the system's operating configuration, formatted as a command sequence. Commands entered from the CLI modify ***running-config***, and copying a file to ***running-config*** updates the operating configuration by executing the commands in the copied file.

Commands for viewing and copying ***running-config*** include:

- **`show running-config`** displays the contents of ***running-config***.
- **`copy running-config startup-config`** copies ***running-config*** contents to ***startup-config***.
- **`write`** copies ***running-config*** contents to ***startup-config***.

2.2.3 startup-config

The ***startup-config*** file is stored in flash memory and contains the configuration that the switch loads when booting. During a switch boot, ***running-config*** is replaced by ***startup-config***. Changes to ***running-config*** that are not copied to ***startup-config*** are lost when the system reboots.

Commands affecting ***startup-config*** include:

- **`show startup-config`** displays the contents of ***startup-config***.
- **`copy`** ***file_name*** **`startup-config`** copies contents of the specified file to ***startup-config***.
- **`delete startup-config`** deletes the ***startup-config*** file.

2.3 Supervisor Redundancy

On modular switches with redundant supervisor modules, control of the switch can be transferred to the standby supervisor to minimize downtime and data loss in the case of a reset, reload, or failure of the active supervisor. How the switchover takes place is determined by the redundancy protocol configured on the active supervisor.

To display the state and the current redundancy protocol of both supervisors, use the **`show redundancy status`** command. To display the state of configuration file synchronization between the supervisors, use the **`show redundancy file-replication`** command.

2.3.1 Redundancy Supervisor Protocols

There are three available supervisor redundancy protocols.

Route Processor Redundancy (RPR)

The default redundancy protocol is Route Processor Redundancy (RPR), which synchronizes ***startup-config*** files between the supervisor modules and partially boots the standby supervisor to a standby warm state, but does not synchronize ***running-config***. If the active supervisor fails, or a manual switchover is initiated with the **`redundancy manual switchover`** command, the standby supervisor will become active. Running state, including spanning tree, is lost, and all links are temporarily brought down.

Under RPR, the CLI of the standby supervisor can be accessed by SSH or through the console port, but the available command set is limited. Any configuration changes made to the standby supervisor will be lost when the supervisor reboots.

Stateful Switchover (SSO)

In Stateful Switchover (SSO) protocol, the switch synchronizes both ***startup-config*** and ***running-config*** files between the supervisor modules and fully boots the standby module to a standby hot state to speed the switchover process and minimize packet loss. If the active supervisor fails, or a manual switchover is initiated, the standby supervisor immediately becomes active, and L2 running state is maintained. An SSO switchover is largely transparent from the outside, but because L3 state is not synchronized the switchover can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

Under SSO, the CLI of the standby supervisor can be accessed only through the console port, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.

Note: When upgrading the EOS on a dual-supervisor switch to an SSO-capable version (*4.11.0* or higher) from a version that does not support SSO, both supervisors will reset simultaneously, causing several seconds of system downtime.

Simplex

When the switch is set to simplex protocol, the standby supervisor is disabled and switchover will not occur even if the active supervisor fails. Reloading the active supervisor results in system downtime while the supervisor reboots, and the standby supervisor remains disabled. To transfer control of the switch to the standby supervisor, the redundancy protocol must be changed to RPR or SSO.

Under simplex protocol, the CLI of the disabled supervisor can be accessed only through the console port, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.

2.3.2 Configuring Supervisor Redundancy

The supervisor redundancy protocol is configured using the **protocol** command in redundancy configuration mode (accessed with the **redundancy** command).

Changing the redundancy protocol on the active supervisor resets the standby supervisor regardless of redundancy protocol, and executing the **write** command on the active supervisor synchronizes the ***startup-config*** files between supervisors in RPR and SSO modes.

Examples

- These commands display the current redundancy state of the switch and the most recent file synchronization information.

```
switch#show redundancy state
  my state = ACTIVE
peer state = STANDBY WARM
      Unit = Primary
   Unit ID = 1

Redundancy Protocol (Operational) = Route Processor Redundancy
Redundancy Protocol (Configured) = Route Processor Redundancy
Communications = Up
Ready for switchover

  Last switchover time = 7:23:56 ago
Last switchover reason = Supervisor has control of the active
 supervisor lock
switch#show redundancy file-replication
0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files
 total.
```

```
File                    Status          Last Synchronized
----------------------- --------------- -------------------
file:persist/sys        Synchronized    0:10:04 ago
flash:startup-config    Synchronized    0:10:04 ago
switch#
```

- These commands set the redundancy protocol for the active supervisor to stateful switchover (SSO).

```
switch#config
switch(config)#redundancy
switch(config-redundancy)#protocol sso
Peer supervisor will be restarted.
switch(config-redundancy)#
```

2.4 System Reset

When a reset condition exists, Aboot can either reset the switch without user intervention or facilitate a manual reset through the Aboot shell. A reset operation clears the switch, including memory states and other hardware logic

- **Fixed systems**: the power supply remains powered up through the reset. Power is removed from all other switch components for two to five seconds.
- **Modular systems**: the power supply on the active supervisor remains powered up through the reset. Power is removed from all other supervisor components for at least one second. In Stateful Switchover (SSO) and Route Processor Redundancy (RPR) modes, resetting the standby supervisor has no effect on the active supervisor, but resetting the active supervisor causes the standby supervisor to immediately become active. After the supervisor becomes functional, it manages the power-cycling of all line cards.

The **reload** command initiates an immediate reset, terminating all CLI instances not running through the console port. The console port CLI displays messages that the switch generates during a reset. On modular switches with redundant supervisors, CLI sessions on the standby supervisor are not terminated.

The **reload (scheduled)** command schedules a reset operation to initiate at a specific time or after a specified period.

2.4.1 Typical Reset Sequence

The **reload** command power cycles the switch, then resets it under Aboot control. The hard reset clears the switch, including memory states and other hardware logic.

By default, the **reload** command triggers a request to store unsaved ***running-config*** commands and an option to open the Aboot shell before starting the reboot when accessing the CLI through the console port. The switch then begins the reboot process controlled by Aboot.

The following procedure is an example of a typical restart.

1. Begin the reboot process by typing the **reload** command:

```
switch#reload
```

The switch sends a message to confirm the reload request:

```
Proceed with reload? [confirm]
```

2. Press **enter** or type **y** to confirm the requested reload. Pressing any other key terminates the reload operation.

   The switch sends a series of messages, including a notification that a message was broadcast to all open CLI instances, informing them that the system is being rebooted. The reload pauses when the CLI displays the Aboot shell notification line.

```
Broadcast message from root@mainStopping sshd: [ OK ]
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

3. To continue the reload process, do nothing. Typing **Ctrl-C** opens the Aboot shell; see **Aboot Commands** for Aboot editing instructions.
4. The switch continues the reset process, displaying messages to indicate the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

```
Booting flash:/EOS.swi
Unpacking new kernel
Starting new kernel
Switching to rooWelcome to Arista Networks EOS 4.4.0

Starting xinetd: [ OK ]
[ OK ] crond: [ OK ]

switch login:
```

5. Log in to the switch to resume configuration tasks.

2.4.2 Switch Recovery

Aboot can automatically erase the internal flash and copy the contents of a USB drive that has been inserted before powering up or rebooting the switch. This recovery method does not require access to the switch console or Aboot password entry, even if the ***boot-config*** file lists one.

Aboot invokes the recovery mechanism only if each of these two conditions is met:

- The USB drive must contain a file called “fullrecover.”
- The file’s contents are ignored; an empty text file is sufficient.
- If the USB drive contains a ***boot-config*** file, its timestamp must differ from the timestamp of the ***boot-config*** file on the internal flash.

  This prevents Aboot from invoking the recovery mechanism again on every boot if you leave the flash key inserted.

To use this recovery mechanism, set up a USB drive with the files to be installed on the internal flash for example, a current EOS software image, and a customized or empty ***boot-config*** plus an empty file named “fullrecover.”

Check that the timestamp of ***boot-config*** is current to ensure that the above conditions are met.

2.4.3 Display Reload Cause

The **`show reload cause`** command displays the cause of the most recent system reset and lists recommended actions, if any exist, to avoid future spontaneous resets or resolve other issues that may have cause the reset.

Example

To display the reset cause, type **`show reload cause`** at the prompt.

```
switch#show reload cause
Reload Cause 1:
-------------------
Reload requested by the user.

Recommended Action:
-------------------
No action necessary.

Debugging Information:
----------------------
None available.
switch#
```

2.4.4 Configuring Zero Touch Provisioning

Zero Touch Provisioning (ZTP) is a switch configuration method that uses files referenced by a DCHP server to initially provision the switch without user intervention. A switch enters ZTP mode when it is reloaded if flash memory does not contain a ***startup-config*** or ***zerotouch-config*** file.

Canceling ZTP boots the switch without using a ***startup-config*** file. When ZTP mode is canceled, a ***startup-config*** file is not stored to flash memory. Until a ***startup-config*** file is stored to flash, the switch returns to ZTP mode on subsequent reboots. This section describes steps required to implement, monitor, and cancel ZTP.

2.4.4.1 Configuring the Network for ZTP

A switch performs the following after booting in ZTP mode:

- Configures each physical interface to **no switchport** mode.
- Sends a DHCP query packet on all Ethernet and management interfaces.

After the switch receives a DHCP offer, it responds with a DHCP request for ***Option 66*** (TFTP server name), ***Option 67*** (bootfile name), and dynamic network configuration settings. When the switch receives a valid DHCP response, it configures the network settings, then fetches the file from the location listed in ***Option 67***. If ***Option 67*** returns a network URL (**`http:// or ftp://`**), the switch obtains the file from the network. If ***Option 67*** returns a file name, the switch retrieves the file from the TFTP server listed in ***Option 66***.

The ***Option 67*** file can be a ***startup-config*** file or a boot script. The switch distinguishes between a ***startup-config*** file and a boot script by examining the first line in the file:

- The first line of a boot file must consist of the #! characters followed by the interpreter path. The switch executes the code in the script, then reboots. The boot script may fetch an EOS software image or perform required customization tasks.

  The following boot file fetches an EOS software image and stores a startup configuration file to flash.

```
#!/usr/bin/Cli -p2
copy http://company.com/startup-config flash:startup-config
copy http://company.com/EOS-2.swi flash:EOS-2.swi
config
boot system flash:EOS-2.swi
```

- The switch identifies any other file as a ***startup-config*** file. The switch copies the ***startup-config*** file into flash as **`mnt/flash/startup-config`**, then reboots.

  The switch uses its system MAC address as the DHCP client identifier and **Arista** as the Vendor Class Identifier (***Option 60***). When the switch receives an http URL through ***Option 67***, it sends the following HTTP headers in the GET request:

```
X-Arista-SystemMAC:
X-Arista-HardwareVersion:
X-Arista-SKU:
X-Arista-Serial:
X-Arista-Architecture:
```

2.4.4.2 Monitoring ZTP Progress

A switch displays the following message after rebooting when it does not contain a ***startup-config*** file:

```
No startup-config was found.

The device is in Zero Touch Provisioning mode and is attempting to
download the startup-config from a remote system. The device will not
be fully functional until either a valid startup-config is downloaded
from a remote system or Zero Touch Provisioning is cancelled. To cancel
Zero Touch Provisioning, login as admin and type 'zerotouch cancel'
at the CLI.

switch login:
```

The switch displays a CONFIG_DOWNLOAD_SUCCESS message after it successfully downloads a ***startup-config*** file, then continues the reload process as described in **Typical Reset Sequence**.

```
==============================================================
==============

Successful download
--------------------

Apr 15 21:36:46 switch ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP request
 on  [

Broadcast messagStopping sshd: [  OK  ]
watchdog is not running
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

2.4.4.3 ZTP Failure Notification

The switch displays a **DHCP_QUERY_FAIL** message when it does not receive a valid DHCP response within 30 seconds of sending the query. The switch then sends a new DHCP query and waits for a response. The switch continues sending queries until it receives a valid response or until ZTP mode is canceled.

```
switch login:admin
admin
switch>Apr 15 21:28:21 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending

 request on
[ Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18,
 Ethernet21,
Ethernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8, Ethernet9,
Management1, Management2 ]
```

2.4.4.4 Canceling ZTP Mode

To boot the switch without a ***startup-config*** file, log into the console, then cancel ZTP mode. After the switch boots, it uses all factory default settings. A ***startup-config*** file must be saved to flash memory to prevent the switch from entering ZTP mode on subsequent boots.

2.4.5 Configuring the Networks

If the ***boot-config*** file contains a NETDEV statement, Aboot attempts to configure the network interface, as specified by Network configuration commands. See **boot-config Command Line Content** for a list of commands that define the network configuration.

2.5 Aboot Shell

The Aboot shell is an interactive command-line interface used to manually boot a switch, restore the internal flash to its factory-default state, run hardware diagnostics, and manage files. The Aboot shell is similar to the Linux Bourne Again Shell (Bash).

The Aboot shell provides commands for restoring the state of the internal flash to factory defaults or a customized default state. You can use these recovery methods to:

- restore the factory-default flash contents before transferring the switch to another owner.
- restore Aboot shell access if the Aboot password is lost or forgotten.
- restore console access if baud rate or other settings are incompatible with the terminal.
- replace the internal flash contents with configuration or image files stored on a USB flash drive.

2.5.1 Aboot Shell Operation

When the switch is powered on or rebooted, Aboot reads its configuration from ***boot-config*** on the internal flash and attempts to boot an EOS software image (with the extension **`.swi`**) automatically if one is configured.

You can monitor the automatic boot process or enter the Aboot shell only from the console port. You can connect a PC or terminal directly to the port and run a terminal emulator to interact with the serial port or access it through a serial concentrator device.

Console settings are stored in ***boot-config***; the factory-default settings for Arista switches are ***9600*** baud, no parity, ***8*** character bits, and ***1*** stop bit. If you do not know the current settings, perform a full flash recovery to restore the factory-default settings. When the console port is connected and the terminal settings are configured properly, the terminal displays a message similar to the following a few seconds after powering up the switch:

```
Aboot 1.0.0

Press Control-C now to enter the Aboot shell
```

To abort the automatic boot process and enter the Aboot shell, press **Ctrl-C** (ASCII 3 in the terminal emulator) after the *Press Control-C now to enter Aboot shell* message appears. Pressing **Ctrl-C** can interrupt the boot process up through the starting of the new kernel.

If the ***boot-config*** file does not contain a password command, the Aboot shell starts immediately. Otherwise, you must enter the correct password at the password prompt to start the shell. If you enter the wrong password three times, Aboot displays this message:

```
Type "fullrecover" and press Enter to revert /mnt/flash to factory
 default

state, or just press Enter to reboot:
```

- Pressing **Enter** continues a normal soft reset without entering the Aboot shell.
- Typing **`fullrecover`** and pressing **Enter** performs a full flash recovery to restore the factory-default settings, removing all previous contents of the flash drive.

The Aboot shell starts by printing:

```
Welcome to Aboot.
```

Aboot then displays the **`Aboot#`** prompt.

Aboot reads its configuration from ***boot-config*** on the internal flash.

2.5.2 Accessing the Aboot Shell

This procedure accesses the Aboot Shell.

1. Reload the switch and press **enter** or type **y** when prompted, as described in Typical Reset Sequence.

   The command line displays this Aboot entry prompt.

   ```
   Press Control-C now to enter Aboot shell
   ```

2. Type **Ctrl-C**.

   If the ***boot-config*** file does not contain a PASSWORD command, the CLI displays an Aboot welcome banner and prompt.

   ```
   ^CWelcome to Aboot.
   Aboot#
   ```

   If the ***boot-config*** file contains a PASSWORD command, the CLI displays a password prompt. In this case, proceed to step 3. Otherwise, the CLI displays the Aboot prompt.

3. If prompted, enter the Aboot password.

   ```
   Press Control-C now to enter Aboot shell
    ^CAboot password:
   Welcome to Aboot.
   Aboot#
   ```

   Aboot allows three attempts to enter the correct password. After the third attempt, the CLI prompts the user to either continue the reboot process without entering the Aboot shell or to restore the flash drive to the factory default state.

   ```
   Press Control-C now to enter Aboot shell
   ^CAboot password:
   incorrect password
   Aboot password:
   incorrect password
   Aboot password:
   incorrect password
   Type "fullrecover" and press Enter to revert /mnt/flash to factory
    default
   state, or just press Enter to reboot: fullrecover
   All data on /mnt/flash will be erased; type "yes" and press Enter to
    proceed,
   or just press Enter to cancel:
   ```

   The **`fullrecover`** operation replaces the flash contents with a factory default configuration. The CLI displays text similar to the following when performing a fullrecover, finishing with another entry option into the Aboot shell.

   Note: For hardware that is purchased after June 2017, the factory default partition will not have the backup EOS software image. This is done to increase the flash size on smaller flash size disks, and other options are available in the **`fullrecover`** command functionality to restore factory default EOS image. This is applicable to both fixed system and modular system hardware.

   ```
   Erasing /mnt/flash
   Writing recovery data to /mnt/flash
   boot-config
   startup-config
   EOS.swi
   210770 blocks
   ```

```
Restarting system.

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

2.5.3 Aboot File Structure

When you enter the Aboot CLI, the current working directory is the root directory on the switch. Switch image and configuration files are at **/mnt/flash.** When exiting the Aboot shell, only the contents of **/mnt/flash** are preserved. The **/mnt** directory contains the file systems of storage devices. Aboot mounts the internal flash device at **/mnt/flash**.

When a USB flash drive is inserted in one of the flash ports, Aboot mounts its file system on **/mnt/usb1**. The file system is unmounted when the USB flash drive is removed from the port. Most USB drives contain an LED that flashes when the system is accessing it; do not remove the drive from the flash port until the LED stops flashing.

2.5.4 Booting From the Aboot Shell

Aboot attempts to boot the EOS software image (with the extension .swi) configured in ***boot-config*** automatically if you take no action during the boot process. If the boot process fails for any reason, such as an incorrectly configured software image, Aboot enters the shell, allowing you to correct the configuration or boot a software image manually. The **`boot`** command loads and boots an EOS software image file.

The **`boot`** command syntax is

`boot` ***SWI***

where ***SWI*** lists the location of the EOS image that the command loads. ***SWI*** options include:

- ***device:path*** loads the image file from the specified storage device. The default ***device*** value is **flash**; other values include **file** and **usb1**.
- */PATH* loads the image file from the specified path in the switch directory.
- **http://*server/path*** loads the image file from the HTTP server on the host server.
- **ftp://*server/path*** loads the image file from the FTP server on the host server.
- **tftp://*server/path*** loads the image file from the TFTP server on the host server.
- **nfs://*server/path*** mounts the path's parent directory from the host server and loads the image file from the loaded directory.

The accepts the same commands as the SWI variable in the boot-config file. See **boot-config Command Line Content** for a list of boot command formats.

If an image file is not specified in ***boot-config***, or if booting the image results in an error condition (for example, an incorrect path or unavailable HTTP server), Aboot halts the boot process and drops into the shell.

Example

To boot EOS.swi from internal flash, enter one of these commands on the Aboot command line:

```
boot flash:EOS.swi
```

```
boot /mnt/flash/EOS.swi
```

2.5.5 Aboot Commands

To list the contents of the internal flash, enter **ls /mnt/flash** at the Aboot# prompt.

Example

```
Aboot#ls /mnt/flash
EOS.swi boot-config startup-config
```

Commonly used commands include:

- **ls** prints a list of the files in the current working directory.
- **cd** changes the current working directory.
- **cp** copies a file.
- **more** prints the contents of a file one page at a time.
- **vi** edits a text file.
- **boot** boots a software image file.
- **swiinfo** prints information about a software image.
- **recover** recovers the factory-default configuration.
- **reboot** reboots the switch.
- **udhcpc** configures a network interface automatically via DHCP.
- **ifconfig** prints or alters network interface settings.
- **wget** downloads a file from an HTTP or FTP server.
- **showtech** prints device hardware information.

Many Aboot shell commands are provided by Busybox, an open-source implementation of UNIX utilities. Busybox command help is found at **http://www.busybox.net/downloads/BusyBox.html**. Aboot provides access to only a subset of the documented commands.

Aboot can access networks through the Ethernet management ports. Aboot provides network interfaces mgmt1 and mgmt2. These ports are unconfigured by default; you can configure management port settings using Aboot shell commands like **ifconfig** and **udhcpc**. When a management interface is configured, use **wget** to transfer files from an HTTP or FTP server, **tftp** to transfer files from a TFTP server, or **mount** to mount an NFS filesystem.

2.6 Aboot Configuration Commands

This section describes the Aboot configuration commands that a ***boot-config*** file can contain.

- CONSOLESPEED
- NET commands

Installation Commands (Aboot)

- install bios source
- PASSWORD (ABOOT)
- SWI

2.6.1 CONSOLESPEED

The **CONSOLESPEED** command in the ***boot-config*** file specifies the console baud rate when the switch is booted. To communicate with the switch, the connected terminal must match the specified rate. Baud rate options include ***1200***, ***2400***, ***4800***, ***9600***, ***19200***, ***38400***, ***57600***, and ***115200***.

The default baud rate is ***9600***.

Command Syntax

CONSOLESPEED= *baud_rate*

Parameters

baud_rate specifies the console speed. Values include **1200**, **2400**, **4800**, **9600**, **19200**, **38400**, **57600**, and **115200**.

Example

This command in a ***boot-config*** file sets the baud rate to 2400 when the switch boots.

```
CONSOLESPEED=2400
```

2.6.2 NET Commands

NET commands in the ***boot-config*** file are used by Aboot during switch booting to configure the network interface that will be used for switch configuration. These commands can also be entered manually in Aboot.

NETDEV indicates which network interface is being configured. If ***boot-config*** does not contain a **NETDEV** command, the booting process does not attempt to configure a network interface. Other **NET** commands specify settings that Aboot uses to configure the interface.

Command Syntax

NETDEV=*device_interface*

NETAUTO=*auto_setting*

NETIP=*interface_address*

NETMASK=*interface_mask*

NETGW=*gateway_address*

NETDOMAIN=*domain_name*

NETDNS=*dns_address*

Parameters

- ***device_interface*** the network interface. Options include:
  - **ma1** management ***port 1***.
  - **ma2** management ***port 2***.
- ***auto_setting*** the configuration method. Options include:
  - **dhcp** interface is configured through a DHCP server; other NET commands are ignored.
  - if the **NETAUTO** command is omitted, the interface is configured with other NET commands.
- ***interface_address*** interface IP address, in dotted-decimal notation.
- ***interface_mask*** interface subnet mask, in dotted-decimal notation.
- ***gateway_address*** default gateway IP address, in dotted decimal notation.
- ***domain_name*** interface domain name.
- ***dns_address*** IP address of the Domain Name Server, in dotted decimal notation.

Example

- This command specifies management ***port 1*** as the network interface to be configured for management traffic.

```
NETDEV=ma1
```

- This command instructs the switch to configure the network interface through a DHCP server, ignoring any other **NET** commands.

```
NETAUTO=dhcp
```

- These **NET** commands configure the network interface.

```
NETIP=10.12.15.10
NETMASK=255.255.255.0
NETGW=10.12.15.24
NETDOMAIN=mycompany.com
NETDNS=10.12.15.13
```

2.6.3 install bios source

`install bios source` command is used to install an Aboot Update File (AUF) to be used to upgrade Aboot firmware.

`install bios source` indicates the location of the source file and the actions to be taken.

Command Syntax

`install bios source` *SOURCE* [active | standby] [reload | now]

Parameters

SOURCE the file location.

Example

- This command installs an AUF file *update.auf* stored in */mnt/flash*.

```
switch#install bios source flash:/update.auf
```

Note: Follow the prompts after executing the command during the installation process.

- This command performs a reboot directly after installation.

```
switch#install bios source flash:/update.auf reload
```

- This command skips the prompts and performs the reboot automatically after installation.

```
switch#install bios source flash:/update.auf now
```

- This command performs the installation only on the standby supervisor.

```
switch#install bios source flash:/update.auf standby
```

Note: By default the active supervisor is upgraded followed by the standby where applicable.

2.6.4 PASSWORD (ABOOT)

PASSWORD specifies the Aboot password, as described in **Accessing the Aboot Shell**. If ***boot-config*** does not contain a **PASSWORD** command, the Aboot shell does not require a password.

The ***boot-config*** file stores the password as an MD5-encrypted string as generated from a clear-text seed by the UNIX passwd program or the crypt library function. When entering the Aboot password, the user types the clear-text seed.

There is no method of recovering the password from the encrypted string. If the clear-text password is lost, delete the corresponding **PASSWORD** command line from the ***boot-config*** file.

Note: The EOS boot secret command is the recommended method for adding or modifying the **PASSWORD** configuration line.

Command Syntax

PASSWORD = *encrypted_string*

Parameters

encrypted_string the encrypted string that corresponds to the clear-text Aboot password.

Example

This line is a **PASSWORD** command example in which the encrypted string corresponds to the clear-text password ***abcde***.

```
PASSWORD=$1$CdWp5wfe$pzNtE3ujBoFEL8vjcq7jo/
```

2.6.5 SWI

SWI specifies the location and file name of the EOS image file that Aboot loads when booting, using the same format as ***boot-config*** to designate a local or network path.

Command Syntax

`SWI` = **SWI_PATH**

Parameters

SWI_PATH specifies the location of the EOS image file. Options include:

- ***file_path*** specifies a file location on the internal flash drive.
- **file**:***file_path*** specifies a file location in the switch directory.
- **usb1**:***file_path*** specifies a file location on the USB drive.
- **http**:***file_path*** specifies an HTTP path to the image file.
- **ftp**:***file_path*** specifies an FTP path to the image file.
- **tftp**:***file_path*** specifies a TFTP path to the image file.
- **nfs**:***file_path*** specifies an NFS path to the image file.

Examples

- This SWI command in ***boot-config*** causes Aboot to boot the switch from the file **`EOS.swi`** on the switch's internal flash drive.

```
SWI=flash:EOS.swi
```

- This SWI command in ***boot-config*** causes Aboot to boot the switch from the file **`EOS.swi`** at the specified location on foo.com.

```
SWI=http://foo.com/images/EOS.swi
```

2.7 Switch Booting Commands

- boot console
- boot secret
- boot system
- delete startup-config
- protocol
- redundancy
- redundancy manual switchover
- reload
- reload (scheduled)
- show platform bios
- show redundancy file-replication
- show redundancy status
- show redundancy switchover sso
- show reload
- show reload cause
- show reload fast-boot

2.7.1 boot console

The **boot console** command configures terminal settings for serial devices connecting to the console port. At this time, the only console setting that can be specified from ***boot-config*** is **speed**.

Factory-default console settings are ***9600*** baud, no parity, ***8*** character bits, and ***1*** stop bit. If you do not know the current settings, restore the factory-default settings as described in Restoring the Factory Default EOS Image and Startup Configuration.

The **no boot console** and **default boot console** commands restore the factory default settings on the switch and remove the corresponding **CONSOLESPEED** command from the ***boot-config*** file.

Command Mode

Global Configuration

Command Syntax

`boot console speed` *baud_rate*

Parameters

baud_rate console baud rate. Options include ***1200***, ***2400***, ***4800***, ***9600***, ***19200***, ***38400***, ***57600***, and ***115200***.

Example

- This command sets the console speed to ***57600*** baud.

```
switch(config)#boot console speed 57600
switch(config)#
```

- This command displays the result of the console-speed change.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: 57600
Aboot password (encrypted): (not set)
switch(config)#
```

- The above **boot console** command adds the following line to ***boot-config***.

```
CONSOLESPEED=57600
```

2.7.2 boot secret

The **boot secret** command creates or edits the Aboot shell password and stores the encrypted string in the **PASSWORD** command line of the ***boot-config*** file.

The **no boot secret** and **default boot secret** commands remove the Aboot password from the ***boot-config*** file. When the Aboot password does not exist, no password is required to enter the Aboot shell.

Command Mode

Global Configuration

Command Syntax

`boot secret` [**ENCRYPT_TYPE**] *password*

`no boot secret`

`default boot secret`

Parameters

- **ENCRYPT_TYPE** indicates the encryption level of the password parameter. Settings include:
  - ***no parameter*** the password is clear text.
  - **0** the password is clear text. Equivalent to the ***no parameter*** case.
  - **5** the password is an MD5-encrypted string.
  - **sha512** the password is entered as an **sha512** encrypted string.
- ***password*** specifies the boot password.
  - ***password*** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
  - ***password*** must be an appropriately encrypted string if **ENCRYPT_TYPE** specifies encryption.

Restrictions

The **sha512** encryption option is not available on Trident platform switches.

Examples

- These equivalent commands set the Aboot password to xr19v.

```
switch(config)#boot secret xr19v
switch(config)#
```

```
switch(config)#boot secret 0 xr19v
switch(config)#
```

This command displays the result:

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): $1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
switch(config)#
```

The **boot secret** commands above add this line to ***boot-config***:

```
PASSWORD=$1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
```

The user must enter **xr19v** at the login prompt to access the Aboot shell.

- These commands set the Aboot password to ***xr123***, then display the resulting ***boot-config*** code. The encrypted string was previously generated with ***xr123*** as the clear-text seed.

```
switch(config)#boot secret 5 $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#
```

  The **`boot secret`** command above adds this line to ***boot-config***:

```
PASSWORD=$1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
```

  The user must enter ***xr123*** at the login prompt to access the Aboot shell.
- This command removes the Aboot password, allowing access to the Aboot shell without a password.

```
switch(config)#no boot secret
switch(config)#
```

2.7.3 boot system

The **boot system** command specifies the location of the EOS software image that Aboot loads when the switch boots. The command can refer to files on flash or on a module in the USB flash port.

Command Mode

Global Configuration

Command Syntax

`boot system` **DEVICE** *file_path*

Parameters

- **DEVICE** location of the image file. Options include:
  - **file:** file is located in the switch file directory.
  - **flash:** file is located in flash memory.
  - **usb1:** file is located on a drive inserted in the USB flash port. Available if a drive is in the port.
  - ***file_path*** path and name of the file.

Examples

- This command designates ***EOS1.swi***, on USB flash memory, as the EOS software image load file.

```
switch(config)#boot system usb1:EOS1.swi
switch(config)#
```

The **boot system** command above adds this line to ***boot-config***.

```
SWI=usb1:/EOS1.swi
```

- This command designates ***EOS1.swi***, on the switch flash, as the EOS software image load file.

```
switch(config)#boot system flash:EOS.swi
switch(config)#
```

The **boot system** command above adds this line to ***boot-config***:

```
s
```

2.7.4 delete startup-config

The `delete startup-config` command erases or deletes the ***startup-config*** file.

Command Mode

Privileged EXEC

Command Syntax

`delete startup-config` [**CONFIRMATION**]

Parameters

CONFIRMATION confirmation for immediate erasure. Options include:

- ***no parameter*** the switch requires a confirmation before starting the erasure.
- **now** the erasure begins immediately without prompting the user to confirm the request.

Examples

- This command deletes the startup configuration from the switch. When the **`delete startup-config`** command is entered, the switch sends a message prompting the user to confirm the request.

```
switch#delete startup-config
Proceed with erasing startup configuration? [confirm]y
switch#
```

- This command deletes the startup configuration from the switch immediately without prompting.

```
switch#delete startup-config now
switch#
```

2.7.5 protocol

The **protocol** command configures how the supervisors on a modular switch will handle switchover events. By default, the switch is set to **route processor redundancy (RPR)**, which synchronizes ***startup-config*** files between the supervisor modules and partially boots the standby supervisor. The mode can also be set to **simplex** (manual switchover only) or to **stateful switchover (SSO)** which synchronizes both ***startup-config*** and ***running-config*** files between the supervisor modules and fully boots the standby module to speed the switchover process and minimize packet loss. Note that SSO synchronizes L2 state between the supervisors, but that L3 state is not synchronized. This can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

The **no protocol** and **default protocol** commands set the redundancy protocol to the default value (**rpr**) by removing the **protocol** command from ***running-config***.

Command Mode

Redundancy Configuration

Command Syntax

`protocol` {rpr | simplex | sso}

`no protocol`

`default protocol`

Parameters

- **rpr** route processor redundancy protocol (RPR, the default).
- **simplex** no redundancy. Switchover must be initiated manually.
- **sso** stateful switchover (SSO).

Related Commands

redundancy places switch in redundancy configuration mode.

Example

These commands enter redundancy configuration mode and set the redundancy protocol to SSO.

```
switch(config)#redundancy
switch(config-redundancy)#protocol sso
switch(config-redundancy)#
```

2.7.6 redundancy

The **redundancy** command places the switch in redundancy configuration mode.

Command Mode

Global Configuration

Command Syntax

```
redundancy
```

Commands Available in Redundancy Configuration Mode

protocol

Related Commands

redundancy manual switchover manually initiates a switchover.

Example

These commands enter redundancy configuration mode and set the redundancy protocol to stateful switchover.

```
switch(config)#redundancy
switch(config-redundancy)#protocol sso
switch(config-redundancy)#
```

2.7.7 redundancy manual switchover

The **redundancy manual switchover** command immediately switches control of the switch to the standby supervisor. If the redundancy mode is set to simplex or the standby supervisor is unavailable for any other reason, this command will not function.

Command Mode

Privileged EXEC

Command Syntax

```
redundancy manual switchover
```

Related Command

redundancy places the switch in redundancy configuration mode.

Example

This command forces a switchover to the standby supervisor. The switchover is executed immediately without further confirmation from the user.

```
switch#redundancy manual switchover
This supervisor will be restarted.
switch#
```

2.7.8 reload

The **reload** command power cycles the switch, then resets it under Aboot control. The hard reset clears the switch, including memory states and other hardware logic.

Note: The **reload fast-boot** and **reload hitless** commands are used to initiate Smart System Upgrade (SSU); for a description of this feature and the appropriate command syntax, refer to the Smart System Upgrade (Leaf SSU) section.

The command behaves differently in fixed and modular systems.

- **Fixed 1-RU systems**: the power supply remains powered up through the reset. Power is removed from all other switch components for two to five seconds.
- **Modular systems**: the power supply on the active supervisor remains powered up through the reset. Power is removed from all other supervisor components for at least one second. After the supervisor becomes functional, it manages the power-cycling of all line cards.

Command Mode

Privileged EXEC

Command Syntax

`reload` [**TARGET**] [**CONFIRMATION**]

Parameters

- **TARGET** specifies which supervisor(s) will be reset. Some options are available only on dual-supervisor switches. Options include:
  - ***no parameter*** the active supervisor is reset.
  - **all** both supervisors are reset.
  - **peer** the peer supervisor is reset.
  - **power** the active supervisor is reset.
- **CONFIRMATION** confirmation for immediate reset. Options include:
  - ***no parameter*** the switch requires a confirmation before starting the reset.
  - **now** the reset begins immediately without prompting the user to confirm the request.

Related Commands

- **reload (scheduled)** schedules a pending reload operation.
- **show reload cause** displays cause of most recent reload.

Examples

- Begin the reboot process by typing the **reload** command:

```
switch#reload
switch#
```

- When the **reload** command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request. In this example, the user does not save modifications to the system before reloading.

```
System configuration has been modified. Save? [yes/no/cancel/diff]:n
Proceed with reload? [confirm]y
```

- The switch responds by broadcasting a series of messages, including a notification that the system is being rebooted, to all open CLI instances. The reload pauses to provide an option for the user to enter Aboot shell; the Aboot shell supports commands that restore the state of the internal flash to factory defaults or create a customized default state.

```
Broadcast message from root@mainStopping sshd: [  OK  ]
```

```
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

- No action is required to continue the reset process. The switch displays messages to indicate the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

```
Booting flash:/EOS.swi

2.7.9 reload (scheduled)

The **reload (scheduled)** command configures the switch to reset at a specified time or after a specified interval. Refer to **reload** for the functional details of the reset operation.

The switch prompts to save the configuration and confirm the reload request. Once the request is confirmed, the switch resumes normal operation until the reload initiates.

The **reload cancel**, **no reload**, and **default reload** commands cancel the pending reload operation.

Command Mode

Privileged EXEC

Command Syntax

`reload` [all | power | **peer**] {at *hh:mm* [*month* | *day*] | in *hh:mm*} [force | reason]

`reload cancel`

`no reload`

`default reload`

Parameters

- **all** reloads all supervisors.
- **power** resets the active supervisor.
- **peer** resets the peer supervisor.
- **at** performs reload at specified times.
  - ***hh:mm*** specifies reload time in hours (0 to 23) and minutes (0 to 59). If no month and day are specified, reload occurs at the specified time on the day the command is issued.
    - ***month*** optionally specifies month of the year (Jan, Feb, etc.)
      - ***day*** day of the month. Values range from ***1*** to ***31***.
- **in** performs the reload after a specified delay.
  - ***hh:mm*** specifies delay before reload in hours (***0*** to ***23***) and minutes (***0*** to ***59***).
- **force** performs action immediately without prompting.
- **reason** enter text to display explaining the purpose of the reload.
- **cancel** cancels any existing reload request.

Related Commands

- **reload** initiates an immediate reload operation.
- **show reload** displays time and reason of any pending reload operation.

Examples

- This command schedules a switch reset to begin in 12 hours.

```
switch#reload in 12:00
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Proceed with reload? [confirm]
Reload scheduled for Tue Mar 27 05:57:25 2012 (in 11 hours 59 minutes)
switch#
```

- This command cancels a scheduled reset.

```
switch#no reload
Scheduled reload has been cancelled
switch#
```

- This command schedules a reload of the active supervisor to begin in 12 hours.

```
switch#reload power in 12:00
Reload scheduled for Thu Feb 13 18:56:01 2020 (in 11 hours 59 minutes)
switch#
```

2.7.10 show platform bios

The **`show platform bios`** **[history | detail]** command displays the BIOS versions on the switch.

Command Mode

EXEC

Command Syntax

`show platform bios`

Example

- This command displays the Running, Programmed and Fallback versions of Aboot.

```
switch#show platform bios
FixedSystem BIOS versions
  Location   Version
  ---------- ---------------------------------
  Running   Aboot-norcal9-9.0.5-13882759
  Programmed Aboot-norcal9-9.0.3-4core-13882759
  Fallback   Aboot-norcal9-9.0.3-4core-13882759
switch#
```

- This command displays the BIOS installation history.

```
switch#show platform bios history
Supervisor-1 BIOS version history

Timestamp           Version
------------------- ---------------------------------
2020-04-07 04:20:22 Aboot-norcal9-9.0.5-13882759
2020-04-05 08:32:03 Aboot-norcal9-9.0.3-4core-13882759

Supervisor-2 BIOS version history

Last update failed on 2020-04-15: Compatibility check failed.

Timestamp           Version
------------------- ---------------------------------
2020-04-05 08:32:09 Aboot-norcal9-9.0.5-13882759
switch#
```

- This command displays the BIOS installation history details.

```
switch#show platform bios history detail
Supervisor-1 BIOS version history

switch#
```

2.7.11 show redundancy file-replication

The **show redundancy file-replication** command displays the status and last synchronization date of file replication between the supervisors on the switch.

Command Mode

EXEC

Command Syntax

```
show redundancy file-replication
```

Related Commands

- **show redundancy status** displays status and redundancy protocol of supervisors.
- **show redundancy switchover sso** displays stateful switchover information since last reload.

Example

This command displays the current file replication status of the supervisors.

```
switch#show redundancy file-replication
0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files
 total.

File                    Status         Last Synchronized
----------------------- -------------- -----------------------
file:persist/sys        Synchronized   25 days, 19:48:26 ago
flash:startup-config    Synchronized   25 days, 19:48:26 ago
switch#
```

2.7.12 show redundancy status

The **show redundancy status** command displays the current status (active or standby) and the configured redundancy protocol of both supervisors, as well as summary information about the latest switchover event.

Command Mode

EXEC

Command Syntax

```
show redundancy status
```

Related Commands

- **show redundancy file-replication** displays status of file replication between supervisors.
- **show redundancy switchover sso** displays stateful switchover information since last reload.

Example

This command displays redundancy information for both supervisors and a summary of the latest switchover.

```
switch#show redundancy status
  my state = ACTIVE
peer state = STANDBY HOT
      Unit = Primary
   Unit ID = 1

Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
switchover completion timeout = 720.0 seconds (default)
Ready for switchover

  Last switchover time = 0:32:15 ago
Last switchover reason = Supervisor has control of the active supervisor
 lock
switch#
```

2.7.13 show redundancy switchover sso

The **show redundancy switchover sso** command displays the number of stateful switchovers since the last reload and a log of the events in the latest stateful switchover.

Command Mode

EXEC

Command Syntax

```
show redundancy switchover sso
```

Related Commands

- **show redundancy file-replication** displays status of file replication between supervisors.
- **show redundancy status** displays status and redundancy protocol of supervisors.

Example

This command displays stateful switchover information.

```
switch#show redundancy switchover sso
Total number of Stateful Switchover completed since reload: 4
```

```
Latest Stateful Switchover occured 29 days, 12:48:22 ago @ 2012-06-09
 19:47:50

switch#
```

2.7.14 show reload

The **show reload** command displays the time and reason of any pending reload operation. The **reload (scheduled)** command schedules a reload operation and can be used to cancel a pending reload.

Command Mode

EXEC

Command Syntax

```
show reload
```

Related Commands

- **reload (scheduled)** schedules a pending reload operation.
- **show reload cause** displays cause of most recent reload.

Example

These commands schedule a reload for 2:45 pm, display the time of the pending reload, then cancel the scheduled reload.

```
switch#reload at 14:45
Proceed with reload? [confirm]
Reload scheduled for Tue Mar 27 14:45:00 2012 ( in 4 hours 11 minutes )
switch#show reload

```

2.7.15 show reload cause

The **show reload cause** command displays the reason of the most recent reload operation. The command displays recommended actions and debug information related to the executed reload.

Command Mode

EXEC

Command Syntax

```
show reload cause
```

Related Commands

- **reload** initiates an immediate reload operation.
- **show reload** displays time and reason of all pending reload operations.

Example

This command displays the cause of the most recent reload operation.

```
switch#show reload cause
Reload Cause 1:
-------------------
Reload requested by the user.

Recommended Action:
-------------------
No action necessary.

Debugging Information:
----------------------
None available.
switch#
```

2.7.16 show reload fast-boot

The **show reload fast-boot** command verifies that the switch configuration is valid for Smart System Upgrade (SSU).

Command Mode

EXEC

Command Syntax

```
show reload fast-boot
```

Related Commands

- **reload** initiates an immediate reload operation.
- **show reload** displays time and reason of all pending reload operations.

Example

This command displays any reasons why SSU cannot be initiated and which features must be reconfigured to allow SSU to proceed.

```
switch# show reload fast-boot
'reload fast-boot' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

Chapter 3

Initial Configuration and Recovery

This chapter describes initial configuration and recovery tasks. Subsequent chapters provide details about features introduced in this chapter.

This chapter contains these sections:

3.1 Initial Switch Access

Arista network switches provide two initial configuration methods:

- Zero Touch Provisioning (ZTP) configures the switch without user interaction (Zero Touch Provisioning).
- Manual provisioning configures the switch through commands entered by a user through the CLI (Manual Provisioning).

3.1.1 Zero Touch Provisioning

Zero Touch Provisioning (ZTP) configures a switch without user intervention by downloading a startup configuration file (***startup-config***) or a boot script from a location specified by a DHCP server. Configuring the Network for ZTP describes network tasks required to set up ZTP.

The switch enters ZTP mode when it boots if flash memory does not contain a ***startup-config*** or ***zerotouch-config*** file. It remains in ZTP mode until a user cancels ZTP mode, or until the switch retrieves a ***startup-config*** or a boot script. After downloading a file through ZTP, the switch reboots again, using the retrieved file.

Security Considerations

The ZTP process cannot distinguish an approved DHCP server from a rogue DHCP server. For secure provisioning, you must ensure that only approved DHCP servers are able to communicate with the switch until after the ZTP process is complete. Arista also recommends validating the EOS image on your ZTP server by confirming that its MD5 checksum matches the MD5 checksum that can be found on the EOS download page of the Arista website.

On a UNIX server, the **md5sum** command calculates this checksum:

```
% md5sum EOS.swi
3bac45b96bc820eb1d10c9ee33108a25  EOS.swi
```

This command is also available on Arista switches from the CLI or from within the Bash shell.

```
switch#bash md5sum /mnt/flash/EOS-4.18.0F.swi
73435f0db3af785011f88743f4c01abd  /mnt/flash/EOS-4.18.0F.swi

switch#[admin@switch ~]$ md5sum /mnt/flash/EOS-4.18.0F.swi
```

```
73435f0db3af785011f88743f4c01abd /mnt/flash/EOS-4.18.0F.swi
[admin@switch ~]$
```

To provision the switch through Zero Touch Provisioning:

1. Mount the switch in its permanent location.
2. Connect at least one management or Ethernet port to a network that can access the DHCP server and the configuration file.
3. Provide power to the switch.

Note: ZTP will not initiate if flash memory contains either a ***startup-config*** or ***zerotouch-config*** file.

ZTP provisioning progress can be monitored through the console port. Console Port provides information for setting up the console port. Canceling Zero Touch Provisioning provides information for monitoring ZTP progress and canceling ZTP mode.

3.1.2 Manual Provisioning

Initial manual switch provisioning requires the cancellation of ZTP mode, the assignment of an IP address to a network port, and the establishment of an IP route to a gateway. Initial provisioning is performed through the serial console and Ethernet management ports.

- The console port is used for serial access to the switch. These conditions may require serial access:
  - management ports are not assigned IP addresses.
  - the network is inoperable.
  - the password for the users log on is not available.
  - the password to access the enable mode is not available.
- The Ethernet management ports are used for out-of-band network management tasks. Before using a management port for the first time, an IP address must be assigned to that port.

3.1.2.1 Console Port

The console port is a serial port located on the front of the switch. Figure 2: Switch Ports shows the console port on the DCS-7050T-64 switch. Use a serial or RS-232 cable to connect to the console port. The accessory kit also includes an RJ-45 to DB-9 adapter cable for connecting to the switch.

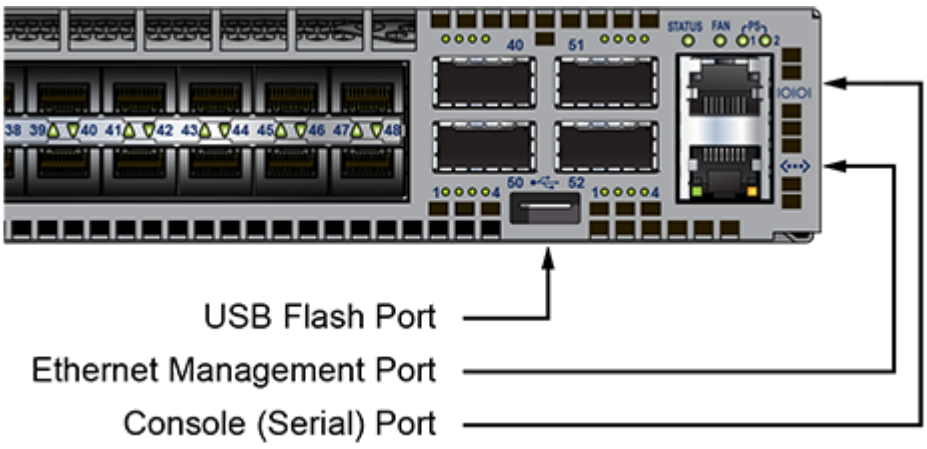

Figure 2: Switch Ports

Port Settings

Use these settings when connecting the console port:

- 9600 baud
- no flow control
- 1 stop bit
- no parity bits
- 8 data bits

Admin Username

The initial configuration provides one username, **admin**, that is not assigned a password. When using the **admin** username without a password, you can only log into the switch through the console port. After a password is assigned to the **admin** username, it can log into the switch through any port.

The username command modifies a specified username, and can be used to create or delete usernames, including **admin**.

Example

This command assigns the password **pxq123** to the **admin** username:

```
switch(config)#username admin secret pxq123
switch(config)#
```

New and altered passwords must be saved to the startup configuration file or they will be lost when the switch is rebooted.

Note: if the configuration is saved with all usernames deleted, it will be necessary to access the Aboot shell through the console port in order to log in to the switch.

3.1.2.2 Canceling Zero Touch Provisioning

Zero Touch Provisioning (ZTP) installs a ***startup-config*** file from a network location if flash memory does not contain a ***startup-config*** or ***zerotouch-config*** file when the switch reboots. Canceling ZTP is required if the switch cannot download a ***startup-config*** or boot script file.

When the switch boots without a ***startup-config*** or ***zerotouch-config*** file, it displays the following message through the console port:

```
No startup-config was found.

The device is in Zero Touch Provisioning mode and is attempting to
download the startup-config from a remote system. The device will not
be fully functional until either a valid startup-config is downloaded
from a remote system or Zero Touch Provisioning is cancelled. To cancel
Zero Touch Provisioning, login as admin and type 'zerotouch cancel'
at the CLI.

localhost login:
```

To cancel ZTP mode, log into the switch with the **admin** password, then enter the **zerotouch cancel** command. The switch immediately boots without installing a ***startup-config*** file.

```
localhost login: admin
admin
localhost>Apr 15 21:28:21 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending
 DHCP
request on  [ Ethernet10, Ethernet13, Ethernet14, Ethernet17,
 Ethernet18,
Ethernet21, E-thernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8,
Ethernet9, Management1, Management2 ]
```

```

Aboot 1.9.0-52504.EOS2.0
Press Control-C now to enter Aboot shell
```

To avoid entering ZTP mode on subsequent reboots, create a ***startup-config*** file as described in Step 8 of Ethernet Management Port.

3.1.2.3 Ethernet Management Port

Arista switches provide one or more Ethernet management ports for configuring the switch and managing the network out of band. Figure 2: Switch Ports shows the location of the Ethernet management ports on a DCS-7050T-64 switch. Only one port is required to manage the switch.

You can access the Ethernet management port(s) remotely over a common network or locally through a directly connected PC. Before you can access the switch through a remote connection, an IP address and a static route to the default gateway are required. On a modular switch with dual supervisors, a virtual IP address can also be configured to access the management port on whichever supervisor is active.

Assigning a Virtual IP Address to Access the Active Ethernet Management Port

On modular switches with dual supervisors, this procedure assigns a virtual IP address which will connect to the Ethernet management port of the active supervisor. (To assign a physical IP address to an individual Ethernet management port, see the following section.)

1. Connect a PC or terminal server to the console port. Use the settings listed in Console Port under Port Settings.
2. Type **admin** at the login prompt to log into the switch. Initial login through the console port does not require a password.

```
Arista EOS
switch login:admin
Last login: Fri Apr 9 14:22:18 on Console
switch>
```

3. Type **enable** at the command prompt to enter Privileged EXEC mode.

```
switch>enable
switch#
```

4. Type **configure terminal** (or **config**) to enter global configuration mode.

```
switch#configure terminal
switch(config)#
```

5. Type **interface management 0** to enter interface configuration mode for the virtual interface which accesses management port 1 on the currently active supervisor.

```
switch(config)#interface management 0
switch(config-if-Ma0)#
```

6. Type **ip address**, followed by the desired address, to assign a virtual IP address for access to the active management port.This command assigns IP address 10.0.2.5 to management port 0.

```
switch(config-if-Ma0)#ip address 10.0.2.5/24
```

7. Type **exit** at both the interface configuration and global configuration prompts to return to ***Privileged EXEC*** mode.

```
switch(config-if-Ma0)#exit
switch(config)#exit
switch#
```

8. Type **write** (or **copy running-config startup-config)** to save the new configuration to the ***startup-config*** file.

```
switch# write
switch#
```

Assigning an IP Address to a Specific Ethernet Management Port

This procedure assigns an IP address to a specific Ethernet management port:

1. Connect a PC or terminal server to the console port. Use the settings listed in Console Port under Port Settings.
2. Type **admin** at the login prompt to log into the switch. The initial login does not require a password.

```
Arista EOS
switch login:admin
Last login: Fri Apr 9 14:22:18 on Console
switch>
```

3. Type **enable** at the command prompt to enter Privileged EXEC mode.

```
switch>enable
switch#
```

4. Type **configure terminal** (or **config**) to enter global configuration mode.

```
switch#configure terminal
```

5. Type **interface management 1** to enter interface configuration mode. (Any available management port can be used in place of management port 1.)

```
switch(config)#interface management 1
switch(config-if-Ma1)#
```

6. Type **ip address**, followed by the desired address, to assign an IP address to the port. This command assigns the IP address 10.0.2.8 to management port 1.

```
switch(config-if-Ma1)#ip address 10.0.2.8/24
```

7. Type **exit** at both the interface configuration and global configuration prompts to return to Privileged EXEC mode.

```
switch(config-if-Ma1)#exit
 switch(config)#exit
switch#
```

8. Type **write** (or **copy running-config startup-config)** to save the new configuration to the ***startup-config*** file.

```
switch# write
switch#
```

Configuring a Default Route to the Gateway

This procedure configures a default route to a gateway located at 10.0.2.1.

1. Enter global configuration mode.

```
switch>enable
switch#configure terminal
```

2. Create a static route to the gateway with the IP route command.

```
switch(config)#ip route 0.0.0.0/0 10.0.2.1
```

3. Save the new configuration.

```
switch#write
switch#
```

3.2 Connection Management

The switch supports three connection methods:

- console
- SSH
- Telnet

The switch always enables console and SSH. Telnet is disabled by default.

Management commands place the switch in a configuration mode for changing session connection parameters.

Examples

- The management console command places the switch in console management mode:

```
switch(config)#management console
switch(config-mgmt-console)#
```

- The management ssh command places the switch in SSH management mode:

```
switch(config)#management ssh
switch(config-mgmt-ssh)#
```

- The management telnet command places the switch in Telnet management mode:

```
switch(config)#management telnet
```

```
switch(config-mgmt-telnet)#
```

- The **exit** command returns the switch to global configuration mode:

```
switch(config-mgmt-ssh)#exit
switch(config)#
```

The **idle-timeout** commands shown below configure the idle-timeout period for the connection type being configured. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

Examples

- This idle-timeout (SSH Management) command configures an SSH idle-timeout period of three hours.

```
switch(config)#management ssh
switch(config-mgmt-ssh)#idle-timeout 180
```

- This idle-timeout (Telnet Management) command disables automatic connection timeout for telnet connections.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#idle-timeout 0
```

- The shutdown (Telnet Management) command enables and disables Telnet on the switch.
- These commands enable Telnet.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#no shutdown
```

- These commands disable Telnet.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#shutdown
```

3.3 Switch Storage Device Secure Erase

Secure erase is used when all data must be securely removed from the flash and optional SSD storage device(s) within an Arista switch. It securely erases the storage devices whose partitions mount to **/mnt/crash**, **/mnt/drive**, and **/mnt/flash** (as applicable), then repartitions these storage devices and re-creates the file systems for each of their partitions. In other words, the partition table of each storage device is the exact same as before this secure erase procedure (MBR gets destroyed during a secure erase); each partition will have the same file system type and partition label, and be mounted to the same mount point with the same options. This makes it possible to boot the EOS again by installing a new boot-config and EOS SWI, then rebooting (which can be done using Aboot/fullrecover).

All secure erasing is best effort; we use firmware-based secure erase when available, and a software-based mechanism when the firmware mechanism might fail or be insufficient (e.g., writing random data even after sending an ATA Secure Erase command) or does not exist (e.g., eUSB). Unfortunately, no non-physically destructive mechanism can completely guarantee the destruction of all data on a storage device.

Note: Certain Arista switches have a dedicated storage device for serial console logging. While we do consider console output to be sensitive data, we do not secure erase this storage device.

Platform support and usage information regarding serial console logging can be found here: https://www.arista.com/en/support/toi/eos-4-21-0f/14038-reload-console-logs.

Preparing for Secure Erase

Always connect to the switch/supervisor via serial console prior to executing the CLI command described below. Executing the CLI command will leave the switch in Aboot; since the Aboot shell is only available from the serial console, a switch will only be accessible via its serial port after executing this command.

If a system has two supervisors, the redundancy state of the supervisor to be secure erased should be `standby`.

Performing Secure Erase

To securely erase the flash and optional SSD storage device(s) on supported platforms, use the **`reset system storage secure`** command.

Examples

The following commands check the redundancy status of the supervisor to be erased, then perform a switchover to change its status to `standby` preparatory to initiating the secure erase:

```
switch#show redundancy status
  my state = active
peer state = standby
switch#config
switch(config)#redundancy manual switchover
This supervisor will be restarted.
```

The following command securely erases data stored on the switch, excluding dedicated console-logging storage:

```
switch#reset system storage secure
WARNING! This will destroy all
data and will NOT be recoverable.
Device will reboot into Aboot, and
execution may take up to one hour.
Would you like to proceed? [y/N]y
```

3.4 Configure Session

The command **`configure session`** creates a configuration session in which CLI commands can be issued that do not take effect until the session is committed . Each **`configure session`** is saved with a unique name. A session can be entered, modified and exited at any time without impacting the currently running system configuration.

When a session is committed, the configuration that was modified during the session is copied into ***running-config***, overwriting any other configuration changes made since the session was created. A session can be aborted or removed, thereby removing the session completely and freeing up memory used by the session. The user must explicitly request that the changes in a deferred session be applied to the configuration of the router by entering a **`commit`** command and exiting the mode. Alternately, the user may abandon the changes by entering an **`abort`** command. An uncommitted configuration session will be discarded if the switch reboots and will time out after 24 hours.

Configuration sessions are used to make sets of changes, after verifying that there are no CLI errors. Configuration sessions allow the administrator to pre-provision a group of CLI commands in a named session, then execute each configuration session at specified times.

3.4.1 Configuration Session

The **configure session** command allows users to make a series of configuration changes in a temporary location and commit them to ***running-config*** at once by issuing the **commit** command.

- **configure session <name of session>** and ***running-config***: The user enters a session (versus **configure terminal** in the case where configuration sessions are not used). If a session name is not specified, a system named session is created. A snapshot of the current ***running-config*** is copied into the session's data structure as the basis of further configuration changes.
- CLI configuration commands: User can run any configuration commands inside the session.
- **rollback clean-config**: User can run **rollback** command to revert the sessions configuration to the factory-default configuration (or clean configuration).
- **show session-config**: User can run **show session-config** to show the sessions configuration, which will be the future ***running-config*** once committed.
- **commit**: User issues **commit** to commit the changes, which will replace the current ***running-config***.
- **abort**: To abort the session and throw away all changes.
- **exit**: User can **exit** from the session, and later return to the same session by running **configure session** again.
- For named session: More than one CLI instance can enter the same session and make changes to the session configuration. Once the session is committed in any of the CLIs, no other CLI can commit or make any other changes in that session.

Note: committing a configuration session replaces ***running-config*** with the session configuration, which consists of the running configuration at the time the session was initiated plus the commands that were entered as part of the session. Any changes that were made to ***running-config*** since the session was initiated will be overwritten when the session is committed.

3.4.2 Configure Replace

The command **configure replace <URL>** replaces the current ***running-config*** with the configuration saved in **<URL>**. By default, **configure replace <URL>** will replace ***running-config*** only if the configuration in **<URL>** loads without errors. The command **configure replace <URL> ignore-errors** forces the operation even if there are errors.

Note: The command **copy <URL> running-config** was typically used to apply a saved configuration file to the system, and append that configuration to the current ***running-config*** (in lieu of replacing it). However, Arista recommends using the CLI command **configure replace <URL>** to streamline the process of deterministically restoring the system back to a known good configuration.

The normal workflow internally uses a configuration session to perform the replace.

3.4.3 Configuration CLI

In the CLI, execute the following configuration steps to create a configuration session.

1. **configure session** [*name of session*]

   Create or enter a session. If a name is not specified, it is automatically generated. The user is put in the session configuration mode and the prompt will change to show the first six characters of the session name. Designating the name of a session is optional. When *name of session* is not specified, a unique name is assigned.

   ```
   no configure session  name of session
   ```

   Delete the specified configuration session. Designating the name of a session is required.

2. **`commit`**

   Commit the changes made in the session. This command must be issued from within the session configuration mode.

   ```
   abort
   ```

   Abort the session, which is the same as deleting it. This command must be issued from within the session configuration mode.
3. **`rollback clean-config`**

   Revert configuration in the session to the clean, factory-default configuration. This command must be issued from within the session configuration mode.
4. **`service configuration session max completed`** *number*

   Sets a limit on the maximum number of committed sessions that are saved.
5. **`service configuration session max pending`** *number*

   Sets a limit on the maximum number of uncommitted sessions that can be outstanding.

3.5 Recovery Procedures

These sections describe switch recovery procedures:

- Removing the Enable Password from the Startup Configuration
- Reverting the Switch to the Factory Default Startup Configuration
- Restoring the Factory Default EOS Image and Startup Configuration
- USB Support for ZeroTouch Provisioning
- Restoring the Configuration and Image from a USB Flash Drive

The first three procedures require Aboot Shell access through the console port. If the console port is not accessible, use the last procedure in the list to replace the configuration file through the USB Flash Drive.

1 describes the switch booting process and includes descriptions of the Aboot shell, Aboot boot loader, and required configuration files.

3.5.1 Removing the Enable Password from the Startup Configuration

The **`enable password`** controls access to Privileged EXEC mode. To prevent unauthorized disclosure, the switch stores the **`enable password`** as an encrypted string that it generates from the clear-text password. When the switch authentication mode is local and an **`enable password`** is configured, the CLI prompts the user to enter the clear-text password after the user types enable at the EXEC prompt.

The ***startup-config*** file stores the encrypted **`enable password`** to ensure that the switch loads it when rebooting. If the text version of the **`enable password`** is lost or forgotten, access to enable mode is restored by removing the encrypted **`enable password`** from the startup configuration file.

Note: During the recovery process, in a system containing more than one supervisor, the secondary supervisor must be physically removed from the system. This ensures the previous configuration is not recovered from the secondary supervisor upon reboot during the recovery process.

This procedure restores access to enable mode without changing any other configuration settings.

1. Access the Aboot shell:
   a. Power cycle the switch by successively removing and restoring access to its power source.
   b. Type **Ctrl-C** when prompted, early in the boot process.

   c. Enter the Aboot password, if prompted. If the Aboot password is unknown, refer to Restoring the Factory Default EOS Image and Startup Configuration for instructions on reverting all flash directory contents to the factory default, including the startup configuration and EOS image.
2. Change the active directory to /mnt/flash directory.

```
Aboot#cd /mnt/flash
```

3. Open the startup-config file in vi.

```
Aboot#vi startup-config
```

4. Remove the enable password line.

   This is an example of an enable password line:

```
enable password 5 $1$dBXo2KpF$Pd4XYLpI0ap1ZaU7glG1w/
```

5. Save the changes and exit vi.
6. Exit Aboot. This boots the switch.

```
Aboot#exit
```

3.5.2 Reverting the Switch to the Factory Default Startup Configuration

The ***startup-config*** file contains configuration parameters that the switch uses during a boot. Parameters that do not appear in ***startup-config*** are set to their factory defaults when the switch reloads. The process requires the Aboot password if Aboot is password protected.

This procedure reverts EOS configuration settings to the default state through bypassing the ***startup-config*** file during a switch boot.

1. Access the Aboot shell through the console port:
   a. Type reload at the Privileged EXEC prompt.
   b. Type **Ctrl-C** when prompted, early in the boot process.
   c. Enter the Aboot password, if prompted. If the Aboot password is unknown, refer to Restoring the Factory Default EOS Image and Startup Configuration for instructions on reverting all flash directory contents to the factory default, including ***startup-config*** and EOS image.
2. Change the active directory to **/mnt/flash** directory.

```
Aboot#cd /mnt/flash
```

3. Rename the startup configuration file.

```
Aboot#mv startup-config startup-config.old
```

4. Exit Aboot. This boots the switch.

```
Aboot#exit
```

5. Cancel Zero Touch Provisioning (ZTP). Refer to Canceling Zero Touch Provisioning for instructions.

   If ZTP is not canceled, the switch either:

   - boots, using the ***startup-config*** file or boot script that it obtains from the network, or
   - remains in ZTP mode if the switch is unable to download a ***startup-config*** file or boot script.
6. Configure the **admin** and **enable** passwords.

```
switch>enable
switch#configure terminal
switch(config)#enable password xyz1
```

```
switch(config)#username admin secret abc41
```

7. Save the new ***running-config*** to the startup configuration file.

```
switch#write
```

8. (Optional) Delete the old startup configuration file.

```
switch#delete startup-config.old
```

After ZTP is canceled, the switch reboots, using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a ***startup-config*** file before the next switch reboot.

3.5.3 Restoring the Factory Default EOS Image and Startup Configuration

A **`fullrecover`** command removes all internal flash contents (including configuration files, EOS image files, and user files), then restores the factory default EOS image and ***startup-config***. A subsequent installation of the current EOS image may be required if the default image is outdated. This process requires Aboot shell access through the console port.

Note: For hardware that is purchased after June 2017, the factory default partition will not have the backup EOS software image. This is done to increase the flash size on smaller flash disks and also since other options are available in the **`fullrecover`** command functionality to restore factory default EOS image. This is applicable to both fixed system and modular system hardware.

This procedure restores the factory default EOS image and startup configuration.

1. Access the Aboot shell through the console port:
   a. Type reload at the Privileged EXEC prompt.
   b. Type **Ctrl-C** when prompted, early in the boot process.
   c. Enter the Aboot password, if prompted. If the Aboot password is not known, enter an empty password three times, after which the CLI displays:

```
Type "fullrecover" and press Enter to revert /mnt/flash to factory
 default state, or just press Enter to reboot:
```

   d. Type **fullrecover** and go to 4 .
2. Type **fullrecover** at the Aboot prompt.

```
Aboot#fullrecover
```

Aboot displays this warning:

```
All data on /mnt/flash will be erased; type "yes" and press Enter to
 proceed, or just press Enter to cancel:
```

3. Type **yes** and press **Enter**.

The switch performs these actions:

- erases the contents of /mnt/flash
- writes new boot-config, startup-config, and EOS.swi files to /mnt/flash
- returns to the Aboot prompt

4. Exit Aboot. This boots the switch.

```
Aboot#exit
```

The serial console settings are restored to their default values (9600/N/8/1/N).

5. Reconfigure the console port if non-default settings are required.

6. Cancel Zero Touch Provisioning (ZTP). Refer to Canceling Zero Touch Provisioning for instructions.

   If ZTP is not canceled, the switch either:

   - boots, using the ***startup-config*** file or boot script that it obtains from the network, or
   - remains in ZTP mode if the switch is unable to download a ***startup-config*** file or boot script.

   After ZTP is canceled, the switch reboots, using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a ***startup-config*** file before the next switch reboot.

3.5.4 USB Support for ZeroTouch Provisioning

Use **Arista's Zero Touch Provisioning** to configure a switch without user intervention. The USB adds another way to provide the bootstrap-name and to verify the authenticity of the file-server.

3.5.4.1 USB Deployment

By using a USB drive during ZTP, the following features are possible:

1. Specify the location of the bootstrap file instead of using DHCP Option 67.
2. Provide the ***x509*** root of trust for verifying the bootstrap download location.
3. Provide the enrollment token for CloudVision Service customers.

3.5.4.2 Configuration

A USB containing a *yaml configuration* file is plugged into the Arista EOS switch before powering on the switch.

The configuration (**<USB-ROOT>/ztp/ztpConfig.yaml**) should look like this:

```
"bootstrapUrl"
 "serverCaCertificate"
 "enrollmentToken"
"version": "1.0"
```

bootstrapUrl: URL for bootstrap file, such as **https://cvp/config.py**.

```
"bootstrapUrl"
```

serverCaCertificate: path for ***x509*** root of trust for the remote file server on the USB, such as **"ca.crt"**.

```
"serverCaCertificate"
```

enrollmentToken: path for enrollment token on the USB, such as **"token.tok"**

```
"enrollmentToken"
```

All ZTP related files, **serverCaCertificate** and **enrollmentToken**, should be present in (**<USB-ROOT>/ztp/*),** and the location is to be specified in the ztpConfiguration **yaml w.r.t** to this folder.

```
"version": "1.0"
```

All the fields are optional. For example, this is a valid configuration. It will act as though there is no USB in place.

```
"bootstrapUrl"
 "serverCaCertificate"
 "enrollmentToken"
```

```
"version": "1.0"
```

- The following is a sample of configuration which is fully filled out. The structure of the USB drive is:
- USB Drive Roo
  - **ca.crt**
  - **token.tok**

```
"bootstrapUrl"
 "serverCaCertificate"
 "enrollmentToken"
"version": "1.0"
```

3.5.4.3 Advantages

- DHCP Server no longer needs to have Option 67 configured.
- The boot script location can now undergo additional checks such as validating the endpoint prior to downloading and running the boot script.
- Customers wishing to enroll their devices in the CloudVision Service have an easy means to do so.

3.5.5 Restoring the Configuration and Image from a USB Flash Drive

The USB flash drive port can be used to restore an original configuration when you cannot establish a connection to the console port. This process removes the contents of the internal flash drive, restores the factory default configuration, and installs a new EOS image from the USB flash drive.

This procedure restores the factory default configuration and installs an EOS image stored on a USB flash drive.

1. Prepare the USB flash drive:
   a. Verify the drive is formatted with MS-DOS or FAT file system. Most USB drives are pre-formatted with a compatible file system.
   b. Create a text file named **fullrecover** on the USB flash drive. The filename does not have an extension. The file may be empty.
   c. Create a text file named **boot-config**. The last modified timestamp of the **boot-config** file on the USB flash must differ from the timestamp of the **boot-config** file on the switch.
   d. Enter this line in the new **boot-config** file on the USB flash:

      ```
      SWI=flash:EOS.swi
      ```

   e. Copy an EOS image file to the flash drive. Rename it **EOS.swi** if it has a different file name. For best results, the flash drive should contain only these three files, because the procedure copies all files and directories on the USB flash drive to the switch.
      - fullrecover
      - boot-config
      - EOS.swi
2. Insert the USB flash drive into the USB flash port on the switch, as shown in Figure 2: Switch Ports.
3. Connect a terminal to the console port and configure it with the default terminal settings (9600/N/8/1) to monitor progress messages on the console.
4. Power up or reload the switch.

   The switch erases internal flash contents and copies the files from the USB flash drive to internal flash. The switch then boots automatically.
5. Cancel Zero Touch Provisioning (ZTP). Refer to Canceling Zero Touch Provisioning for instructions.

   If ZTP is not canceled, the switch either:
   - boots, using the startup-config file or boot script that it obtains from the network, or

- remains in ZTP mode if the switch is unable to download a ***startup-config*** file or boot script.

After ZTP is canceled, the switch reboots using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a ***startup-config*** file before the next switch reboot.

3.6 Session Management Commands

Global Configuration Commands

- configure replace
- configure session
- management api eos-sdk-rpc
- management api external-services
- management api gnmi
- management api gnsi
- management api gribi
- management api http-commands
- management api models
- management api netconf
- management api restconf
- management console
- management ssh
- management telnet
- management xmpp
- reset system storage secure

Management Configuration Commands

- domain (XMPP Management)
- idle-timeout (Console Management)
- idle-timeout (SSH Management)
- idle-timeout (Telnet Management)
- protocol http (API Management)
- protocol https (API Management)
- protocol https certificate (API Management)
- server (XMPP Management)
- session privilege (XMPP Management)
- shutdown (API Management)
- shutdown (Telnet Management)
- shutdown (XMPP Management)
- switch-group (XMPP Management)
- username (XMPP Management)
- vrf (API Management)
- vrf (XMPP Management)
- xmpp send
- xmpp session

Display Commands

- show inventory
- show xmpp neighbors
- show xmpp status
- show xmpp switch-group

3.6.1 configure replace

The **`configure replace`** command replaces the current configuration with the new configuration from the specified source.

Command Mode

Privileged EXEC

Command Syntax

`configure replace` {***source_file_path:source_file_name*** | boot-extensions | clean-config | installed-extensions | running-config | startup-config}[ignore-errors] [md5 *md5sum*] [skip-checkpoint]

Parameters

- ***source_file_path:source_file_name*** replaces current configuration with the configuration from the specified source file.
- **boot-extensions** replaces current configuration with the boot extensions configuration.
- **clean-config** replaces current configuration with clean and default configurations.
- **installed-extensions** replaces current configuration with the installed extensions configuration.
- **running-config** obsolete.
- **starup-config** replaces current configuration with the startup configuration.
- **ignore-errors** ignores errors while loading the new configuration.
- **md5** *md5sum* performs a checksum to validate data integrity with the specified MD5 hashing algorithm.
- **skip-checkpoint** skips creating the checkpoint file of ***running-config***.

Example

This command replaces the current configuration state with the startup configuration.

```
switch(config)# configure replace start-config
! Preserving static routes. Use 'no ip routing delete-static-
routes' to clear
them.
switch#
```

3.6.2 configure session

The **configure session** command allows a series of configuration changes to be made in a temporary location, then commited to ***running-config*** later by issuing the **commit** command. An uncommitted configuration session will be discarded if the switch reboots and will time out after 24 hours.

Note: committing a configuration session replaces ***running-config*** with the session configuration, which consists of the running configuration at the time the session was initiated plus the commands that were entered as part of the session. Any changes that were made to ***running-config*** since the session was initiated will be overwritten when the session is committed.

The **no configure session** *session_name* and **default configure session** ***session_name*** commands delete the specified configuration session.

Command Mode

Privileged EXEC

Command Syntax

configure session [***session_name***]

no configure session ***session_name***

default configure session ***session_name***

Parameter

session_name session name.

Guidelines

- If a session name is not specified, a session is created with a name generated by the systems.
- The switch permits up to five uncommitted sessions.
- Any uncommitted sessions are discarded when the switch reboots.
- Uncommitted sessions time out after 24 hours.

Example

This command creates a session (automatically named ***sess-1***) and adds commands to it. Issuing the **commit** command would cause all of the commands to be executed and would overwrite any configuration performed since the session was created.

```
switch(config)# configure session
switch(config-s-sess-1)# no username kevin
switch(config-s-sess-1)# aaa authentication dot1x default group
 radius
switch(config-s-sess-1)# dot1x system-auth-control
switch(config-s-sess-1)# copy running-config startup-config
switch(config-s-sess-1)# reload all now
switch(config-s-sess-1)#
```

3.6.3 domain (XMPP Management)

The **domain** command configures the switchs XMPP domain name. Only messages using a domain matching the locally configured one are accepted by the XMPP client. The switch's domain name is used if none is specified.

Management over XMPP is disabled by default. To enable it, you must provide the location of the server along with the domain, username and password for the switch.

Arista recommends configuring the XMPP domain before the username, because it will provide shortcuts for the **switch-group** and **username** so they can be configured without the domain attached to it (e.g., USERNAME instead of USERNAME@DOMAIN).

The **no domain** and **default domain** commands delete the domain name by removing the **domain** command from ***running-config***.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

domain ***string***

no domain

default domain

Parameters

string domain name (text string).

Examples

- This command configures *test.aristanetworks.com* as the switchs domain name.

```
switch(config)# management xmpp
test1(config-mgmt-xmpp)# server arista-xmpp
test1(config-mgmt-xmpp)# domain test.aristanetworks.com
test1(config-mgmt-xmpp)# username test1@test.aristanetworks.
com password 0 arista
test1(config-mgmt-xmpp) #no shutdown
```

- This command removes the domain name from the XMPP *configuration*.

```
switch(config-mgmt-xmpp)# no domain
switch(config-mgmt-xmpp)#
```

3.6.4 idle-timeout (Console Management)

The **idle-timeout (Console Management)** command configures the idle-timeout period for console connection sessions. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The **no idle-timeout** and **default idle-timeout** commands disables the automatic connection timeout by removing the **idle-timeout** statement from ***running-config***.

Command Mode

Mgmt-console

Command Syntax

idle-timeout ***idle_period***

no idle-timeout

default idle-timeout

Parameters

idle_period session idle-timeout length. Options include:

- ***0*** Automatic connection timeout is disabled.
- ***1 to 86400*** Automatic timeout period (minutes).

Example

- These commands configure a console idle-timeout period of three hours, then return the switch to global configuration mode.

```
switch(config)# management console
switch(config-mgmt-console)# idle-timeout 180
switch(config-mgmt-console)# exit
switch(config)#
```

- These commands disable automatic connection timeout.

```
switch(config)# management console
switch(config-mgmt-console)# idle-timeout 0
switch(config-mgmt-console)#
```

3.6.5 idle-timeout (SSH Management)

The **idle-timeout (SSH Management)** command configures the idle-timeout period for SSH connection sessions. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The **no idle-timeout** and **default idle-timeout** commands disables the automatic connection timeout by removing the **idle-timeout** statement from ***running-config***.

Command Mode

Mgmt-ssh Configuration

Command Syntax

idle-timeout ***idle_period***

no idle-timeout

default idle-timeout

Parameters

idle_period session idle-timeout length. Options include:

- ***0*** Automatic connection timeout is disabled.
- ***1 to 86400*** Automatic timeout period (minutes).

Example

- These commands configure an ssh idle-timeout period of three hours, then return the switch to global configuration mode.

```
switch(config)# management ssh
switch(config-mgmt-ssh)# idle-timeout 180
switch(config-mgmt-ssh)# exit
switch(config)#
```

- These commands disable automatic connection timeout.

```
switch(config)# management ssh
switch(config-mgmt-ssh)# idle-timeout 0
switch(config-mgmt-ssh)#
```

3.6.6 idle-timeout (Telnet Management)

The **idle-timeout (Telnet Management)** command configures the idle-timeout period for Telnet connection sessions. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The **no idle-timeout** and **default idle-timeout** commands disables the automatic connection timeout by removing the **idle-timeout** statement from ***running-config***.

Command Mode

Mgmt-telnet

Command Syntax

idle-timeout ***idle_period***

no idle-timeout

default idle-timeout

Parameters

idle_period session idle-timeout length. Options include:

- ***0*** Automatic connection timeout is disabled.
- ***1 to 86400*** Automatic timeout period (minutes).

Examples

- These commands configure a telnet idle-timeout period of three hours, then return the switch to ***global configuration mode***.

```
switch(config)# management telnet
switch(config-mgmt-telnet)# idle-timeout 180
switch(config-mgmt-telnet)# exit
switch(config)#
```

- These commands disable automatic connection timeout.

```
switch(config)# management telnet
switch(config-mgmt-telnet)# idle-timeout 0
switch(config-mgmt-telnet)#
```

3.6.7 management api eos-sdk-rpc

The **management api eos-sdk-rpc** command places the switch in EOS SDK RPC API management configuration mode.

The **no management api eos-sdk-rpc** and **default management api eos-sdk-rpc** commands delete the mgmt-api-eos-sdk-rpc configuration mode statements from ***running-config***.

EOS SDK RPC API management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting EOS SDK RPC API management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api eos-sdk-rpc

no management api eos-sdk-rpc

default management api eos-sdk-rpc

Commands Available in EOS SDK RPC API Configuration Mode

- **transport (EOS SDK RPC API Management)**

Examples

- This command places the switch in EOS SDK RPC API management configuration mode.

```
switch(config)#management api eos-sdk-rpc
switch(config-mgmt-api-eos-sdk-rpc)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-eos-sdk-rpc)#exit
switch(config)#
```

3.6.8 management api external-services

The **management api external-services** command places the switch in External Services API configuration mode.

The **no management api external-services** and **default management api external-services** commands delete the mgmt-api-external-services configuration mode statements from ***running-config***.

External Services API configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting External Services API configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api external-services

no management api external-services

default management api external-services

Commands Available in Mgmt-API Configuration Mode

- **shutdown (External Services API Management)**
- **vrf (External Services API Management)**

Examples

- This command places the switch in External Services API Management configuration mode.

```
switch(config)# management api external-services
switch(config-mgmt-api-external-services)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-external-services)# exit
switch(config)#
```

3.6.9 management api gnmi

The **management api gnmi** command places the switch in GNMI API Management configuration mode.

The **no management api gnmi** and **default management api gnmi** commands delete the mgmt-api-gnmi configuration mode statements from ***running-config***.

GNMI API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting GNMI API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api gnmi

no management api gnmi

default management api gnmi

Commands Available in Mgmt-API Configuration Mode

- **operation (GNMI API Management)**
- **provider (GNMI API Management)**
- **transport (GNMI API Management)**

Examples

- This command places the switch in GNMI API Management configuration mode.

```
switch(config)# management api gnmi
switch(config-mgmt-api-gnmi)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-gnmi)# exit
switch(config)#
```

3.6.10 management api gnsi

The **management api gnsi** command places the switch in GNSI API management configuration mode.

The **no management api gnsi** and **default management api gnsi** commands delete the mgmt-api-gnsi configuration mode statements from ***running-config***.

GNSI API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting GNSI API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api gnsi

no management api gnsi

default management api gnsi

Commands Available in GNSI API Management Configuration Mode

- **service (GNSI API Management)**
- **transport (GNSI API Management)**

Examples

- This command places the switch in GNSI API Management configuration mode.

```
switch(config)# management api gnsi
switch(config-mgmt-api-gnsi)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-gnsi)# exit
switch(config)#
```

3.6.11 management api gribi

The **management api gribi** command places the switch in gRIBI API Management configuration mode.

The **no management api gribi** and **default management api gribi** commands delete the mgmt-api-gribi configuration mode statements from ***running-config***.

gRIBI API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting gRIBI API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api gribi

no management api gribi

default management api gribi

Commands Available in gRIBI API Management Configuration Mode

- **transport (gRIBI API Management)**

Examples

- This command places the switch in gRIBI API Management configuration mode.

```
switch(config)# management api gribi
switch(config-mgmt-api-gribi)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-gribi)# exit
switch(config)#
```

3.6.12 management api http-commands

The **management api http-commands** command places the switch in HTTP Commands API Management configuration mode.

The **no management api http-commands** and **default management api http-commands** commands delete the mgmt-api-http-command configuration mode statements from ***running-config***.

HTTP Commands API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting HTTP Commands API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api http-commands

no management api http-commands

default management api http-commands

Commands Available in HTTP Commands API Management Configuration Mode

- **protocol http (API Management)**
- **protocol https (API Management)**
- **protocol https certificate (API Management)**
- **protocol shutdown (API Management)**
- **protocol vrf (API Management)**

Examples

- This command places the switch in HTTP Commands API Management configuration mode.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-http-cmds)# exit
switch(config)#
```

3.6.13 management api models

The **management api models** command places the switch in Models API Management configuration mode.

The **no management api models** and **default management api models** commands delete the mgmt-api-models configuration mode statements from ***running-config***.

Models API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting Models API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api models

no management api models

default management api models

Commands Available in Models API Management Configuration Mode

- **models (Models API Management)**
- **modules (Models API Management)**
- **provider (Models API Management)**

Examples

- This command places the switch in Models API Management configuration mode.

```
switch(config)# management api models
switch(config-mgmt-api-models)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-models)# exit
switch(config)#
```

3.6.14 management api netconf

The **management api netconf** command places the switch in Netconf API Management configuration mode.

The **no management api netconf** and **default management api netconf** commands delete the mgmt-api-netconf configuration mode statements from ***running-config***.

Netconf API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting Netconf API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api netconf

no management api netconf

default management api netconf

Commands Available in Netconf API Management Configuration Mode

- **transport (Netconf API Management)**

Examples

- This command places the switch in Netconf API Management configuration mode.

```
switch(config)# management api netconf
switch(config-mgmt-api-netconf)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-netconf)# exit
switch(config)#
```

3.6.15 management api restconf

The **management api restconf** command places the switch in Restconf API Management configuration mode.

The **no management api restconf** and **default management api restconf** commands delete the mgmt-api-restconf configuration mode statements from ***running-config***.

Restconf API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting Restconf API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management api restconf

no management api restconf

default management api restconf

Commands Available in Restconf API Management Configuration Mode

- **transport (Restconf API Management)**

Examples

- This command places the switch in Restconf API Management configuration mode.

```
switch(config)# management api restconf
switch(config-mgmt-api-restconf)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-restconf)# exit
switch(config)#
```

3.6.16 management console

The **`management console`** command places the switch in mgmt-console configuration mode to adjust the idle-timeout period for console connection sessions. The idle-timeout period determines the inactivity interval that terminates a connection session.

The **`no management console`** and **default management console** commands delete mgmt-console configuration mode statements from ***running-config***.

The ***mgmt-console*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***mgmt-console*** configuration mode does not affect ***running-config***. The **`exit`** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

`management console`

`no management console`

`default management console`

Commands Available in mgmt-console Configuration Mode

idle-timeout (Console Management)

Examples

- This command places the switch in mgmt-console configuration mode:

```
switch(config)# management console
switch(config-mgmt-console)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-console)# exit
switch(config)#
```

3.6.17 management ssh

The **management ssh** command places the switch in mgmt-ssh configuration mode to adjust SSH session connection parameters.

The **no management ssh** and **default management ssh** commands delete the ***mgmt-ssh*** configuration mode statements from ***running-config***.

The ***mgmt-ssh*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***mgmt-ssh*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

management ssh

no management ssh

default management ssh

Commands Available in Mgmt-ssh Configuration Mode

- **authentication mode (Management-SSH)**
- **cipher (Management-SSH)**
- **fips restrictions (Management-SSH)**
- **hostkey (Management-SSH)**
- **idle-timeout (Management-SSH)**
- **ip access group (Management-SSH)**
- **ipv6 access group (Management-SSH)**
- **login timeout (Management-SSH)**
- **key-exchange (Management-SSH)**
- **mac hmac (Management-SSH)**
- **server-port (Management-SSH)**
- **shutdown (Management-SSH)**
- **vrf** (Management-SSH)

Examples

- This command places the switch in mgmt-ssh configuration mode:

```
switch(config)# management ssh
switch(config-mgmt-ssh)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-ssh)# exit
switch(config)#
```

3.6.18 management telnet

The **`management telnet`** command places the switch in mgmt-telnet configuration mode to adjust telnet session connection parameters.

The **`no management telnet`** and **`default management telnet`** commands delete the mgmt-telnet configuration mode statements from ***running-config***.

The **mgmt-telnet configuration mode** is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***mgmt-telnet configuration mode*** does not affect ***running-config***. The **`exit`** command returns the switch to ***global configuration mode***.

Command Mode

Global Configuration

Command Syntax

`management telnet`

`no management telnet`

`default management telnet`

Commands Available in mgmt-telnet Configuration Mode

- **`idle-timeout` (Management-Telnet)**
- **`ip access group` (Management-Telnet)**
- **`ipv6 access group` (Management-Telnet)**
- **`shutdown` (Management-Telnet)**
- **`vrf` (Management-Telnet)**

Examples

- This command places the switch in mgmt-telnet configuration mode:

```
switch(config)# management telnet
switch(config-mgmt-telnet)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-telnet)# exit
switch(config)#
```

3.6.19 management xmpp

The **management xmpp** command places the switch in mgmt-xmpp configuration mode. Management over XMPP is disabled by default. To enable XMPP, you must provide the location of the XMPP server along with the username and password for the switch.

The **no management xmpp** and **default management xmpp** commands delete the mgmt-xmpp configuration mode statements from ***running-config***.

The ***mgmt-xmpp*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***mgmt-xmpp*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to ***global configuration mode***.

Command Mode

Global Configuration

Command Syntax

management xmpp

no management xmpp

default management xmpp

Commands Available in Mgmt-xmpp Configuration Mode

- **domain (Management-xmpp)**
- **server (Management-xmpp)**
- **session (Management-xmpp)**
- **shutdown (Management-xmpp)**
- **switch-group (Management-xmpp)**
- **username (Management-xmpp)**
- **vrf (Management-xmpp)**

Examples

- This command places the switch in ***mgmt-xmpp configuration mode***:

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)#
```

- This command returns the switch to ***global*** management mode:

```
switch(config-mgmt-xmpp)#exit
switch(config-mgmt-xmpp)#
```

3.6.20 protocol http (API Management)

The **`protocol http`** command enables the hypertext transfer protocol (HTTP) server.

The **`no protocol http`** and **`default protocol http`** commands disable the HTTP server by removing the **protocol http** statement from ***running-config***.

Command Mode

Mgmt-API Configuration

Command Syntax

`protocol http` [**TCP_PORT**]

`no protocol http`

`default protocol http`

Parameters

- **TCP_PORT** Port number to be used for the HTTP server. Options include:
  - ***no parameter*** Specifies default ***port number 80***.
  - **port *1 to 65535*** Specifies HTTP server port number. Value ranges from ***1*** to ***65535***.
- **localhost** The name of the server bound on the localhost.
- **port** The number of the TCP port to serve on.

Related Commands

management api http-commands places the switch in ***mgmt-api configuration mode***.

Example

These commands enables the management API for the HTTP server.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)#
```

3.6.21 protocol https (API Management)

The **`protocol https`** command enables the HTTP secure server. The HTTP secure server is active by default.

The **`default protocol https`** command restores the default setting by removing the **`no protocol https`** statement from ***running-config***. The **`no protocol https`** command disables the HTTP secure server.

Command Mode

Mgmt-API Configuration

Command Syntax

`protocol https` [**TCP_PORT**]

`no protocol https`

`default protocol https`

Parameters

- **TCP_PORT** Port number to be used for the HTTPS server. Options include:
  - ***no parameter*** Specifies default ***port number 443***.
  - **port *1 to 65535*** Specifies HTTP server port number. Value ranges from ***1*** to ***65535***.
- **certificate** The HTTPS key and certificate to use.
- **cipher** Exclusive list of cryptographic ciphers.
- **key-exchange** Exclusive list of key-exchange algorithms.
- **mac** Exclusive list of MAC algorithms.
- **port** The number of the TCP port to serve on.
- **ssl** Configure SSL options.

Related Commands

management api http-commands places the switch in ***mgmt-api configuration mode***.

Examples

- These commands enables service to the HTTP server. The **`no shutdown`** command allows access to the service.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# protocol https
switch(config-mgmt-api-http-cmds)# no shutdown
```

- These commands specifies the port number that should be used for the HTTPS server. The **`no shutdown`** command allows access to the service.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# protocol https port 52
switch(config-mgmt-api-http-cmds)# no shutdown
```

3.6.22 protocol https certificate (API Management)

The **`protocol https certificate`** command configures the HTTP secure server to request an X.509 certificate from the client. The client then authenticates the certificate with a public key.

The **`no protocol https certificate`** and **`default protocol https certificate`** commands restore default behavior by removing the **`protocol https certificate`** statement from ***running-config***.

Command Mode

Mgmt-API Configuration

Command Syntax

`protocol https certificate`

`no protocol https certificate`

`default protocol https certificate`

Related Command

management api http-commands places the switch in ***mgmt-api configuration mode***.

Example

These commands configure the HTTP secure server to request an X.509 certificate from the client for authentication.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# protocol https certificate
switch(config-mgmt-api-http-cmds)#
```

3.6.23 reset system storage secure

Use the **reset system storage secure** command to trigger the secure erase mechanism. A secure erase is generally defined as a command that deliberately, permanently, and irreversibly removes/destroys the data stored on a storage device, rendering that data unrecoverable.

Command Mode

EXEC

Command Syntax

reset system storage secure

Examples

- To trigger the secure erase mechanism, use the **reset system storage secure** command.

```
switch# reset system storage secure
WARNING! This will destroy all
data and will NOT be recoverable.
Device will reboot into Aboot, and
execution may take up to one hour.
Would you like to proceed? [y/N]
```

- If a particular platform does not support the **reset system storage secure** command , the following message will appear:

```
switch# reset system storage secure
% Unavailable command (not supported on this hardware platform)
```

3.6.24 server (XMPP Management)

The **server** command adds a XMPP server to ***running-config***. Multiple XMPP servers can be set up for redundancy. For redundant configurations, the XMPP server location should be a DNS name and not a raw IP address. The DNS server is responsible for returning the list of available XMPP servers, which the client can go through until an accessible server is found.

User authentication is provided by the XMPP server. Command authorization can be provided by EOS local configuration or TACACS+. The XMPP server should use the same authentication source as the switches. RADIUS is not supported as an XMPP authorization mechanism.

The **no server** and **default server** commands remove the specified XMPP server from ***running-config***.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

server **SERVER_NAME** [**SERVER_PORT**]

no server

default server

Parameters

- **SERVER_NAME** XMPP server location. Options include:
  - ***IP address*** in dotted decimal notation.
  - a host name for the XMPP server.
- **SERVER_PORT** Server port. Options include:
  - **port *1 to 65535*** where *number* ranges from ***1*** to ***65535***. If no port is specified, the default ***port 5222*** is used.

Examples

- This command configures the server hostname **arista-xmpp to server port 1**.

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)# server arista-xmpp port 1
```

- This command removes the XMPP server.

```
switch(config-mgmt-xmpp)# no server
```

3.6.25 session privilege (XMPP Management)

The **session privilege** command will place the user in EXEC mode. The initial privilege level is meaningless by default. However, with the configuration of roles, users can add meaning to the different privilege levels. By default, XMPP does not limit access to any command.

Level 1-15: Commands accessible from EXEC Mode.

If AAA is not configured and the switch is configured to connect to the XMPP client, any message received is executed with privilege level 1 by default.

The **no session privilege** and **default session privilege** commands revert the list contents to **none** for the specified privilege levels.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

session privilege PRIV_LEVEL

no session privilege

default session privilege

Parameter

PRIV_LEVEL Privilege levels of the commands. Value ranges from ***0*** and ***15.***

Examples

- These commands authorizes configuration commands (privilege level config 5) for XMPP.

```
switch(config)#(config)# management xmpp
switch(config-mgmt-xmpp)# session privilege 5
switch(config-mgmt-xmpp)#
```

- This command removes the privilege levels set for the XMPP session.

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)# no session privilege
```

3.6.26 show inventory

The **`show inventory`** command displays the hardware components installed in the switch. Serial numbers and a description is also provided for each component.

Command Mode

EXEC

Command Syntax

`show inventory`

Example

This command displays the hardware installed in a DCS-7150S-52 switch.

```
switch> show inventory
System information
  Model                     Description
  ------------------------- ----------------------------------
  DCS-7150S-52-CL           52-port SFP+ 10GigE 1RU + Clock

switch>
```

3.6.27 show xmpp neighbors

The **show xmpp neighbors** command displays all neighbors and their connection status. The XMPP server keeps track of all relationships between its users.

Command Mode

EXEC

Command Syntax

show xmpp neighbors

Example

This command displays all the XMPP neighbors and their connection status.

```
switch# show xmpp neighbors
Neighbor                          State           Last Seen Login Time
--------------------------------  --------------- ---------------------
admin@test.aristanetworks.com     present         0:01:40 ago
test1@test.aristanetworks.com     present         20:29:39 ago

Neighbor                          Status Message
--------------------------------  -----------------------------------
admin@test.aristanetworks.com
test1@test.aristanetworks.com   Arista Networks DCS-7048T-4S
switch#
```

3.6.28 show xmpp status

The **show xmpp status** command displays the current XMPP connection status to the server.

The XMPP server keeps track of all relationships between its users. In order for two users to directly communicate, this relationship must first be established and confirmed by the other party.

Switches automatically confirm requests from outside parties as long as they are a user from the same domain name, for example when you chat with your switch from your own XMPP chat client.

Command Mode

EXEC

Command Syntax

show xmpp status

Example

This command displays the current XMPP connection status to the server.

```
switch# show xmpp status
XMPP Server:  port 5222
Client username: test@test.aristanetworks.com
Default domain: test.aristanetworks.com
Connection status: connected
switch#
```

3.6.29 show xmpp switch-group

The **show xmpp switch-group** command displays the configured and active switch groups for the switch.

Command Mode

EXEC

Command Syntax

show xmpp switch-group

Example

This command displays the configured and active switch groups.

```
switch# show xmpp switch-group
testroom@conference.test.aristanetworks.com
switch#
```

3.6.30 shutdown (API Management)

The **shutdown** command, in mgmt-api configuration mode, disables management over API on the switch. API is disabled by default.

The **no shutdown** command, in mgmt-api configuration mode, enables the management API access.

The **default shutdown** command, in mgmt-api configuration mode, disables the management API access.

Command Mode

Mgmt-API Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Command

management api http-commands places the switch in ***mgmt-api*** configuration mode.

Example

- These commands disables API access to the HTTP server.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# shutdown
switch(config-mgmt-api-http-cmds)#
```

- These commands enables API access to the HTTP server.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# no shutdown
switch(config-mgmt-api-http-cmds)#
```

3.6.31 shutdown (Telnet Management)

The **shutdown** command, in management-telnet mode, disables or enables Telnet on the switch. Telnet is disabled by default. The management telnet command places the switch in management-telnet mode.

- To enable Telnet, enter **no shutdown** at the management-telnet prompt.
- To disable Telnet, enter **shutdown** at the management-telnet prompt.

Command Mode

Management-Telnet Configuration

Command Syntax

shutdown

no shutdown

Examples

- These commands enable Telnet, then return the switch to ***global*** configuration mode.

```
switch(config)# management telnet
switch(config-mgmt-telnet)# no shutdown
switch(config-mgmt-telnet)# exit
switch(config)#
```

- This command disables Telnet.

```
switch(config-mgmt-telnet)# shutdown
```

3.6.32 shutdown (XMPP Management)

The **shutdown** command, in mgmt-xmpp mode, disables or enables management over XMPP on the switch. XMPP is disabled by default.

The **no shutdown** and **default shutdown** commands re-enable XMPP by removing the **shutdown** command from ***running-config***.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands enable management over XMPP, then return the switch to ***global*** configuration mode.

```
switch(config-mgmt-xmpp)# no shutdown
switch(config-mgmt-xmpp)# exit
switch(config)#
```

- This command disables management over XMPP.

```
switch(config-mgmt-xmpp)# shutdown
switch(config-mgmt-xmpp)#
```

3.6.33 switch-group (XMPP Management)

The **switch-group** command allows you to configure each switch to join specified chat rooms on startup. In order for the switch to participate in a chat group, the switch has to be configured to belong to the specified chat room.

The **no switch-group** and **default switch-group** commands delete the specified switch-group configuration (or all switch-group configurations if no name is specified) by removing the corresponding **switch-group** statement from ***running-config***.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

switch-group ***name*** **SECURITY**

no switch-group

default switch-group

Parameters

- ***name*** Group name text that the user enters at the login prompt to access the CLI. To enter multiple names in a single command, separate them with spaces.

  Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

  @ # $ % ^ & * - _ = + ; < > ,. ~ |
- **SECURITY** password assignment.
  - **password** *pwd_txt name* is protected by specified password. *pwd_txt* is a clear-text string.
  - **password 0** *pwd_txt name* is protected by specified password. *pwd_txt* is a clear-text string.
  - **password 7** *pwd_txt name* is protected by specified password. *pwd_txt* is encrypted string.

Guidelines

- A switch group is an arbitrary grouping of switches within the network which belong to one chat group.
- In order to belong to one or more switch groups, the switch has to be manually assigned to it.
- Switch groups are defined dynamically based on the configuration of all of the switches in the network.
- As per the multi-user chat XMPP standard (XEP-0045), switch groups have a full name of GROUPNAME@conference.DOMAIN.
- All CLI commands allow either the full group name or the short name, which are appended the @conference.DOMAIN.
- If the switch belongs to multiple chat rooms, you must configure each group with a separate command.

Examples

- These commands configure the switch-group to be part of the chat room.

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)# switch-group
testroom@conference.test.aristanetworks.com password 0 arista
```

- Use the **show xmpp switch-group** to verify the active switch-group for the switch.

```
switch# show xmpp switch-group
```

```
testroom@conference.test.aristanetworks.com
```

3.6.34 username (XMPP Management)

The **username** command configures the switch's username and password on the XMPP server.

The **no username** and **default username** commands delete the specified username by removing the corresponding **username** statement from ***running-config***.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

username ***name*** **SECURITY**

no username

default username

Parameters

- ***name*** username text that defines the XMPP username and password.

  Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

  @ # $ % ^ & * ( ) - _ = + { } [ ] ; < > ,. ~ |
- **SECURITY** password assignment.
  - **password** *pwd_txt name* specifies and unencrypted shared key. *pwd_txt* is a clear-text string.
  - **password 0** *pwd_txt name* specifies and unencrypted key. *pwd_txt* is a clear-text string.
  - **password 7** *pwd_txt name* specifies a hidden key. *pwd_txt* is encrypted string.

Guidelines

Encrypted strings entered through this parameter are generated elsewhere. The **password 7** option (**SECURITY**) is typically used to enter a list of username-passwords from a script.

Examples

- These commands create the username and assigns it a password. The password is entered in clear text because the parameter is set to ***0***.

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)# server arista-xmpp
switch(config-mgmt-xmpp)# domain test.aristanetworks.com
switch(config-mgmt-xmpp)# username test1@test.aristanetworks.
com password 0
arista
switch(config-mgmt-xmpp)# no shutdown
```

- This command removes all usernames from the XMPP server.

```
switch(config-mgmt-xmpp)# no username
switch(config-mgmt-xmpp)#
```

3.6.35 vrf (API Management)

The **vrf** command places the switch in VRF configuration mode for the server. If the named VRF does not already exist, this command creates it.

Command Mode

Mgmt-API Configuration

Command Syntax

vrf VRF_INSTANCE

Parameters

VRF_INSTANCE specifies the VRF instance.

- **default** Instance is created in the default VRF.
- ***vrf_name*** Instance is created in the specified user-defined VRF.

Related Command

management api http-commands places the switch in ***mgmt-api*** configuration mode.

Example

This command creates a VRF named management-vrf and places the switch in ***VRF*** configuration mode for the new VRF.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# vrf management-vrf
switch(config-mgmt-api-http-cmds-vrf-management-vrf)#
```

3.6.36 vrf (XMPP Management)

The **vrf** command places the switch in VRF configuration mode for the XMPP server. If the named VRF does not already exist, this command creates it.

The VRF configuration for the client is for the entire XMPP service, rather than per server. All servers resolving on a particular hostname must be reachable in the same VRF.

Command Mode

Mgmt-xmpp Configuration

Command Syntax

vrf [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE specifies the VRF instance.

- **default** Instance is created in the default VRF.
- ***vrf_name*** Instance is created in the specified user-defined VRF.

Example

This command creates a VRF named management-vrf and places the switch in ***VRF*** configuration mode for the server.

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)# vrf management-vrf
switch(config-mgmt-xmpp)
```

3.6.37 xmpp send

The **xmpp send** command can be used to connect to the XMPP server and send messages to switches or switch groups within the network.

Before switches can send messages to each other, they must friend each other. An easy way to have them auto friend each other is to have them join the same chat room. The friendship between switches can be verified by using the **show xmpp neighbor** command.

Command Mode

Privileged EXEC

Command Syntax

xmpp send to ***neighbor*** **XMIT_TYPE** ***content***

Parameters

- ***neighbor*** Options include switches or switch groups within the network that are connected as friends in a chat room.
- **XMIT_TYPE** Transmission type. Valid options include:
  - **command** Sends an XMPP command.
  - **message** Sends an XMPP message.
- ***content*** The command you want the friends within the chat room to display or execute.

Configuration Restrictions

- Only enable-mode commands are allowed within the multi-switch CLI.
- Changing into a different CLI mode and running several commands in that mode is not supported (e.g., into configuration mode).
- An external XMPP client (for example Adium) can be used to send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After the message is processed, the switch automatically return to the enable mode.
- Commands that prompt for a response (like reload) are not supported.
- Long commands, such as image file copies, may cause the switch XMPP client to momentarily stop responding and disconnect. The switch should reconnect and the long command should complete.
- Many command outputs display in a specific table format. To achieve the same visual feel as through a terminal, use a monospaced font, such as Courier, for the incoming messages.

Example

This command sends the switch in the chat room the request to execute the show version command.

```
switch# xmpp send test2 command show version
message from user: test2@test.aristanetworks.com
-----------------------------------------------
Hardware version:     04.40
Serial number:        JFL08432083
System MAC address:   001c.7301.7d69
Software image version:  4.12.3
Architecture:            i386
Internal build version:  4.12.3
Internal build ID:       f5ab5f57-9c26-4fe4-acaa-fb60fa55d01d
Uptime:                  2 hours and 38 minutes
Total memory:            1197548 kB
Free memory:             182452 kB
```

3.6.38 xmpp session

The **xmpp session** command is similar to running SSH from the switch. The user is required to input their username (default is to USER@DEFAULTDOMAIN) and password in order to connect to the XMPP server. This command allows you to interact in the enable mode with a switch or switch group over XMPP using the standard CLI, with access to help and tab completion. All commands are then executed remotely and only the non-empty results are displayed on the screen.

Command Mode

Privileged EXEC

Command Syntax

xmpp session ***switchgroup***

Parameters

switchgroup The option includes the switch group within the network that is connected as friends in a chat room.

Configuration Restrictions

- Only enable-mode commands are allowed within the multi-switch CLI.
- Changing into a different CLI mode and running several commands in that mode is not supported (e.g., into configuration mode).
- An external XMPP client (for example Adium) can be used to send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After the message is processed, the switch automatically return to the enable mode.
- Commands that prompt for a response (like reload) are not supported.
- Long commands, such as image file copies, may cause the switch XMPP client to momentarily stop responding and disconnect. The switch should reconnect and the long command should complete.
- Many command outputs display in a specific table format. To achieve the same visual feel as through a terminal, use a monospaced font, such as Courier, for the incoming messages.

Example

This command displays the status of ***Ethernet 3*** from ***test1***, which is a member of the switch group chat room.

```
switch# xmpp session all@test.aristanetworks.com
xmpp-all# show int Eth3 status

response from: test1@test.aristanetworks.com
--------------------------------------------------
Port  Name  Status     Vlan     Duplex  Speed   Type
Et3   bs3   connected  in Po3   a-full  a-1000  10GBASE-SR
switch#
```

Chapter 4

Administering the Switch

This chapter describes administrative tasks that are typically performed only after initially configuring the switch or after recovery procedures.

This chapter includes these sections:

4.1 Managing the Switch Name

These sections describe how to configure the switchs domain and host name.

- Assigning a Name to the Switch describes the assigning of an FQDN to the switch.
- Specifying DNS Addresses describes the adding of name servers to the configuration.

4.1.1 Assigning a Name to the Switch

A Fully Qualified Domain Name (FQDN) labels the switch and defines its organization ID in the Domain Name System hierarchy. The switchs FQDN consists of a host name and domain name.

The host name is uniquely associated with one device within an IP-domain. The default host name is ***localhost***. You can configure the prompt to display the host name, as described in prompt.

- To assign a host name to the switch, use the **`hostname`** command. To return the switchs host name to the default value of ***localhost***, use the **`no hostname`** command.
- To specify the domain location of the switch, use the **`dns domain`** command.

Examples

- This command assigns the string *main-host* as the switchs host name.

```
switch(config)# hostname main-host
main-host(config)#
```

- This command configures *aristanetworks.com* as the switchs domain name.

```
switch(config)# dns domain aristanetworks.com
switch(config)#
```

- This procedure configures ***sales1.samplecorp.org*** as the switchs FQDN.

```
switch(config)# dns domain samplecorp.org
switch(config)#
```

- This ***running-config*** extract contains the switchs host name and IP-domain name.

```
switch# show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)
!

vlan 3-4
!
username john secret 5 $1$a7Hjept9$TIKRX6ytkg8o.ENja.na50
!
hostname sales1
ip name-server vrf default 172.17.0.22
dns domain samplecorp.org
!

end
switch#
```

4.1.2 Specifying DNS Addresses

The Domain Name Server (DNS) maps FQDN labels to IP addresses and provides addresses for network devices. Each network requires at least one server to resolve addresses. The configuration file can list a maximum of three server addresses.

To add name servers to the configuration, use the **ip name-server** command. Each command can add multiple servers. All server addresses support multiple VRFs and a priority may be specified for each name server. If all name servers have the default priority (***0***) the default DNSmasq behavior is followed for the configuration. It queries all name servers simultaneously and forwards the requests to the first name server for 50 queries or 20 seconds, whichever expires sooner for answering. If any priorities are non-zero, queries are issued in order with a five second timeout between unresponsive name servers.

Note: DNSmasq does not fulfill in-flight requests to unresposive name servers.

Example

This code displays the configuration file.

```
switch(config)# show ip name-server
IP Address VRF     Priority
---------- ------- --------
10.0.0.1   default        0
10.0.0.2   default        1
10.0.0.1   vrf1           2
10.0.0.2   vrf1           3
fc00::1    default        4
```

The switch assigns source IP addresses to outgoing DNS requests. To force the switch to use a single, user-defined source interface for all requests, use the **ip domain lookup** command.

Examples

- This command forces the switch to use ***VLAN 5*** as the source interface for DNS requests originating from the default VRF.

```
switch(config)# ip domain lookup source-interface Vlan5
switch(config)#
```

- This command forces the switch to use ***VLAN 10*** as the source interface for DNS requests originating from VRF purple.

```
switch(config)# ip domain lookup vrf purple source-interface Vlan10
switch(config)#
```

- This command configures up to four name servers on VRF purple.

```
switch(config)# ip name-server vrf purple 10.1.1.24 priority 4
switch(config)#
```

- This command removes the name servers.

```
switch(config)# no ip name-server vrf purple 10.1.1.24
switch(config)#
```

- This command removes all configured name in all VRFs.

```
switch(config)# no ip name-server
switch(config)#
```

Note:

NXDOMAIN is considered a valid reply for the query.

4.2 System Clock and Time Protocols

The switch uses the system clock for displaying the time and for time-stamping messages. The system clock is set to Coordinated Universal Time (UTC); the switch calculates local time based on the time zone setting. Time-stamps and time displays are in local time. The system clock can be set either manually or via Network Time Protocol (NTP); any NTP servers properly configured on the switch override time that is manually entered.

The following sections deal with the configuration of the system clock and the use of NTP and PTP.

- Configuring the Time Zone
- Setting the System Clock Manually
- Displaying the Time
- Network Time Protocol (NTP)

4.2.1 Configuring the Time Zone

The time zone setting is used by the switch to convert the system time (UTC) to local time. To specify the time zone, use the **clock timezone** command.

Examples

- These commands configure the switch for the United States Central Time Zone.

```
switch(config)#clock timezone US/Central
switch(config)#show clock
Mon Jan 14 18:42:49 2013
timezone is US/Central
switch(config)#
```

- To view the predefined time zone labels, enter **clock timezone** with a question mark.

```
switch(config)#clock timezone ?
 Africa/Abidjan                    Africa/Accra
```

```
  WET                                   WET timezone
  Zulu                                  Zulu timezone

switch(config)#clock timezone
```

- This command displays all time zone labels that start with **America**.

```
switch(config)#clock timezone AMERICA?
America/Adak                    America/Anchorage

America/Yellowknife
switch(config)#clock timezone AMERICA
```

4.2.2 Setting the System Clock Manually

The **clock set** command manually configures the system clock time and date, in local time. Any NTP servers properly configured on the switch override time that is manually entered.

Example

This command manually sets the switch time.

```
switch#clock set 08:15:24 14 Jan 2013
Mon Jan 14 08:15:25 2013
timezone is US/Central
```

4.2.3 Displaying the Time

To display the local time and configured time zone, enter the **show clock** command.

Example

This command displays the switch time.

```
switch(config)#show clock
Mon Jan 14 16:32:46 2013
timezone is America/Los_Angeles
```

4.2.4 Network Time Protocol (NTP)

Network Time Protocol (NTP) is enabled on the switch by default, and time settings from any properly configured NTP server will override manual setting of the system clock.

NTP servers synchronize time settings of systems running an NTP client. The switch supports NTP versions 1 through 4. The default is version 4. After configuring the switch to synchronize with an NTP server, it may take up to ten minutes for the switch to set its clock. The ***running-config*** lists NTP servers that the switch is configured to use.

The following NTP sections deal with NTP on the switch:

- Configuring the NTP Server
- Configuring the NTP Source
- Configuring the Switch as an NTP Server
- Configuring NTP Authentication
- Viewing NTP Settings and Status

4.2.4.1 Configuring the NTP Server

The **ntp server** command adds a server to the list or modifies the parameters of a previously listed address. When the system contains multiple NTP servers, the prefer keyword can be used to specify a preferred NTP server, which will be used as the NTP server if not discarded by NTP.

Note that all NTP servers must be in the same VRF, and that they are added in the default VRF if no VRF is specified.

The system clock is set via NTP if NTP is enabled and there is at least one NTP server properly configured on the switch, and NTP overrides manual setting of the system clock. NTP is enabled by default. To disable NTP, use the **no ntp** command.

Example

These commands add three NTP servers, designating the second server as preferred.

```
switch(config)#ntp server local-NTP
switch(config)#ntp server 172.16.0.23 Prefer
switch(config)#ntp server 172.16.0.25
```

4.2.4.2 Configuring the NTP Source

To control the address to which NTP responses to the switch are sent, a local interface can be specified as the source in outgoing NTP packets using the **ntp local-interface** command. The IP address of that interface is then used as the source address in all outgoing NTP packets unless the switch is acting as an NTP server and a server-specific source is configured using the **source** option of the **ntp server** command.

Example

This command configures the IP address of ***VLAN interface 25*** as the source specified in all outgoing NTP packets.

```
switch(config)#ntp local-interface vlan 25
switch(config)#
```

4.2.4.3 Configuring the Switch as an NTP Server

To configure the switch to accept NTP requests on all interfaces, use the **ntp serve all** command to enable NTP server mode globally on the switch. To configure an individual interface to accept or deny NTP requests, use the **ntp serve** command. Interface level settings override the global settings, and changing the settings at either the global or interface level also causes the switch to re-synchronize with its upstream NTP server. NTP server mode is disabled by default.

Examples

- This command configures the switch to act as an NTP server, accepting NTP requests.

```
switch(config)# ntp serve all
switch(config)#
```

- These commands configure ***interface ethernet 5*** to accept NTP requests regardless of global settings.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)#ntp serve
switch(config-if-Et5)#
```

4.2.4.4 Configuring NTP Authentication

The switch can be configured to accept NTP packets only from an authenticated server or client. NTP authentication is disabled by default.

To configure the switch to authenticate NTP packets, create one or more authentication keys using the **ntp authentication-key** command, specify which keys are trusted by using the **ntp trusted-key** command, use the **ntp authenticate** command to enable NTP authentication, and specify to use the trusted-key for a specific server. The NTP server must be configured to use the same authentication key and key ID number.

Note: When NTP authentication is enabled on a switch, all NTP servers upstream of the switch, as well as all NTP clients of the switch, should have matching keys configured, and clients must have NTP authentication enabled.

Example

These commands configure the switch to authenticate NTP packets using key 328 with the plaintext password timeSync.

```
switch(config)#ntp authentication-key 328 md5 timeSync
switch(config)#ntp trusted key 328
switch(config)#ntp authenticate
switch(config)#
```

4.2.4.5 Viewing NTP Settings and Status

To display the status of Network Time Protocol (NTP) on the switch, use the **show ntp status** command. To display the status of connections to NTP servers, use the **show ntp associations** command.

Note: In the output for **show ntp associations**, the reference ID (which identifies the time source of the NTP server) is either the IPv4 address of the time source or, if that source has an IPv6 address, the first four octets of the MD5 hash of that IPv6 address. In EOS releases prior to *4.23.2*, the **show ntp status** command identified the system peer by its reference ID as described above, but in later releases it shows the IP address (whether IPv4 or IPv6).

Examples

- This command displays the status of the switch's NTP connection.

```
switch# show ntp status
synchronised to NTP server (192.168.78.62) at stratum 3
   time correct to within 66 ms
   polling server every 1024 s
switch #
```

- This command displays data about the NTP servers in the configuration.

```
switch# show ntp associations
remote           refid          st t when  poll reach   delay   offset  jitter
==============================================================================
+l.ntp.arista.co 125.157.10.11   2 u  539  1024  377  121.748   -0.345   0.893
-3.ntp.arista.co 127.31.152.34   2 u  868  1024  377  101.671    2.434   1.529
+2.ntp.arista.co 176.131.12.185  2 u  676  1024  377  116.505     0.03   0.768
*4.ntp.arista.co 120.181.192.192 2 u  696  1024  377   48.431   -0.416    0.15
switch#
```

4.3 Managing Display Attributes

Display commands control the content of the banner and the command line prompt.

4.3.1 Banners

The switch can display two banners:

- **Login banner**: The login banner precedes the login prompt. One common use for a login banner is to warn against unauthorized network access attempts.
- **motd banner**: The message of the day (motd) banner is displayed after a user logs into the switch.

This output displays both banners in bold:

```
This is a login banner
switch login: john
Password:
Last login: Mon Jan 14 09:24:36 2013 from adobe-wrks.aristanetworks.com
This is an motd banner
switch>
```

These commands create the login and motd banner shown earlier in this section.

```
switch(config)#banner login
Enter TEXT message. Type 'EOF' on its own line to end.
This is a login banner
EOF
switch(config)#banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner
EOF
switch(config)#
```

To create a banner:

1. Enter global configuration mode.

   ```
   switch#config
   switch(config)#
   ```

2. Enter banner edit mode by typing the desired command:
   - To create a login banner, type **banner login**.
   - To create a motd banner, type **banner motd**.

     The switch responds with instructions on entering the banner text.

     ```
     switch(config)#banner login
     Enter TEXT message. Type 'EOF' on its own line to end.
     ```

3. Enter the banner text.

   This is the first line of banner text.

   This is the second line of banner text.

4. Press **Enter** to place the cursor on a blank line after completing the banner text.
5. Exit banner edit mode by typing EOF.

   ```
   EOF
   switch(config)#
   ```

4.3.2 Configuring prompt

The prompt provides an entry point for EOS commands. The `prompt` command configures the contents of the prompt. The **`no prompt`** command returns the prompt to the default of %H%P.

Characters allowed in the prompt include A-Z, a-z, 0-9, and these punctuation marks:

! @ # $ % Âˆ & * ( ) - = + f g [ ] ; : < > , . ? / Â˜ n

The prompt supports these control sequences:

- %s “ space character
- %t “ tab character
- %% “ percent character
- %H “ host name
- %D “ time and date
- %D{*f_char*} “ time and date, format specified by the BSD **strftime** (f_char) time conversion function.
- %h “ host name up to the first."
- %P “ extended command mode
- %p “ command mode
- %r “ redundancy status on modular systems (has no effect on a fixed system)
- %R “ extended redundancy status on modular systems â€“ includes status and slot number (has no effect on a fixed system)

Examples

- This command creates a prompt that displays **system 1** and the command mode.

```
switch(config)# prompt system%s1%P
system 1(config)#
```

- This command creates a prompt that displays the command mode.

```
switch(config)# prompt %p
(config)#
```

- These equivalent commands create the default prompt.

```
% prompt %H%P
host-name.dut103(config)#

%no prompt
host-name.dut103(config)#
```

4.4 Logging of Event Notifications

Arista switches log event notifications using the Syslog protocol. By default, event notifications are logged internally to /var/log/messages, but they can also be displayed on the console or logged to an external server. Severity levels and log message destinations can be configured via the CLI, and individual processes and protocols can also be configured to adjust or limit the messages that they log. Details of the current logging configuration may be viewed using the **`show logging`** command.

For a full list of Syslog messages, visit the Arista website.

4.4.1 Managing TCAM Capacity Warnings

Strata chipsets (present in the 7010, 7050X, 7060X, 7250X, 7260X, and 7300X series) provide event logging for the hardware capacity of TCAM tables on a per-slice basis, triggering a capacity warning

by default whenever any TCAM slice exceeds 90% capacity. As a result, default TCAM logging can generate high levels of syslog messages on these platforms. If this presents a problem, the **hardware capacity alert table** command can be used to adjust the capacity levels at which warnings occur to above the 90% default; this adjustment can be made per TCAM resource and per slice. The command can also be used to disable TCAM hardware capacity messages of level “Warning” and below entirely for a given slice. To disable messages, set the threshold to 0 or use the **no** version of the command.

Examples

- This command reduces hardware capacity Syslog warnings by increasing the capacity threshold to 99% for EFP table monitoring in slice 2.

```
switch(config)#hardware capacity alert table EFP feature Slice-2
 threshold 99
```

- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the IFP table in slice 5.

```
switch(config)#hardware capacity alert table IFP feature Slice-5
 threshold 0
```

- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the VFP table in all slices.

```
switch(config)#no hardware capacity alert table VFP
```

Note: Hardware capacity messages are user-configurable only at or below the “Warning” level. The TCAM management software always sends “Error” messages to Syslog and to affected features when all TCAM resources are depleted.

4.5 Event Monitor

The event monitor writes system event records to local files for access by SQLite database commands.

Note:

Beginning with release *EOS-4.20.5F*, **event-monitor** is not enabled by default. Use the **event-monitor** command to explicitly enable event-monitor.

4.5.1 Description

The event monitor receives notifications for important events or changes to the enabled event monitor tables. These changes are logged to a fixed-size circular buffer. The size of this buffer is configurable, but it does not grow dynamically. Buffer contents can be stored to permanent files to increase the event monitor effective capacity. The permanent file size and the number of permanent files is configurable. The buffer is stored at a fixed location on the switch.

Specific event monitor queries are available through CLI commands. For queries not available through specific commands, manual queries are supported through other CLI commands. When the user issues a query command, the relevant events from the circular buffer and permanent files are written to and accessed from a temporary SQLite database file. The database keeps a separate table for each logging type (such as MAC, ARP, route, and others). When the monitor receives notification of a new event, the database file is deleted, then recreated.

4.5.2 Configuring the Event Monitor

Enabling the Event Monitor

The **event-monitor** command enables the event monitor and specifies the types of events that are logged. The event monitor is an event logging service that records system events to a local database. The event monitor records these events:

- all changes to all events.
- ARP changes to the ARP table (IPv4 address to MAC address mappings).
- Neighbor changes to the neighbor table (IPv6 address to MAC address mappings).
- backup backed up log files.
- buffer changes to the local buffer settings.
- IGMP snoopingchanges to the IGMP snooping table.
- LACP changes to the LACP table events.
- MAC changes to the MAC address table (MAC address to port mappings).
- mroute changes to the IP multicast routing table.
- neighbor changes to the neighbor routing table.
- route changes to the IPv4 routing table.
- route6 changes to the IPv6 routing table.
- stpunstable events that cause STP instability.

Beginning with Release *EOS-4.20.5F*, **event-monitor** is not enabled by default. Use the **event-monitor** command to explicitly enable event-monitor.The **no event-monitor all** disables the event monitor. The **no event-monitor** command, followed by a log type parameter, disables event recording for the specified type.

Example

- This command disables the event monitor for all types of events.

```
switch(config)#no event-monitor all
```

- This command enables the event monitor for routing table changes.

```
switch(config)#event-monitor route
```

The **event-monitor clear** command removes the contents of the event monitor buffer. If event monitor backup is enabled, this command removes the contents from all event monitor backup files.

Example

This command clears the contents of the event monitor buffer.

```
switch#event-monitor clear
switch(config)#
```

Configuring the Buffer

The **event-monitor buffer max-size** command specifies the size of the event monitor buffer. The event monitor buffer is a fixed-size circular data structure that receives event records from the event monitor. When event monitor backup is enabled, the buffer is copied to a backup file before each rollover. Buffer size ranges from 6 Kb to 50 Kb. The default size is 32 Kb.

Example

This command configures a buffer size of ***48 Kb***.

```
switch(config)#event-monitor buffer max-size 48
switch(config)#
```

Configuring Permanent Files

The **event-monitor backup path** command enables storage of the event monitor buffer to permanent switch files and specifies the path/name of these files. The command references file location either from the flash drive root directory where the CLI operates (**/mnt/flash**) or from the switch root directory (/).

The event monitor buffer is circular after the buffer is filled, new data replaces older data at the beginning of the buffer. The buffer is copied into a new backup file after each buffer writing cycle before the switch starts re-writing the buffer.

Example

These commands configure the switch to store the event monitor buffer in sw-event.log, then display the new file in the flash directory.

```
switch(config)#event-monitor backup path eventmon_backup_dir/event.log
switch(config)#
bash-4.3# ls /mnt/flash/eventmon_backup_dir/

arpevent.log.1  lacpevent.log.1  neighborevent.log.1  routeevent.log.1
igmpsnoopingevent.log.1  macevent.log.1   route6event.log.1
stpunstableevent.log.1
```

The **event-monitor backup max-size** command specifies the quantity of event monitor backup files the switch maintains. The switch appends an extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file if the file limit is exceeded.

Example

These commands configure the switch to back up the event buffer to a series of files named sw-event.log. The switch can store a maximum of four files.

```
switch(config)#event-monitor backup path sw-event.log
switch(config)#event-monitor backup max-size 4
switch(config)#
```

The first five files that the switch creates to store event monitor buffer contents are:

sw-event.log.0

sw-event.log.1

sw-event.log.2

sw-event.log.3

sw-event.log.4

The switch deletes **sw-event.log.0** the first time it verifies the number of existing backup files after the creation of **sw-event.log.4**.

4.5.3 Querying the Event Monitor

These CLI commands perform SQL-style queries on the event monitor database:

- The **show event-monitor arp** command displays ARP table events.
- The **show event-monitor mac** command displays MAC address table events.
- The **show event-monitor route** command displays routing table events.

Example

This command displays all events triggered by MAC address table events.

```
switch#show event-monitor mac
% Writing 0 Arp, 0 Route, 1 Mac events to the database
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|added|
0
```

For other database queries, the **show event-monitor sqlite** command performs an SQL-style query on the database, using the statement specified in the command.

Example

This command displays all entries from the route table.

```
switch#show event-monitor sqlite select * from route;
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|

```

4.5.4 Accessing Event Monitor Database Records

The **event-monitor interact** command replaces the CLI prompt with an SQLite prompt. The event monitor buffer and all backup logs are synchronized into a single SQLite file and loaded for access from the prompt.

- To access help from the SQLite prompt, enter **.help**
- To exit SQLite and return to the CLI prompt, enter **.quit** or **.exit**.

The **event-monitor sync** command combines the event monitor buffer and all backup logs and synchronizes them into a single SQLite file. The data can be accessed through SQLite or by using the **show event-monitor** commands described above.

Examples

- This command replaces the EOS CLI prompt with an SQLite prompt.

```
switch#event-monitor interact
```

```
sqlite>
```

- This command exits SQLite and returns to the EOS CLI prompt.

```
sqlite> .quit
switch#
```

- This command synchronizes the buffer and backup logs into a single SQLite file.

```
switch(config)#event-monitor sync
switch(config)#
```

4.6 Managing EOS Extensions

The most simple and efficient way to make the most of the extensibility on which EOS is built is through the use of extensions. An extension is a pre-packaged optional feature or a set of scripts in an RPM Package Manager (RPM) or Software image extension (SWIX) format. A variety of extensions are available from the EOS Central page at https://www.arista.com/en/.

These sections describe basic EOS extension tasks:

- Installing EOS Extensions
- Installing EOS Extensions on a Dual-Supervisor Switch
- Verifying EOS Extensions Installation
- Uninstalling an EOS Extension

4.6.1 Installing EOS Extensions

Complete the following steps to install an EOS extension.

1. Download the desired extension and copy it onto the devices flash storage.

```
switch# dir
Directory of flash:/
-rwx 479183792 Jun 23 09:46 EOS-4.13.3F.swi
-rwx 21280296 Feb 6 16:48 arista-splunk-extension.swix
-rwx 27 Jun 23 10:08 boot-config  drwx 4096 Sep 26 2012 schedule
-rwx 1481 Jun 27 05:54 startup-config
```

2. Copy the file from the flash storage to the extensions partition.

```
switch# copy flash:arista-splunk-extension.swix extension:
Copy completed successfully.
```

3. Install the EOS extension.

```
switch# extension arista-splunk-extension.swix
If this extension modifiers the behavior of the Cli, any running Cli
 sessions will
need to be reset in order for the Cli modifications to take effect.
```

4. If extension persistence across reboots is required, the extension should also be copied into the boot-extensions partition.

```
switch# copy installed-extensions boot-extensions
```

5. Run the extension. As the CloudVision extension adds additional CLI commands to EOS, the CLI session must be restarted so that the additional commands are available. To achieve this, close the SSH or the telnet session and open a new session.

4.6.2 Installing EOS Extensions on a Dual-Supervisor Switch

Complete the following steps to install an EOS extension on a dual-supervisor switch.

1. Copy the extension from the primary supervisor to the standby supervisors flash directory.

```
switch(s1)#copy flash:<filename>.swixsupervisor-peer://mnt/flash/
```

2. Establish a session to the standby supervisor from the primary.

```
switch(s1)#session peer-supervisor
Warning: Permanently added '[127.1.0.2]:3601' (RSA) to the list of
 known hosts.
Last login: Mon Aug 27 17:32:00 2018 from supervisor1
```

```
WARNING - you are currently logged in to the standby supervisor.
Not all cli commands are available or supported. Any configuration
done from this cli will not be reflected in the active supervisor's
running config and will be lost when the active supervisor writes
its startup config.
switch(s2)#
```

3. Repeat the steps listed in the Installing EOS Extensions to install the EOS extension.
4. Repeat the steps listed in the Verifying EOS Extensions Installation to verify the extension installation.
5. Exit standby supervisor.

```
switch(s2)#exit
Connection to 127.1.0.1 closed.
switch(s1)#
```

4.6.3 Verifying EOS Extensions Installation

Complete the steps to verify that the EOS extensions are installed correctly.

1. Run the **`show extensions`** command to verify that the EOS extensions are available and installed correctly.

```
switch#show extensions
Name Version/Release Status Extension
---------------------------------------- ------------------------
EosSdk-1.2.1-fl.boca-1943435.i686.rpm 1.2.1/1943435.flbocaeossd A, NI
 1
arista-splunk-extension.swix 0.95/1498976.2013ltdsplun A, I 2
fping-2.4b2-10.fc12.i686.rpm 2.4b2/10.fc12 A, I 1
gnuplot.swix 1.10.0/1.fc14 A, I 16
splunkforwarder-5.0.9-213964.i386.rpm 5.0.9/213964 A, NI 1
```

```
A: available | NA: not available | I: installed | NI: not installed |
 F: forced
```

2. Run the **`show boot-extensions`** command to verify that the EOS extensions are enabled for boot persistence.

```
switch#show boot-extensions
arista-splunk-extension.swix
fping-2.4b2-10.fc12.i686.rpm
gnuplot.swix
```

4.6.4 Uninstalling an EOS Extension

Complete the following steps to uninstall an EOS extension.

1. Uninstall the existing EOS extension using the **`no extension`** command.

```
switch#no extension fping-2.4b2-10.fc12.i686.rpm
switch#show extensions
Name                                       Version/Release              Status extension
------------------------------------------ -------------------------    ----------
EosSdk-1.2.1-fl.boca-1943435.i686.rpm      1.2.1/1943435.flbocaeossd A,  NI 1
arista-splunk-extension.swix               0.95/1498976.2013ltdsplun A,  I 2
fping-2.4b2-10.fc12.i686.rpm               2.4b2/10.fc12 A,              NI 1
gnuplot.swix                               1.10.0/1.fc14 A,              I 16
splunkforwarder-5.0.9-213964.i386.rpm      5.0.9/213964 A,               NI 1
```

```
A: available | NA: not available | I: installed | NI: not installed |
 F: forced
```

2. Remove the extension from the boot-extension using the **`copy installed-extensions boot-extensions`** command.

```
switch#copy installed-extensions boot-extensions
```

Note: If your system is a Dual-Supervisor Switch, connect to the secondary supervisor using the session peer-supervisor command, repeat steps 1 and 2, and finally exit from the secondary supervisor.

4.7 Switch Administration Commands

Switch Name Configuration Commands

- clear ptp interface counters
- dns domain
- hostname
- ip domain-list
- ip domain lookup
- ip host
- ip name-server
- ipv6 host
- show hostname
- show hosts
- show ip domain-name
- show ip name-server
- show local-clock time-properties

Banner Configuration Commands

- banner login
- banner motd
- show banner

Prompt Configuration Command

- prompt

Event Manager Commands

- event-monitor
- event-monitor backup max-size
- event-monitor backup path
- event-monitor buffer max-size
- event-monitor clear
- event-monitor interact
- event-monitor sync
- no event-monitor
- show event-monitor arp
- show event-monitor igmpsnooping
- show event-monitor mac
- show event-monitor mroute
- show event-monitor neighbor
- show event-monitor route6
- show event-monitor route
- show event-monitor sqlite
- show event-monitor stpunstable

Email Configuration Command

- email

System Clock Commands

- clock set
- clock timezone
- show clock

NTP Commands

- ntp authenticate
- ntp authentication-key
- ntp local-interface
- ntp serve
- ntp serve all
- ntp server
- ntp trusted-key
- show ntp associations
- show ntp status

Syslog Configuration Commands

- logging format
- logging persistent
- logging repeat-messages

Power Configuration Commands

- power enable module

4.7.1 banner login

The **banner login** command configures a message that the switch displays before login and password prompts. The login banner is available on console, telnet, and ssh connections.

The **no banner login** and **default banner login** commands delete the login banner.

Command Mode

Global Configuration

Command Syntax

banner login

no banner login

default banner login

Parameters

- *banner_text* To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports the following keywords:
  - **$(hostname)** displays the switchs host name.
- **EOF** To end the banner editing session, type EOF on its own line and press **enter**.

Examples

- These commands create a two-line login banner.

```
switch(config)# banner login
Enter TEXT message. Type 'EOF' on its own line to end.
This is a login banner for $(hostname).
Enter your login name at the prompt.
EOF
switch(config)#
```

- This output displays the login banner.

```
This is a login banner for switch.
Enter your login name at the prompt.
switch login:john
Password:
Last login: Mon Jan 14 09:05:23 2013 from adobe-wrks.aristanetworks.com
switch>
```

4.7.2 banner motd

The **banner motd** command configures a message of the day (motd) that the switch displays after a user logs in. The motd banner is available on console, telnet, and ssh connections.

The **no banner motd** and **default banner motd** commands delete the motd banner.

Command Mode

Global Configuration

Command Syntax

banner motd

no banner motd

default banner motd

Parameters

- *banner_text* To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports this keyword:
  - **$(hostname)** displays the switchs host name.
- **EOF** To end the banner editing session, type EOF on its own line and press **enter**.

Examples

- These commands create an motd banner.

```
switch(config)#banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner for $(hostname)
EOF
switch(config)#
```

- This output displays the motd banner.

```
switch login:john
Password:
Last login: Mon Jan 14 09:17:09 2013 from adobe-wrks.aristanetworks.com
This is an motd banner for Switch
switch>
```

4.7.3 clear ptp interface counters

The **clear ptp interface counters** command resets the Precision Time Protocol (PTP) packet counters.

Command Mode

Privileged EXEC

Command Syntax

clear ptp interface [**INTERFACE_NAME**] **counters**

Parameters

INTERFACE_NAME Interface type and numbers. Options include:

- ***no parameter*** Displays information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Valid parameter formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command clears all PTP counters.

```
switch# clear ptp counters
switch#
```

4.7.4 clock set

The **clock set** command sets the system clock time and date. If the switch is configured with an NTP server, NTP time synchronizations override manually entered time settings.

Time entered by this command is local, as configured by the **clock timezone** command.

Command Mode

Privileged EXEC

Command Syntax

clock set ***hh:mm:ss date***

Parameters

- ***hh:mm:ss*** is the current time (24-hour notation).
- ***date*** is the current date. Date formats include:
  - **mm/dd/yy** example: 05/15/2012
  - example: May 15 2012
  - example: 15 May 2012

Example

This command manually sets the switch time.

```
switch# clock set 08:15:24 14 Jan 2013
Mon Jan 14 08:15:25 2013
timezone is US/Central
```

4.7.5 clock timezone

The **clock timezone** command specifies the UTC offset that converts system time to local time. The switch uses local time for time displays and to time-stamp system logs and messages.

The **no clock timezone** and **default clock timezone** commands delete the **timezone** statement from ***running-config***, setting local time to UTC.

Command Mode

Global Configuration

Command Syntax

clock timezone ***zone_name***

no clock timezone

default clock timezone

Parameters

zone_name the time zone. Settings include a list of predefined time zone labels.

Examples

- This command configures the switch for the United States Central Time Zone.

```
switch(config)# clock timezone US/Central
switch(config)# show clock
Fri Jan 11 18:42:49 2013
timezone is US/Central
switch(config)#
```

- To view the predefined time zone labels, enter **clock timezone** with a question mark.

```
switch(config)# clock timezone ?
  Africa/Abidjan                    Africa/Accra
  Africa/Addis_Ababa                Africa/Algiers
  Africa/Asmara                     Africa/Asmera
  Africa/Bamako                     Africa/Bangui

  W-SU                              W-SU timezone
  WET                               WET timezone
  Zulu                              Zulu timezone

switch(config)#clock timezone
```

- This command displays all time zone labels that start with **America**.

```
switch(config)# clock timezone AMERICA?
America/Adak                    America/Anchorage
America/Anguilla                America/Antigua
America/Araguaina               America/Argentina/Buenos_Aires

America/Virgin                  America/Whitehorse
America/Winnipeg                America/Yakutat
America/Yellowknife

switch(config)#clock timezone AMERICA
```

4.7.6 dns domain

The **dns domain** command configures the switchs domain name. The switch uses this name to complete unqualified host names.

The **no dns domain** and **default dns domain** commands delete the domain name by removing the **dns domain** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

dns domain ***string***

no dns domain

default dns domain

Parameters

string domain name (text string).

Example

This command configures ***aristanetworks.com*** as the switchs domain name.

```
switch(config)# dns domain aristanetworks.com
switch(config)#
```

4.7.7 email

The **email** command places the switch in email client configuration mode. If you configure a from-user and an outgoing SMTP server on the switch, you can then use an email address as an output modifier to a **show** command and receive the output as email.

Command Mode

Global Configuration

Command Syntax

email

Example

This command places the switch in email client configuration mode.

```
switch(config)# email
switch(config)#
```

4.7.8 event-monitor backup max-size

The **event-monitor backup max-size** command specifies the quantity of event monitor backup files the switch maintains. Values range from 1 to 200 files with a default of ten files.

The **event-monitor backup path** command specifies the path/name of these files. The switch appends an extension to the file name that tracks the creation order of backup files. When the quantity of files exceeds the configured limit, the switch deletes the oldest file.

The **no event-monitor backup max-size** and **default event-monitor backup max-size** command restores the default maximum number of backup files the switch can store to ten by removing the corresponding **event-monitor backup max-size** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

event-monitor backup max-size ***file_quantity***

no event-monitor backup max-size

default event-monitor backup max-size

Parameters

file_quantity maximum number of backup files. Value ranges from ***1*** to ***200***. Default is ***10***.

Example

These commands configure the switch to back up the event buffer to a series of files named sw-event.log. The switch can store a maximum of four files.

```
switch(config)# event-monitor backup path sw-event.log
switch(config)# event-monitor backup max-size 4
switch(config)#
```

The first five files that the switch creates to store event monitor buffer contents are:

sw-event.log.0

sw-event.log.1

sw-event.log.2

sw-event.log.3

sw-event.log.4

The switch deletes **sw-event.log.0** the first time it verifies the number of existing backup files after the creation of **sw-event.log.4**.

4.7.9 event-monitor backup path

The **event-monitor backup path** command enables the storage of the event monitor buffer to switch files and specifies the path/name of these files. The command references the file location either from the flash drive root directory (/mnt/flash) where the CLI operates or from the switch root directory (/).

The event monitor buffer is circular after the buffer is filled, new data is written to the beginning of the buffer, replacing old data. At the conclusion of each buffer writing cycle, it is copied into a new backup file before the switch starts re-writing the buffer. The switch appends a extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file if the file limit specified by the **event-monitor backup max-size** command is exceeded.

running-config can contain a maximum of one **event-monitor backup path** statement. Subsequent **event-monitor backup path** commands replace the existing statement in ***running-config***, changing the name of the file where event monitor backup files are stored.

The **no event-monitor backup path** and **default event-monitor backup path** commands disable the storage of the event monitor buffer to switch files by deleting the **event-monitor backup path** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

event-monitor backup path **URL_FILE**

no event-monitor backup path

default event-monitor backup path

Parameters

URL_FILE path and file name of the backup file:

- ***path_string*** specified path is appended to **/mnt/flash/**.
- **file:** ***path_string*** specified path is appended to /.
- **flash:** ***path_string*** specified path is appended to **/mnt/flash/**.

Example

These commands configure the switch to store the event monitor buffer in sw-event.log, then display the new file in the flash directory.

```
switch(config)# event-monitor backup path eventmon_backup_dir/event.log
switch(config)#
bash-4.3# ls /mnt/flash/eventmon_backup_dir/

arpevent.log.1  lacpevent.log.1  neighborevent.log.1  routeevent.log.1
igmpsnoopingevent.log.1  macevent.log.1   route6event.log.1
stpunstableevent.log.1
```

4.7.10 event-monitor buffer max-size

The **event-monitor buffer max-size** command specifies the size of the event monitor buffer. The event monitor buffer is a fixed-size circular data structure that receives event records from the event monitor. When event monitor backup is enabled (**event-monitor backup path**), the buffer is copied to a backup file before each rollover.

Buffer size ranges from ***6 Kb*** to ***50 Kb***. The default size is ***32 Kb***.

The **no event-monitor buffer max-size** and **default event-monitor buffer max-size** commands restore the default buffer size of 32 Kb by removing the **event-monitor buffer max-size** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

event-monitor buffer max-size ***buffer_size***

no event-monitor buffer max-size

default event-monitor buffer max-size

Parameters

buffer_size buffer capacity (Kb). Values range from ***6*** to ***50***. Default value is ***32***.

Example

This command configures a buffer size of ***48 Kb***.

```
switch(config)# event-monitor buffer max-size 48
switch(config)#
```

4.7.11 event-monitor clear

The **event-monitor clear** command removes the contents of the event monitor buffer. If event monitor backup is enabled, this command removes the contents from all event monitor backup files.

Command Mode

Privileged EXEC

Command Syntax

event-monitor clear

Example

This command clears the contents of the event monitor buffer.

```
switch# event-monitor clear
switch#
```

4.7.12 event-monitor interact

The **event-monitor interact** command replaces the CLI prompt with an SQLite prompt. The event monitor buffer and all backup logs are synchronized into a single SQLite file and loaded for access from the prompt.

- To access help from the SQLite prompt, enter **.help**.
- To exit SQLite and return to the CLI prompt, enter **.quit** or **.exit**.

Command Mode

Privileged EXEC

Command Syntax

event-monitor interact

Examples

- This command replaces the EOS CLI prompt with an SQLite prompt.

```
switch# event-monitor interact
sqlite>
```

- This command exits SQLite and returns to the EOS CLI prompt.

```
sqlite> .quit
switch#
```

4.7.13 event-monitor sync

The **event-monitor buffer sync** command combines the event monitor buffer and all backup logs and synchronizes them into a single SQLite file, which is stored at **/var/log/eventMon.db**.

Command Mode

Privileged EXEC

Command Syntax

event-monitor sync

Example

This command synchronizes the buffer and backup logs into a single SQLite file.

```
switch(config)# event-monitor sync
switch(config)#
```

4.7.14 event-monitor

The **event-monitor** command enables the event monitor and specifies the types of events that are logged. The event monitor is an event logging service that records system events to a local database.

The database maintains a separate table for each event type.

The event monitor is disabled by default.

- The **no event-monitor all** command disables the event monitor.
- The **no event-monitor** command, followed by a log type parameter, disables event recording for the specified type.
- The **event-monitor** command enables the specified event logging type by removing the corresponding **no event-monitor** command from ***running-config***.

The **no event-monitor** and **default event-monitor** commands, without a **LOG_TYPE** parameter, restore the default event monitor settings by deleting all event monitor related commands from ***running-config***.

Command Mode

Global Configuration

Command Syntax

event-monitor LOG_TYPE

no event-monitor LOG_TYPE

default event-monitor LOG_TYPE

Parameters

LOG_TYPE specifies the event logging type. Options include:

- **all** all event logging types.
- **arp** changes to ARP table.
- **backup** backed up log files.
- **buffer** changes to the local buffer settings.
- **igmpsnooping** changes to IGMP snooping table.
- **lacp** changes to the LACP table events.
- **mac** changes to MAC address table.
- **mroute** changes to multicast routing table.
- **neighbor** changes to the neighbor routing table.
- **route** changes to IP routing table.
- **route6** changes to IP route6 table.
- **stpunstable** events that cause STP instability.

Related Command

no event-monitor

Examples

- This command disables the event monitor for all types of events.

```
switch(config)# no event-monitor all
switch(config)#
```

- This command enables the event monitor for routing table changes.

```
switch(config)# event-monitor route
switch(config)#
```

4.7.15 hostname

The **hostname** command assigns a text string as the switchs host name. The default host name is ***localhost***.

The prompt displays the host name when appropriately configured through the **prompt** command.

The **no hostname** and **default hostname** commands return the switchs host name to the default value of ***localhost***.

Command Mode

Global Configuration

Command Syntax

hostname *string*

no hostname

default hostname

Parameter

string host name assigned to the switch.

Example

This command assigns the string ***main-host*** as the switchs host name.

```
switch(config)# hostname main-host
main-host(config)#
```

The prompt was previously configured to display the host name.

4.7.16 ip domain lookup

The **ip domain lookup** command specifies the source interface for all DNS requests sent from the specified VRF.

The **no ip domain lookup** and **default ip domain lookup** commands return the switch to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

Command Mode

Global Configuration

Command Syntax

ip domain lookup [VRF_INSTANCE] source-interface INTF_NAME

no ip domain lookup [**VRF_INSTANCE**] **source-interface**

default ip domain lookup [**VRF_INSTANCE**] **source-interface**

Parameters

- **VRF_INSTANCE** specifies the VRF instance being modified.
  - ***no parameter*** changes are made to the default VRF.
  - **vrf *vrf_name*** changes are made to the specified VRF.
- **INTF_NAME** name of source interface to be used for DNS requests. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - management ***m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - vlan ***v_num*** VLAN interface specified by ***v_num***.

Examples

- This command specifies ***VLAN 5*** as the source interface for DNS requests originating from the default VRF.

```
switch(config)# ip domain lookup source-interface Vlan5
switch(config)#
```

- This command specifies ***VLAN 10*** as the source interface for DNS requests originating from VRF purple.

```
switch(config)# ip domain lookup vrf purple source-interface Vlan10
switch(config)#
```

4.7.17 ip domain-list

The **ip domain-list** command specifies a domain name to add to the IP domain list.

The **no ip domain-list** and **default ip domain-list** commands return the IP domain list to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

Command Mode

Global Configuration

Command Syntax

ip domain-list [**IP_DOMAIN_NAME**]

no ip domain-list [**IP_DOMAIN_NAME**]

default ip domain-list [**IP_DOMAIN_NAME**]

Parameter

IP_DOMAIN_NAME specifies the IP domain name.

Examples

- This command specifies foo.com as the IP domain name to add to the IP domain list.

```
switch(config)# ip domain-list foo.com
switch(config)#
```

- This command removes foo.com and returns the IP domain list to its default state.

```
switch(config)# no ip domain-list foo.com
switch(config)#
```

4.7.18 ip host

The **ip host** command associates a hostname to an IPv4 address. This command supports local hostname resolution based on local hostname-IP address maps. Multiple hostnames can be mapped to an IP address. IPv4 and IPv6 addresses can be mapped to the same hostname (to map an IPv6 address to a hostname, use the **ipv6 host** command). The **show hosts** command displays the local hostname-IP address mappings.

The **no ip host** and **default ip host** commands removes hostname-IP address maps by deleting the corresponding **ip host** command from ***running-config***, as specified by command parameters:

- ***no parameters***: command removes all hostname-IP address maps.
- ***hostname*** parameter: command removes all IP address maps for the specified hostname.
- ***hostname*** and ***IP address*** parameters: command removes specified hostname-IP address maps.

Command Mode

Global Configuration

Command Syntax

ip host ***hostname hostadd_1*** [***hostadd_2***] ...[***hostadd_X***]

no ip host [***hostname***] [***hostadd_1*** [***hostadd_2***] [***hostadd_X***]

default ip host [***hostname***] [***hostadd_1*** [***hostadd_2***] [***hostadd_X***]

Parameters

- ***hostname*** hostname (text).
- ***hostadd_N*** IPv4 address associated with hostname (dotted decimal notation).

Related Commands

- **ipv6 host**
- **show hosts**

Examples

- This command associates the hostname ***test_lab*** with the IP addresses ***10.24.18.5*** and ***10.24.16.3***.

```
switch(config)# ip host test_lab 10.24.18.5 10.24.16.3
```

- This command removes all IP address maps for the hostname ***production_lab***.

```
switch(config)# no ip host production_lab
switch(config)#
```

4.7.19 ip name-server

The **ip name-server** command adds name server addresses to ***running_config***. The switch uses name servers for name and address resolution. The switch can be configured with up to three name servers. Although a command can specify multiple name server addresses, ***running_config*** stores each address in a separate statement. Name server addresses can be IPv4 and IPv6; each command can specify both address types.

Attempts to add a fourth server generate an error message. All name server addresses must be configured in the same VRF. When name servers were previously configured in a VRF, they must all be removed before adding new name server entries.

The **no ip name-server** and **default ip name-server** commands remove specified name servers from ***running_config***. Commands that do not list an address remove all name servers.

Command Mode

Global Configuration

Command Syntax

ip name-server [**VRF_INSTANCE**] [***SERVER_1***] [***SERVER_2***] [***SERVER_3***]

no ip name-server [**VRF_INSTANCE**] [***SERVER_1***] [***SERVER_2***] [***SERVER_3***]

default ip name-server [**VRF_INSTANCE**] [***SERVER_1***] [***SERVER_2***] [***SERVER_3***]

Parameters

- **VRF_INSTANCE** specifies the VRF instance containing the addresses.
  - ***no parameter*** default VRF.
  - **vrf *vrf_name*** a user-defined VRF.
- **SERVER_X** IP address of the name server (dotted decimal notation). Options include:
  - ***ipv4_addr*** (A.B.C.D)
  - ***ipv6_addr*** (A:B:C:D:E:F:G:H)

  A command can contain both (IPv4 and IPv6) address types.

Guidelines

All configured name server addresses must come from the same VRF. To use a user defined VRF for connection to a name server, first remove any name servers configured in the default VRF.

Examples

- This command adds two name servers to the configuration.

```
switch(config)# ip name-server 172.0.14.21 3:4F21:1902::
switch(config)#
```

- This command attempts to add a name server when the configuration already lists three servers.

```
switch(config)# ip name-server 172.1.10.22
% Maximum number of nameservers reached. '172.1.10.22' not added
switch(config)#
```

4.7.20 ipv6 host

The **ipv6 host** command associates a hostname to an IPv6 address. This command supports local hostname resolution based on local hostname-IP address maps. Multiple hostnames can be mapped to an IPv6 address. IPv4 and IPv6 addresses can be mapped to the same hostname (to map IPv4 addresses to a hostname, use the **ip host** command). The **show hosts** command displays the local hostname-IP address mappings.

The **no ipv6 host** and **default ipv6 host** commands remove hostname-IP address maps by deleting the corresponding **ipv6 host** command from ***running-config***, as specified by command parameters:

- ***no parameters***: command removes all hostname-IPv6 address maps.
- ***hostname*** parameter: command removes all IPv6 address maps for the specified hostname.
- ***hostname*** and ***IP address*** parameters: command removes specified hostname-IP address maps.

Command Mode

Global Configuration

Command Syntax

ipv6 host ***hostname hostadd_1*** [***hostadd_2***] ...[***hostadd_X***]

no ipv6 host [***hostname***] [***hostadd_1*** [***hostadd_2***] [***hostadd_X***]

default ipv6 host [***hostname***] [***hostadd_1*** [***hostadd_2***] [***hostadd_X***]

Parameters

- ***hostname*** hostname (text).
- ***hostadd_N*** IPv6 addresses associated with hostname (dotted decimal notation).

Related Commands

- **ip host**
- **show hosts**

Example

This command associates the hostname ***support_lab*** with the IPv6 address ***2001:0DB8:73:ff:ff:26:fd:90***.

```
switch(config)# ipv6 host support_lab 2001:0DB8:73:ff:ff:26:fd:90
switch(config)#
```

4.7.21 logging format

The **`logging format`** command configures formatting options for syslog messages.

The **`no logging format`** and **`default logging format`** commands remove the corresponding **`logging format`** command from ***running-config*** and restore the specified formatting to its default setting.

Command Mode

Global Configuration

Command Syntax

`logging format` {hostname{fqdn|ipv4}|rfc5424|sequence-numbers|timestamp{high-resolution|traditional[timezone][year]}}

`no logging format` {hostname|rfc5424|sequence-numbers|timestamp}

`default logging format` {hostname|rfc5424|sequence-numbers|timestamp}

Parameters

hostname {fqdn\ipv4} specifies the formatting for the hostname in syslog messages as either **fqdn** (fully qualified domain name) or **ipvr** (IPv4 address).

rfc5424 causes syslogs generated locally to include high-resolution timestamps, and syslogs forwarded to remote servers to be sent in RFC5424 format.

sequence-numbers causes the sequence numbers of syslog messages to be visible when the messages are displayed.

timestamp {high-resolution|traditional[timezone][year]} specifies the formatting for syslog timestamps as either **high-resolution** (high-resolution RFC3339 timestamps) or **traditional** (traditional syslog timestamps as specified in RFC3164). When using the traditional timestamp format, **timezone** and **year** can also be included.

Examples

- This command enables sequence numbering that can been seen when Syslog messages are displayed.

```
switch(config)# logging format sequence-numbers
switch(config)#
```

- To display the sequence numbers, issue the **`show logging`** command.

```
switch# show logging
    Syslog logging: enabled
    Buffer logging: level debugging
    Console logging: level informational
    Synchronous logging: disabled
    Trap logging: level informational
    Sequence numbers: enabled
    Syslog facility: local4
    Hostname format: Hostname only
    Repeat logging interval: disabled

Log Buffer:

4.7.22 logging persistent

The **`logging persistent`** command logs the files stored on the flash disk.

The **`no logging persistent`** command disables the logging from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

`logging persistent` ***logging file size***

`no logging persistent` ***logging file size***

Parameter

- ***logging file size*** The maximum size (in bytes) of logging file stored on flash disk. The value ranges from 1024 to 2147483647.

Example

- This command configures logging persistent on the switch.

```
switch# config
switch(config)# logging persistent 1024
! Note: writing system log message on non-volatile flash will affect
 the life
expectancy of the flash drive due to heavy writing. Please disable
 persistent logging unless needed.
```

4.7.23 logging repeat-messages

The **logging repeat-messages** command configures repetition of syslog messages instead of summarizing the count of repeats.

The **no logging repeat-messages** and **default logging repeat-messages** commands disable the functionality to repeat logging messages in ***running-config***.

Command Mode

Global Configuration

Command Syntax

logging repeat-messages

no logging repeat-messages

default logging repeat-messages

Examples

- This command repeats syslog messages instead of summarizing the count of repeats.

```
switch(config)# logging repeat-messages
switch(config)#
```

- This command displays the status of logging repeat messages command.

```
switch(config)# show logging
Syslog logging: enabled
    Buffer logging: level debugging
    Console logging: level debugging
    Monitor logging: level debugging
    Synchronous logging: disabled
    Trap logging: level informational
    Sequence numbers: disabled
    Syslog facility: local4
    Hostname format: Hostname only
    Repeat logging interval: disabled
    Repeat messages: enabled

Facility             Severity            Effective Severity
--------------       -------------       ------------------
aaa                  debugging           debugging
accounting           debugging           debugging

switch(config)#
```

4.7.24 no event-monitor

The **no event-monitor** and **default event-monitor** commands remove the specified **event-monitor** configuration statements from ***running-config***, returning the switch to the specified default state.

- **no event-monitor** with ***no parameters***, restores all default setting states:
  - event monitor is enabled.
  - buffer backup is disabled.
- The **no event-monitor backup** disables the backup.

To disable the event monitor, enter the **no event-monitor all** command (**event-monitor**).

Command Mode

Global Configuration

Command Syntax

no event-monitor [**PARAMETER**]

default event-monitor [**PARAMETER**]

Parameters

PARAMETER the event monitor property that is returned to the default state.

- ***no parameter*** all event monitor properties.
- **backup** event monitor buffer backup is disabled.

Example

This command removes all event monitor configuration statements from ***running-config***.

```
switch(config)# no event-monitor
switch(config)#
```

4.7.25 ntp authenticate

The **ntp authenticate** command enables the authentication of incoming NTP packets. When authentication is enabled, NTP packets will be used to synchronize time on the switch only if they include a trusted authentication key. Authentication keys are created on the switch using the **ntp authentication-key** command, and the **ntp trusted-key** command is used to specify which keys are trusted. NTP authentication is disabled by default.

The **no ntp authenticate** and **default ntp authenticate** commands disable NTP authentication on the switch by removing the corresponding **ntp authenticate** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ntp authenticate

no ntp authenticate

default ntp authenticate

Examples

- This command enables NTP authentication on the switch.

```
switch(config)# ntp authenticate
switch(config)#
```

- This command disables NTP authentication on the switch.

```
switch(config)# no ntp authenticate
switch(config)#
```

4.7.26 ntp authentication-key

The **ntp authentication-key** command creates an authentication key for use in authenticating incoming NTP packets. For the key to be used in authentication:

- It must be configured as a trusted key using the **ntp trusted-key** command.
- NTP authentication must be enabled on the switch using the **ntp authenticate** command.
- The same key must be configured on the NTP server.

The **no ntp authentication-key** and **default ntp authentication-key** commands remove the specified authentication key by removing the corresponding **ntp authentication-key** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ntp authentication-key*key_id* ENCRYPT_TYPE *password_text*

no ntp authentication-key *key_id*

default ntp authentication-key *key_id*

Parameters

- ***key_id*** key ID number. Value ranges from ***1*** to ***65534***.
- **ENCRYPT_TYPE** encryption method. Values include:
  - **md5 *key_text*** is MD5 encrypted.
  - **sha1 *key_text*** is SHA-1 encrypted.
- ***password_text*** the authentication-key password.

Examples

- This command creates an NTP authentication key with ***ID 234*** and password ***timeSync*** using MD5 encryption.

```
switch(config)# ntp authentication-key 234 md5 timeSync
```

  Running-config stores the password as plain text.
- This command removes ***NTP authentication key 234***.

```
switch(config)# no ntp authentication-key 234
```

4.7.27 ntp local-interface

The **ntp local-interface** command configures an interface as the local NTP source. The IP address of that interface will then be used as the source address in NTP packets sent by the switch. If the switch is acting as an NTP server and a server-specific source interface has been configured using the **source** option of the **ntp server** command, the server-specific source address will take precedence.

The **no ntp local-interface** and **default ntp local-interface** commands remove the **ntp local-interface** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ntp local-interface [**VRF_INSTANCE**] **INT_PORT**

no ntp local-interface

default ntp local-interface

Parameters

- **VRF_INSTANCE** the VRF instance to be used for connection to the specified server. Options include:
  - ***no parameter*** connects using the default VRF.
  - **vrf *vrf_name*** connects using the specified user-defined VRF.
- **INT_PORT** the interface port that specifies the NTP local interface. Settings include:
  - **ethernet *e_range*** Ethernet interface list.
  - **loopback *l_range*** loopback interface list.
  - **management *m_range*** management interface list.
  - **port-channel *c_range*** port channel interface list.
  - **vlan *v_range*** VLAN interface list.

Examples

- This command configures ***ntp local-interface vlan 25*** as the local NTP source. NTP packets exiting the switch use the IP address of ***VLAN interface 25*** as their source address.

```
switch(config)# ntp local-interface vlan 25
switch(config)#
```

- This command removes the **ntp local-interface** command from the configuration.

```
switch(config)# no ntp local-interface
switch(config)#
```

4.7.28 ntp serve all

The **ntp serve all** command configures the switch to act as an NTP server by accepting incoming NTP requests.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

Individual interfaces can be configured separately to accept or deny NTP requests by using the **ntp serve** command, and these settings override the global setting.

Command Mode

Global Configuration

Command Syntax

ntp serve all

no ntp serve all

default ntp serve all

Example

- This command configures the switch to accept incoming NTP requests.

```
switch(config)# ntp serve all
switch(config)#
```

- This command configures the switch to deny incoming NTP requests.

```
switch(config)# no ntp serve all
switch(config)#
```

4.7.29 ntp serve

The **ntp serve** command configures the command mode interface to accept incoming NTP requests regardless of the global setting.

The **no ntp serve** command configures the command mode interface to refuse incoming NTP requests regardless of the global setting. The **default ntp serve** command configures the command mode interface to follow the global setting.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

Command Modes

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

ntp serve

no ntp serve

default ntp serve

Examples

- These commands configure ***interface ethernet 5*** to accept incoming NTP requests regardless of global settings.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)#ntp serve
switch(config-if-Et5)#
```

- These commands configure ***interface ethernet 5*** to deny incoming NTP requests regardless of global settings.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)#no ntp serve
switch(config-if-Et5)#
```

- These commands configure ***interface ethernet 5*** to use global settings in responding to incoming NTP requests.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)#default ntp serve
switch(config-if-Et5)#
```

4.7.30 ntp server

The **ntp server** command adds a Network Time Protocol (NTP) server to ***running-config***. If the command specifies a server that already exists in ***running-config***, it will modify the server settings. The switch synchronizes the system clock with an NTP server when ***running-config*** contains at least one valid NTP server.

The switch supports NTP versions 1 through 4. The default is version 4.

The **prefer** option specifies a preferred NTP server, which is used as the NTP server if not discarded by NTP.

The **no ntp server** and **default ntp server** commands remove the specified NTP server from ***running-config***. To remove an NTP server configured in a user-defined VRF, include the VRF name in the **no ntp server** command.

Command Mode

Global Configuration

Command Syntax

ntp server [**VRF_INSTANCE**] **SERVER_NAME** [**PREFERENCE**] [**NTP_VERSION**] [**IP_SOURCE**] [**burst**] [**iburst**] [**AUTH_KEY**][**MAX_POLL_INT**][**MIN_POLL_INT**]

no ntp server [**VRF_INSTANCE**] **SERVER_NAME**

default ntp server [**VRF_INSTANCE**] **SERVER_NAME**

All parameters except **VRF_INSTANCE** and **SERVER_NAME** can be placed in any order.

Parameters

- **VRF_INSTANCE** the VRF instance to be used for connection to the specified server.
  - ***no parameter*** connects using the default VRF.
  - **vrf *vrf_name*** connects using the specified user-defined VRF.
- **SERVER_NAME** NTP server location. Options include:
  - ***IP address*** in dotted decimal notation.
- **PREFERENCE** indicates priority of this server when the switch selects a synchronizing server.
  - ***no parameter*** server has no special priority.
  - **prefer** server has priority when the switch selects a synchronizing server.
- **NTP_VERSION** specifies the NTP version. Settings include:
  - ***no parameter*** sets NTP version to 4 (default).
  - **version *number***, where ***number*** ranges from ***1*** to ***4***.
- **IP_SOURCE** specifies the source interface for NTP updates for the specified NTP server. This option overrides global settings created by the **ntp local-interface** command. Options include:
  - ***no parameter*** sets the source interface to the global default.
  - **source ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **source loopback *l_num*** loopback interface specified by ***l_num***.
  - **source management *m_num*** management interface specified by ***m_num***.
  - **source port-channel *p_num*** port-channel interface specified by ***p_num***.
  - **source vlan *v_num*** VLAN interface specified by ***v_num***.
- **burst** indicates that when the NTP server is reached, the switch sends packets to the server in bursts of eight instead of the usual one. Recommended only for local servers. Off by default.
- **iburst** indicates that the switch sends packets to the server in bursts of eight instead of the usual one until the server is reached. Recommended for general use to speed synchronization. Off by default.

- **AUTH_KEY** the authentication key to use in authenticating NTP packets from the server.
  - ***no parameter*** no authentication key is specified.
  - **key *1 to 65534*** switch will use the specified key to authenticate NTP packets from the server.
- **MAX_POLL_INT** specifies the maximum polling interval for the server (as the base-2 logarithm of the interval in seconds). Settings include:
  - ***no parameter*** sets the maximum polling interval to ***10*** (***1,024*** seconds, the default).
  - **maxpoll *number***, where ***number*** is the base-2 logarithm of the interval in seconds. Values range from ***3*** (***8*** seconds) to ***17*** (***131,072*** seconds, approximately ***36*** hours).
- **MIN_POLL_INT** specifies the minimum polling interval for the server (as the base-2 logarithm of the interval in seconds). Settings include:
  - ***no parameter*** sets the minimum polling interval to ***6*** (***64*** seconds, the default).
  - **minpoll *number***, where ***number*** is the base-2 logarithm of the interval in seconds. Values range from ***3*** (***8*** seconds) to ***17*** (***131,072*** seconds, approximately ***36*** hours).

Guidelines

To configure multiple parameters for a single server, include them all in a single **`ntp server`** command. Using the command again for the same server overwrites parameters previously configured in ***running-config***.

All NTP servers must use the same VRF. If no VRF is specified, the server is configured in the default VRF. To use a user-defined VRF for connection to an NTP server, first use the **`no ntp server`** command to remove any NTP servers configured in the default VRF.

When specifying a source interface, choose an interface in the same VRF as the server. If the source interface is not in the same VRF, the source data will be included in ***running-config*** but will not be added to NTP packets.

An NTP server may be configured using an invalid or inactive VRF, but the status of the NTP server will remain inactive until the VRF is active.

Examples

- This command configures the switch to update its time with the NTP server at address ***172.16.0.23*** and designates it as a preferred NTP server.

```
switch(config)# ntp server 172.16.0.23 prefer
```

- This command configures the switch to update its time through an NTP server named ***local-nettime***.

```
switch(config)# ntp server local-nettime
```

- This command configures the switch to update its time through a ***version 3*** NTP server.

```
switch(config)# ntp server 171.18.1.22 version 3
```

- These commands reconfigure the switch to access the above NTP servers through VRF magenta.

```
switch(config)# no ntp server 172.16.0.23
switch(config)# no ntp server local-nettime
switch(config)# no ntp server 171.18.1.22
switch(config)# ntp server vrf magenta 172.16.0.23 prefer
switch(config)# ntp server vrf magenta local-nettime
switch(config)# ntp server vrf magenta 171.18.1.22 version 3
switch(config)#
```

4.7.31 ntp trusted-key

The **ntp trusted-key** command specifies which authentication keys will be trusted for authentication of NTP packets. A packet with a trusted key will be used to update the local time if authenticated.

The **no ntp trusted-key** and **default ntp trusted-key** commands remove the specified authentication keys from the trusted key list by removing the corresponding **ntp trusted-key** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ntp trusted-key key_list

no ntp trusted-key

default ntp trusted-key

Parameters

key_list specified one or more keys. Formats include a number (***1*** to ***65534***), number range, or comma-delimited list of numbers and ranges.

Example

This command configures the switch to trust authentication keys ***234*** and ***237*** for authentication of NTP packets.

```
switch(config)# ntp trusted-key 234,237
switch(config)#
```

4.7.32 power enable module

The **power enable module** command powers up the specified module. The **no power enable module** command powers down the specified module.

Command Mode

Global Configuration

Command Syntax

power enable module {**fabric**|**linecard**|**supervisor**|**switchcard**} ***module_number***

no power enable module {**fabric**|**linecard**|**supervisor**|**switchcard**} ***module_number***

default power enable module {**fabric**|**linecard**|**supervisor**|**switchcard**} ***module_number***

Parameters

fabric specifies a fabric card

linecard specifies a linecard

supervisor specifies a supervisor

switchcard specifies a switch card

module_number specifies the number of the module

Examples

- This command powers down linecard 3.

```
switch(config)# no power enable module linecard 3
switch(config)#
```

- These commands reload fabric module 2.

```
switch(config)# no power enable module fabric 2
switch(config)#power enable module fabric 2
switch(config)#
```

4.7.33 prompt

The **`prompt`** command specifies the contents of the CLI prompt. Characters allowed in the prompt include A-Z, a-z, 0-9, and these punctuation marks:

! @ # $ % # & * ( ) - = + f g [ ] ; : < > , . ? / # n

The prompt supports these control sequences:

- %s – space character
- %t – tab character
- %% – percent character
- %D – time and date
- %D{*f_char*} – time and date, format specified by the BSD **strftime** (f_char) time conversion function.
- %H – host name
- %h – host name up to the first '.'
- %P – extended command mode
- %p – command mode
- %r [1] – redundancy status on modular systems.
- %R [2] – extended redundancy status on modular systems – includes status and slot number.

Table 4: Command Mode Prompt Examples

Command Mode	Command Mode Prompt	Extended Command Mode Prompt
Exec	>	>
Privileged Exec	#	#
Global Configuration	(config)#	(config)#
Ethernet Interface Configuration	(config-if)#	(config-if-ET15)#
VLAN Interface Configuration	(config-if)#	(config-if-Vl24)#
Port Channel Interface Configuration	(config-if)#	(config-if-Po4)#
Management Interface Configuration	(config-if)#	(config-if-Ma1)
Access List Configuration	(config-acl)#	(config-acl-listname)#
OSPF Configuration	(config-router)#	(config-router-ospf)#
BGP Configuration	(config-router)#	(config-router-bgp)#

[1] When logged into a fixed system or a supervisor on a modular system, this option has no effect.
[2] When logged into a fixed system, this option has no effect.

The **no prompt** and **default prompt** commands return the prompt to the default of ***%H%R%P***.

Command Mode

Global Configuration

Command Syntax

prompt ***p_string***

no prompt

default prompt

Parameters

p_string prompt text (character string). Elements include letters, numbers, and control sequences.

Examples

- This command creates a prompt that displays ***system 1*** and the command mode.

```
host-name.dut103(config)# prompt system%s1%P
system 1(config)#
```

- This command creates a prompt that displays the command mode.

```
host-name.dut103(config)# prompt %p
(config)#
```

- These equivalent commands create the default prompt.

```
% prompt %H%P
host-name.dut103(config)#
```

```
% no prompt
host-name.dut103(config)#
```

4.7.34 show banner

The **show banner** command displays the specified banner.

Command Mode

Privileged EXEC

Command Syntax

show banner BANNER_TYPE [login | motd]

Parameters

BANNER_TYPE banner that the command displays. Options include:

- **login** command displays login banner.
- **motd** command displays message of the day banner.

Example

These commands configure and display the message of the day banner.

```
switch(config)# banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner for $(hostname)
EOF

switch(config)# show banner motd
This is an motd banner for $(hostname)
switch(config)#
```

4.7.35 show clock

The **show clock** command displays the current system clock time and configured time zone. The switch uses the system clock for system log messages and debugging traces.

Command Mode

EXEC

Command Syntax

show clock

Example

This command displays the current system clock time and configured time zone.

```
switch> show clock
Wed Nov  2 10:29:32 2011
timezone is America/Los_Angeles
switch>
```

4.7.36 show event-monitor arp

The **`show event-monitor arp`** command performs an SQL-style query on the event monitor database and displays ARP table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

`show event-monitor arp` [**GROUP**] [**MESSAGES**] [**INTERFACE**] [**IP**] [**MAC**] [**TIME**] [**VRF**]

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
  - ***no parameter*** results are not grouped.
  - **group by interface** results are grouped by interface.
  - **group by ip** results are grouped by IP address.
  - **group by mac** results are grouped by MAC address.
  - **group by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - ***no parameter*** result-set not restricted by interface.
  - **match-interface ethernet *e_range*** Ethernet interface list.
  - **match-interface loopback *l_range*** loopback interface list.
  - **match-interface management *m_range*** management interface list.
  - **match-interface port-channel *c_range*** port channel interface list.
  - **match-interface tunnel *t_range*** tunnel interface list.
  - **match-interface vxlan *vx_range*** VXLAN interface list.
  - **match-interface port-channel *c_range*** port channel interface list.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific IP addresses.
  - **match-ip *ip_address_rex*** IP address, as represented by regular expression.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific MAC addresses.
  - **match-mac *mac_address_rex*** MAC address, as represented by regular expression.
- **TIME** restricts result-set to events generated during specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.
- **VRF** restricts result-set to events that include a specific VRF.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-vrf *vrf_name*** the VRF name.

Example

This command displays ARP table events listed in the event monitor database.

```
switch# show event-monitor arp
% Writing 220017 Arp, 234204 Route, 1732559 Mac events to the database
2012-11-06 12:36:10|10.33.6.159|Vlan1417|0000.00dc.cc0d|0|added|2186271

switch#
```

4.7.37 show event-monitor igmpsnooping

The **show event-monitor igmpsnooping** command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

show event-monitor igmpsnooping [**GROUP**] [**MESSAGES**] [**MAC**] [**INTERFACE**] [**VLAN**] [**TIME**]

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
  - ***no parameter*** results are not grouped.
  - **group-by interface** results are grouped by interface.
  - **group-by mac** results are grouped by MAC address.
  - **group-by vlan** results are grouped by VLAN.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific MAC addresses.
  - **match-mac *mac_address_rex*** MAC address, as represented by regular expression.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - ***no parameter*** result-set not restricted by interface.
  - **match-interface ethernet *e_range*** Ethernet interface list.
  - **match-interface loopback *l_range*** loopback interface list.
  - **match-interface management *m_range*** management interface list.
  - **match-interface port-channel *c_range*** port channel interface list.
  - **match-interface vlan *v_range*** VLAN interface list.
  - **match-interface tunnel *t_range*** tunnel interface list.
  - **match-interface vxlan *vx_range*** VXLAN interface list.
- **TIME** restricts result-set to events with specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.
- **VLAN** restricts result-set to events that include a specific VLAN (SQL Like command).
  - ***no parameter*** result-set not restricted by time of event.
  - **match-vlan vlan** VLAN interface number.

Example

```
switch# show event-monitor igmpsnooping
switch#
```

4.7.38 show event-monitor mac

The **show event-monitor mac** command performs an SQL-style query on the event monitor database and displays MAC address table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

show event-monitor mac [**GROUP**] [**MESSAGES**] [**INTERFACE**] [**MAC**] [**TIME**]

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
  - ***no parameter*** results are not grouped.
  - **group-by interface** results are grouped by interface.
  - **group-by mac** results are grouped by MAC address.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - ***no parameter*** result-set not restricted by interface.
  - **match-interface ethernet *e_range*** Ethernet interface list.
  - **match-interface loopback *l_range*** loopback interface list.
  - **match-interface management *m_range*** management interface list.
  - **match-interface port-channel *c_range*** port channel interface list.
  - **match-interface vlan *v_range*** VLAN interface list.
  - **match-interface tunnel *t_range*** tunnel interface list.
  - **match-interface vxlan *vx_range*** VXLAN interface list.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific MAC addresses.
  - **match-mac *mac_address_rex*** MAC address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

Examples

- This command displays all events triggered by MAC address table events.

```
switch# show event-monitor mac
% Writing 0 Arp, 0 Route, 1 Mac events to the database
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|
added|0
```

- This command displays events triggered by MAC address table changes.

```
switch# show event-monitor mac match-mac 08:08:08:%
```

```
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|
added|0
```

4.7.39 show event-monitor mroute

The **show event-monitor mroute** command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

show event-monitor mroute [**GROUP**] [**MESSAGES**] [**IP**] [**INTERFACE**] [**SRC_IP**] [**TIME**]

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
  - ***no parameter*** results are not grouped.
  - **group-by interface** results are grouped by interface.
  - **group-by ipv6** results are grouped by IPv6 address.
  - **group-by mac** results are grouped by MAC address.
  - **group-by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific IP addresses.
  - **match-ipv6 *ip_address_rex*** IP address, as represented by regular expression.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - ***no parameter*** result-set not restricted by interface.
  - **match-interface ethernet *e_range*** Ethernet interface list.
  - **match-interface loopback *l_range*** loopback interface list.
  - **match-interface management *m_range*** management interface list.
  - **match-interface port-channel *c_range*** port channel interface list.
  - **match-interface vlan *v_range*** VLAN interface list.
  - **match-interface tunnel *t_range*** tunnel interface list.
  - **match-interface vxlan *vx_range*** VXLAN interface list.
- **SRC_IP** restricts result-set to events that include specified Source IP address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific IP addresses.
  - **match-ip *ip_address_rex*** IP address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

Example

This command displays neighbor table events listed in the event monitor database.

```
switch# show event-monitor mroute
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|||added|30
```

```
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|Vlan2|iif|join|31
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|Vlan3|oif|join|32
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|Vlan4|oif|join|33
2011-07-28 12:33:28|default|10.11.12.13/32|225.0.0.2/32|||added|34
2011-07-28 12:33:28|default|10.11.12.13/32|225.0.0.2/32|Vlan3|iif|join|35
2011-07-28 12:33:28|default|10.11.12.13/32|225.0.0.2/32|Vlan2|oif|join|36

```

4.7.40 show event-monitor neighbor

The **`show event-monitor neighbor`** command performs an SQL-style query on the event monitor database and displays neighbor table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

`show event-monitor neighbor` [**GROUP**][**MESSAGES**][**INTERFACE**][**IP6**][**MAC**][**TIME**][**VRF**]

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
  - ***no parameter*** results are not grouped.
  - **group-by interface** results are grouped by interface.
  - **group-by ip6** results are grouped by IPv6 address.
  - **group-by mac** results are grouped by MAC address.
  - **group-by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
  - ***no parameter*** result-set not restricted by interface.
  - **match-interface ethernet *e_range*** Ethernet interface list.
  - **match-interface loopback *l_range*** loopback interface list.
  - **match-interface management *m_range*** management interface list.
  - **match-interface port-channel *c_range*** port channel interface list.
  - **match-interface vlan *v_range*** VLAN interface list.
  - **match-interface tunnel *t_range*** tunnel interface list.
  - **match-interface vxlan *vx_range*** VXLAN interface list.
- **IP6** restricts result-set to events that include specified IP address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific IP addresses.
  - **match-ipv6 *ip6_address_rex*** IPv6 address, as represented by regular expression.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific MAC addresses.
  - **match-mac *mac_address_rex*** MAC address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.
- **VRF** restricts result-set to events that include a specific VRF (SQL Like command).
  - ***no parameter*** result-set not restricted by time of event.
  - **match-vrf *vrf_name*** VRF name, as represented by a regular expression.

Example

This command displays neighbor table events listed in the event monitor database.

```
switch# show event-monitor neighbor
2019-09-30 14:37:32.894147|def0::1|Vlan1|default|0005.0005.0005|1|added|1

```

4.7.41 show event-monitor route6

The **show event-monitor route6** command performs an SQL-style query on the event monitor database and displays routing6 table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

show event-monitor route6 [**GROUP**][**MESSAGES**][**IP6**][**TIME**]

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
  - ***no parameter*** results are not grouped.
  - **group by interface** results are grouped by interface.
  - **group by ip6** results are grouped by IPv6 address.
  - **group by mac** results are grouped by MAC address.
  - **group by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **IP6** restricts result-set to events that include specified IP address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific IP addresses.
  - **match-ipv6 *ip6_address_rex*** IPv6 address, as represented by regular expression.
- TIME restricts result-set to events with specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

Example

This command displays neighbor table events listed in the event monitor database.

```
switch# show event-monitor route6

4.7.42 show event-monitor route

The **show event-monitor route** command performs an SQL-style query on the event monitor database and displays routing table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

show event-monitor route [**GROUP**][**MESSAGES**][**IP**][**TIME**]

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
  - ***no parameter*** results are not grouped.
  - **group-by ip** results are grouped by IPv4 address.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
  - ***no parameter*** result-set not restricted to specific IP addresses.
  - **match-ip *ip_address_rex*** IP address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

Example

This command displays 10 routing table events listed in the event monitor database.

```
switch# show event-monitor route limit 10

switch#
```

4.7.43 show event-monitor sqlite

The **show event-monitor sqlite** command performs an SQL-style query on the event monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

show event-monitor sqlite ***statement***

Parameter

statement SQLite statement.

Example

This command displays all entries from the route table.

```
switch# show event-monitor sqlite select * from route;
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|

4.7.44 show event-monitor stpunstable

The **show event-monitor stpunstable** command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

show event-monitor stpunstable [**MESSAGES**][**TIME**]

Optional parameters can be placed in any order.

Parameters

- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
  - ***no parameter*** result-set size is not limited.
  - **limit *msg_quantity*** number of results that are displayed. Values range from ***1*** to ***15,000***.
- **TIME** restricts result-set to events with specified period.
  - ***no parameter*** result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

Example

```
switch# show event-monitor stpunstable limit 5
2019-02-07 07:22:10.286164|Cist|Ethernet5|forward-delay-while|1
2019-02-07 07:22:10.286651|Cist|Ethernet6|forward-delay-while|2
2019-02-07 07:22:10.286844|Cist|Ethernet8|forward-delay-while|3
2019-02-07 07:22:10.287030|Cist|Ethernet14|forward-delay-while|4
2019-02-07 07:22:10.287215|Cist|Ethernet21|forward-delay-while|5
switch#
```

4.7.45 show hostname

The **show hostname** command displays the hostname and the Fully Qualified Domain Name (FQDN) of the switch.

Command Mode

EXEC

Command Syntax

show hostname

Example

This command displays the hostname and FQDN of the switch.

```
switch> show hostname
Hostname: switch_1
FQDN:     switch_1.aristanetworks.com

switch>
```

4.7.46 show hosts

The **show hosts** command displays the default domain name, name lookup service style, a list of name server hosts, and the static hostname-IP address maps.

Command Mode

EXEC

Command Syntax

show hosts

Example

This command displays the switchs IP domain name:

```
switch> show hosts
Default domain is: aristanetworks.com
Name/address lookup uses domain service
Name servers are: 172.22.22.40, 172.22.22.10
Static Mappings:

Hostname                         IP     Addresses

TEST_LAB                        IPV4    10.24.18.6
PRODUCTION_LAB                  IPV4    10.24.18.7
SUPPORT_LAB                     IPV6    2001:0DB8:73:ff:ff:26:fd:90
switch>
```

4.7.47 show ip domain-name

The **show ip domain-name** command displays the switchs IP domain name that is configured with the ip domain name command.

Command Mode

EXEC

Command Syntax

show ip domain-name

Example

This command displays the switchs IP domain name:

```
switch> show ip domain-name
aristanetworks.com
switch>
```

4.7.48 show ip name-server

The **`show ip name-server`** command displays the ip addresses of name-servers in ***running-config***. The name servers are configured by the **`ip name-server`** command.

Command Mode

EXEC

Command Syntax

`show ip name-server`

Example

This command displays the IP address of name servers that the switch is configured to access.

```
switch>show ip name-server
172.22.22.10
172.22.22.40
switch>
```

4.7.49 show local-clock time-properties

The **show local-clock time-properties** command displays the Precision Time Protocol (PTP) clock properties.

Command Mode

Privileged EXEC

Command Syntax

show local-clock time-properties

Example

This command shows the PTP clock properties.

```
switch# show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0
switch#
```

4.7.50 show ntp associations

The **show ntp associations** command displays the status of connections to NTP servers.

Command Mode

EXEC

Command Syntax

show ntp associations

Display Values

- **refid (reference ID)**: the reference ID of the configured NTP server's time source. The reference ID is either the IPv4 address of the source or (if the source has an IPv6 address) the first four octets of the MD5 hash of the IPv6 address.
- **st (stratum)**: number of steps between the switch and the reference clock.
- **t (transmission type)**: u unicast; b broadcast; l local.
- **when**: interval since reception of last packet (seconds unless unit is provided).
- **poll**: interval between NTP poll packets. Maximum (1024) reached as server and client syncs.
- **reach**: octal number that displays status of last eight NTP messages (377 - all messages received).
- **delay**: round-trip delay of packets to the NTP server.
- **offset**: difference between local clock and the server's clock.
- **jitter**: nominal offset estimation error.

Example

This command displays the status of the switch's NTP associations.

```
switch>show ntp associations
     remote           refid      st t when  poll reach   delay   offset  jitter
==============================================================================

switch#
```

4.7.51 show ntp status

The **show ntp status** command displays the status of NTP on the switch. If the switch clock is not synchronized to an NTP server, the status reads “unsynchronised” and shows the server polling interval. If the clock is synchronized to an NTP server, the status shows the IP address and stratum of the server, the precision of the synchronization, and the polling interval.

Note:

In EOS releases prior to *4.23.2*, this command identified system peers with IPv6 addresses by their reference IDs (the first four octets of the MD5 hash of the IPv6 address). In later releases, this command always shows the IP address of the system peer (whether IPv4 or IPv6).

Command Mode

EXEC

Command Syntax

show ntp status

Example

This command displays the switch’s NTP status.

```
switch> show ntp status
synchronised to NTP server (192.168.78.62) at stratum 3
   time correct to within 66 ms
   polling server every 1024 s
switch>
```

Chapter 5

7130 Layer 1 Configuration

The source for patching Layer 1 traffic between front panel ports, application FPGA ports, and Switch interfaces is configured using the **`l1 source`** command. Switch interfaces can be used instead of the Application interfaces for making connections between SwitchApp interfaces and front panel ports.

For more information refer to https://www.arista.com/en/support/toi/eos-4-27-1f/14877-switchapp-ultra-low-latency-packet-switch

7130 Layer 1 Commands

- l1 source
- show l1 source
- show l1 source capabilities
- show l1 destination
- show l1 matrix
- show l1 path

5.1 l1 source

The **`l1 source`** command configures the source for patching Layer 1 traffic between various front panel and Switch Application (SwitchApp) ports in the Ethernet Interface configuration mode.

The **`no l1 source`** and **`default l1 source`** commands remove the source configurations and return to the default platform configurations.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`l1 source` {interface | mac | none}

Parameters

- **interface** patches the Layer 1 traffic from the specified interface.
  - **application** Application FPGA connector interface
  - **cpu** CPU interface
  - **ethernet** Ethernet interface
  - **switch** Switch interface
- **mac** patches the Layer 1 traffic from the specified MAC address.
- **none** unpatches the Layer 1 traffic source.

Examples

- This command patches the Layer 1 traffic from the Ethernet interface ***et2***.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# l1 source interface et2
switch(config-if-Et1)#
```

- This command unpatches the Layer 1 traffic source.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# l1 source none
```

5.2 show l1 source

The **show l1 source** command displays the list of all source interfaces to connect for specific interfaces such as Ethernet ports, switch, FPGA ports, or CPU ports.

Command Mode

Privileged EXEC

Command Syntax

show l1 source [interface | capabilities]

Parameters

- **interface** lists the source interfaces available to connect for the specified interface.
  - **application** Application FPGA connector interface
  - **cpu** CPU interface
  - **ethernet** Ethernet interface
  - **switch** Switch interface
- **capabilities** lists the Layer 1 source capabilities for the specified switch.

Examples

- This command displays the list of all source interfaces to connect in the crosspoint and the specific interfaces.

```
switch# show l1 source
   Interface             Source Interface    Type
-------------------- ---------------------- -------
   Ethernet1             App1/1              dynamic
   Ethernet2
   Ethernet3             Ethernet2           dynamic
   Ethernet4             Ethernet2           dynamic
   Ethernet5             MAC                 dynamic
   App1/1                Ethernet1           dynamic
   App1/2                Sw17                static
   Sw1                   Ethernet1           dynamic
   Sw2
   Sw3
   Sw4
   Sw5
   Sw17                  App1/2              static
   Cpu1
   Cpu2
```

Note: Interfaces that do not have a source port are listed too but the Source Interface and Type columns appear as blanks.

- This command displays the list of source interfaces to connect for the Ethernet interface ***et1***.

```
switch# show l1 source interface et1
Interface             Source Interface    Type
-------------------- ------------------- -------
Ethernet1             App1/1              dynamic
```

5.3 show l1 source capabilities

The **`show l1 source capabilities`** command displays the list of all interfaces available to connect in the crosspoint and their possible source ports.

Command Mode

Privileged EXEC

Command Syntax

`show l1 source capabilities`

Example

- This command displays the list of all possible source interfaces available to connect in the crosspoint and the specific interfaces.

```
switch# show l1 source capabilities
Interface             Possible Source Interface(s)
--------------------- --------------------------------
Ethernet1             Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet2             Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet3             Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet4             Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet5             Ap1/1,Cpu1-2,Et1-16,Sw1-16
Application1/1        Ap1/1,Cpu1-2,Et1-16,Sw1-16
Application1/2        Sw17
Switch1               Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch2               Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch3               Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch4               Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch5               Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch17              Ap1/2
Cpu1                  Ap1/1,Cpu1-2,Et1-16,Sw1-16
Cpu2                  Ap1/1,Cpu1-2,Et1-16,Sw1-16
```

- This command displays the list of possible source interfaces available to connect for the Ethernet interface ***et1***.

```
switch# show l1 source interface et1 capabilities
Interface             Possible Source Interface(s)
--------------------- --------------------------------
Ethernet1             Ap1/1,Cpu1-2,Et1-16,Sw1-16
```

- This command displays the list of possible source interfaces available to connect for the FPGA port ***fpga***.

```
switch# show l1 source fpga capabilities
Interface             Possible Source Interface(s)
--------------------- ------------------------------
Application1/1        Ap1/1,Cpu1-2,Et1-16,Sw1-16
Application1/2        Sw17
```

5.4 show l1 destination

The **`show l1 destination`** command displays the list of all destinations for all interfaces.

Command Mode

Privileged EXEC

Command Syntax

`show l1 destination` [interface]

Parameters

interface lists the destination interfaces to connect for the specified interface.

- **application** Application FPGA connector interface.
- **cpu** CPU interface.
- **ethernet** Ethernet interface.
- **switch** Switch interface.

Examples

- This command displays the the list of all interfaces to connect in the crosspoint and their specific destination ports.

```
switch> show l1 destination
   Interface             Destination Interface(s) Type
   ------------------    ------------------------ ------
   Ethernet1             App1/1, Sw1              dynamic
   Ethernet2             Ethernet3, Ethernet4     dynamic
   Ethernet3
   Ethernet4
   Ethernet5
   App1/1                Ethernet1                dynamic
   App1/2                Sw17                     static
   Sw1
   Sw2
   Sw3
   Sw4
   Sw5
   Sw17                  App1/2                   static
   Cpu1
   Cpu2
```

Note: Interfaces that do not have a destination port are listed too but the Destination Interface and Type columns appear as blanks.

- This command displays the list of destination interfaces to connect for the Ethernet interface ***et1***.

```
switch# show l1 destination interface et1

Interface             Destination Interfaces   Type
--------------------- ------------------------ ------
Ethernet1             App1/1, Sw1              dynamic
```

5.5 show l1 matrix

The **show l1 matrix** command displays the matrix representation of Layer 1 paths for available interfaces in the privileged EXEC mode.

Command Mode

Privileged EXEC

Command Syntax

show l1 matrix [all | interface | detail | physical]

Parameters

- **all** displays the matrix of Layer 1 paths for possible interface types even if they do not have a connection.
- **interface** displays the matrix of Layer 1 paths for the specified interface.
  - **application** Application FPGA connector interface.
  - **cpu** CPU interface.
  - **ethernet** Ethernet interface.
  - **switch** Switch interface.
- **detail** displays the detailed matrix of Layer 1 paths.
- **physical** displays the Layer 1 matrix for physical interfaces only.

Examples

- This command displays the matrix of Layer 1 paths for all available interface types.

```
switch> show l1 matrix
              Ethernet   Switch     App
              1 3 4      1 17       1/1 1/2
              | | |      | |        |   |
      Et1 -> -|-|-|------+-|--------+   |
      Et2 -> -|-+-+        |            |
     Sw17 -> -|------------|------------+
   App1/1 -> -+            |
   App1/2 -> --------------+
```

- This command displays the matrix of Layer 1 paths for all available interface types even if the interfaces do not have a connection.

```
switch> show l1 matrix all
              Ethernet                                      Switch

              1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16   1 2 3 4 5 6 7 8

     Et1 -> --------------------|-----+   |
     Et2 ->                     |         |
     Et3 ->                     |         |
     Et4 ->                     |         |
     Et5 ->                     |         |
     Et6 ->                     |         |
     Et7 ->                     |         |
     Et8 ->                     |         |
     Et9 ->                     |         |
    Et10 ->                     |         |
    Et11 ->                     |         |
    Et12 ->                     |         |
    Et13 ->                     |         |
    Et14 ->                     |         |
    Et15 ->                     |         |
    Et16 ->                     |         |
     Sw1 ->                     |         |
     Sw2 ->                     |         |
     Sw3 ->                     |         |
     Sw4 ->                     |         |
     Sw5 ->                     |         |
     Sw6 ->                     |         |
     Sw7 ->                     |         |
     Sw8 ->                     |         |
     Sw9 ->                     |         |
    Sw10 ->                     |         |
    Sw11 ->                     |         |
    Sw12 ->                     |         |
    Sw13 ->                     |         |
    Sw14 ->                     |         |
    Sw15 ->                     |         |
    Sw16 ->                     |         |
    Sw17 -> --------------------|---------+
  App1/1 ->                     |
  App1/2 -> --------------------+
    Cpu1 ->
```

```
     Cpu2 ->
```

- This command displays the matrix of Layer 1 paths for the specific Ethernet interfaces ***et1*** and ***et4***.

```
switch> show l1 matrix interface et1, et4
           Ethernet   Switch   App
           1 4        1        1/1
           | |        |        |
   Et1 -> -|-|--------+--------+
   Et2 -> -|-+
App1/1 -> -+
```

5.6 show l1 path

The **show l1 path** command displays the source and destination paths for all interfaces in the system.

Command Mode

Privileged EXEC

Command Syntax

show l1 path [interface]

Parameters

- **interface** lists the connections available for the specified interface.
  - **application** Application FPGA connector interface.
  - **cpu** CPU interface.
  - **ethernet** Ethernet interface.
  - **switch** Switch interface.

Examples

- This command displays the source and destination paths for all interfaces in the system.

```
switch# show l1 path
   Source               Destination          Type
   -------------------  -------------------- -------
   Ethernet1             App1/1              dynamic
   Ethernet1             Sw1                 dynamic
   Ethernet2             Ethernet3           dynamic
   Ethernet2             Ethernet4           dynamic
   App1/1                Ethernet1           dynamic
   App1/2                Sw17                static
   Sw17                  App1/2              static
```

- This command displays the list of all connections that include the Ethernet interfaces ***et1*** and ***et4***.

```
switch# show l1 path interface et1, et4
   Source               Destination          Type
-------------------- -------------------- -------
   Ethernet1             App1/1              dynamic
   Ethernet1             Sw1                 dynamic
   Ethernet2             Ethernet4           dynamic
   App1/1                Ethernet1           dynamic
```

Chapter 6

Timing Protocols

The Precision Time Protocol (PTP) provides a greater degree of clock accuracy for networked devices, allowing clocks to be synchronized locally in increments of less than a microsecond. PTP uses a master-slave hierarchy similar to that used by NTP. The most precise clock available is referred to as the master clock, and slave devices use the signal from the master to synchronize their own clocks.

The master clock sends out a **sync** message (referred to as an **announce** message in IEEE 1588-2008) at a regular interval. The slave clock responds with a time-stamped delay request message in order to measure and compensate for packet delays between the devices. The slave then receives a message from the master specifying when the delay message was received, which allows the slave to calculate final values for clock synchronization. Synchronization is maintained by the regular exchange of PTP packets between master and slave.

Note: Arista switches do not support setting of the system clock using PTP. System clock synchronization is best supported by the NTP service on the PTP grandmaster.

PTP is disabled globally by default. The following steps are required to enable PTP on an interface:

- Setting the PTP Mode
- Enabling PTP on an Interface

The following PTP global configurations are optional:

- Configuring the PTP Domain
- Configuring the Offset Hold Time
- Setting the PTP Priority
- Configuring the Source IP
- Configuring the TTL for PTP Packets
- Configuring PTP Monitoring

The following PTP interface-level configurations are optional:

- Setting the PTP Announce Interval
- Setting the PTP Timeout Interval
- Configuring the PTP Delay Mechanism
- Setting the Delay Request Interval
- Setting the Peer Delay Request Interval
- Setting the Peer Link Propagation Threshold
- Setting the Interval for Sending Synchronization Messages
- Setting the PTP Transport Type
- Viewing PTP Settings and Status
- Precision Time Protocol (PTP) Commands

6.1 Setting the PTP Mode

To allow PTP to be used on switch interfaces, first set the PTP mode using the **`ptp mode`** command. PTP mode options include:

- **boundary** The device acts as a boundary clock, and both runs and participates in the best master clock algorithm.
- **disabled** PTP is disabled, and the device forwards all PTP packets as normal traffic.

- **end-to-end transparent** The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
- **peer-to-peer transparent** The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
- **generalized Precision Time Protocol (gPTP)** The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

To disable PTP globally on the switch, use the **no** or **default** forms of the **ptp mode** command.

Example

This command configures the device as a PTP boundary clock.

```
switch(config)# ptp mode boundary
switch(config)#
```

6.2 Enabling PTP on an Interface

To enable PTP on a specific interface on the device, use the **ptp enable** command.

Example

This command enables PTP on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)#ptp enable
```

6.3 Configuring the PTP Domain

To set the domain number to use for the clock, use the **ptp domain** command.

Example

This command configures the ***domain 1*** to use with a clock.

```
switch(config)# ptp domain 1
switch(config)#
```

6.4 Configuring the Offset Hold Time

To set the PTP offset hold time, use the **ptp hold-ptp-time** command.

Example

This command configures the PTP offset hold time to ***600*** seconds.

```
switch(config)# ptp hold-ptp-time 600
switch(config)#
```

6.5 Setting the PTP Priority

To set the priority 1 value, use the **ptp priority1** command. Lower values take precedence.

This command configures the priority 1 value of ***120*** to use when advertising the clock.

```
switch(config)# ptp priority1 120
switch(config)#
```

To set the priority 2 value for the clock, use the **ptp priority2** command.

This command configures the priority 2 value of ***128***.

```
switch(config)# ptp priority2 128
switch(config)#
```

6.6 Configuring the Source IP

To set the source IP address for all PTP packets, use the **ptp source** command.

Example

This command configures the source IP address of `10.0.2.1` for all PTP packets.

```
switch(config)# ptp source ip 10.0.2.1
switch(config)#
```

This command configures the source IP address of `2001:db8:ac10:fe01::` for all PTP packets.

```
switch(config)# ptp source ip 2001:db8:ac10:fe01::
switch(config)#
```

6.7 Configuring the TTL for PTP Packets

To set the Time To Live (TTL) of PTP packets, use the **ptp ttl** command. TTL is the maximum number of hops that a PTP packet may make.

Example

This command configures a TTL of ***64*** hops for PTP packets.

```
switch(config)# ptp ttl 64
switch(config)#
```

6.8 Configuring PTP Monitoring

PTP monitoring records PTP information including offset from master, mean path delay, and skew values, which can then be viewed using a **show** command. When this feature is enabled, PTP Syslog messages will also be generated for those metrics for which threshold values have been configured on the switch. PTP monitoring is enabled by default.

Enabling and Disabling PTP Monitoring

Use the **ptp monitor** command to enable PTP monitoring on the device (it is enabled by default). The no form of the command disables PTP monitoring and clears all the recorded PTP data.

Example

This command disables PTP monitoring and clears all recorded PTP data from the switch.

```
switch(config)# no ptp monitor
```

Configuring the Offset-from-master Threshold

The offset is the difference in nanoseconds between master and slave time. Use the **ptp monitor threshold offset-from-master** command to specify the offset-from-master threshold in nanoseconds. A Syslog message is generated if the most recently calculated time offset from the PTP master is outside of the range (-<threshold>, <threshold>). The maximum offset threshold is one second. The no form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

Example

This command sets an offset-from-master threshold value of ***500*** nanoseconds.

```
switch(config)# ptp monitor threshold offset-from-master 500
```

Configuring the Mean-path-delay Threshold

Mean path delay is the mean time in nanoseconds that PTP packets take to travel between master and slave. Use the **ptp monitor threshold mean-path-delay** command to specify the mean-path-delay threshold in nanoseconds. A Syslog message is generated if the value of the most recently calculated mean path delay is greater than or equal to this threshold. The maximum mean-path-delay threshold is one second. The no form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

Note: Mean path delay is always non-negative.

Example

This command sets a mean-path-delay threshold value of ***2000*** nanoseconds.

```
switch(config)# ptp monitor threshold mean-path-delay 2000
```

Configuring the Skew Threshold

PTP skew is the clock frequency difference between master and slave. Use the **ptp monitor threshold skew** command to configure the value of the skew-threshold percentage. A Syslog message is generated if the value of the most recently calculated skew is not in the range (1/(1+<threshold>), 1*(1+<threshold>)). Skew threshold percentage is represented a double precision (16 digit) real number ranging from ***0*** (0%) to ***10*** (1000%). The no form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

Example

This command sets a skew threshold value of ***5*** (500%).

```
switch(config)# ptp monitor threshold skew 5
```

6.9 Setting the PTP Announce Interval

To set the interval at which an interface sends PTP **announce** messages, use the **ptp announce interval** command. The interval is measured in log seconds. This value also affects the timeout interval.

This command configures the interval between PTP announcement messages on ***interface ethernet 5*** to ***4*** seconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce interval 2
switch(config-if-Et5)#
```

6.10 Setting the PTP Timeout Interval

To set the timeout multiplier for an interface, use the **ptp announce timeout** command. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP announcement before a timeout occurs; values range from ***2*** to ***255***. The default multiplier is ***3***, which results in a ***6***-second timeout interval when the announcement interval is set to the default of ***2*** seconds.

This command sets timeout multiplier for the interface to ***5***; since the announcement interval has just been set to ***2*** (***4*** seconds), this means the interface will time out if it doesnt receive a PTP announcement for ***20*** seconds.

```
switch(config-if-Et5)# ptp announce timeout 5
switch(config-if-Et5)#
```

6.11 Configuring the PTP Delay Mechanism

To set the delay mechanism used in boundary-mode, use the **ptp delay-mechanism** command.

Example

This command sets the delay mechanism in boundary clock mode for the interface to peer-to-peer.

```
switch(config-if-Et5)# ptp delay-mechanism p2p
switch(config-if-Et5)#
```

6.12 Setting the Delay Request Interval

To set the time for the slave devices to send delay request messages, use the **ptp delay-req interval** command.

Example

This command sets the time the slave devices to send delay request messages to the master state to ***3*** for the interface.

```
switch(config-if-Et5)# ptp delay-request interval 3
switch(config-if-Et5)#
```

6.13 Setting the Peer Delay Request Interval

To set the minimum interval between the PTP peer delay-request messages, use the **ptp pdelay-req interval** command.

Example

This command sets the interval between PTP peer delay-request messages on the interface to ***3***.

```
switch(config-if-Et5)# ptp pdelay-request interval 3
switch(config-if-Et5)#
```

6.14 Setting the Peer Link Propagation Threshold

To set the delay threshold for which the peer will be considered unable to run generalized Precision Time Protocol (gPTP), use the **ptp pdelay-neighbor-threshold** command.

Example

This command sets the link propagation delay threshold on the interface to ***200000*** nanoseconds..

```
switch(config-if-Et5)# ptp pdelay-neighbor-threshold 200000
switch(config-if-Et5)#
```

6.15 Setting the Interval for Sending Synchronization Messages

To set the interval (in log seconds) for sending synchronization messages, use the **ptp sync-message interval** command. Value ranges and defaults vary based on the PTP mode of the switch.

Example

This command configures the interval for sending synchronization messages on the interface to ***3*** (***8*** seconds).

```
switch(config-if-Et5)# ptp sync-message interval 3
switch(config-if-Et5)#
```

6.16 Setting the PTP Transport Type

To set the PTP transport type, use the **ptp transport** command.

- This command configures the PTP transport type for the interface to IPv4.

```
switch(config-if-Et5)# ptp transport ipv4
switch(config-if-Et5)#
```

- This command configures the PTP transport type for the interface to IPv6.

```
switch(config-if)# ptp transport ipv6
switch(config-if)#
```

Setting the Local Priority of the Clock and Interfaces

To set the local priority of the clock and interfaces to control the topology, use the **ptp local-priority** command.

```
switch(config)# ptp local-priority 1
switch(config-if)# ptp local-priority 255
```

Setting up as a Slave to another PTP Device

Each interface may be configured with a candidate grantor IP address to send requests and potentially become slave to another PTP device. Once configured, the switch starts negotiating with the IP and depending on the Announce messages it receives, it may start requesting Sync and Delay Response to sync its clock. Each grantor may be associated with a unicast negotiation profile. If the profile is omitted, the default interval of one second and duration of 60 seconds for all message types is used. If the profile does not exist, the switch uses the default values until the profile gets added.

Use the **ptp unicast-negotiation candidate-grantor** command to set up the profile. The following commands set up the candidate grantor profile.

```
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1
 profile fastProfile
```

Setting up as a Master to another PTP Device

Each interface may be configured with a range of IP addresses of remote grantees to grant incoming requests and potentially become a master to another PTP device. By default, incoming requests outside the configured range of IP addresses will be denied. Each grantee may be associated with a unicast negotiation profile. If the profile is omitted, incoming requests with interval of ***0*** or longer for all message types are granted. If a profile is specified, it will compare with the configured interval. If the profile does not exist, the switch uses the default values until the profile gets added.

Use the **ptp unicast-negotiation remote-grantee** command to set up the profile. The following commands set up the remote grantee profile.

```
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24
 profile fastProfile
```

Setting the masterOnly Flag

For ports that should never be a slave regardless of other attributes, use the **ptp role master** command.

```
switch(config-if)# ptp role master
```

Configuring the Unicast Profile

A Unicast negotiation profile may be configured to change message rates and durations. The default value and the configurable range of each value are shown in the table below.

Field	Range	Default
Announce interval	[-3, 0]	0
Announce duration	[60, 1000]	60

Sync interval	[-7, 0]	0
Sync duration	[60, 1000]	60
Delay Response interval	[-7, 0]	0
Delay Response duration	[60, 1000]	60

When a profile is applied to a remote grantee on a Grant port, it will use the values to determine whether the given request should be granted or denied. If the requested interval is shorter than the profile, it will be denied; otherwise, it will be granted. When a profile is applied to a candidate grantor on a Request port, it will be requested to the candidate grantor using the values in the profile.

The following configures a typical Unicast negotiation profile.

```
switch(config)# ptp unicast-negotiation profile fastProfile
switch(config-unicast-negotiation-profile-fastProfile)# announce interval
 -2
switch(config-unicast-negotiation-profile-fastProfile)# announce duration
 500
switch(config-unicast-negotiation-profile-fastProfile)# sync interval -3
switch(config-unicast-negotiation-profile-fastProfile)# sync duration 300
switch(config-unicast-negotiation-profile-fastProfile)# delay-resp
 interval -3
switch(config-unicast-negotiation-profile-fastProfile)# delay-resp
 duration 300
```

Displaying Unicast Negotiation Configurations

The **show ptp unicast-negotiation profile** command displays all user configured profiles and their values.

```
(switch)# show ptp unicast-negotiation profile
Unicast Negotiation Profile fastProfile
Announce interval: 0.25 seconds
Announce duration: 500 seconds
Sync interval: 0.125 seconds
Sync duration: 300 seconds
Delay Response interval: 0.125 seconds
Delay Response duration: 300 seconds
```

The **show ptp unicast-negotiation candidate-grantor** command displays all configured candidate grantors, associated profile name and latest update.

```
(switch)# show ptp unicast-negotiation candidate-grantor
 Interface    Address      Profile       Grantor Status
----------- ---------- -------------- ------------------
 Ethernet1    4::1       fastProfile    Master
 Ethernet1    4::2       fastProfile    Candidate Master
 Ethernet2    4::2       fastProfile    Blacklisted
```

The **show ptp unicast-negotiation remote-grantee** command displays all configured configured remote grantees, associated profile name and latest update.

```
(switch)# show ptp unicast-negotiation remote-grantee
Interface    Address      Profile
----------- ---------- -------------
 Ethernet1    4::1/96    fastProfile
 Ethernet1    4::2/96    fastProfile
 Ethernet2    4::2/96    fastProfile
```

The **show ptp unicast-negotiation granted** command displays to which remote grantees each port has granted and some detail.

```
(switch)# show ptp unicast-negotiation granted
Interface    Address    Message     Interval        Duration       Expires In
---------- ---------- ---------- -------------- -------------- -------------
 Ethernet2    4::1       Announce    0.25 seconds    300 seconds    30 seconds
 Ethernet2    4::1       Sync        2.0 seconds     300 seconds    30 seconds
```

The **show ptp unicast-negotiation requested** command displays to which candidate grantors each port has requested and some detail.

```
(switch)# show ptp unicast-negotiation requested
 Interface    Address    Message     Interval        Duration       Expires In
------------ --------- ----------- --------------- -------------- -------------
 Ethernet2    4::2       Announce    0.25 seconds    600 seconds    250 seconds
 Ethernet2    4::2       Sync        2.0 seconds     300 seconds    denied
```

The **show ptp local-clock** command displays the clock local priority in G8275.2 mode.

```
(switch)# show ptp local-clock
 PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Clock Domain: 44
Number of PTP ports: 64
Priority1: 128
Priority2: 128
Local Priority: 128
Clock Quality:
   Class: 248
   Accuracy: 0x30
   OffsetScaledLogVariance: 0xffff
Offset From Master: -5
Mean Path Delay: 416 nanoseconds
Steps Removed: 1
Skew: 1.00000006399
Last Sync Time: 23:42:33 UTC Nov 01 2018
Current PTP System Time: 23:42:33 UTC Nov 01 2018
```

The **show ptp interface** command displays the interface local priority in G8275.2 mode.

Note: The Announce, Sync and Delay request message intervals are for multicast mode. Since G8275.2 operates in unicast mode, those values should be ignored.

```
(switch)# show ptp interface Ethernet 42 | nz  Interface Ethernet42
PTP: Enabled
Port state: Slave
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 0.25 seconds
Local Priority: 128
Transport mode: ipv4
Announce messages received: 2964
Sync messages received: 2558
Follow up messages received: 2558
Delay request messages sent: 2540
Delay response messages received: 2540
Signaling messages sent: 98
Signaling messages received: 101
```

6.17 Viewing PTP Settings and Status

The following commands display the status of the switch PTP server connections:

- Displaying General PTP Information
- Displaying PTP Local Clock and Offset
- Displaying PTP Masters Information
- Displaying PTP Clock Properties
- Displaying PTP Information for all Interfaces
- Displaying PTP Interface Counters
- Displaying PTP Foreign Master
- Displaying PTP Monitoring Information
- Displaying PTP Source IP

6.17.1 Displaying General PTP Information

To display general Precision Time Protocol (PTP) information, use the **show ptp** command.

```
switch# show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1
Neighbor Rate Ratio: 1.00000007883
Rate Ratio: 1.00000007883
Interface  State    ASTime  Since LastNeighbor Mean         Path         Residence
Capable    Changed  Rate    Ratio              Delay (ns)   Time (ms)
---------  -------- ------- ------------------ ------------ ------------ ---------
Et1        Disabled No      Never              1.0          00
Et2        Disabled No      Never              1.0          00
Et3        Disabled No      Never              1.0          00
Et4        Disabled No      Never              1.0          00
Et5        Disabled No      Never              1.0          00
Et6        Disabled No      Never              1.0          00
Et7        Master   Yes                        0:21:08      1.000000094200
```

6.17.2 Displaying PTP Clock Properties

To display PTP clock properties, use the Displaying PTP Clock Properties command.

```
switch# show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0
switch#
```

6.17.3 Displaying PTP Foreign Master

To display information about foreign masters (PTP sources not designated as the switchs master from which the switch has received sync packets), use the **show ptp foreign-master-record** command.

```
switch# show ptp foreign-master-record
No Foreign Master Records
switch#
```

6.17.4 Displaying PTP Information for all Interfaces

To display PTP information for specified interfaces, use the **show ptp interface** command.

```
switch# show ptp interface
Interface Ethernet1
PTP: Disabled
Port state: Disabled
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 32.0 seconds
Transport mode: ipv4

Interface Ethernet5
PTP: Disabled
Port state: Disabled
Sync interval: 8.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 5
Delay mechanism: peer to peer
Peer delay request message interval: 8.0 seconds
Peer Mean Path Delay: 0
Transport mode: ipv4

switch#
```

6.17.5 Displaying PTP Interface Counters

To display PTP interface counters for specified interfaces, use the **show ptp interface counters** command.

```
switch# show ptp interface ethernet 5 counters
Interface Ethernet5
Announce messages sent: 0
Announce messages received: 0
Sync messages sent: 0
Sync messages received: 0
Follow up messages sent: 0
Follow up messages received: 0
Delay request messages sent: 0
Delay request messages received: 0
Delay response messages sent: 0
Delay response messages received: 0
Peer delay request messages sent: 0
Peer delay request messages received: 0
Peer delay response messages sent: 0
Peer delay response messages received: 0
Peer delay response follow up messages sent: 0
```

```
Peer delay response follow up messages received: 0
switch#
```

6.17.6 Displaying PTP Local Clock and Offset

To display the local PTP clock and offset, use the **show ptp local-clock** command.

```
switch# show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
   Class: 248
   Accuracy: 0x30
   OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0
switch#
```

6.17.7 Displaying PTP Masters Information

To display the PTP clocks master and grandmaster identity and configuration, use the **show ptp masters** command.

```
switch# show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Grandmaster Clock Quality:
   Class: 248
   Accuracy: 0x30
   OffsetScaledLogVariance: 0xffff
   Priority1: 128
   Priority2: 128
switch#
```

6.17.8 Displaying PTP Monitoring Information

To display the list of up to 100 recorded entries of offset from master, mean path delay and skew values, the current PTP mode, whether or not the feature is enabled, the number of entries displayed, and the configured thresholds for each metric, use the **show ptp monitor** command. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

```
switch# show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
```

```
Mean path delay threshold: not configured
Skew threshold: 0.5
Interface  Time                           Offset from   Mean Path    Skew
                                          Master (ns)   Delay (ns)
---------- ------------------------------ ------------ -------------
 -----------
Et8        21:23:12.901 UTC Feb 22 2018  71            5849
 1.003159918
Et1        21:23:12.901 UTC Feb 22 2018  113           3672
 1.004990621
Et2        21:23:12.901 UTC Feb 22 2018  706           7799
 1.002744199
Et1        21:23:12.901 UTC Feb 22 2018  803           5861
 1.003432049
Et1        21:23:12.901 UTC Feb 22 2018  610           3415
 0.998974658
```

6.17.9 Displaying PTP Source IP

To display PTP IP source information, use the **show ptp source ip** command.

```
switch# show ptp source ip
PTP source IP: 10.0.2.1
switch#
```

6.18 Precision Time Protocol (PTP) Commands

PTP Commands

- ptp announce interval
- ptp announce timeout
- ptp delay-mechanism
- ptp delay-req interval
- ptp domain
- ptp enable
- ptp forward-v1
- ptp hold-ptp-time
- ptp local-priority
- ptp mode
- ptp monitor
- ptp monitor threshold mean-path-delay
- ptp monitor threshold offset-from-master
- ptp monitor threshold skew
- ptp pdelay-neighbor-threshold
- ptp pdelay-req interval
- ptp priority1
- ptp priority2
- ptp role
- ptp source
- ptp sync timeout
- ptp sync-message interval
- ptp transport
- ptp ttl
- ptp unicast-negotiation

PTP Show Commands

- show ptp foreign-master-record
- show ptp interface
- show ptp interface counters
- show ptp local-clock
- show ptp masters
- show ptp monitor
- show ptp source ip
- show ptp unicast-negotiation
- show ptp unicast-negotiation profile
- show ptp

6.18.1 ptp announce interval

The **ptp announce interval** command configures the interval at which the configuration mode interface sends PTP **announce** messages. The **no ptp announce interval** command resets the announce interval to its default of 1 (2 seconds).

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp announce interval ***log_interval***

no ptp announce interval

default ptp announce interval

Parameters

log_interval The number of log seconds between PTP **announce** messages (base ***2*** log (seconds)). Value ranges from ***-3*** (***1/8*** second) to ***4*** (***16*** seconds); default value is ***1*** (***2*** seconds).

Examples

- These commands set the interval between PTP **announce** messages sent by ***interface ethernet 5*** to ***4*** seconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce interval 2
switch(config-if-Et5)#
```

- These commands reset the PTP **announce** interval on ***interface ethernet 5*** to the default value of ***1*** (***2*** seconds).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp announce interval
switch(config-if-Et5)#
```

6.18.2 ptp announce timeout

The **ptp announce timeout** sets the timeout multiplier for the configuration-mode interface. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP **announce** message before a timeout occurs; the range is from ***2*** to ***255***. The default multiplier is 3, which results in a 6-second timeout interval when the announce interval is set to the default of 2 seconds. To configure the announce interval, use the **ptp announce interval** command.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp announce timeout ***multiplier***

no ptp announce timeout

default ptp announce timeout

Parameters

multiplier Number of announce intervals after which the interface will time out if it does not receive a PTP **announce** message. The range is from ***2*** to ***255***; default value is ***3***.

Examples

- This command sets the timeout multiplier for ***interface ethernet 5*** to ***5***. This means that the interface will time out if it doesnt receive a PTP **announce** message within five announce intervals.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce timeout 5
switch(config-if-Et5)#
```

- These commands reset the PTP timeout interval on ***interface ethernet 5*** to the default value of ***3***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp announce timeout
switch(config-if-Et5)#
```

6.18.3 ptp delay-mechanism

The **ptp delay-mechanism** command configures the delay mechanism in boundary clock mode. The **no ptp delay-mechanism** command disables the feature.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp delay-mechanism ***mech_type***

no ptp delay-mechanism

default ptp delay-mechanism

Parameters

mech_type The delay mechanism. Options include:

- **e2e** end-to-end delay mechanism.
- **p2p** peer-to-peer mechanism.

Examples

- This command sets the delay mechanism to peer-to-peer in the boundary clock mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp delay-mechanism p2p
switch(config-if-Et5)#
```

- This command sets the delay mechanism to end-to-end in the boundary clock mode.
- This command removes the delay mechanism configuration from ***Ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp delay-mechanism e2e
switch(config-if-Et5)#
```

6.18.4 ptp delay-req interval

The **ptp delay-req interval** command specifies the time in log seconds recommended to the slave devices to send delay request messages. You must enable PTP on the switch first and configure the source IP address for PTP communication. The **no ptp delay-req interval** command resets the interval to its default of ***5*** (***32*** seconds).

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp delay-req interval ***log_interval***

no ptp delay-req interval

default ptp delay-req interval

Parameters

log_interval The range is ***-1*** to ***8*** log seconds (base ***2*** log (seconds)). The default is ***5*** (***32*** seconds).

Examples

- These commands set the minimum interval allowed between PTP delay request messages on ***interface ethernet 5*** to ***3*** (***8*** seconds).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp delay-request interval 3
switch(config-if-Et5)#
```

- These commands reset the minimum interval allowed between PTP delay-request messages to the default of ***5*** (***32*** seconds).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp delay-request interval
switch(config-if-Et5)#
```

6.18.5 ptp domain

The **ptp domain** command sets the domain number to use for the clock. The **no ptp domain** command resets or restores the domain to the default number 0.

Command Mode

Global Configuration

Command Syntax

ptp domain ***domain_number***

no ptp domain

default ptp domain

Parameters

domain_number Value ranges from ***0*** to ***255***. Default number is 0.

Examples

- This command shows how to configure ***domain 1*** for use with a clock.

```
switch(config)# ptp domain 1
switch(config)#
```

- This command removes the configured ***domain 1*** for use with a clock.

```
switch(config)# no ptp domain 1
switch(config)#
```

6.18.6 ptp enable

The **ptp enable** command enables PTP on the interface. The **no ptp enable** command disables PTP on the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp enable

no ptp enable

default ptp enable

Examples

- This command enables PTP on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp enable
```

- This command disables PTP on ***Ethernet interface 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp enable
```

6.18.7 ptp forward-v1

The **ptp forward-v1** command configures the switch to forward Precision Time Protocol version 1 packets as regular multicast traffic. By default, PTP v1 packets are trapped by the CPU, logged and discarded.

The **no ptp forward-v1** and **default ptp forward-v1** commands restore the default forwarding behavior by removing the corresponding **ptp forward-v1** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ptp forward-v1

no ptp forward-v1

default ptp forward-v1

Examples

- This command configures the switch to forward PTP v1 packets as regular multicast traffic.

```
switch(config)# ptp forward-v1
switch(config)#
```

- This command configures the switch to log and discard PTP v1 packets.

```
switch(config)# no ptp forward-v1
switch(config)#
```

6.18.8 ptp hold-ptp-time

The **ptp hold-ptp-time** command configures the PTP offset hold time in seconds. The **no ptp hold-ptp-time** command resets or restores the PTP hold time to the default value.

Command Mode

Global Configuration

Command Syntax

ptp hold-ptp-time ***offset***

no ptp hold-ptp-time

default ptp hold-ptp-time

Parameters

offset Value ranges from ***0*** to ***86400***.

Examples

- This command shows how to configure the PTP offset hold time.

```
switch(config)# ptp hold-ptp-time 600
switch(config)#
```

- This command resets or restores the PTP offset hold time to the default value.

```
switch(config)# no ptp hold-ptp-time
switch(config)#
```

6.18.9 ptp local-priority

The **`ptp local-priority`** command configures the local priority of the clock and interfaces to control the topology.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`ptp local-priority` **PRIORITY_NUM**

Parameters

PRIORITY_NUM The priority number from ***1*** to ***255***.

Example

This command sets the priority for the subinterface.

```
switch(config)# ptp local-priority 1
switch(config-if)# ptp local-priority 255
```

6.18.10 ptp mode

The **ptp mode** command configures the Precision Time Protocol (PTP) packet forwarding mode for the switch. By default, PTP is disabled globally; the mode must be changed to use PTP on switch interfaces.

The **no ptp mode** and **default ptp mode** commands return the forwarding mode to **disabled** by removing the **ptp mode** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ptp mode ***mode_name***

no ptp mode

default ptp mode

Parameters

mode_name Default mode is **disabled**. Options include:

- **boundary** The device acts as a boundary clock, and both runs and participates in the best master clock algorithm.
  - **disabled** The default mode. PTP is disabled, and the device forwards all PTP packets as normal traffic.
  - **e2etransparent** The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
  - **p2ptransparent** The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
  - **gptp** The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

Examples

- This command configures the switch to act as a PTP boundary clock.

```
switch(config)# ptp mode boundary
switch(config)#
```

- This command restores PTP to disabled mode.

```
switch(config)# no ptp mode
switch(config)#
```

6.18.11 ptp monitor threshold mean-path-delay

Mean path delay is the mean time in nanoseconds that PTP packets take to travel between PTP master and slave. The **ptp monitor threshold mean-path-delay** command configures the mean-path-delay threshold in nanoseconds. When this threshold is configured, a Syslog message is generated if the value of the most recently calculated mean path delay is greater than or equal to this value.

The **no ptp monitor threshold mean-path-delay** and **default ptp monitor threshold mean-path-delay** commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

Command Mode

Global Configuration

Command Syntax

ptp monitor threshold mean-path-delay ***threshold***

no ptp monitor threshold mean-path-delay

default ptp monitor threshold mean-path-delay

Parameter

threshold threshold in nanoseconds. Values range from ***0*** to ***1000000000*** (***1*** second).

Example

This command sets a mean-path-delay threshold value of ***2000*** nanoseconds.

```
switch(config)# ptp monitor threshold mean-path-delay 2000
```

6.18.12 ptp monitor threshold offset-from-master

PTP offset is the difference in nanoseconds between master and slave time. The **ptp monitor threshold offset-from-master** command configures the offset-from-master threshold in nanoseconds. A Syslog message is generated if the most recently calculated time offset from the PTP master is outside of the range (-<threshold>, <threshold>). The maximum offset threshold is one second.

The **no ptp monitor threshold offset-from-master** and **no ptp monitor threshold offset-from-master** commands clear the threshold value and prevents further Syslog messages from being generated for this parameter.

Command Mode

Global Configuration

Command Syntax

ptp monitor threshold offset-from-master ***threshold***

no ptp monitor threshold offset-from-master

default ptp monitor threshold offset-from-master

Parameter

threshold Offset threshold value in nanoseconds. Values range from ***0*** to ***1000000000***.

Example

This command sets an offset-from-master threshold value of ***500*** nanoseconds.

```
switch(config)# ptp monitor threshold offset-from-master 500
switch(config)#
```

6.18.13 ptp monitor threshold skew

PTP skew is the clock frequency difference between master and slave. The **ptp monitor threshold skew** command configures the value of the skew-threshold percentage. A Syslog message is generated if the value of the most recently calculated skew is not in the range (1/(1+*threshold*), 1*(1+*threshold*)).

The **no ptp monitor threshold skew** and **default ptp monitor threshold skew** commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

Command Mode

Global Configuration

Command Syntax

ptp monitor threshold skew ***threshold***

no ptp monitor threshold skew

default ptp monitor threshold skew

Parameters

threshold skew percentage threshold represented as a double precision (16 digit) real number ranging from ***0*** (***0%***) to ***10*** (***1000%***).

Example

This command sets a skew threshold value of ***5*** (***500%***).

```
switch(config)# ptp monitor threshold skew 5
switch(config)#
```

6.18.14 ptp monitor

The **ptp monitor** command enables and disables PTP monitoring on the switch. When PTP monitoring is enabled, the switch records PTP status and configuration information (which can be viewed using the **show ptp monitor** command) and generates Syslog messages for metrics whose threshold values have been configured. PTP monitoring is enabled by default.

The **no ptp monitor** command disables the PTP monitoring and clears all the recorded data from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ptp monitor

no ptp monitor

Related Commands

- **ptp monitor threshold mean-path-delay**
- **ptp monitor threshold offset-from-master**
- **ptp monitor threshold skew**
- **show ptp monitor**

Example

This command disables ptp monitor PTP monitoring on the switch and clears all the recorded data.

```
switch(config)# ptp monitor
switch(config)#
```

6.18.15 ptp pdelay-neighbor-threshold

The **ptp pdelay-neighbor-threshold** command configures the propagation delay threshold above which the switch will consider the neighbor connected to this port to be incapable of participating in generalized Precision Time Protocol (gPTP).

The **no ptp pdelay-neighbor-threshold** and **default ptp pdelay-neighbor-threshold** commands restore the threshold to 100000 nanoseconds by removing the corresponding **ptp pdelay-neighbor-threshold** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp pdelay-neighbor-threshold ***link_prop***

no ptp pdelay-neighbor-threshold

default ptp pdelay-neighbor-threshold

Parameters

link_prop Threshold in nanoseconds. Value ranges from ***0*** to ***10000000000*** (ten billion). Default is ***100000***.

Examples

- These commands set the link propagation delay threshold on ***interface ethernet 5*** to ***200000*** nanoseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp pdelay-neighbor-threshold 200000
switch(config-if-Et5)#
```

- These commands restore the link propagation delay threshold on ***interface ethernet 5*** to its default value of ***100000*** nanoseconds.

```
switch(config)# interface ethernet 5s
witch(config-if-Et5)# no ptp pdelay-neighbor-threshold
switch(config-if-Et5)#
```

6.18.16 ptp pdelay-req interval

The **ptp pdelay-req interval** command configures the interval between Precision Time Protocol peer delay-request messages. The **no ptp pdelay-req interval** command removes the configuration.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp pdelay-req interval ***log_interval***

no ptp pdelay-req interval

default ptp pdelay-req interval

Parameters

log_interval The log interval in seconds (base 2 log (seconds)). Value ranges from ***0*** to ***5***.

Examples

- This command shows how to configure the interval allowed between PTP peer delay request messages on ***interface Ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp pdelay-request interval 3
switch(config-if-Et5)#
```

- This command removes the configure the interval allowed between PTP peer delay request messages on ***interface Ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp pdelay-request interval
switch(config-if-Et5)#
```

6.18.17 ptp priority1

The **ptp priority1** command configures the priority 1 value for advertising the switchs PTP clock. Priority 1 is the most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The **no ptp priority1** and **default ptp priority1** commands restore the priority 1 default setting of 128.

Command Mode

Global Configuration

Command Syntax

ptp priority1 ***priority_rate***

no ptp priority1

default ptp priority1

Parameters

priority_rate Value ranges from ***0*** to ***255***. Default is ***128***.

Examples

- This command sets the ***priority 1*** level for the switchs PTP clock to ***120***.

```
switch(config)# ptp priority1 120
switch(config)#
```

- This command restores the default ***priority 1*** level of ***128***.

```
switch(config)# no ptp priority1
switch(config)#
```

6.18.18 ptp priority2

The **ptp priority2** command sets the ***priority 2*** value for the clock. The range is from ***0*** to ***255***. ***Priority 2*** is the fifth most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The **no ptp priority2** and **default ptp priority2** commands restore the ***priority 2*** default setting of ***128***.

Command Mode

Global Configuration

Command Syntax

ptp priority2 ***priority_rate***

no ptp priority2

default ptp priority2

Parameters

priority_rate Specifies the ***priority 2*** level for the PTP clock. Value ranges from ***0*** to ***255***; default value is ***128***.

Examples

- This command sets the ***priority 2*** level for the switchs PTP clock to ***120***.

```
switch(config)# ptp priority2 120
switch(config)#
```

- This command restores the default ***priority 2*** level of ***128***.

```
switch(config)# no ptp priority2
switch(config)#
```

6.18.19 ptp role

The **ptp role** command configures a port to operate either in the master mode or the dynamic mode when it is executed in the interface configuration mode.

The **no ptp role** command removes the master or dynamic mode if it was previously configured on an interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ptp role [dynamic | master]

no ptp role

default ptp role

Related Commands

- **ptp enable**
- **ptp enable**
- **show ptp interface**

Parameters

- **dynamic** the dynamic mode.
- **master** the master clock mode that has the most precise time.

Examples

- This command configures a port to operate in the master mode for ***interface ethernet 1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# ptp role master
```

- This command configures a port to operate in the dynamic mode for ***interface ethernet 1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# ptp role dynamic
```

6.18.20 ptp source

The **ptp source** command configures the source IP address for all PTP packets. The IP address can be in IPv4 or IPv6 format. The **no ptp source ip** command removes this configuration.

Command Mode

Global Configuration

Command Syntax

ptp source ip {ip|ipv6} ***ip_addr***

no ptp source ip

default ptp source ip

Parameters

ip specifies an IPv4 source address.

ipv6 specifies an IPv6 source address.

ip_addr the source IP address.

Examples

- This command configures the source IP address `10.0.2.1` for all PTP packets.

```
switch(config)# ptp source ip 10.0.2.1
switch(config)#
```

- This command configures the source IP address `2001:db8:ac10:fe01::` for all PTP packets.

```
switch(config)# ptp source ip 2001:db8:ac10:fe01::
switch(config)#
```

- This command removes any configured source IP address for all PTP packets.

```
switch(config)# no ptp source ip
switch(config)#
```

6.18.21 ptp sync timeout

A PTP synchronization timeout occurs if a sync message is not received for a specified period of time, calculated as a multiple of the PTP sync-message interval. The **ptp sync timeout** command configures the sync timeout multiplier. The range is ***2*** to ***255***, with a default of ***20*** (20 times the sync interval). To configure the sync interval, use the **ptp sync-message interval** command.

The **no ptp sync timeout** and **default ptp sync timeout** commands restore the PTP sync timeout multiplier to its default value of ***20***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ptp sync timeout ***interval_multiplier***

no ptp sync timeout

default ptp sync timeout

Parameters

interval_multiplier The number of sync intervals that must pass without the configuration mode interface receiving a PTP sync message before a timeout occurs. Value ranges from ***2*** to ***255***. Default value is ***20***.

Example

These commands configure the sync timeout on ***interface ethernet 5*** to ten times the configured sync interval.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp sync timeout 10
switch(config-if-Et5)#
```

6.18.22 ptp sync-message interval

The **ptp sync-message interval** command configures the time for sending synchronization messages by specifying its log2 value. Default values and ranges depend on the PTP mode, which is set using the **ptp mode** command.

The **no ptp sync-message interval** and **default ptp sync-message interval** commands restore the sync interval to its default (***1*** second in **boundary** mode, ***1/8*** second in **gptp** mode) by removing the corresponding **ptp sync-message interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp sync-message interval ***log_interval***

no ptp sync-message interval

default ptp sync-message interval

Parameters

log_interval The interval between PTP synchronization messages sent from the master to the slave (base 2 log (seconds)). Values vary according to PTP mode: in **boundary** mode, the range is from ***-7*** (***1/128*** second) to ***3*** (***8*** seconds) and the default value is ***0*** (***1*** second). In **gptp** mode, the range is from ***-3*** (***1/8*** second) to ***17*** (***131072*** seconds, approximately ***36*** hours) with a default of ***-3***.

Examples

- These commands set the interval for PTP synchronization messages on ***interface ethernet 5*** to ***3*** (***8*** seconds).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp sync-message interval 3
switch(config-if-Et5)#
```

- In **boundary** mode, these commands restore the interval for PTP synchronization messages on ***interface ethernet 5*** to its default of ***0*** (***1*** second).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp sync-message interval
switch(config-if-Et5)#
```

6.18.23 ptp transport

The **ptp transport** command configures the PTP transport type for a specific interface. Any values set in interface PTP configuration mode override the settings in the PTP configuration profile associated with the interface. The **no ptp transport** command removes the stetting from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

ptp transport **TRANSPORT_TYPE**

no ptp transport

default ptp transport

Parameters

TRANSPORT_TYPE The transport mode in boundary clock mode. Options include:

- **ipv4** The IPv4 address used as the transport type on the interface.
- **ipv6** The IPv6 address used as the transport type on the interface.
- **layer2** The Layer 2 protocol used as the transport type on the interface.

Examples

- This command overrides the transport type in the profile and sets it to be IPv4 for the interface.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp transport ipv4
switch(config-if-Et5)#
```

- This command removes the interval for PTP synchronization messages on ***interface Ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp transport
switch(config-if-Et5)#
```

6.18.24 ptp ttl

The **`ptp ttl`** command configures the Time To Live (TTL) value of the PTP packets. The **`no ptp ttl`** resets the TTL value to the default value of ***1*** hop by removing the **`ptp ttl`** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

`ptp ttl` ***hop_count***

`no ptp ttl`

`default ptp ttl`

Parameters

hop_count The TTL value measured in hops. Value ranges from ***1*** to ***255***, default is ***1***.

Examples

- This command sets the time to live of the PTP packets to ***60*** hops.

```
switch(config)# ptp ttl 60
switch(config)#
```

- This command resets the time to live of the PTP packets to the default value of ***1*** hop.

```
switch(config)# no ptp ttl
switch(config)#
```

6.18.25 ptp unicast-negotiation

The **ptp unicast-negotiation** command configures the master slave profiles for PTP devices.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ptp unicast-negotiation

ptp unicast-negotiation remote-grantee

Parameters

- **candidate-grantor** become slave to another PTP device.
- **remote-grantee** become master to another PTP device.

Examples

- This command sets up an interface as a potential master.

```
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24
 profile fastProfile
```

- This command sets up an interface as a potential slave.

```
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1
 profile fastProfile
```

6.18.26 show ptp

The **show ptp** command displays summary Precision Time Protocol (PTP) information and PTP status of switch ports.

Command Mode

EXEC

Command Syntax

show ptp

Example

This command displays summary PTP information.

```
switch#show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1
Neighbor Rate Ratio: 1.00000007883
Rate Ratio: 1.00000007883
Interface StateASTime Since LastNeighborMean PathResidence
Capable   Changed  Rate    Ratio              Delay (ns)  Time (ms)

```

6.18.27 show ptp foreign-master-record

The **show ptp foreign-master-record** command displays information about foreign masters (PTP sources not designated as the switchs master from which the switch has received sync packets).

Command Mode

EXEC

Command Syntax

show ptp foreign-master-record

Example

This command displays information about PTP foreign masters.

```
switch# show ptp foreign-master-record
No Foreign Master Records
switch#
```

6.18.28 show ptp interface counters

The **show ptp interface counters** command displays PTP interface counters for all interfaces.

Command Mode

EXEC

Command Syntax

show ptp[**INTERFACE_NAME**] **counters**

Parameters

INTERFACE_NAME Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the PTP interface counters.

```
switch# show ptp interface ethernet 5 counters
Interface Ethernet5
Announce messages sent: 0
Announce messages received: 0
Sync messages sent: 0
Sync messages received: 0
Follow up messages sent: 0
Follow up messages received: 0
Delay request messages sent: 0
Delay request messages received: 0
Delay response messages sent: 0
Delay response messages received: 0
Peer delay request messages sent: 0
Peer delay request messages received: 0
Peer delay response messages sent: 0
Peer delay response messages received: 0
Peer delay response follow up messages sent: 0
Peer delay response follow up messages received: 0
switch#
```

6.18.29 show ptp interface

The **show ptp interface** command displays PTP information for all the interfaces on the device.

Command Mode

EXEC

Command Syntax

show ptp [**INTERFACE_NAME**][**STATUS_FILTER**]

Parameters

- **INTERFACE_NAME** Interface type and numbers. Options include:
  - ***no parameter*** Display information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.

  Valid range formats include number, number range, or comma-delimited list of numbers and ranges.
- **STATUS_FILTER** Filters interfaces by their configuration status. Options include:
  - ***no parameter*** all interfaces.
  - **enabled** PTP configured interfaces.

Example

This command displays PTP information for all the interfaces on the device.

```
switch# show ptp interface
Interface Ethernet1
PTP: Disabled
Port state: Disabled
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 32.0 seconds
Transport mode: ipv4

Interface Ethernet5
PTP: Disabled
Port state: Disabled
Sync interval: 8.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 5
Delay mechanism: peer to peer
Peer delay request message interval: 8.0 seconds
Peer Mean Path Delay: 0
Transport mode: ipv6

switch#
```

6.18.30 show ptp local-clock

The **show ptp local-clock** command displays the Precision Time Protocol (PTP) clock information.

Command Mode

EXEC

Command Syntax

show ptp local-clock

Example

This command shows how to display the PTP local clock and offset.

```
switch# show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
   Class: 248
   Accuracy: 0x30
   OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0
switch#
```

6.18.31 show ptp masters

The **show ptp masters** command displays information about the switchs PTP master and grand master clocks.

Command Mode

Privileged EXEC

Command Syntax

show ptp masters

Example

This command displays information about the switchs PTP master and grand master clocks.

```
switch# show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40

   Priority2: 128
switch#
```

6.18.32 show ptp monitor

The **show ptp monitor** command to displays the list of up to 100 recorded entries of offset from master, mean path delay and skew values, along with current PTP mode, whether or not the feature is enabled, number of entries displayed and the configured thresholds for each metric. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

Command Mode

EXEC

Command Syntax

show ptp monitor

Example

This command displays the information recorded by PTP monitoring.

```
switch# show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
Mean path delay threshold: not configured
Skew threshold: 0.5
Interface  Time                          Offset from   Mean Path     Skew
                                         Master (ns)   Delay (ns)
---------- ----------------------------- ------------  ------------- -----------
Et8        21:23:12.901 UTC Feb 22 2018  71            5849           1.003159918
Et1        21:23:12.901 UTC Feb 22 2018  113           3672           1.004990621
Et2        21:23:12.901 UTC Feb 22 2018  706           7799           1.002744199
Et1        21:23:12.901 UTC Feb 22 2018  803           5861           1.003432049
Et1        21:23:12.901 UTC Feb 22 2018  610           3415           0.998974658
```

6.18.33 show ptp source ip

The **`show ptp source ip`** command displays the PTP source IP for the device.

Command Mode

Privileged EXEC

Command Syntax

`show ptp source ip`

Example

This command shows the PTP source IP to be `10.0.2.1`

```
switch# show ptp source ip
PTP source IP: 10.0.2.1
switch#
```

This command shows the PTP source IP to be `2001:db8:ac10:fe01::`

```
switch# show ptp source ip
PTP source IP: 2001:db8:ac10:fe01::
switch#
```

6.18.34 show ptp unicast-negotiation

The **show ptp unicast-negotiation** command displays PTP unicast negotiation information for the switch.

Command Mode

EXEC

Command Syntax

show ptp unicast-negotiation profile

show ptp unicast-negotiation [**DETAILS**]

Parameters

DETAILS Details requested. Options include:

- **candidate-grantor** Display all configured candidate grantors, associated profile name and latest update.
- **remote-grantee** Display all configured remote grantees, associated profile name and latest update.
- **granted** Display to which remote grantees each port has granted and some detail.
- **requested** Display to which candidate grantors each port has requested and some detail.

Examples

- This command displays the unicast negotiation profiles configured on the switch.

```
switch# show ptp unicast-negotiation profile
Unicast Negotiation Profile fastProfile
Announce interval: 0.25 seconds
Announce duration: 500 seconds
Sync interval: 0.125 seconds
Sync duration: 300 seconds
Delay Response interval: 0.125 seconds
Delay Response duration: 300 seconds
```

- This command displays all configured candidate grantors, associated profile name and latest update.

```
switch# show ptp unicast-negotiation candidate-grantor
 Interface  Address    Profile        Grantor Status
---------- ---------- -------------- ------------------
 Ethernet1  4::1       fastProfile    Master
 Ethernet1  4::2       fastProfile    Candidate Master
 Ethernet2  4::2       fastProfile    Blacklisted
```

- This command displays all configured remote grantees, associated profile name and latest update.

```
switch# show ptp unicast-negotiation remote-grantee
 Interface    Address    Profile
------------ ---------- -------------
 Ethernet1    4::1/96    fastProfile
 Ethernet1    4::2/96    fastProfile
 Ethernet2    4::2/96    fastProfile
```

- This command displays to which remote grantees each port has granted and some detail.

```
switch# show ptp unicast-negotiation granted
Interface    Address    Message     Interval       Duration       Expires In
---------- ---------- ------------ -------------- -------------- -----------
 Ethernet2   4::1       Announce    0.25 seconds   300 seconds    30 seconds
 Ethernet2   4::1       Sync        2.0 seconds    300 seconds    30 seconds
```

- This command displays to which candidate grantors each port has requested and some detail.

```
switch# show ptp unicast-negotiation requested
Interface    Address   Message     Interval       Duration       Expires In
---------- --------- ----------- -------------- -------------- ------------
 Ethernet2   4::2      Announce    0.25 seconds    600 seconds    250 seconds
```

```
Ethernet2    4::2       Sync         2.0 seconds     300 seconds    denied
```

6.18.35 show ptp unicast-negotiation profile

The **show ptp unicast-negotiation profile** command displays all user configured profiles and their values.

Command Mode

EXEC

Command Syntax

show ptp unicast-negotiation profile

Example

This command displays the PTP profiles.

```
switch# show ptp unicast-negotiation profile
Unicast Negotiation Profile fastProfile
Announce interval: 0.25 seconds
Announce duration: 500 seconds
Sync interval: 0.125 seconds
Sync duration: 300 seconds
Delay Response interval: 0.125 seconds
Delay Response duration: 300 seconds
```

Chapter 7

Switch Environment Control

The following sections describe the commands that display temperature, fan, and power supply status:

The switch chassis, fans, power supplies, line cards, and supervisors also provide LEDs that signal status and conditions that require attention. The Quick Start Guide for the individual switches provides information about their LEDs.

7.1 Environment Control Introduction

Arista Networks switching platforms are designed to work reliably in common data center environments.

To ensure their reliable operation and to monitor or diagnose the switch's health, Arista provides a set of monitoring capabilities available through the CLI or SNMP entity MIBs to monitor and diagnose potential problems with the switching platform.

7.2 Environment Control Overview

This section contains the following topics:

7.2.1 Temperature

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold**: All fans run at maximum speed and a warning message is logged.
- **Critical Threshold**: The component is shut down immediately and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch is shut down if the temperature remains above the critical threshold for three minutes.

7.2.2 Fans

Arista switches include fan modules that maintain internal components at proper operating temperatures. The number and type of fans vary with switch chassis type:

- **Fixed configuration switches** contain hot-swappable independent fans. Fan models with different airflow directions are available. All fans within a switch must have the same airflow direction.
- **Modular switches** contain independent fans that circulate air from front-to-rear panel. Power supplies for modular switches also include fans that cool the power supply and supervisors.

The switch operates normally when one fan is not operating. Non-functioning modules should not be removed from the switch unless they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an ***insufficient fan shutdown*** condition. Under normal operations, this condition initiates a switch power down procedure.

Fans are accessible from the rear panel.

7.2.3 Power

Arista switches contain power supplies which provide power to internal components.

- **Fixed configuration switches** contain two power supplies, providing 1+1 redundancy.
- **Modular switches** contain four power supplies, providing a minimum of 2+2 redundancy.

Power supply LED indicators are visible from the rear panel.

7.3 Configuring and Viewing Environment Settings

This section contain the following topics:

7.3.1 Overriding Automatic Shutdown

This section contains the following topics:

7.3.1.1 Overheating

The switch can be configured to continue operating during temperature shutdown conditions. Ignoring a temperature shutdown condition is strongly discouraged because operating at high temperatures can damage the switch and void the warranty.

Temperature shutdown condition actions are specified by the environment overheat action command. The switch displays this warning when configured to ignore shutdown temperature conditions.

```
Switch(config)# environment overheat action ignore
======================================================================
WARNING: Overriding the system shutdown behavior when the system
is overheating is unsupported and should only be done under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment overheat action shutdown' command.
======================================================================
Switch(config)#
```

The ***running-config*** contains the **`environment overheat action`** command when it is set to **ignore**. When the command is not in ***running-config***, the switch shuts down when an overheating condition exists.

The following ***running-config*** file lists the **`environment overheat action`** command.

```
switch# show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)

ip route 0.0.0.0/0 10.255.255.1
!
environment overheat action ignore
!
!
end
switch#
```

7.3.1.2 Insufficient Fans

The switch can be configured to ignore the ***insufficient fan shutdown*** condition. This is strongly discouraged because continued operation without sufficient cooling may lead to a critical temperature condition that can damage the switch and void the warranty.

Insufficient-fans shutdown override is configured by the environment insufficient-fans action command. The switch displays this warning when configured to ignore insufficient-fan conditions.

```
switch(config)# environment insufficient-fans action ignore
=====================================================================
WARNING: Overriding the system shutdown behavior when the system
has insufficient fans inserted is unsupported and should only be done
under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment insufficient-fans action shutdown' command.
=====================================================================
switch(config)#
```

The ***running-config*** contains the **`environment insufficient-fans action`** command when it is set to ***ignore***. When ***running-config*** does not contain this command, the switch shuts down when it detects an insufficient-fans condition.

7.3.1.3 Fan Speed

The switch can be configured to override the automatic fan speed. The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

Fan speed override is configured by the environment fan-speed command. The switch displays this warning when its control of fan speed is overridden.

```
switch(config)# environment fan-speed override 50
=====================================================================
WARNING: Overriding the system fan speed is unsupported and should only
be done under the direction of an Arista Networks engineer.
You can risk damaging hardware by setting the fan speed too low
and doing so without direction from Arista Networks can be grounds
for voiding your warranty.
To set the fan speed back to automatic mode, use the
'environment fan-speed auto' command
=====================================================================
switch(config)#
```

The ***running-config*** contains the **`environment fan-speed override`** command if it is set to override. When ***running-config*** does not contain this command, the switch controls the fan speed.

7.3.2 Viewing Environment Status

This section contains the following topics:

- Power Status
- Temperature Status
- Fan Status
- System Status

7.3.2.1 Power Status

The show environment power command displays the status of the power supplies.

Example

This command displays the status of the power supplies.

```
switch> show environment power
Power Input Output Output
Supply  Model         Capacity  Current  Current  Power    Status
------- ------------ --------- -------- -------- -------- -------
1       PWR-650AC      650W      0.44A    10.50A  124.0W   Ok
Switch>
```

7.3.2.2 Temperature Status

To display internal temperature sensor status, enter show environment temperature.

```
switch> show environment temperature
System temperature status is: Ok
                                                 Alert      Critical
Sensor  Description              Temperature  Threshold  Threshold
------- ------------------------ ------------ ---------- ----------
1       Front-panel temp sensor   22.000C       65C        75C
2       Fan controller 1 sensor   23.000C       75C        85C
3       Fan controller 2 sensor   28.000C       75C        85C
4       Switch chip 1 sensor      40.000C       105C       115C
5       VRM 1 temp sensor         48.000C       105C       110C
switch>
```

System temperature status is the first line that the command displays. **System temperature status** values indicate the following:

- **Ok:** All sensors report temperatures below the alert threshold.
- **Overheating:** At least one sensor reports a temperature above its alert threshold.
- **Critical:** At least one sensor reports a temperature above its critical threshold.
- **Unknown:** The switch is initializing.
- **Sensor Failed:** At least one sensor is not functioning.

7.3.2.3 Fan Status

The show system environment cooling command displays the cooling and fan status.

Example

This command displays the fan and cooling status:

```
switch> show system environment cooling
System cooling status is: Ok
Ambient temperature: 22C
Airflow: port-side-intake
Fan Tray  Status          Speed
--------- --------------- ------
1 Ok 35%
2 Ok 35%
3 Ok 35%
4 Ok 35%
5 Ok 35%
switch>
```

7.3.2.4 System Status

The show system environment all command lists the temperature, cooling, fan, and power supply information that the individual show environment commands display, as described in Temperature Status, Fans, and Power.

Example

This command displays the temperature, cooling, fan, and power supply status:

```
switch> show system environment all
System temperature status is: Ok
                                                  Alert
 Critical
Sensor  Description              Temperature   Threshold
 Threshold
------- ------------------------ ------------ ----------
 ----------
1       Front-panel temp sensor   22.750C       65C        75C
2       Fan controller 1 sensor   24.000C       75C        85C
3       Fan controller 2 sensor   29.000C       75C        85C
4       Switch chip 1 sensor      41.000C       105C       115C
5       VRM 1 temp sensor         49.000C       105C       110C

System cooling status is: Ok
Ambient temperature: 22C
Airflow: port-side-intake
Fan Tray  Status          Speed
--------- --------------- ------
1         Ok                35%
2         Ok                35%
3         Ok                35%
4         Ok                35%
5         Ok                35%

Power                          Input    Output   Output
Supply  Model       Capacity   Current  Current  Power    Status
------- ----------- ---------  -------- -------- -------- -------
1       PWR-650AC   650W        0.44A   10.50A   124.0W   Ok
```

7.3.3 Locating Components on the Switch

When a component requires service, the switch administrator may use the locator-led command to assist a technician in finding the component. The command causes the status LED on the specified component to flash, and also displays a “service requested” message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. Use the show locator-led command to display all locator LEDs currently enabled on the switch.

- This command enables the locator LED on fan tray ***3***:

```
switch# locator-led fantray 3
Enabling locator led for FanTray3
switch#
```

- This command displays all locator LEDs enabled on the switch:

```
switch# show locator-led
There are no locator LED enabled
switch#
```

7.4 Environment Commands

Environment Control Configuration Commands

- environment fan-speed
- environment insufficient-fans action
- environment overheat action
- locator-led

Environment Display Commands

- show environment power
- show environment temperature
- show locator-led
- show system environment all
- show system environment cooling
- show system environment power budget

7.4.1 environment fan-speed

The **`environment fan-speed`** command determines the method of controlling the speed of the switch fans. The switch automatically controls the fan speed by default.

The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

The **`no environment fan-speed`** and **`default environment fan-speed`** commands restore the default action of automatic fan-speed control by removing the **environment fan-speed override** statement from ***running-config***.

Note: Overriding the system fan speed is unsupported and should only be done under the direction of an Arista Networks engineer. You can risk damaging hardware by setting the fan speed too low. Doing so without direction from Arista Networks can be grounds for voiding your warranty.

Command Mode

Global Configuration

Command Syntax

`environment fan-speed` **ACTION**

`no environment fan-speed`

`default environment fan-speed`

Parameters

ACTION Fan speed control method. Valid settings include:

- **auto** Fan speed is controlled by the switch.

  This option restores the default setting by removing the **`environment fan-speed override`** command from ***running-config***
- **override *percent*** Fan speed is set to the specified percentage of the maximum. Valid ***percent*** settings range from ***30*** to ***100***.

Examples

- This command overrides the automatic fan speed control and configures the fans to operate at 50% of maximum speed.

```
switch(config)# environment fan-speed override 50
======================================================================
WARNING: Overriding the system fan speed is unsupported and should
only be done under the direction of an Arista Networks engineer.
You can risk damaging hardware by setting the fan speed too low
and doing so without direction from Arista Networks can be grounds
for voiding your warranty.
To set the fan speed back to automatic mode, use the
'environment fan-speed auto' command
======================================================================
switch(config)#
```

- This command restores control of the fan speed to the switch.

```
switch(config)# environment fan-speed auto
switch(config)#
```

7.4.2 environment insufficient-fans action

The **environment insufficient-fans** command controls the switch response to the insufficient fan condition. By default, the switch initiates a shutdown procedure when it senses insufficient fans.

The switch operates normally when one fan is not operating. Non-functioning modules should not be removed from the switch unless they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an ***insufficient fan shutdown*** condition. This condition normally initiates a power down procedure.

The **no environment insufficient-fans** and **default environment insufficient-fans** commands restore the default shutdown response to the insufficient-fans condition by removing the **environment insufficient-fans action ignore** statement from ***running-config***.

Note: Overriding the system shutdown behavior when the system has insufficient fans inserted is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

Command Mode

Global Configuration

Command Syntax

environment insufficient-fans action **REMEDY**

no environment insufficient-fans action

default environment insufficient-fans action

Parameters

REMEDY Configures action when switch senses an insufficient fan condition. Settings include:

- **ignore** Switch continues operating when insufficient fans are operating.
- **shutdown** Switch shuts power down when insufficient fans are operating.

  The **shutdown** parameter restores default behavior by removing the **environment insufficient-fans** command from ***running-config***.

Examples

- This command configures the switch to continue operating after it senses insufficient fan condition.

```
switch(config)# environment insufficient-fans action ignore
================================================================
WARNING: Overriding the system shutdown behavior when the system
has insufficient fans inserted is unsupported and should only be done
under the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment insufficient-fans action shutdown' command.
================================================================
```

- This command configures the switch to shut down when it senses an insufficient fan condition.

```
switch(config)# environment insufficient-fans action shutdown
```

```
switch(config)#
```

7.4.3 environment overheat action

The **environment overheat** command controls the switch response to an overheat condition. By default, the switch shuts down when it senses an overheat condition.

Note: Overriding the system shutdown behavior when the system is overheating is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold**: All fans run at maximum speed and a warning message is logged.
- **Critical Threshold**: The component is shut down immediately and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch normally shuts down if the temperature remains above the critical threshold for three minutes.

The **no environment overheat action** and **default environment overheat action** commands restore the default shutdown response to the environment overheat condition by removing the **environment overheat action ignore** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

environment overheat action **REMEDY**

no environment overheat action

default environment overheat action

Parameters

REMEDY Reaction to an overheat condition. Default value is **shutdown**.

- **shutdown** Switch shuts power down by an overheat condition.
- **ignore** Switch continues operating during an overheat condition.

Examples

- This command configures the switch to continue operating after it senses an overheat condition.

```
switch(config)# environment overheat action ignore
======================================================================
WARNING: Overriding the system shutdown behavior when the system
is overheating is unsupported and should only be done under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment overheat action shutdown' command.
======================================================================
switch(config)#
```

- This command configures the switch to shut down when it senses an overheat condition.

```
switch(config)# environment overheat action shutdown
```

```
switch(config)#
```

7.4.4 locator-led

When a component requires service, the **locator-led** command activates a locator to assist a technician in finding the component. The command causes the status LED on the specified component to flash, and also displays a “service requested” message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. The available locators vary by platform; to see a list of the locator LEDs available on the switch, use the **locator-led ?** command. To disable the locator LED, use the **no locator-led** command.

Command Mode

Privileged EXEC

Command Syntax

locator-led {fantray ***tray_num*** | interface ***interface*** | module ***module_num*** | powersupply ***supply_num***}

no locator-led {fantray ***tray_num*** | interface ***interface*** | module ***module_num*** | powersupply ***supply_num***}

Parameters

- **fantray *tray_num*** Activates locator on specified fan tray.
- **interface *interface*** Activates locator on specified interface.
- **module *module_num*** Activates locator on specified module.
- **powersupply *supply_num*** Activates locator on specified power supply.

Examples:

- This command enables the locator LED on ***fantray 3***.

```
switch# locator-led fantray 3
Enabling locator led for FanTray3
switch#
```

- This command disables the locator LED on ***fantray 3***.

```
switch# no locator-led fantray 3
Disabling locator led for FanTray3
switch#
```

- This command displays the locator LEDs available on the switch.

```
switch# locator-led ?
  fantray      Fan tray LED
  interface    Interface LED
  module       Module LED
  powersupply  Power supply LED
switch#
```

7.4.5 show environment power

The **show environment power** command displays the status of all power supplies in the switch.

Command Mode

EXEC

Command Syntax

show environment power [**INFO_LEVEL**]

Parameters

INFO_LEVEL Specifies level of detail that the command displays. Options include:

- ***no parameter*** Displays current and power levels for each supply.
- **detail** Also includes status codes that can report error conditions.

Example

This command displays the status of power supplies on the switch.

```
switch>show environment power
Power                          Input    Output   Output
Supply  Model      Capacity  Current  Current  Power    Status
------- ---------- --------- -------- -------- -------- -------
1       PWR-760AC  760W       0.81A    11.00A   132.8W   Ok
2       PWR-760AC  760W       0.00A    0.00A    0.0W AC  Loss
switch>
```

7.4.6 show environment temperature

The **show environment temperature** command displays the operating temperature of all sensors on the switch.

Command Mode

EXEC

Command Syntax

show environment temperature [**MODULE_NAME**] [**INFO_LEVEL**]

Parameters

- **MODULE_NAME** Specifies modules for which data is displayed. This parameter is only available on modular switches. Options include:
  - ***no parameter*** All modules (identical to **all** option).
  - **fabric *fab_num*** Specified fabric module. Number range varies with switch model.
  - **linecard *line_num*** Line card module. Number range varies with switch model.
  - **supervisor *super_num*** Supervisor module. Number range varies with switch model.
  - ***mod_num*** Supervisor (1 to 2) or line card (3 to 18) module.
  - **all** All modules.
- **INFO_LEVEL** Specifies level of detail that the command displays. Options include:
  - ***no parameter*** Displays table that lists the temperature and thresholds of each sensor.
  - **detail** Displays data block for each sensor listing the current temperature and historic data.

Display Values

System temperature status is the first line that the command displays. Values report the following:

- ***Ok*** All sensors report temperatures below the alert threshold.
- ***Overheating*** At least one sensor reports a temperature above its alert threshold.
- ***Critical*** At least one sensor reports a temperature above its critical threshold.
- ***Unknown*** The switch is initializing.
- ***Sensor Failed*** At least one sensor is not functioning.

Examples

- This command displays a table that lists the temperature measured by each sensor.

```
switch> show environment temperature
System temperature status is: Ok
                                                Alert
 Critical
Sensor  Description              Temperature  Threshold
 Threshold
------- ------------------------ ------------ ----------
 ----------
1       Front-panel temp sensor   30.750C       65C        75C
2       Fan controller 1 sensor   32.000C       75C        85C
3       Fan controller 2 sensor   38.000C       75C        85C
4       Switch chip 1 sensor      50.000C       105C
 115C
5       VRM 1 temp sensor         60.000C       105C
 110C
switch>
```

- This command lists the temperature detected by each sensor, and includes the number of previous alerts, the time of the last alert, and the time of the last temperature change.

```
switch> show environment temperature detail
TempSensor1 - Front-panel temp sensor
                      Current State   Count    Last Change
  Temperature         30.750C
  Max Temperature     35.000C                  4 days,
 23:35:24 ago
  Alert                False           0        never

TempSensor2 - Fan controller 1 sensor

 22:54:51 ago
  Alert                 False              0       never

switch>
```

7.4.7 show locator-led

The **show locator-led** command displays the status of locator LEDs enabled on the switch.

Command Mode

Privileged EXEC

Command Syntax

show locator-led

Example

This command displays all locator LEDs enabled on the switch.

```
switch# show locator-led
There are no locator LED enabled
switch#
```

7.4.8 show system environment all

The **`show system environment all`** command displays temperature, cooling, and power supply status.

Command Mode

EXEC

Command Syntax

`show system environment all`

Example

This command displays the switch's temperature, cooling, and power supply status

```
switch> show system environment all
System temperature status is: Ok
                                                  Alert      Critical
Sensor  Description              Temperature  Threshold  Threshold
------- ------------------------ ------------ ---------- ----------
1       Front-panel temp sensor   31.000C       65C        75C
2       Fan controller 1 sensor   32.000C       75C        85C
3       Fan controller 2 sensor   38.000C       75C        85C
4       Switch chip 1 sensor      50.000C       105C       115C
5       VRM 1 temp sensor         60.000C       105C       110C

System cooling status is: Ok
Ambient temperature: 31C
Airflow: port-side-intake
Fan Tray  Status           Speed
--------- ---------------- ------
1          Ok                52%
2          Ok                52%
3          Ok                52%
4          Ok                52%
5          Ok                52%

Power                          Input    Output   Output
Supply  Model       Capacity  Current  Current  Power    Status
------- ----------- --------- -------- -------- -------- -------
1       PWR-760AC    760W     0.81A    11.00A    132.6W  Ok
2       PWR-760AC    760W     0.00A     0.00A      0.0W  AC Loss

switch>
```

7.4.9 show system environment cooling

The **show system environment cooling** command displays fan status, air flow direction, and ambient temperature on the switch.

Command Mode

EXEC

Command Syntax

show system environment cooling [**INFO_LEVEL**]

Parameters

- **INFO_LEVEL** Specifies level of detail that the command displays. Options include:
  - ***no parameter*** Displays the fan status, air flow direction, and ambient switch temperature.
  - **detail** Also displays actual and configured fan speed of each fan.

Status

- System Cooling Status
  - **Ok** No more than one fan has failed or is not inserted.
  - **Insufficient fans** More than one fan has failed or is not inserted. This status is also displayed if fans with different airflow directions are installed. The switch shuts down if the error is not resolved.
  - **Ambient temperature** Temperature of the surrounding area.
  - **Airflow** Indicates the direction of the installed fans:
    - **port-side-intake** All fans flow air from the front (port side) to the rear of the chassis.
    - **port-side-exhaust** All fans flow air from the rear to the front (port side) of the chassis.
    - **incompatible fans** Fans with different airflow directions are inserted.
    - **Unknown** The switch is initializing.
- **Fan Tray Status** table Displays the status and operating speed of each fan. Status values indicate the following conditions:
  - **OK** The fan is operating normally.
  - **Failed** The fan is not operating normally.
  - **Unknown** The system is initializing.
  - **Not Inserted** The system is unable to detect the specified fan.
  - **Unsupported** The system detects a fan that the current software version does not support.

Example

This command displays the fan status, air flow direction, and ambient switch temperature.

```
switch> show system environment cooling
System cooling status is: Ok
Ambient temperature: 30C
Airflow: port-side-intake
Fan Tray  Status           Speed
--------- ---------------- ------
1         Ok                 51%
2         Ok                 51%
3         Ok                 51%
4         Ok                 51%
5         Ok                 51%
```

```
switch>
```

7.4.10 show system environment power budget

The **show system environment power budget** command displays the configured power budget for PoE switches and a table to show the current consumption.

Command Mode

EXEC

Command Syntax

show system environment power budget

This command displays the configured power budget for a PoE switch and a table to show the current consumption

```
switch>show system environment power budget
Budget is 300.0W out of 1425.2W of total power
Active devices using up to 60.0W

Device                  Consumed
Name                    Power
----------------------- -----------------------
Ethernet37              30.0W
Ethernet38              30.0W
Total                   60.0W

switch>
```

Chapter 8

Upgrades and Downgrades

This chapter describes the procedures for upgrading or downgrading the switch software.

This chapter contains these sections:

8.1 Upgrade/Downgrade Overview

Upgrading or downgrading the Arista Extensible Operating System (EOS) is accomplished by replacing the EOS image and reloading the switch. Depending on the switch model and the software change being made, it may be possible to minimize (or virtually eliminate) downtime and packet loss during an upgrade. There are two upgrade methods for the EOS:

Smart System Upgrade: SSU significantly decreases downtime and packet loss during upgrades. SSU is available on selected platforms, and is ideal for leaf switches and other non-redundant deployments.

Standard Upgrades and Downgrades: In those cases where an accelerated upgrade is not needed or not an option (such as for software downgrades and on unsupported platforms), performing a standard upgrade or downgrade using the steps described here will minimize downtime and packet loss.

Note: To upgrade the software on switches participating in an MLAG, see Upgrading MLAG Peers.

8.2 Smart System Upgrade

Smart System Upgrade (SSU) significantly reduces reload time by streamlining and optimizing the reload procedure for upgrades, and by continuing to send LACP PDUs while the CPU is rebooting, keeping port channels operational during the reload. SSU leverages protocols capable of graceful restart to minimize traffic loss during upgrade.

Features capable of hitless restart under SSU include:

- QinQ
- 802.3ad Link Aggregation/LACP
- 802.3x flow control
- BGP (BGP graceful restart must be enabled: see Configuring BGP)
- MP-BGP (BGP graceful restart must be enabled: see Configuring BGP)
- 128-way Equal Cost Multipath Routing (ECMP)
- VRF
- route maps
- L2 MTU
- QoS

Note: SSU is not compatible with VRRP. If VRRP is configured on the switch, another upgrade method must be used.

8.2.1 Upgrading the EOS image with Smart System Upgrade

Using SSU to upgrade the active EOS image is a five-step process:

1. Prepare switch for upgrade (Prepare the Switch for SSU).
2. Transfer image file to the switch (Transfer the Image File for SSU). (Not required if desired file is on the switch).
3. Modify ***boot-config*** file to point to the desired image file (Modify boot-config).
4. Start the SSU process (Start the SSU Process).
5. Verify that the upgrade was successful (Verify Success of the Upgrade).

8.2.1.1 Prepare the Switch for SSU

To prepare the switch for SSU, take the following steps:

- Backing Up Critical Software
- Making Room on the Flash Drive
- Verifying Connectivity
- Verifying Configuration
- Configuring BGP

Note: configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, ensure that BGP sessions are stable and all BGP routing information has been learned and advertised before proceeding with SSU.

Backing Up Critical Software

Before upgrading the EOS image, ensure that copies of the currently running EOS version and the ***running-config*** file are available in case of corruption during the upgrade process. To copy the ***running-config*** file, use the **`copy running-config`** command. In this example, ***running-config*** is copied to a file in the flash drive on the switch.

```
switch# copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

Making Room on the Flash Drive

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image, plus a recommended 240MB (if available) for diagnostic information in case of a fatal error. Use the **`dir`** command to check the “bytes free” figure.

```
switch# dir flash:
Directory of flash:/
-rwx   293168526      Nov 4    22:17   EOS4.11.0.swi
-rwx          36      Nov 8    10:24   boot-config
-rwx       37339      Jun 16   14:18   cfg_06162014
606638080 bytes total (602841088 bytes free)
```

Verifying Connectivity

Ensure that the switch has a management interface configured with an IP addresses and default gateway. See Assigning a Virtual IP Address to Access the Active Ethernet Management Port and Configuring a Default Route to the Gateway. Confirm that the switch can be reached through the network by using the command and pinging the default gateway.

```
switch# show interfaces status
Port    Name     Status     Vlan       Duplex   Speed      Type
```

```
Et3/1            notconnect   1         auto    auto     1000BASE-T

<-------OUTPUT OMITTED FROM EXAMPLE-------->
Ma1/1            connected    routed    unconf   unconf    Unknown

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

Verifying Configuration

Verify that the switch configuration is valid for SSU by using the **show reload fast-boot** command. If parts of the configuration are blocking execution of SSU, an error message will be displayed explaining what they are. For SSU to proceed, the configuration conflicts must be corrected before issuing the **reload fast-boot** command.

```
switch# show reload fast-boot
switch#'reload fast-boot' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

Note: The **show reload hitless** and **reload hitless** commands can still be used, but their effect is identical to the commands shown above.

Configuring BGP

For hitless restart of BGP and MP-BGP, BGP graceful restart must first be enabled using the **graceful-restart** command. The default restart time value (***300*** seconds) is appropriate for mostconfigurations.

The BGP configuration mode in which the **graceful-restart** command is issued determines which BGP connections will restart gracefully.

Note: configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, ensure that BGP sessions are stable and all BGP routing information has been learned and advertised before proceeding with SSU.

- For all BGP connections, use the **graceful-restart** command in BGP configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# graceful-restart
switch(config-router-bgp)#
```

- For all BGP connections in a specific VRF, use the **graceful-restart** command in BGP VRF configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# graceful-restart
switch(config-router-bgp-vrf-purple)# exit
switch(config-router-bgp)#
```

- For all BGP connections in a specific BGP address family, use the **graceful-restart**command in BGP address-family configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# graceful-restart
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#
```

8.2.1.2 Transfer the Image File for SSU

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for two copies of the image plus an optional 240MB for diagnostic information, use the **copy** command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.

USB Memory

Command

copy usb1:/***sourcefile*** flash:/***destfile***

Example

```
sch# copy usb1:/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

FTP Server

Command

copy ftp:/***ftp-source***/***sourcefile*** flash:/***destfile***

Example

```
switch# copy ftp:/user:password@10.0.0.3/EOS-4.14.4.swi flash:/EOS-4.
14.4.swi
```

SCP

Command

copy scp://***scp-source***/***sourcefile*** flash:/***destfile***

Example

```
switch# copy scp://user@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.
13.2.swi
```

HTTP

Command

copy http://***http-source***/***sourcefile*** flash:/***destfile***

Example

```
switch# copy http://10.0.0.10/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch# dir flash:
Directory of flash:/
-rwx     293168526   Nov 4     22:17     EOS4.14.2.swi
-rwx            36   Nov 8     10:24     boot-config
-rwx         37339   Jun 16    14:18     cfg_06162014
-rwx     394559902   May 30    02:57     EOS4.13.1.swi

606638080 bytes total (208281186 bytes free)
switch# verify /md5 flash:EOS-4.14.4.swi
verify /md5 (flash:EOS-4.14.4.swi) =c277a965d0ed48534de6647b12a86991
switch#
```

8.2.1.3 Modify boot-config

After transferring and confirming the desired image file, use the **boot system** command to update the ***boot-config*** file to point to the new EOS image.

This command changes the ***boot-config*** file to point to the image file located in flash memory at ***EOS-4.14.4.swi***.

```
switch# configure terminal
switch(config)# boot system flash:/EOS-4.14.4.swi
```

Use the **show boot-config** command to verify that the ***boot-config*** file is correct:

```
switch(config)# show boot-config
Software image: flash:/EOS-4.14.4.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7/Qxbi2l1
```

Save the configuration to the ***startup-config*** file with the **write** command.

```
switch# write
```

8.2.1.4 Start the SSU Process

After updating the ***boot-config*** file, verify that your configuration supports SSU (if you have not already done so) by using the **show reload fast-boot** command. If parts of the configuration are blocking execution of SSU, an error message will be displayed explaining what they are.

```
switch# show reload fast-boot
switch#'reload fast-boot' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

Then start the SSU process using the **reload fast-boot** command to reload the switch and activate the new image. The CLI will identify any changes that must be made to the configuration before starting SSU, prompt to save any modifications to the system configuration, and request confirmation before reloading.

```
switch# reload fast-boot
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Copy completed successfully.
```

```
Proceed with reload? [confirm]y
```

Note: The **show reload hitless** and **reload hitless** commands can also be used, but their effect is identical to the commands shown above.

8.2.1.5 Verify Success of the Upgrade

Before making any configuration changes to the switch after reload, verify that the SSU process is complete using the command **show boot stages log**. If the process is complete, the last message should be “Hitless boot stages complete.”

```
switch# show boot stages log
Timestamp           Delta Begin Msg
2022-10-03 12:42:06 000.000000 Asu Hitless boot stages started
2022-10-03 12:42:06 000.001592 stage CriticalAgent started
2022-10-03 12:42:06 000.001834   event CriticalAgent:PhyEthtool completed

[ . . . ]

2022-10-03 12:43:02 056.316874 stage BootSanityCheck is complete
2022-10-03 12:43:02 056.317491 Asu Hitless boot stages complete
switch#
```

Completion of the SSU process may also be verified by checking the syslog for the following message:

```
LAUNCHER-6-BOOT_STATUS: 'reload fast-boot' reconciliation complete
```

To verify whether the SSU upgrade was successful, use the **show reload cause** command. If a fatal error occurred during the upgrade process, the switch will have completely rebooted and the fatal error will be displayed along with the directory in which diagnostic information can be found. If the SSU upgrade has succeeded, it will read “Hitless reload requested by the user.”

Fatal Error Display

```
switch# show reload cause
Reload Cause 1:
-------------------
Fatal error occurred during Asu Hitless boot. (stageMgr - LinkStatusUpd
ate timed out)

Reload Time:
------------
Reload occurred at Sun Oct 02 12:06:37 2022 PDT.

Recommended Action:
-------------------
The system rebooted due to a fatal error.
If the problem persists, contact your customer support representative.

Debugging Information:
------------------------------
/mnt/flash/persist/fatalError-2022-10-02_120637
switch#
```

Successful Upgrade Display

```
switch# show reload cause
Reload Cause 1:
-------------------
```

```
Hitless reload requested by the user.

Reload Time:
------------
Reload occurred at Mon Oct 03 13:29:31 2022 PDT.

Recommended Action:
-------------------
No action necessary.

Debugging Information:
------------------------------
None available.
switch#
```

The **`show version`** command confirms whether the correct image is loaded. The ***Software image version*** line displays the version of the active image file.

```
switch# show version
switch#show version
Arista DCS-7050QX-32-F
Hardware version: 02.00
Serial number: JPE14071098
System MAC address: 001c.7355.556f
Software image version: 4.14.5F-2353054.EOS4145F
Architecture: i386
Internal build version: 4.14.5F-2353054.EOS4145F
Internal build ID: e8748ea7-916d-4217-878f-4bfe2adc7122
Uptime: 4 minutes
Total memory: 3981328 kB
Free memory: 1342408 kB
switch#
```

Note: If a fatal error occurs during the SSU process, the new EOS image will still be loaded and booted.

8.3 Standard Upgrades and Downgrades

Standard software upgrades and downgrades on Arista switches are accomplished by installing a different EOS image and reloading the switch. On switches with redundant supervisors, the EOS image must be installed on both supervisors. Using the procedure described below will minimize packet loss during a standard upgrade or downgrade.

These sections describe standard switch upgrade and downgrade procedures.:

- Upgrading or Downgrading the EOS on a Single-Supervisor Switch
- Upgrading or Downgrading the EOS on a Dual-Supervisor Switch

8.3.1 Upgrading or Downgrading the EOS on a Single-Supervisor Switch

Modifying the active EOS image is a five-step process:

1. Prepare switch for upgrade (Prepare the Switch for SSU).
2. Transfer image file to the switch (Transfer the Image File). (Not required if desired file is on the switch).
3. Modify ***boot-config*** file to point to the desired image file (Modify boot-config for Single-Supervisor switch).
4. Reload switch (Reload).
5. Verify that switch is running the new image (Verify the New Image for Single-Supervisor Switch).

8.3.1.1 Prepare the Switch for SSU

To prepare the switch for SSU, take the following steps:

- Backing Up Critical Software
- Making Room on the Flash Drive
- Verifying Connectivity
- Verifying Configuration
- Configuring BGP

Note: configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, ensure that BGP sessions are stable and all BGP routing information has been learned and advertised before proceeding with SSU.

Backing Up Critical Software

Before upgrading the EOS image, ensure that copies of the currently running EOS version and the ***running-config*** file are available in case of corruption during the upgrade process. To copy the ***running-config*** file, use the **`copy running-config`** command. In this example, ***running-config*** is copied to a file in the flash drive on the switch.

```
switch# copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

Making Room on the Flash Drive

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image, plus a recommended 240MB (if available) for diagnostic information in case of a fatal error. Use the **`dir`** command to check the “bytes free” figure.

```
switch# dir flash:
Directory of flash:/
-rwx   293168526      Nov 4    22:17   EOS4.11.0.swi
-rwx          36      Nov 8    10:24   boot-config
-rwx       37339      Jun 16   14:18   cfg_06162014
606638080 bytes total (602841088 bytes free)
```

Verifying Connectivity

Ensure that the switch has a management interface configured with an IP addresses and default gateway. See Assigning a Virtual IP Address to Access the Active Ethernet Management Port and Configuring a Default Route to the Gateway. Confirm that the switch can be reached through the network by using the command and pinging the default gateway.

```
switch# show interfaces status
Port    Name      Status      Vlan       Duplex   Speed      Type
Et3/1             notconnect   1          auto    auto     1000BASE-T

<-------OUTPUT OMITTED FROM EXAMPLE-------->
Ma1/1             connected   routed     unconf   unconf    Unknown

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

Verifying Configuration

Verify that the switch configuration is valid for SSU by using the **show reload fast-boot** command. If parts of the configuration are blocking execution of SSU, an error message will be displayed explaining what they are. For SSU to proceed, the configuration conflicts must be corrected before issuing the **reload fast-boot** command.

```
switch# show reload fast-boot
switch#'reload fast-boot' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

Note: The **show reload hitless** and **reload hitless** commands can still be used, but their effect is identical to the commands shown above.

Configuring BGP

For hitless restart of BGP and MP-BGP, BGP graceful restart must first be enabled using the **graceful-restart** command. The default restart time value (***300*** seconds) is appropriate for mostconfigurations.

The BGP configuration mode in which the **graceful-restart** command is issued determines which BGP connections will restart gracefully.

Note: configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, ensure that BGP sessions are stable and all BGP routing information has been learned and advertised before proceeding with SSU.

- For all BGP connections, use the **graceful-restart** command in BGP configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# graceful-restart
switch(config-router-bgp)#
```

- For all BGP connections in a specific VRF, use the **graceful-restart** command in BGP VRF configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# graceful-restart
switch(config-router-bgp-vrf-purple)# exit
switch(config-router-bgp)#
```

- For all BGP connections in a specific BGP address family, use the **graceful-restart**command in BGP address-family configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# graceful-restart
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#
```

8.3.1.2 Transfer the Image File

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for the image, use the CLI **copy** command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.

USB Memory

Command

copy usb1:/***sourcefile*** flash:/***destfile***

Example

```
sch# copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

FTP Server

Command

copy ftp:/***ftp-source***/***sourcefile*** flash:/***destfile***

Example

```
sch# copy ftp:/user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.
13.2.swi
```

SCP

Command

copy scp://***scp-source***/***sourcefile*** flash:/***destfile***

Example

```
sch# copy scp://user@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

HTTP

Command

copy http://***http-source***/***sourcefile*** flash:/***destfile***

Example

```
sch# copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch# dir flash:
Directory of flash:/
-rwx     293168526   Nov 4     22:17     EOS4.11.0.swi
-rwx            36   Nov 8     10:24     boot-config
-rwx         37339   Jun 16    14:18     cfg_06162014
-rwx     394559902   May 30    02:57     EOS-4.12.2.swi

606638080 bytes total (208281186 bytes free)
switch#53# verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991
```

8.3.1.3 Modify boot-config for Single-Supervisor switch

After transferring and confirming the desired image file, use the **`boot system`** command to update the ***boot-config*** file to point to the new EOS image.

This command changes the ***boot-config*** file to point to the image file located in flash memory at ***EOS-4.12.2.swi***.

```
switch# configure terminal
switch(config)# boot system flash:/EOS-4.13.2.swi
```

Use the **`show boot-config`** command to verify that the ***boot-config*** file is correct:

```
switch(config)# show boot-config
Software image: flash:/EOS-4.13.2.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7/Qxbi2l1
```

Save the configuration to the ***startup-config*** file with the **`write`** command.

```
switch# write
```

8.3.1.4 Reload

After updating the ***boot-config*** file, reset the switch to activate the new image. The reload command resets the switch, resulting in temporary downtime and packet loss on single supervisor switches.

When reloading from the console port, all rebooting messages are displayed on the terminal. From any port except the console, the CLI displays this text:

```
switch# reload
The system is going down for reboot NOW!
```

Note: The EOS boot process makes a copy of the .swi image file in the internal flash while booting, so sufficient space for ***two copies*** must be present when loading the new EOS image. If the switch is reloaded without adequate space on the flash drive, it will boot to the Aboot prompt from which you can delete files from /mnt/flash to free up additional space. Exiting Aboot will begin the boot process again.

8.3.1.5 Verify the New Image for Single-Supervisor Switch

After the switch finishes reloading, log into the switch and use the **`show version`** command to confirm the correct image is loaded. The **`Software image version`** line displays the version of the active image file.

```
switch# show version
Arista DCS-7150S-64-CL-F
Hardware version:    01.01
Serial number:       JPE13120819
System MAC address:  001c.7326.fd0c

Software image version: 4.13.2F
Architecture:           i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:      eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:                 14 hours and 48 minutes
Total memory:           4017088 kB
Free memory:            1569760 kB

switch>
```

8.3.2 Upgrading or Downgrading the EOS on a Dual-Supervisor Switch

Modifying the active EOS image is a four-step process:

1. Prepare switch for upgrade (Prepare the Switch for Dual-Supervisor Switch).
2. Transfer image file to primary supervisor (Transfer the Image File to the Primary Supervisor). (Not required if desired file is on switch).
3. Use the install command to install the new EOS image and update ***boot-config*** (Install the New EOS Image).
4. Verify that the switch is running the new image (Verify the New Image).

Note: Due to a change in the supervisor heartbeat timeout, booting one supervisor with a post-SSO image (version ***4.10.0-SSO***, ***4.11.X*** and later) while the other supervisor is running a pre-SSO image will cause the supervisor running the pre-SSO image to reload. This causes a disruption as both supervisors are inactive for a short time. To minimize downtime, upgrade the images on both supervisors and reload the entire chassis using the install command.

8.3.2.1 Prepare the Switch for Dual-Supervisor Switch

To prepare the switch for an EOS upgrade, take the following steps:

- Back up essential files.
- Ensure that you are logged in to the primary supervisor.
- Ensure that the primary supervisor is reachable and that the management interfaces are configured.
- Ensure that there is enough room on both supervisors for the new image file.
- Ensure that any extensions running on the active supervisor are also available on the standby.

Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the ***running-config*** file are available in case of corruption during the upgrade process. To copy the ***running-config*** file, use the **`copy running-config`** command. In this example, ***running-config*** is copied to a file called ***backup2*** on the flash drive.

```
switch# copy running-config backup2
Copy completed successfully.
switch#
```

Ensure that you are logged in to the primary supervisor, not the standby. Use the show redundancy status command, and verify that ***my state*** reads **`ACTIVE`** and not **`STANDBY`**.

```
switch# show redundancy status
my status = Active
peer state = STANDBY HOT
Unit = Secondary
Unit ID = 1
Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
Ready for switchover
Last switchover time = 25 days, 19:51:34 ago
Last switchover reason = Other supervisor stopped sending heartbeats
```

Ensure that the switch has a management interface configured with an IP addresses and default gateway. Refer the sections, Assigning a Virtual IP Address to Access the Active Ethernet Management Port and Configuring a Default Route to the Gateway (see Assigning a Virtual IP Address to Access the Active Ethernet Management Port and Configuring a Default Route to the Gateway), and confirm that both management interfaces are in the up state and can ping the default gateway by using the**`show interfaces status`** command and **`ping`** command.

Note: If the management VRF interface is used, use the virtual management interface (management 0) instead of the IP address on the physical management interface.

```
switch# show interfaces status
Port    Name      Status      Vlan       Duplex   Speed      Type
Et3/1             notconnect   1          auto    auto     1000BASE-T

<-------OUTPUT OMITTED FROM EXAMPLE-------->
Ma1/1             connected   routed     unconf   unconf    Unknown

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image (use the **dir** command to check the bytes free figure).

```
switch# dir flash:
Directory of flash:/
-rwx   293168526      Nov 4    22:17   EOS4.11.0.swi
-rwx          36      Nov 8    10:24   boot-config
-rwx       37339      Jun 16   14:18   cfg_06162014
<-------OUTPUT OMITTED FROM EXAMPLE-------->
606638080 bytes total (602841088 bytes free)
Standby supervisor:
switch# dir supervisor-peer:mnt/flash/
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
<-------OUTPUT OMITTED FROM EXAMPLE-------->
606638080 bytes total (602841088 bytes free)
```

And, finally, ensure that any extensions running on the primary supervisor are also available on the secondary supervisor.

8.3.2.2 Transfer the Image File to the Primary Supervisor

Load the desired image to the file system on the primary supervisor, typically into the flash. Use the CLI **copy** command to load files to the flash on the primary supervisor, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to flash from various locations.

USB Memory

Command

copy usb1:/*sourcefile* flash:/*destfile*

Example

```
Sch#copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

FTP Server

Command

copy ftp:/*ftp-source*/*sourcefile* flash:/*destfile*

Example

```
sch# copy ftp:/user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.
13.2.swi
```

SCP

Command

copy scp://***scp-source***/***sourcefile*** flash:/***destfile***

Example

```
sch# copy scp://user@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

HTTP

Command

copy http://***http-source***/***sourcefile*** flash:/***destfile***

Example

```
sch# copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the **`verify`** command. The MD5 checksum for each available image can be found on the EOS download page of the Arista website.

```
switch# dir flash:
Directory of flash:/
-rwx      293168526     Nov 4    22:17     EOS4.11.0.swi
-rwx             36     Nov 8    10:24     boot-config
-rwx          37339     Jun 16   14:18     cfg_06162014
-rwx      394559902     May 30   02:57     EOS-4.12.2.swi

<-------OUTPUT OMITTED FROM EXAMPLE-------->

606638080 bytes total (208281186 bytes free)
switch#53# verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991
```

8.3.2.3 Install the New EOS Image

Once the EOS image has been copied to the flash drive of the primary supervisor, use the install command to update the ***boot-config***, copy the new image to the secondary supervisor and reload both supervisors. When upgrading to a new image, both supervisors will briefly be unavailable; using the **`install`** command minimizes packet loss during reload.

```
switch(config)# install source EOS-4.13.2.swi reload
Preparing new boot-config... done.
Copying new software image to standby supervisor... done.
Copying new boot-config to standby supervisor... done.
Committing changes on standby supervisor... done.
Reloading standby supervisor... done.
Committing changes on this supervisor... done.
Reloading this supervisor...
```

8.3.2.4 Verify the New Image

After the switch finishes reloading, log into the switch and use the **`show version`** command to confirm the correct image is loaded. The **`Software image version`** line displays the version of the active image file.

```
switch# show version
Arista DCS-7504
Hardware version:    01.01
Serial number:       JPE13120819
System MAC address:  001c.7326.fd0c

Software image version: 4.13.2F
Architecture:           i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:      eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:                 1 hour and 36 minutes
Total memory:           4017088 kB
Free memory:            1473280 kB

switch#
```

8.4 Upgrade/Downgrade Commands

- install
- reload fast-boot
- reload hitless

8.4.1 install

The **install** command copies the specified EOS image onto the switch (if the source is external), configures the ***boot-config*** file to point to the specified EOS image, copies the image to the standby supervisor (on dual-supervisor switches), and optionally reloads the switch to run the new EOS.

Command Mode

Privileged EXEC

Command Syntax

install source ***source_path*** [destination ***destination_path***][now][reload]

Parameters

- ***source_path*** file path and name of EOS image. If no file path is specified, the switch will look for the image on the flash drive of the primary supervisor.
- **destination** ***destination_path*** destination file path and name of the EOS image. If no destination or name is specified, the EOS image will be stored on the flash drive with its original file name.
- **now** command is executed immediately without further prompts.
- **reload** supervisor is reloaded after the image and updated ***boot-config*** file are installed. On dual-supervisor switches, reloads both supervisors, after which control is returned to the primary supervisor.

Example

This command updates the ***boot-config*** file to point to the **EOS.swi** file on the primary supervisors flash drive, copies the image and ***boot-config*** file to the secondary supervisor, and reboots both.

```
switch(config)# install source EOS.swi reload
Preparing new boot-config... done.
Copying new software image to standby supervisor... done.
Copying new boot-config to standby supervisor... done.
Committing changes on standby supervisor... done.
Reloading standby supervisor... done.
Committing changes on this supervisor... done.
Reloading this supervisor...
```

8.4.2 reload fast-boot

Smart System Upgrade (SSU) allows critical switches to be upgraded with minimal downtime and packet loss by optimizing the reload procedure and leveraging protocols capable of graceful restart. The **`reload fast-boot`** command starts the SSU process using the EOS image specified by the ***boot-config*** file (configured by the **`boot system`** command).

When the **`reload fast-boot`** command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

Command Mode

Privileged EXEC

Command Syntax

`reload fast-boot`

Guidelines

- SSU is supported only for upgrades (not downgrades).
- SSU is not supported if the EOS upgrade requires an FPGA upgrade.
- Enough free space must be available on the flash drive to store two copies of the target EOS image. It is also recommended that an additional 240MB be available to store diagnostic information.

Examples

- This command starts the Smart Software Upgrade process.

```
switch# reload fast-boot
Proceed with reload? [confirm]
```

- If there are issues with the current switch configuration that prevents SSU from being performed, the switch lists the changes that must be made before SSU can begin.

```
switch# reload fast-boot
switch#'reload fast-boot' cannot proceed due to the following:
Spanning-tree portfast is not enabled for one or more ports
Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

- When the **`reload fast-boot`** command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

```
switch# reload fast-boot
System configuration has been modified. Save? [yes/no/cancel/
diff]:y
Copy completed successfully.
Proceed with reload? [confirm]y
```

8.4.3 reload hitless

The **reload hitless** command is a legacy command now identical to the **reload fast-boot** command. It starts the Smart System Upgrade (SSU) process using the EOS image specified by the ***boot-config*** file (configured by the boot system command).

Command Mode

Privileged EXEC

Command Syntax

reload hitless

Guidelines

- SSU is supported only for upgrades (not downgrades).
- SSU is not supported if the EOS upgrade requires an FPGA upgrade.
- Enough free space must be available on the flash drive to store two copies of the target EOS image. It is also recommended that an additional 240MB be available to store diagnostic information.

Examples

- This command starts the SSU process.

```
switch# reload hitless
Proceed with reload? [confirm]
```

- If there are issues with the current switch configuration that prevents SSU from being performed, the switch lists the changes that must be made before SSU can begin.

```
switch# reload hitless
switch#'reload hitless' cannot proceed due to the following:
Spanning-tree portfast is not enabled for one or more ports
Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

- When the **reload hitless** command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

```
switch# reload hitless
System configuration has been modified. Save? [yes/no/cancel/
diff]:y
Copy completed successfully.
Proceed with reload? [confirm]y
```

Chapter 9

Security

The Security chapter contains the following sections:

9.1 User Security

This section covers the following:

9.1.1 AAA Configuration

This section describes Authentication, Authorization, and Accounting (AAA), and contains these topics:

9.1.1.1 Authentication, Authorization, and Accounting Overview

This section contains the following topics:

9.1.1.1.1 Methods

The switch controls access to EOS commands by authenticating user identity and verifying user authorization. Authentication, Authorization, and Accounting (AAA) activities are conducted through three data services - a local security database, TACACS+ servers, and RADIUS servers. Configuring the Security Services describes these services.

9.1.1.1.2 Configuration Statements

Enabling AAA on the switch requires two steps:

1. Configure security service parameters.

   The switch provides configuration commands for each security service:

   - A local file supports authentication through **username** and enable password commands.
   - TACACS+ servers provide security services through **`tacacs-server`** commands.

- RADIUS servers provide security services through **`radius-server`** commands.
- Configuring the Security Services describes security service configuration commands.

2. Activate AAA services.

   EOS provides **`aaa authorization`**, **`aaa authentication`**, and **`aaa accounting`** commands to select the primary and backup services. Activating Security Services provides information on implementing a security environment.

9.1.1.1.3 Encryption

The switch uses clear-text passwords and server access keys to authenticate users and communicate with security systems. To prevent accidental disclosure of passwords and keys, ***running-config*** stores their corresponding encrypted strings. The encryption method depends on the type of password or key.

Commands that configure passwords or keys can accept the clear-text password or an encrypted string that was generated by the specified encryption algorithm with the clear-text password as the seed.

9.1.1.2 Configuring the Security Services

The switch can access three security data services to authenticate users and authorize switch tasks: a local file, TACACS+ servers, and RADIUS Servers.

This section contains the following topics:

- Local Security File
- TACACS+
- RADIUS
- AAA with LDAP

9.1.1.2.1 Local Security File

The local file uses passwords to provide these authentication services:

- authenticate users as they log into the switch.
- control access to configuration commands.
- control access to the switch root login.

The local file contains username-password combinations to authenticate users. Passwords also authorize access to configuration commands and the switch root login.

9.1.1.2.1.1 Passwords

The switch recognizes passwords as clear text and encrypted strings.

- **Clear-text** passwords are the text that a user enters to access the CLI, configuration commands, or the switch root login.
- **Encrypted strings** are SHA-512-encrypted strings generated with the **clear text** as the seed. The local file stores passwords in this format to avoid unauthorized disclosure. When a user enters the clear-text password, the switch generates the corresponding secure hash and compares it to the stored version.

  Note: The switch cannot recover the clear text from which an encrypted string is generated.

Valid passwords contain the characters A-Z, a-z, 0-9 and any of these punctuation characters:

! @ # $ % ^ & * ( ) - _ = + { } [ ] ; : < > , . ? / ~ \

9.1.1.2.1.2 Usernames

Usernames control access to the EOS and all switch commands. The switch is typically accessed through an SSH login, using a previously defined username-password combination. To create a new username or modify an existing username, use the username command.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

@ # $ % ^ & * - _ = + ; < > , . ~ |

The default username is **admin**, which is described in Admin Username.

Examples

- These equivalent commands create the username ***john*** and assign it the password ***x245***. The password is entered in clear text because the encrypt-type parameter is omitted or zero.

```
switch(config)# username john secret x245
switch(config)# username john secret 0 x245
```

- This command creates the username ***john*** and assigns it to the text password that corresponds to the encrypted string ***1sU.7hptc$TsJ1qslCL7ZYVbyXNG1wg1***. The string was generated by an MD5-encryption program using ***x245*** as the seed.

```
switch(config)# username john secret 5 $1$sU.7hptc$TsJ1qslCL7ZYVb
yXNG1wg1
```

The username is authenticated by entering ***x245*** when the CLI prompts for a password.

- This command creates the username ***jane*** without securing it with a password. It also removes a password if the ***jane*** username exists.

```
switch(config)# username jane nopassword
```

- This command removes the username ***william*** from the local file.

```
switch(config)# no username william
```

9.1.1.2.1.3 Logins by Unprotected Usernames

The default switch configuration allows usernames that are not password-protected to log in only from the console. The aaa authentication policy local allow-nopassword-remote-login command configures the switch to allow unprotected usernames to log in from any port. To reverse this setting to the default state, use no form of aaa authentication policy local allow-nopassword-remote-login.

Note: Allowing remote access to accounts without passwords is a severe security risk. Arista Networks recommends assigning strong passwords to all usernames.

Examples

- This command configures the switch to allow unprotected usernames to log in from any port.

```
switch(config)# aaa authentication policy local allow-nopassword-
remote-login
```

- This command configures the switch to allow unprotected usernames to log in only from the console port.

```
switch(config)# no aaa authentication policy local allow-nopassword-
remote-login
```

9.1.1.2.1.4 Enable Command Authorization

The **enable** command controls access to Privileged EXEC and all configuration command modes. The enable password authorizes users to execute the **enable** command. When the enable password is set, the CLI displays a password prompt when a user attempts to enter ***Privileged EXEC*** mode.

```
main-host> enable
Password:
main-host#
```

If an incorrect password is entered three times in a row, the CLI displays the EXEC mode prompt.

If no enable password is set, the CLI does not prompt for a password when a user attempts to enter ***Privileged EXEC*** mode.

To set the enable password, use the enable password command.

Examples

- These equivalent commands assign ***xyrt1*** as the enable password.

```
switch(config)# enable password xyrt1
switch(config)# enable password 0 xyrt1
```

- This command assigns the enable password to the clear text ***12345*** corresponding to the encrypted string ***$1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/***. The string was generated by an MD5-encryption program using ***12345*** as the seed.

```
switch(config)# enable password 5 $1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/
```

- This command deletes the enable password.

```
switch(config)# no enable password
```

9.1.1.2.1.5 Root Account Password

The root account accesses the root directory in the underlying Linux shell. When it is not password protected, you can log into the root account only through the console port. After you assign a password to the root account, you can log into it through any port.

To set the password for the root account, use the aaa root command.

Examples

- These equivalent commands assign ***f4980*** as the root account password.

```
switch(config)# aaa root secret f4980
switch(config)# aaa root secret 0 f4980
```

- This command assigns the text ***ab234*** that corresponds to the encrypted string ***1HW05LEY8$QEVw6JqjD9VqDfh.O8r.b***. as the root password.

```
switch(config)# aaa root secret 5 $1$HW05LEY8$QEVw6JqjD9VqDfh.O8r.b
```

- This command removes the password from the root account.

```
switch(config)# aaa root nopassword
```

- This command disables the root login.

```
switch(config)# no aaa root
```

9.1.1.2.2 TACACS+

Terminal Access Controller Access-Control System Plus (TACACS+), derived from the TACACS protocol defined in ***RFC 1492***, is a network protocol that provides centralized user validation services. TACACS+ information is maintained on a remote database. EOS support of TACACS+ services requires access to a TACACS+ server.

TACACS+ manages multiple network access points from a single server. The switch defines a TACACS+ server connection by its address and port, allowing the switch to conduct multiple data streams to a single server by addressing different ports on the server.

These sections describe steps that configure access to TACACS+ servers. Configuring TACACS + access is most efficiently performed when TACACS+ is functioning prior to configuring switch parameters.

9.1.1.2.2.1 Configuring TACACS+ Parameters

TACACS+ parameters define settings for the switch to communicate with TACACS+ servers. A set of values can be configured for individual TACACS+ servers that the switch accesses. Global parameters define settings for communicating with servers for which parameters are not individually configured.

The switch supports the following TACACS+ parameters.

Encryption Key

The encryption key is code that the switch and the TACACS+ server share to facilitate communications.

- The tacacs-server host command defines the encryption key for a specified server.
- The tacacs-server key command defines the global encryption key.

Examples

- This command configures the switch to communicate with the TACACS+ server assigned the host name ***TAC_1*** using the encryption key ***rp31E2v***.

```
switch(config)# tacacs-server host TAC-1 key rp31E2v
```

- This command configures ***cv90jr1*** as the global encryption key.

```
switch(config)# tacacs-server key 0 cv90jr1
```

- This command assigns ***cv90jr1*** as the global key, using the corresponding encrypted string.

```
switch(config)# tacacs-server key 7 020512025B0C1D70
```

Session Multiplexing

The switch supports multiplexing sessions on a single TCP connection.

- The tacacs-server host command configures the multiplexing option for a specified server.
- There is no global multiplexing setting.

Example

This command configures the switch to communicate with the TACACS+ server at ***10.12.7.9*** and indicates the server supports session multiplexing on a TCP connection.

```
switch(config)# tacacs-server host 10.12.7.9 single-connection
```

Timeout

The timeout is the period the switch waits for a successful connection to, or response from, the TACACS+ server. The default is ***5*** seconds.

- The tacacs-server host command defines the timeout for a specified server.
- The tacacs-server timeout command defines the global timeout.

Examples

- This command configures the switch to communicate with the TACACS+ server assigned the host name ***TAC_1*** and configures the timeout period as ***20*** seconds.

  ```
  switch(config)# tacacs-server host TAC_1 timeout 20
  ```

- This command configures ***40*** seconds as the period that the server waits for a response from a TACACS+ server before issuing an error.

  ```
  switch(config)# tacacs-server timeout 40
  ```

Port

The port specifies the port number through which the switch and the servers send information. The TACACS+ default port is ***49***.

- The tacacs-server host command specifies the port number for an individual TACACS+ server.
- The global TACACS+ port number cannot be changed from the default value of ***49***.

Example

This command configures the switch to communicate with the TACACS+ server at ***10.12.7.9*** through port ***54***.

```
switch(config)# tacacs-server host 10.12.7.9 port 54
```

9.1.1.2.2.2 TACACS+ Status

To display the TACACS+ servers and their interactions with the switch, use the show tacacs command.

Example

This command lists the configured TACACS+ servers.

```
switch(config)# show tacacs

server1: 10.1.1.45
Connection opens: 15
Connection closes: 6
Connection disconnects: 6
Connection failures: 0
Connection timeouts: 2
```

```
Messages sent: 45
Messages received: 14
Receive errors: 2
Receive timeouts: 2
Send timeouts: 3

Last time counters were cleared: 0:07:02 ago
```

To reset the TACACS+ status counters, use the clear aaa counters tacacs+ command.

Example

This command clears all TACACS+ status counters.

```
switch(config)# clear aaa counters tacacs
```

9.1.1.2.3 RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a networking protocol that provides centralized AAA services for computers connecting to and using network resources. RADIUS is used to manage access to the Internet, internal networks, wireless networks, and integrated email services.

These sections describe steps that configure RADIUS server access. Configuring RADIUS parameters is most efficiently performed when RADIUS is functioning prior to configuring switch parameters.

9.1.1.2.3.1 RADIUS Vendor-Specific Attribute-Value Pairs

RADIUS servers and client companies extend basic RADIUS functionality through vendor-specific attributes. A dictionary file includes a list of RADIUS attribute-value pairs that Arista switches use to perform AAA operations through the RADIUS server.

Arista switches use the following attribute values:

- Arista Vendor number: ***30065***
- Attribute: Arista-AVPair 1 string

Acceptable string values for Arista-AVPair include:

- **shell:priv-lvl=<privilege level of a user, 0-15>**
- **shell:roles=<list of roles for a user>**

Example

This is a sample dictionary file that identifies Arista RADIUS vendor-specific attribute value pairs.

```
#
# dictionary.arista
#
VENDOR          Arista    30065
#   Standard Attribute
BEGIN-VENDOR    Arista
ATTRIBUTE       Arista-AVPair    1    string
END-VENDOR      Arista
```

9.1.1.2.3.2 Configuring RADIUS Defaults

RADIUS policies specify settings for the switch to communicate with RADIUS servers. A set of values can be configured for individual RADIUS servers that the switch accesses. Global parameters define settings for communicating with servers for which parameters are not individually configured.

The switch defines the following RADIUS parameters.

Encryption Key

The encryption key is the key shared by the switch and RADIUS servers to facilitate communications.

- The radius-server host command defines the encryption key for a specified server.
- The radius-server key command specifies the global encryption key.

Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name ***RAD-1*** using the encryption key ***rp31E2v***.

```
switch(config)# radius-server host RAD-1 key rp31E2v
```

- This command configures ***cv90jr1*** as the global encryption key.

```
switch(config)# radius-server key 0 cv90jr1
```

- This command assigns ***cv90jr1*** as the key by specifying the corresponding encrypted string.

```
switch(config)# radius-server key 7 020512025B0C1D70
```

Timeout

The timeout is the period that the switch waits for a successful connection to, or response from, a RADIUS server. The default period is ***5*** seconds.

- The radius-server host command defines the timeout for a specified server.
- The radius-server key command defines the global timeout.

Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name ***RAD-1*** and configures the timeout period as ***20*** seconds.

```
switch(config)# radius-server host RAD-1 timeout 20
```

- This command configures ***50*** seconds as the period that the server waits for a response from a RADIUS server before issuing an error.

```
switch(config)# radius-server timeout 50
```

Retransmit

Retransmit is the number of times the switch attempts to access the RADIUS server after the first server timeout expiry. The default value is ***3*** times.

- The radius-server host command defines the retransmit for a specified server.
- The radius-server retransmit command defines the global retransmit value.

Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name ***RAD-1*** and configures the retransmit value as ***2***.

```
switch(config)# radius-server host RAD-1 retransmit 2
```

- This command configures the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to ***50*** seconds, then the total period that the switch waits for a response is ((5+1)*50) = ***300*** seconds.

```
switch(config)# radius-server retransmit 5
```

Deadtime

Deadtime is the period when the switch ignores a non-responsive RADIUS server or a server that does not answer retransmit attempts after timeout expiry. Deadtime is disabled if a value is not specified.

- The radius-server host command defines the deadtime for a specified server.
- The radius-server deadtime command defines the global deadtime setting.

Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name ***RAD-1*** and configures the deadtime period as ***90*** minutes.

```
switch(config)# radius-server host RAD-1 deadtime 90
```

- This command programs the switch to ignore a server for two hours if the server does not respond to a request during the timeout-retransmit period.

```
switch(config)# radius-server deadtime 120
```

Port

The port specifies the port number through which the switch and servers send information.

- The radius-server host command specifies the port numbers for an individual RADIUS server.
- The global RADIUS port numbers cannot be changed from the default values of ***1812*** for an authorization port and ***1813*** for an accounting port.

Example

These commands configure the switch to communicate with the RADIUS server named ***RAD-1*** through port number ***1850*** for authorization and port number ***1851*** for accounting.

```
switch(config)# radius-server host RAD-1 auth-port 1850
switch(config)# radius-server host RAD-1 acct-port 1851
```

To remove the configuration for this server, use **`no radius-server host`** command and specify the hostname or IP address with both the authorization and accounting port numbers.

9.1.1.2.3.3 DSCP Support for CPU-generated Traffic

The Differentiated Services Code Point (DSCP) is a 6 bit field in the IP header, which marks traffic for providing Quality of Service (QoS). All protocol-specific traffic from the switch is marked with the configured DSCP value set individually for the following network management protocols:

- RADIUS
- TACACS
- SNMP
- SSH
- sFlow

Configuring DSCP Value

The following commands are applicable to all platforms for configuring DSCP value.

Example

This command configures the DSCP value of ***62*** for RADIUS-server.

```
switch(config)# radius-server qos dscp 62
```

This command configures the DSCP value of ***36*** for TACACS-server.

Example

```
switch(config)# tacacs-server qos dscp 36
```

This command configures the DSCP value of ***36*** for snmp-server.

```
switch(config)# snmp-server qos dscp 36
```

Example

This command configures the DSCP value of ***36*** for sFlow.

```
switch(config)# sFlow qos dscp 36
```

This command configures the DSCP value of ***36*** for snmp-server.

```
switch(config)# snmp-server qos dscp 36
```

9.1.1.2.3.4 RADIUS Status

The show radius command displays configured RADIUS servers and their interactions with the switch.

Examples

- This command lists the configured RADIUS servers.

```
switch(config)# show radius

server1: 10.1.1.45
Messages sent: 24
Messages received: 20
Requests accepted: 14
Requests rejected: 8
Requests timeout: 2
Requests retransmitted: 1
Bad responses: 1
Last time counters were cleared: 0:07:02 ago
```

  To reset the RADIUS status counters, use the clear aaa counters radius command.
- This command clears all RADIUS status counters.

```
switch(config)# clear aaa counters radius
```

9.1.1.2.4 AAA with LDAP

The switches support AAA with LDAP protocol for authentication and authorization using TLS communication with a remote LDAP server, and interoperates with Microsoft's ActiveDirectory when configured with LDAP plugins. LDAP authentication configuration is required for LDAP to work. AAA requests to servers are made in the order of their configuration. Once a server is marked as unreachable, it is tried only after all other servers are also found unreachable.

Configuring LDAP Authentication

For all platforms, the **`ldap`** command is configured from the management **ldap** mode and requires configuration files to provide remote authentication.

Active Directory Server with LDAP Plug-in Configured

The file extract below configures the authentication for ***rdn attribute user*** and ***search filter***.

```
aaa authentication login default group ldap local
aaa authorization exec default group ldap local
!
management ldap
   server host ldap-server.samplecompany.com
   !
   server defaults
      base-dn dc=samplecompany,dc=com
      rdn attribute user cn
      ssl-profile testProfile
      authorization group policy basic-role-example
      search username cn=ldap-admin-acct,OU=ServiceAccounts,O
U=Sample,dc=samplecompany,dc=com password 0 secretString
   !
   group policy basic-role-example
      search filter objectclass group attribute member
      group "Network Admin" role network-admin
      group "Network Newbie" role network-operator
!
management security
   ssl profile testProfile
      fips restrictions
      trust certificate caCert
!
```

The file extract below configures the management **ldap** mode.

```
management ldap
   server host ldap-server.samplecompany.com
      ssl-profile testProfile2
      authorization group policy company1
   !
   Server host ldap-server.company2.com
   !
   server defaults
      base-dn dc=samplecompany,dc=com
      rdn attribute user cn
      ssl-profile testProfile1
      authorization group policy basic-role-example
      search username cn=ldap-admin-acct,OU=ServiceAccounts,O
U=Sample,dc=samplecompany,dc=com password 0 secretString
   !
   group policy basic-role-example
      search filter objectclass group attribute member
      group "Network Admin" role network-admin
      group "Network Newbie" role network-operator
   !
   group policy company1
      search filter objectclass group attribute member
      group "Network Admin2" role network-admin
      group "Network Newbie2" role network-operator
   !
```

Use LDAP with the following configuration as a minimum.

```
aaa authentication login default group ldap
!
management ldap
   server host <ldap server hostname/ip>
   !
   server defaults
      base-dn <base distinguished name>
      rdn attribute user <relative distinguished attribute name>
      search username <full distinguished name> password <password>
```

The configuration sets up aaa authentication with LDAP. The LDAP server supports IPv4, IPv6, hostnames, and VRFs for specifying the address. The **RDN** , relative distiguished name, is typically an attribute/value pair to specify a user. When a user attempts to connect to the switch, the admin username searches recursively for the **RDN**s which match the passed-in username from the base-dn folder to generate a shortened list of potential **DN**s, which are then searched for a match with the provided password.

Configuring LDAP Authorization

Active Directory Server with LDAP Plug-in Configured

The file extract below configures the authorization for a user.

```
aaa authorization exec default group ldap
!
management ldap
   server defaults
      authorization group policy basic-role-example
   !
   group policy basic-role-example
      search filter objectclass group attribute member
      group "Network Admin" role network-admin
      group "Network Newbie" role network-operator
```

The **group** / **role** maps an LDAP group to an EOS role for RBAC. The matching is done so that the first group that is matched against results in the role being mapped to the user. **`before`** and **`after`** commands are used to insert rules in the appropriate priority.

The LDAP admin account uses the **`search filter`** command to search for LDAP groups which contain the user, where **objectclass** defines the object which contains the LDAP group and **attribute** is the entry attribute name which contains the DN of the group member.

TLS Communication

LDAP supports TLS communication using SSL profiles. A trust certificate, or multiple intermediate certificates, is required to verify the root of trust of the LDAP server. The server will not be used for authentication if **ssl profiles** are configured and the server does not support TLS or fails x509 verification. Other **ssl profiles** supported commands are:

- fips restrictions
- crl
- tls version
- cipher-list

Active Directory Server with LDAP Plug-in Configured

The file extract below configures TLS communication.

```
management ldap
```

```
   !
   server defaults
      ssl-profile testProfile
management security
   ssl profile testProfile
      trust certificate <root of trust>
```

9.1.1.3 Server Groups

A server group is a collection of servers that are associated with a single group name. Subsequent authorization and authentication commands can access all servers in a group by invoking the group name. The switch supports ***TACACS+*** and ***RADIUS*** server groups.

The **`aaa group server`** commands create server groups and place the switch in a ***server-group*** configuration mode to assign servers to the group. Commands that reference an existing group place the switch in a ***server-group*** configuration mode to modify the group.

These commands create named server groups and enter the appropriate command mode for the specified group:

- aaa group server radius
- aaa group server tacacs+

The server (server-group-RADIUS configuration mode) commands add servers to the configuration mode server group. Servers must be previously configured with a radius-server host or tacacs-server host command before they are added to a group.

Examples

- This command creates the TACACS+ server group named ***TAC-GR*** and enters ***server-group*** configuration mode for the new group.

  ```
  switch(config)# aaa group server tacacs+ TAC-GR
  switch(config-sg-tacacs+-TAC-GR)#
  ```

- These commands add two servers to the ***TAC-GR*** server group. To add servers to this group, the switch must be in ***sg-tacacs+-TAC-GR*** configuration mode.

  The CLI remains in ***server-group*** configuration mode after adding the ***TAC-1*** server (port ***49***) and the server located at ***10.1.4.14*** (port ***151***) to the group.

  ```
  switch(config-sg-tacacs+-TAC-GR)# server TAC-1
  switch(config-sg-tacacs+-TAC-GR)# server 10.1.4.14 port 151
  switch(config-sg-tacacs+-TAC-GR)#
  ```

- This command exits ***server-group*** configuration mode.

  ```
  switch(config-sg-tacacs+-TAC-GR)# exit
  switch(config)#
  ```

- This command creates the RADIUS server group named ***RAD-SV1*** and enters s***erver-group*** configuration mode for the new group.

  ```
  switch(config)# aaa group server radius RAD-SV1
  switch(config-sg-radius-RAD-SV1)#
  ```

- These commands add two servers to the ***RAD-SV1*** server group. To add servers to this group, the switch must be in s***g-radius-RAD-SV1*** configuration mode.

The CLI remains in server-group configuration mode after adding the RAC-1 server (authorization port ***1812***, accounting port ***1813***) and the server located at ***10.1.5.14*** (authorization port ***1812***, accounting port ***1850***) to the group.

```
switch(config-sg-radius-RAD-SV1)# server RAC-1
switch(config-sg-radius-RAD-SV1)# server 10.1.5.14 acct-port 1850
switch(config-sg-radius-RAD-SV1)#
```

9.1.1.4 Role-Based Authorization

Role-based authorization is a method of restricting access to CLI commands through the assignment of profiles, called ***roles***, to user accounts. Each role consists of rules that permit or deny access to a set of commands within specified command modes.

All roles are accessible to the local security file through a username parameter and to remote users through ***RADIUS*** or ***TACACS+*** servers. Each role can be applied to multiple user accounts. Only one role may be applied to a user.

9.1.1.4.1 Role Types

The switch defines two types of roles: user-defined and built-in.

- User-defined roles are created and edited through CLI commands.
- Built-in roles are supplied with the switch and are not user-editable.

Built-in roles supplied by the switch are ***network-operator*** and ***network-admin***.

9.1.1.4.2 Role Structure

A role is an ordered list of rules that restricts access to specified commands from users on whom it is applied. Roles consist of deny and permit rules. Each rule references a set of command modes and contains a regular expression that specifies one or more CLI commands. Commands are compared sequentially to the rules within a role until a rule's regular expression matches the command.

- Commands that match a regular expression in a permit rule are executed.
- Commands that match a regular expression in a deny rule are disregarded.
- Commands that do not match a regular expression are evaluated against the next rule in the role.

Upon its entry in the CLI, a command is compared to the first rule of the role. Commands that match the rule are ***executed*** (permit rule) or ***disregarded*** (deny rule). Commands that do not match the rule are compared to the next rule. This process continues until the command either matches a rule or the rule list is exhausted. The switch disregards commands not matching any rule.

9.1.1.4.3 Role Rules

Role rules consist of four components: sequence number, filter type, mode expression, and command expression.

Sequence Number

The sequence number designates a rule’s placement in the role. Sequence numbers range in value from 1 to 256. Rule commands that do not include a sequence number append the rule at the end of the list, deriving its sequence number by adding 10 to the sequence number of the last rule in the list.

Example

These rules have sequence numbers ***10*** and ***20***.

```
10 deny mode exec command reload
```

```
20 deny mode config command (no |default )?router
```

Filter Type

The filter type specifies the disposition of matching commands. Filter types are permit and deny. Commands matching permit rules are executed. Commands matching deny rules are disregarded.

Example

These rules are deny and permit rules, respectively.

```
10 deny mode exec command reload
20 permit mode config command interface
```

Mode Expression

The mode expression specifies the command mode under which the command expression is effective. The mode expression may be a regular expression or a designated keyword. Rules support the following mode expressions:

- **exec** EXEC and Privileged EXEC modes
- **config** Global Configuration Mode
- **config-all** All configuration modes, including Global Configuration Mode
- ***short_name***
- short key name of a command mode (exact match)
- ***long_name*** long key name of a command mode (regular expression match of one or more modes)
- ***no parameter*** all command modes

The prompt command configures the CLI to display a configuration mode's key name:

- %P long key name
- %p short key name

Examples

- These commands use the prompt command to display short key name (**if**) and long key name (**if-Et1**) for ***interface ethernet 1***.

  ```
  switch(config)# prompt switch%p
  switch(config)# interface ethernet 1
  switch(config-if)# exit
  switch(config)# prompt switch%P
  switch(config)# interface ethernet 1
  switch(config-if-Et1)#
  ```

  The command supports the use of regular expressions to reference multiple command modes.
- These regular expressions correspond to the listed command modes:
  - **if-Vlan(1|2)** matches ***interface-VLAN 1*** or ***interface-VLAN 2***.
  - **if** matches all interface modes.
  - **acl-text1** matches ACL configuration mode for ***text1*** ACL.

Command Expression

The command expression is a regular expression that corresponds to one or more CLI commands.

Examples

These regular expressions correspond to the specified commands:

- **`reload`** reload command

- **(no |default)? router** commands that enter routing protocol configuration modes
- **(no |default)?(ip|mac) access-list** commands that enter ACL configuration modes
- **(no |default)?(ip|mac) access-group** commands that bind ACLs to interfaces
- **lacp | spanning-tree** LACP and STP commands
- **.*** all commands

9.1.1.4.4 Creating and Modifying Roles

This section contains the following topics:

- Built-in Role
- Managing Roles
- Modifying Roles

9.1.1.4.4.1 Built-in Role

The switch provides the following two built-in roles:

- **network-operator** Allows all commands in EXEC (Privileged) modes. Commands in all other modes are denied.
- **network-admin** Allows all CLI commands in all modes.

The **network-admin** role is typically assigned to the **admin** user to allow it to run any command.

Built-in roles are not editable.

Example

These **show users roles** commands display the contents of the built-in roles.

```
switch(config)# show users roles network-operator
The default role is network-operator
role: network-operator
        10 deny mode exec command bash|\|
        20 permit mode exec command .*
switch(config)# show users roles network-admin
The default role is network-operator
role: network-admin
        10 permit command .*
switch(config)#
```

9.1.1.4.4.2 Managing Roles

Creating and Opening a Role

Roles are created and modified in ***Role*** configuration mode. To create a role, enter the role command with the role's name. The switch enters ***Role*** configuration mode. If the command is followed by the name of an existing role, subsequent commands edit that role.

Example

This command places the switch in ***Role*** configuration mode to create a role named ***sysuser***.

```
switch(config)# role sysuser
switch(config-role-sysuser)#
```

Saving Role Changes

Role configuration mode is a group-change mode; changes are saved by exiting the mode.

Examples

- These commands create a role, then add a deny rule to the role. Because the changes are not yet saved, the role remains empty, as shown by show users roles.

```
switch(config)# role sysuser
switch(config-role-sysuser)# deny mode exec command reload
switch(config-role-sysuser)# show users roles sysuser
The default role is network-operator

switch(config-role-sysuser)#
```

- To save all current changes to the role and exit role configuration mode, type **exit**.

```
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
switch(config)#
```

Note: After exiting role mode, ***running-config*** must be saved to ***startup-config*** to preserve role changes past system restarts.

Discarding Role Changes

The **abort** command exits ***Role*** configuration mode without saving pending changes.

Example

These commands enter ***Role*** configuration mode to add deny rules, but discard the changes before saving them to the role.

```
switch(config)# role sysuser
switch(config-role-sysuser)# deny mode exec command reload
switch(config-role-sysuser)# abort
switch(config)# show users roles sysuser
The default role is network-operator

switch(config)#
```

9.1.1.4.4.3 Modifying Roles

Adding Rules to a Role

The deny (Role) command adds a deny rule to the configuration mode role. The permit (Role) command adds a permit rule to the configuration mode role.

To append a rule to the end of a role, enter the rule without a sequence number while in Role Configuration Mode. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

Example

These commands enter the first three rules into a new role.

```
switch(config)# role sysuser
switch(config-role-sysuser)# deny mode exec command reload
switch(config-role-sysuser)# deny mode config command (no |default )?
router
```

```
switch(config-role-sysuser)# permit command .*
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
        20 deny mode config command (no |default )?router
        30 permit command .*
switch(config)#
```

Inserting a Rule

To insert a rule into a role, enter the rule with a sequence number between the existing rules numbers.

Example

This command inserts a rule between the first two rules by assigning it the sequence number 15.

```
switch(config)# role sysuser
switch(config-role-sysuser)# 15 deny mode config-all command lacp
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
        15 deny mode config-all command lacp
        20 deny mode config command (no |default )router
        30 permit command .*
switch(config)#
```

Deleting a Rule

To remove a rule from the current role, perform one of these commands:

- Enter **no**, followed by the sequence number of the rule to be deleted.
- Enter **no**, followed by the rule be deleted.
- Enter **default**, followed by the sequence number of the rule to be deleted.
- Enter **default**, followed by the rule to be deleted.

Example

- These equivalent commands remove rule ***30*** from the list.

```
switch(config-role-sysuser)# no 30
switch(config-role-sysuser)# default 30
switch(config-role-sysuser)# no permit command .*

switch(config-role-sysuser)# default permit command .*
```

- This role results from entering one of the preceding commands.

```
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
        15 deny mode config-all command lacp|spanning-tree
        20 deny mode config command (no |default )router
switch(config)#
```

Redistributing Sequence Numbers

Sequence numbers determine the order of the rules in a role. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Redistributing rule numbers changes adjusts the sequence number of rules to provide a constant difference between adjacent rules. The resequence (Role) command adjusts the sequence numbers of role rules.

Example

The **resequence** command renumbers rules in the sysuser role. The sequence number of the first rule is ***100***; subsequent rules numbers are incremented by ***20***.

```
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
        20 deny mode config-all command lacp|spanning-tree
        25 deny mode config command (no |default )?router
        30 permit command .*
switch(config)# role sysuser
switch(config-role-sysuser)# resequence 100 20
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        100 deny mode exec command reload
        120 deny mode config-all command lacp|spanning-tree
        140 deny mode config command (no |default )?router
        160 permit command .*
switch(config)#
```

9.1.1.4.5 Assigning a Role to a Username

Roles are assigned to local users through the username command and to remote users through RADIUS servers or TACACS+ servers. Each user is assigned one role. Each role can be assigned to multiple local and remote users.

9.1.1.4.5.1 Default Roles

Users that are not explicitly assigned a role are assigned the default role. The aaa authorization policy local default-role command designates the default role. The ***network-operator*** built-in role is the default role when the default role is not configured.

Examples

- These commands assign ***sysuser*** as the default role, then display the name of the default role.

```
switch(config)# aaa authorization policy local default-role sysuser
switch(config)# show users roles
The default role is sysuser

switch(config)#
```

- These commands restore ***network-operator*** as the default role by deleting the **aaa authorization policy local default-role** statement from ***running-config***, then display the default role name.

```
switch(config)# no aaa authorization policy local default-role
```

```
switch(config)# show users roles
The default role is network-operator

switch(config)#
```

9.1.1.4.5.2 Local Security File (Username Command)

Roles are assigned to users with the username command's **role** parameter. A username whose ***running-config*** **`username`** statement does not include a **role** parameter is assigned the default role.

The **role** parameter function in a command creating a username is different from its function in a command editing an existing name.

Assigning a Role to a New Username

A **`username`** command creating a username explicitly assigns a role to the username by including the **role** parameter; commands without a **role** parameter assigns the default role to the username.

ExampleThese commands create two usernames. The first user is assigned a role; the second user assumes the default role.

```
switch(config)# username FRED secret 0 axced role sysuser1
switch(config)# username JANE nopassword
switch(config)# show running-config
<-------OUTPUT OMITTED FROM EXAMPLE-------->
!
username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.l20
username JANE nopassword
!
<-------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```

Editing the Role of an Existing Username

The role of a previously configured username may be edited by a **`username`** command without altering its password. The role assignment of a username is not changed by **`username`** commands that do not include a **role** parameter.

Examples

- These commands assign a role to a previously configured username.

```
switch(config)# username JANE role sysuser2
switch(config)# show running-config

<-------OUTPUT OMITTED FROM EXAMPLE-------->
!
username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.l20
username JANE role sysuser2 nopassword
!
<-------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```

- These commands reverts a username to the default role by removing its role assignment.

```
switch(config)# no username FRED role
switch(config)# show running-config
<-------OUTPUT OMITTED FROM EXAMPLE-------->
!

username FRED secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.l20
```

```
username JANE role sysuser2 nopassword
!
<-------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```

Displaying the Role Assignments

The show users accounts command displays role assignment of the configured users. The show users detail command displays roles of users that are currently logged into the switch.

Examples

- This command displays the configured users and their role assignments.

```
switch(config)# show users accounts
user: FRED
       role: <unknown>
       privilege level: 1
user: JANE
       role: sysuser2
       privilege level: 1
user: admin
       role: network-admin
       privilege level: 1
switch(config)#
```

- This command displays information about the active AAA login sessions.

```
switch(config)# show aaa session
Session  Username  Roles             TTY    State Duration  Auth          Remote Host
-------  --------- ------------      ------ ----- --------  ------------- ------------
2         admin     network-operator ttyS0   E     0:01:21  local
4         Fred      sysadmin         telnet  E     0:02:01  local         sf.example.com
6         Jane      sysuser2         ssh     E     0:00:52  group radius  ny.example.com
9         admin     network-admin    ssh     E     0:00:07  local         bj.example.com
10        max       network-admin    telnet  E     0:00:07  local         sf.example.com
```

9.1.1.4.5.3 Radius Servers

A role can be assigned to a remote user authenticated through a RADIUS server. Roles are assigned through the vendor-specific Attribute-Value (AV) pair named “Arista-AVPair.” The switch extracts the remote user’s role upon a successful authentication when RADIUS authentication is enabled.

Example

This file extract is sample FreeRadius server code that includes the AV pair that assigns roles to three remote users.

```
# Sample RADIUS server users file
"Jane"          Cleartext-Password := "Abc1235"
                Arista-AVPair = "shell:roles=sysuser2",
                Service-Type = NAS-Prompt-User
"Mary"          Cleartext-Password := "xYz$2469"
                Arista-AVPair = "shell:roles=sysadmin",
                Service-Type = NAS-Prompt-User
"Fred"          Cleartext-Password := "rjx4#222"
                Arista-AVPair = "shell:roles=network-operator",
                Service-Type = NAS-Prompt-User
```

The aaa authentication login command selects the user authentication service (see Configuring Service Lists).

Example

This command configures the switch to authenticate users through all RADIUS servers.

```
switch(config)# aaa authentication login default group radius
```

9.1.1.4.5.4 Enable Role-Based Access Control

To enable Role-Based Access Control on the switch, apply the following configuration:

```
switch(config)# aaa authorization commands all default local
```

9.1.1.5 Activating Security Services

After configuring the access databases, **`aaa authentication`**, **`aaa authorization`**, and **`aaa accounting`** commands designate active and backup services for handling access requests.

These sections describe the methods of selecting the database that the switch uses to authenticate users and authorize access to network resources.

9.1.1.5.1 Authenticating Usernames and the Enable Password

Service lists specify the services the switch uses to authenticates usernames and the enable password.

9.1.1.5.1.1 Service List Description

Service list elements are service options, ordered by their priority.

Note: When the local file is one of the service list elements, any attempts to locally authenticate a username that is not included in the local file will result in the switch continuing to the next service list element.

Example

This is an example service list for username authentication:

1. ***Location_1*** server group - specifies a server group (see Server Groups).
2. ***Location_2*** server group - specifies a server group.
3. TACACS+ servers - specifies all hosts for which a **`tacacs-server host`** command exists.
4. Local file - specifies the local file.
5. None - specifies that no authentication is required - all access attempts succeed.

To authenticate a username, the switch checks ***Location_1*** server group. If a server in the group is available, the switch authenticates the username through that group. Otherwise, it continues through the list until it finds an available service or utilizes option 5, which allows the access attempt to succeed without authentication.

9.1.1.5.1.2 Configuring Service Lists

Service lists are incorporated into these **`aaa authentication`** commands to specify services the switch uses to authenticate usernames and the enable password.

- aaa authentication login specifies services the switch uses to authenticate usernames.
- aaa authentication enable specifies services the switch uses to authenticate the enable password.

Examples

- This command configures the switch to authenticate usernames through the ***TAC-1*** server group. The local database is the backup method if ***TAC-1*** servers are unavailable.

```
switch(config)# aaa authentication login default group TAC-1 local
```

- This command configures the switch to authenticate usernames through all ***TACACS+*** servers, then all RADIUS servers if the ***TACACS+*** servers are not available. If the RADIUS servers are unavailable, the switch does not authenticate any login attempts.

```
switch(config)# aaa authentication login default group tacacs+ group
 radius none
```

- This command configures the switch to authenticate the enable password through all ***TACACS+*** servers, then through the local database if the ***TACACS+*** servers are unavailable.

```
switch(config)# aaa authentication enable default group TACACS+ local
```

9.1.1.5.2 AAA Time-based Lockout

AAA time-based lockout enables managing remote user unsuccessful login attempts for a configurable time duration.

- aaa authentication policy lockout failure command locks the remote user from getting access for a specific duration of time after specific consecutive unsuccessful login attemps within a lockout period. In the following example, a user is allowed 4 attempts to log in within a duration of 1 day (the default window). If the user has 4 unsuccessful consecutive logins, the person will be locked out of the account for 360 seconds.

```
switch(config)# aaa authentication policy lockout failure 4
duration 360
```

- show aaa authentication lockout command displays the status of locked-out users.

```
switch# show aaa authentication lockout
```

- clear aaa authentication lockout command clears the locked status of a user so as to allow access within a lockout period.

```
switch# clear aaa authentication lockout
```

9.1.1.5.3 Authorization

Authorization commands control EOS shell access, CLI command access, and configuration access through the console port. The switch also supports role-based authorization, which allows access to specified CLI commands by assigning command profiles (or roles) to usernames. See Role-Based Authorization for details.

During the exec authorization process, TACACS+ server responses may include attribute-value (AV) pairs. The switch recognizes the mandatory AV pair named ***priv-lvl=x*** (where **x** is between ***0*** and ***15***).

By default, a TACACS+ server that sends any other mandatory AV pair is denied access to the switch. The receipt of optional AV pairs by the switch has no affect on decisions to permit or deny access to the TACACS+ server. The tacacs-server policy command programs the switch to allow access to TACACS+ servers that send unrecognized mandatory AV pairs.

Authorization to switch services is configured by the following **`aaa authorization`** commands.

- To specify the method of authorizing the opening of an EOS shell, enter aaa authorization exec.
- To specify the method of authorizing CLI commands, enter aaa authorization commands.

Examples

- This command specifies that TACACS+ servers authorize users attempting to open a CLI shell.

```
switch(config)# aaa authorization exec default group tacacs+
```

- This command programs the switch to authorize configuration commands (privilege level ***15***) through the local file and to deny command access to users not listed in the local file.

```
switch(config)# aaa authorization commands all default local
```

- This command programs the switch to permit all commands entered on the CLI.

```
switch(config)# aaa authorization commands all default none
```

- This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.

```
switch(config)# tacacs-server policy unknown-mandatory-attribute ignore
```

All commands are typically authorized through aaa authorization commands. However, the **no aaa authorization config-commands** command disables the authorization of configuration commands. In this state, authorization to execute configuration commands can be managed by controlling access to global configuration commands. The default setting authorizes configuration commands through the policy specified for all other commands.

- To enable the authorization of configuration commands with the policy specified for all other commands, enter aaa authorization config-commands.
- To require authorization of commands entered on the console, enter aaa authorization serial-console.

  By default, EOS does not verify authorization of commands entered on the console port.

Examples

- This command disables the authorization of configuration commands.

```
switch(config)# no aaa authorization config-commands
```

- This command enables the authorization of configuration commands.

```
switch(config)# aaa authorization config-commands
```

- This command configures the switch to authorize commands entered on the console, using the method specified through a previously executed **aaa authorization** command.

```
switch(config)# aaa authorization serial-console
```

9.1.1.5.4 Accounting

The accounting service collects information for billing, auditing, and reporting. The switch supports TACACS+ and RADIUS accounting by reporting user activity to either the TACACS+ server or RADIUS server in the form of accounting records.

The switch supports two types of accounting:

- **EXEC**: Provides information about user CLI sessions.
- **Commands**: Command authorization for all commands, including configuration commands that are associated with a privilege level.

The accounting mode determines when accounting notices are sent. Mode options include:

- **start-stop**: a **start** notice is sent when a process begins; a **stop** notice is sent when it ends.
- **stop-only**: a **stop** accounting record is generated after a process successfully completes.

Accounting is enabled by the aaa accounting command.

Examples

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting commands all default start-stop group
 tacacs+
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting exec console stop group tacacs+
```

9.1.1.6 TACACS+ Configuration Examples

These sections describe two sample TACACS+ host configurations.

9.1.1.6.1 Single Host Configuration

The example single host configuration consists of a TACACS+ server with these attributes:

- IP address: ***10.1.1.10***.
- encryption key: ***example_1***.
- port number: ***49*** (global default).
- timeout: ***5*** seconds (global default).

The switch authenticates the username and enable command against all TACACS+ servers which, in this case, is one host. If the TACACS+ server is unavailable, the switch authenticates with the local file.

1. This step configures TACACS+ server settings port number and timeout are global defaults.

```
switch(config)# tacacs-server host 10.1.1.10 key example_1
```

2. This step configures the login authentication service.

```
switch(config)# aaa authentication login default group tacacs+ local
```

3. This step configures the **enable** command password authentication service.

```
switch(config)# aaa authentication enable default group tacacs+ local
```

9.1.1.6.2 Multiple Host Configuration

The example multiple host configuration consists of three TACACS+ servers at these locations:

- IP address ***10.1.1.2*** - port ***49***.
- IP address ***172.16.4.12*** - port ***4900***.
- IP address ***192.168.2.10*** - port ***49***.

The configuration combines the servers into these server groups:

- ***Bldg_1*** group consists of the servers at ***10.1.1.2*** and ***172.16.4.12***.
- ***Bldg_2*** group consists of the servers at ***192.168.2.10***.

All servers use these global TACACS+ defaults:

- encryption key - ***example_2***.

- timeout - ***10 seconds***.

The switch authenticates these access methods:

- username access against ***Bldg_1*** group then, if they are not available, against the local file.
- enable command against ***Bldg_2*** group, then ***Bldg_1*** group, then against the local file.

1. TACACS+ Host commands:

   These commands configure the IP address and ports for the three TACACS+ servers. The port for the first and third server is default ***49***.

   ```
   switch(config)# tacacs-server host 10.1.1.12
   switch(config)# tacacs-server host 172.16.4.12 port 4900
   switch(config)# tacacs-server host 192.168.2.10
   ```

2. Global Configuration Commands:

   These commands configure the global encryption key and timeout values.

   ```
   switch(config)# tacacs-server key example_2
   switch(config)# tacacs-server timeout 10
   ```

3. Group Server Commands:

   The **`aaa group server`** commands create the server groups and place the CLI in server group configuration mode, during which the servers are placed in the group. The port number must be included if it is not the default port, as in the line that adds ***192.168.1.1***.

   ```
   switch(config)# aaa group server tacacs+ Bldg_1
   switch(config-sg-tacacs+-Bldg_1)# server 10.1.1.2
   switch(config-sg-tacacs+-Bldg_1)# server 192.168.1.1 port 4900
   switch(config-sg-tacacs+-Bldg_1)# exit
   switch(config)# aaa group server tacacs+ Bldg_2
   switch(config-sg-tacacs+-Bldg_2)# server 192.168.2.2
   switch(config-sg-tacacs+-Bldg_2)# exit
   switch(config)#
   ```

4. Login and enable configuration authentication responsibility commands:

   These commands configure the username and enable command password authentication services.

   ```
   switch(config)# aaa authentication login default group Bldg_1 local
   switch(config)# aaa authentication enable default group Bldg_1 group
    Bldg_2 local
   ```

9.1.1.7 AAA Commands

Local Security File Commands

- aaa root
- enable password
- show privilege
- show users
- show users accounts
- username
- username ssh-key

Accounting, Authentication, and Authorization Commands

- aaa accounting
- aaa accounting dot1x
- aaa accounting system
- aaa authentication dot1x
- aaa authentication enable
- aaa authentication login
- aaa authentication policy local allow-nopassword-remote-login
- aaa authentication policy lockout failure
- aaa authentication policy log
- aaa authorization commands
- aaa authorization config-commands
- aaa authorization exec
- aaa authorization policy local default-role
- aaa authorization serial-console
- clear aaa authentication lockout
- clear aaa counters
- clear aaa counters radius
- clear aaa counters tacacs+
- show aaa
- show aaa authentication lockout
- show aaa counters
- show aaa methods
- show management ldap
- show users detail

Server (RADIUS and TACACS+) Configuration Commands

- ip radius source-interface
- ip tacacs source-interface
- radius-server deadtime
- radius-server host
- radius-server key
- radius-server retransmit
- radius-server timeout
- show radius
- show tacacs
- tacacs-server host

- tacacs-server key
- tacacs-server policy
- tacacs-server timeout

Server Group Configuration Commands

- aaa group server radius
- aaa group server tacacs+
- server (server-group-RADIUS configuration mode)
- server (server-group-TACACS+ configuration mode)

Role-Based Authorization Configuration Commands

- deny (Role)
- no <sequence number> (Role)
- permit (Role)
- resequence (Role)
- role
- show users roles

9.1.1.7.1 aaa accounting dot1x

The **aaa accounting dot1x** command enables the accounting of requested 802.1X services for network access.

The **no aaa accounting dot1x** and **default aaa accounting dot1x** commands disable the specified method list by removing the corresponding **aaa accounting dot1x** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

aaa accounting dot1x default [**METHOD_1**][**METHOD_2**][**METHOD_N**]

no aaa accounting dot1x default

default aaa accounting dot1x default

Parameters

- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - **start-stop** a *start* notice is sent when a process begins; a *stop* notice is sent when it ends.
- **METHOD_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.
- Parameter value is not specified if **MODE** is set to **none**. If **MODE** is not set to **none**, the command must provide at least one method. Each method is composed of one of the following:
- ***group name*** the server group identified by *name*.
  - ***group radius*** server group that includes all defined RADIUS hosts.
  - ***logging*** server group that includes all defined TACACS+ hosts.

Examples

- This example configures ***IEEE 802.1X*** accounting on the switch.

```
switch(config)# aaa accounting dot1x default start-stop group
 radius
switch(config)#
```

- This example disables ***IEEE 802.1X*** accounting on the switch.

```
switch(config)# no aaa accounting dot1x default
switch(config)#
```

9.1.1.7.2 aaa accounting system

The **aaa accounting system** command performs accounting for all system-level events.

The **no aaa accounting system** and **default aaa accounting system** commands clear the specified method list by removing the corresponding **aaa accounting system** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

aaa accounting system default [**METHOD_1**][**METHOD_2**] **...** [**METHOD_N**]

no aaa accounting system default

default aaa accounting system default

Parameters

- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - **none** no notices are sent.
  - **start-stop** a *start* notice is sent when a process begins; a *stop* notice is sent when it ends.
  - **stop-only** a *stop* accounting record is generated after a process successfully completes.
- **METHOD_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.
- Parameter value is not specified if **MODE** is set to **none**. If **MODE** is not set to **none**, the command must provide at least one method. Each method is composed of one of the following:
  - **group *name*** the server group identified by *name.*
    - **group radius** server group that includes all defined RADIUS hosts.
    - **group tacacs+** server group that includes all defined TACACS+ hosts.
    - **logging** server group that includes all defined TACACS+ hosts.

Examples

- This command configures AAA accounting to not use any accounting methods for system events.

```
switch(config)# aaa accounting system default none
switch(config)#
```

- This command configures the switch to maintain stop accounting records for system events to all defined RADIUS hosts.

```
switch(config)# aaa accounting system default stop-only group
 radius
switch(config)#
```

9.1.1.7.3 aaa accounting

The **aaa accounting** command configures accounting method lists for a specified authorization type. Each list consists of a prioritized list of methods. The accounting module uses the first available listed method for the authorization type.

The **no aaa accounting** and **default aaa accounting** commands clear the specified method list by removing the corresponding **aaa accounting** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

aaa accounting **TYPE CONNECTION MODE** [**METHOD_1**][**METHOD_2**] ... [**METHOD_N**]

no aaa accounting **TYPE CONNECTION**

default aaa accounting **TYPE CONNECTION**

Parameters

- **TYPE** authorization type for which the command specifies a method list. Options include:
  - **EXEC** records user authentication events.
  - **COMMANDS ALL** records all entered commands.
  - **COMMANDS** *level* records entered commands of the specified *level* (ranges from ***0*** to ***15***).
- **CONNECTION** connection type of sessions for which method lists are reported. Options include:
  - **console** console connection.
  - **default** all connections not covered by other command options.
- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - **none** no notices are sent.
  - **start-stop** a *start* notice is sent when a process begins; a *stop* notice is sent when it ends.
  - **stop-only** a *stop* accounting record is generated after a process successfully completes.
- **METHOD_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.
- Parameter value is not specified if **MODE** is set to **none**. If **MODE** is not set to **none**, the command must provide at least one method. Each method is composed of one of the following:
  - ***group name*** the server group identified by *name*.
  - ***group radius*** server group that includes all defined RADIUS hosts.
  - ***group tacacs+*** server group that includes all defined TACACS+ hosts.
  - ***logging*** log all accounting messages to Syslog.

Examples

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting commands all default start-stop
 group tacacs+
switch(config)#
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting exec console stop group tacacs+
switch(config)#
```

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting commands all default start-stop
 group tacacs+
switch(config)#
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting exec console stop group tacacs+
switch(config)#
```

9.1.1.7.4 aaa authentication dot1x

The **aaa authentication dot1x** command configures the default authentication list of requested 802.1X services for network access.

The **no aaa authentication dot1x** and **default aaa authentication dot1x** commands remove the default authentication list for IEEE 802.1X.

Command Mode

Global Configuration

Command Syntax

aaa authentication dot1x default group {***group_name*** | ***radius***}

no aaa authentication dot1x default

default aaa authentication dot1x

Parameters

- **default** configures the default authentication list of requested 802.1X services for network access.
- **group** configures server group.
- ***group_name*** server group name; multiple group names can be entered in a single command.
- **radius** list of all defined RADIUS hosts.

Example

This command configures the switch in the **auth1** group for IEEE 802.1X authentication.

```
switch(config)# aaa authentication dot1x default group auth1
switch(config)#
```

9.1.1.7.5 aaa authentication enable

The **aaa authentication enable** command configures the service list that the switch references to authorize access to Privileged EXEC command mode.

The list consists of a prioritized list of service options. Available service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authentication
- no authentication

The switch authorizes access by using the first listed service option that is available. When the local file is a service list element, attempts to locally authenticate a username that is not in the local file result in the switch continuing to the next service list element.

When the list is not configured, it is set to **local**.

The **no aaa authentication enable** and **default aaa authentication enable** commands revert the list configuration as **local** by removing the **aaa authentication enable** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

aaa authentication enable ***default*** **METHOD_1** [**METHOD_2**] ... [**METHOD_N**]

no aaa authentication enable ***default***

default aaa authentication enable ***default***

Parameters

METHOD_X authentication service method list. The command must provide at least one method. Each method is composed of one of the following:

- **group *name*** the server group identified by *name*.
- **group radius** a server group that consists of all defined RADIUS hosts.
- **group tacacs+** a server group that consists of all defined TACACS+ hosts.
- **local** local authentication.
- **none** users are not authenticated; all access attempts succeed.

Example

This command configures the switch to authenticate the enable password through all configured TACACS+ servers. Local authentication is the backup if TACACS+ servers are unavailable.

```
switch(config)# aaa authentication default enable group TACACS+
 local
switch(config)#
```

9.1.1.7.6 aaa authentication login

The **aaa authentication login** command configures service lists the switch references to authenticate usernames. Service lists consist of service options ordered by usage priority. The switch authenticates usernames through the first available service option. Supported service options include:

- a named server group.
- all defined TACACS+ hosts.
- all defined RADIUS hosts.
- local authentication.
- no authentication.

When the local file is a service list element, attempts to locally authenticate a username that is not in the local file result in the switch continuing to the next service list element.

The switch supports a **console** list for authenticating usernames through the console and a default list for authenticating usernames through all other connections.

- When the **console** list is not configured, the console connection uses the **default** list.
- When the **default** list is not configured, it is set to *local*.

The **no aaa authentication login** and **default aaa authentication login** commands revert the specified list configuration to its default by removing the corresponding **aaa authentication** login command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

aaa authentication login CONNECTION SERVICE_1 [**SERVICE_2**] **...** [**SERVICE_N**]

no aaa authentication login CONNECTION

default aaa authentication login CONNECTION

Parameters

- **CONNECTION** connection type of sessions for which authentication list is used.
  - **default** the default authentication list.
  - **console** the authentication list for console logins.
- **SERVICE_X** an authentication service. Settings include:
  - ***group name*** identifies a previously defined server group.
  - ***group radius*** a server group that consists of all defined RADIUS hosts.
  - ***group tacacs+*** a server group that consists of all defined TACACS+ hosts.
  - ***local*** local authentication.
  - ***none*** The switch does not perform authentication. All access attempts succeed.

Examples

- This command configures the switch to authenticate usernames through the ***TAC-1*** server group. The local database is the backup method if ***TAC-1*** servers are unavailable.

```
switch(config)# aaa authentication login default group TAC-1
 local
switch(config)#
```

- This command configures the switch to authenticate usernames through all TACACS + servers, then all RADIUS servers if the TACACS+ servers are not available. If the

RADIUS servers are also unavailable, the switch allows access to all login attempts without authentication.

```
switch(config)# aaa authentication login default group tacacs+
 group radius none
switch(config)#
```

9.1.1.7.7 aaa authentication policy local allow-nopassword-remote-login

The **aaa authentication policy local allow-nopassword-remote-login** command permits usernames without passwords to log in from any port. The default switch setting only allows unprotected usernames to log in from the console.

The **no aaa authentication policy local allow-nopassword-remote-login** and **default aaa authentication policy local allow-nopassword-remote-login** commands return the switch to the default setting of allowing unprotected usernames to log in only from the console.

Command Mode

Global Configuration

Command Syntax

aaa authentication policy local allow-nopassword-remote-login

no aaa authentication policy local allow-nopassword-remote-login

default aaa authentication policy local allow-nopassword-remote-login

Examples

- This command configures the switch to allow unprotected usernames to log in from any port.

```
switch(config)# aaa authentication policy local allow-nopassw
ord-remote-login
switch(config)#
```

- This command configures the switch to allow unprotected usernames to log in only from the console port.

```
switch(config)# no aaa authentication policy local allow-
nopassword-remote-login
switch(config)#
```

9.1.1.7.8 aaa authentication policy lockout failure

The **aaa authentication policy lockout failure** command configures the switch to lock the remote user from getting access after specific unsuccessful login attempts within a lockout period.

The **no aaa authentication policy lockout failure** and the **default aaa authentication policy lockout failure** commands disable the lockout period configuration.

Command Mode

Global Configuration

Command Syntax

aaa authentication policy lockout failure ***failure_count*** duration ***duration_time*** {window ***window_time***}

no aaa authentication policy lockout failure

default aaa authentication policy lockout failure

Parameters

- ***failure_count*** the number of failed logins allowed during access. The valid number is between 1 and 255.
- duration ***duration_time*** the time in seconds to block a user account from login. The value is between ***1*** and ***4294967295*** seconds.
- window ***window_time*** the time in seconds to track failed logins within this duration. The value is between ***1*** and ***4294967295*** seconds while the default is 1 day.

Examples

- This command configures the system to allow four attempts to log in within a duration of 1 day (the default window). If the user has 4 unsuccessful consecutive logins, the person will be locked out of the account for 360 seconds.

```
switch(config)# aaa authentication policy lockout failure 4
duration 360
```

- This command configures the system to allow five attempts to log in within a duration of 1 day (the default window). If the user has 5 unsuccessful consecutive logins, the person will be locked out of the account for 60 seconds.

```
switch(config)# aaa authentication policy lockout failure 5
window 10 duration 60
```

9.1.1.7.9 aaa authentication policy log

The **aaa authentication policy log** command configures the switch to generate syslog messages for login authentication success or failure events.

The **no aaa authentication policy log** and the **default aaa authentication policy log** commands restore the default behavior of not generating syslog messages for these events.

Command Mode

Global Configuration

Command Syntax

aaa authentication policy {on-failure | on-success} **log**

no aaa authentication policy {on-failure | on-success} **log**

default aaa authentication policy {on-failure | on-success} **log**

Parameters

- **on-failure** generates syslog messages for failed login events.
- **on-success** generates syslog messages for successful login events.

Example

This command configures the switch to log successful and failed login attempts.

```
switch(config)# aaa authentication policy on-success log
switch(config)# aaa authentication policy on-failure log
```

9.1.1.7.10 aaa authorization commands

The **aaa authorization commands** command configures the service list that authorizes CLI command access. All switch commands are assigned a privilege level that corresponds to the lowest level command mode from which it can be executed:

- **Level 1**: Commands accessible from ***EXEC*** mode.
- **Level 15**: Commands accessible from any mode except ***EXEC***.

Command usage is authorized for each privilege level specified in the command.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option that is available. The available service options include:

- a named server group.
- all defined TACACS+ hosts.
- all defined RADIUS hosts.
- local authorization.
- no authorization.

The list is set to **none** for all unconfigured privilege levels, allowing all CLI access attempts to succeed.

The **no aaa authorization commands** and **default aaa authorization commands** commands revert the list contents to **none** for the specified privilege levels.

Command Mode

Global Configuration

Command Syntax

aaa authorization commands **PRIV** **default** **SERVICE_1**[**SERVICE_2**] **...** [**SERVICE_N**]

no aaa authorization commands **PRIV** **default**

default aaa authorization commands **PRIV** **default**

Parameters

- **PRIV** Privilege levels of the commands. Options include:
  - ***level*** numbers from ***0*** and ***15***. Number, range, and comma-delimited list of numbers and ranges.
  - **all** commands of all levels.
- **SERVICE_X** Authorization service. Command must list at least one service. Options include:
  - **group *name*** the server group identified by name.
  - **group tacacs+** a server group that consists of all defined TACACS+ hosts.
  - **local** local authorization.
  - **none** the switch does not perform authorization. All access attempts succeed.

Examples

- This command authorizes configuration commands (privilege level ***15***) through the local file. The switch denies command access to users not listed in the local file.

```
switch(config)# aaa authorization commands all default local
switch(config)#
```

- This command authorizes all commands entered on the CLI.

```
switch(config)# aaa authorization commands all default none
```

```
switch(config)#
```

9.1.1.7.11 aaa authorization config-commands

The **aaa authorization config-commands** command enables authorization of commands in any configuration mode, such as Global Configuration and all interface configuration modes. Commands are authorized through the policy specified by the aaa authorization commands setting. Authorization is enabled by default, so issuing this command has no effect unless ***running-config*** contains the **no aaa authorization config-commands** command.

The **no aaa authorization config-commands** command disables configuration command authorization. When configuration command authorization is disabled, ***running-config*** contains the **no aaa authorization config-commands** command. The **default aaa authorization config-commands** command restores the default setting by removing the **no aaa authorization config-commands** from ***running-config***.

Command Mode

Global Configuration

Command Syntax

aaa authorization config-commands

no aaa authorization config-commands

default aaa authorization config-commands

Examples

- This command enables the authorization of configuration commands.

```
switch(config)# aaa authorization config-commands
switch(config)#
```

- This command disables the authorization of configuration commands.

```
switch(config)# no aaa authorization config-commands
switch(config)#
```

9.1.1.7.12 aaa authorization exec

The **aaa authorization exec** command configures the service list that the switch references to authorize access to open an EOS CLI shell.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option to which the switch can connect. When the switch cannot communicate with an entity that provides a specified service option, it attempts to use the next option in the list.

The available service options include:

- a named server group.
- all defined TACACS+ hosts.
- all defined RADIUS hosts.
- local authentication.
- no authentication.

When the list is not configured, it is set to **none**, allowing all CLI access attempts to succeed.

The **no aaa authorization exec** and **default aaa authorization exec** commands set the list contents to **none**.

Command Mode

Global Configuration

Command Syntax

aaa authorization exec default **METHOD_1** [**METHOD_2**] **...** [**METHOD_N**]

no aaa authorization exec default

default aaa authorization exec default

Parameters

- **METHOD_X** authorization service (method). The switch uses the first listed available method.

  The command must provide at least one method. Each method is composed of one of the following:
- **group *name*** the server group identified by name.
  - **group radius** a server group that consists of all defined RADIUS hosts.
    - **group tacacs+** a server group that consists of all defined TACACS+ hosts.
    - **local** local authentication.
    - **none** the switch does not perform authorization. All access attempts succeed.

Guidelines

During the EXEC authorization process, the TACACS+ server response may include attribute-value (AV) pairs. The switch recognizes **priv-lvl=x** (where **x** is an integer between ***0*** and ***15***), which is a mandatory AV pair. A TACACS+ server that sends any other mandatory AV pair is denied access to the switch. The receipt of optional AV pairs by the switch has no affect on decisions to permit or deny access to the TACACS+ server.

Example

This command specifies that the TACACS+ servers authorize users that attempt to open an EOS CLI shell.

```
switch(config)# aaa authorization exec default group tacacs+
switch(config)#
```

9.1.1.7.13 aaa authorization policy local default-role

The **aaa authorization policy local** command specifies the name of the default role. A role is a data structure that supports local command authorization through its assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The default role is assigned to the following users:

- local or remote users assigned to a role that is not configured.
- local users to whom a role is not assigned.

When the default-role is not specified, **network-operator** is assigned to qualified users as the default role. The network-operator role authorizes assigned users access to all CLI commands in EXEC and Privileged EXEC modes.

The **no aaa authentication policy local default-role** and **default aaa authentication policy local default-role** commands remove the **authentication policy local default-role** statement from ***running-config***. Removing this statement restores **network-operator** as the default role.

Command Mode

Global Configuration

Command Syntax

aaa authorization policy local default-role ***role_name***

no aaa authorization policy local default-role

default aaa authorization policy local default-role

Parameters

role_name Name of the default role.

Related Command

The role command places the switch in ***role*** configuration mode for creating and editing roles.

Examples

- This command configures the sysuser as the default role.

```
switch(config)# aaa authorization policy local default-role
 sysuser
switch(config)#
```

- This command restores **network-operator** as the default role.

```
switch(config)# no aaa authorization policy local default-role
switch(config)#
```

- This command displays the contents of the **network-operator** role.

```
switch# show users roles network-operator
The default role is network-operator
role: network-operator
        10 deny mode exec command bash|\|
        20 permit mode exec command .*
switch#
```

9.1.1.7.14 aaa authorization serial-console

The **aaa authorization serial-console** command configures the switch to authorize commands entered through the console. By default, commands entered through the console do not require authorization.

The **no aaa authorization serial-console** and **default aaa authorization serial-console** commands restore the default setting.

Command Mode

Global Configuration

Command Syntax

aaa authorization serial-console

no aaa authorization serial-console

default aaa authorization serial-console

Example

This command configures the switch to authorize commands entered on the console, using the method specified through a previously executed aaa authorization commands command.

```
switch(config)# aaa authorization serial-console
switch(config)#
```

9.1.1.7.15 aaa group server radius

The **`aaa group server radius`** command enters the Server-group-RADIUS Configuration Mode for the specified group name. The command creates the specified group if it was not previously created. Commands are available to add servers to the group.

A server group is a collection of servers that are associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a radius-server host command.

The **`no aaa group server radius`** and **`default aaa group server radius`** commands delete the specified server group from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`aaa group server radius` ***group_name***

`no aaa group server radius` ***group_name***

`default aaa group server radius` ***group_name***

Parameters

group_name name (text string) assigned to the group. Cannot be identical to a name already assigned to a TACACS+ server group.

Commands Available in Server-group-RADIUS Configuration Mode

server (server-group-RADIUS configuration mode).

Related Command

aaa group server tacacs+.

Example

This command creates the RADIUS server group named ***RAD-SV1*** and enters ***Server-group-RADIUS*** configuration mode for the new group.

```
switch(config)# aaa group server radius RAD-SV1
switch(config-sg-radius-RAD-SV1)#
```

9.1.1.7.16 aaa group server tacacs+

The **aaa group server tacacs+** command enters Server-group-TACACS+ Configuration Mode for the specified group name. The command creates the specified group if it was not previously created. Commands are available to add servers to the group.

A server group is a collection of servers that are associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a tacacs-server host command.

The **no aaa group server tacacs+** and **default aaa group server tacacs+** commands delete the specified server group from ***running-config***.

Command Mode

Global Configuration

Command Syntax

aaa group server tacacs+ ***group_name***

no aaa group server tacacs+ ***group_name***

default aaa group server tacacs+ ***group_name***

Parameters

group_name name (text string) assigned to the group. Cannot be identical to a name already assigned to a RADIUS server group.

Commands Available in Server-group-TACACS+ Configuration Mode

server (server-group-TACACS+ configuration mode)

Related Command

aaa group server radius

Example

This command creates the TACACS+ server group named TAC-GR and enters the Server-group-TACAS+ Configuration Mode for the new group.

```
switch(config)# aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)#
```

9.1.1.7.17 aaa root

The **aaa root** command specifies the password security level for the root account and can assign a password to the account.

The **no aaa root** and **default aaa root** commands disable the root account by removing the **aaa root** command from ***running-config***. The root account is disabled by default.

Command Mode

Global Configuration

Command Syntax

aaa root **SECURITY_LEVEL** [**ENCRYPT_TYPE**] [***password***]

no aaa root

default aaa root

Parameters

- **SECURITY_LEVEL** password assignment level. Settings include:
  - **secret** the root account is assigned to the password.
  - **nopassword** the root account is not password protected.
- **ENCRYPT_TYPE** encryption level of the ***password*** parameter. This parameter is present only when **SECURITY_LEVEL** is **secret**. Settings include:
  - **no parameter** the password is entered as clear text.
  - **0** the password is entered as clear text. Equivalent to **no parameter**.
  - **5** the password is entered as an MD5-encrypted string.
  - **sha512** the password is entered as an SHA-512-encrypted string.
- ***password*** text that authenticates the username. The command includes this parameter only if **SECURITY_LEVEL** is **secret**.
  - ***password*** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
  - ***password*** must be an appropriately encrypted string if **ENCRYPT_TYPE** specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

Examples

- These equivalent commands assign ***f4980*** as the root account password.

```
switch(config)# aaa root secret f4980
switch(config)# aaa root secret 0 f4980
```

- This command assigns the text (***ab234***) that corresponds to the encrypted string of ***1HW05LEY8$QEVw6JqjD9VqDfh.O8r.b.*** as the root password.

```
switch(config)# aaa root secret 5 $1$HW05LEY8$QEVw6JqjD9VqDf
h.O8r.b
switch(config)#
```

- This command removes the password from the root account.

```
switch(config)# aaa root nopassword
switch(config)#
```

- This command disables the root login.

```
switch(config)# no aaa root
```

```
switch(config)#
```

9.1.1.7.18 clear aaa authentication lockout

The **`clear aaa authentication lockout`** command clears the locked status of a user so as to allow access within a lockout period. If no user is specified, the command clears the locked status of all users.

Command Mode

Privileged EXEC

Command Syntax

`clear aaa authentication lockout` [user *user_name*]

Parameter

- user ***user_name*** the specific name of the user.

Example

- This command clears the locked status of the user ***Alice***.

```
switch# clear aaa authentication lockout user Alice
```

9.1.1.7.19 clear aaa counters radius

The **clear aaa counters radius** command resets the counters that track the statistics for the RADIUS servers that the switch accesses. The show radius command displays the counters reset by the **clear aaa counters radius** command.

Command Mode

Privileged EXEC

Command Syntax

clear aaa counters radius

Example

These commands display the effect of the **clear aaa counters radius** command on the RADIUS counters.

```
switch# show radius
RADIUS server            : radius/10
          Connection opens:         204
         Connection closes:           0
    Connection disconnects:         199
       Connection failures:          10
       Connection timeouts:           2
             Messages sent:        1490
         Messages received:        1490
            Receive errors:           0
          Receive timeouts:           0
             Send timeouts:           0

Last time counters were cleared: never
switch# clear aaa counters radius
switch# show radius
RADIUS server            : radius/10
          Connection opens:           0
         Connection closes:           0
    Connection disconnects:           0
       Connection failures:           0
       Connection timeouts:           0
             Messages sent:           0
         Messages received:           0
            Receive errors:           0
          Receive timeouts:           0
             Send timeouts:           0

Last time counters were cleared: 0:00:03 ago
switch#
```

9.1.1.7.20 clear aaa counters tacacs+

The **clear aaa counters tacacs+** command resets the counters that track the statistics for the TACACS+ servers that the switch accesses. The show tacacs command displays the counters reset by the **clear aaa counters tacacs+** command.

Command Mode

Privileged EXEC

Command Syntax

clear aaa counters tacacs+

Example

These commands display the effect of the **clear aaa counters tacacs+** command on the tacacs+ counters.

```
switch# show tacacs
TACACS+ server            : tacacs/49
          Connection opens:      15942
         Connection closes:          7
    Connection disconnects:       1362
       Connection failures:          0
       Connection timeouts:          0
             Messages sent:      34395
         Messages received:      34392
            Receive errors:          0
           Receive timeouts:          2
              Send timeouts:          0

9.1.1.7.21 clear aaa counters

The **clear aaa counters** command resets the counters that track the number of service transactions performed by the switch since the last time the counters were reset. The show aaa counters command displays the counters reset by the **`clear aaa counters`** command.

Command Mode

Privileged EXEC

Command Syntax

`clear aaa counters` [**SERVICE_TYPE**]

Example

These commands display the effect of the **`clear aaa counters`** command on the AAA counters.

```
switch# clear aaa counters
switch# show aaa counters
Authentication
          Successful:          0
              Failed:          0
 Service unavailable:          0

Authorization
             Allowed:          1
              Denied:          0
 Service unavailable:          0

Accounting
          Successful:          0
               Error:          0
             Pending:          0

Last time counters were cleared: 0:00:44 ago
```

9.1.1.7.22 deny (Role)

The **deny** command adds a deny rule to the configuration mode role. Deny rules prohibit access of specified commands from usernames to which the role is applied. Sequence numbers determine rule placement in the role. Commands are compared sequentially to rules within a role until it matches a rule. A commands authorization is determined by the first rule it matches. Sequence numbers for commands without numbers are derived by adding 10 to the number of the roles last rule.

Deny rules use regular expressions to denote commands. A **mode** parameter specifies command modes from which commands are restricted. Modes are denoted either by predefined keywords, a command modes short key, or a regular expression that specifies the long key of one or more command modes.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode role. The no <sequence number> (Role) command also removes the specified rule from the role.

Command Mode

Role Configuration

Command Syntax

[**SEQ_NUM**] deny [**MODE_NAME**] command ***command_name***

no deny [**MODE_NAME**] command ***command_name***

default deny [**MODE_NAME**] command ***command_name***

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding 10 to the number of the roles last rule.
  - ***1 - 256*** Number assigned to entry.
- **MODE_NAME** Command mode from which command access is prohibited. Values include:
  - ***no parameter*** All command modes.
  - **mode *short_name*** Exact match of a modes short key name.
  - **mode *long_name*** Regular expression matching long key name of one or more modes.
  - **mode config *Global*** configuration mode.
  - **mode config-all** All configuration modes, including ***global*** configuration mode.
  - **mode exec *EXEC*** and ***Privileged EXEC*** modes.
- ***command_name*** Regular expression that denotes the name of one or more commands.

Guidelines

These CLI prompt format commands program the prompt to display the following mode keys:

- **%p** Short mode key.
- **%P** Long mode key.

Deny statements are saved to ***running-config*** only upon exiting **Role** configuration mode.

Related Command

The role command places the switch in **Role** configuration mode.

Example

These commands append a **deny** rule at the end of the ***sysuser*** role that restricts access to the **reload** command from ***EXEC*** and ***Privileged EXEC*** mode.

```
switch(config)# role sysuser
switch(config-mode-sysuser)# deny mode exec command reload
```

```
switch(config-mode-sysuser)#
```

9.1.1.7.23 enable password

The **enable password** command creates a new enable password or changes an existing password.

The **no enable password** and **default enable password** commands delete the **enable password** by removing the **enable password** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

enable password [**ENCRYPT_TYPE**] ***password***

no enable password

default enable password

Parameters

- **ENCRYPT_TYPE** encryption level of the ***password*** parameter. Settings include:
  - ***no parameter*** the password is entered as clear text.
  - ***0*** the password is entered as clear text. Equivalent to <no parameter>.
  - ***5*** the password is entered as an MD5 encrypted string.
  - ***sha512*** the password is entered as an SHA-512-encrypted string.
- ***password*** text that authenticates the username.
  - ***password*** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
  - ***password*** must be an appropriately encrypted string if **ENCRYPT_TYPE** specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

Examples

- These equivalent commands assign ***xyrt1*** as the enable password.

```
switch(config)#enable password xyrt1
switch(config)#enable password 0 xyrt1
```

- This command assigns the enable password to the clear text (***12345***) that corresponds to the encrypted string ***$1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/***. The string was generated by an MD5-encryption program using ***12345*** as the seed.

```
switch(config)# enable password 5 $1$8bPBrJnd$Z8wbKLHpJEd7d4
tc5Z/6h/
switch(config)#
```

- This command deletes the enable password.

```
switch(config)# no enable password
switch(config)#
```

9.1.1.7.24 ip radius source-interface

The **ip radius source-interface** command specifies the interface from which the IPv4 address is derived for use as the source for outbound RADIUS packets. When a source interface is not specified, the switch selects an interface.

The **no ip radius source-interface** and **default ip radius source-interface** commands remove the **ip radius source-interface** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip radius [**VRF_INST**] **source-interface** **INT_NAME**

no ip radius [**VRF_INST**] **source-interface**

default ip radius [**VRF_INST**] **source-interface**

Parameters

- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - ***no parameter*** switch communicates with the server using the default VRF.
  - **vrf *vrf_name*** switch communicates with the server using the specified user-defined VRF.
- **INT_NAME** Interface type and number. Options include:
  - **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **interface loopback *l_num*** Loopback interface specified by ***l_num***.
  - **interface management *m_num*** Management interface specified by ***m_num***.
  - **interface port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command configures the source address for outbound RADIUS packets as the IPv4 address assigned to the loopback interface.

```
switch(config)# ip radius source-interface loopback 0
switch(config)#
```

9.1.1.7.25 ip tacacs source-interface

The **ip tacacs source-interface** command specifies the interface from which the IPv4 address is derived for use as the source for outbound TACACS+ packets. When a source interface is not specified, the switch selects an interface.

The **no ip tacacs source-interface** and **default ip tacacs source-interface** commands remove the **ip tacacs source-interface** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip tacacs [**VRF_INST**] **source-interface INT_NAME**

no ip tacacs [**VRF_INST**] **source-interface**

default ip tacacs [**VRF_INST**] **source-interface**

Parameters

- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - ***no parameter*** switch communicates with the server using the default VRF.
  - **vrf *vrf_name*** switch communicates with the server using the specified user-defined VRF.
- **INT_NAME** Interface type and number. Options include:
  - **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **interface loopback *l_num*** Loopback interface specified by ***l_num***.
  - **interface management *m_num*** Management interface specified by ***m_num***.
  - **interface port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command configures the source address for outbound TACACS+ packets as the IPv4 address assigned to the loopback interface.

```
switch(config)# ip tacacs source-interface loopback 0
switch(config)#
```

9.1.1.7.26 no <sequence number> (Role)

The **no <sequence number>** command removes the rule with the specified sequence number from the configuration-mode role. The **default <sequence number>** command also removes the specified rule.

Command Mode

Role Configuration

Command Syntax

no ***sequence_num***

default ***sequence_num***

Parameters

sequence_num sequence number of rule to be deleted. Values range from ***1*** to ***256***.

Guidelines

Role statement changes are saved to ***running-config*** only upon exiting ***Role*** configuration mode.

Related Command

The role command places the switch in ***Role*** configuration mode.

Example

These commands display the rules in the ***sysuser*** role, remove rule ***30*** from the role, then display the edited role.

```
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
        20 deny mode config command (no |default )?router
        30 deny mode config command (no |default )?(ip|mac)
 access-list
        40 deny mode if command (no |default )?(ip|mac) access-
group
        50 deny mode config-all command lacp|spanning-tree
        60 permit command .*
switch(config)# role sysuser
switch(config-role-sysuser)# no 30
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
        20 deny mode config command (no |default )?router
        40 deny mode if command (no |default )?(ip|mac) access-
group
        50 deny mode config-all command lacp|spanning-tree
        60 permit command .*
switch(config)#
```

9.1.1.7.27 radius-server deadtime

The **radius-server deadtime** command defines global deadtime period, when the switch ignores a non-responsive RADIUS server. A non-responsive server is one that fails to answer any attempt to retransmit after a timeout expiry. Deadtime is disabled if a value is not configured.

The **no radius-server deadtime** and **default radius-server deadtime** commands restore the default global deadtime period of three minutes by removing the **radius-server deadtime** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

radius-server deadtime ***dead_interval***

no radius-server deadtime

default radius-server deadtime

Parameters

dead_interval period that the switch ignores non-responsive servers (minutes). Values range from ***1*** to ***1000***. Default is ***3***.

Example

This command programs the switch to ignore a server for two hours if it fails to respond to a request during the period defined by timeout and retransmit parameters.

```
switch(config)# radius-server deadtime 120
switch(config)#
```

9.1.1.7.28 radius-server host

The **`radius-server host`** command sets parameters for communicating with a specific RADIUS server. These values override global settings when the switch communicates with the specified server.

A RADIUS server is defined by its server address, authorization port, and accounting port. Servers with different address-authorization port-accounting port combinations have separate configurations.

The **`no radius-server host`** and **`default radius-server`** commands remove settings for the RADIUS server configuration at the specified address-authorization port-accounting port location by deleting the corresponding **`radius-server host`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`radius-server host` **ADDR** [**VRF_INST**][**AUTH**][**ACCT**][**TIMEOUT**][**DEAD**][**RETRAN**][**ENCRYPT**]

`no radius-server host` [**ADDR**][**VRF_INST**][**AUTH**][**ACCT**]

`default radius-server host` [**ADDR**][**VRF_INST**][**AUTH**][**ACCT**]

Parameters

- **ADDR** RADIUS server location. Options include:
  - ***ipv4_addr*** server's IPv4 address.
  - ***host_name*** server's DNS host name (FQDN).
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - ***no parameter*** switch communicates with the server using the default VRF.
  - **vrf *vrf_name*** switch communicates with the server using the specified user-defined VRF.
- **AUTH** Authorization port number.
  - ***no parameter*** default port of ***1812***.
  - **auth-port *number*** number ranges from ***1*** to ***65535***.
- **ACCT** Accounting port number.
  - ***no parameter*** default port of ***1813***.
  - **acct-port *number*** numbers range from ***1*** to ***65535***.
- **TIMEOUT** timeout period (seconds). Ranges from ***1*** to ***1000***.
  - ***no parameter*** assigns global timeout value (see radius-server timeout).
  - **timeout *number*** assigns number as the timeout period. Ranges from ***1*** to ***1000***.
- **DEAD** period (minutes) when the switch ignores a non-responsive RADIUS server.
  - ***no parameter*** assigns global deadtime value (see radius-server deadtime).
  - **deadtime *number*** specifies deadtime, where number ranges from ***1*** to ***1000***.
- **RETRAN** attempts to access RADIUS server after the first timeout expiry.
  - ***no parameter*** assigns global retransmit value (see radius-server retransmit).
  - **retransmit *number*** specifies number of attempts, where number ranges from ***1*** to ***100***.
- **ENCRYPT** encryption key that switch and server use to communicate.
  - ***no parameter*** assigns global encryption key (see radius-server key).
  - **key *key_text*** where ***key_text*** is in clear text.
  - **key 5 *key_text*** where ***key_text*** is in clear text.
  - **key 7 *key_text*** where ***key_text*** is provide in an encrypted string.

Examples

- This command configures the switch to communicate with the RADIUS server located at ***10.1.1.5***. The switch uses the global timeout, deadtime, retransmit, and key settings to communicate with this server, and communicates through port ***1812*** for authorization and ***1813*** for accounting.

```
switch(config)# radius-server host 10.1.1.5
switch(config)#
```

- This command configures the switch to communicate with the RADIUS server assigned the host name ***RAD-1***. Communication for authorization is through port ***1850***; communication for accounting is through port ***1813*** (the default).

```
switch(config)# radius-server host RAD-1 auth-port 1850
switch(config)#
```

9.1.1.7.29 radius-server key

The **`radius-server key`** command defines the global encryption key the switch uses when communicating with any RADIUS server for which a key is not defined.

The **`no radius-server key`** and **`default radius-server key`** commands remove the global key from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`radius-server key` [**ENCRYPT_TYPE**] ***encrypt_key***

`no radius-server key`

`default radius-server key`

Parameters

- **ENCRYPT_TYPE** encryption level of *encrypt_key*.
  - ***no parameter*** encryption key is entered as clear text.
  - ***0*** encryption key is entered as clear text. Equivalent to ***no parameter***.
  - ***7 encrypt_key*** is an encrypted string.
- ***encrypt_key*** shared key that authenticates the username.
  - ***encrypt_key*** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
  - ***encrypt_key*** must be an encrypted string if **ENCRYPT_TYPE** specifies an encrypted string.

Encrypted strings entered through this parameter are generated elsewhere.

Related Command

radius-server host

Examples

- This command configures ***cv90jr1*** as the global encryption key.

```
switch(config)# radius-server key 0 cv90jr1
switch(config)#
```

- This command assigns ***cv90jr1*** as the key by specifying the corresponding encrypted string.

```
switch(config)# radius-server key 7 020512025B0C1D70
switch(config)#
```

9.1.1.7.30 radius-server retransmit

The **`radius-server retransmit`** command defines the global retransmit count, which specifies the number of times the switch attempts to access the RADIUS server after the first timeout expiry.

The **`no radius-server retransmit`** and **`default radius-server retransmit`** commands restore the global retransmit count to its default value of three by deleting the **`radius-server retransmit`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`radius-server retransmit` ***count***

`no radius-server retransmit`

`default radius-server retransmit`

Parameters

count retransmit attempts after first timeout expiry. Values range from ***1*** to ***100***. Default is ***3***.

Related Command

radius-server host

Example

This command configures the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to ***50*** seconds, then the total period that the switch waits for a response is ((5+1)*50) = ***300*** seconds.

```
switch(config)# radius-server retransmit 5
switch(config)#
```

9.1.1.7.31 radius-server timeout

The **`radius-server timeout`** command defines the global timeout the switch uses when communicating with any RADIUS server for which a timeout is not defined.

The **`no radius-server timeout`** and **`default radius-server timeout`** commands restore the global timeout default period of five seconds by removing the **`radius-server timeout`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`radius-server timeout` ***time_period***

`no radius-server timeout`

`default radius-server timeout`

Parameters

time_period timeout period (seconds). Values range from ***1*** to ***1000***. Default is ***5***.

Related Commands

- radius-server host
- radius-server key
- radius-server deadtime
- radius-server retransmit

Example

This command configures the switch to wait ***50*** seconds for a RADIUS server response before issuing an error.

```
switch(config)# radius-server timeout 50
switch(config)#
```

9.1.1.7.32 resequence (Role)

The **resequence** command assigns sequence numbers to rules in the configuration mode role. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

The maximum sequence number is 256.

Command Mode

Role Configuration

Command Syntax

resequence ***start_num inc_num***

Parameters

- ***start_num*** sequence number assigned to the first rule. Value ranges from ***1*** to ***256***. Default is ***10***.
- ***inc_num*** numeric interval between consecutive rules. Value ranges from ***1*** to ***256***. Default is ***10***.

Guidelines

Role statement changes are saved to ***running-config*** only upon exiting ***Role*** configuration mode.

Related Command

The role command places the switch in ***Role*** configuration mode.

Example

The **resequence** command renumbers the rules in the ***sysuser*** role, starting the first rule at ***15*** and incrementing subsequent lines by ***5***.

```
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        10 deny mode exec command reload
        20 deny mode config command (no |default )?router
        40 deny mode if command (no |default )?(ip|mac) access-
group
        50 deny mode config-all command lacp|spanning-tree
        60 permit command .*
switch(config)# role sysuser
switch(config-role-sysuser)# resequence 15 5
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
        15 deny mode exec command reload
        20 deny mode config command (no |default )?router
        25 deny mode if command (no |default )?(ip|mac) access-
group
        30 deny mode config-all command lacp|spanning-tree
        35 permit command .*
switch(config)#
```

9.1.1.7.33 permit (Role)

The **permit** command adds a permit rule to the configuration mode role. Permit rules authorize access to specified commands for usernames to which the role is applied. Sequence numbers determine rule placement in the role. Commands are compared sequentially to rules within a role until it matches a rule. A command's authorization is determined by the first rule it matches. Sequence numbers for commands without numbers are derived by adding 10 to the number of the role's last rule.

Permit rules use regular expression to denote commands. A **mode** parameter specifies command modes in which commands are authorized. Modes are denoted either by predefined keywords, a command modes short key, or a regular expression that specifies the long key of one or more command modes.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode role. The no <sequence number> (Role) command also removes the specified rule from the role.

Command Mode

Role Configuration

Command Syntax

[**SEQ_NUM**] **permit** [**MODE_NAME**] command ***command_name***

no permit [**MODE_NAME**] command] ***command_name***

default permit [**MODE_NAME**] command ***command_name***

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***<no parameter>*** Number is derived by adding 10 to the number of the roles last rule.
  - ***<1 - 256>*** Number assigned to entry.
- **MODE_NAME** Command mode in which command access is authorized. Values include:
  - ***no parameter*** All command modes.
  - **mode *short_name*** Exact match of a modes short-key name.
  - **mode *long_name*** Regular expression matching long-key name of one or more modes.
  - **mode config *Global*** configuration mode.
  - **mode config-all** All configuration modes, including ***global*** configuration mode.
  - **mode exec** EXEC and Privileged EXEC modes.
- ***command_name*** Regular expression that denotes the name of one or more commands.

Guidelines

These CLI prompt format commands program the prompt to display the following mode keys:

- **%p** Short-mode key.
- **%P** Long-mode key.

Permit statements are saved to ***running-config*** only upon exiting **Role** configuration mode.

Related Commands

The role command places the switch in **Role** Cconfiguration mode.

Example

These commands append a **permit** rule at the end of the sysuser role that authorizes all commands from ***VLAN 1*** or ***VLAN 2*** interface configuration modes.

```
switch(config)# role sysuser
switch(config-mode-sysuser)# permit mode if-Vl(1|2) command .*
```

```
switch(config-mode-sysuser)#
```

9.1.1.7.34 role

The **role** command places the switch in Role Configuration Mode, which is a group-change mode that modifies a role. A role is a data structure that supports local command authorization through its assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The **role** command specifies the name of the role that subsequent commands modify and creates a role if it references a nonexistent role. All changes in a group change mode edit session are pending until the session ends:

- The **exit** command saves pending changes to ***running-config*** and returns the switch to Global Configuration Mode. Changes are also saved by entering a different configuration mode.
- The **abort** command discards pending changes, returning the switch to Global Configuration Mode.

The **no role** and **default role** commands delete the specified role by removing the role and its statements from ***running-config***.

Command Mode

Global Configuration

Command Syntax

role ***role_name***

no role ***role_name***

default role ***role_name***

Parameters

role_name Name of role.

Commands Available in Role Configuration Mode:

- deny (Role)
- permit (Role)
- no <sequence number> (Role)
- resequence (Role)

Related Commands

show users roles

Examples

- This command places the switch in ***Role*** configuration mode to modify the speaker role.

```
switch(config)# role speaker
switch(config-role-speaker)#
```

- This command saves changes to **speaker** role, then returns the switch to ***Global*** configuration mode.

```
switch(config-role-speaker)# exit
switch(config)#
```

- This command discards changes to **speaker**, then returns the switch to ***Global*** configuration mode.

```
switch(config-role-speaker)# abort
```

```
switch(config)#
```

9.1.1.7.35 server (server-group-RADIUS configuration mode)

The **`server (server-group-RADIUS configuration mode)`** command adds the specified RADIUS server to the configuration-mode group. Servers must be configured with the radius-server host command before adding them to the server group.

A RADIUS server is defined by its server address, authorization port, and accounting port. A group can contain multiple servers with the same IP address that have different authorization or accounting ports.

The **`no server`** and **`default server`** commands remove the specified server from the group.

Command Mode

Server-Group-RADIUS Configuration

Command Syntax

`server` **LOCATION** [**VRF_INST**][**AUTH**][**ACCT**]

`no server` **LOCATION** [**VRF_INST**][**AUTH**][**ACCT**]

`default server` **LOCATION** [**VRF_INST**][**AUTH**][**ACCT**]

Parameters

- **LOCATION** RADIUS server location. Options include:
  - ***ipv4_addr*** server's IPv4 address.
  - **host_name** server's DNS host name (FQDN).
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - ***no parameter*** switch communicates with the server using the default VRF.
  - **vrf *vrf_name*** switch communicates with the server using the specified user-defined VRF.
- **AUTH** Authorization port number.
  - ***no parameter*** default port of ***1812***.
  - **auth-port *number*** *number* ranges from ***1*** to ***65535***.
- **ACCT** Accounting port number.
  - ***no parameter*** default port of ***1813***.
  - **acct-port *number*** *number* ranges from ***1*** to ***65535***.

Related Commands

The aaa group server radius command places the switch in ***Server-group-RADIUS*** cConfiguration mode.

Example

These commands add two servers to the ***RAD-SV1*** server group.

```
switch(config)# aaa group server radius RAD-SV1
switch(config-sg-radius-RAD-SV1)# server RAC-1
switch(config-sg-radius-RAD-SV1)# server 10.1.5.14 acct-port 1851
switch(config-sg-radius-RAD-SV1)#
```

9.1.1.7.36 server (server-group-TACACS+ configuration mode)

The **`server (server-group-TACACS+ configuration mode)`** command adds the specified TACACS+ server to the configuration-mode group. Servers must be configured with the tacacs-server host command before adding them to the server group.

A TACACS+ server is defined by its server address and port number. Servers with different address-port combinations have separate statements in ***running-config***.

The **`no server`** and **`default server`** commands remove the specified server from the group.

Command Mode

Server-group-TACACS+ Configuration

Command Syntax

`server` **LOCATION** [**VRF_INST**][**PORT**]

`no server` **LOCATION** [**VRF_INST**][**PORT**]

`default server` **LOCATION** [**VRF_INST**][**PORT**]

Parameters

- **LOCATION** TACACS+ server location. Options include:
  - ***ipv4_addr*** server's IPv4 address.
  - ***ipv6_addr*** server's IPv6 address.
  - **host_name** server's DNS host name (FQDN).
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - ***no parameter*** switch communicates with the server using the default VRF.
  - **vrf *vrf_name*** switch communicates with the server using the specified user-defined VRF.
- **PORT** TCP connection port number.
  - ***no parameter*** default port of ***49***.
  - **port** *number* ***number*** ranges from ***1*** to ***65535***.

Related Command

The aaa group server tacacs+ command places the switch in ***Server-group-TACACS+*** configuration mode.

Example

These commands add two servers to the TAC-GR server group with default port number ***49***.

```
switch(config)# aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)# server TAC-1
switch(config-sg-tacacs+-TAC-GR)# server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR)#
```

9.1.1.7.37 show aaa

The **show aaa** command displays the user database. The command displays the encrypted enable password first, followed by a table of usernames and their corresponding encrypted password.

The command does not display unencrypted passwords.

Command Mode

Privileged EXEC

Command Syntax

show aaa

Example

This command displays the local user database.

```
switch# show aaa
Enable password (encrypted): $1$UL4gDWy6$3KqCPYPGRvxDxUq3qA/Hs/
Username  Encrypted passwd
--------  --------------------------------
admin
janis     $1$VVnDH/Ea$iwsfnrGNO8nbDsf0tazp9/
thomas    $1$/MmXTUil$.fJxLfcumzppNSEDVDWq9.
switch#
```

9.1.1.7.38 show aaa authentication lockout

The **show aaa authentication lockout** command displays the status of locked-out users who could not log within the specified time and number of login attempts.

Command Mode

Privileged EXEC

Command Syntax

show aaa authentication lockout

Example

- This command displays the status of Alice, who is the locked out user. Alice's last failed login was at 17:50:06, and her lockout will be cleared at 17:51:06, in 58 seconds. When the duration of 58 seconds elapses, Alice’s name will no longer be displayed.

```
switch# show aaa authentication lockout
 User     Start Time                End Time                  Expires In
--------- ------------------------- ------------------------- ----------
 alice    Fri Jul 12 17:50:06 2020  Fri Jul 12 17:51:06 2020  0:00:58
```

9.1.1.7.39 show aaa counters

The **show aaa counters** command displays the number of service transactions performed by the switch since the last time the counters were reset.

Command Mode

Privileged EXEC

Command Syntax

show aaa counters

Example

This command displays the number of AAA transactions.

```
switch# show aaa counters
Authentication
          Successful:          30
              Failed:           0
 Service unavailable:           0

Authorization
             Allowed:         188
              Denied:           0
 Service unavailable:           0

Accounting
          Successful:           0
               Error:           0
             Pending:           0

Last time counters were cleared: never
switch#
```

9.1.1.7.40 show aaa methods

The **show aaa methods** command displays all the named method lists defined in the specified Authentication, Authorization, and Accounting (AAA) service.

Command Mode

Privileged EXEC

Command Syntax

show aaa methods SERVICE_TYPE

Parameters

SERVICE_TYPE the service type of the method lists that the command displays.

- **accounting** accounting services.
- **authentication** authentication services.
- **authorization** authorization services.
- **all** accounting, authentication, and authorization services.

Example

This command configures the named method lists for all AAA services.

```
switch# show aaa methods all
Authentication method lists for LOGIN:
  name=default methods=group tacacs+, local
Authentication method list for ENABLE:
  name=default methods=local
Authorization method lists for COMMANDS:
  name=privilege0-15 methods=group tacacs+, local
Authentication method list for EXEC:
  name=exec methods=group tacacs+, local
Accounting method lists for COMMANDS:
  name=privilege0-15 default-action=none
Accounting method list for EXEC:
  name=exec default-action=none
switch#
```

9.1.1.7.41 show management ldap

The **`show management ldap`** command displays information about the LDAP configuration.

Command Mode

EXEC

Command Syntax

`show management ldap`

Parameter

- ***no parameter*** state of the system.

The following command shows general information for LDAP.

```
switch# show management ldap
LDAP server: prod-dc-hq1.aristanetworks.com/389
   Binds requested: 6
   Binds successful: 6
   Binds failed: 0
   Binds timed out: 0
   FIPS is ON

Last time counters were cleared: 1:16:41 ago
```

The authentication action in LDAP is the ***bind***, which is equivalent to attempting a log-in. There will be two binds per login attempt, one for the admin account and one for the user account.

The FIPS mode is controlled by the SSL profile in AAA. To validate an SSL profile use the following:

```
switch# show management security ssl profile
   Profile          State
---------------- -----------
   testProfile      valid

To verify a user accounts authorization being performed by ldap, use “show users detail”:
switch# show users detail
Session  Username  Roles         TTY  State Duration  Auth       Remote Host
-------- --------- ------------- ---- ----- --------- ---------- ----------------------------------------
1006     erahn     network-admin vty3 E     0:00:05   group ldap fd7a:629f:52a4:dc25:b08d:feff:feed:2ce7
```

To validate the role for a current session the **vty** information in the TTY column must be matched against the Line column in the following command. The row with a “*” character at the start is the current session where the command was run:

```
switch#show users
   Line      User             Host(s)  Idle       Location
   1 con 0   admin            idle     01:19:00   -
   2 vty 10  srv-sw-ldaptest  idle     01:19:00   172.16.124.151
*  3 vty 3   erahn            idle     00:00:04   fd7a:629f:52a4:dc25:b08d:feff:feed:2ce7
```

9.1.1.7.42 show privilege

The **show privilege** command displays the current privilege level for the CLI session.

Command Mode

EXEC

Command Syntax

show privilege

Example

This command displays the current privilege level.

```
switch> show privilege
Current privilege level is 15
switch>
```

9.1.1.7.43 show radius

The **show radius** command displays statistics for the RADIUS servers that the switch accesses.

Command Mode

EXEC

Command Syntax

```
show radius
```

Example

This command displays statistics for connected RADIUS servers.

```
switch#show radius
RADIUS server            : radius/10
          Connection opens:        204
         Connection closes:          0
    Connection disconnects:        199
       Connection failures:         10
       Connection timeouts:          2
             Messages sent:       1490
         Messages received:       1490
            Receive errors:          0
          Receive timeouts:          0
             Send timeouts:          0

Last time counters were cleared: never
switch#
```

9.1.1.7.44 show tacacs

The **show tacacs** command displays statistics for the TACACS+ servers that the switch accesses.

Command Mode

EXEC

Command Syntax

show tacacs

Example

This command displays statistics for connected TACACS+ servers.

```
switch# show tacacs
TACACS+ server            : tacacs/49
          Connection opens:      15942
         Connection closes:          7
    Connection disconnects:       1362
       Connection failures:          0
       Connection timeouts:          0
             Messages sent:      34395
         Messages received:      34392
            Receive errors:          0
          Receive timeouts:          2
             Send timeouts:          0

Last time counters were cleared: never

TACACS+ source-interface: Enabled
  TACACS+ outgoing packets will be sourced with an IP address
 associated with the
Loopback0 interface
switch#
```

9.1.1.7.45 show users accounts

The **`show users accounts`** command displays the names, roles, and privilege levels of users that are listed in ***running-config***. The SSH public key is also listed for names for which an SSH key is configured.

Command Mode

Privileged EXEC

Command Syntax

`show users accounts`

Example

This command displays the usernames that are configured on the switch.

```
switch# show users accounts
user: FRED
       role: <unknown>
       privilege level: 1
       ssh public key: ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAA

eKSFSZBd3Pb admin@switch
switch#
user: JANE
       role: sysuser2
       privilege level: 1
user: admin
       role: network-admin
       privilege level: 1
```

9.1.1.7.46 show users detail

The **show users detail** command displays information about active AAA login sessions. Information includes username, roles, TTY, state of the session (pending or established), duration, authentication method, and if available, remote host and remote username.

Command Mode

Privileged EXEC

Command Syntax

show users detail

Example

This command displays information about the active AAA login sessions.

```
switch# show users detail
Session  Username Roles            TTY    State Duration  Auth          Remote Host
-------   ---------- ------------ ------ ----- --------  ------------- ------------
2      admin     network-admin    ttyS0  E     0:01:21  local
4      joe       sysadmin         telnet E     0:02:01  local        sf.example.com
6      alice     sysadmin         ssh    E     0:00:52  group radius ny.example.com
7      bob       sysadmin         ssh    E     0:00:48  group radius la.example.com
8      kim       network-admin1   ssh    E     0:00:55  group radius de.example.com
9      admin     network-admin    ssh    E     0:00:07  local        bj.example.com
10     max       network-admin    telnet E     0:00:07  local        sf.example.com
```

9.1.1.7.47 show users roles

The **show users roles** command displays the name of the default role and the contents of the specified roles. Commands that do not specify a role display the rules in all built-in and configured roles.

Command Mode

Privileged EXEC

Command Syntax

show users roles [**ROLE_LIST**]

Parameters

ROLE_LIST Roles that the command displays. Options include:

- ***no parameter*** Command displays all roles.
- ***role_name*** Name of role displayed by command.

Related Command

The role command places the switch in ***Role*** configuration mode, which is used to create new roles or modify existing roles.

Example

This command displays the contents of all user-defined and built-in roles.

```
switch# show users roles
The default role is network-operator

role: network-admin
        10 permit command .*
role: network-operator
        10 deny mode exec command bash|\|
        20 permit mode exec command .*
role: sysuser
        15 deny mode exec command reload
        20 deny mode config command (no |default )?router
        25 deny mode if command (no |default )?(ip|mac) access-
group
        30 deny mode config-all command lacp|spanning-tree
        35 permit command .*
        40 deny mode exec command .*
        50 permit mode exec command show|clear (counters|pla
tform)|configure
```

9.1.1.7.48 show users

The **show users** command displays the usernames that are currently logged into the switch.

Command Mode

Privileged EXEC

Command Syntax

show users

Example

This command displays the users that are logged into the switch.

```
switch# show users
    Line       User       Host(s)              Idle       Location
   1 vty 2     john       idle                    1d  10.22.6.113
   2 vty 4     jane       idle                21:33:00  10.22.26.26
*  3 vty 6     ted        idle                00:00:01  10.17.18.71
switch#
```

9.1.1.7.49 tacacs-server host

The **`tacacs-server host`** command sets communication parameters for communicating with a specific TACACS+ server. These values override global settings when the switch communicates with the specified server.

A TACACS+ server is defined by its server address and port number. Servers with different combinations of address-port-VRF-multiplex settings have separate statements in ***running-config***.

The **`no tacacs-server host`** and **`default tacacs-server host`** commands remove settings for the TACACS+ server configuration at the specified address-port-VRF combination by deleting the corresponding **`tacacs-server host`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`tacacs-server host` **SERVER_ADDR** [**MULTIPLEX**][**VRF_INST**][**PORT**][**TIMEOUT**][**ENCRYPT**]

`no tacacs-server host` [**SERVER_ADDR**][**MULTIPLEX**][**VRF_INST**][**PORT**]

`default tacacs-server host` [**SERVER_ADDR**][**MULTIPLEX**][**VRF_INST**][**PORT**]

Parameters

- **SERVER_ADDR** TACACS+ server location. Options include:
  - ***ipv4_addr*** server's IPv4 address.
  - ***ipv6_addr*** server's IPv6 address.
  - ***host_name*** server's DNS host name (FQDN).
- **MULTIPLEX** TACACS+ server support of multiplex sessions on a TCP connection.
  - ***no parameter*** server does not support multiplexing.
  - **single-connection** server supports session multiplexing.
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
  - ***<no parameter>*** switch communicates with the server using the default VRF.
  - **vrf** *vrf_name* switch communicates with the server using the specified user-defined VRF.
- **PORT** port number of the TCP connection.
  - ***no parameter*** default port of ***49***.
  - **port *number*** port number ranges from ***1*** to ***65535***.
- **TIMEOUT** timeout period (seconds).
  - ***no parameter*** assigns the globally configured timeout value (see tacacs-server timeout).
  - **timeout *number*** timeout period (seconds). Number ranges from ***1*** to ***1000***.
- **ENCRYPT** encryption key the switch and server use to communicate. Settings include:
  - ***no parameter*** assigns the globally configured encryption key (see tacacs-server key).
  - **key *key_text*** where ***key_text*** is in clear text.
  - **key 5 *key_text*** where ***key_text*** is in clear text.
  - **key 7 *key_text*** where ***key_text*** is an encrypted string.

Examples

- This command configures the switch to communicate with the TACACS+ server located at ***10.1.1.5***. The switch uses the global timeout, encryption key, and port settings.

```
switch(config)# tacacs-server host 10.1.1.5
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server assigned the host name ***TAC_1***. The switch defines the timeout period as ***20*** seconds and the encryption key as ***rp31E2v***.

```
switch(config)# tacacs-server host TAC_1 timeout 20 key
 rp31E2v
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server located at ***10.12.7.9***, indicates that the server supports multiplexing sessions on the same TCP connection, and that access is through port ***54***.

```
switch(config)# tacacs-server host 10.12.7.9 single-connection
 port 54
switch(config)#
```

9.1.1.7.50 tacacs-server key

The **tacacs-server key** command defines the global encryption key the switch uses when communicating with any TACACS+ server for which a key is not defined.

The **no tacacs-server key** and **default tacacs-server key** commands remove the global key from ***running-config***.

Command Mode

Global Configuration

Command Syntax

tacacs-server key [**ENCRYPT_TYPE**] ***encrypt_key***

no tacacs-server key

default tacacs-server key

Parameters

- **ENCRYPT_TYPE**encryption level of *encrypt_key*.
  - ***no parameter*** encryption key is entered as clear text.
  - ***0*** encryption key is entered as clear text. Equivalent to ***no parameter***.
  - ***7 encrypt_key*** is an encrypted string.
- ***encrypt_key*** shared key that authenticates the username.
  - ***encrypt_key*** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
  - ***encrypt_key*** must be an encrypted string if **ENCRYPT_TYPE** specifies an encrypted string.

  Encrypted strings entered through this parameter are generated elsewhere.

Related Command

tacacs-server host

Examples

- This command configures ***cv90jr1*** as the encryption key.

```
switch(config)# tacacs-server key 0 cv90jr1
switch(config)#
```

- This command assigns ***cv90jr1*** as the key by specifying the corresponding encrypted string.

```
switch(config)# tacacs-server key 7 020512025B0C1D70
switch(config)#
```

9.1.1.7.51 tacacs-server policy

The **tacacs-server policy** command programs the switch to permit access to TACACS+ servers that send mandatory attribute-value (AV) pairs that the switch does not recognize. By default, the switch denies access to TACACS+ servers when it receives unrecognized AV pairs from the server.

The switch recognizes the following mandatory AV pairs:

priv-lvl=x where x is an integer between ***0*** and ***15***.

The **no tacacs-server policy** and **default tacacs-server policy** commands restore the switch default of denying access to servers from which it receives unrecognized mandatory AV pair by deleting the **tacacs-server policy** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

tacacs-server policy unknown-mandatory-attribute ignore

no tacacs-server policy unknown-mandatory-attribute ignore

default tacacs-server policy unknown-mandatory-attribute ignore

Example

This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.

```
switch(config)# tacacs-server policy unknown-mandatory-attribute
 ignore
switch(config)#
```

9.1.1.7.52 tacacs-server timeout

The **tacacs-server timeout** command defines the global timeout the switch uses when communicating with any TACACS+ server for which a timeout is not defined.

The **no tacacs-server timeout** and **default tacacs-server timeout** commands restore the global timeout default period of five seconds by removing the **tacacs-server timeout** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

tacacs-server timeout ***time_period***

no tacacs-server timeout

default tacacs-server timeout

Parameters

time_period timeout period (seconds). Values range from ***1*** to ***1000***. Default is ***5***.

Related Command

tacacs-server host

Example

This command configures the switch to wait ***20*** seconds for a TACACS+ server response before issuing an error.

```
switch(config)# tacacs-server timeout 20
switch(config)#
```

9.1.1.7.53 username ssh-key

The **`username ssh-key`** command configures an SSH key for the specified username. Command options allow the key to be entered directly into the CLI or referenced from a file.

The specified username must be previously configured through a username command.

The **`no username ssh-key`** and **`default username ssh-key`** commands delete the SSH key for the specified username by removing the corresponding **`username ssh-key`** command from ***running-config***.

The **`no username ssh-key role`** and **`default username ssh-key role`** commands perform the following:

- delete the SSH key for the specified username by removing the corresponding **username ssh-key** command from ***running-config***.
- delete the role assignment from the specified username by editing the corresponding username statement in ***running-config***.

Command Mode

Global Configuration

Command Syntax

`username` ***name*** **`sshkey`** **KEY**

`no username` ***name*** **`sshkey`** [role]

`default username` ***name*** **`sshkey`** [role]

Parameters

- ***name*** username text that the user enters at the login prompt to access the CLI.

  Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

  @ # $ % ^ & * - _ = + ; < > , . ~ |
- **KEY** SSH key. Options include:
  - ***key_text*** username is associated with ssh key specified by ***key_text*** string.
  - **file** ***key_file*** username is associated with SSH key in the specified file.

Example

These commands create the username ***john***, assign it the password ***x245***, then associate it to the SSH key listed in the file named ***john-ssh***.

```
switch(config)# username john secret x245
switch(config)# username john sshkey file john-ssh
switch(config)#
```

9.1.1.7.54 username

The **username** command adds a username to the local file and optionally assigns a password to the username. If the command specifies an existing username, the command replaces the password in the local file. The command can also define a username without a password or remove the password from a username.

The **no username** command deletes the specified username by removing the corresponding **username** statement from ***running-config***. The **default username** command removes user-specified usernames, but restores the **admin** username to its default parameters.

The **no username role** command assigns the default role assignment to the specified **username** statement by editing the corresponding **username** statement in ***running-config***. The **default username role** command reverts the specified username to its default role by editing the corresponding **username** statement in ***running-config***. For the **admin** username, this restores **network-admin** as its role, even if the **admin** username has been deleted and then created again.

Command Mode

Global Configuration

Command Syntax

username ***name*** [**PRIVILEGE_LEVEL**] **SECURITY** [**ROLE_USER**]

no username ***name*** [**role**]

default username ***name*** [**role**]

All parameters except ***name*** can be placed in any order.

Parameters

- ***name*** username text that the user enters at the login prompt to access the CLI.

  Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

  @ # $ % ^ & * - _ = + ; < > , . ~ |
- **PRIVILEGE_LEVEL** user's initial session privilege level. This parameter is used when an authorization command includes the local option.
  - ***no parameter*** the privilege level is set to ***1***.
  - **privilege** ***rank*** where rank is an integer between ***0*** and ***15***.
- **SECURITY** password assignment option.
  - **nopassword** *name* is not password protected.
  - **secret** ***password name*** is protected by specified password (clear-text string).
  - **secret 0** ***password name*** is protected by specified password (clear-text string).
  - **secret 5** ***password name*** is protected by specified password. (MD5-encrypted string).
  - **secret sha5** ***password name*** is protected by specified password (SHA-512-encrypted string).
- **ROLE_USER** specifies the role for performing command authorization. Options include:
  - ***no parameter*** user is assigned default role aaa authorization policy local default-role.
  - **role** ***role_name*** specifies role assigned to the user.

Guidelines

Encrypted strings entered through this parameter are generated elsewhere. The secret 5 option (**SECURITY**) is typically used to enter a list of username-passwords from a script.

The **SECURITY** parameter is mandatory for unconfigured usernames. For previously configured users, the command can specify a **PRIVILEGE_LEVEL** or **ROLE** without a **SECURITY** setting.

The **admin** username is provided by the initial configuration, but it can be deleted, and its parameters are editable. The initial **admin** configuration is:

```
username admin privilege 1 role network-admin nopassword
```

Note: when deleting the **admin** username, it is advisable to create at least one other username on the switch before saving the configuration.

Examples

- These equivalent commands create the username ***john*** and assign it the password ***x245***. The password is entered in clear text because the **ENCRYPTION** parameter is either omitted or zero.

  ```
  switch(config)# username john secret x245
  switch(config)# username john secret 0 x245
  ```

- This command creates the username ***john*** and assigns it to the text password that corresponds to the encrypted string ***1sU.7hptc$TsJ1qslCL7ZYVbyXNG1wg1***. The string was generated by an MD5-encryption program using ***x245*** as the seed.

  ```
  switch(config)# username john secret 5 $1$sU.7hptc$T
  sJ1qslCL7ZYVbyXNG1wg1
  switch(config)#
  ```

  A user authenticates the username ***john*** by entering ***x245*** when the CLI prompts for a password.
- This command creates the username ***jane*** without securing it with a password or removes a password if the ***jane*** username exists.

  ```
  switch(config)# username jane nopassword
  switch(config)#
  ```

- This command removes the username ***william*** from the local file.

  ```
  switch(config)# no username william
  switch(config)#
  ```

9.2 Control Plane Security

This section contains the following topics:

9.2.1 Transport Layer Security

Transport Layer Security (TLS), the successor to Secure Sockets Layer (SSL), is a security protocol used to communicate between client and server. It establishes an encrypted communication channel to secure data.

By default, EOS uses a self signed certificate for client and server connections. However, some browsers or TLS libraries may refuse connections to the default self-signed certificates on EOS and in such cases it is recommended to install the TLS server certificates that meet the following criteria:

- RSA key sizes must be greater than or equal to ***2048*** bits.
- There must be less than ***825*** days to expiry.
- Certificate must use ***SHA-2*** family of Hashing function.

Note: Although Arista switches use TLS, the terms TLS and SSL are used interchangeably in this document.

Following are the two main components used by TLS for authentication of identity before any communication starts.

- Certificate
- Key

An SSL certificate is required to establish a secure connection between the client and server. The certificate includes all of the details which are necessary for authentication. Cryptographic keys are used to provide a secure channel of communication. TLS uses two cryptographic keys: a private keyknown only to the server and a public key embedded in the certificate. The keys are used to validate the certificate.

This chapter contains the following sections.

9.2.1.1 Overview

With the SSL certificate, key, and profile management framework we can manage and configure SSL certificates, keys and profiles. SSL is an application-layer protocol which transfers the data securely between the client and server using a combination of authentication, encryption, and data integrity. SSL uses certificates and private-public key pairs to provide this security. An user can configure an SSL profile which includes certificate, key and trusted CA certificates used in SSL communication. A user can manage certificates, keys, and also multiple SSL profiles. A SSL profile can be configured and attached to any other EOS configuration which supports SSL communication. The individual EOS configuration using this framework includes details of using the SSL profile in their configuration.

The only private keys supported are those using the RSA algorithm. Both the certificate and keys must be encoded in the Privacy Enhanced Mail (PEM) format.

Example

This is a code sample of a PEM encoded certificate.

```
$cat server.crt

9.2.1.2 Configuration

- Configuring Certificates
- Configuring Keys
- Configuring a certificate with a RSA key in SSL Profile

9.2.1.2.1 Configuring Certificates

Copying a Certificate to the Switch

The **copy file: certificate:** command copies the certificate to the *certificate:* file system from any supported source URLs of the copy command. The source file may contain multiple PEM encoded certificates, but must not contain other entities such as keys.

Example

This command copies a server.crt certificate to the *certificate:* file system.

```
switch(config)#copy file:/tmp/ssl/server.crt certificate:
Copy completed successfully.
switch(config)#
```

Errors while Copying the Certificates

Examples

- The PEM encoded entities in the source file must all be certificates. If the source file contains different types of entities (e.g. a certificate and a key), the copy fails and an error message is displayed as shown.

```
switch(config)#copy file:tmp/ssl/mixed.crt certificate:
% Error copying file:tmp/ssl/mixed.crt to certificate:
 (Multiple types of entities in
certificate file not supported)
switch(config)#
```

- The source file must contain valid PEM encoded certificates. If the file contains invalid certificates, the copy fails and an error message is displayed as shown.

```
switch(config)#copy file:tmp/ssl/bad.crt certificate:
% Error copying file:tmp/ssl/bad.crt to certificate: (Invalid
 certificate)
switch(config)#
```

- Only certificates with RSA public keys are supported. If the certificate does not have an RSA public key, the copy fails and an error message is displayed as shown.

```
switch(config)#copy file:tmp/ssl/dsa.crt certificate:
% Error copying file:tmp/ssl/dsa.crt to certificate:
 (Certificate does not have
RSA key)
```

```
switch(config)#
```

Deleting a Certificate

The **delete certificate** command deletes a certificate configuration from the *certificate:* file system on the switch.

Example

This command deletes the *server.crt* certificate from the switch.

```
switch(config)#delete certificate:server.crt
switch(config)#
```

Generating Certificates

The following commands help the user to generate a self-signed certificate or Certificate Signing Request (CSR).

Examples

- This command generates a self-signed certificate or Certificate Signing Request (CSR). In the example below, the existing private key *test.key* is used to generate the certificates. The user will be prompted for the common name, two-letter country code, etc. A common name is required. The generated Certificate Signing Request (CSR) can be viewed on the CLI, whereas a self-signed certificate will be saved to the certificate: file system.

  ```
  switch#security pki certificate generate self-signed test.crt
   key test.key
  Common Name for use in subject: test
  [...]
  certificate:test.crt generated
  switch#
  ```

- This command specifies the digest and the validity (in days) of the certificate. The validity is applicable only for self-signed certificates.

  ```
  switch#security pki certificate generate signing-request key
   test.key digest sha256 validity 365
  Common Name for use in subject: test
  [...]
  certificate:test.crt generated
  switch#
  ```

- This command adds the certificate parameters such as common-name, country, email, and others.

  ```
  switch#security pki certificate generate signing-request key
   test.key parameters common-name Test [country US ...]
  certificate:test.crt generated
  switch#
  ```

9.2.1.2.2 Configuring Keys

Copying a Key to the Switch

The **copy** command copies an RSA key to the sslkey: file system. The key can be copied from any supported source URLs of the copy command. The source file must contain only one key. Password protected keys are not supported.

Example

This command copies a server.key RSA key to the sslkey: file system.

```
switch#copy file:/tmp/ssl/server.key sslkey:
Copy completed successfully.
switch#
```

Errors While Copying the Keys

Examples

- Only one PEM encoded key per file is supported. If the source file contains multiple PEM encoded keys, the copy fails and an error message is displayed as shown.

```
switch#copy file:tmp/ssl/multi.key sslkey:
% Error copying file:tmp/ssl/multi.key to sslkey: (Multiple
 PEM entities in
single file not supported)
```

- The source file must contain a valid PEM encoded RSA key. If the file contains an invalid RSA key, the copy fails and an error message is displayed as shown.

```
switch# copy file:tmp/ssl/bad.key sslkey:
% Error copying file:tmp/ssl/bad.key to sslkey: (Invalid RSA
 key)
```

- Password protected keys are not supported. If the source file contains a password protected key, the copy fails and an error message is displayed as shown.

```
switch#copy file:/tmp/ssl/pass.key sslkey:
% Error copying file:tmp/ssl/pass.key to sslkey: (Password
 protected keys are not
supported)
```

Deleting a Key

The **delete** command deletes the key configuration from the switch.

Example

This command deletes the server.key key from the switch.

```
switch# delete sslkey:server.key
```

Generating Keys

The following commands help the user to generate RSA keys.

Examples

- This command generates a 2048-bit long RSA private key and saves it to sslkey:test.key.

  ```
  switch# security pki key generate rsa 2048 test.key
  ```

- This command generates a 4096-bit long self-signed certificate RSA key and 2048-bit long certificate signing request RSA key.

  ```
  switch# security pki certificate generate self-signed test.crt
   key test.key
  generate rsa 4096
  switch#security pki certificate generate signing-request key
   test.key
  generate rsa 2048
  ```

9.2.1.2.3 Configuring a certificate with a RSA key in SSL Profile

A SSL profile is configured with a certificate and its corresponding RSA key. The public key information in the certificate must match the RSA key. This certificate and RSA key pair are used to authenticate to the peer during SSL negotiation. The individual EOS features that use SSL profile configuration will decide whether the certificate and key configuration is optional or mandatory.

Examples

- ```
  switch# config
  switch(config)# management security
  switch(config-mgmt-security)# ssl profile server
  switch(config-mgmt-sec-ssl-profile-server)# certificate
   server.crt key server.key
  ```

- In this case, if the RSA key configured in SSL profile does not match with the configured certificate, the SSL profile state becomes invalid, and an error message is displayed.

  ```
  switch(config-mgmt-security)# ssl profile server
  switch(config-mgmt-sec-ssl-profile-server)# certificate server.crt key
   client.key
  switch(config-mgmt-sec-ssl-profile-server)# show management security ssl
   profile
     Profile       State      Error
  ------------ ------------- ----------------------------------------
     server        invalid    Certificate 'server.crt' does not match
                              with key
  ```
  ```

9.2.1.2.3.1 Configuring SSL Profile with a Certificate Authority (CA)

During SSL negotiation with mutual authentication, the peer (or client) certificate is verified by checking if it is signed by one of these trusted certificates. For peer certificates that do not have a chain to a trusted certificate, the full bundle of certificates leading to the trusted certificates must be included. The individual EOS features that use SSL profile configuration will decide whether the trusted certificate configuration is optional or mandatory.

Example

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# trust certificate ca1.crt
switch(config-mgmt-sec-ssl-profile-server)# trust certificate ca2.crt
```

9.2.1.2.3.2 Configuring Certificate Chains

Certificate chains are used to provide a chain of trust for the SSL Profile server certificate to a remote party. Several chain certificate commands can be issued to build a certificate chain with many intermediate CAs, regardless of the order. Use the **chain certificate** command to configure the certificate chain for a SSL profile. The **no** form of the command deletes the certificate configuration.

Examples

Assume that *server.crt* is issued by an intermediate CA *intermediate.crt* and *intermediate.crt* itself is issued by the root CA *ca.crt*, as shown in the following figure.

Figure 3: Certificate Chain Example

- These commands configure the certificate chain shown schematically in figure Configuring Certificate Chains above. *server.crt* is issued by an intermediate CA *intermediate.crt* and *intermediate.crt* is itself issued by the root CA *ca.crt*.

```
switch#(config)# management security
switch#(config-mgmt-security)# ssl profile server
switch#(config-mgmt-sec-ssl-profile-server)# certificate
 server.crt key server.key
switch#(config-mgmt-sec-ssl-profile-server)# chain certificate
 intermediate.crt
switch#(config-mgmt-sec-ssl-profile-server)# exit
switch(config)#
```

- The other peer can be configured to trust *ca.crt* in order to verify the certificate chain during the TLS handshake as shown below.

```
switch# config
switch#(config)# management security
switch(config-mgmt-security)# ssl profile client
switch(config-mgmt-sec-ssl-profile-client)# certificate
 client.crt key client.key
```

```
switch(config-mgmt-sec-ssl-profile-client)# trust certificate
 ca.crt
```

- To check the revocation status of the server certificate chain, the client can add the Certificate Revocation List (CRLs) to its SSL profile configuration. One CRL needs to be specified for every CA in the chain, even if its not revoking any certificate.

```
switch# config
switch#(config)# management security
switch(config-mgmt-security)# ssl profile client
switch(config-mgmt-sec-ssl-profile-client)# crl intermediate.
crl
switch(config-mgmt-sec-ssl-profile-client)# crl ca.crl
```

Note: Both the chain certificate and `crl` commands look into the *certificate:* file system to find the right PEM file.

Several **`chain certificate`** commands can be used to build a certificate chain with multiple intermediate CAs, regardless of the order. The following diagram shows an example certificate chain.

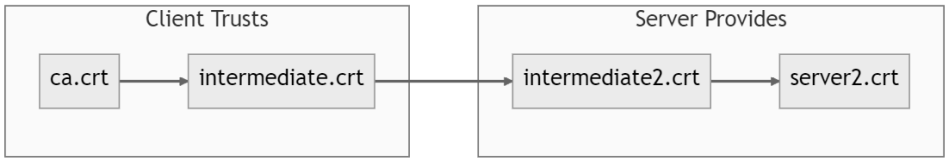

Figure 4: Certificate Chain Example 2

This SSL profile can be configured in the following way. Note that the order of intermediate CAs does not matter.

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile server2
switch(config-mgmt-sec-ssl-profile-server2)#certificate
 server2.crt key server2.key
switch(config-mgmt-sec-ssl-profile-server2)#chain certificate
 intermediate2.crt
switch(config-mgmt-sec-ssl-profile-server2)#chain certificate
 intermediate.crt
switch(config-mgmt-sec-ssl-profile-server2)#exit
switch(config-mgmt-security)#exit
switch(config)#
```

A certificate chain can be split into two parts, each part configured on a different peer. The location of the split can be anywhere, as long as between the client and the server, a complete certificate chain can be constructed. The following example shows a server and client SSL profile configuration with a split certificate chain.

Server side:

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile server2
switch(config-mgmt-sec-ssl-profile-server2)#certificate
 server2.crt key server2.key
```

```
switch(config-mgmt-sec-ssl-profile-server2)#chain certificate
 intermediate2.crt
switch(config-mgmt-sec-ssl-profile-server2)#exit
switch(config-mgmt-security)#exit
switch(config)#
```

Client side:

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile client
switch(config-mgmt-sec-ssl-profile-client)#certificate client.crt
 key client.key
switch(config-mgmt-sec-ssl-profile-client)#trust certificate
 ca.crt
switch(config-mgmt-sec-ssl-profile-client)#trust certificate
 intermediate.crt
switch(config-mgmt-sec-ssl-profile-client)#exit
switch(config-mgmt-security)#exit
switch(config)#
```

The following configuration will not work, as it results in invalid SSL profiles.

Server:

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile server2
switch(config-mgmt-sec-ssl-profile-server2)#certificate
 server2.crt key server2.key
switch(config-mgmt-sec-ssl-profile-server2)#chain certificate
 intermediate.crt
switch(config-mgmt-sec-ssl-profile-server2)#show management
 security ssl profile
   Profile                       State      Additional Info

--------------------------- ------------ -------------
---------------------------
   server3                       invalid    Profile has invalid
 certificate chain
switch(config-mgmt-sec-ssl-profile-server3)#exit
switch(config-mgmt-security)#exit
switch(config)#
```

Client:

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile client3
switch(config-mgmt-sec-ssl-profile-client3)#certificate
 client3.crt key client3.key
switch(config-mgmt-sec-ssl-profile-client3)#trust certificate
 intermediate.crt
switch(config-mgmt-sec-ssl-profile-client3)#show management
 security ssl profile
   Profile                       State      Additional Info

--------------------------- ------------ -------------
---------------------------
   client3                       invalid    Profile has invalid
 trusted certificate
                                          chain
switch(config-mgmt-sec-ssl-profile-client3)#exit
switch(config-mgmt-security)#exit
```

```
switch(config)#
```

9.2.1.2.3.3 Local Certificate Checks

EOS performs various checks on the certificates in an SSL profile before allowing the use of the profile. The way these checks is performed can be modified, added to or relaxed locally. The following are some of the checks that can be performed before any communication with the peer.

Examples

- Check whether the certificate has an extended key usage attribute:

```
switch(config-mgmt-sec-ssl-profile-client)# certificate
 requirement extended-key-usage
```

- Check whether all the trusted certificates or certificates in the chain have CA basic constraints set to true.

```
switch(config-mgmt-sec-ssl-profile-client)# trust certificate
 requirement
basic-constraints ca true
switch(config-mgmt-sec-ssl-profile-client)# chain certificate
 requirement
basic-constraints ca true
```

- Do not mark an expired certificate as invalid.

```
switch(config-mgmt-sec-ssl-profile-client)# certificate policy
 expiry-date ignore
```

9.2.1.2.3.4 Displaying SSL profile status and SSL profile errors

The **show management security ssl profile** command displays the SSL profile status information. To view a specific SSL profile status, use the name of the SSL profile. Otherwise, all SSL profile statuses are displayed.

Example

This command displays the status of the SSL profile server.

```
switch# show management security ssl profile server
 Profile      State
------------- -----------
 server       valid
```

If there are any errors in the SSL profile, an **invalid** state is displayed and the errors are listed in the third column. Once the error is fixed, the SSL profile becomes **valid**.

Examples

- When the certificate ***server.crt*** does not match with the key, the following error message is shown.

```
switch# show management security ssl profile server
 Profile        State       Error
------------- ------------- ----------------------------------------
 server         invalid     Certificate 'server.crt' does not match
                            with key
```

- When a trusted certificate ***ca2.crt*** does not exist, the following error message is shown.

```
switch# show management security ssl profile server
 Profile        State       Error
------------- ------------- -------------------------------------
 server         invalid     Certificate 'ca2.crt' does not exist
```

- When a trusted certificate ***foo.crt*** is not a self-signed root certificate, the following error message is shown.

```
switch# show management security ssl profile server
 Profile        State       Error
------------- ------------- ----------------------------------------
server         invalid     Certificate 'foo.crt' is trusted and not
                           a root certificate
```

- When the certificate ***server.crt*** is expired the following error message is shown.

```
switch# show management security ssl profile server
 Profile        State       Error
------------- ------------- -------------------------------------
 server         invalid     Certificate 'server.crt' has expired
```

- When the certificate chain is missing an intermediate certificate, the following error message is shown.

```
switch# show management security ssl profile server
    Profile        State     Error
------------- ------------- ------------------------------------------------
    server        invalid    Profile has invalid certificate chain
                             Certificate 'intermediate.crt' does not exist
```

9.2.1.3 Rotating Certificate and Key Pair

The certificate and key pair used in SSL profile can be rotated using rotation commands. For example, let's say we want to rotate ***cert.pem*** and ***key.pem*** in the SSL profile ***profile01***.

```
switch01# show running-config section ssl
management security
ssl profile profile01
certificate cert.pem key key.pem
```

Run the **`security pki certificate generate signing-request rotation ssl profile`** command to generate a new key and corresponding signing request for SSL profile ***profile01***. This command also generates a unique rotation ID that can be later used to import the certificate.

```
switch01# security pki certificate generate signing-request rotation ssl
 profile profile01 key generate rsa 2048 parameters common-name switch01
Rotation ID: 2ad7771e8cbc11ebbba37483ef8d9c4b
Certificate Signing Request:
-----BEGIN CERTIFICATE REQUEST-----
MIICZzCCAU8CAQAwEzERMA8GA1UEAwwIc3dpdGNoMDEwggEiMA0GCSqGSIb3DQEB
AQUAA4IBDwAwggEKAoIBAQCy5EsczfEZlAVNZQ8/nfRgEF3bg/tz0XrQJwP/zHhI
UFx1A1VI4O7XhUrYReH1h4OQWhXXX0AHTLTsaClJWHH9m7SXb4iZVo/Y1zXGdyju
```

```
1FmnWnNDi72M8f60WXG9gAMtnZK9K53A3lwvrKS+CwJkLCOjlH4xyp1Wsg1+yfay
AdfXAj+s1Vmg3Rux/XR8iP3N620YVbQ+AfWUQkSNFSsykcTeLvx2WybqX4p4Kids
nqU28ml/NZPS5wEc2OXhagrBn3jHbxdmI33/4SJHN8iNZ6h+gQz+JI18bQrlTHng
RzAx1ENvnz7ZzzeN/n/wh/ArZ6Q9aojrBtAk55aGuY4hAgMBAAGgDzANBgkqhkiG
9w0BCQ4xADANBgkqhkiG9w0BAQsFAAOCAQEAqwQbAsdw6UhpvjDk8OdmXLgCNOSC
jGFLFZe4I67gDmyGQR2lG1brRTQPKp7OphpPxaqr3YvxErEFdQ35gvIUyo9j8qp1
F22yAZGjLqU3prnGLEAZ/I3PcdivNVzL9UJw/JMfHI1CMH6yGtbEI2BXsCTetfxm
JE+N9ujfBlQ/MjUR6IszNxEB2YkFh/DvnVUHoqV0ka+JRmMhGkmTrXwad8bhxYZs
g7cwXktsMLuy2otK21fkFcRvd9OHXssJ2Mf7914ALiDe2sfixHX+35SytR8bahTk
z09HPCkxJmfl+cdhS9SWXrXpHHwXicjwYCj1pqZulBFXtgnVs2Kmd3NnRA==
-----END CERTIFICATE REQUEST-----
```

The complete syntax of the above command is as follows. The **import-timeout** specifies the timeout for this rotation ID. If no certificate is imported within this timeout, the rotation ID expires and will be deleted.

```
switch# security pki certificate generate signing-request rotation ssl
 profile <profile-name>
key generate rsa <2048|3072|4096>
[ import-timeout <minutes> ] (default: 60 mins)
[ digest <sha256|sha384|sha512> ]  (default: sha256) parameters common-
name <common-name>
[ country <country-code> ]
[ state <state-name> ]
[ locality <locality-name> ]
[ organization <org-name> ]
[ organization-unit <org-unit-name> ]
[ email <email> ]
[ subject-alternative-name [ ip <ip1 ip2 …> ]
[ dns  <nm1 nm2 …> ] [ dns  <nm1 nm2 …> ]
```

Use the **show security pki certificate rotation** command to view the status of rotation IDs.

Example

```
switch# show security pki certificate rotation
Rotation ID                       Profile Name State           Expiry
--------------------------------- ------------ ---------------
 -------------------
2ad7771e8cbc11ebbba37483ef8d9c4b  profile01    Import Pending  2021-03-24
 10:15:37
```

Copy the signing request, get it signed by a CA and import the certificate using the **security pki certificate rotation import <rotation-id>** command. Use the rotation ID that was generated with the signing request.

```
switch# security pki certificate rotation import 2ad7771e8cbc1
1ebbba37483ef8d9c4b
Enter TEXT certificate. Type 'EOF' on its own line to end.

Vg==
-----END CERTIFICATE-----
EOF
Success
```

Commit the rotation ID using the **security pki certificate rotation commit <rotation-id>** command. This will rotate ***cert.pem*** and ***key.pem*** of SSL profile ***profile01*** with new certificate and key.

```
switch# security pki certificate rotation commit 2ad7771e8cbc1
1ebbba37483ef8d9c4b
Success
```

Note: If the key is generated outside EOS, then instead of the above workflow, we can rotate the certificate and key pair using a single command as below:

```
switch# security pki certificate rotation commit ssl profile
 profile01
Enter TEXT private key. Type 'EOF' on its own line to end.

Success
```

Once the certificate and key pair is rotated, use the **show management security ssl certificate cert.pem** and **show management security ssl key key.pem** commands to display the new contents.

9.2.1.4 Resetting Diffie-Hellman Parameters

The Diffie-Hellman parameters file is used for symmetric key exchange during SSL negotiation. When the system is booted, the system auto generates a Diffie-Hellman parameters file if one does not exist. To reset the auto generated Diffie-Hellman parameters file, use the reset command. The individual features that use SSL profile configuration will decide whether they also use the Diffie-Hellman parameters file. The switch uses 2048-bit Diffie-Hellman parameters with no options to select the size.

Note: Not all features that use SSL profile configuration will use Diffie-Hellman parameters file.

Example

This command resets the Diffie-Hellman parameters file.

```
switch# reset ssl diffie-hellman parameters
```

9.2.1.4.1 Displaying the Diffie-Hellman parameters

The **show management security ssl diffie-hellman** command displays the Diffie-Hellman parameters.

Example

This command displays the Diffie-Hellman parameters.

```
switch# show management security ssl diffie-hellman
Last successful reset on Apr 10 16:18:08 2015
Diffie-Hellman Parameters 1024 bits
```

```
 Generator: 2

```

9.2.1.5 Configuring the TLS Handshake Settings

During a TLS handshake, both peers send each other a list of the TLS versions they support as a way to agree on and use the highest common version. In a SSL profile the following allowable versions can be configured using the **`tls versions`** command. By default, ***TLSv1***, ***TLSv1.1***, and ***TLSv1.2*** are enabled.

Examples

- This command forces ***TLSv1.2*** to be used. If the other peer does not support this version, the TLS handshake fails.

```
switch# config
switch#(config)# management security
switch(config-mgmt-security)# ssl profile client
switch(config-mgmt-sec-ssl-profile-client)#
switch(config-mgmt-sec-ssl-profile-client)# tls versions 1.2
```

- These commands add support for ***TLSv1.1*** on top of the already configured ***TLSv1.2***.

```
switch(config-mgmt-sec-ssl-profile-client)# tls versions add
 1.1
switch(config-mgmt-sec-ssl-profile-client)# tls versions 1.1
 1.2
```

Similarly to the TLS version, the cipher suite is negotiated between the client and the server during a TLS handshake. Ideally, the client will send the list of cipher suites it supports and the server will choose a common cipher suite after looking at the clients list as well as its own list of cipher suites. The default cipher-list setting here is an Open SSL cipher string that is **HIGH:!eNULL:!aNULL:!MD5**, which only allows key length larger than 128 bits and forbids cipher suites using MD5. The full list of cipher suites can be expanded using the shell command **openssl ciphers HIGH:!eNULL:!aNULL:!MD5**

Example

This command builds a cipher suite list.

```
switch(config-mgmt-sec-ssl-profile-client)# cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-client)# cipher-list
 SHA256:SHA384
switch(config-mgmt-sec-ssl-profile-client)# cipher-list ECDHE-
ECDSA-AES256-GCM-SHA384
```

9.2.1.5.1 Enabling the Federal Information Processing Standards (FIPS) Mode

Federal Information Processing Standards (FIPS) is a cryptographic standard used to restrict the cryptographic functions and protocol versions that are used by OpenSSL.

Example

This command enables the FIPS mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client)# fips restrictions
```

9.2.1.6 Syslog with TLS Support

To collect Syslog information on a remote Syslog server define an SSL profile. Traffic to the server is then sent over a TLS connection.

Configuring Syslog with TLS Support

Configure a remote Syslog server with an SSL profile using the following command. It configures a Syslog server with hostname ***test.example.com***. The SSL profile (***test-profile***) is used for communications over port ***1234***.

```
switch(config)# logging host test.example.com 1234 protocol tls ssl-
profile test-profile
```

SSL Profile Example (Minimal)

The following commands set up a minimal profile to support remote logging over TLS. All relevant configuration on the remote server for TLS communication should also be configured.

```
switch(config-mgmt-security)# ssl profile test-profile
switch(config-mgmt-sec-ssl-profile-test-profile)# certificate clientCert
 key clientKey
switch(config-mgmt-sec-ssl-profile-test-profile)# trust certificate
 serverCA
```

9.2.1.7 Displaying Certificate and Key Information

- Displaying Certificate Information
- Displaying Key Information

9.2.1.7.1 Displaying Certificate Information

Displaying the Directory Information

The **dir** command displays the directory output of certificate file systems.

Example

This command displays the directory output of certificate: file-system.

```
switch# dir certificate:
Directory of certificate:/
   -rw- 3319 Apr 10 11:50 server.crt
```

```
No space information available
```

Displaying the certificate information

The **show management security ssl certificate** command displays the certificate information. To view a specific certificate use the name of the certificate, else all the certificates are displayed.

Example

This command displays the server.crt certificate information.

```
switch# show management security ssl certificate server.crt
Certificate server.crt:
 Version:                    1
 Serial Number:              9
 Issuer:
    Common name:             ca
    Email address:           ca@foo.com
    Organizational unit:     Foo Org
    Organization:            Foo
    Locality:                SC
    State:                   CA
    Country:                 US
 Validity:
    Not before:             Aug 11 21:44:17 2014 GMT
    Not After:              May 14 21:44:17 2069 GMT
 Subject:
    Common name:            server
    Email address:          server@arista.com
    Organizational unit:    Foo Org
    Organization:           Foo
    Locality:               SC
    State:                  CA
    Country:                US
 Subject public key info:
    Encryption Algorithm:   RSA
    Size:                   2048 bits
    Public exponent:        65537
    Modulus:                e04e3ff8e1c64dbcb141fe9613
3f998e90a322c671b9f28307bf873
                            2239f69804a77fbb8f146841eb
6253b7bb50bf6c66bbf3097ec695b
                            0d7985cfdd939c9913b4ba4f6c
b8655b208ed0254a269ecab574987
                            ea5ee80085f5216d303cf70437
2b2fa1aae62756c3762441fcc1c04
                            635a831d5ec96d841
```

Displaying Certificate Revocation List (CRL) Information

The **show management security ssl crl** command displays the installed Certificate Revocation List (CRL) information. To view a specific CRL use the name of the CRL, else all the CRLs are displayed.

Example

This command displays the ***intermediate.crl*** information.

```
switch# show management security ssl crl intermediate.crl
CRL intermediate.crl:
   CRL Number: 11
   Issuer:
      Common name: intermediate
      Email address: intermediate@foo.com
      Organizational unit: Foo Org
      Organization: Foo
      State: CA
      Country: US
   Validity:
      Last Update: Jul 19 19:27:34 2016 GMT
      Next Update: Dec 05 19:27:34 2043 GMT
```

9.2.1.7.2 Displaying Key Information

Displaying the Directory Information

The **dir** command displays the directory output of SSL key file systems.

Example

This command displays the directory output of sslkey: file-system.

```
switch# dir sslkey:
Directory of sslkey:/
   -rw- 1675 Apr 10 12:55 server.key
No space information available
```

Displaying the RSA Key Information

The **show management security ssl key** command displays the RSA key information. To view a specific RSA key use the name of the key, otherwise, all the keys are displayed. For security reasons, only the public part of the key is displayed.

Example

This command displays the server.key key information.

```
switch# show management security ssl key server.key
Key server.key:
 Encryption Algorithm: RSA
 Size:                 2048 bits
 Public exponent:      65537
 Modulus:              e04e3ff8e1c64dbcb141fe96133f998e90a322c
671b9f28307bf873
                       2239f69804a77fbb8f146841eb6253b7bb50bf6
c66bbf3097ec695b
                       0d7985cfdd939c9913b4ba4f6cb8655b208ed02
54a269ecab574987
                       b502f8c3f541fa3bae59743cced6e6ca04f6ca6
c9268744add79c3a
```

```
                                f8178d12dd744ddf5db100b33c46b40e53f0a1c
7d49f83488976c5d
```

9.2.1.8 TLS Commands

Configuration Commands

- copy file: certificate:
- copy file: sslkey:
- delete certificate:
- delete sslkey:
- dir certificate:
- dir sslkey:
- reset ssl diffie-hellman parameters
- security pki certificate generate
- security pki key generate
- ssl profile

Show Commands

- show management security ssl certificate
- show management security ssl crl
- show management security ssl diffie-hellman
- show management security ssl key
- show management security ssl profile

9.2.1.8.1 copy file: certificate:

The **copy file: certificate:** command copies the certificate to the certificate: file system. The certificate can be copied from any supported source URL of the **copy** command.

Command Mode

Global Configuration

Command Syntax

copy file: ***file_name*** **certificate:**

Parameters

file_name location or the path of the file or the directory where the certificate is saved.

Guidelines

The following requirements apply to copying certificates:

- A single source file can contain multiple PEM encoded entities, but they must all be certificates. If other types such as SSL keys are also included, the copy fails and an error message is displayed as shown.

```
switch(config)#copy file:tmp/ssl/mixed.crt certificate:
% Error copying file:tmp/ssl/mixed.crt to certificate: (Multiple types
 of entities in certificate file not supported)
switch(config)#
```

- The source file must contain valid PEM encoded certificates. If the file contains invalid certificates, the copy fails and an error message is displayed as shown.

```
switch(config)#copy file:tmp/ssl/bad.crt certificate:
% Error copying file:tmp/ssl/bad.crt to certificate: (Invalid
 certificate)
switch(config)#
```

- Only certificates with RSA public keys are supported. If the certificate does not have an RSA public key, the copy fails and an error message is displayed as shown.

```
switch(config)#copy file:tmp/ssl/dsa.crt certificate:
% Error copying file:tmp/ssl/dsa.crt to certificate: (Certificate does
 not have RSA key)
switch(config)#
```

Example

This command copies a server.crt certificate to the certificate: file system.

```
switch(config)# copy file:/tmp/ssl/server.crt certificate:
Copy completed successfully.
```

9.2.1.8.2 copy file: sslkey:

The **copy file: sslkey:** command copies the SSL key to the sslkey: file system. The key can be copied from any supported source URL of the **copy** command.

Command Mode

Global Configuration

Command Syntax

copy file: ***file_name*** **sslkey:**

Parameters

file_name location or the path of the file or the directory where the key is saved.

Guidelines

The following requirements apply to copying SSL keys:

- Only one PEM encoded key per file is supported. If the source file contains multiple PEM encoded keys, the copy fails and an error message is displayed as shown.

```
switch#copy file:tmp/ssl/multi.key sslkey:
% Error copying file:tmp/ssl/multi.key to sslkey: (Multiple PEM
 entities in single file not supported)
```

- The source file must contain a valid PEM encoded RSA key. If the file contains an invalid RSA key, the copy fails and an error message is displayed as shown.

```
switch#copy file:tmp/ssl/bad.key sslkey:
% Error copying file:tmp/ssl/bad.key to sslkey: (Invalid RSA key)
```

- Password protected keys are not supported. If the source file contains a password protected key, the copy fails and an error message is displayed as shown.

```
switch#copy file:/tmp/ssl/pass.key sslkey:
% Error copying file:tmp/ssl/pass.key to sslkey: (Password protected
 keys are not supported)
```

Example

This command copies an SSL key in the file *server.key* to the sslkey: file system.

```
switch(config)#copy file:/tmp/ssl/server.key sslkey:
Copy completed successfully.
switch(config)#
```

9.2.1.8.3 delete certificate:

The **`delete certificate:`** command deletes a specified certificate from certificate: file system on the switch.

Command Mode

Global Configuration

Command Syntax

`delete certificate:` ***certificate_name***

Parameters

certificate_name name of the certificate to be deleted.

Example

This command deletes the server.crt certificate from the switch.

```
switch(config)# delete certificate:server.crt
```

9.2.1.8.4 delete sslkey:

The **`delete sslkey:`** command deletes a SSL key from sslkey: file system on a switch.

Command Mode

Global Configuration

Command Syntax

`delete sslkey:` ***key_name***

Parameters

key_name name of the key.

Example

This command deletes the server.key SSL key on the switch.

```
switch(config)# delete sslkey:server.key
```

9.2.1.8.5 dir certificate:

The **dir certificate:** command displays the directory output of certificate: file system on the switch.

Command Mode

Global Configuration

Command Syntax

dir certificate:

Example

This command shows the directory output of certificate: file system on the switch.

```
switch(config)# dir certificate:
Directory of certificate:/
   -rw- 3319 Apr 10 11:50 server.crt
No space information available
```

9.2.1.8.6 dir sslkey:

The **dir sslkey:** command displays the directory output of sslkey: file system on the switch.

Command Mode

Global Configuration

Command Syntax

dir sslkey:

Example

This command shows the directory output of sslkey: file system on the switch.

```
switch(config)# dir sslkey:
Directory of sslkey:/
   -rw- 1675 Apr 10 12:55 server.key
No space information available
```

9.2.1.8.7 reset ssl diffie-hellman parameters

The **reset ssl diffie-hellman parameters** command resets the Diffie-Hellman parameters file after a system reboot.

Command Mode

Global Configuration

Command Syntax

reset ssl diffie-hellman parameters

Example

This command resets the Diffie-Hellman parameters file.

```
switch(config)# reset ssl diffie-hellman parameters
switch(config)#
```

9.2.1.8.8 security pki certificate generate

The **`security pki certificate generate`** command is used to generate a self-signed certificate or a Certificate Signing Request (CSR) certificate. The generated CSR is displayed on the CLI, whereas a self-signed certificate is saved to the certificate: file system.

Many other parameters can be entered and applied to the certificate as shown in the following examples below.

Command Mode

Global Configuration

Command Syntax

`security pki certificate generate` {**`self-signed`** | **`signing-request`**} ***certificate_name*** **`Key`** ***key_name***

Parameters

- ***certificate_name*** name of the certificate to generate. Options includes:
  - self-signed request to generate self-signed certificate.
  - signing-request request to generate signing-request.
  - **digest** signs the certificate or key with the following cryptographic hash algorithm (***sha256***, ***sha384***, ***sha512***).
  - ***key_name*** name of the key to modify.
- **parameters** signing request parameters for a certificate. Option includes:
  - ***common-name*** common name for use in subject.
  - ***country*** two-letter country code for use in subject.
  - ***email*** email address for use in subject.
  - ***locality*** locality name for use in subject.
  - ***organization*** organization name for use in subject.
  - ***organization-unit*** organization Unit Name for use in subject.
  - ***state*** state for use in subject.
  - ***subject-alternative-name*** subject alternative name extension.
  - ***rotation*** to generate a unique rotation ID.
- ***validity*** validity of the certificate in days. Value ranges from ***1*** to ***30000*** .

Examples

- This command generates a self-signed certificate or CSR certificate. In the example below an existing private key (***test.key***) is used to generate the certificates.

```
switch(config)# security pki certificate generate self-signed test.crt
 key test.key
```

- This command specifies the digest and the validity (in days) of the certificate or key.

```
switch(config)# security pki certificate generate signing-request key
 test.key digest sha256 validity 365
```

- This command adds the certificate parameters such as common-name, country, email, and others.

```
switch(config)# security pki certificate generate signing-request key
 test.key parameters common-name Test [country US ...]
```

9.2.1.8.9 security pki key generate

The **security pki key generate** command generates a RSA key used to validate a specific certificate.

The key generated can be modified and saved by entering the value of the length in generate rsa <length> parameter.

Command Mode

Global Configuration

Command Syntax

security pki key generate ***rsa key_name***

Parameters

- *rsa* use Rivest-Shamir-Adleman (RSA) algorithm. Options include.
  - ***2048*** Use 2048-bit keys.
  - ***3072*** Use 3072-bit keys.
  - ***4096*** Use 4096-bit keys.
- ***key_name*** name of the key to generate.

Examples

- This command generates a a 2048-bit long RSA private key(***test.key***) and save it to sslkey:test.key.

```
switch(config)#security pki key generate rsa 2048 test.key
```

- This command modifies the generated RSA key length value.

```
switch(config)# security pki certificate generate self-signed test.crt
 key
test.key generate rsa 4096
switch(config)# security pki certificate generate signing-request key
 test.key
generate rsa 2048
```

9.2.1.8.10 show management security ssl certificate

The **show management security ssl certificate** command displays information about the certificate. Provide the name of the certificate if you want to view more information of the certificate. If no name is provided, this command displays information of all the certificates.

Command Mode

EXEC

Command Syntax

show management security ssl certificate [***certificate_name***]

Parameter

certificate_name name of the certificate. This is optional.

Example

This command displays the server.crt certificate information.

```
switch# show management security ssl certificate server.crt
Certificate server.crt:
 Version:                    1
 Serial Number:              9
 Issuer:
    Common name:             ca
    Email address:           ca@foo.com
    Organizational unit:     Foo Org
    Organization:            Foo
    Locality:                SC
    State:                   CA
    Country:                 US
 Validity:
    Not before:             Aug 11 21:44:17 2014 GMT
    Not After:              May 14 21:44:17 2069 GMT
 Subject:
    Common name:            server
    Email address:          server@arista.com
    Organizational unit:    Foo Org
    Organization:           Foo
    Locality:               SC
    State:                  CA
    Country:                US
 Subject public key info:
    Encryption Algorithm:   RSA
    Size:                   2048 bits

```

9.2.1.8.11 show management security ssl crl

The **show management security ssl crl** command displays the basic information on the installed Certificate Revocation List (CRLs).To view information of a specific CRL provide the name of the CRL. If no name is provided, this command shows information of all the CRLs.

Note: The command only shows basic information and does not show any information on the revocation status of certificates.

Command Mode

EXEC

Command Syntax

show management security ssl crl

Example

This command displays the basic information of the intermediate.crl CRL.

```
switch# show management security ssl crl intermediate.crl
CRL intermediate.crl:
   CRL Number: 11
   Issuer:
      Common name: intermediate
      Email address: intermediate@foo.com
      Organizational unit: Foo Org
      Organization: Foo
      State: CA
      Country: US
   Validity:
      Last Update: Jul 19 19:27:34 2016 GMT
      Next Update: Dec 05 19:27:34 2043 GMT
```

9.2.1.8.12 show management security ssl diffie-hellman

The **show management security ssl diffie-hellman** command displays the Diffie-Hellman parameter information.

Command Mode

EXEC

Command Syntax

show management security ssl diffie-hellman

Example

This command displays the Diffie-Hellman parameter information.

```
switch# show management security ssl diffie-hellman
Last successful reset on Apr 10 16:18:08 2015
Diffie-Hellman Parameters 1024 bits
 Generator: 2

```

9.2.1.8.13 show management security ssl key

The **`show management security ssl key`** command displays the RSA key information. To view information of a specific key, provide the name of the key in the command. If no name is provided, this command displays information of all the keys.

Note: For security reasons, only the public part of the key is shown.

Command Mode

EXEC

Command Syntax

`show management security ssl key` [***key_name***]

Parameter

key_name name of the key. This is optional.

Example

This command displays the server.key key information.

```
switch# show management security ssl key server.key
Key server.key:
Encryption Algorithm: RSA
Size:                 2048 bits
Public exponent:      65537

```

9.2.1.8.14 show management security ssl profile

The **show management security ssl profile** command displays the SSL profile status information. To display information of a specific SSL profile, provide the name of the profile. If no name is provided, this command displays profile status of all the SSL profiles.

If there are any errors in the SSL profile, the state is shown invalid and the errors are listed in the third column as shown in the example below.

Command Mode

EXEC

Command Syntax

show management security ssl profile [***profile_name***]

Parameter

profile_name name of the SSL profile, this is optional.

Examples

- This command displays the SSL profile status of profile server.

```
switch# show management security ssl profile server
 Profile      State
------------- -----------
 server       valid
```

- When the certificate ***server.crt*** does not match with the key the following error occurs.

```
switch# show management security ssl profile server
Profile       State         Error
------------- ------------- ----------------------------------------
server        invalid       Certificate 'server.crt' does not match
                            with key
```

- When a trusted certificate ***ca2.crt*** does not exist the following error occurs.

```
switch# show management security ssl profile server
Profile       State         Error
------------- ------------- ----------------------------------------
server        invalid       Certificate 'ca2.crt' does not exist
```

- When a trusted certificate ***foo.crt*** is not self-signed root certificate the following error occurs.

```
switch# show management security ssl profile server
Profile       State         Error
------------- ------------- ----------------------------------------
server         invalid      Certificate 'foo.crt' is trusted and not
                            a root certificate
```

- When the certificate ***server.crt*** is expired the following error occurs.

```
switch# show management security ssl profile server
Profile       State         Error
------------- ------------- ----------------------------------------
 server       invalid       Certificate 'server.crt' has expired
```

- When the certificate chain is missing an intermediate certificate the following error occurs.

```
switch# show management security ssl profile server
Profile        State         Error
-------------- ------------- ----------------------------------------
------
```

```
server          invalid       Profile has invalid certificate chain
                              Certificate 'intermediate.crt' does not
 exist
```

9.2.1.8.15 ssl profile

The **ssl profile** command places the switch in the SSL profile configuration mode. Various SSL profile management configurations are allowed in this mode. For example, this mode allows to configure a SSL profile with a certificate and its corresponding RSA key.

Similarly, other configurations such as trust certificate, chain certificate, crl, tls, cipher-list can be configured to a SSL profile in this mode.

The no form of the command deletes the SSL profile management configuration from ***running-config***.

Command Mode

Management Security Mode

SSL Profile Mode

Command Syntax

ssl profile ***profile_name***

Parameter

profile_name name of the profile.

Examples

- These commands place the switch in SSL profile mode.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#
```

- These commands configure SSL profile server with a certificate and its corresponding RSA key. The **no** command deletes the certificate configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# certificate server.crt key
 server.key
switch(config-mgmt-sec-ssl-profile-server)# no certificate server.crt
 key server.key
```

- These commands configure the trust certificate ca1.crt to an SSL profile. The **no** command deletes a trusted certificate configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# trust certificate ca1.crt
switch(config-mgmt-sec-ssl-profile-server)# no trust certificate
 ca1.crt
```

- These commands configure the intermediate.crt chain certificate to an SSL profile. The **no** command deletes a chain certificate configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# certificate server.crt key
 server.key
switch(config-mgmt-sec-ssl-profile-server)# chain certificate
 intermediate.crt
```

```
switch(config-mgmt-sec-ssl-profile-server)# no chain certificate
 intermediate.crt
```

- These commands provides Certificate Revocation List (CRL) to a SSL profile to check the revocation status of the certificate chain. The **no** command deletes the CRL configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# crl intermediate.crl
switch(config-mgmt-sec-ssl-profile-server)# crl ca.crl
switch(config-mgmt-sec-ssl-profile-server)# no crl ca.crl
```

- These commands configure ***TLSv1.2*** to be used in the SSL profile.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# tls versions 1.2
```

- These commands build a cipher suite list.
-

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-server)# cipher-list SHA256:SHA38
switch(config-mgmt-sec-ssl-profile-server)# cipher-list ECDHE-ECDSA-A
ES256-GCM-SHA384
```

- This command check that the certificate has an extended key usage attribute.

```
switch(config-mgmt-sec-ssl-profile-client)#certificate requirement
 extended-key-usage
```

- These commands check that all the trusted certificates or certificates in the chain have a CA basic constraints set to true.

```
switch(config-mgmt-sec-ssl-profile-client)# trust certificate
 requirement basic-constraints ca true
switch(config-mgmt-sec-ssl-profile-client)# chain certificate
 requirement basic-constraints ca true
```

- This command enables the Federal Information Processing Standards (FIPS) mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client)# fips restrictions
```

9.2.2 802.1X Port Security

This section explains the basic concepts behind 802.1X port security, including switch roles, how the switches communicate, and the procedure used for authenticating clients.

- 802.1X Port Security Introduction
- 802.1X Port Security Description
- Configuring 802.1X Port Security
- 802.1X AAA Unresponsive VLAN
- 802.1X Web Authentication
- Displaying 802.1X Information
- 802.1X Port Security Commands

9.2.2.1 802.1X Port Security Introduction

802.1X is an IEEE standard protocol that prevents unauthorized devices from gaining access to the network.

802.1X defines three device roles,

- Supplicant (client).
- Authenticator (switch).
- Authentication server (RADIUS).

Before authentication can succeed, switchport is in unauthorized mode and blocks all traffic but, after authentication has succeeded, normal data can then flow through the switchport.

Port security control who can send or receive traffic from an individual switch port. An end node is not allowed to send or receive traffic through a port until the node is authenticated by a RADIUS server.

This prevents unauthorized individuals from connecting to a switch port to access your network. Only designated valid users on a RADIUS server will be allowed to use the switch to access the network.

9.2.2.2 802.1X Port Security Description

802.1X port security controls can send traffic through and receive traffic from the individual switch ports. A supplicant must authenticate itself using EAPoL packets with the switch before it can gain full access to the port. Arista switches act as an authenticator, passing the messages from 802.1X supplicants through to the RADIUS server and vice versa. 802.1X can operate in three different modes:

- Single Host Mode: Once the 802.1X supplicant is authenticated on the port, only the traffic coming from the supplicant's MAC is allowed through the port.
- Multi-Host Mode: Once the 802.1X supplicant is authenticated on the port, traffic coming from any source MAC is allowed through the port.
- Multi-Host authenticated Mode: Multiple 802.1X supplicants are allowed and the traffic coming from all authenticated supplicant’s MAC address is only allowed through the port.

The Single Host and the Multi-Host modes allow only one 802.1X supplicant to be authenticated for one port. Once it is successfully authenticated, no other 802.1X supplicant can be authenticated, unless the current one logs off. However, the Multi-Host authenticated Mode allows multiple 802.1X supplicants to be authenticated and provided access to the network.

Apart from 802.1X authentication, Arista switches also support MAC-Based Authentication (MBA), which allows devices not speaking 802.1X to have access to the network. The authenticator uses the MAC address of such devices as username/password in its RADIUS request packets. Depending on the MAC-Based Authentication configuration on the RADIUS server, it decides whether to authenticate the supplicant or not. Unlike 802.1X supplicants, multiple MBA supplicants are allowed on a single port. The MBA configuration is independent of the 802.1X host modes. MBA supplicants will not be considered to allow or reject unauthenticated traffic, based on the host mode.

Arista switches also support Dynamic VLAN assignment, which allows the RADIUS server to indicate the desired VLAN for the supplicant, using the tunnel attributes with the Access-Accept message. Both 802.1X and MBA supplicants can be assigned a VLAN via the RADIUS server. Note that only one VLAN per port is supported. When the first host authenticates, the authenticator port is put in the respective VLAN (via dynamic VLAN assignment) and subsequently, all other hosts must belong to that VLAN as well.

802.1X features are now supported on 802.1Q trunk ports allowing the user to have Port-Based Network Access Control (PNAC) on such a port. With this feature, traffic coming into an 802.1X enabled port with a VLAN tag can also be authenticated via both 802.1X or MBA.

By default, traffic from any unauthenticated device on an 802.1X enabled port is dropped. By configuring Authentication Failure VLAN on the authenticator switch, 802.1X or MBA supplicants traffic can be put into a specific VLAN, if the supplicant fails to authenticate via the RADIUS server.

Note: Only one configurable VLAN for failure is supported. That is, failure due to server timeout, server unreachable, server AUTH-FAIL, or Quarantine.

9.2.2.2.1 Switch Roles for 802.1X Configurations

The 802.1X standard specifies the roles of **Supplicant (client)**, **Authenticator**, and **Authentication Server** in a network. Switch Roles for 802.1X Configurations illustrates these roles.

Authentication Server The switch that validates the client and specifies whether or not the client may access services on the switch. The switch supports Authentication Servers running RADIUS.

Authenticator The switch that controls access to the network. In an 802.1X configuration, the switch serves as the Authenticator. As the Authenticator, it moves messages between the client and the Authentication Server. The Authenticator either grants or does not grant network access to the client based on the identity data provided by the client, and the authentication data provided by the Authentication Server.

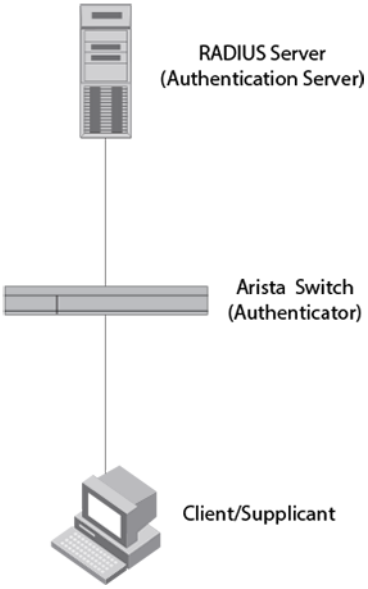

Figure 5: Authenticator, Supplicant, and Authentication Server in an 802.1X configuration

Supplicant/Client The client provides a username or password data to the Authenticator. The Authenticator sends this data to the Authentication Server. Based on the supplicants information, the Authentication Server determines whether the supplicant can use services given by the Authenticator. The Authentication Server gives this data to the Authenticator, which then provides services to the client, based on the authentication result.

9.2.2.2.2 Authentication Process

The authentication that occurs between a supplicant, authenticator, and authentication server include the following processes.

- Either the authenticator (a switch port) or the supplicant starts an authentication message exchange. The switch starts an exchange when it detects a change in the status of a port, or if it gets a packet on the port with a source MAC address that is not included in the MAC address table.
- An authenticator starts the negotiation by sending an EAP-Request/Identity packet. A supplicant starts the negotiation with an EAPOL-Start packet, to which the authenticator answers with a EAP-Request/Identity packet.

- The supplicant answers with an EAP-Response/Identity packet to the authentication server via the authenticator.
- The authentication server responds with an EAP-Request packet to the supplicant via the authenticator.
- The supplicant responds with an EAP-Response.
- The authentication server transmits either an EAP-Success packet or EAP-Reject packet to the supplicant.
- If an EAP-Reject is received, the supplicant will receive an EAP-Reject message and their traffic will not be forwarded.

9.2.2.2.3 Communication Between the Switches

For communication between the switches, 802.1X port security uses the Extensible Authentication Protocol (EAP), defined in ***RFC 2284*** and the RADIUS authentication protocol.

The 802.1X standard defines a method for encapsulating EAP messages so they can be sent over a LAN. This encapsulated kind of EAP is known as EAP over LAN (EAPOL). The standard also specifies a means of transferring the EAPOL information between the client or Supplicant, Authenticator, and Authentication Server.

EAPOL messages are passed between the Supplicants and Authenticators Port Access Entity (PAE). The figure below shows the relationship between the Authenticator PAE and the Supplicant PAE.

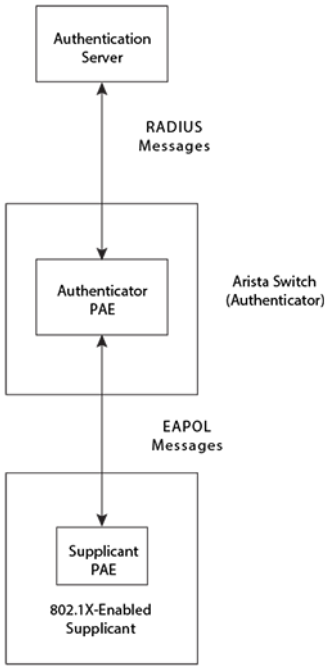

Figure 6: Authenticator PAE and Supplicant PAE

Authenticator PAE: The Authenticator PAE communicates with the Supplicant PAE to receive the Supplicants identifying information. Behaving as a RADIUS client, the Authenticator PAE passes the Supplicants information to the Authentication Server, which decides whether to grant the Supplicant access. If the Supplicant passes authentication, the Authenticator PAE allows it access to the port.

Supplicant PAE: The Supplicant PAE provides information about the client to the Authenticator PAE and replies to requests from the Authenticator PAE. The Supplicant PAE may initiate the authentication procedure with the Authenticator PAE, as well as send logoff messages.

9.2.2.2.4 Dot1x Dropped Counters

The Dot1x Dropped Counters count the packets dropped by dot1x interfaces. The dropped counter will not represent all the dropped packets in case of high volume dropping, and the CPU queue drop counter will reflect the rest of the dropped packet counter. This is due to the fact that EOS limits the bandwidth for the packets that get sent to the CPU.

The following counters are supported and increment depending on the ***dot1x interface*** configuration mode:

- EAPOL unauthorized port (indicates the dropped packet number due to the unauthorized EAPOL port when Mac Base Authorization is disabled).
- EAPOL unauthorized host (indicates the dropped packet number due to the unauthorized EAPOL host).
- MBA unauthorized host (counts the dropped packet due to the unauthorized host when Mac Base Authorization is enabled.)

9.2.2.2.5 Enable 802.1X Port Control

To enable 802.1X port authentication on the switch, global command configuration is required:

```
switch(config)# dot1x system-auth-control
```

Port mode can be set to access/trunk port and 802.1X port access entity is set to authenticator:

```
switch(config-if-Et1)# switchport mode access
switch(config-if-Et1)# dot1x pae authenticator
```

9.2.2.2.6 Controlled and Uncontrolled Ports

A physical port on the switch used with 802.1X has two virtual access points that include a controlled port and an uncontrolled port. The controlled port grants full access to the network. The uncontrolled port only gives access for EAPOL traffic between the client and the Authentication Server. When a client is authenticated successfully, the controlled port is opened to the client.

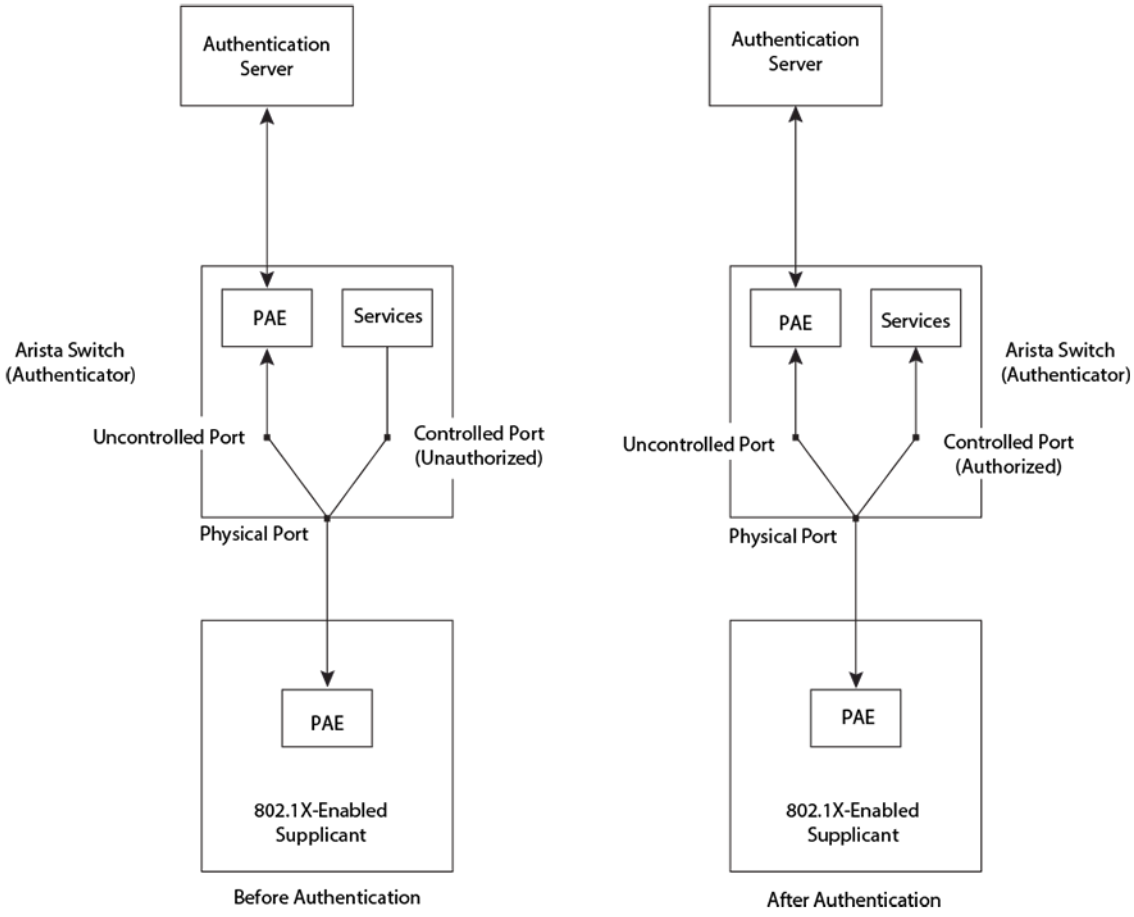

Figure 7: Ports Before and After Client Authentication

9.2.2.2.6.1 Control Port State

Before the port is authenticated, the port is in an unauthorized state. In this state, only EAPOL packets are processed by 802.1X agent and all other packets are dropped. After the port is successfully authenticated, the port is in the authorized state and all packets are allowed to pass. The state transition is controlled by authentication exchange between supplicant and authentication server. However, the user can control the state by using any one of the following commands:

`dot1x port-control` force-authorized

force-authorized: disables 802.1X authentication and directly put the port to the authorized state. This is the default setting.

`dot1x port-control` force-unauthorized

force-unauthorized: also disables 802.1X authentication and directly put the port to unauthorized state, ignoring all attempts by the client to authenticate.

`dot1x port-control` auto

auto: enables 802.1X authentication and put the port to unauthorized state first. The port state remains in an unauthorized state or transit to authorized state according to authentication result and configuration.

9.2.2.2.6.2 Uncontrolled Port State

The uncontrolled port on the Authenticator is the only one open before a client is authenticated. The uncontrolled port permits only EAPOL frames to be swapped between the client and the Authentication Server. No traffic is allowed to pass through the controlled port in the unauthorized state.

During authentication, EAPOL messages are swapped between the Supplicant PAE and the Authenticator PAE, and RADIUS messages are swapped between the Authenticator PAE and the Authentication Server. If the client is successfully authenticated, the controlled port becomes authorized, and traffic from the client can flow through the port normally.

All controlled ports on the switch are placed in the authorized state, allowing all traffic, by default. When authentication is initiated, the controlled port on the interface is initially set in the unauthorized state. If a client connected to the port is authenticated successfully, the controlled port is set in the authorized state.

9.2.2.2.7 Message Exchange During Authentication

The figure below illustrates an exchange of messages between an 802.1X-enabled client, a switch operating as Authenticator, and a RADIUS server operating as an Authentication Server.

Arista switches support MD5-challenge TLS and any other EAP-encapsulated authentication types in EAP Request or Response messages. In other words, the switches are transparent to the authentication scheme used.

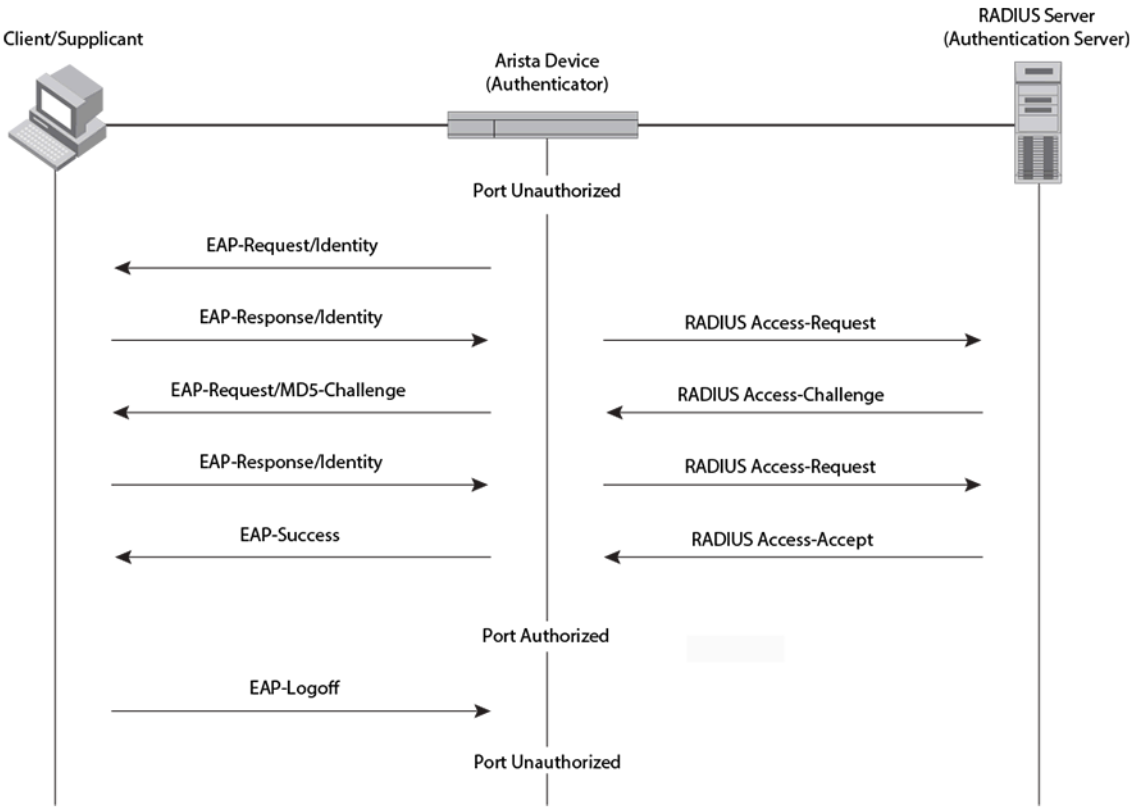

Figure 8: Message Exchange During Authentication

9.2.2.2.8 Authenticating Multiple Clients Connected to the Same Port

Arista switches support 802.1X authentication for ports with more than one client connected to them. Figure 9: Multiple clients connected to a 802.1X-enabled port illustrates a sample configuration where multiple clients are connected to a single 802.1X port. 802.1X authentication may use multi-host mode, or (on selected switches) single-host mode. In both modes, the port authenticates the packets received

from any one client, and the packets received from other clients are dropped, until the connected client is authenticated by the RADIUS server.

9.2.2.2.8.1 Single-host Mode

In single-host mode, once the 802.1X client has been authenticated by the RADIUS server further authentication is not required, but the port accepts packets only from the MAC address of the authenticated client.

9.2.2.2.8.2 Multi-host Mode

In multi-host mode, once the 802.1X client has been authenticated by the RADIUS server, the port is open to accept all packets from any connected client, and these packets do not require any authentication.

9.2.2.2.9 802.1X MAC- Based Authentication

The 802.1X MAC-based authentication allows a set of MAC addresses to be programmed into the RADIUS server. These MAC addresses (MAC-based authentication supplicants) do not connect to 802.1X profiles but are still allowed access to the network. The authenticator identifies devices that do not support 802.1X and uses the MAC address of these devices as username and password in its RADIUS request packets.

In a MAC-based authentication, every supplicant trying to gain access to the authenticator port is individually authenticated as opposed to authenticating just one supplicant on a given VLAN or port with 802.1X. The behavior is different for MAC-based authentication supplicants when we have a 802.1.x supplicant authenticated in single host and multi-host 802.1X modes.

To enable Mac-based authentication, use the following command:

Command syntax

`dot1x mac based authentication`

Note: This command is added to the existing 802.1X configuration on the port, so a typical 802.1X interface configuration with MAC-Based Authentication enabled may look something like this:

```
switch(config-if-Et1/1)# show active
speed forced 1000full
dot1x pae authenticator
dot1x port-control auto
dot1x mac based authentication
```

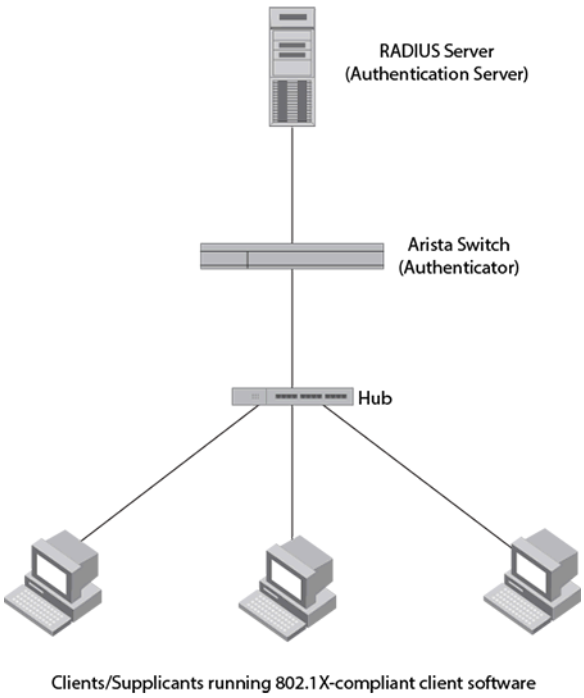

Figure 9: Multiple clients connected to a 802.1X-enabled port

Mac-Based Authentication Delay

Use the **`mac based authentication delay`** command to configure a Mac-based Authentication delay. By default, the delay is triggered after ***5*** seconds.

Comman Syntax

`mac based authentication` delay ***0-300*** seconds

Mac-Based Authentication Hold-Period

When Mac Based Authentication is rejected by a AAA server, there is a default hold period of ***60*** seconds before the Mac Based Authentication is retried again even if the host continues to send traffic. However, the hold-period can be configured manually using the **`mac based authentication hold period`** command.

Command Syntax

`mac based authentication` hold period ***0-300*** seconds

Note: Configuring a low value for the hold-period can significantly increase the load on a AAA server in- case MAC-Based Authentication is not enabled for a host.

9.2.2.3 802.1X AAA Unresponsive VLAN

Overview

Devices connected to 802.1X controlled ports must perform authentication before their generic traffic is allowed into the network. During this process, the switch contacts a configured AAA server that determines if the device's access to the network is accepted or denied. When the AAA server is unresponsive, the default behavior is to deny all authentication attempts. The AAA Unresponsive VLAN feature allows the user to specify different behavior for this case, accepting authentication attempts and assigning devices to the native VLAN or a specified VLAN. As in other failure scenarios, the switch tries to authenticate the supplicant after the quiet period has passed.

9.2.2.3.1 Configuring 802.1X AAA Unresponsive VLAN

The aaa unresponsive action traffic allow vlan command is configured under the dot1x configuration sub-mode to enable the dot1x AAA unresponsive VLAN feature on the switch. When configured, the switch changes the action taken with regards to authentication attempts when the AAA server is unresponsive. The AAA server is considered unresponsive when communication with it times out.

Example

These commands places the switch in the dot1x configuration mode and enables the dot1x AAA unresponsive VLAN feature on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# aaa unresponsive action traffic allow vlan
```

9.2.2.3.2 Limitations

- AAA unresponsive VLAN does not act on devices that tried to authenticate using VLAN-tagged frames.
- When AAA unresponsive VLAN is enabled without a VLAN, devices get assigned to the native VLAN – even phones that would otherwise be assigned to the phone VLAN. If phones should be assigned to the phone VLAN when AAA is unavailable, the knob aaa unresponsive phone vlan action allow should be additionally used.

9.2.2.4 802.1X Web Authentication

802.1X Web authentication feature authenticates a supplicant through a web page, generally referred to as a captive portal, which is why this feature is also known as captive portal authentication. Redirection to captive portal provides support for guest devices/supplicants that neither speak 802.1X nor can be whitelisted in advance or where 802.1X is not sufficient and an additional web based authentication is required.

9.2.2.4.1 Configuring 802.1X Web authentication

A global knob under the 802.1X node is used to enable the 802.1X Web authentication:

Command Syntax

`captive portal` url ***URL***][ssl profile ***profile***]

Enabling the 802.1X Web authentication starts the redirection agent (Dot1xWeb) and its internal HTTP redirector, and makes 802.1X act on radius web-auth-start VSA's. If a URL is specified, it's used for the redirection when AAA does not provide a specific URL. If a valid SSL profile is specified, the configured certificate and key are used to start 802.1X Web's internal HTTPS redirector.

For ACL based Web Authentication, there is one more configuration knob as follows :

```
switch(config-dot1x)# captive portal access-list ipv4 test-ACL
```

An ACL can be defined locally on the switch and be configured to use for web authentication, for cases, when AAA is not able to send ACL with web auth = start.

Here are the details about the radius VSAs.

AttributeName	Attribute ID	Type	Value
Arista-WebAuth	6	integer	start = 1 complete = 2
Arista-Captive-Portal	10	string	any valid url

Show Commands

The “show” commands that display the state of a host show the new values for WebAuth stage as well.

Example

```
switch(config)# show dot1x hosts
Interface: Ethernet36
Supplicant MAC     Auth Method     State               VLAN Id
--------------     -----------     -----               -------
00:1c:73:73:f9:38  MAC-BASED-AUTH  WEB-AUTH-START
00:1c:73:73:f9:39  MAC-BASED-AUTH  WEB-AUTH-FAILED
```

9.2.2.4.2 Limitations

The following limitations apply to the 802.1X feature.

- Only one device per port is supported (MAC ACLs are not supported), connected in wired fashion.
- HTTPS redirection is only attempted when the connection is to the default TCP port ***443***.
- Limitations present in versions lower than **RIO RELEASE**.
  - HTTPS is not supported.
- Limitations present in versions EOS Release *4.25.0* and *4.25.1*:
  - There is no downloadable ACL support - only implicit ACL support is available. This might not suffice if there is a need to allow multiple intranet websites.
  - There is only support of one Captive portal at a time.
- Limitations in version EOS Release *4.25.0*:
  - IPv4 Management IP needs to be configured on the management interface. If the management ip address is changed, then captive portal configuration needs to be reconfigured.
  - SVI needs to be configured for the VLAN where the host is going to be after the first phase of authentication - be it EAPOL or MBA.

9.2.2.5 Configuring 802.1X Port Security

Basic steps to implementing 802.1X Port-based Network Access Control and RADIUS accounting on the switch:

1. A RADIUS server is required on one or more of your network servers or management stations. 802.1X is not supported with the TACACS+ authentication protocol.
2. You must create supplicant accounts on the RADIUS server:
   - The account for a supplicant connected to an authenticator port must have a username and password combination when set to the 802.1X authentication mode.
     - An account for the supplicant connected to an authenticator port and placed in the MAC address-based authentication mode needs use the MAC address of the node as both the username and password.
     - Connected clients to an 802.1X authenticator port will require 802.1X client software.
3. The RADIUS client must be configured by entering the IP addresses and encryption keys of the authentication servers on your network.
4. The port access control settings must be configured on the switch. This includes the following:
   - Specifying the port roles.
     - Configuring 802.1X port parameters.
       - Enabling 802.1X Port-based Network Access Control.

Guidelines

- Do not set a port that is connected to a RADIUS authentication server to the authenticator role as an authentication server cannot authenticate itself.
- A supplicant connected to an authenticator port set to the 802.1X username and password authentication method must have 802.1X client software.
- To prevent unauthorized individuals from accessing the network through unattended network workstations, end users of 802.1X port-based network access control should always log off when they are finished with a work session.
- The RADIUS client should be configured on the switch before activating port-based access control.

9.2.2.5.1 Configuring 802.1X Authentication Methods

IEEE 802.1X port security relies on external client-authentication methods, which must be configured for use. The method currently supported on Arista switches is RADIUS authentication. To configure the switch to use a RADIUS server for client authentication, use the **aaa authentication dot1x** command.

Example

This command configures the switch to use RADIUS authentication.

```
switch(config)# aaa authentication dot1x default group radius
switch(config)#
```

9.2.2.5.2 Configuring Dot1x Dropped Counters

Use the **statistics packets dropped** command to cofigure the dot1x dropped counters on the switch under ***dot1x*** configuration mode. By default, the dot1x dropped counters is disabled. The **no** form of the command disables the dot1x dropped counters from the running configuration.

Example

These commands places the switch in the ***dot1x*** mode and enables the dot1x dropped counters.

```
switch(config-dot1x)# statistics packets dropped
```

9.2.2.5.3 Globally Enable IEEE 802.1X

To enable IEEE 802.1X port authentication globally on the switch, use the **dot1x system-auth-control** command.

Example

This command enables IEEE 802.1X globally on the switch.

```
switch(config)# dot1x system-auth-control
switch(config)#
```

9.2.2.5.4 Designating Authenticator Ports

To set the port access entity (PAE) type of an Ethernet or management interface to the **authenticator**, use the **dot1x pae authenticator** command.

Example

These commands configure the PAE type to **authenticator** on the Ethernet interface ***1*** to enable IEEE 802.1X on the port.

```
switch(config)# interface ethernet 1
```

```
switch(config-if-Et1)# dot1x pae authenticator
switch(config-if-Et1)#
```

Example

For ports to act as authenticator ports to connected supplicants, those ports must be designated using the **dot1x port-control** command.

The **auto** option of the**dot1x port-control** command designates an authenticator port for immediate use, blocking all traffic that is not authenticated by the AAA server.

Example

This command configures Ethernet ***1*** to immediately begin functioning as an authenticator port.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x port-control auto
switch(config-if-Et1)#
```

The **force-authorized** option of the dot1x port-control command sets the state of the port to **authorized** without authentication, allowing traffic to continue uninterrupted.

Example

These commands designate Ethernet ***1*** as an authenticator port that forwards packets without authentication.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x port-controlforce-authorized
switch(config-if-Et1)#
```

To designate a port as an authenticator but prevent it from authorizing any traffic, use the **force-unauthorized** option of the **dot1x port-control** command.

Example

The **force-unauthorized** option of the **dot1x port-control** command places the specified port in the unauthorized state, which will deny any access requests from users of the ports.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x port-controlforce-authorized
switch(config-if-Et1)#
```

9.2.2.5.5 Specifying the Authentication Mode for Multiple Clients

By default, Arista switches authenticate in multi-host mode, allowing packets from any source MAC address once 802.1X authentication has taken place. To configure the switch for single-host mode (allowing traffic only from the authenticated clients MAC address), use the **dot1x host-mode** command.

Example

These commands configure Ethernet interface ***1*** to use single-host mode for 802.1X authentication.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x host-mode single-host
switch(config-if-Et1)#
```

9.2.2.5.6 Configuring Re-authentication

The **dot1x reauthentication** command enables re-authentication of authenticator ports with the default values.

The **dot1x timeout reauth-period** command allows to customize the re-authentication period of authenticator ports.

Examples

- These commands configures the configuration mode interface to require re-authentication from clients at regular intervals.

```
switch(config)# interface Ethernet 1
switch(config-if-Eth)# dot1x reauthentication
```

- These commands configure the Ethernet interface ***1*** authenticator to require re-authentication from clients every ***6*** hours (***21600*** seconds).

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x reauthentication
switch(config-if-Et1)# dot1x timeout reauth-period 21600
switch(config-if-Et1)#
```

- These commands deactivate re-authentication on Ethernet interface ***1***.
-

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# no dot1x reauthentication
switch(config-if-Et1)#
```

9.2.2.5.7 Setting the EAP Request Maximum

The **dot1x reauthorization request limit** command configures the number of times the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

Example

These commands set the number of times the authenticator sends an EAP request packet to the client before restarting authentication.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x reauthorization request limit 4
switch(config-if-Et1)#
```

The default value is ***2***.

9.2.2.5.8 Disabling Authentication on a Port

To disable authentication on an authenticator port, use the **no** form of the **dot1x port-control** command.

Example

These commands disable authentication on Ethernet interface ***1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no dot1x port-control
switch(config-if-Et1)#
```

9.2.2.5.9 Setting the Quiet Period

If the switch fails to immediately authenticate the client, the time the switch waits before trying again is specified by the **dot1x timeout quiet-period** command. This timer also indicates how long a client that failed authentication is blocked.

Example

These commands set the 802.1X quiet period for Ethernet interface ***1*** to ***30*** seconds.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x timeout quiet-period 30
```

The default value is ***60*** seconds.

9.2.2.5.10 Setting the Dot1x Timeout Reauth-period

The **dot1x timeout reauth-period** command specifies the time period in seconds that the configuration mode interface waits before requiring re-authentication from clients.

Example

These commands configure the timeout reauth-period to ***21600*** seconds.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x reauthentication
switch(config-if-Et1)# dot1x timeout reauth-period 21600
```

The default value is ***3600*** seconds.

9.2.2.5.11 Setting the Transmission Timeout

Authentication and re-authentication are accomplished by the authenticator sending an Extensible Authentication Protocol (EAP) request to the supplicant and the supplicant sending a reply which the authenticator forwards to an authentication server. If the authenticator doesnt receive a reply to the EAP request, it waits a specified period of time before retransmitting. To configure that wait time, use the **dot1x timeout tx-period** command.

Example

These commands configure Ethernet interface ***1*** to wait ***30*** seconds before retransmitting EAP requests to the supplicant.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x timeout tx-period 30
switch(config-if-Et1)#
```

The default value is ***5*** seconds.

9.2.2.5.12 Enable Authentication Failure VLAN

Configure Authentication Failure VLAN on a dot1x-enabled port using the following CLI command under the ***interface-config*** mode. The CLI command to set ***VLAN10*** as authentication failure VLAN is as follows:

```
switch(config-if-Et1/1)# dot1x authentication failure action traffic
 allow vlan 10
```

When **no authentication failure** VLAN is configured on a dot1x-enabled port, the default action is to drop any unauthorized traffic on the port. This behavior can also be specified using the following command:

Example

```
switch(config-if-Et1/1)# dot1x authentication failure action traffic drop
```

9.2.2.5.13 Clearing 802.1X Statistics

The **clear dot1x statistics** command resets the 802.1X counters.

Examples

- This command clears the 802.1X counters on all interfaces.

```
switch# clear dot1x statistics all
switch#
```

- This command clears the 802.1X counters on Ethernet interface ***1***.

```
switch# clear dot1x statistics interface ethernet 1
switch#
```

9.2.2.6 Displaying 802.1X Information

You can display information about 802.1X on the switch and on individual ports.

9.2.2.6.1 Displaying 802.1X statistics

Use the **show dot1x statistics** command to display 802.1X statistics for the specified port or ports.

Example

- This command displays IEEE 802.1X statistics for Ethernet interface ***5***.

```
switch# show dot1x interface ethernet 5 statistics
Dot1X Authenticator Port Statistics for Ethernet5
-------------------------------------------------
RxStart = 0      RxLogoff = 0    RxRespId = 0
RxResp = 0       RxInvalid = 0   RxTotal = 0
TxReqId = 0      TxReq = 0       TxTotal = 0
RxVersion = 0    LastRxSrcMAC = 0000.0000.0000
switch#
```

- This command displays the dot1x dropped counters for all the dot1x interfaces.

```
switch# show dot1x all statistics
Dot1X Authenticator Port Statistics for Ethernet51/1
----------------------------------------------------
RX start = 1     RX logoff = 0   RX response ID = 1
RX response = 10         RX invalid = 0  RX total = 12
TX request ID = 2        TX request = 11         TX total = 13
RX version = 2   Last RX src MAC = ded6.404b.ec94
Data packet drop counters:
EAPOL unauthorized port = 2
EAPOL unauthorized host = 1
MBA unauthorized host = 0

Dot1X Authenticator Port Statistics for Ethernet49
----------------------------------------------------
```

```
RX start = 1     RX logoff = 0   RX response ID = 1
RX response = 10         RX invalid = 0  RX total = 12
TX request ID = 2        TX request = 11         TX total = 13
RX version = 2   Last RX src MAC = ded6.404b.ec94
Data packet drop counters:
EAPOL unauthorized port = 2
EAPOL unauthorized host = 1
MBA unauthorized host = 0
```

9.2.2.6.2 Displaying 802.1X supplicant information

Use the **show dot1x hosts** command to display information for all the supplicants.

Example

This command displays 802.1X supplicant information.

```
switch# show dot1x hosts
    Interface: Ethernet1/1
    Supplicant MAC       Auth Method      State     VLAN Id
    --------------       -----------      -----     -------
    e2:29:cb:11:2f:4a    EAPOL            SUCCESS   300
    e2:29:cb:11:2f:4b    MAC-BASED-AUTH   SUCCESS   300
```

9.2.2.6.3 Displaying Mac-address Tables

Use the **show mac address-table** command to display the MAC address of the supplicants allowed to pass the traffic through the port.

Example

```
switch# show mac address-table
    Mac Address Table
    ------------------------------------------------------------------------

    Vlan    Mac Address       Type        Ports      Moves   Last Move
    ----    -----------       ----        -----      -----   ---------
    300     e229.cb11.2f4a    STATIC      Et1/1
    300     e229.cb11.2f4b    STATIC      Et1/1
    Total Mac Addresses for this criterion: 2
```

9.2.2.6.4 Displaying Port Security Configuration Information

The **show dot1x** command shows information about the 802.1X configuration on the specified port or ports.

Example

This commands displays IEEE 802.1X configuration information for Ethernet interface ***5***.

```
switch# show dot1x interface ethernet 5
Dot1X Information for Ethernet5
-------------------------------------------
PortControl             : auto
QuietPeriod             : 60 seconds
TxPeriod                : 5 seconds
ReauthPeriod            : 3600 seconds
MaxReauthReq            : 2
switch#
```

9.2.2.6.5 Displaying the Status of the 802.1X Attributes for each Port

Use the **show dotx1 interface** ***interface-id*** command to display the status of the 802x1 attributes for each port.

Example

```
switch(config-if-Et1/1)# show dot1x interface ethernet1/1
       Dot1X Information for Ethernet1
       ---------------------------------------
       PortControl             : force-authorized
       HostMode                : multi-host
       QuietPeriod             : 60 seconds
       TxPeriod                : 5 seconds
       ReauthPeriod            : 0 seconds
       MaxReauthReq            : 2
       ReauthTimeoutIgnore     : No
       AuthFailVlan            : 10
```

9.2.2.6.6 Displaying 802.1X Information for all Ports

Use the **show dot1x all brief** command to display IEEE 802.1X status for all ports.

Example

The following commands display a summary of IEEE 802.1X status.

```
switch# show dot1x all brief
Interface   Client   Status
----------  -------- -------------
Ethernet5   None     Unauthorized
switch#
```

9.2.2.6.7 Displaying VLANS

Use the **show vlan** command to display if a VLAN has been dynamically assigned to the port.

Example

```
switch# show vlan
    VLAN  Name          Status    Ports
    ----- ------------- --------- ---------------------------------
    1     default        active
    2     VLAN0002       active    Et7, Et17, Et18, Et41
    300*  VLAN0300       active    Et1/1, Et6, Et19, Et20, Et29
                                   Et30, Et31, Et32, Et42, Et43, Et44

* indicates a Dynamic VLAN
```

9.2.2.6.8 Displaying EAPOL Fallback to MBA Authentication and MBA Timeout Information

Use the **show dotx1 interface** ***interface ID*** **details** command to display information about the EAPOL fallback to MBA authentication and MBA timeout details.

Example

```
switch(config-if-Et1)# show dot1x interface Ethernet1 details
Dot1X Information for Ethernet1
---------------------------------------
Port control: auto
Host mode: multi-host authenticated
```

```
Quiet period: 60 seconds
TX period: 5 seconds
Maximum reauth requests: 2
Ignore reauth timeout: No
Auth failure VLAN: 101
Unauthorized access VLAN egress: Yes
Unauthorized native VLAN egress: Yes
EAPOL: enabled
MAC-based authentication: disabled
EAPOL authentication failure fallback: MBA, timeout 200 seconds

Dot1X Authenticator Client

Port status: Authorized
Supplicant MAC  Reauth Period (in seconds)
--------------  --------------------------
0022.0100.0001  120
```

9.2.2.7 802.1X Port Security Commands

Global Configuration Commands

- dot1x system-auth-control

Dot1x Configuration Commands

- aaa unresponsive action traffic allow vlan
- captive portal
- dot1x mac based authentication delay
- dot1x mac based authentication hold period

Interface Configuration Commands Ethernet Interface

- dot1x host-mode
- dot1x mac based authentication
- dot1x pae authenticator
- dot1x port-control
- dot1x reauthentication
- dot1x reauthorization request limit
- dot1x timeout quiet-period
- dot1x timeout reauth-period
- dot1x timeout tx-period
- statistics packets dropped

Privileged EXEC Commands

- clear dot1x statistics
- show dot1x
- show dot1x all brief
- show dot1x hosts
- show dot1x statistics

9.2.2.7.1 aaa unresponsive action traffic allow vlan

The **aaa unresponsive action traffic allow vlan** enables the the dot1x AAA unresponsive VLAN feature on the switch.

The **no aaa unresponsive action traffic allow vlan** command disbales the dot1x AAA unresponsive VLAN feature from the ***running-config***.

Command Mode

Dot1x Configuration Mode

Command Syntax

aaa unresponsive action traffic allow vlan ***VLAN-ID***

no unresponsive action traffic allow vlan

Parameters

- **unresponsive** Configure AAA timeout options.
- **action** Set action for supplicant when AAA times out.
- **traffic** Set action for supplicant traffic when AAA times out.
- **allow** Allow traffic when AAA times out.
- **vlan** Allow traffic in VLAN when AAA times out.
- ***VLAN-ID*** Identifier for a Virtual LAN. Value ranges from ***1*** to ***4094***.

Example

These commands places the switch in the dot1x configuration mode and enables the dot1x AAA unresponsive VLAN feature on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# aaa unresponsive action traffic allow vlan 50
```

9.2.2.7.2 captive portal

The **captive portal** command enables the 802.1X Web Authentication on the switch.

The **no captive portal** command removes the 802.1X Web Authentication configuration from the ***running-config***.

Command Mode

Dot1x Configuration Mode

Command Syntax

captive portal url ***URL*** ssl profile ***profile*** access-list ipv4 ***ACL name***

no captive portal url ***URL*** ssl profile ***profile*** access-list ipv4 ***ACL name***

Parameters

- **url** Configure captive portal URL.
- **ssl** Configure SSL related option.
- **access-list** Configure access control list.

Example

- This command enables 802.1X Web Authentication on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# captive portal ssl profile test-ssl_profile
```

- This command enables the ACL based Web authentication.

```
switch(config)# dot1x
switch(config-dot1x)# captive portal access-list ipv4 test-ACL
```

9.2.2.7.3 clear dot1x statistics

The **clear dot1x statistics** command resets the 802.1X counters on the specified interface or all interfaces.

Command Mode

Privileged EXEC

Command Syntax

clear dot1x statistics **INTERFACE_NAME**

Parameters

INTERFACE_NAME Interface type and number. Options include:

- **all** Display information for all interfaces.
- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by***l_num***.
- **interface management *m_num*** Management interface specified by ***m_num***.
- **interface port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command resets the 802.1X counters on all interfaces.

```
switch# clear dot1x statistics all
switch#
```

9.2.2.7.4 dot1x mac based authentication

The **dot1x mac based authentication** command enables MAC-based authentication on the existing 802.1X authenticator port.

The **no dot1x mac based authentication** and the **default dot1x mac based authentication** commands restore the switch default by disabling the corresponding dot1x mac based authentication command for the specific 802.1X authenticator port.

Command Mode

Interface-Ethernet Configuration

Command Syntax

dot1x mac based authentication

no dot1x mac based authentication

default dot1x mac based authentication

Related Command

show dot1x hosts

Example

These commands configure MAC-based authentication on ***Ethernet interface 1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x mac based authentication
switch(config-if-Et1)#
```

9.2.2.7.5 dot1x mac based authentication delay

The **dot1x mac based authentication delay** command enables MAC-based authentication delay. By default, the delay is triggered after ***5*** seconds.

The **no dot1x mac based authentication delay** and the **default dot1x mac based authentication delay** commands restore the switch default by disabling the corresponding dot1x mac based authentication delay command.

Command Mode

Dot1x Configuration

Command Syntax

dot1x mac based authentication delay *delay-time* seconds

no dot1x mac based authentication delay

default dot1x mac based authentication delay

Parameter

- ***delay-time*** Delay in seconds. The value is from ***0*** to ***300***.
- **seconds** Unit in seconds.

Example

These commands configure a MAC-based authentication delay of ***30*** seconds on a switch.

```
switch(config)# dot1x
switch(config-dot1x)# mac based authentication delay 30 seconds
```

9.2.2.7.6 dot1x mac based authentication hold period

The **dot1x mac based authentication hold period** command enables MAC-based authentication hold period. By default, the hold period is ***60*** seconds.

The **no dot1x mac based authentication hold period** and the **default dot1x mac based authentication hold period** commands restore the switch default by disabling the corresponding dot1x mac based authentication hold period command.

Command Mode

Dot1x Configuration

Command Syntax

dot1x mac based authentication hold period ***hold period-time*** seconds

no dot1x mac based authentication hold period

default dot1x mac based authentication hold period

Parameter

- ***hold period-time*** Hold period in seconds. The value is from ***1*** to ***300*** in seconds.
- **seconds** Unit in seconds.

Example

These commands configure a MAC-based authentication hold period of ***100*** seconds on a switch.

```
switch(config)# dot1x
switch(config-dot1x)# mac based authentication hold period 100 seconds
```

9.2.2.7.7 dot1x pae authenticator

The **dot1x pae authenticator** command sets the port access entity (PAE) type of the configuration mode interface to **authenticator**, which enables IEEE 802.1X on the port. IEEE 802.1X is disabled on all ports by default.

The **no dot1x pae authenticator** and **default dot1x pae authenticator** commands restore the switch default by deleting the corresponding **dot1x pae authenticator** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

dot1x pae authenticator

no dot1x pae authenticator

default dot1x pae authenticator

Examples

- These commands configure ***interface ethernet 2*** as a port access entity (PAE) authenticator, enabling IEEE 802.1X on the port.

```
switch(config-if-Et1)# interface ethernet 2
switch(config-if-Et1)# dot1x pae authenticator
switch(config-if-Et1)#
```

- These commands disable IEEE 802.1X authentication on ***interface ethernet 2***.

```
switch(config-if-Et1)# interface ethernet 2
switch(config-if-Et1)# no dot1x pae authenticator
switch(config-if-Et1)#
```

9.2.2.7.8 dot1x reauthentication

The **dot1x reauthentication** command configures the configuration mode interface to require re-authentication from clients at regular intervals. The interval is set by the **dot1x timeout reauth-period** command.

The **no dot1x reauthentication** and **default dot1x reauthentication** commands restore the default setting by deleting the corresponding **dot1x reauthentication** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

dot1x reauthentication

no dot1x reauthentication

default dot1x reauthentication

Example

These commands configure the ***interface Ethernet 1*** authenticator to require periodic re-authentication from clients.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x reauthentication
switch(config-if-Et1)#
```

9.2.2.7.9 dot1x reauthorization request limit

The **dot1x reauthorization request limit** command configures how many times the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

The **no dot1x reauthorization request limit** and **default dot1x reauthorization request limit** commands restore the default value of 2 by deleting the corresponding **dot1x reauthorization request limit** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

dot1x reauthorization request limit attempts

no dot1x reauthorization request limit

default dot1x reauthorization request limit

Parameters

attempts Maximum number of attempts. Values range from ***1*** to ***10***; default value is ***2***.

Examples

- This command sets the 802.1X EAP-request retransmit limit to ***6***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x reauthorization request limit 6
switch(config-if-Et1)#
```

- This command restores the default request repetition value of ***2***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no dot1x reauthorization request limit
switch(config-if-Et1)#
```

9.2.2.7.10 dot1x system-auth-control

The **dot1x system-auth-control** command enables 802.1X authentication on the switch.

The **no dot1x system-auth-control** and **default dot1x system-auth-control** commands disables 802.1X authentication by removing the **dot1x system-auth-control** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

dot1x system-auth-control

no dot1x system-auth-control

default dot1x system-auth-control

Examples

- This command enables 802.1X authentication on the switch.

```
switch(config)# dot1x system-auth-control
switch(config)#
```

- This command disables 802.1X authentication on the switch.

```
switch(config)# no dot1x system-auth-control
switch(config)#
```

9.2.2.7.11 dot1x timeout quiet-period

If the switch fails to immediately authenticate the client, the time the switch waits before trying again is specified by the **dot1x timeout quiet-period** command. This timer also indicates how long a client that failed authentication is blocked.

The **no dot1x timeout quiet-period** and **default dot1x timeout quiet-period** commands restore the default quiet period of ***60*** seconds by removing the corresponding **dot1x timeout quiet-period** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

dot1x timeout quiet-period ***quiet_time***

no dot1x timeout quiet-period

default dot1x timeout quiet-period

Parameter

quiet_time Interval in seconds. Values range from ***1*** to ***65535***. Default value is ***60***.

Example

These commands set the 802.1X quiet period for Ethernet interface ***1*** to ***30*** seconds.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x timeout quiet-period 30
switch(config-if-Et1)#
```

9.2.2.7.12 dot1x timeout reauth-period

The **dot1x timeout reauth-period** command specifies the time period that the configuration mode interface waits before requiring re-authentication from clients.

The **no dot1x timeout reauth-period** and **default dot1x timeout reauth-period** commands restore the default period of ***60*** minutes by removing the corresponding **dot1x timeout reauth-period** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

dot1x timeout reauth-period ***reauth_time***

no dot1x timeout reauth-period

default dot1x timeout reauth-period

Parameter

reauth_time The number of seconds the interface passes traffic before requiring re-authentication. Values range from ***1*** to ***65535***. Default value is ***3600***.

Example

These commands configure theinterface Ethernet ***1*** authenticator to require re-authentication from clients every ***6*** hours (***21600*** seconds).

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x reauthentication
switch(config-if-Et1)# dot1x timeout reauth-period 21600
switch(config-if-Et1)#
```

9.2.2.7.13 dot1x timeout tx-period

Authentication and re-authentication are accomplished by the authenticator sending an Extensible Authentication Protocol (EAP) request to the supplicant and the supplicant sending a reply which the authenticator forwards to an authentication server. If the authenticator does not get a reply to the EAP request, it waits a specified period of time before retransmitting. The **dot1x timeout tx-period** command configures that wait time.

The **no dot1x timeout tx-period** and **default dot1x timeout tx-period** commands restore the default wait time by removing the corresponding **dot1x timeout tx-period** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

dot1x timeout tx-period ***tx_time***

no dot1x timeout tx-period

default dot1x timeout tx-period

Parameter

tx_time Values range from ***1*** to ***65535***. Default value is ***5***.

Example

These commands configure interface Ethernet ***1*** to wait ***30*** seconds before retransmitting EAP requests to the supplicant.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x timeout tx-period 30
switch(config-if-Et1)#
```

9.2.2.7.14 dot1x host-mode

When multiple clients are connected to an Ethernet interface providing 802.1X authentication, the port can accept packets from all MAC addresses once the supplicant has been authenticated (multi-host mode), or it can accept only those packets originating from the MAC address of the authenticated client (single-host mode) or ultiple authenticated clients (multi-host authenticated mode) . The **dot1x host-mode** command specifies the host mode for authentication of multiple clients on the configuration mode interface.

The **no dot1x host-mode** and **default dot1x host-mode** commands restore the switch default (multi-host mode) by removing the corresponding dot1x host-mode command for the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

dot1x host-mode [multi-host | single-host | multi-host authenticated]

no dot1x host-mode

default dot1x host-mode

Parameters

- **multi-host** Configures the interface to use multi-host mode (the default).
- **single-host** Configures the interface to use single-host mode.
- **multi-host authenticated** Configures the interface to use multi-host authenticated mode.

Example

These commands configure ***interface Ethernet 1*** to use single-host mode for 802.1X authentication.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x host-mode single-host
switch(config-if-Et1)#
```

9.2.2.7.15 dot1x port-control

The **dot1x port-control** command configures the configuration mode interface as an authenticator port and specifies whether it will authenticate traffic.

The **no dot1x port-control** and **default dot1x port-control** commands configure the port to pass traffic without authorization by removing the corresponding **dot1x port-control** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

dot1x port-control **STATE**

no dot1x port-control

default dot1x port-control

Parameters

STATE Specifies whether the interface will authenticate traffic. The default value is **force-authorized**. Options include:

- **auto** Configures the port to authenticate traffic using Extensible Authentication Protocol messages.
- **force-authorized** Configures the port to pass traffic without authentication.
- **force-unauthorized** Configures the port to block all traffic regardless of authentication.

Examples

- These commands configure ***interface Ethernet 1*** to pass traffic without authentication. This is the default setting.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x port-control force-authorized
switch(config-if-Et1)#
```

- These commands configure ***interface Ethernet 1*** to block all traffic.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x port-control force-unauthorized
switch(config-if-Et1)#
```

- These commands configure ***interface Ethernet 1*** to authenticate traffic using EAP messages.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x port-control auto
switch(config-if-Et1)#
```

9.2.2.7.16 show dot1x all brief

The **show dot1x all brief** command displays the IEEE 802.1X status for all ports.

Command Mode

EXEC

Command Syntax

show dot1x all brief

Example

This command displays the IEEE 802.1X status.

```
switch# show dot1x all brief
Interface           Client          Status
--------------------------------------------------
Ethernet5           None            Unauthorized
switch#
```

9.2.2.7.17 show dot1x hosts

The **show dot1x hosts** command displays 802.1X information for all the supplicants.

Command Mode

EXEC

Command Syntax

show dot1x hosts [ethernet]

Parameter

ethernet *e_num* Ethernet interface specified by ***e_num***.

Related Command

dot1x mac based authentication

Example

This command displays 802.1X information for all the supplicants.

```
switch# show dot1x hosts
Interface: Ethernet1/1
    Supplicant MAC       Auth Method       State      VLAN Id
    --------------       -----------       -----      -------
    e2:29:cb:11:2f:4a    MAC-BASED-AUTH    SUCCESS     300
```

9.2.2.7.18 show dot1x statistics

The **show dot1x statistics** command displays 802.1X statistics for the specified port or ports.

Command Mode

EXEC

Command Syntax

show dot1x INTERFACE_NAME statistics

Parameters

- **INTERFACE_NAME** Interface type and number. Options include:
  - **all** Display information for all interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  -
- **Output Fields**
  - **RxStartNumber** of EAPOL-Start frames received on the port.
  - **TxReqIdNumber** of EAP-Request/Identity frames transmitted on the port.
  - **RxVersionVersion** number of the last EAPOL frame received on the port.
  - **RxLogoffNumber** of EAPOL-Logoff frames received on the port.
  - **RxInvalidNumber** of invalid EAPOL frames received on the port.
  - **TxReqNumber** of transmitted EAP-Request frames that were not EAP-Request/Identity.
  - **LastRxSrcMAC** The source MAC address in the last EAPOL frame received on the port.
  - **RxRespId** The number of EAP-Response/Identity frames received on the port.
  - **RxTotal** The total number of EAPOL frames transmitted on the port.
  - **TxTotal** The total number of EAPOL frames transmitted on the port.

Example

This command displays the 802.1X statistics for ***interface ethernet 5***.

```
switch# show dot1x interface ethernet 5 statistics
Dot1X Authenticator Port Statistics for Ethernet5
-------------------------------------------------
RxStart = 0      RxLogoff = 0    RxRespId = 0
RxStart= 0       RxInvalid = 0   RxTotal = 0
TxReqId = 0      TxReq = 0       TxTotal = 0
RxVersion = 0    LastRxSrcMAC = 0000.0000.0000
switch#
```

9.2.2.7.19 show dot1x

The **`show dot1x`** command displays 802.1X information for the specified interface.

Command Mode

EXEC

Command Syntax

`show dot1x` INTERFACE_NAME INFO

Parameters

- **INTERFACE_NAME** Interface type and number. Options include:
  - **all** Display information for all interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
- **INFO** Type of information the command displays. Values include:
  - ***no parameter*** displays summary of the specified interface.
  - **detail** displays all 802.1X information for the specified interface.

Examples

- This command displays 802.1X summary information for ***interface ethernet 5***.

```
switch# show dot1x interface ethernet 5
Dot1X Information for Ethernet5
-------------------------------------------
PortControl             : auto
QuietPeriod             : 60 seconds
TxPeriod                : 5 seconds
ReauthPeriod            : 3600 seconds
MaxReauthReq            : 2
switch#
```

- This command displays detailed 802.1X information for ***interface ethernet 5***.

```
switch# show dot1x interface ethernet 5 detail
Dot1X Information for Ethernet5
-------------------------------------------
PortControl             : auto
QuietPeriod             : 60 seconds
TxPeriod                : 5 seconds
ReauthPeriod            : 3600 seconds
MaxReauthReq            : 2

Dot1X Authenticator Client

Port Status             : Unauthorized
switch#
```

9.2.2.7.20 statistics packets dropped

The **`statistics packets dropped`**command to cofigure the dot1x dropped counters on the switch under ***dot1x*** configuration mode. By default, the dot1x dropped counters is disabled. The **no** form of the command disables the dot1x dropped counters from the running configuration.

The **`no statistics packets dropped`** command disables the dot1x dropped counters from the running configuration.

Command Mode

Dot1x Configuration

Command Syntax

`statistics packets dropped`

`no statistics packets dropped`

Example

These commands places the switch in the ***dot1x*** mode and enables the dot1x dropped counters.

```
switch(config-dot1x)# statistics packets dropped
```

9.3 Data Plane Security

This section contains the following topics:

9.3.1 IP NAT

Network Address Translation (NAT) is a router process that modifies address information of IP packets in transit. NAT is typically used to correlate address spaces between a local network and a remote, often public, network. Static NAT defines a one-to-one map between local and remote IP addresses. Static maps are configured manually through CLI commands. An interface can support multiple NAT commands, but each command must specify a unique local IP address-port location.

NAT is configured on routers that have interfaces connecting to the local networks and interfaces connecting to a remote network.

Inside and Outside Addresses

In NAT configurations, IP addresses are placed into one of two categories: inside or outside. Inside refers to IP addresses used within the organizational network. Outside refers to addresses on an external network outside the organizational network.

9.3.1.1 Static IP NAT

Static NAT configurations create a one-to-one mapping and translate a particular address to another address. This type of configuration creates a permanent entry in the NAT table as long as the configuration is present, and it enables both inside and outside hosts to initiate a connection.

Static NAT options include source NAT, destination NAT, and twice NAT.

- Source NAT modifies the source address in the IP header of a packet exiting the interface, and can optionally change the source port referenced in the TCP/UDP headers.
- Destination NAT modifies the destination address in the IP header of a packet entering the interface, and can optionally change the destination port referenced in the TCP/UDP headers.
- Twice NAT modifies both the source and destination address of packets entering and exiting the interface, and can optionally change the L4 port information in the TCP/UDP headers. Twice NAT is generally used when inside network addresses overlap or otherwise conflict with outside network addresses. When a packet exits the interface, local source and destination addresses are translated to global source and destination addresses. When a packet enters the interface, global source and destination addresses are translated to local source and destination addresses.

9.3.1.1.1 Configuring Static NAT

Configuring Source NAT

Network address translation of a source address (source NAT) is enabled by the ip nat source static command for the configuration mode interface. Applying source NAT to interfaces that connect to local hosts shields the IP address of the host when sending IP packets to remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

Note: The switch uses a common NAT table for the entire switch, not a per interface one. For example, if a customer has the same inside local address translated to different inside global addresses depending on which interface it exits. It might be translated to exit interface B's inside global address even though it exits through interface A. A way to avoid this is to use an access list that differentiates based on the destination IP address.

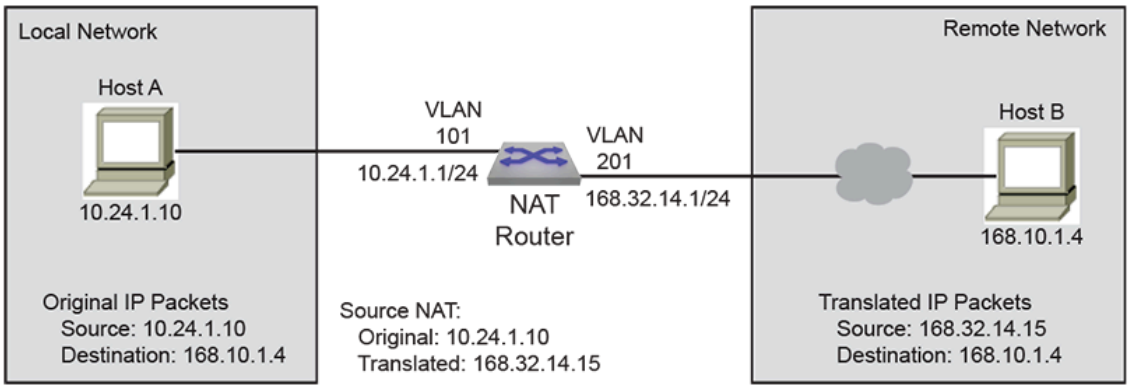

Figure 10: Source NAT Example

Example

These commands configure ***VLAN 201*** to translate source address ***10.24.1.10*** to ***168.32.14.15***.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip nat source static 10.24.1.10
 168.32.14.15
switch(config-if-Vl201)#
```

The **`ip nat source static`** command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for source NAT must specify a source IP address of **any**. Source port or protocol matching is not permitted. The destination may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

Example

These commands configure ***VLAN 101*** to translate the source address ***10.24.1.10*** to ***168.32.14.15*** for all packets with IP destination addresses in the ***168.10.1.1/32*** subnet.

```
switch(config)# ip access-list ACL1
switch(config-acl-ACL1)# permit ip any 168.10.1.0/24
switch(config-acl-ACL1)# exit
switch(config)# interface vlan 101
switch(config-if-Vl101)# ip nat source static 10.24.1.10 access-
list ACL1 168.32.14.15
switch(config-if-Vl101)#
```

Configuring Destination NAT

Network address translation of a destination address (destination NAT) is enabled by the ip nat destination static command for the configuration mode interface. Applying destination NAT to interfaces that connect to remote hosts shields the IP address of the recipient host when receiving IP packets from remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

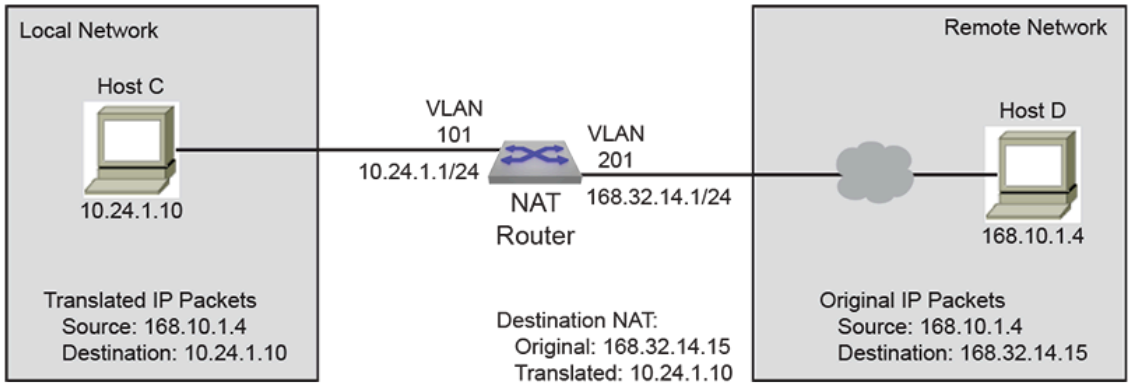

Figure 11: Detination NAT Example

Example

These commands configure ***VLAN 201*** to translate destination address ***168.32.14.15*** to ***10.24.1.10***.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip nat destination static 168.32.14.15
 10.24.1.10
switch(config-if-Vl201)#
```

The ip nat destination static command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for destination NAT must specify a destination IP address of **any**. Destination port or protocol matching is not permitted. The source may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

Example

These commands configure ***VLAN 201*** to translate the destination address ***168.32.14.15*** to ***10.24.1.10*** for all packets with IP source addresses in the ***168.10.1.4/32*** subnet.

```
switch(config)# ip access-list ACL2
switch(config-acl-ACL2)# permit ip 168.10.1.4/32 any
switch(config-acl-ACL2)# exit
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip nat destination static 168.32.14.15
 access-list ACL2
10.24.1.10
```

```
switch(config-if-Vl201)#
```

Configuring Twice NAT

Network address translation of both source and destination addresses on the same interface (twice NAT) is enabled by creating one source NAT rule and one destination NAT rule on the same interface and associating them through a NAT group using the ip nat source static and ip nat destination static commands.

The **ip nat source static** command translates the actual local source address to a source address which can be used outside the local network to reference the source. The **ip nat destination static** command translates an internally used destination address to the actual IP address that is the destination of the packet.

The source and destination NAT rules must reference the same NAT group, and both should either specify only IP addresses or specify both IP addresses and L4 port information. If L4 port information is configured in one rule but not in the other, an error message will be displayed.

Each NAT rule installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. Twice NAT does not support the use of access control lists to filter packets for translation.

Example

These commands configure ***interface ethernet 2*** to translate the local source address ***10.24.1.10*** to the global source address ***168.32.14.15***, and to translate the local destination address ***10.68.104.3*** to the global destination address ***168.25.10.7*** for all packets moving through the interface. The use of NAT ***group 3*** is arbitrary, but must be the same in both rules.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 10.24.1.10
 168.32.14.15 group 3
switch(config-if-Et2)# ip nat destination static 10.68.104.3
 168.25.10.7 group 3
```

9.3.1.1.2 Static NAT Configuration Considerations

Egress VLAN Filter for Static NAT

When a static source NAT is configured on an interface, the source IP translation happens only for those packets that is going 'out' of this interface. If a packet is egressing on an interface which does not have NAT configured, then the source IP is not translated.

When there are two interfaces on which static SNAT is configured then the translation specified for one interface can be applied to a packet going out on the other interface.

Examples

- In this example, the packets with source IP ***20.1.1.1*** going out of ***E1*** will still have the source IP translated to ***172.1.1.1*** even though the rule is configured in ***E2*** and not on ***E1***.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# ip nat source static 10.1.1.1 171.1.1.1
```

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 20.1.1.1 172.1.1.1
```

- To prevent this, use an ACL to filter the traffic that needs NAT on the interfaces.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit ip any 171.1.1.0/24
switch(config)# ip access-list acl2
switch(config-acl-acl2)# permit ip any 172.1.1.0/24
switch(config)# interface ethernet 1
switch(config-if-Et1)# ip nat source static 10.1.1.1 access-
list acl1 171.1.1.1
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 20.1.1.1 access-
list acl2 172.1.1.1
```

- ACL filtering is not supported when using twice NAT.

9.3.1.2 Dynamic NAT

Dynamic NAT can be used when fewer addresses are accessible than the number of hosts to be translated. A NAT table entry is created when the host starts a connection and establishes a one-to-one mapping between addresses. The mapping can vary and is dependent upon the registered addresses in the pool at the time of the communication. Dynamic NAT sessions are only allowed to be initiated only from inside networks. NAT should be configured on a Layer 3 interface, either a routed port or Switch Virtual Interface (SVI). If the host doesn't communicate for a specific period, dynamic NAT entries are removed from the translation table. The address will then returned to the pool for use by another host

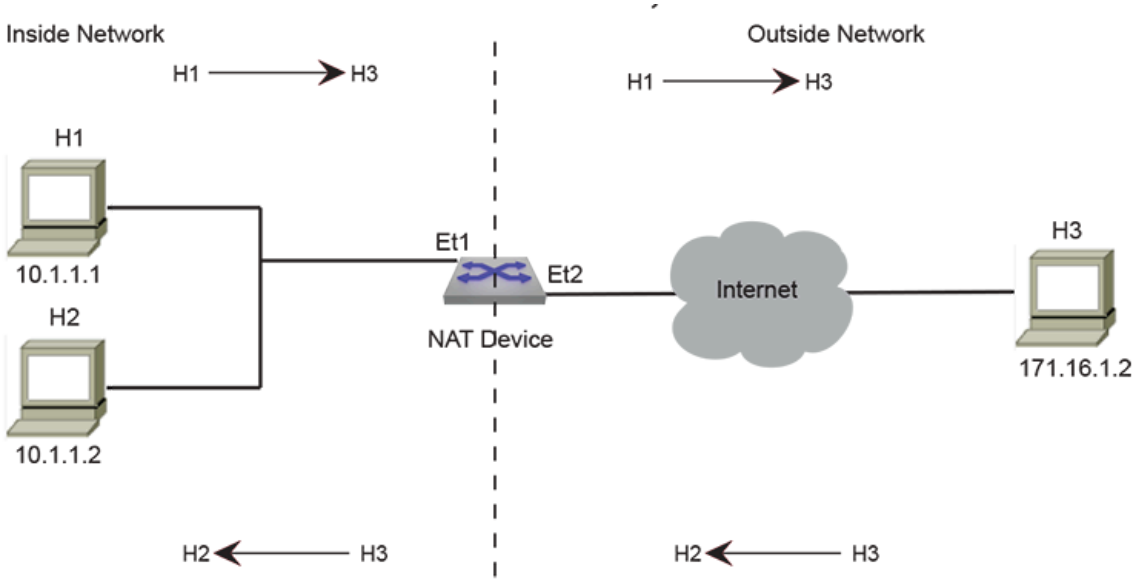

Figure 12: Dynamic NAT Scenario

Dynamic NAT options:

- Many-to-Many NAT

  Maps local addresses to a global address that is selected from a pool of global addresses. After pool is configured, the first available address from the pool is picked dynamically on receiving the first packet.
- Many-to-One NAT (PAT)

PAT is a form of dynamic NAT where multiple local addresses are mapped to a single global address (many-to-one) using different source ports. This method is also called NAT Overloading, Network and Port address translation (NAPT), and Masquerade. The global address can be the IP address configured on the outside interface.

Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.

Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. Upon using NAT, inside usually refers to a private network while outside usually refers to a public network.

A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded with dynamic pools containing the same global addresses.

Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.

Commands may include ACLs to filter packets that are cleared. Source NAT use ACLs to filter packets based on destination IP address. Destination NAT use ACLs to filter packets based on source IP address. When using NAT, inside usually refers to a private network while outside usually refers to a public network.

A switch with NAT configured translates forwarded traffic between inside and outside interfaces, and the flow that matches the criteria specified for translation.

Note: The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded with dynamic pools containing the same global addresses.

Note: Dynamic NAT with ACL destination port is not supported on 7050SX3.

9.3.1.2.1 Configuring Dynamic NAT

Prerequisites

- Configure an ACL to specify IP addresses allowed to be translated.
- Determine if you should use an IP address as the translated source address.
- Decide on a public IP address pool for address translation.

Configure the Address Pool

The addresses used for translation are configured by issuing the ip nat pool command in global configuration mode.

Example

This command configures the pool of addresses using start address, and end address.

```
switch(config)# ip nat pool p1 10.15.15.15 10.15.15.25
```

```
switch(config)#
```

Set the IP Address

The ip address command configures ***VLAN 201*** with an IP address.

Examples

- This command configures an IPv4 address for ***VLAN 201***.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip address 10.0.0.1/24
switch(config-if-Vl201)#
```

- This command configures the dynamic NAT source address and sets the NAT overload for pool ***P2***.

```
switch(config-if-Vl201)# ip nat source dynamic access-list
 ACL2 pool p2
switch(config-if-Vl201)#
```

Configuring Dynamic NAT Priority

For each Dynamic NAT configuration, you can specify the priority from lowest to highest in an interface mode. The ip nat source dynamic command allows you to configure dynamic NAT priority from the source IP address. Multiple dynamic NAT configurations have the same priority irrespective of the order. If priority is not specified in NAT rule, by default the priority is ***0*** (lowest priority).

Service FTP dynamic NAT rules with a single IP in the pool are considered to be of highest priority.

Note: Priorities in address-only and non-address-only NAT rules are independent of each other.

Example

This command configures the dynamic NAT priority of the access-list in the pool with the order ***a5 > a4 > a3 > a2 > a1 > a0***.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip address 10.0.0.1/24
switch(config-if-Vl201)# ip nat source dynamic access-list a0
 pool p0
switch(config-if-Vl201)# ip nat source dynamic access-list a1
 pool p1 priority 1
switch(config-if-Vl201)# ip nat source dynamic access-list a2
 pool p2 priority 2
switch(config-if-Vl201)# ip nat source dynamic access-list a3
 pool p3 priority 3
switch(config-if-Vl201)# ip nat source dynamic access-list a4
 pool p4 priority 4
switch(config-if-Vl201)# ip nat source dynamic access-list a5
 pool p5 priority 5
switch(config-if-Vl201)#
```

Configuring Dynamic NAT with Overload

The following configures a dynamic NAT profile with overload.

Example

This command configures the dynamic NAT for overload.

```
ip nat profile patName
   ip nat source dynamic access-list accessList1 overload
!

ip access-list accessList1
   20 permit ip host 1.1.1.2 any log
```

Define the NAT Source Address for Translation

The ip nat source dynamic command specifies a dynamic translation from the source IP address to the pool and to overload the pool address (or addresses).

Example

This command configures the dynamic NAT source address and sets the pool ***P2*** NAT overload.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# ip nat source dynamic access-list ACL2
 pool p2
switch(config-if-Et3/1)#
```

Specify the Timeout Values

The ip nat translation tcp-timeout or ip nat translation udp-timeout commands alter the translation timeout period for NAT translation table entries.

Examples

- This command globally sets the timeout for TCP to **600** seconds.

```
switch(config)# ip nat translation tcp-timeout 600
 switch(config)#
```

- This command globally sets the timeout for UDP to **800** seconds.

```
switch(config)# ip nat translation udp-timeout 800
 switch(config)#
```

9.3.1.2.2 Verify the NAT Configuration

Display the Address Pools

The show ip nat pool command displays the configuration of the address pool.

Example

This command displays all the address pools configured on the switch.

```
switch# show ip nat pool

Pool      StartIp           EndIp           Prefix
p1        10.15.15.15       10.15.15.25     24
p2        10.10.15.15       10.10.15.25     22
p3        10.12.15.15       10.12.15.25     12

switch#
```

9.3.1.2.3 Clearing IP NAT Table Entries

Use the clear ip nat flow translation command to remove all or the specified NAT table entries.

Example

This command clears all dynamic entries from the NAT table.

```
switch# clear ip nat flow translation
switch#
```

9.3.1.2.4 Dynamic NAT Configuration Considerations

Configuring Dynamic NAT Using Pools in a L2 Adjacent Network

When many-to-one dynamic NAT is configured using a NAT pool, and the next hop router for the NAT device is on the same network (L2 adjacent), then you must configure the IP addresses in the NAT pool as a secondary address on the interface.

Example:

The IP addresses in the NAT pool are configured as the secondary address on the interface.

```
switch(config)# ip nat pool p1 10.1.1.1 10.1.1.4 prefix-length 24
switch(config)# interface ethernet 1
switch(config-if-Et1)# ip nat source dynamic access-list a1 pool
 p1
switch(config-if-Et1)# ip address 10.1.1.1/24 secondary
switch(config-if-Et1)# ip address 10.1.1.2/24 secondary
switch(config-if-Et1)# ip address 10.1.1.3/24 secondary
switch(config-if-Et1)# ip address 10.1.1.4/24 secondary
```

Configuring Dynamic NAT Using Pool in a L3 Network

If the next hop of the NAT device is on a different subnet, then you should configure a static Null route for the IP addresses in the NAT pool. Redistribute the static route using BGP/OSPF.

Examples

- Outside Interface

```
switch(config)# interface port-channel 319
switch(config-if-Po319)# ip nat source dynamic access-list
 dynamic-nat-m2m pool
natpl-dynamic-nat-m2m
switch(config)# ip access-list dynamic-nat-m2m
switch(config-acl-dynamic-nat-m2m)# 10 permit ip 192.168.93.0/
24 any
switch(config)# ip nat pool natpl-dynamic-nat-m2m prefix-
length 24
switch(config-natpool-p1)# range 11.3.3.2 11.3.3.10
```

- Static Null Route for Virtual IP

```
switch(config)# ip route 11.0.0.0/8 Null0
switch(config)# router ospf 1
switch(config-router-ospf)# redistribute static
```

Configuring Dynamic NAT Using Overload with ECMP Routes

Dynamic many-to-one NAT using overload (PAT) should not be configured on interfaces that form an ECMP group. When one interface in the group goes down, the return packet for connections that are already established will continue to go to the IP address of the interface that went down and will not be forwarded to the inside host. For this type of scenario, use Dynamic NAT with pool configurations.

9.3.1.2.5 Dynamic NAT Peer State Synchronization

The NAT peer state synchronization provides redundancy and resiliency for dynamic NAT across a pair of devices to avoid single NAT device failure. Both devices in redundant pair are active and they track new sessions and create or delete NAT entries dynamically. Essentially, an active NAT entry is maintained on both devices irrespective of who created the NAT entry.

Configuring Dynamic NAT Peer State Synchronization

The following prerequisites should be fulfilled before configuring NAT peer state synchronization on devices in a redundant pair.

- Both devices in redundant pair must be reachable across an IP address within the same subnet.
- NAT version on both devices in redundant pair must be compatible.
- Dynamic NAT configuration must be identical across both devices in redundant pair.

The following configuration output indicates a valid running configuration of the NAT peer state synchronization on one device.

```
ip nat pool POOL61 prefix-length 24
  range 170.24.0.2 170.24.0.200

ip access-list NatACL61
  10 permit ip 61.0.0.0/16 any

interface Port-Channel5
  mtu 9214
  no switchport
  ip address 10.0.0.1/31
  ip nat source dynamic access-list NatACL61 pool POOL61
```

```
ip nat synchronization
  peer-address 11.11.11.1
  local-interface Vlan1111
  port-range 1024 2048
```

The following limitations are applicable during NAT peer state synchronization.

- While configuring dynamic NAT peer state synchronization across peer switches, the port range values of the switches should always be disjoint to avoid virtual IP conflict.
- NAT peer state synchronization does not support asymmetrical TCP setup (SYN - SYNACK - ACK should always be hashed to the same peer.)
- The connection is only synchronized with a peer if the TCP state is established.

The following command specifies the description of the device itself.

```
switch(config)#ip nat synchronization
switch(config-nat-synchronization)#description <description>
```

The following command specifies seconds the switch needs to wait before timing out existing connections.

```
switch(config)#ip nat synchronization
switch(config-nat-synchronization)#expiry-interval 6
```

The following command specifies seconds the IP address of the peer device from where the synchronization is coming.

```
switch(config)#ip nat synchronization
switch(config-nat-synchronization)#peer address 202.1.1.2
```

The following command displays the details of connections, which are advertised to peer device.

```
switch(config)#show ip nat synchronization advertised-translations
Source IP  Destination IP  Translated IP  TGT  Type  Interface/Profile
------------------------------------------------------------------------
------------------
10.1.3.10:21800  191.1.1.10:80  139.1.1.1:21800  SRC  DYN  Port-Channel1
00
10.1.2.10:13750  191.1.1.10:80  139.1.1.1:13750  SRC  DYN  Port-Channel1
00
10.1.2.10:33757  191.1.1.10:80  139.1.1.1:5951   SRC  DYN  Port-Channel1
00
10.1.5.10:37111  191.1.1.10:80  139.1.1.1:7561   SRC  DYN  Port-Channel1
00
```

The following command displays the details of connections, which has been advertised by the peer device.

```
switch(config)#show ip nat synchronization discovered-translations
Source IP  Destination IP  Translated IP  TGT  Type  Interface/Profile
------------------------------------------------------------------------
------------------
10.1.3.10:28606  191.1.1.10:80  139.1.1.1:28606  SRC  DYN  Port-Channel1
00
10.1.6.10:39697  191.1.1.10:80  139.1.1.1:39697  SRC  DYN  Port-Channel1
00
10.1.6.10:20583  191.1.1.10:80  139.1.1.1:31683  SRC  DYN  Port-Channel1
00
10.1.6.10:28419  191.1.1.10:80  139.1.1.1:28419  SRC  DYN  Port-Channel1
00
```

9.3.1.3 Applying NAT profile on a Tunnel Interface

The following commands apply the configured NAT profile on a tunnel interface.

Example

This command applies the NAT configuration profile ***natNameProfile*** to the tunnel ***Tunnel0***.

```
interface Tunnel0
   ip address 10.1.1.1/24
   tunnel source 2.1.1.1
   tunnel destination 2.1.1.2
   ip nat service-profile <natNameProfile>
```

9.3.1.4 IP NAT Commands

IP NAT Commands

- clear ip nat flow translation
- ip address
- ip nat destination static
- ip nat pool
- ip nat source dynamic
- ip nat source static
- ip nat translation counters
- ip nat translation low-mark
- ip nat translation max-entries
- ip nat translation tcp-timeout
- ip nat translation udp-timeout
- show ip nat access-list interface
- show ip nat pool
- show ip nat synchronization advertised-translations
- show ip nat synchronization discovered-translations
- show ip nat synchronization peer
- show ip nat translation

9.3.1.4.1 clear ip nat flow translation

The **`clear ip nat flow translation`** command clears all or the specified NAT table entries.

Command Mode

Privileged EXEC

Command Syntax

`clear ip nat flow translation` [**HOST_ADDR** [**DEST_ADDR**]][**INTF**][**PROT_TYPE**]

Parameters

DEST_ADDR must immediately follow **HOST_ADDR**. All other parameters, including **HOST_ADDR** may be placed in any order.

- **HOST_ADDR** Host address to be modified. Options include:
  - ***no parameter*** All packets with specified destination address are cleared.
  - **address *local_ipv4*** IPv4 address.
  - **address *local_ipv4 local_port*** IPv4 address and port (port value ranges from **`1`** to **`65535`**).
- **DEST_ADDR** Destination address of translated packet. Destination address can be entered only when the **HOST_ADDR** is specified. Options include:
  - ***no parameter*** All packets with specified destination address are cleared.
  - ***global_ipv4*** IPv4 address.
  - ***global_ipv4 global_port*** IPv4 address and port (port value ranges from **`1`** to **`65535`**).
- **INTF** Route source. Options include:
  - ***no parameter*** All packets with specified destination address are cleared.
  - **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **interface loopback *l_num*** Loopback interface specified by ***l_num***.
  - **interface management *m_num*** Management interface specified by ***m_num***.
  - **interface port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **interface vlan *v_num*** VLAN interface specified by ***v_num***.
- **PROT_TYPE** Filters packets based on protocol type. Options include:
  - ***no parameter*** All packets with specified destination address are cleared.
  - **tcp** TCP packets with specified destination address are cleared.
  - **udp** UDP packets with specified destination address are cleared.

Examples

- This command clears all dynamic entries from the NAT translation table.

```
switch# clear ip nat flow translation
switch#
```

- This command clears a specific NAT IP address ***172.22.30.52***.

```
switch# clear ip nat flow translation address 172.22.30.52
switch#
```

- This command clears the inside entry that maps the private address ***10.10.10.3*** to Internet address ***172.22.30.52***.

```
switch# clear ip nat flow translation address 172.22.30.52
 10.10.10.3
```

```
switch#
```

9.3.1.4.2 ip address

The **ip address** command configures the IPv4 address and connected subnet on the configuration mode interface. Each interface can have one primary address and multiple secondary addresses.

The **no ip address** and **default ip address** commands remove the IPv4 address assignment from the configuration mode interface. Entering the command without specifying an address removes the primary and all secondary addresses from the interface. The primary address cannot be deleted until all secondary addresses are removed from the interface.

Removing all IPv4 address assignments from an interface disables IPv4 processing on that port.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip address [***ipv4_subnet***][**PRIORITY**]

no ip address [***ipv4_subnet***][**PRIORITY**]

default ip address [***ipv4_subnet***][**PRIORITY**]

Parameters

- ***ipv4_subnet*** IPv4 and subnet address (CIDR or address-mask notation). ***Running-config*** stores value in CIDR notation.
- **PRIORITY** interface priority. Options include:
  - ***no parameter*** The address is the primary IPv4 address for the interface.
  - **secondary** The address is the secondary IPv4 address for the interface.

Guidelines

The **ip address** command is supported on routable interfaces.

Example

This command configures an IPv4 address for ***VLAN 200***.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip address 10.0.0.1/24
switch(config-if-Vl200)#
```

9.3.1.4.3 ip nat destination static

The **ip nat destination static** command enables NAT of a specified destination address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat destination static** and **default ip nat destination static** commands disables NAT translation of the specified destination address by removing the corresponding **ip nat destination static** command from ***running_config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip nat destination static **ORIGINAL** [**FILTER**] **TRANSLATED** [***PROT_TYPE***][group ***group_number***]

no ip nat destination static **ORIGINAL** [**FILTER**] **TRANSLATED** [***PROT_TYPE***] [group ***group_number***]

default ip nat destination static **ORIGINAL** [**FILTER**] **TRANSLATED** [***PROT_TYPE***] [group ***group_number***]

Parameters

- **ORIGINAL** Destination address to be modified. Options include:
  - ***local_ipv4*** IPv4 address.
  - ***local_ipv4 local_port*** IPv4 address and port (port value ranges from **1** to **65535**)
- **FILTER** Access control list that filters packets. Options include:
  - ***no parameter*** All packets with specified destination address are cleared.
  - **access-list *list_name*** List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED** Destination address of translated packet. Options include:
  - ***global_ipv4*** IPv4 address.
  - ***global_ipv4 global_port*** IPv4 address and port (port value ranges from **1** to **65535**). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT_TYPE** Filters packets based on protocol type. Options include:
  - ***no parameter*** All packets with specified destination address are cleared.
  - **protocol tcp** TCP packets with specified destination address are cleared.
  - **protocol udp** UDP packets with specified destination address are cleared.
- **group*group_number*** Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from **1** to **255**) is arbitrary, but must be the same in both rules.

Examples

- These commands configure ***VLAN 201*** to translate destination address ***10.24.1.10*** to ***168.32.14.15***.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip nat destination static 10.24.1.10
 168.32.14.15
switch(config-if-Vl201)#
```

- These commands configure ***VLAN 201*** to translate the source address ***10.24.1.10*** to ***168.32.14.15*** for all packets with IP destination addresses in the ***168.10.1.1/32*** subnet.

```
switch(config)# ip access-list ACL2
switch(config-acl-ACL2)# permit ip 168.10.1.1/32 any
switch(config-acl-ACL2)# exit
switch(config)# interface vlan 201
switch(config-if-Vl201)#
switch(config-if-Vl201)#
```

- These commands configure ***interface Ethernet 2*** to translate the local source address ***10.24.1.10*** to the global source address ***168.32.14.15***, and to translate the local destination address ***10.68.104.3*** to the global destination address ***168.25.10.7*** for all packets moving through the interface. The use of NAT ***group 3*** is arbitrary, but must be the same in both rules.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 10.24.1.10
 168.32.14.15 group 3
switch(config-if-Et2)# ip nat destination static 10.68.104.3
 168.25.10.7 group 3
```

9.3.1.4.4 ip nat pool

The **ip nat pool** command identifies a pool of addresses using start address, end address, and either netmask or prefix length. If its starting IP address and ending IP address are the same, there is only one address in the address pool.

The **no ip nat pool** removes the **ip nat pool**command from ***running_config***.

Command Mode

Global Configuration

Command Syntax

ip nat pool ***pool_name*** [***ADDRESS_SPAN***] ***SUBNET_SIZE***

no ip nat pool ***pool_name***

default ip nat pool ***pool_name***

Parameters

- ***pool_name*** Name of the IP address pool.
- ***ADDRESS_SPAN*** Options include:
  - ***start_addr*** The first IP address in the address pool (IPv4 addresses in dotted decimal notation).
  - ***end_addr*** The last IP address in the address pool. (IPv4 addresses in dotted decimal notation).
- ***SUBNET_SIZE*** This functions as a sanity check to ensure it is not a network or broadcast network. Options include:
  - **netmask** ***ipv4_addr*** The netmask of the address pool's network (dotted decimal notation).
  - **prefix-length** **0** to **32** The number of bits of the netmask (of the address pool's network) that are ones (how many bits of the address indicate network).

Examples

- This command configures the pool of addresses using start address, end address, and prefix length of **24**.

```
switch(config)# ip nat pool poo1 10.15.15.15 10.15.15.25
 prefix-length 24
switch(config)
```

- This command removes the pool of addresses.

```
switch(config)# no ip nat pool poo1 10.15.15.15 10.15.15.25
 prefix-length 24
 switch(config)
```

9.3.1.4.5 ip nat source dynamic

The **ip nat source dynamic** command enables NAT of a specified source address for packets sent and received on the configuration mode interface. This command installs hardware translation entries for forward and reverse traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

The **no ip nat source dynamic** and **default ip nat source dynamic** commands disables NAT translation of the specified destination address by removing the corresponding **ip nat source dynamic** command from ***running_config*** .

Note: Ethernet and Port-channel interfaces should be configured as routed ports.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip nat source dynamic access-list ***acl_name*** **POOL_TYPE**

no ip nat source dynamic access-list ***acl_name***

default ip nat source dynamic access-list ***acl_name***

Parameters

- ***acl_name*** Access control list that controls the internal network addresses eligible for NAT.
- **POOL_TYPE** Options include:
  - **overload** Translates multiple local addresses to a single global address. When overloading is enabled, conversations using the same IP address are distinguished by their TCP or UDP port number.
  - **pool** ***pool_name*** The name of the IP address pool. The pool is defined using the ip nat pool command.

    The pool option is required even if the pool has just one address. NAT uses that one address for all of the translations.
- ***pool_fullcone*** Enables full cone NAT where all requests from the same internal IP address and port are mapped to the same external IP address and port.

Examples

- This command configures the dynamic NAT source address and sets the NAT overload for pool ***P2***.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# ip nat source dynamic access-list
 ACL2 pool p2
switch(config-if-Et3/1)#
```

- This command disables the NAT source translation on interface Ethernet ***3/1***.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# no ip nat source dynamic access-list
 ACL2
```

```
switch(config-if-Et3/1)#
```

9.3.1.4.6 ip nat source static

The **ip nat source static** command enables NAT of a specified source address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat source static** and **default ip nat source static** commands disables NAT translation of the specified source address by removing the corresponding **ip nat source** command from ***running_config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

`ip nat source static` **ORIGINAL** [**FILTER**] **TRANSLATED** [**PROT_TYPE**] [group *group_number*]

`no ip nat source static` **ORIGINAL** [**FILTER**] **TRANSLATED** [**PROT_TYPE**] [group *group_number*]

`default ip nat source static` **ORIGINAL** [**FILTER**] **TRANSLATED** [**PROT_TYPE**] [group *group_number*]

Parameters

- **ORIGINAL** Source address to be modified. Options include:
  - ***original_ipv4*** IPv4 address.
  - ***original_ipv4 original_port*** IPv4 address and port (port value ranges from **1** to **65535**).
- **FILTER** Access control list that filters packets. Options include:
  - ***no parameter*** All packets with specified source address are cleared.
  - **access-list *list_name*** List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED** Source address of translated packet. Options include:
  - ***translated_ipv4*** IPv4 address.
  - ***translated_ipv4 translated_port*** IPv4 address and port (port value ranges from **1** to **65535**). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT_TYPE** Filters packets based on protocol type. Options include:
  - ***no parameter*** All packets with specified source address are cleared.
  - **protocol tcp** TCP packets with specified source address are cleared.
  - ***protocol udp*** UDP packets with specified source address are cleared.
- **group *group_number*** Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from **1** to **255**) is arbitrary, but must be the same in both rules.

Restrictions

- If **ORIGINAL** includes a port, **TRANSLATED** must also include a port.
- If **ORIGINAL** does not include a port, **TRANSLATED** cannot include a port.

Examples

- These commands configure ***VLAN 101*** to translate source address ***10.24.1.10*** to ***168.32.14.15***.

```
switch(config)# interface vlan 101
switch(config-if-Vl101)# ip nat source static 10.24.1.10
 168.32.14.15
switch(config-if-Vl101)#
```

- These commands configure ***VLAN 101*** to translate the source address ***10.24.1.10*** to access-list ACL1 ***168.32.14.15*** for all packets with IP destination addresses in the ***168.10.1.1/32*** subnet.

```
switch(config)# ip access-list ACL1
switch(config-acl-ACL1)# permit ip any 168.10.1.1/24
switch(config-acl-ACL1)# exit
switch(config)# interface vlan 101
switch(config-if-Vl101)# ip nat source static 10.24.1.10
 access-list ACL1
168.32.14.15
switch(config-if-Vl101)#
```

- These commands configure Ethernet interface ***2*** to translate the local source address ***10.24.1.10*** to the global source address ***168.32.14.15***, and to translate the local destination address ***10.68.104.3*** to the global destination address ***168.25.10.7*** for all packets moving through the interface. The use of NAT ***group 3*** is arbitrary, but must be the same in both rules.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 10.24.1.10
 168.32.14.15 group 3
switch(config-if-Et2)# ip nat destination static 10.68.104.3
 168.25.10.7 group 3
```

9.3.1.4.7 ip nat translation counters

The **ip nat translation counters** command enables the feature to count packets that are translated by static and twice NAT rules in hardware. Once this feature is enabled, all current rules in hardware and new rules that are configured after running this command receive policers for counting packets.

The **no ip nat translation counters** and **default ip nat translation counters** commands disable the packet counter feature for static and twice NAT connections.

Command Mode

Global Configuration

Command Syntax

ip nat translation counters

no ip nat translation counters

default ip nat translation counters

Guidelines

The **ip nat translation counters** command is supported on the DCS-7150 series switches only. This command is solely intended to debug static and twice NAT translation failures in hardware. Disable this feature after completing troubleshooting. If this feature remains enabled even when the count of static connections exceed ***275***, it can cause unpredictable behavior including restart of FocalPointV2 agent. The restart of FocalPointV2 agent results in traffic disruption.

Example

The **ip nat translation counters** command enables the packet counter feature for static and twice NAT connections. Using the **show ip nat translation hardware detail** and the **show ip nat translation twice hardware detail** commands, you can verify the packet count.

```
switch(config)# ip nat translation counters
switch(config)# show ip nat translation hardware detail

Source IP        Destination IP  Translated IP  TGT Type Intf   Proto  Packets  Packets Reply
-------------------------------------------------------------------------------------------

19.16.150.2:0  10.1.150.2:0    20.1.150.2:0   10.1.160.2:0  Vl2922 12 -    2
```

9.3.1.4.8 ip nat translation low-mark

The **ip nat translation low-mark** command configures the minimum threshold that triggers the resumption of programming new NAT translation connections.

The ip nat translation max-entries command specifies the maximum number of NAT translation connections that can be stored. When this limit is reached, new connections are dropped instead of being programmed in hardware or software. At this point no new connections will be programmed until the number of stored entries drop below the configured low-mark, expressed as a percentage of the max-entries value. The default low mark value is 90%.

The **no ip nat translation low-mark** and **default ip nat translation low-mark** commands restores the default low-mark value by removing the **ip nat translation low-mark** command from ***running_config***.

Command Mode

Global Configuration

Command Syntax

ip nat translation low-mark ***threshold***

no ip nat translation low-mark

default ip nat translation low-mark

Parameters

threshold Percentage of maximum connection entries. Value ranges from **1** to **99**. Default is **90**.

Example

This command globally sets the translation low mark of ***93%***.

```
switch(config)# ip nat translation low-mark 93
switch(config)#
```

9.3.1.4.9 ip nat translation max-entries

The **ip nat translation max-entries** command specifies maximum number of NAT translation connections. After this threshold is reached, new connections are dropped until the number of programmed connections is reduced below the level specified by the ip nat translation low-mark command.

The **no ip nat translation max-entries** and **default ip nat translation max-entries** commands removes the maximum connection limit and resets the parameter value to zero by removing the **ip nat translation max-entries** command from ***running_config***.

Command Mode

Global Configuration

Command Syntax

ip nat translation max-entries ***connections***

no ip nat translation max-entries

default ip nat translation max-entries

Parameters

- ***connections*** The maximum number of NAT translation connections. Value ranges from **0** to **4294967295**. Default value is **0**, which removes the connection limit.

Example

This command limits the number of NAT translation connections the switch can store to ***3000***.

```
switch(config)# ip nat translation max-entries 3000
switch(config)#
```

9.3.1.4.10 ip nat translation tcp-timeout

The **ip nat translation tcp-timeout** command specifies the translation timeout period for translation table entries. The timeout period specifies the interval during which the switch will attempt to reuse an existing TCP translation for devices specified by table entries.

The **no ip nat translation tcp-timeout** and **default ip nat translation tcp-timeout** commands reset the timeout to its default by removing the corresponding **ip nat translation tcp-timeout** command from ***running_config***.

Command Mode

Global Configuration

Command Syntax

ip nat translation tcp-timeout ***period***

no ip nat translation tcp-timeout

default ip nat translation tcp-timeout

Parameters

period Time-out period in seconds for port translations. Value ranges from **0** to **4294967295**. Default value is **86400** (24 hours).

Examples

- This command sets the TCP timeout for translations to ***600*** seconds.

```
switch(config)# ip nat translation tcp-timeout 600
switch(config)#
```

- This command removes the TCP translation timeout.

```
switch(config)# no ip nat translation tcp-timeout
switch(config)#
```

9.3.1.4.11 ip nat translation udp-timeout

The **ip nat translation udp-timeout** command specifies the translation timeout period for translation table entries. The timeout period specifies the interval the switch attempts to establish a UDP connection with devices specified by table entries.

The **no ip nat translation udp-timeout** and **default ip nat translation udp-timeout** commands disables NAT translation of the specified destination address by removing the corresponding **ip nat translation udp-timeout** command from ***running_config***.

Command Mode

Global Configuration

Command Syntax

ip nat translation udp-timeout ***period***

no ip nat translation udp-timeout

default ip nat translation udp-timeout

Parameters

period Value ranges from **0** to **4294967295**. Default value is **300** (5 minutes).

Examples

- This command globally sets the timeout for UDP to ***800*** seconds.

```
switch(config)# ip nat translation udp-timeout 800
```

- This command removes the timeout for UDP.

```
switch(config)# no ip nat translation udp-timeout
```

9.3.1.4.12 show ip nat access-list interface

The **`show ip nat acl interface`** command displays the access control lists (ACLs) that are configured as source NAT or destination NAT filters. The display indicates ACL rules that do not comply with these NAT requirements:

- Source IP address is any.
- Destination IP address may use any mask size.
- Source port matching is not allowed.
- Protocol matching is not allowed.

Command Mode

EXEC

Command Syntax

`show ip nat access-list` [**INTF**][**LISTS**]

Parameters

- **INTF** Filters NAT statements by interface. Options include:
  - ***no parameter*** Includes all statements on all interfaces.
  - **interface ethernet *e_num*** Statements on specified Ethernet interface.
  - **interface loopback *l_num*** Statements on specified Loopback interface.
  - **interface management *m_num*** Statements on specified Management interface.
  - **interface port-channel *p_num*** Statements on specified Port-Channel Interface.
  - **interface vlan *v_num*** Statements on specified VLAN interface.
  - **interface vxlan *vx_num*** Statements on specified VXLAN interface.
- **LISTS** ACLs displayed by command. Options include:
  - ***no parameter*** All ACLs.
  - ***acl_name*** Specifies individual ACL.

Example:

These commands display the NAT command usage of the ACL1 and ACL2 access control lists.

```
switch> show ip nat acl ACL1

acl ACL1
        (0.0.0.0/0, 168.10.1.1/32)
Interfaces using this ACL for Nat:
        Vlan100

switch> show ip nat acl ACL2
acl ACL2
        (168.10.1.1/32, 0.0.0.0/0)
Interfaces using this ACL for Nat:
        Vlan201
switch>
```

9.3.1.4.13 show ip nat pool

The **show ip nat pool** command displays the configuration of the address pool.

Command Mode

EXEC

Command Syntax

show ip nat pool POOL_SET

Parameters

- ***pool_name*** The name of the pool.
- **POOL_SET** Options include:
  - ***no parameter*** All configured port channels.
  - ***pool_name*** The name of the pool.

Examples

- This command displays all the address pools configured on the switch.

```
switch# show ip nat pool
Pool                 StartIp              EndIp
   Prefix
p1                   10.15.15.15          10.15.15.25
   24
p2                   10.10.15.15          10.10.15.25
   22
p3                   10.12.15.15          10.12.15.25
   12
switch#
```

- These commands display specific information for the address pools configured on the switch.

```
switch# show ip nat pool p1
Pool                 StartIp              EndIp
   Prefix
p1                   4.1.1.1              4.1.1.2
   24
                     1.1.1.1              1.1.1.2
   24
                     3.1.1.1              3.1.1.2
   24
switch# show ip nat pool p2
Pool                 StartIp              EndIp
   Prefix
p2                   10.1.1.1             10.1.1.2
   16
switch#
```

9.3.1.4.14 show ip nat synchronization advertised-translations

The **show ip nat synchronization advertised-translations** command displays the detailed status of devices that are advertised to a peer device.

Command Mode

EXEC

Command Syntax

show ip nat synchronization advertised-translations

Example

This command displays details of devices that are advertised to a peer device.

```
switch# show ip nat synchronization advertised-translations

Source IP         Destination IP   Translated IP          TGT
 Type Intf
-------------------------------------------------------------
------------
61.0.0.15:6661    100.0.0.2:80     192.170.230.171:6661    SRC

 DYN  Et5
```

9.3.1.4.15 show ip nat synchronization discovered-translations

The **show ip nat synchronization discovered-translations** command displays details of what has been advertised from a peer device.

Command Mode

EXEC

Command Syntax

show ip nat synchronization discovered-translations

Example

This command displays details of devices that are advertised to a peer device.

```
switch# show ip nat synchronization discovered-translations

Source IP         Destination IP    Translated IP          TGT
 Type Intf
-------------------------------------------------------------

```

9.3.1.4.16 show ip nat synchronization peer

The **`show ip nat synchronization peer`** command displays the detailed status of a peer device.

Command Mode

EXEC

Command Syntax

`show ip nat synchronization peer`

Example:

This command displays details of a peer device with an IP address of ***11.11.11.0*** and interface ***VLAN 1111*** that is used to connect to the peer device.

```
switch# show ip nat synchronization peer
Description : Value
Peer : 11.11.11.0
Connection Port : 4532
Connection Source : 0.0.0.0
Kernel Interface : vlan1111
Local Interface : Vlan1111
Established Time : 1969-12-31 16:00:00
Connection Attempts : 0
Oldest Supported Version : 1
Newest Supported Version : 1
Version Compatible : True
Connection State : connected
Shutdown State : False
Status Mount State : mountMounted
Version Mount State : mountMounted
Recover Mount State : mountMounted
Reboot Mount State : mountMounted
```

9.3.1.4.17 show ip nat translation

The **show ip nat translation** command displays configured NAT statements in the switch hardware.

Command Mode

EXEC

Command Syntax

show ip nat translation [address | address-only | destination | detail | dynamic | hardware | interface | kernel | max-entries | source | static | summary | twice]

Command position of all parameters are interchangeable.

Parameters

- ***no parameter*** Displays all NAT connections installed in software.
- **address *ipv4_addr*** Displays NAT connections of the specified IPv4 host address.
- **address-only *ipv4_addr*** Displays address-only NAT connections of the specified IPv4 host address.
- **destination** Displays destination NAT connections installed in software.
- **detail** Displays detailed output of all NAT connections.
- **dynamic** Displays dynamic NAT connections.
- **hardware** Displays NAT connections installed in hardware.
- **interface** Filters NAT connections by interface. Options include:
  - **interface ethernet *e_num*** Displays NAT connections of the specified ethernet interface.
  - **interface port-channel *p_num*** Displays NAT connections of the specified port-channel interface.
  - **interface vlan *v_num*** Displays NAT connections of the specified VLAN interface.
- **kernel** Displays NAT connections installed in kernel.
- **max-entries** Displays the configured NAT connection limits of a hardware.
- **source** Displays source NAT connections installed in software.
- **static** Displays static NAT connections.
- **summary** Displays summary of all NAT connections.
- **twice** Displays twice NAT connections.

Examples

- This command displays all configured NAT translations.

```
switch> show ip nat translation

Source IP          Destination IP   Translated IP         TGT Type Intf
-------------------------------------------------------------------------
192.168.1.10:62822 172.22.22.40:53  172.17.254.161:62822  SRC DYN  Vl3925

-------------------------------------------------------------------------
10.1.1.1       10                    9(90%)                0
```

9.3.2 Media Access Control Security

This section explains the basic concepts about Media Access Control Security (MACsec) including overview, configuration, and the different MACsec commands that are used.

9.3.2.1 MACsec Overview

Media Access Control Security (MACsec) is an industry standard encryption mechanism that protects all traffic flowing on the Ethernet links. MACsec is based on IEEE 802.1X and IEEE 802.1AE standards.

The major benefits of MACsec are:

- MACsec supports packet authentication by providing integrity checking so that packet data is not altered during a packet flow.
- MACsec provides secure encryption at Layer 2 level by ensuring complete data confidentiality.
- A high density MACsec solution for Cloud Data Centers is integrated with 7500R for highest density and performance in a modular platform.
- Cost and performance is optimized for Data Center Interconnect to transport massive volumes of traffic through metro or long haul networks.
- Secure transport of data over distance is made possible with MACsec encryption eliminating additional intermediate devices.

9.3.2.1.1 MACsec Terminology

MACsec Key Agreement Protocol (MKA) is the key agreement protocol for discovering MACsec peers and negotiating keys between MACsec peers (IEEE 802.1X-REV).

A **Connectivity Association (CA)** is a security relationship between MACsec-capable devices (endpoints). Endpoints in the same CA share a Connectivity Association Key (CAK). Arista implementation allows 2 endpoints.

A **Connectivity Association Key (CAK)** is a master key that is used to generate all other keys that are used for MACsec. Endpoints in the same secure Connectivity Association (CA) share a CAK. This key can either be a static pre-shared key, or dynamically derived with the use of 802.1X authentication.

Primary Key- It is ideally the CAK for the MKA session in progress. The Primary key is a combination of key name and the actual key. For example, when a configuration uses ***0abcd1 0 1234abcd*** as a primary key, in this the ***0abcd1*** is the hex key name, while ***1234abcd*** is the actual key. Note, a key name must be in hex format too.

Note: That the operator ***0*** means the key being entered here is unencrypted (or unhashed), vs. ***7*** meaning the hashed version of this key is being entered (in cases where the configuration is being replayed onto the switch).

Fallback Key- In case the primary configured key does not establish its connection, the fallback key is used, so as to ensure no loss of traffic.

Secure Association Key (SAK) - The SAK is derived from the CAK and is the key used by the network device ports to encrypt traffic for a given session.

Key Server - One of the MACsec peers in the CA becomes the Key Server. The main role of the Key Server is to create and distribute Secure Association Keys (SAKs), which are used in actual data encryption.

A **Static Secure Association Key (SAK)** is an SAK configured directly on a switch and used with unidirectional links, in situations where the MKA protocol is not feasible. Static SAKs require the use of eXtended Packet Numbering (XPN) cipher suites.

9.3.2.1.2 MACsec Limitations

The limitations of MACsec are:

- MACsec is supported only on point-to-point links, unless static SAK is enabled.
- When MACsec is enabled on an interface for the first time, interface flapping occurs for MACsec to take effect.
- If static SAK is not enabled, the port does not forward any traffic until the MKA protocol converges and negotiates encryption keys. This occurs initially when MACsec is configured on a port.

9.3.2.1.3 MACsec Licensing

MACsec encryption is a EOS licensed feature. A valid MACsec license must be configured on a switch. MACsec licenses are tied to a switch serial number and the licensee. Every switch running MACsec requires a separate license of its own.

There are two ways of configuring MACsec license:

1. Use the command **`license`** ***licensee_name license_value*** in MACsec mode. The license value is an 8 digit hexadecimal number. This method of license configuration is no longer being used except for backward compatibility.
2. Use the command **`license`** **import** ***license_file_path*** in Global configuration mode. All new licenses generated on the license portal are JSON-based.

Contact your system engineer to acquire the required license codes before attempting to configure MACsec.

9.3.2.1.4 MACsec in FIPS mode

Federal Information Processing Standards (FIPS) are a set of standards defined by the United States federal government related to the processing of data in computer systems by non-military government agencies and government contractors. These standards define specific requirements for various purposes such as ensuring computer security and interoperability within and across the computer networking industry.

Arista devices are compliant with FIPS 140. The FIPS 140 enforces the use of a "FIPS Crypto Module". This both ensures that the algorithms are correct and restricts the set of allowed algorithms to those approved by the FIPS standard. These are the FIPS supported algorithms AES-128/256, SHA-256/512, RSA with 2048 bit keys, a subset of EcDSA. MACsec has both the AES-128-GCM and AES-256-GCM algorithms certified for the data plane. The FIPS mode is enabled using the **`fips restrictions`** command which when enabled filters out any unapproved algorithms and warns you if you try to set them.

9.3.2.1.5 VLAN Tagged MACsec

Media Access Control Security (MACsec) is configured on subinterfaces using the **`mac security profile`** command. Since subinterfaces are logical interfaces that send and receive VLAN tagged traffic, encryption/decryption is applied per VLAN tag.

9.3.2.1.6 MACsec Using Static Secure Association Key

MAC security uses the MACsec Key Agreement (MKA) protocol to negotiate between peers using keys (CAKs and CKNs) which are either pre-shared or derived from an 802.1X session, and derives a Secure Association Key (SAK) based on the MKA negotiation. This SAK is then programmed in hardware and used for encrypting and decrypting data traffic. In cases where MKA negotiation is not feasible but encryption and decryption of traffic is required (such as unidirectional links), MACsec can instead be configured to use static Secure Association Keys (SAK) configured separately on transmitting and receiving peers. Each peer can have up to four receiving secure keys and one transmitting key.

9.3.2.2 Configuring MACsec

These sections describe basic MACsec configuration steps:

- Enabling MACsec
- Configuring MACsec for MKA
- Configuring the FIPS mode
- Configuring MACsec Profile on a Subinterface
- Configuring MACsec Using Static SAK
- Configuring MACsec Proxy For VXLAN
- Configuring MAC Security Dynamic Key Derivation
- Configuring MACsec Fallback to Unprotected Traffic

9.3.2.2.1 Enabling MACsec

MACsec requires a configuration profile. Use the **`mac security`** command to enable MACsec and enter MAC Security Configuration Mode, then use the **`profile`** command to create a profile and enter MAC Security Profile Configuration Mode, where the following commands are available for detailed configuration:

- cipher
- key (MACsec)
- mka key-server
- mka session
- replay
- sci
- traffic unprotected allow

Example

These commands enable MACsec and enter MAC Security Configuration Mode, then create a profile named "MACsec_test" and enter MAC Security Profile Configuration Mode.

```
switch(config)# mac security
switch(config-mac-security)# profile MACsec_test
switch(config-mac-security-profile-MACsec_test)#
```

9.3.2.2.2 Configuring MACsec for MKA

By default, MAC security (MACsec) uses the MACsec Key Agreement (MKA) protocol to negotiate and exchange encryption keys among peers. To complete a typical MACsec configuration, use the **`cipher`** command to select a valid encryption standard. Then use the **`key`** command to enter a Connectivity Association Key (CAK). You can use the **fallback** option to add a fallback CAK to be used if the primary CAK fails.

The key server is responsible for generating and distributing encryption keys. Run the **mka key-server priority** command on a peer to change its priority. The peer with the lowest priority is elected as the key server. If multiple peers have the same priority, the one with the lowest MAC address is chosen. Priority values range from 0 to 255 and the default priority is 16.

Configure the period at which the Secure Association Key (SAK) is refreshed with the **mka session rekey-period** command. MACsec uses an SAK for encrypting data traffic, and this SAK is derived from the CAK. Rekey-period values range from ***30*** to ***100000*** seconds. By default, there is no session rekey period, and the SAK will not be refreshed periodically.

To improve the randomness of the numbers used to generate MACsec's cryptographic keys, add a source of entropy with the **entropy source** command in Management Security Configuration Mode.

Examples

These commands configure MACsec to use the AES256-GCM-XPN cipher and add a key and fallback key. For MKA with pre shared key configuration, keys with any length are allowed to work. However, we should have keys with 64 hexadecimal digits in length for a 256-bit cipher.

```
switch(config-mac-security-profile-test)# cipher aes256-gcm-xpn
switch(config-mac-security-profile-test)# key 0abc12340def56780abc12340d
ef5678 7 06070E234E4D0A48544540585F507E
switch(config-mac-security-profile-test)# key 0def56780abc12340def56780a
bc1234 7 09484A0C1C0311475E5A527D7C7C70 fallback
```

These commands give the switch a key-server priority of 10 and an MKA session rekey period of 600 seconds.

```
switch(config-mac-security-profile-test)# mka key-server priority 10
switch(config-mac-security-profile-test)# mka session rekey-period 600
```

These commands add an entropy source for more random cryptographic keys.

```
switch(config-mac-security-profile-test)# management security
switch(config-mgmt-security)# entropy source hardware
```

These commands apply the "test" profile to Ethernet interface 5/3/1.

```
switch(config-mgmt-security)# interface ethernet 5/3/1
switch(config-if-Et5/3/1)# mac security profile test
switch(config-if-Et5/3/1)#
```

9.3.2.2.3 Configuring the FIPS mode

To configure the FIPS mode on the MACsec protocol, use the **FIPS** command.

Example

This command configures the FIPS mode on the MACsec protocol.

```
switch(config)# mac security
switch(config-mac-security) fips restrictions
```

9.3.2.2.4 Configuring MACsec Profile on a Subinterface

Following are the commands used to configure a MACsec profile on a subinterface.

Example

- The following example enables MAC security on a subinterface with a predefined MACsec profile **test-profile**.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# interface ethernet1.10
switch(config-if-Et1.10)# encapsulation dot1q vlan 20
switch(config-if-Et1.10)# mac security profile test-profile
```

9.3.2.2.5 Configuring MACsec Using Static SAK

Static SAK is configured for receive (Rx) and transmit (Tx) directions separately. In the Rx direction, multiple SAKs can be configured. For the Tx direction, only one SAK is allowed at a time. An SAK configured for Rx on the local peer should match the SAK configured for Tx on the connected peer, and vice versa. The Rx direction should be configured first on all the MACsec peers, and then the Tx direction should be configured. Use the **cipher** command to select a cipher suite. You must choose an eXtended Packet Number (XPN) cipher suite, such as AES128-GCM-XPN or AES256-GCM-XPN. Static SAK will not work with a non-XPN cipher.

Examples

- These commands select the AES256-GCM-XPN cipher suite for the MACsec profile ***rx_test*** on the receiving peer (Rx).

```
switch(config)# mac security
switch(config-mac-security)# profile rx_test
switch(config-mac-security-profile-rx_test)# cipher aes128gcm-xpn
switch(config-mac-security-profile-rx_test)#
```

- This command configures the key source as static SAK.

```
switch(config-mac-security-profile-rx_test)# key source sak static
switch(config-mac-security-profile-rx_test-sak-static)#
```

- These commands configure a secure channel identifier (SCI) on the receiving peer. The SCI is a MAC address with six hexadecimal octets and a decimal port number.

```
switch(config-mac-security-profile-rx_test-sak-static)# secure channel
 rx
switch(config-mac-security-profile-rx_test-sak-static-rx)# identifier
 01:02:03:04:05:06::1234
switch(config-mac-security-profile-rx_test-sak-static-rx)#
```

- This command configures an SAK and assigns it an association number (AN) of ***0***.

```
switch(config-mac-security-profile-rx_test-sak-static-rx)# an 0 key 0
 11112222333344445555666677778888
switch(config-mac-security-profile-rx_test-sak-static-rx)#
```

- This command configures another SAK and its association number. Up to four associations can be configured.

```
switch(config-mac-security-profile-rx_test-sak-static-rx)# an 1 key 0
 9999aaaabbbbccccddddeeeeffff0000
switch(config-mac-security-profile-rx_test-sak-static-rx)#
```

- These commands configure the secure channel on a transmitting peer using the profile ***tx_test***. Only one SAK can be configured per transmitting peer. This will encrypt traffic in the Tx direction, so the receiving peer must be configured with a matching SAK to decrypt this traffic.

```
switch(config-mac-security-profile-tx_test-sak-static)# secure channel
 tx
switch(config-mac-security-profile-tx_test-sak-static-tx)# identifier
 01:02:03:04:05:07::1235
switch(config-mac-security-profile-tx_test-sak-static-tx)# an 0 key 0
 22223333444455556666777788889999
switch(config-mac-security-profile-tx_test-sak-static-tx)#
```

9.3.2.2.6 Configuring MACsec Proxy For VXLAN

The switch platforms which use this feature are:

- 7280SRAM-48C6
- 7280CR2M-30
- 7500R2M-36CQ-LC

The mandatory steps to configure a MACsec proxy sub-interface on an Arista switch are:

1. Configure the parent interface to be a routed port.
2. Create a L3 sub-interface on the parent interface. This is the MACsec proxy sub-interface.
3. Create a L2 sub-interface on the parent interface. This is the MACsec patch sub-interface.
4. Configure and enable the MACsec proxy port on a sub-interface.
5. Configure the VXLAN tunnel.
6. Assign the forwarding VLAN ID for the MACsec patch sub-interface and VXLAN tunnel.

Example Configurations

a. Configure a ***100g*** MACsec interface as a routed port.

```
switch(config)# interface et49/1
switch(config-if-Et49/1)# no switchport
```

b. Create a new L3 sub-interface - ***et49/1.1*.**

```
switch(config-if-Et49/1)# interface et49/1.1
```

c. Create a new L2 sub-interface - ***et49/1.2***.

```
switch(config-if-Et49/1)# interface et49/1.2
```

d. Configure the MACsec proxy port, and enable MACsec on the proxy port.

```
switch(config)# interface et49/1.1
switch(config-if-Et49/1.1)# mac security proxy patch Ethernet49/1.2
switch(config-if-Et49/1.1)# mac security profile test1
switch(config-if-Et49/1.1)# ip address 2.2.2.1/24
```

e. Configure the VXLAN tunnel. The remote VTEP is provided as the flood VTEP.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface Loopback0
switch(config-if-Vx1)# vxlan udp-port 4789
switch(config-if-Vx1)# vxlan vlan 20 vni 20
switch(config-if-Vx1)# vxlan vlan 20 flood vtep 100.100.100.2
```

f. Configure the L2 MACsec patch interface to be in the same VLAN as VXLAN.

```
switch(config)# interface et49/1.2
switch(config-if-Et49/1.2)# vlan id 20
```

9.3.2.2.7 Configuring MAC Security Dynamic Key Derivation

9.3.2.2.8 Configuring MACsec Fallback to Unprotected Traffic

This feature is supported on all MACsec capable cards except for 7500E-6CFPX-LC.

The MACsec Fallback to Unprotected Traffic feature is configured under MACsec profile mode using the **`traffic unprotected allow`** command. The **no** form of the command removes the configuration from the switch. This configuration must be present in both the peers for the unprotected traffic to flow between them successfully.

Example

```
switch(config-mac-security-profile-sampleProfile)# no traffic unprotected
 allow
```

9.3.2.3 Displaying MACsec Information

The following sections provide information about MACsec on a switch.

This section contains the following topics:

- Displaying MACsec Information
- Displaying MACsec detailed information
- Displaying MACsec participants
- Displaying MACsec participants detailed information
- Displaying MACsec MKA Counters
- Displaying MACsec Security Counters Detailed Information
- Displaying MACsec Security Counters
- Displaying MACsec MKA Counters detailed information
- Displaying MACsec FIPS Status
- Displaying Information for MACsec Using Static Secure Association Key

9.3.2.3.1 Displaying MACsec Information

The **`show mac security interface`** command shows information about the MACsec on the interface.

Example

```
switch# show mac security interface
Interface SCI Controlled Port Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605 True 9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613 True 9d5bc0d3076ea4a08b99b9d9:1
```

9.3.2.3.2 Displaying MACsec detailed information

Use the **`show mac security interface detail`** command to display detailed information about MACsec.

Example

```
switch# show mac security interface detail
Interface: Ethernet4/1/1
    SCI: 28:99:3a:82:6f:82::605
    SSCI: 00000002
    Controlled port: True
    Key server priority: 16
    Session rekey period: 0
    Traffic: Protected
    Key in use: 9d5bc0d3076ea4a08b99b9d9:1
    Latest key: None
    Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)

Interface: Ethernet4/3/1
    SCI: 28:99:3a:82:6f:85::613
    SSCI: 00000001
    Controlled port: True
    Key server priority: 16
    Session rekey period: 0
    Traffic: Protected
    Key in use: 9d5bc0d3076ea4a08b99b9d9:1
    Latest key: None
    Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)
```

About the Output:

- **`Interface`**: Name of the interface.
- **`Secure Channel Identifier (SCI)`**: Combination of MAC address and port number. Used to uniquely identify a Mac Security port.
- **`Controlled Port`**: Indicates if Mac Security is enabled on the port. A value of True indicates that encryption is enabled on the port.
- **`Key In Use`**: The SAK identifier currently in use. Combination of Key Servers message identifier (see below) and key number.
- **`Key Server Priority`**: Configured key server priority.
- **`Session Rekey Period`**: Configured session rekey period.
- **`Latest Key`**: Latest SAK being negotiated by Mac Security Key Agreement Protocol (MKA)
- **`Old Key`**: The last SAK negotiated by Mac Security Key Agreement Protocol (MKA)

Note: Latest and Old key are MKA protocol specific terminology and are used to refer to the last two keys in use. For all practical purposes, Key In Use field is used to identify the current key.

9.3.2.3.3 Displaying MACsec participants

Use the **`show mac security participants`** command to display information about the MACsec participants.

Example

```
switch# show mac security participants
Interface: Ethernet4/1/1
    CKN: abcd
      Message ID: 9d5bc0d3076ea4a08b99b9d9
      Elected self: True
      Success: True
      Principal: True
      Default: False

    CKN: dead
```

```
      Message ID: 4ef4cf009161bd551b5e7434
      Elected self: True
      Success: True
      Principal: False
      Default: True

Interface: Ethernet4/3/1
    CKN: abcd
      Message ID: c79ad8882c2dd3a8e838a691
      Elected self: False
      Success: True
      Principal: True
      Default: False

    CKN: dead
      Message ID: 3dfd4486b5f68a81014a37ec
      Elected self: False
      Success: True
      Principal: False
      Default: True
```

9.3.2.3.4 Displaying MACsec participants detailed information

Use the **`show mac security participants detail`** command to display detailed information about the MACsec participants.

Example

```
switch# show mac security participants detail
Interface: Ethernet4/1/1
    CKN: abcd
      Message ID: 9d5bc0d3076ea4a08b99b9d9
      Elected self: True
      Success: True
      Principal: True
      Default: False
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: True
      LLPN exhaustion: 0
      Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
      Live peer list: ['c79ad8882c2dd3a8e838a691']
      Potential peer list: []

    CKN: dead
      Message ID: 4ef4cf009161bd551b5e7434
      Elected self: True
      Success: True
      Principal: False
      Default: True
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: False
      LLPN exhaustion: 0
      Distributed key identifier: None
      Live peer list: ['3dfd4486b5f68a81014a37ec']
      Potential peer list: []

Interface: Ethernet4/3/1
    CKN: abcd
      Message ID: c79ad8882c2dd3a8e838a691
      Elected self: False
      Success: True
      Principal: True
```

```
      Default: False
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: True
      LLPN exhaustion: 0
      Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
      Live peer list: ['9d5bc0d3076ea4a08b99b9d9']
      Potential peer list: []

    CKN: dead
      Message ID: 3dfd4486b5f68a81014a37ec
      Elected self: False
      Success: True
      Principal: False
      Default: True
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: False
      LLPN exhaustion: 0
      Distributed key identifier: None
      Live peer list: ['4ef4cf009161bd551b5e7434']
      Potential peer list:
```

About the Output

- **`Connectivity Association Key Name (CKN)`**: Configured name of the key in use.
- **`Message ID`**: A random 92 bit string used as an identifier for an MKA participant.
- **`Elected Self`**: True if this participant is the elected key server.
- **`Success`**: True if this participant is live and has at least one live peer.
- **`Principal`**: True if this participant is the principal participant elected to distribute SAKs or if participant receives SAKs from key server.
- **`Default`**: True if this participant is a fallback/backup participant (spawned when a fallback key is configured in a Mac Security profile).
- **`Key Server SCI`**: The SCI of the key server.
- **`SAK Transmit`**: True if the participant is ready to use the negotiated key for transmit.
- **`LLPN Exhaustion`**: Increments if the number of data packets sent using the current key exceeds a certain threshold.
- **`Distributed Key Identifier`**: Message ID + key number of the most recently generated SAK.
- **`Live Peer List`**: Message IDs of all the live peers of the participant.
- **`Potential Peer List`**: Message IDs of all the potential peers of the participant. These are peers which havent yet established mutual liveness but have sent out at least one control packet.

9.3.2.3.5 Displaying MACsec MKA Counters

Use the **`show mac security mka counters`** command to display information about the MACsec MKA counters.

Example

```
switch# show mac security mka counters
Interface       Rx Success      Rx Failure      Tx Success      Tx
 Failure
Ethernet4/1/1   287             0               288             0
Ethernet4/3/1   288             0               287             0
```

9.3.2.3.6 Displaying MACsec Security Counters Detailed Information

Use the **`show mac security counters detail`** command to display detailed information about the MACsec security counters.

Example

```
switch# show mac security counters detail
Ethernet4/1/1     Counter Name        Count
-------------------------------------------------------
                  outPktsEncrypted    112
                  outOctetsEncrypted  11984
                  outPktsUntagged     0
                  outPktsTooLong      0
                  outPktCtrl          224
                  inPktsDecrypted     2
                  inOctetsDecrypted   214
                  inPktsUnchecked     0
                  inPktsOK            2
                  inPktsNotValid      0
                  inPktsNotUsingSA    0
                  inPktsCtrl          223
                  inPktsNoTag         8
                  inPktsTagged        0
                  inPktsBadTag        0
                  inPktsNoSCI         0
                  inPktsLate          0

Ethernet4/3/1     Counter Name        Count
-------------------------------------------------------
                  outPktsEncrypted    2
                  outOctetsEncrypted  214
                  outPktsUntagged     0
                  outPktsTooLong      0
                  outPktCtrl          223
                  inPktsDecrypted     111
                  inOctetsDecrypted   11877
                  inPktsUnchecked     0
                  inPktsOK            111
                  inPktsNotValid      0
                  inPktsNotUsingSA    0
                  inPktsCtrl          224
                  inPktsNoTag         9
                  inPktsTagged        0
                  inPktsBadTag        0
                  inPktsNoSCI         0
                  inPktsLlate         0
```

9.3.2.3.7 Displaying MACsec Security Counters

Use the **show mac security counters** command to display information about the MACsec security counters.

Example

```
switch# show mac security counters
Port     InPktsDecrypted  InOctetsDecrypted  OutPktsEncrypted OutOctetsEncrypted
Et4/1/1                2                214               109              11663
Et4/3/1              109              11663                 2                214
```

9.3.2.3.8 Displaying MACsec MKA Counters detailed information

Use the **show mac security mka counters detail** command to display detailed information about the MACsec MKA counters.

Example

```
switch# show mac security mka counters detail
Interface: Ethernet4/1/1
    Tx packet success: 290
    Tx packet failure: 0
        Tx invalid: 0
    Rx packet success: 289
    Rx packet failure: 0
        Rx invalid: 0
        Rx eapol error: 0
        Rx basic parameter set error: 0
        Rx unrecognized CKN error: 0
        Rx ICV validation error: 0
        Rx live peer list error: 0
        Rx potential peer list error: 0
        Rx SAK use set error: 0
        Rx distributed SAK set error: 0
        Rx distributed CAK set error: 0
        Rx ICV Indicator error: 0
        Rx unrecognized parameter set error: 0

Interface: Ethernet4/3/1
    Tx packet success: 289
    Tx packet failure: 0
        Tx invalid: 0
    Rx packet success: 290
    Rx packet failure: 0
        Rx invalid: 0
        Rx eapol error: 0
        Rx basic parameter set error: 0
        Rx unrecognized CKN error: 0
        Rx ICV validation error: 0
        Rx live peer list error: 0
        Rx potential peer list error: 0
        Rx SAK use set error: 0
        Rx distributed SAK set error: 0
        Rx distributed CAK set error: 0
        Rx ICV Indicator error: 0
        Rx unrecognized parameter set error: 0
```

9.3.2.3.9 Displaying MACsec FIPS Status

Use the **show mac sec status** command to display information about the MACsec FIPS status.

Example

```
switch(config)# mac security
switch(config-mac-security)# show mac sec status
Active Profiles:          1
FIPS Mode:                Yes
Secured Interfaces:       2
```

9.3.2.3.10 Displaying Information for MACsec Using Static Secure Association Key

If MACsec is configured to use static SAKs, these commands will show additional information related to static SAKs:

- **show active**

In MAC Security configuration mode, the **show active** command displays the MAC security key source. If one or more static SAKs are configured, this key source will be shown as "key source sak static."

- **show mac security interface**

  With a static SAK configured, the **show mac security interface** command shows the association numbers for SAKs which are programmed for Rx and Tx. **Show** commands never display actual SAK values.

  If a unidirectional link is configured with a static SAK, the Rx side will show the SCI as "00:00:00:00:00:00::0," and only the Rx AN will be shown. On the Tx side, the configured SCI and Tx AN will be shown.

- **show mac security sak**

  If one or more SAKs are configured in the switch, the **show mac security sak** command will show SAK-related details.

9.3.2.4 MACsec Key Retirement Immediate

The MACsec uses the concept of configuring two keys for MKA negotiation: Primary and Fallback (as a backup). Given a mac security profile configured on an interface, there is an actor created per key which is responsible for MKA negotiation with the other peer. When a new primary key is configured, old primary keys actor is retained in the system till the time MKA session becomes successful with the configured new primary key. Same holds good for fallback key as well. When **key retirement immediate** command is used it removes the actor corresponding to old key, be it primary or fallback, from the system immediately.

MACsec Key Retirement Immediate Operations

- If a new primary key is configured in a mac security profile, old primary keys actor is deleted from the system immediately.
- If a new fallback key is configured in a mac security profile, old fallback keys actor is deleted from the system immediately.
- Removing the feature configuration from mac security profile will just prevent cleaning up of old keys immediately when new keys are configured. It will not create old actor again.

Note: The **key retirement immediate** command only deletes the actor corresponding to old key. It does not clean up the SAK programmed in the hardware until a new SAK is available to be programmed. However, as a side effect of deletion of actor, a new principal actor will be chosen (if an eligible actor is available) over which a new SAK will be distributed subsequently.

MACsec Key Retirement Immediate Feature Interactions

MACsec EAP-FAST Support

If Dynamic MAC Security keys is used with key retirement immediate, then on every new primary key derived from 802.1X, old primary keys actor will be deleted from the system. This will usually happen based on the reauth time interval configuration for 802.1X.

MACsec Fallback to Unprotected Traffic Support

The key retirement immediate is configured with Fallback to Unprotected Traffic feature, transition between unprotected traffic and protected traffic may become more frequent. This is because with Key Retirement Immediate feature, whenever a new key is configured, existing successful MKA session corresponding to the old key are not maintained, which might bring down the number of successful

MKA sessions to zero, which eventually moves the interface to unprotected traffic state as per Fallback to Unprotected Traffic feature functionality.

9.3.2.4.1 MACsec Key Retirement Immediate Configuration

The **show dot1x supplicant** command is configured in mac security profile mode, the configuration needs to be present on both key server and non key server peers. Since key server decides the principal actor for SAK distribution, it is recommended that this configuration is present in key server for triggering the re-election of principal actor immediately.

If key retirement immediate is configured only on key server, non key server will still try to negotiate MKA over old primary key unnecessarily utilizing some system resources and some time even when not required.

If key retirement immediate is configured only on non key server, it will take ***6*** seconds (MKA Lifetime) for triggering any re-election on key server as a result of session failure.

```
switch(config-mac-security-profile-sampleProfile)# [no] key retirement
 immediate
```

Configuration Scenarios

When both Primary Key and Fallback Key configured: without configuring key retirement immediate, when a new primary is configured, the actor corresponding to the old actor will stay active till MKA session on the new primary becomes successful. With key retirement immediate, the actor corresponding to the old primary is deleted immediately. Since fallback is also configured, key server will choose it as the new principal actor, if eligible. Once a new principal actor is chosen, new SAK is distributed which will eventually get programmed and used for encryption & decryption.

When only Primary Key is configured: the behavior is same as above except the fact that no other actor will become principal until the new primary becomes successful. Till then hardware will continue to use SAK generated with old primary.

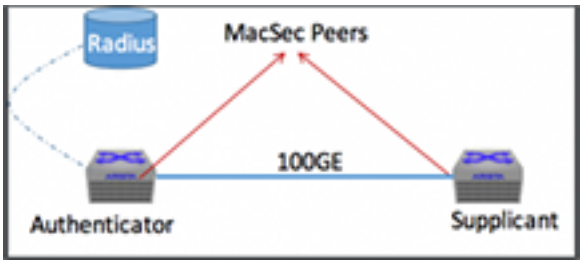
When Fallback is Principal actor: without key retirement immediate, when a new fallback key is configured, old fallback will stay in the system till the time new fallback becomes active or primary becomes active. With key retirement immediate, old fallback actor is deleted immediately. Till the time a new principal actor is elected, hardware will continue to use SAK generated with old fallback.

The **show mac security participants** command shows all the participants present in the system. When key retirement immediate is configured, the actor corresponding to old keys will no longer list up in the output of the above **show** command.

9.3.2.5 MACsec EAP-FAST Support

The Media Access Control Security (MACsec) with static keys feature brings support for dynamic Mac Security keys. To derive Mac Security keys dynamically, both peers must be configured for 802.1X authentication. One peer must be configured to be the Authenticator and the other peer to be the Supplicant. Upon a successful 802.1X authentication sequence between the peers, keying material is generated by both the authenticator and the supplicant. This keying material is then used to derive Mac Security keys to establish a MACsec Key Agreement (MKA) protocol session. This feature brings in support for Arista devices to act as the supplicant to derive Mac Security keys in a bidirectional fashion.

The following diagram illustrates a typical Mac Security + 802.1X topology:



9.3.2.5.1 Configuring MAC Security Dynamic Key Derivation

9.3.2.5.1.1 802.1X Authenticator Configuration

A new option is added to 802.1X authenticator configuration to make the authenticator more strong to unreliable authentication servers. By default, when an authentication server is unreachable, the authenticator blocks all traffic on the port and keeps the port as Unauthorized until it gets replies from the authentication server. The following option changes the behavior and maintains the port in its current state if the authentication server is not reachable:

Example

```
switch(config-if-Et1)# dot1x timeout reauth-timeout-ignore always
```

9.3.2.5.1.2 802.1X Supplicant Configuration

The 802.1X supplicant configurations are done through MACsec profiles. MACsec profile contain all the credentials necessary for 802.1X authentication to succeed.

Following are the steps to configure an 802.1X supplicant profile:

1. Use **dot1x** command to enter the dot1x mode to configure a supplicant profile.

   ```
   switch(config)# dot1x
   switch(config-dot1x)#
   ```

2. Use **supplicant profile** command to configure a 802.1X supplicant profile.

   ```
   switch(config)# supplicant profile <profileName>
   ```

   The following mandatory commands must be configured for a supplicant profile to be operational:

3.
4. An Extensible Authentication Protocol (EAP) method must be configured for the profile. The only method supported by Arista supplicants is EAP-FAST.

   ```
   switch(config-dot1x-supp-profile-test)# eap-method fast
   ```

   a. Configure EAP Identity which is used to authenticate the supplicant with the Radius server:

      ```
      switch(config-dot1x-supp-profile-test)# identity <user-identity>
      ```

   b. Configure EAP pass-phrase the password used to authenticate the supplicant with the Radius server:

      ```
      switch(config-dot1x-supp-profile-test)# passphrase <options>
      ```

   Example

This is an sample 802.1X supplicant profile:

```
switch(config-dot1x-supp-profile-test)# show active
dot1x
   supplicant profile test
      identity arista
      passphrase 7 070E334D5D1D0B04
```

Apply the supplicant profile by enabling it on the Mac Security interface:

```
switch(config-if-Et6/1)# dot1x pae supplicant test
```

Mac Security

Mac Security configuration remains the same as described in the configuration guide with a single important difference. Instead of configuring manual keys, a Mac security profile must instead be configured to use dynamic keys:

```
switch(config-mac-security-profile-test)# key source dot1x
```

9.3.2.5.2 Displaying 802.1X Supplicant Status

The **`show dot1x supplicant`** command displays the 802.1X supplicant status.

```
switch #show dot1x supplicant
Interface: Ethernet6/1
    Identity: arastra
    EAP method: fast
    Status: success
    Supplicant MAC: 44:4c:a8:34:bf:20
    Authenticator MAC: 00:1c:73:e0:d3:76
```

About the Output

- **`Interface`**: The port on which the supplicant is running.
- **`Identity`**: Configured supplicant identity.
- **`EAP method`**: Configured EAP method (Currently just EAP-FAST).
- **`Status`**: Supplicant Status. Can be one of the following:
  - Success Authentication has been successful.
  - Down Authentication sequence has not begun.
  - Failed Authentication has failed.
  - Connecting Authentication is in progress.
  - Unused Supplicant is uninitialized.
- **`Supplicant MAC`**: MAC address of the supplicant.
- **`Authenticator MAC`**: MAC address of the authenticator (peer).
- **`Existing Mac Security`**: Show commands can be used to look at Mac Security status.

9.3.2.6 MACsec Proxy For VXLAN

The MACsec Proxy for VXLAN feature enables the MACsec service over VXLAN. MACsec over VXLAN is provided by mapping a Visual Networking Index (VNI), Remote VXLAN Tunnel Endpoint (VTEP) IP to a MACsec proxy sub interface.

Any packets routed to the MACsec proxy sub interface is encrypted and tunneled to the remote VTEP. On the receiving path the packets are decrypted, then decapsulated and forwarded. MKA negotiates and renews the encryption keys, for this purpose a MACsec capable front panel port has

to be dedicated and cannot be plugged in as it will be used to recycle packets being encrypted and decrypted.

9.3.2.6.1 Configuring MACsec Proxy For VXLAN

The switch platforms which use this feature are:

- 7280SRAM-48C6
- 7280CR2M-30
- 7500R2M-36CQ-LC

The mandatory steps to configure a MACsec proxy sub-interface on an Arista switch are:

1. Configure the parent interface to be a routed port.
2. Create a L3 sub-interface on the parent interface. This is the MACsec proxy sub-interface.
3. Create a L2 sub-interface on the parent interface. This is the MACsec patch sub-interface.
4. Configure and enable the MACsec proxy port on a sub-interface.
5. Configure the VXLAN tunnel.
6. Assign the forwarding VLAN ID for the MACsec patch sub-interface and VXLAN tunnel.

Example Configurations

a. Configure a ***100g*** MACsec interface as a routed port.

```
switch(config)# interface et49/1
switch(config-if-Et49/1)# no switchport
```

b. Create a new L3 sub-interface - ***et49/1.1*.**

```
switch(config-if-Et49/1)# interface et49/1.1
```

c. Create a new L2 sub-interface - ***et49/1.2***.

```
switch(config-if-Et49/1)# interface et49/1.2
```

d. Configure the MACsec proxy port, and enable MACsec on the proxy port.

```
switch(config)# interface et49/1.1
switch(config-if-Et49/1.1)# mac security proxy patch Ethernet49/1.2
switch(config-if-Et49/1.1)# mac security profile test1
switch(config-if-Et49/1.1)# ip address 2.2.2.1/24
```

e. Configure the VXLAN tunnel. The remote VTEP is provided as the flood VTEP.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface Loopback0
switch(config-if-Vx1)# vxlan udp-port 4789
switch(config-if-Vx1)# vxlan vlan 20 vni 20
switch(config-if-Vx1)# vxlan vlan 20 flood vtep 100.100.100.2
```

f. Configure the L2 MACsec patch interface to be in the same VLAN as VXLAN.

```
switch(config)# interface et49/1.2
switch(config-if-Et49/1.2)# vlan id 20
```

9.3.2.6.2 Displaying MACsec Proxy For VXLAN Information

Use **`show mac security interface`** command to display the proxy sub-interface information.

Examples

- Use **`show mac security mka counters`** command to display the MACsec counters and detailed values.

```
switch(config)# show mac security interface
Interface     SCI                     Controlled Port  Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605  True             9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613  True             9d5bc0d3076ea4a08b99b9d9:1
```

-
```
switch(config)# show mac security mka counters
Interface      Rx Success  Rx Failure  Tx Success   Tx Failure
Ethernet4/1/1  287         0            288          0
Ethernet4/3/1  288         0            287          0

switch(config)# show mac security mka counters ethernet 49/1.1 detail
Interface: Ethernet49/1.1
    Tx packet success: 84
    Tx packet failure: 0
        Tx invalid: 0
    Rx packet success: 82
    Rx packet failure: 0
        Rx invalid: 0
        Rx eapol error: 0
        Rx basic parameter set error: 0
        Rx unrecognized CKN error: 0
        Rx ICV validation error: 0
        Rx live peer list error: 0
        Rx potential peer list error: 0
        Rx SAK use set error: 0
        Rx distributed SAK set error: 0
        Rx distributed CAK set error: 0
        Rx ICV Indicator error: 0
        Rx unrecognized parameter set error: 0
```

9.3.2.6.3 Limitations

When this feature is in use, following limitations can be noticed:

- An interface while moving from allowing unprotected traffic to allowing only protected traffic can experience a traffic disruption of up to ***4*** seconds.
- If the key server interface manages to establish a MKA session with its old credentials (CKN/CAK pair) while unprotected traffic was allowed, then traffic disruption for a duration of up to ***6*** seconds can be noticed in addition to the duration mentioned in the above point.

9.3.2.7 MACsec Fallback to Unprotected Traffic

When MACsec is enabled on an interface, it tries to establish MACsec Key Agreement (MKA) session(s) with its peer. If no MKA sessions is successfully established, then the interface can continue to protect the traffic with the last known negotiated key, and if such a key does not exist then it blocks the traffic. The MACsec Fallback to Unprotected Traffic feature introduces an optional configuration which, if provided, allows unprotected traffic whenever there is no successful MKA session with the peer in the following scenarios:

- If MACsec is enabled on an interface with this feature configured, then the interface allows unprotected traffic immediately without waiting for MKA session establishment.
- If a MACsec enabled interface was blocking traffic as no MKA sessions were established and its corresponding MACsec profile is changed to enable this feature, the interface will start allowing unprotected traffic immediately.
- If a MACsec enabled interface was allowing unprotected traffic and its corresponding MACsec profile is changed to disable this feature, the interface will block traffic immediately.
- While an interface is allowing unprotected traffic, it will stop doing so when a new Secure Association Key (SAK) is generated (if this interface is key server) or when a SAK is received from the key-server (if this interface is not the key server).

- If MACsec Fallback to Unprotected Traffic is configured and all MKA sessions between the peers fail, the peers will switch to unprotected traffic. If not configured, protected traffic could have continued with last known negotiated key.

To protect traffic between pairs, primary MKA session derived keys are given priority over Fallback MKA session. With this feature enabled, the priority order of traffic between peers is -

1. Protected using derived keys from primary MKA sessions.

2. Protected using derived keys from Fallback MKA sessions.

3. Unprotected traffic.

Note: Arista allows a primary and a Fallback Connectivity Association Key (CAK) and Connectivity Association Key Name (CKN) pair to be configured on an interface. And interfaces tries to establish a MKA session with its peer corresponding to each CAK/CKN pair.

9.3.2.7.1 MACsec Fallback to Unprotected Traffic Feature Interaction

This feature interacts with other related features in following way:

- **MACsec EAP-FAST Support**: If dynamic MAC Security keys (derived from 802.1X authentication) are used, then the feature configuration has no effect.
- **MACsec Proxy Interfaces**: This feature does not work with MACsec proxy sub interfaces.
- **Key Retirement Immediate**: If this feature is configured with Key Retirement Immediate feature on an interface, transition between unprotected traffic and protected traffic may become more frequent. This is because with Key Retirement Immediate feature, whenever a new key is configured, existing successful MKA session corresponding to the old key is not maintained.

9.3.2.7.2 Limitations

When this feature is in use, following limitations can be noticed:

- An interface while moving from allowing unprotected traffic to allowing only protected traffic can experience a traffic disruption of up to ***4*** seconds.
- If the key server interface manages to establish a MKA session with its old credentials (CKN/CAK pair) while unprotected traffic was allowed, then traffic disruption for a duration of up to ***6*** seconds can be noticed in addition to the duration mentioned in the above point.

9.3.2.7.3 Configuring MACsec Fallback to Unprotected Traffic

This feature is supported on all MACsec capable cards except for 7500E-6CFPX-LC.

The MACsec Fallback to Unprotected Traffic feature is configured under MACsec profile mode using the **`traffic unprotected allow`** command. The **no** form of the command removes the configuration from the switch. This configuration must be present in both the peers for the unprotected traffic to flow between them successfully.

Example

```
switch(config-mac-security-profile-sampleProfile)# no traffic unprotected
 allow
```

9.3.2.7.4 Displaying MACsec Fallback to Unprotected Traffic Information

The **`show mac security interface detail`** command can be used to verify if the interface is currently allowing unprotected traffic.

```
switch# show mac security interface Ethernet 6/1/1 detail
Interface: Ethernet4/1/1
```

```
    SCI: 28:99:3a:82:6f:82::605
    SSCI: 00000002
    Controlled port: True
    Key server priority: 16
    Session rekey period: 0
    Traffic: Unprotected
    Key in use: 9d5bc0d3076ea4a08b99b9d9:1
    Latest key: None
    Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)

Interface: Ethernet4/3/1
    SCI: 28:99:3a:82:6f:85::613
    SSCI: 00000001
    Controlled port: True
    Key server priority: 16
    Session rekey period: 0
    Traffic: Protected
    Key in use: 9d5bc0d3076ea4a08b99b9d9:1
    Latest key: None
    Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)
```

9.3.2.8 MACsec Commands

MACsec Configuration Commands

- an (MACsec)
- cipher
- entropy source hardware
- identifier (MACsec)
- key (MACsec)
- key retirement immediate
- license (Global Mode)
- license (MACsec)
- mac security
- mka key-server
- mka session
- profile (MACsec)
- replay
- sci
- secure channel (MACsec)
- traffic unprotected allow

MACsec Profile on a Subinterface

- mac security profile

MACsec Show Commands

- show mac security counters
- show mac security counters detail
- show mac security interface
- show mac security interface detail
- show mac security mka counters
- show mac security participants
- show mac security participants detail
- show mac security profile
- show mac security sak
- show mac security status

MACsec EAP FAST Support Commands

- dot1x
- dot1x pae supplicant
- dot1x timeout reauth-timeout-ignore always
- show dot1x supplicant
- supplicant profile

9.3.2.8.1 an (MACsec)

The **an** command defines an Association Number (AN) and a Secure Association Key (SAK) for use in the selected channel in MACsec. Up to 4 SAKs can be configured in the Rx direction, with ANs ranging from 0 to 3. The Tx channel can only have one AN and one SAK. The **no an** and **default an** commands remove the specified AN and its SAK from ***running-config***.

Command Mode

MAC Security Profile SAK Static Secure Channel Configuration

Command Syntax

an ***an_number*** **key** ***key_type key_string***

no an ***an_number***

default an ***an_number***

Parameters

- ***an_number*** The Association Number. For the Rx channel, values range from 0 to 3. For the Tx channel, the only allowed value is 0. There is no default value.
- ***key_type*** The type of string specifying the SAK. There are three valid key types:
  - **0** indicates that the key string which follows is not encrypted.
  - **7** indicates that the key string which follows is hidden or obfuscated.
  - **8a** The following key is encrypted with AES-256-GCM.
- ***key_string*** The Secure Association Key itself, in hexadecimal octets.

Example

These commands add a static SAK with ***AN 1*** to the Rx channel for profile ***test***.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# key source sak static
switch(config-mac-security-profile-test-sak-static)# secure channel rx
switch(config-mac-security-profile-test-sak-static-rx)# an 1 key 0
 11112222333344445555666677778888
switch(config-mac-security-profile-test-sak-static-rx)#
```

9.3.2.8.2 cipher

The **cipher** command configures the cipher authentication for MAC security on the switch.

Command Mode

MACsec Profile

Command Syntax

cipher ***encryption_standard***

Parameters

encryption_standard The cipher authentication options.

- **aes128-gcm-xpn** Advanced Encryption Standard (128 bit, Galois/Counter mode, Extended Packet Numbering).
- **aes256-gcm-xpn** Advanced Encryption Standard (256 bit, Galois/Counter mode, Extended Packet Numbering).

Example

The following command configures the **cipher aes128-gcm-xpn** for MAC security on the switch for the MACsec profile called test.

```
switch(config-mac-security-profile-test)# cipher aes128-gcm-xpn
switch(config-mac-security-profile-test)#
```

9.3.2.8.3 dot1x pae supplicant

The **dot1x pae supplicant** command applies the supplicant profile by enabling it on the Mac Security interface.

Command Mode

Interface Configuration

Command Syntax

dot1x pae supplicant

Example

The following command applies the supplicant profile test on the ***MACsec interface 6/1***.

```
switch(config-if-Et6/1)# dot1x pae supplicant test
```

9.3.2.8.4 dot1x timeout reauth-timeout-ignore always

The **dot1x timeout reauth-timeout-ignore always** command retains the current port state without blocking it irrespective of when the authentication server is unreachable or in-case of supplicant time outs.

Command Mode

Interface Configuration

Command Syntax

dot1x timeout reauth-timeout-ignore always

Example

The following command retains the current port status of ***interface Ethernet 6/1*** when there is authentication server timeout.

```
switch(config-if-Et6/1)# dot1x timeout reauth-timeout-ignore always
```

9.3.2.8.5 dot1x

The **dot1x** command places the switch in the dot1x mode. In this mode user is allowed to configure various MACsec configurations.

Command Mode

Global Configuration

Command Syntax

dot1x

Example

The following command places the switch in the ***dot1x*** mode.

```
switch(config)# dot1x
switch(config-dot1x)#
```

9.3.2.8.6 entropy source hardware

The **entropy source hardware** command generates the cryptographic keys to strengthen the random number generator used by MACsec.

Command Mode

Management Configuration

Command Syntax

entropy source hardware

Example

The following command configures the entropy source hardware and generates the cryptographic keys.

```
switch(config)# management security
switch(config-mgmt-security)# entropy source hardware
```

9.3.2.8.7 identifier (MACsec)

The **identifier** command defines a Secure Channel Identifier (SCI) for the Rx or Tx secure channel for use with MACsec static SAKs. The SCI is a MAC address in the format H:H:H:H:H:H::P, where H is a hexadecimal octet and P is a decimal integer. The **no identifier** and **default identifier** commands remove the channel's SCI from ***running-config***.

Command Mode

MAC Security Profile SAK Static Secure Channel Configuration

Command Syntax

identifier ***MAC_address***

no identifier

default identifier

Parameters

- ***MAC_address*** The MAC address identifying the secure channel.

Example

These commands add the SCI 01:02:03:04:05:06::1234 to the Rx channel for profile "test".

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# key source sak static
switch(config-mac-security-profile-test-sak-static)# secure channel rx
switch(config-mac-security-profile-test-sak-static-rx)# identifier
 01:02:03:04:05:06::1234
switch(config-mac-security-profile-test-sak-static-rx)#
```

9.3.2.8.8 key (MACsec)

The **key** command configures the primary key so that the MACsec profile is activated.

Note: Optionally a fallback CAK can also be configured on a profile. This CAK is picked up by MACsec to negotiate keys if the primary CAK fails. A CAK can be configured as a backup key using the fallback keyword with the key command.

Command Mode

MACsec Profile Configuration

Command Syntax

key <options>

Parameters

- **CKN** Connectivity association key name in hex octets. Options include:
  - ***0*** Specifies that an UNENCRYPTED key will follow.
  - ***7*** Specifies that an HIDDEN key will follow.
  - **CAK** Connectivity association key in hex octets.
  - **fallback** Configure the key as a fallback.
- **retirement** Retire the key. Options include:
  - **immediate** Retire the key immediately.
- **source** List of sources to derive MAC security keys. Options include:
  - **dot1xDerive** MAC security keys from IEEE 802.1X based port authentication
  - **group-cak** Derive MAC security keys from Group CAK Distribution.
  - **sak static** Enter

Examples

- The following example configures the primary key for the profile called sample profile for MAC security on the switch.

```
switch(config)# mac security
switch(config-mac-security)# profile sample_Profile
switch(config-mac-security-profile-sample_Profile)# key 0abcd1 0
 1234abcd
```

- The following example configures the fallback CAK on a profile.

```
switch(config)# mac security
switch(config-mac-security)# profile sample_Profile
switch(config-mac-security-profile-sample_Profile)# key 0abcd1 0
 1234abcd fallback
```

9.3.2.8.9 key retirement immediate

The **`key retirement immediate`** command configures the key retirement feature on the key server and assists the key server to decide the principal actor for SAK distribution by triggering the re-election of principal actor immediately. It is recommended that the key retirement is configured on both key server and non key server peers.

The **`no key retirement immediate`** command disable the key retirement function by removing the key retirement immediate command from the ***running-config***.

Command Mode

MACsec Profile

Command Syntax

`key retirement immediate`

Example

The following commands configures the key retirement immediate feature on a switch for a MACsec profile called ***sample***.

```
switch(config)# mac security
switch(config-mac-security)# profile sample
switch(config-mac-security-profile-sample)# key retirement immediate
```

9.3.2.8.10 license (Global Mode)

The **`license`** command configures EOS licenses on the switch under the global configuration mode. These licenses include the MACsec license.

Note: Contact your system engineer to acquire the required license codes before attempting to configure MACsec.

Command Mode

Global Configuration

Command Syntax

`license` {**import *URL*** | **update**}

Parameters

- **import** Import license from a URL.
- ***URL*** The URL from which to import a license.
- **update** Trigger a check for licenses.

Example

The following example configures the MACsec license on the switch using a JSON file as shown.

```
switch# license import flash:EOSLic-1.json
switch#
```

9.3.2.8.11 license (MACsec)

The **`license`** command configures the MACsec license on the switch under the MAC Security configuration mode using a hex key.

The **`no license`** and **`default license`** commands delete the current license from ***running-config***.

Note: This method of license configuration is no longer being used except for backward compatibility.

Command Mode

MAC Security

Command Syntax

`license` ***licensee_name license_value***

Parameters

- ***licensee_name*** Name of the licensee.
- ***license_value*** 8 digit hexadecimal key to authorize MAC security.

Example

The following example configures the MACsec license on the switch using an 8 digit hexadecimal key.

```
switch(config)# mac security
switch(config-mac-security)# license Test-LICNC AABBCCDD
switch(config-mac-security)#
```

9.3.2.8.12 mac security

The **mac security** command enables MAC security provision on the switch.

The **no mac security** and **default mac security** commands restore the switch to its default state by removing the corresponding mac security command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

mac security

no mac security

default mac security

Example

The following command places the switch in MAC security mode.

```
Switch(config)# mac security
Switch(config-mac-security)#
```

9.3.2.8.13 mac security profile

The **mac security profile** command applies a MACsec profile to an interface or subinterface.

The **no mac security profile** and **default mac security profile** commands remove the MACsec profile, disabling MACsec on the configuration-mode interface.

Command Mode

Interface Ethernet Configuration Mode

Command Syntax

mac security profile ***profile-name***

no mac security profile ***profile-name***

default mac security profile ***profile-name***

Parameter

- ***profile-name*** the MACsec profile name.

Example

- The following commands enable MACsec on Ethernet subinterface ***1.10*** by applying the MACsec profile called ***test-profile***.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# interface ethernet1.10
switch(config-if-Et1.10)# encapsulation dot1q vlan 20
switch(config-if-Et1.10)# mac security profile test-profile
```

9.3.2.8.14 mka key-server

The **mka key-server** command configures key server among the MACsec peers.

Command Mode

MACsec Profile Configuration

Command Syntax

mka key-server priority ***value***

Parameters

- **priority** MKA key server priority.
- ***value*** Key server priority value. Value ranges from ***0*** to ***255***.

Example

The following example configures the key server value of ***10*** among the MACsec peers.

```
Switch(config)# mac security
Switch(config-mac-security)# profile sample_Profile
Switch(config-mac-security-sample_Profile)# mka key-server priority 10
```

9.3.2.8.15 mka session

The **mka session** command configures period at which the SAK is refreshed .

Command Mode

MACsec Profile Configuration

Command Syntax

mka session rekey-period ***value***

Parameter

- **rekey-period** Sets MKA session re-key period.
- ***value*** Session re-key period in seconds. Value ranges from ***30*** to ***100000***.

Example

The following example configures the mka session rekey-period time of ***10*** seconds at which the SAK is refreshed.

```
Switch(config)# mac security
Switch(config-mac-security)# profile sample_Profile
Switch(config-mac-security-sample_Profile)# mka session rekey-period 10
```

9.3.2.8.16 profile (MACsec)

The **profile** command places the switch in MAC Security Profile configuration mode and creates a MACsec profile if a profile of the specified name does not already exist. MACsec profiles contain the configuration information needed to establish a MACsec connection, and are applied to interfaces using the **mac security profile** command.

Command Mode

MAC Security Configuration

Command Syntax

profile ***profile-name***

Parameter

profile-name Name of the MACsec profile.

Commands Available in MAC Security Profile Configuration Mode

- cipher
- key (MACsec)
- mka key-server
- mka session
- replay
- sci
- traffic unprotected allow

Example

The following commands create a MACsec profile called ***test*** and place the switch in MAC Security Profile configuration mode for that profile.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)#
```

9.3.2.8.17 replay

The **replay** command configures the action to be taken when packets received are not in order, based on their packet numbers. The window size in replay protection specifies the window size within which out-of-order packets are allowed. This command is configured under the MACsec Profile configuration mode.

The **no** and **default** form of the command removes all the configurations related to `replay` command from the running configuration on the switch.

Command Mode

MACsec Profile

Command Syntax

replay protection {**disabled** | **window** ***window_size***}

no replay protection {**disabled** | **window** ***window_size***}

default replay protection {**disabled** | **window** ***window_size***}

Parameters

- protection Specifies the action to be taken when packets received are not in order, based on their packet numbers..
- **disabled** Disables replay protection.
- **window** Specifies the allowable window within which an out-of-order packet can be received.
  - ***window_size*** The allowable value ranges from ***0*** tthrough **4294967295**.

Example

The following commands configures a MACsec profile called TEST and a replay protection with a window size of ***100*** is configured on the switch.

```
switch(config)# mac security
switch(config-mac-security)# profile TEST
switch(config-mac-security-profile-TEST)# replay protection window 100
```

9.3.2.8.18 sci

The **sci** command add a Secure Channel Identifier (SCI) in data packets for MACsec on the switch. Each MACsec device has a Secure Channel (SC) used to send traffic to other device. Each channel has an 8-byte Secure Channel Identifier (SCI). The first 6 bytes match the MAC address of the device transmitting through that channel. The remaining 2 bytes are a Port Identifier used to distinguish between multiple channels from the same device. The command is configured under the MACsec profile configuration mode.

Command Mode

MACsec Profile

Command Syntax

sci

Example

The following commands place the switch on MACsec profile configuration mode and add a SCI for the MACsec profile called **TEST**.

```
switch(config)# mac security
switch(config-mac-security)# profile TEST
switch(config-mac-security-profile-TEST)# sci
```

9.3.2.8.19 secure channel (MACsec)

The **secure channel** command enters MAC Security Profile Static SAK Secure Channel configuration mode. In this mode, you can add Association Numbers (AN) and Secure Channel Identifiers (SCI) for the specified channel. The available channels are Rx (receive) and Tx (transmit).

Command Mode

MAC Security Profile Static SAK Configuration Mode

Command Syntax

secure channel {**Rx**|**Tx**}

Parameters

- **Rx** Enter the configuration mode for the Rx channel.
- **Tx** Enter the configuration mode for the Tx channel.

Available Commands

- **an**
- **identifier**

Example

These commands enter MAC Security Profile Static SAK Secure Channel configuration mode for the Tx channel.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# key source sak static
switch(config-mac-security-profile-test-sak-static)# secure channel tx
switch(config-mac-security-profile-test-sak-static-sc-tx)#
```

9.3.2.8.20 show dot1x supplicant

The **show dot1x supplicant** command displays the 802.1X supplicant status.

Command Mode

EXEC

Command Syntax

show dot1x supplicant

Example

The following example displays information about 802.1X supplicant status.

```
switcb# show dot1x supplicant

Interface: Ethernet6/1
    Identity: arastra
    EAP method: fast
    Status: success
    Supplicant MAC: 44:4c:a8:34:bf:20
    Authenticator MAC: 00:1c:73:e0:d3:76
```

About the Output

- **Interface:** The port on which the supplicant is running.
- **Identity:** Configured supplicant identity.
- **EAP method:** Configured EAP method (Currently just EAP-FAST).
- **Status:** Supplicant Status. Can be one of the following:
  - Success Authentication has been successful.
  - Down Authentication sequence has not begun.
  - Failed Authentication has failed.
  - Connecting Authentication is in progress.
  - Unused Supplicant is uninitialized.
- **Supplicant MAC:** MAC address of the supplicant.
- **Authenticator MAC:** MAC address of the authenticator (peer). Existing Mac Security show commands can be used to look at Mac Security status.

9.3.2.8.21 show mac security counters detail

The **show mac security counters detail** command to displays the detail information about the MACsec security counters.

Command Mode

EXEC

Command Syntax

show mac security counters detail

Example

The following example displays detail information about MACsec security counters.

```
switch# show mac security counters detail
Ethernet4/1/1     Counter Name        Count
-----------------------------------------------------
                  outPktsEncrypted    112
                  outOctetsEncrypted  11984
                  outPktsUntagged     0
                  outPktsTooLong      0
                  outPktCtrl          224
                  inPktsDecrypted     2
                  inOctetsDecrypted   214
                  inPktsUnchecked     0
                  inPktsOK            2
                  inPktsNotValid      0
                  inPktsNotUsingSA    0
                  inPktsCtrl          223
                  inPktsNoTag         8
                  inPktsTagged        0
                  inPktsBadTag        0
                  inPktsNoSCI         0
                  inPktsLate          0

Ethernet4/3/1     Counter Name        Count
-----------------------------------------------------
                  outPktsEncrypted    2
                  outOctetsEncrypted  214
                  outPktsUntagged     0
                  outPktsTooLong      0
                  outPktCtrl          223
                  inPktsDecrypted     111
                  inOctetsDecrypted   11877
                  inPktsUnchecked     0
                  inPktsOK            111
                  inPktsNotValid      0
                  inPktsNotUsingSA    0
                  inPktsCtrl          224
                  inPktsNoTag         9
                  inPktsTagged        0
                  inPktsBadTag        0
                  inPktsNoSCI         0
                  inPktsLate          0
```

9.3.2.8.22 show mac security counters

The **show mac security counters** command to displays information about the MACsec security counters.

Command Mode

EXEC

Command Syntax

show mac security counters

Example

The following example displays information about MACsec security counters.

```
switch# show mac security counters
Port       InPktsDecrypted  InOctetsDecrypted  OutPktsEncrypted OutOctetsEncrypted
Et4/1/1                  2                214               109             11663
Et4/3/1                109              11663                 2               214
```

9.3.2.8.23 show mac security interface detail

The **show mac security interface detail** command displays the detail information about the MACsec on the interface.

Command Mode

EXEC

Command Syntax

show mac security interface detail

Example

The following example displays detail information about MACsec on the interface.

```
switch# show mac security interface detail
Interface: Ethernet4/1/1
    SCI: 28:99:3a:82:6f:82::605
    SSCI: 00000002
    Controlled port: True
    Key server priority: 16
    Session rekey period: 0
    Traffic: Protected
    Key in use: 9d5bc0d3076ea4a08b99b9d9:1
    Latest key: None
    Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)

Interface: Ethernet4/3/1
    SCI: 28:99:3a:82:6f:85::613
    SSCI: 00000001
    Controlled port: True
    Key server priority: 16
    Session rekey period: 0
    Traffic: Protected
    Key in use: 9d5bc0d3076ea4a08b99b9d9:1
    Latest key: None
    Old key: 9d5bc0d3076ea4a08b99b9d9:1(RT)
```

About the Output

- **Interface**: Name of the interface.
- **Secure Channel Identifier (SCI)**: Combination of MAC address and port number. Used to uniquely identify a Mac Security port.
- **Controlled Port**: Indicates if Mac Security is enabled on the port. A value of True indicates that encryption is enabled on the port.
- **Key In Use**: The SAK identifier currently in use. Combination of Key Servers message identifier (see below) and key number.
- **Key Server priority**: Configured key server priority.
- **Session Rekey Period**: Configured session rekey period.
- **Latest Key**: Latest SAK being negotiated by Mac Security Key Agreement Protocol (MKA)
- **Old Key**: The last SAK negotiated by Mac Security Key Agreement Protocol (MKA)

Note: Latest and Old key are MKA protocol specific terminology and are used to refer to the last two keys in use. For all practical purposes, Key In Use field is used to identify the current key.

9.3.2.8.24 show mac security interface

The **show mac security interface** command shows information about MACsec on the interface.

Command Mode

EXEC

Command Syntax

show mac security interface

Example

The following example displays information about MACsec on the interface.

```
switch# show mac security interface
Interface     SCI                    Controlled Port Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605  True            9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613  True            9d5bc0d3076ea4a08b99b9d9:1
switch#
```

The following example displays the association numbers (ANs) of SAKs for both Rx and Tx on the interface ***Ethernet9/1***. Actual SAK values are never displayed in ***show*** command output.

```
switch# show mac security interface
Interface       SCI                        Controlled Port      Key in Use
Ethernet9/1     01:02:03:04:05:06::1235    True                 static
 SAK: Rx AN: 0,1 Tx AN: 0
switch#
```

The following example displays MACsec information for a unidirectional link. On the Rx side, the SCI is shown as ***00:00:00:00:00:00::0***, and only the Rx AN is shown.

```
switch# show mac security interface
Interface       SCI                        Controlled Port      Key in Use
Ethernet9/1     00:00:00:00:00:00::0000    True                 static
 SAK: Rx AN: 0
switch#
```

The following example displays MACsec information on the Tx side of a unidirectional link. In this case, the configured SCI is shown, along with the Tx AN.

```
switch(config)# show mac security interface
Interface       SCI                        Controlled Port      Key in Use
Ethernet9/1     01:02:03:04:05:06::1235    True                 static
 SAK: Tx AN: 0
```

9.3.2.8.25 show mac security mka counters

The **show mac security mka counters** command to display information about the MACsec MKA counters.

Command Mode

EXEC

Command Syntax

show mac security mka counters

Example

The following example displays information about MACsec MKA counters.

```
switch# show mac security mka counters
Interface       Rx Success      Rx Failure      Tx Success      Tx
 Failure
Ethernet4/1/1   287             0               288             0
Ethernet4/3/1   288             0               287             00
```

9.3.2.8.26 show mac security participants detail

The **show mac security participants detail** command displays detail information about the MACsec participants.

Command Mode

EXEC

Command Syntax

show mac security participants detail

Example

The following example displays information about MACsec participants details.

```
switch# show mac security participants detail
Interface: Ethernet4/1/1
    CKN: abcd
      Message ID: 9d5bc0d3076ea4a08b99b9d9
      Elected self: True
      Success: True
      Principal: True
      Default: False
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: True
      LLPN exhaustion: 0
      Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
      Live peer list: ['c79ad8882c2dd3a8e838a691']
      Potential peer list: []

    CKN: dead
      Message ID: 4ef4cf009161bd551b5e7434
      Elected self: True
      Success: True
      Principal: False
      Default: True
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: False
      LLPN exhaustion: 0
      Distributed key identifier: None
      Live peer list: ['3dfd4486b5f68a81014a37ec']
      Potential peer list: []

Interface: Ethernet4/3/1
    CKN: abcd
      Message ID: c79ad8882c2dd3a8e838a691
      Elected self: False
      Success: True
      Principal: True
      Default: False
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: True
      LLPN exhaustion: 0
      Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
      Live peer list: ['9d5bc0d3076ea4a08b99b9d9']
      Potential peer list: []

    CKN: dead
      Message ID: 3dfd4486b5f68a81014a37ec
      Elected self: False
      Success: True
      Principal: False
      Default: True
```

```
      KeyServer SCI: 28:99:3a:82:6f:82::605
      SAK transmit: False
      LLPN exhaustion: 0
      Distributed key identifier: None
      Live peer list: ['4ef4cf009161bd551b5e7434']
      Potential peer list:
```

About the Output

- **Connectivity Association Key Name (CKN):** Configured name of the key in use.
- **Message ID:** A random 92 bit string used as an identifier for an MKA participant.
- **Elected Self:** True if this participant is the elected key server.
- **Success:** True if this participant is live and has at least one live peer.
- **Principal:** True if this participant is the principal participant elected to distribute SAKs.
- **Default:** True if this participant is a fallback/backup participant (spawned when a fallback key is configured in a Mac Security profile).
- **Key Server SCI:** The SCI of the key server.
- **SAK Transmit:** True if the participant is ready to use the negotiated key for transmit.
- **LLPN Exhaustion:** Increments if the number of data packets sent using the current key exceeds a certain threshold. Because we use a 64 bit packet number cipher suite, this should never increment.
- **Distributed Key Identifier:** Message ID + key number of the most recently generated SAK.

9.3.2.8.27 show mac security participants

The **show mac security participants interface** command displays information about the MACsec participants.

Command Mode

EXEC

Command Syntax

show mac security interface

Example

The following example displays information about MACsec participants.

```
switch# show mac security participants
Interface: Ethernet4/1/1
    CKN: abcd
      Message ID: 9d5bc0d3076ea4a08b99b9d9
      Elected self: True
      Success: True
      Principal: True
      Default: False

    CKN: dead
      Message ID: 4ef4cf009161bd551b5e7434
      Elected self: True
      Success: True
      Principal: False
      Default: True

Interface: Ethernet4/3/1
    CKN: abcd
      Message ID: c79ad8882c2dd3a8e838a691
      Elected self: False
      Success: True
      Principal: True
      Default: False

    CKN: dead
      Message ID: 3dfd4486b5f68a81014a37ec
      Elected self: False
      Success: True
      Principal: False
      Default: True
```

9.3.2.8.28 show mac security profile

The **show mac security profile** command displays information about the specified MACsec profile. If no profile is specified, information about all profiles is shown.

Command Mode

EXEC

Command Syntax

show mac security profile [***profile_name***]

Parameters

profile_name The MACsec profile to show information about.

Example

The following command shows information for the MACsec profile ***test***.

```
switch# show mac security profile
Profile: test
    Cipher: aes256-gcm-xpn
    Primary CKN:
    Primary CAK SHA-256 hash:
    Fallback CKN:
    Fallback CAK SHA-256 hash:
    Source: cli
    Priority: 100
    SCI Inclusion: disabled
    Key retirement policy: delayed
    Unprotected traffic policy: allow active-sak
    MKA lifetime: 6 seconds
    MKA key server priority: 16
    Session rekey period: 0
    Bypassed protocols:
    Max AN value of SAK: 3
    Configured on:
switch#
```

9.3.2.8.29 show mac security sak

The **show mac security sak** command displays information about MACsec static secure association key (SAK) status for the specified Ethernet interface. If no interface is specified, all interfaces are shown. The following information is shown for each Ethernet interface.

- The name of the Ethernet interface.
- The installed SAK IDs.
- The SAK profile name.
- The total number of SAKs generated.
- The number of SAKs generated due to a new live peer.
- The number of SAKs generated due to a rekey timer.
- The number of SAKs generated due to packet number exhaustion.
- The SAK installation time in seconds in each direction.
- The number of forced new Tx SAK installations.

Command Mode

EXEC

Command Syntax

show mac security sak [interface ethernet ***Ethernet_interface]***

Parameters

interface ethernet Show SAK status information about the specified Ethernet interface. If this option is omitted, information for all Ethernet interfaces is shown.

Ethernet_interface The Ethernet interface to show SAK status for.

Example

The following command displays the MACsec SAK status for the Ethernet interface Ethernet9/1.

```
switch(config-mac-security-profile-test)# show mac security sak
Interface: Ethernet9/1
Installed SAK ID: static SAK: Rx AN: 0,1 Tx AN: 0
Installed SAK from: static-SA
Total SAK generated: 0
SAK generated due to new live peer: 0
SAK generated due to rekey timer: 0
SAK generated due to packet number exhaustion: 0
SAK installation time( in seconds ):
Direction    0-1   1-2   2-3    3+
---------- ----- ----- ----- -----
Rx             1     0     0     0
Tx             1     0     0     0

Maximum Rx installation time: 0.0884998080001 seconds
Maximum Tx installation time: 0.0884941590002 seconds
Forced new Tx SAK installation count: 0
```

9.3.2.8.30 show mac security status

The **show mac security status** command displays the MACsec status information on a switch.

Command Mode

EXEC

Command Syntax

show mac security status

Example

The following command displays the MACsec status information.

```
switch# show mac security status
Active Profiles:                1
Data Delay Protection:         No
FIPS Mode:                     No
Secured Interfaces:             2
License:                       Enabled
```

9.3.2.8.31 supplicant profile

The **supplicant profile** command configures the supplicant profile containing all the credentials necessary for 802.1X authentication to succeed.

Command Mode

dot1x Configuration

Command Syntax

supplicant profile ***profile_name options***

Parameters

- ***profile_name*** Name of the supplicant profile.
- The following parameters can be included after entering the profile mode:
  - **eap-method** Extensible Authentication Protocol (EAP) method. Option include:
    - **fastEAP** Flexible Authentication via Secure Tunneling (FAST).
  - **identity** Extensible Authentication Protocol (EAP) user identity. Option include:
    - **WORD** User identity name.
  - **passphrase** Extensible Authentication Protocol (EAP) password. Options include:
    - ***0*** Specifies that an UNENCRYPTED key will follow.
    - ***7*** Specifies that an HIDDEN key will follow.
    - **LINE** The UNENCRYPTED (clear-text) shared key.

Examples

- The following commands place the switch in the supplicant profile mode.

```
Switch(config)# dot1x
Switch(config-dot1x)# supplicant profile test
Switch(config-dot1x-supp-profile-test)#
```

- The following commands configures the EAP FAST method for the supplicant profile called ***test profile*** for MAC security on the switch.

```
Switch(config)# dot1x
Switch(config-dot1x)# supplicant profile test
Switch(config-dot1x-supp-profile-test)#eap-method fast
```

- The following commands configures the Identity for the supplicant profile called test profile for MAC security on the switch.

```
Switch(config)# dot1x
Switch(config-dot1x)# supplicant profile test
Switch(config-dot1x-supp-profile-test)# identity New_User
```

- The following commands configures the passphrase for the supplicant profile called ***test profile*** for MAC security on the switch.

```
Switch(config)# dot1x
Switch(config-dot1x)# supplicant profile test
Switch(config-dot1x-supp-profile-test)# passphrase 7 070E334D5D1D0B04
```

9.3.2.8.32 traffic unprotected allow

The **`traffic unprotected allow`** command configures the switch to allow the unprotected traffic whenever there is no successful MKA session established with the peer.

The **`no traffic unprotected allow`** command disable the MACsec Fallback to Unprotected Traffic function by removing the traffic unprotected allow command from ***running-config***.

Command Mode

MACsec Profile

Command Syntax

`traffic unprotected allow`

`no traffic unprotected allow`

Example

The following commands configures the MACsec Fallback traffic unprotected allow feature on a switch for a MACsec profile called sample.

```
Switch(config)# mac security
Switch(config-mac-security)# profile sample
Switch(config-mac-security-profile-sample)# no traffic unprotected allow
```

9.3.3 Internet Protocol Security (IPsec)

This section describes Aristas IPsec implementation. Topics in this section include:

- IPsec Introduction
- IPsec Overview
- Configuring IPsec
- IPsec Commands

9.3.3.1 IPsec Introduction

Internet Protocol Security (IPsec) is a protocol suite for securing Internet Protocol (IP) communications by authenticating and encrypting each IP packet of a communication session. IPsec includes protocols for establishing mutual authentication between agents periodically during the session and negotiation of cryptographic keys to be used during the session. IPsec supports network-level peer authentication, data origin authentication, data integrity, data confidentiality (encryption), and replay protection.

IPsec is used to protect data traffic between sites for example between Branch, HQ and Data center sites in an enterprise.

IPsec uses the following protocols to perform various functions:

- Authentication Headers (AH): provides the connectionless integrity and data origin authentication for IP datagrams and provides protection against replay attacks.
- Encapsulating Security Payloads (ESP): provides the confidentiality, data-origin authentication, connectionless integrity and an anti-replay service (a form of partial sequence integrity).
- Internet Key Exchange (IKE): is a key management protocol which provides security for virtual private networks' (VPNs) negotiations and network access to random hosts. It is also described as a method for exchanging keys for encryption and authentication over an unsecured medium, such as the Internet.

9.3.3.2 IPsec Overview

9.3.3.2.1 Security Associations

Security Associations (SA) provide the bundle of algorithms and data that provide the parameters necessary for AH and/or ESP operations. The Internet Security Association and Key Management Protocol (ISAKMP) provides a framework for authentication and key exchange, with actual authenticated keying material provided either by manual configuration with pre-shared keys, Internet Key Exchange (IKE and IKEv2) and other mechanisms. In order to decide what protection is to be provided for an outgoing packet, IPsec uses the Security Parameter Index (SPI), an index to the security association database (SADB), along with the destination address in a packet header, which together uniquely identify a security association for that packet. A similar procedure is performed for an incoming packet, where IPsec gathers decryption and verification keys from the security association database.

Full bidirectional communication requires at least two SAs, one for each direction. SA is defined by the following parameters:

- Security Algorithms (AH) or Encapsulating Security Payloads (ESP) and keys.
- **Mode:** Tunnel or Transport.
- **Key Management Method:** Manual or IKE.
- **Lifetime:** Expressed in hours.

9.3.3.2.2 Mode of Operation

IPsec on Arista switches operates in tunnel mode. In tunnel mode, the entire IP packet is encrypted and/or authenticated. It is then encapsulated into a new IP packet with a new IP header.

Tunnel mode is used to create virtual private networks for network-to-network communications (for example, between routers to link sites). Tunnel mode is used for most network-to-network IPsec.

9.3.3.2.3 Key Management

Key management on Arista switches uses the Internet Key Exchange (IKE) method. Internet Key Exchange (IKE) supports automated generation and renegotiation of SAs (includes keys) between the devices at a configured interval so it is much more scalable and secure.

IPsec needs SAs to define the algorithms and keys to use for protecting traffic. IKE establishes the SA so IPsec can protect traffic.

There are two IKE versions, IKEv1 and IKEv2. IKEv2 builds on IKEv1 but both are still widely used today.

9.3.3.2.3.1 IKEv1

IKEv1 has two phases.

- IKEv1 Phase 1
- IKEv1 Phase 2

IKEv1 Phase 1

- Uses main or aggressive mode exchange
- Negotiates IKE SA
- Used for control plane
- Peer authentication

IKEv1 Phase 2

- Uses quick mode exchange
- Negotiates IPsec SAs

Note that there are two different SAs that are established. The IKE SA protects only the IKE key management session using the IKE policy defined. The policy should include the following parameters:

- - Encryption algorithm
  - Hash MAC (HMAC) algorithm
  - Peer authentication procedure
  - Diffie-Hellman group for initial key exchange
  - SA lifetime

IKE initially performs a Diffie-Hellman (DH) exchange at the start of the IKE session. A Diffie-Hellman (DH) exchange allows participants to produce a shared secret value. The strength of the technique is that it allows participants to create the secret value over an unsecured medium without passing the secret value through the wire. From that exchange, peers get shared keying material, which is then used for IKE encryption and integrity functions. The strength of that keying material can be used for faster performance, by choosing lower key sizes for Diffie-Hellman exchanges. The key length (strength) of Diffie-Hellman exchanges can be changed with the use of different DH groups.

When an IKE session's lifetime expires, a new Diffie-Hellman exchange is performed between peers and the IKE SA is re-established.

The IPsec protection policy resulting in IPsec SAs, defines the protection of network traffic. These IPsec SAs are usually negotiated over IKE sessions. The parameters that define the IPsec protection policy are:

- Encryption Algorithm
- Hash MAC (HMAC) Algorithm

Note that the key material for IPsec SA (also called Child SA) is derived from keying material from IKEv1 phase 1.

There are two different modes for phase 1:

- Main Mode
- 6 packet exchange
- Full identity protection and better anti-DoS protection
- Aggressive Mode
- 3 packet faster session establishment
- Identities are exchanged in clear
- Weak DoS protection

Authentication

- **Pre-Shared Keys (PSK):** As the name suggests, a shared secret is distributed out-of-band to the peers. The peers use this information and nonce parameters to create a hash that is used to authenticate messages.
- **PKI Certificates:** Here, certificates of the peers are exchanged and hashes are calculated over these certificates to authenticate each other.

9.3.3.2.3.2 IKEv2

IKEv2 differs from IKEv1 in the following ways:

- Faster setup because of reduced number of messages.
- More secure.
- ESP is reused for all IKEv2 messages.
- Suite-B support.
- There is no aggressive mode, so IKEv2 always provides identity protection.
- Additional authentication methods.
- Local and remote can use different authentication methods and use different pre-shared keys.
- Authentication is done unidirectionally in IKEv2.

9.3.3.2.4 Route-based VPN

A route-based VPN employs routed tunnel interfaces as the endpoints of the virtual network. All traffic passing through a tunnel interface is placed into the VPN. Rather than relying on an explicit policy to dictate which traffic enters the VPN, static and/or dynamic IP routes are formed to direct the desired traffic through the VPN tunnel interface.

Since route-based VPNs support dynamic routing information through VPN tunnels. EOS supports only route based VPN for dynamic routing support and for easier configuration and management.

In route-based VPN, features like NAT, ACL, QoS is applied to packets before they are encrypted by applying these features to tunnel interface and can be applied to encrypted packets to applying these features on the physical interface carrying the tunnel traffic.

Virtual Template Interface (VTI)

A new tunnel interface type vti is introduced to represent the VPN tunnel. This tunnel interface will participate in the routing and any packets forwarded to it will be encrypted and forwarded to the other end of the tunnel. Note, that this does not add a new header to the packet.

9.3.3.3 Configuring IPsec

Complete the following steps to configure IPsec tunnels over the switch.

This configuration will use the default IKE version 2 procedure.

1. Use **ip security** command to enter IP security mode.

```
switch(config)# ip security
```

2. To use IKE version 1, complete the following before completing the default IKE version the steps below.

```
switch(config)# ip security
switch(config-ipsec)# ike policy ike-peerRtr
switch(config-ipsec-ike)# version 1
```

3. Create an IKE Policy to be used to communicate with the peer to establish IKE. You have the option of configuring multiple IKE policies.

   The default IKE Policy values are:

   - **Encryption:** AES256 / AES128
   - **Integrity:** SHA256 / SHA128
   - **DH group:** Group 14
   - **IKE lifetime:** 8 hours

```
switch(config-ipsec)# ike policy ike-router
switch(config-ipsec-ike)# encryption aes256
switch(config-ipsec-ike)# integrity sha256
switch(config-ipsec-ike)# dh-group 24
switch(config-ipsec-ike)# version 2
```

4. If the router is behind a NAT, configure the local-id with the local public IP address. The public IP corresponds to the underlying interface over which the IKE communications are done with the peer.

```
switch(config-ipsec-ike)# local-id <public ip address>
```

5. Create an IPsec Security Association policy to be used in the data path for encryption and integrity. Use the option of enabling Perfect Forward Secrecy by configuring a DH group to the SA. In this example, ***AES256*** is used for encryption, ***SHA 256*** is used for integrity, and Perfect Forward Secrecy is enabled (the DH group is 14).

```
switch(config-ipsec)# sa policy sa-vrouter
switch(config-ipsec-sa)# esp encryption aes256
switch(config-ipsec-sa)# esp integrity sha256
switch(config-ipsec-sa)# pfs dh-group 14
switch(config-ipsec-sa)# sa lifetime 2
switch(config-ipsec-sa)# exit
```

6. Bind or associate the IKE and SA policies together using an IPsec profile. Provide a shared-key, which must be common on both peers. The default profile assigns default values for all parameters that are not explicitly configured in the other profiles. In this example, the IKE Policy ***ike-peerRtr*** and SA Policy ***sa-peerRtr*** are applied to profile ***peer-Rtr***. Dead Peer Detection is enabled and configured to delete the connection when the peer is down for more than ***50*** seconds. The peer ***peer-Rtr*** is set to be the responder.

```
switch(config-ipsec)# profile default
switch(config-ipsec-profile)# ike-policy ikedefault
switch(config-ipsec-profile)# sa-policy sadefault
switch(config-ipsec-profile)# shared-key arista
switch(config-ipsec-profile)# connection start
switch(config-ipsec)# profile vrouter
switch(config-ipsec-profile)# ike-policy ike-vrouter
switch(config-ipsec-profile)# sa-policy sa-vrouter
```

```
switch(config-ipsec-profile)# dpd 10 50 clear
switch(config-ipsec-profile)# connection add
```

7. Configure the WAN interface to be the underlying interface for the tunnel. You must specify an L3 address for the tunnel. If you do not, the switch cannot route packets using the tunnel.

```
switch(config)# interface Et1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ip address 1.0.0.1/24
switch(config-if-Et1)# mtu 1500
```

8. Apply the IPsec profile to a new tunnel interface. You create the new tunnel interface as part of this step. You can configure the tunnel as a VTI IPsec tunnel. In this example, the new tunnel interface is ***Tunnel0***. The new tunnel interface is configured to use IPsec. The other end of the tunnel also needs to be configured as a GRE-over-IPsec tunnel.

```
switch(config)# interface tunnel0
switch(config-if-Tu0)# ip address 1.0.3.1/24
switch(config-if-Tu0)# mtu 1394
switch(config-if-Tu0)# tunnel source 1.0.0.1
switch(config-if-Tu0)# tunnel destination 1.0.0.2
switch(config-if-Tu0)# tunnel ipsec profile vrouter
```

Example Configuration

```
ip security
ike policy ikebranch1
integrity sha256
dh-group 15
!
sa policy sabranch1
sa lifetime 2
pfs dh-group 14
!
profile hq
mode tunnel
ike-policy ikebranch1
sa-policy sabranch1
connection add
shared-key keyAristaHq
dpd 10 50 clear
!
interface Tunnel1
mtu 1404
ip address 1.0.3.1/24
tunnel source 1.0.0.1
tunnel destination 1.0.0.2
tunnel ipsec profile hq
!
interface Ethernet1
no switchport
ip address 1.0.0.1/24
!
```

9.3.3.3.1 Displaying IPsec Information

- Use the **show ip security policy** command to display the IPsec policy information.

```
switch# show ip security policy
Policy Name   Authentication   Encryption   Integrity    Lifetime  Rekey  DH Group
```

```
ike-policy    Pre-shared      256-bit AES  256bit Hash  8 hours   False  3072 bit
```

- Use the **show ip security profile** command to display the IP security profile information.

```
switch# show ip security profile
Profile name      IKE Policy Name      SA
ipsec-profile     ike-policy           sa-policy
```

9.3.3.4 IPsec Commands

- ike policy
- interface tunnel (IPsec)
- ip security
- profile (IPsec)
- sa policy
- show ip security applied-profile
- show ip security connection
- show ip security policy
- show ip security profile
- show ip security security-association

9.3.3.4.1 ike policy

The **ike policy** command configures the Internet Security Association and Key Mgmt Protocol on the switch and related policies. The IKE policy is configured in IP security configuration mode.

The **no ike policy** command deletes the IKE policy configuration from the switch.

The **exit** command returns the switch to the global configuration mode.

Command Mode

IP Security Configuration

Command Syntax

ike policy ***policy-name***

no ike policy ***policy-name***

Parameters

- ***policy-name*** Specifies the IKE policy name.

The following parameters are allowed to configure when the switch is placed in IKE policy configuration mode:

- **authentication** specifies the authentication type.
- **dh-group** specifies Diffie-Hellman Group value.
- **encryption** specifies the encryption type.
- **ike-lifetime** sets the ikeLifetime for ISAKMP security association. Expressed in hours.
- **integrity** specifies the Integrity algorithm.
- **local-id** specifies the local IKE identification.
- **remote-id** remote peer IKE identification.
- **version** specifies the IKE version.

Example

This command configures the IKE policy test for IP security configuration.

```
switch(config)# ike policy test
switch(config-ipsec-ike)#
```

9.3.3.4.2 interface tunnel (IPsec)

The **`interface tunnel`** command places the switch in the interface tunnel configuration mode.

Interface tunnel configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed.

The **`no interface tunnel`** command deletes the interface tunnel configuration.

The **`exit`** command returns the switch to the global configuration mode.

Command Mode

Global Configuration

Command Syntax

`interface tunnel` ***value***

`no interface tunnel` ***value***

Parameter

value Tunnel interface number. The value ranges from ***0*** to ***255***.

Example

This command places the switch in interface tunnel configuration mode with a tunnel value ***10***.

```
switch(config)# interface tunnel 10
switch(config-if-Tu10)#
```

9.3.3.4.3 ip security

The **ip security** command places the switch in the IP security configuration mode.

IP security configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed.

The **no ip security** command deletes the IP security configuration.

The **exit** command returns the switch to the global configuration mode.

Command Mode

Global Configuration

Command Syntax

ip security

no ip security

Example

This command places the switch in IP security configuration mode.

```
switch(config)# ip security
switch(config-ipsec)# ike policy IKE1
switch(config-ipsec-IKE1)# exit
switch(config-ipsec)# sa policy SA1
switch(config-SA1)#
```

9.3.3.4.4 profile (IPsec)

The **profile** command configures the IP security profile on the switch. The profile is configured in IP security configuration mode.

The **no profile** command deletes the IP security profile configuration from the switch.

The **exit** command returns the switch to the global configuration mode.

Command Mode

IP Security Configuration

Command Syntax

profile ***profile-name***

no profile ***profile-name***

Parameter

- ***profile-name*** Specifies the IP security profile name.

The following parameters can be configured in SA policy configuration mode:

- **connection** IPsec Connection (Initiator/Responder/Dynamic).
- **dpd** Dead Peer Detection.
- **flow** sets the flow.
- **ike-policy** ISAKMP policy.
- **mode** IP security mode type.
- **sa-policy** security association name.
- **shared-key** specifies key value.

Example

This command configures the IP security profile test for IP security configuration.

```
switch(config)# profile test
switch(config-ipsec-profile)#
```

9.3.3.4.5 sa policy

The **sa policy** command specifies a Security Association (SA) policy to be used for IPsec configuration, and enters IP security SA policy configuration mode to configure the named policy.

The **no sa policy** command deletes the specified SA policy configuration from the switch.

The **exit** command returns the switch to the global configuration mode.

Note: Arista EOS 4.22.0F release supports two combinations of encapsulations only: "esp encryption aes128" with "esp integrity sha1" and "esp encryption aes256" with "esp integrity sha256".

Command Mode

IP Security Configuration

Command Syntax

sa policy ***policy_name***

no sa policy ***policy_name***

Parameter

- ***policy_name*** Specifies the SA policy name.

The following parameters are configured in IP security SA policy configuration mode:

- **anti-replay** IPsec duplicate IP datagram detection.
- **esp** Encapsulation Security Payload.
- **pfs** Perfect Forward Secrecy.
- **sa** Security Association.

Example

This command applies the SA policy called ***test*** for IP security and enters IP security SA policy configuration mode for the test policy.

```
switch(config)# sa policy test
switch(config-ipsec-sa)#
```

9.3.3.4.6 show ip security applied-profile

The **`show ip security applied-profile`** command displays the IP security profile names and the interfaces on which they are applied.

Command Mode

EXEC

Command Syntax

`show ip security applied-profile`

Example

This command displays the IP security ***profile-1*** and the interfaces on which it is applied.

```
switch# show ip sec applied-profile
Profile Name                  Interface
ipsec-profile-1               Tunnel1,
                              Tunnel2,
                              Tunnel3,
                              Tunnel4,
                              Tunnel5,
                              Tunnel6,
                              Tunnel7,
                              Tunnel8,
                              Tunnel9,
                              Tunnel10,
                              Tunnel11,
                              Tunnel12,
                              Tunnel13,
                              Tunnel14,
                              Tunnel15,
                              Tunnel16,
                              Tunnel17,
                              Tunnel18,
                              Tunnel19,
                              Tunnel20,
                              Tunnel21,
                              Tunnel22,
                              Tunnel23,
                              Tunnel24,
                              Tunnel25,
                              Tunnel26,
```

9.3.3.4.7 show ip security connection

The **`show ip security connection`** command displays the IP security connection status information.

Command Mode

EXEC

Command Syntax

`show ip security connection`

Example

These commands display the IP security connection status information.

```
switch# show ip sec conn tunnel 1
Tunnel   Source     Dest     Status       Uptime     Input    Output        Rekey Time
Tunnel1  11.1.1.1   11.2.1.1 Established  19 hours   0 bytes  0 bytes       4 hours
                                                     0 pkts   62937679 pkts

switch# show ip sec conn tunnel 1 detail
Tunnel1:
   source address 11.1.1.1, dest address 11.2.1.1
   state: Established
   uptime: 19 hours, 7 minutes, 23 seconds

```

9.3.3.4.8 show ip security policy

The **`show ip security policy`** command displays the IP security policy information.

Command Mode

EXEC

Command Syntax

`show ip security policy`

Example

This command displays IP security policy configuration information.

```
switch# show ip security policy
Policy Name   Authentication  Encryption   Integrity    Lifetime  Rekey  DH Group

ike-policy    Pre-shared      256-bit AES  256bit Hash  8 hours   False  3072 bit
```

9.3.3.4.9 show ip security profile

The **show ip security profile** command displays the IP security profile information.

Command Mode

EXEC

Command Syntax

show ip security profile

Example

This command displays IP security profile configuration information.

```
switch# show ip security profile
Profile name            IKE Policy Name        SA

ipsec-profile           ike-policy             sa-policy
```

9.3.3.4.10 show ip security security-association

The **show ip security security-association** command displays the IP security SA information.

Command Mode

EXEC

Command Syntax

show ip security security-association

Example

This command displays the IP security SA information.

```
switch# show ip sec security-association
SA Name      ESP Encryption   ESP Integrity    Lifetime  PFS Group

sa-policy-1  256-bit AES      256bit Hash      24 hours  2k bit
```

9.3.4 Macro-Segmentation Service (CVX)

Arista MSS is designed as a service in CloudVision that provides the point of integration between individual vendor firewalls or a firewall manager and the Arista network fabric. MSS provides flexibility on where to place the service devices and workloads. It is specifically aimed at Physical-to-Physical (P-to-P) and Physical-to-Virtual (P-to-V) workloads.

Topics in this section include:

- Overview
- How MSS Works
- Configuration
- MSS Integration with Check Point
- MSS for Layer 3 Firewall Enhancements
- MSS Commands

9.3.4.1 Overview

The advent of contemporary networking features such as mobile applications and the Internet of Things (IoT) bring in additional security challenges that are unprotected by legacy infrastructure. These security breaches cannot be handled by installing a firewall at the Internet edge. Arista Macro-Segmentation Service (MSS) addresses the security breach issue, besides securing access, protecting critical data and end-user privacy.

Arista MSS is designed as a service in CloudVision that provides the point of integration between a vendor firewall or a firewall manager and the Arista network fabric. MSS provides flexibility on where to place the service devices and workloads. It is specifically aimed at Physical-to-Physical (P-to-P) and Physical-to-Virtual (P-to-V) workloads.

MSS components include:

- Arista leaf-spine switch fabric
- Arista CloudVision
- Vendor firewall attached to a spine or service leaf switches. Different vendor firewalls can be attached to different switches to enhance scalability.

The above component topology allows for consistency in application deployment, scale, manageability, and easier scalability of the network and service layers.

- Benefits
- Terminology
- Usage Scenarios

9.3.4.1.1 Benefits

MSS provides the following key benefits:

- Enhanced security between any physical and virtual workloads in the data center.
- The automatic and seamless service insertion ability of MSS eliminates manual steering of traffic for a workload or a tenant.
- Security policies are applied to the host and application throughout the network.
- MSS is flexible since there are no proprietary frame formats, tagging, or encapsulation.

9.3.4.1.2 Terminology

The following terms related to MSS are used to describe the MSS feature:

- **Intercept Switch/VTEP**: TOR switch and VXLAN tunnel end-point connected to host from which traffic is intercepted. In the topology diagram, Intercept-1 and Intercept-2 are intercept switches.

- **Service Switch/VTEP**: TOR switch and VXLAN tunnel end-point connected to a firewall. In the topology diagram, Service-1 is the service switch.
- **VXLAN**: Virtual eXtensible LAN - a standards-based method of encapsulating Layer 2 traffic across a Layer 3 fabric.
- **CVX**: Arista CloudVision eXchange (CVX) is a part of CloudVision and is a virtualized instance of the same Extensible Operating System (EOS) that runs on physical switches. It functions as a point of integration between customer firewalls or firewall policy managers and the Arista network in order to steer traffic to the firewall.

9.3.4.1.3 Usage Scenarios

The following usage scenarios describe a few major security challenges in today's data center that are successfully handled by MSS.

1. Securing server-to-server traffic.

   This scenario provides information about the role of MSS in securing network traffic between physical-to-physical (P-to-P) and physical to virtual (P-to-V) servers. Prior to MSS, network infrastructure devices followed the firewall sandwich setup where firewalls were placed in line between the security zones. This setup would impact scalability and performance of the servers.

   Using MSS, this restriction on firewall placement is reduced. Firewalls are now attached to a service leaf switch in the network fabric and they still protect hosts without concern about their physical location. The following topology demonstrates the usage scenario.

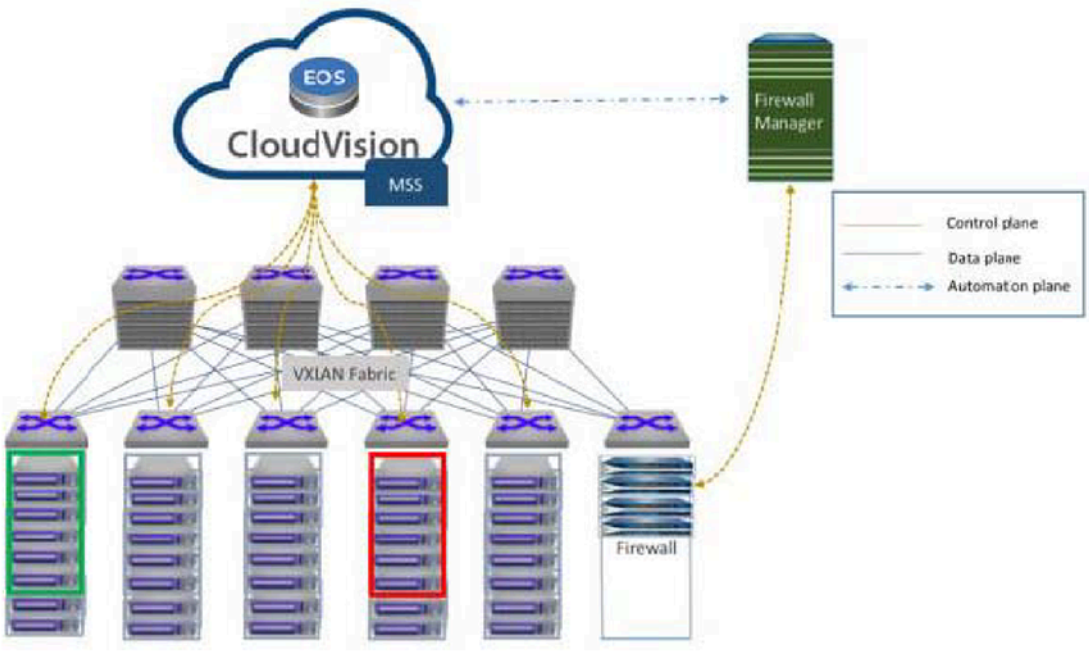

Figure 13: Securing server-server traffic

2. Monitoring and securing management traffic.

   This usage scenario demonstrates how MSS successfully monitors and secures management interfaces in the data center.

   The modern data center caters to managing the application, storage, virtualization, network, analytics and other layers. With virtualization, the hypervisor management also needs to be secured to prevent unwanted access to a hypervisor management interface. In the event of a rogue access, Aristas MSS protects management interfaces. The explicitly allowed hosts can gain access through

a jump host or administrator end-user computing instances. The following topology diagram illustrates the role of MSS in a data center.

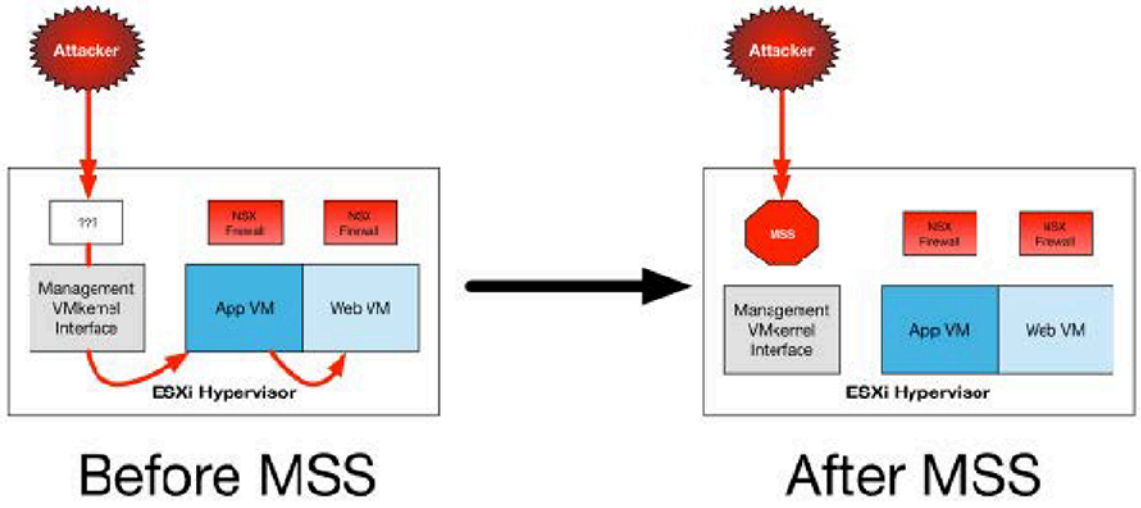

Figure 14: Monitoring and Securing management traffic

9.3.4.2 How MSS Works

The following steps provide information about how MSS works as a service in the data center.

1. MSS is enabled on the CloudVision eXchange (CVX) and the Arista switches are configured to stream their active state to CVX. This allows CVX to build a database of hosts and firewalls attached to the network and also to identify physical ports and IP addresses. CVX is also configured to communicate and synchronize policies from a vendor's firewall.
2. CVX sends a request to the firewall or firewall manager to provide information about the security policies which are tagged for MSS usage.
3. The MSS service on CVX determines the flow based forwarding rules to be pushed to the switches in the network.

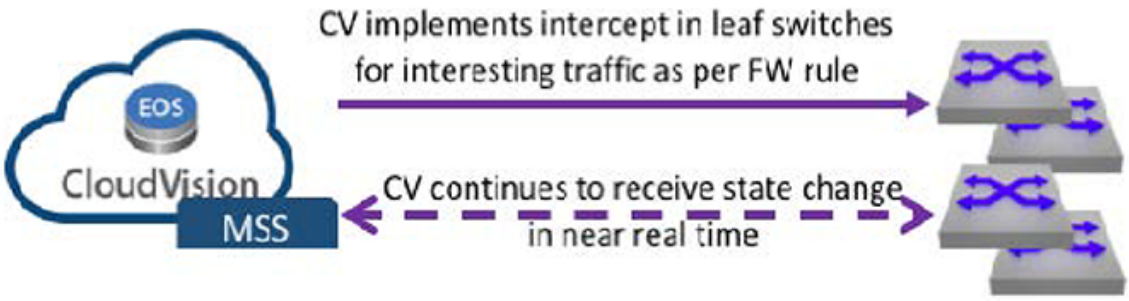

Figure 15: CVX intercept

4. The leaf switch starts sending intercepted traffic to the service leaf when the intercept has been applied to the leaf switch.

Figure 16: Leaf switches intercept

5. Traffic is forwarded completely unmodified to the firewall after it enters the service leaf where the firewall is attached. Based on the configuration policy, the firewall applies the required actions such as inspection, log, allow, or deny.
6. The service leaf switch sends the inspected traffic to its final destination or to the destination based on the firewall policy.

9.3.4.3 Configuration

The following sections provide detailed information about MSS configuration, system requirements, recommendations, and limitations.

The traffic flow below is an example of a typical MSS deployment with a 3-tiered application. The goal of this design is to limit access between hosts in the following zones: web-untrust, app-untrust, db-untrust, web-trust, app-trust, and db-trust.

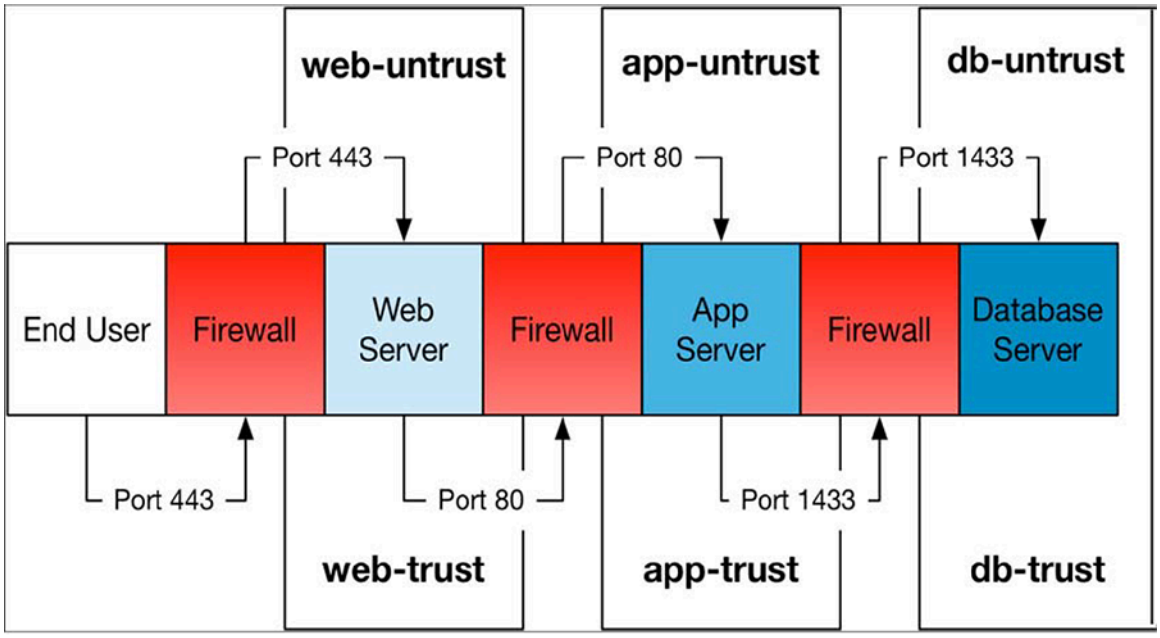

Figure 17: Traffic flow in an MSS deployment

End users in the untrust zone access the web server through the TCP/443 port. Traffic flows through the active firewall to the web server interface in the web-untrust security zone. The web server interface in the web-trust security zone accesses the application server interface in the app-untrust security zone through port TCP/80 after traversing the firewall. From there, the application server interface in the app-trust security zone accesses the database through TCP/1433 in the db-untrust zone.

The following physical topology indicates the MSS setup.

The hosts are attached to a pair of intercept leaf switches. A firewall is connected to a service leaf switch using a pair of physical interfaces with a subinterface per zone or vWire.

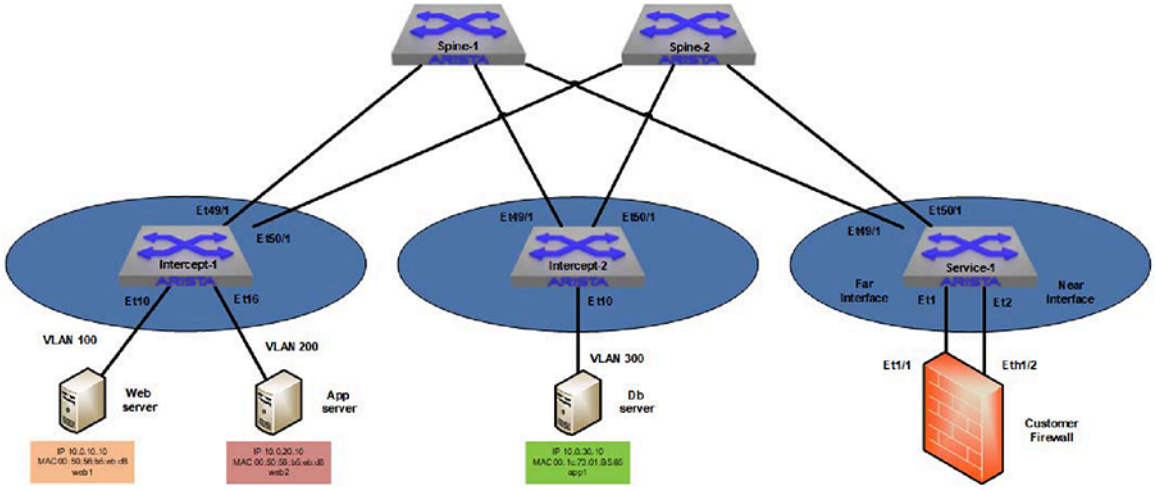

Figure 18: Physical Topology of the MSS

- System Requirements
- Recommendations and Limitations
- Configuring MSS

9.3.4.3.1 System Requirements

The system requirements to effectively run MSS are listed below.

- Arista CloudVision eXchange (CVX).
- Arista 7280SR, 7280TR, 7280CR, 7020SR, 7020TR series switches; 7050X, 7050X2, 7060X, and 7060X2 series top of rack (TOR) switches.
- Connected to the hosts to intercept traffic from the firewall devices.
- The network must be a VXLAN-enabled fabric with CVX running the VXLAN Control Service (VCS) or EVPN.

9.3.4.3.2 Recommendations and Limitations

Firewall

The firewall policy name must not have any whitespace character in the name. As an example, ***PCI policy*** is an unacceptable policy name. An acceptable name would be ***PCI_policy***.

9.3.4.3.3 Configuring MSS

These sections describe steps to configure MSS.

- Deploying CVX
- Enabling the VXLAN Control Service on CVX
- Configuring the Access Switches and the Service Switch Ports
- Enabling DirectFlow on Access Switches and Service Switches
- Enabling VXLAN routing on the TOR switches
- Configuring MSS on CVX
- Configuring the Firewall

9.3.4.3.3.1 Deploying CVX

Deploy CloudVision and configure the Arista TOR switches to connect to it. A CVX cluster of three instances with host names of ***cvx01***, ***cvx02***, and ***cvx03*** are configured as an example.

Note: As a best practice, always deploy the CV in a HA cluster with a minimum of three instances.

9.3.4.3.3.2 Enabling the VXLAN Control Service on CVX

Enable the VXLAN Control Service (VCS) on every CVX instance after the three Arista CVX instances have been deployed and the TOR switches are configured to be managed by them.

VCS allows hardware VXLAN Tunnel End Points (VTEPs) to share state with each other in order to establish VXLAN tunnels without the need for a multicast control plane.

Example

CVX instance cvx01

```
cvx01(config-cvx)# service vxlan
cvx01(config-cvx-vxlan)# no shutdown
```

Similarly, VCS is enabled on the ***cvx02*** and ***cvx03*** devices.

9.3.4.3.3.3 Configuring the Access Switches and the Service Switch Ports

Configure the switch ports that are connected to the hosts, whose traffic should be steered to the firewalls and the service switch ports which are connected to the firewalls.

Access Switch Configuration

The switch ports connected to the hosts, whose traffic needs to be intercepted, need to be configured as 802.1q trunks with the VLAN that is mapped to the VNI requiring interception. Unique VLAN IDs are configured for each tier of the application.

Access Switch (Intercept-1)

```
intercept-1# configure
intercept-1(config)# interface et10
intercept-1(config-if-Et10)# description web server
intercept-1(config-if-Et10)# switchport mode trunk
intercept-1(config-if-Et10)# switchport trunk allowed vlan 100

intercept-1(config)# interface et16
intercept-1(config-if-Et16)# description app server
intercept-1(config-if-Et16)# switchport mode trunk
intercept-1(config-if-Et16)# switchport trunk allowed vlan 200
```

Access Switch (Intercept-2)

```
intercept-2# configure
intercept-2(config)# interface et10
intercept-2(config-if-Et1)# description db server
intercept-2(config-if-Et1)# switchport mode trunk
intercept-2(config-if-Et1)# switchport trunk allowed vlan 300
```

Note: For untagged traffic, configure a native VLAN on the port using the **switchport trunk native vlan** command.

Service Switch (Service-1)

```
service-1# configure
service-1(config)# interface port-channel 10
```

```
service-1(config-if-Po10)# description Far Interface
service-1(config-if-Po10)# switchport mode trunk
service-1(config-if-Po10)# switchport trunk allowed vlan none
service-1(config-if-Po10)# spanning-tree bpdufilter enable

service-1(config)# interface port-channel 20
service-1(config-if-Po20)# description Near Interface
service-1(config-if-Po20)# switchport mode trunk
service-1(config-if-Po20)# switchport trunk allowed vlan none
service-1(config-if-Po20)# spanning-tree bpdufilter enable
```

Note: Dynamically mapped VLANs are not shown in the switch port configuration. You can view them by running the **`show vlan`** command on the switch once a policy is applied.

9.3.4.3.3.4 Enabling DirectFlow on Access Switches and Service Switches

Arista MSS uses DirectFlow to intercept traffic while the VxLAN is used to carry tunnel traffic from the intercepted host to the firewall and back. DirectFlow should be enabled on every intercept switch as well as the service switches.

Switch Service-1

```
service-1# configure
service-1(config)# directflow
service-1(config-directflow)# no shutdown
```

Switch Intercept-1

```
intercept-1# configure
intercept-1(config)# directflow
intercept-1(config-directflow)# no shutdown
```

Switch Intercept-2

```
intercept-2# configure
intercept-2(config)# directflow
intercept-2(config-directflow)# no shutdown
```

9.3.4.3.3.5 Enabling VXLAN routing on the TOR switches

CVX uses Address Resolution Protocol (ARP) to determine where intercept hosts are physically located in the network. VXLAN routing should be configured on every TOR switch that will be intercepting traffic to ensure that CVX is aware of every host ARP entry.

The following configuration shows the routing configuration for each tier of the application, but not the entire VXLAN configuration. For more information on how to configure VXLAN and VXLAN routing, refer to the VXLAN section of the ***Arista EOS Configuration Guide***.

Switch Intercept-1

```
intercept-1# configure
intercept-1(config)# ip routing
intercept-1(cofig)# interface vlan100
intercept-1(config-if-Vl100)# ip address virtual 10.0.10.254/24
intercept-1(config)# interface vlan200
intercept-1(config-if-Vl200)# ip address virtual 10.0.20.254/24
intercept-1(config)# interface vlan300
intercept-1(config-if-Vl300)# ip address virtual 10.0.30.254/24
```

Switch Intercept-2

```
intercept-2# configure
intercept-2(config)# ip routing
intercept-2(cofig)# interface vlan100
intercept-2(config-if-Vl100)# ip address virtual 10.0.10.254/24
intercept-2(config)# interface vlan200
intercept-2(config-if-Vl200)# ip address virtual 10.0.20.254/24
intercept-2(config)# interface vlan300
intercept-2(config-if-Vl300)# ip address virtual 10.0.30.254/24
```

Switch Service-1

```
service-1# configure
service-1(config)# ip routing
service-1(cofig)# interface vlan100
service-1(config-if-Vl100)# ip address virtual 10.0.10.254/24
service-1(config)# interface vlan200
service-1(config-if-Vl200)# ip address virtual 10.0.20.254/24
service-1(config)# interface vlan300
service-1(config-if-Vl300)# ip address virtual 10.0.30.254/24
```

9.3.4.3.3.6 Configuring MSS on CVX

This step enables configuring Arista MSS on CVX. The topology diagram depicts three CVX instances in a cluster and the configuration is the same for every instance. The active and standby vendor firewalls are configured. If Panorama is used, only Panorama should be configured.

Example

In the example, the primary vendor firewall has a DNS name of ***fw-ha-node-1***. The standby firewall has a DNS name of ***fw-ha-node-2***. The username and password are set as ***admin***.

CVX instance *cvx01*

```
cvx01# configure
cvx01(config)# cvx
cvx01(config-cvx)# no shutdown
cvx01(config-cvx)# service mss
cvx01(config-cvx-mss)# no shutdown
cvx01(config-cvx-mss)# vni range 20000-30000
cvx01(config-cvx-mss)# dynamic device-set panfw1
cvx01(config-cvx-mss-panfw1)# tag Arista_MSS
cvx01(config-cvx-mss-panfw1)# type palo-alto firewall
cvx01(config-cvx-mss-panfw1)# state active
cvx01(config-cvx-mss-panfw1)# device fw-ha-node-1
cvx01(config-cvx-mss-panfw1-fw-ha-node-1)# username admin password 0
 admin
```

CVX instance *cvx02*

```
cvx02# configure
cvx02(config)# cvx
cvx02(config-cvx)# no shutdown
cvx02(config-cvx)# service mss
cvx02(config-cvx-mss)# no shutdown
cvx02(config-cvx-mss)# vni range 20000-30000
cvx02(config-cvx-mss)# dynamic device-set panfw1
cvx02(config-cvx-mss-panfw1)# tag Arista_MSS
cvx02(config-cvx-mss-panfw1)# type palo-alto firewall
cvx02(config-cvx-mss-panfw1)# state active
cvx02(config-cvx-mss-panfw1)# device fw-ha-node-1
```

```
cvx02(config-cvx-mss-panfw1-fw-ha-node-1)# username admin password 0
 admin
```

CVX instance *cvx03*

```
cvx03# configure
cvx03(config)# cvx
cvx03(config-cvx)# no shutdown
cvx03(config-cvx)# service mss
cvx03(config-cvx-mss)# no shutdown
cvx03(config-cvx-mss)# vni range 20000-30000
cvx03(config-cvx-mss)# dynamic device-set panfw1
cvx03(config-cvx-mss-panfw1)# tag Arista_MSS
cvx03(config-cvx-mss-panfw1)# type palo-alto firewall
cvx03(config-cvx-mss-panfw1)# state active
cvx03(config-cvx-mss-panfw1)# device fw-ha-node-1
cvx03(config-cvx-mss-panfw1-fw-ha-node-1)# username admin password 0
 admin
```

9.3.4.3.3.7 Configuring the Firewall

Three policies are created in addition to the default implicit deny policy for inter-zone traffic. The implicit deny ensures that the inter-zone traffic is not allowed unless a policy explicitly allows for it.

The first policy ***untrust_to_web1*** is from the ***untrust*** zone to the ***web1*** zone, that allows HTTPS traffic from anywhere to the web server web.

The third policy ***web2_to_app1*** is from the ***web2*** zone to the app1 zone that allows HTTP traffic between the web server web and the application server app.

The fifth policy ***app2_to_db1*** is from the ***app2*** zone to the ***db1*** zone that allows database traffic on port ***TCP/1433*** between the application server app and the database server db.

The second, fourth, and sixth policies prevent the firewall to drop a session for which does not see the initial connection to the protected resource. This could happen if the protected resource has not sent any traffic previous to this point.

Refer to the following images for more clarity about the above policies and interface configuration.

				Source		Destination		Rule Usage					
	Name	Tags	Type	Zone	Address	Zone	Address	Hit Count	Last Hit	First Hit	Application	Service	Action
1	vl 150 allow	offload	universal	vl 1200	150.0.1.0/30	phy int	160.0.5.1/32	0	-	-	any	UDP_dst_2000-1	Allow
2	test	offload	universal	vl 1200	170.0.1.0/30	any	any	0	-	-	any	application-default	Allow

ethernet1/17	Layer3	allow ping		none	none	Untagged	none	none		
ethernet1/17.1200	Layer3	allow ping		199.2.0.2/21 199:2::100:2/64	default	1200	none	vl 1200		
ethernet1/17.1201	Layer3	allow ping		199.2.8.2/21	default	1201	none	vl 1201		

Figure 20: Firewall Interface Configuration

Create a rule that Arista MSS will use to intercept and redirect traffic and add a firewall policy with the default Arista_MSS tag as shown in the example above. MSS intercepts all traffic from endpoints identified in policies that match the tag values configured in CVX. The firewall will apply all rules (tagged or untagged) to all traffic.

Note: LLDP should always be enabled on the firewall interfaces attached to the service switches. To minimize reconvergence time on the network changes, reduce the LLDP transmit interval and hold time multiples on the firewall, while keeping the LLDP hold time above the LLDP timer configured on the connected Arista switches.

Alternatively, the **`device interface map`** command can be used on CVX to manually map a device to Arista switch interfaces. To map multiple devices, add a mapping entry for each device.

```
dynamic device-set fw1
device dc-firewall-1
map device-interface ethernet1/1 switch 00:1c:73:7e:21:bb interface
 Ethernet1
map device-interface ethernet1/2 switch 00:1c:73:7e:21:bb interface
 Ethernet9
```

The first policy ***untrust_to_web1*** is from the untrust zone to the web1 zone, that allows HTTPS traffic from anywhere to the web server web.

The third policy ***web2_to_app1*** is from the web2 zone to the app1 zone that allows HTTP traffic between the web server web and the application server app.

The fifth policy ***app2_to_db1*** is from the app2 zone to the db1 zone that allows database traffic on port TCP/1433 between the application server app and the database server db.

The second, fourth, and sixth policies prevent the firewall to drop a session for which does not see the initial connection to the protected resource. This could happen if the protected resource has not sent any traffic previous to this point.

Refer to the following images for more clarity about the above policies and interface configuration.

	Name	Tags	Type	Source Zone	Source Address	Destination Zone	Destination Address	Rule Usage Hit Count	Rule Usage Last Hit	Rule Usage First Hit	Application	Service	Action

Figure 22: Firewall Interface Configuration

Create a rule that Arista MSS will use to intercept and redirect traffic and add a firewall policy with the default ***Arista_MSS*** tag as shown in the example above. MSS intercepts all traffic from endpoints identified in policies that match the tag values configured in CVX. The firewall will apply all rules (tagged or untagged) to all traffic.

Note: LLDP should always be enabled on the firewall interfaces attached to the service switches. To minimize reconvergence time on the network changes, reduce the LLDP transmit interval and hold time multiples on the firewall, while keeping the LLDP hold time above the LLDP timer configured on the connected Arista switches.

Alternatively, the **`device interface map`** command can be used on CVX to manually map a device to Arista switch interfaces. To map multiple devices, add a mapping entry for each device.

```
dynamic device-set fw1
device dc-firewall-1
map device-interface ethernet1/1 switch 00:1c:73:7e:21:bb interface
 Ethernet1
map device-interface ethernet1/2 switch 00:1c:73:7e:21:bb interface
 Ethernet9
```

9.3.4.4 MSS Integration with Check Point

Macro Segmentation Service (MSS) is configurable for Check Point Software Technologies (Check Point) Firewalls. The configuration and deployment requires the use of Check Point Management Server (Gaia), a security management platform which allows central management of Check Point gateway security devices.

Requirements

The following requirements apply to the deployment.

- ***MSS version R80.30 version 1.5*** and above and a special URL access on the Management Server using a Gateway API provided by Check Point.
- ***Gateway version R80.30*** with API version 1.2 and above.
- ***Check Point Management Server release R31*** and above.

Configuration and Deployment

The following components of the solution require configuration:

- Check Point Gateway firewalls
- Check Point Management Server
- Arista leaf switches
- CVX

Check Point Firewalls (Gateways)

Interface Configuration

Configure IPv4 addresses on the routed L3 interfaces on the firewall interfaces connected to the Arista TORs.

IPv4 Static Routes Configuration

Configure IPv4 static routes to include routes to all subnets of the hosts which MSS will be intercepting either using a WebUI or CLI as shown below. The nexthop gateway addresses are the gateway of the subnet to which the firewall interfaces. The static route information is used by MSS to identify which firewall interface is connected to the subnet to which the intercepted traffic needs to be forwarded.

```
set static-route 192.0.2.0/24 nexthop gateway address 192.0.2.155 on
```

The following displays the configuration.

```
gateway1>show route static
Codes: C - Connect ed, S - Static, R - RIP, B - BGP (D - Default),
       O - OSPF IntraArea (IA - InterArea, E - External, N - NSSA),
       A - Aggregate, K - Kernel Remnant, H - Hidden, P - Suppressed,
       U - Unreachable, i - Inactive

S               0.0.0.0/0           via 172.2.18.12, Mgmt, cost 0, age
 3134690
S               10.6.10.0/24        via 10.6.100.2, eth1, cost 0, age
 3134690
S               10.6.20.0/24        via 10.6.200.2, eth2, cost 0, age
 3134690
```

Check Point Management Server Configuration

The Check Point firewall devices intended to be used with Arista MSS must be registered and fully manageable via a Check Point Management Server.

- Identify or define a new security policy network layer to be considered by MSS where 'TestPolicy' is the security policy network layer that is referenced in the CVX configuration.
- Create firewall access rules (to be used by Arista MSS).
- In the access rule, the supported source and destination object types are Host, Network, and Security Zone.
- In the “Services & Applications,” the following services are supported: 1: ICMP, IGMP, IPv4, TCP, EGP, UDP, IPv6, RSVP, GRE, OSPFIGP, SCTP.

- Add tags in the policy comments/description field in this format: "tags(<tag1>, <tag2>, ...)", e.g. “tags(Arista_MSS1, Arista_MSS2)”
  - Arista MSS inspects management server access rules that have an embedded "tags( )" string in the comments field. Individual tags are extracted from within the enclosing parentheses and compared with the tags configured in the Arista MSS device-set on CVX.

1-to-1 HA Cluster Configuration

The following figure shows the 1-to-1 HA cluster. The HA interface pairs connected to the Arista switches should have Virtual IP addresses where the intercepted traffic will be forwarded. The active firewall sends out a GARP with its own MAC to indicate where traffic sent to the VIP should be forwarded.

Arista Leaf Switches Configuration

The following configures the switch interfaces connected to the firewall.

```
switchport trunk native vlan <interface vlan>
switchport mode trunk
spanning-tree portfast
spanning-tree bpdufilter enable

interface Vlan<interface vlan>
   ip address virtual <interface IPv4 address>/<mask>
```

CVX Configuration

The following displays the CVX configuration with Standalone Check Point firewall.

```
!! Standalone firewall
cvx
   no shutdown
   service mss
      no shutdown
      !
      dynamic device-set chkpt
         device <management-server-ip-or-dnsName>
            username admin password 7 PKigsm//o3IcnW5rqoZXWQ==
            protocol https 4434   (or the configured https port like 443)
            group <management-server-network-layer>
         !
         device member <checkpoint-device-name>
            map device-interface eth1 switch 00:1c:73:7e:28:11 interface
 Ethernet39
            map device-interface eth2 switch 00:1c:73:7e:28:11 interface
 Ethernet40
         type check-point management-server
         policy tag offload Arista_MSS_offload
         policy tag redirect Arista_MSS
         state active
```

The checkpoint-device-name used in the **`device member`** command is the name used in the Management Server to identify that firewall. A sample CVX configuration with Check Point firewalls in 1-to-1 High Availability cluster configuration will include more than one device member as follows:

```
!! HA Active/Passive firewall pair
cvx
   no shutdown
   service mss
      no shutdown
      !
      dynamic device-set chkpt
```

```
         device <management-server-ip-or-dnsName>
            username admin password 7 PKigsm//o3IcnW5rqoZXWQ==
            protocol https 4434   (or the configured https port like 443)
            group <management-server-network-layer>
         !
         device member <checkpoint-device1-name>
            map device-interface eth1 switch 00:1c:73:7e:28:11 interface
Ethernet39
            map device-interface eth2 switch 00:1c:73:7e:28:11 interface
Ethernet40
         device member <checkpoint-device2-name>
            map device-interface eth1 switch 00:1c:73:7e:28:11 interface
Ethernet41
            map device-interface eth2 switch 00:1c:73:7e:28:11 interface
Ethernet42
         type check-point management-server
         policy tag offload Arista_MSS_offload
         policy tag redirect Arista_MSS
         state active
```

9.3.4.5 MSS for Layer 3 Firewall Enhancements

The **verbatim** qualifier enhances the Macro Segmentation Service (MSS) with two policy actions: **redirect** and **offload**. For firewall policies tagged with the **redirect** tag, MSS extracts IP addresses from the policy and forwards all traffic destined to or generated from that set of IP addresses to the firewall. The additional **verbatim** tag, redirecting bidirectional traffic is restricted to the subset that matches the additional qualifiers of a firewall policy to a firewall (such as the source, destination IP addresses or subnets, protocol, L4 ports).

The **verbatim** tag can also be paired with the **offload** tag for a policy which installs necessary DirectFlow rules at the TORs to drop or allow the traffic matching the exact qualifiers in the policy definition. If the **verbatim** tag is not used with the offload tag, the behavior is to offload enforcement for all traffic matching the specific policy rule, while redirecting the remainder of the (non-matching) traffic to the firewall to ensure the security policy for the protected host remains in compliance. The addition of the **verbatim** tag removes this implicit redirection

Configuring for Verbatim Use

Firewall Configuration

The verbatim is a modifier of the original policy enforcement scheme and works with multiple firewalls such as those from Palo Alto Networks and Fortinet.

Policy Semantics

IP address extraction for **redirect** or **redirect** tag:

- If IP addresses are specified in source or destination field, Mss extracts those for redirection.
- If no IP addresses are specified, then Mss extracts the subnets corresponding to the source and destination zone for redirection.
- If no zones are specified, then Mss extracts all subnets in the **default** virtual-router for redirection.

Constraints on **offload** tag policies:

- Must have IP address specified in source or destination field if the corresponding zone is an **external** zone (zone towards default route).

Constraints on **redirect verbatim** tag policies:

- Must have IP address specified in source or destination field if the corresponding zone is an **external** zone (zone towards default route).

- Must have either zone or IP specified in both source and destination field. ‘Any’, ‘All’, or similar constructs are not supported for source or destination fields.

Policies with broadcast or multicast destination:

Only **offload** and **offloadverbatim** tags are supported for policies with IPv4 broadcast or IPv4 multicast destination.

CVX Configuration

The following configuration commands set 'tag-list' as the verbatim modifier on a per device basis for the **redirect** and **offload** tags.

```
cvx
   service mss
      dynamic device-set <device-set-name>
         device <device-name>
           [no | default] policy tag redirect <tag-list>
           [no | default] policy tag offload <tag-list>
           [no | default] policy tag modifier verbatim <tag-list>
```

TCAM Profile Configuration

The following depicts a recommended TCAM profile to be used with MSS.

Note: This is an example for some of the devices that are currently supported.

```
hardware tcam
   profile direct-flow-mssl3-vxlan
      feature acl port ip
         sequence 50
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops l4-
src-port src-ip tcp-control ttl
         action count drop
         packet ipv4 forwarding bridged
         packet ipv4 forwarding routed
         packet ipv4 forwarding routed multicast
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet ipv4 non-vxlan forwarding routed decap
         packet ipv4 vxlan eth ipv4 forwarding routed decap
         packet ipv4 vxlan eth ipv6 forwarding routed decap

```

The following displays the profile. The platform does not support any arbitrarily created PMF profile. If the PMF profile cannot be programmed, the show command will print '**ERROR**' in the status column.

```
switch# show hardware tcam profile
                     Configuration            Status
FixedSystem          direct-flow-mssl3-vxlan  direct-flow-mssl3-vxlan
```

Limitations

- DirectFlow needs to be enabled at the TOR so that the policies enforced by MSS are correctly programmed.
- *Group* option is available only for some switches.
- Deployments with a mix of switches require special considerations. The following table summarizes supported configurations in different deployment models.

Table 5: Configuration Summary

Both compute and service TORs: DCS-7050X, DCS-7050X2, DCS-7050X3, DCS-7060X, DCS-7060X2	group, verbatim	• redirect • offload • redirect, verbatim • offload, verbatim

Both compute and service TORs: DCS-7020R, DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2	verbatim	• redirect, verbatim • offload, verbatim
Both compute and service TORs: DCS-7050X, DCS-7050X2, DCS-7050X3, DCS-7060X, DCS-7060X2, DCS-7020R, DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2	verbatim	• redirect, verbatim • offload, verbatim
DCS-7050X, DCS-7050X2, DCS-7050X3, DCS-7060X, DCS-7060X2 as compute TOR and other series as service TOR (with no intercepted hosts connected).	group, verbatim	• redirect • offload • redirect, verbatim • offload, verbatim

Backward Compatibility and Other Considerations

For existing deployments, (where any of DCS-7020R, DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2 switch platforms are used in the service rack), in order to upgrade hitlessly, upgrade the CVX cluster first and execute the following command prior to upgrading EOS on any switch:

```
cvx
   service mss
      policy enforcement rules group verbatim
```

The command **[no|default] policy enforcement rules {group verbatim | verbatim}** disables / enables policy enforcement.

Displaying CVX Status

The following displays the status of the mss policy.

```
switch#show service mss policy

<--snip-->

9.3.4.6 MSS Commands

Configuration Commands

- dynamic device-set
- exception device
- group
- name-resolution interval (CVX-OpenStack)
- service mss
- state
- tag
- type palo-alto

CVX Show Commands

- show service mss dynamic device-set
- show service mss policy
- show service mss status
- show service mss zone

9.3.4.6.1 dynamic device-set

The **`dynamic device-set`** command configures a device such as a firewall to communicate with the MSS in the MSS configuration mode.

The **`no dynamic device-set`** command removes a previously configured device from the MSS configuration and returns to the CVX mode.

Command Mode

MSS Configuration

Command Syntax

`dynamic device-set` *device-set_name*

`no dynamic device-set` *device-set_name*

Parameters

device-set_name a unique name for the device set.

Example

This example creates a set of firewalls with the name ***panfw1***.

```
cvx#configure
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#no shutdown
cvx(config-cvx-mss)#vni range 30000-40000
cvx(config-cvx-mss)#dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)#
```

Note: The **`vni range`** command configures a range of VXLAN Network Identifiers (VNI) that MSS uses to tunnel traffic to the firewall. If VNI range is not configured, the default VNIs in the range of ***1*** to ***16777214*** are used.

9.3.4.6.2 exception device

The **exception device** command bypasses or continues redirecting traffic to service device such as a firewall if the service device control-plane API is unreachable after initial policies have been processed.

The no exception device command.

Command Mode

MSS Configuration

Command Syntax

`exception device unreachable` [bypass | redirect]

`no exception device unreachable` [bypass | redirect]

`default exception device unreachable bypass`

Parameters

- **device**: service device in the device set.
- **unreachable**: service device control-plane API is unreachable.
- **bypass**: bypass the service device.
- **redirect**: continue redirecting traffic to the service device.

Example

This example redirects traffic to the service device.

```
cvx#configure
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#no shutdown
cvx(config-cvx-mss)#vni range 30000-40000
cvx(config-cvx-mss)#dynamic device-set fw
cvx(config-cvx-mss-fw)#device firewall-dc7
cvx(config-cvx-mss-fw)#username admin password 7 PKigsmo3IcnW5rqoZXWQ
cvx(config-cvx-mss-fw)#state active
cvx(config-cvx-mss-fw)#type palo-alto firewall
cvx(config-cvx-mss-fw)#exception device unreachable redirect
```

9.3.4.6.3 group

The **group** command configures the Panorama device group name to be used with MSS.

The no group command removes the group from the MSS configuration when the Panorama firewall manager is used.

See the type palo-altocommand for more information about the firewall manager.

Command Mode

Device-set mode

Command Syntax

`group` *group_name*

`no group` *group_name*

Parameters

group_name the name of the group.

Example

This command configures the group name as ***mssDevices***.

```
cvx(config)#cvx
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#dynamic device-set pano2
cvx(config-cvx-mss-pano2)#type palo-alto panorama
cvx(config-cvx-mss-pano2)#device myPanorama
cvx(config-cvx-mss-pano2-myPanorama)#group mssDevices
```

9.3.4.6.4 name-resolution interval (CVX-OpenStack)

The **`name-resolution interval`** command specifies the period between consecutive requests that the OpenStack controller sends to the Keystone service for VM and tenant name updates. Keystone is OpenStack's authentication and authorization service.

The default period is ***21600*** seconds (6 hours).

The name-resolution force (CVX-OpenStack) command performs an immediate update, as opposed to waiting for the periodic update.

Command Mode

CVX-OpenStack Configuration

Command Syntax

`name-resolution interval` period

Parameters

period: Keystone identity service polling interval (seconds).

Comment

`service openstack` places the switch in ***CVX-OpenStack*** configuration mode.

Example

These commands set the name resolution interval period at five hours.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#name-resolution interval 18000
switch(config-cvx-openstack)#
```

9.3.4.6.5 service mss

The **`service mss`** command enters the MSS configuration sub-mode.

The no service mss command exits the MSS configuration mode and returns to the CVX mode.

Command Mode

CVX Configuration

Command Syntax

```
service mss
```

```
no service mss
```

```
default service mss
```

Example

This example enables MSS on CVX and enters the MSS config mode.

Note: The **`no shutdown`** command enables MSS on the CloudVision eXchange (CVX).

```
cvx#configure
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#no shutdown
```

9.3.4.6.6 show service mss dynamic device-set

The **`show service mss dynamic device-set`** command displays detailed information about a specific service device set. Information such as device group members, high availability, network, resource details are displayed.

Note: Interfaces from multiple switches can be placed in the same zone by the device.

Command Mode

EXEC

CVX Configuration

Command Syntax

`Show service mss dynamic device-set` *device_set_name* [device *device_name* [group-members | high-availability | neighbors | network | policies | resources]]

Parameters

- ***device_set_name*** defines the device set name.
- **device *device name*** defines the service device properties such as the DNS hostname or IP address of the service device.
- **group members** lists device-group members for an aggregation manager.
- **high-availability** displays service device high availability information.
- **neighbors** displays the service devices ethernet interface neighbor information.
- **network** displays the service devices network interface information.
- **policies** displays the list of policies read from service device that have the MSS tag.
- **resources** displays the service devices system resource information.

Related Commands

- show service mss status
- show service mss policy

Examples

- This command displays information about interfaces that are placed in a zone by the ***device1***.

```
switch#show service mss zone
Source: static
-----------------------------------------------
Device: device1
```

- This command displays information about interfaces that are placed in a zone by the ***device1***.

```
switch#show service mss zone
Source: static
-----------------------------------------------
Device: device1
Zone: zone1
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet1/1
Allowed VLAN: 1000-1010
Port-Channel2/1:
Allowed VLAN: 1000-2000
Switch: 00:00:00:00:00:02
Hostname: switch2.arista.com
Interfaces:
Ethernet10/1
```

```
Allowed VLAN: 1000-1010
Zone: zone2
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet10/1
Allowed VLAN: 1000-1010
Ethernet 20/1
Allowed VLAN: 1000-2000
```

9.3.4.6.7 show service mss policy

The **show service mss policy** command displays generic information about the configuration and operational state of the macro-segmentation service (MSS) policies on a device.

Command Mode

EXEC

CVX Configuration

Command Syntax

`show service mss policy` [[device *device_name*][name *policy-name*][source (static | *plugin_name*)]]

Parameters

- **device *device name*** defines the service device name.
- **name *policy-name*** the filter policy name.
- **source** the source of the policy.
- **static** the policy configured using the command line interface.
- ***plugin_name*** the service device type.

Related Commands

- show service mss status
- show service mss zone

Example

This command displays information about the MSS policy ***policy1*** enabled on the device.

```
cvx#show service mss policy name policy1
Source  Device    Policy  Config   Status
------  --------  ------  -------  -------------  -------------
vendor  Firewall  pan100  policy1  Enabled        Initialized
```

The **Config** column indicates the configuration state of a policy. The different states are: **Enabled**, **dry run**, and **disabled** states.

The **Status** column indicates the operational state of a policy. The different status types are **initialized**, **pending**, **initializing**, **active**, **reinitializing**, **dry-run Complete**, and **deactivating**.

9.3.4.6.8 show service mss status

The **show service mss status** command displays the status of a macro-segmentation service (MSS) on the device.

Command Mode

EXEC

CVX Configuration

Command Syntax

```
show service mss status
```

Related Commands

- show service mss policy
- show service mss zone

Examples

- This command displays the MSS status on the device as Enabled.

```
switch#show service mss status
State: Enabled
Service VNIs: 1500-1600,1800,1900-2000
```

- This command displays the MSS status on the device as Disabled.

```
switch#show service mss status
State: Disabled
Service VNIs: 1-16777214
```

9.3.4.6.9 show service mss zone

The **`show service mss zone`** command displays information about the interfaces that are placed in a single zone by the service device. Along with the show service mss policy command, we can use this command to identify issues with the policy configuration.

Interfaces from multiple switches can be placed in the same zone by the device.

Command Mode

EXEC

CVX Configuration

Command Syntax

`show service mss zone` [[device *device_name*]|[name *zone_name*]|[source (static | *dynamic_source*)]]

Parameters

- **device *device name*** defines the service device properties.
- **name *policy-name*** the filter zone name.
- **source** the source of the zone.
- **static** the zone configured using the command line interface.
- ***dynamic_source*** the service device type.

Related Commands

- show service mss status
- show service mss policy

Example

This command displays information about interfaces that are placed in a zone by the ***device1***.

```
switch#show service mss zone
Source: static
--------------------------------------
Device: device1
Zone: zone1
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet1/1
Allowed VLAN: 1000-1010
Port-Channel2/1:
Allowed VLAN: 1000-2000
Switch: 00:00:00:00:00:02
Hostname: switch2.arista.com
Interfaces:
Ethernet10/1
Allowed VLAN: 1000-1010
Zone: zone2
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet10/1
Allowed VLAN: 1000-1010
Ethernet 20/1
Allowed VLAN: 1000-2000
```

9.3.4.6.10 state

The **state** command configures device set as active or disabled or suspended state.

The no state command disables the previously configured state of the device set.

Command Mode

MSS Configuration

Command Syntax

`state` [active | shutdown | suspend]

`no state`

Parameters

- **active**: the active state of the device set. Policy monitoring and network traffic redirection are enabled.
- **shutdown**: the disabled state of the device set. Policy monitoring and network traffic redirection is stopped.
- **suspend**: the suspended state of the device set. Policy monitoring is suspended but there is no change in the existing traffic redirection.

Example

This output example configures the device set state as active.

```
cvx#configure
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#no shutdown
cvx(config-cvx-mss)#vni range 30000-40000
cvx(config-cvx-mss)#dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)#tag Arista_MSS
cvx(config-cvx-mss-panfw1)#type palo-alto firewall
cvx(config-cvx-mss-panfw1)#state active
```

9.3.4.6.11 tag

The **`tag`** command specifies the tag or tags that MSS searches when it is reading the security policy from the firewall or firewall manager in the ***dynamic device-se***t configuration mode. You can specify more than one tag as well.

The no tag command removes the tag from the MSS configuration.

Note: The tag specified should always match with the firewall policy tags in the vendor firewall policy for the MSS to read the policy and set up the intercept.

Command Mode

MSS Configuration

Command Syntax

`tag` *tag_name*

`no tag`

`default tag` Arista_MSS

Parameters

tag_name: a unique name for the tag.

Examples

- This command specifies the tag with the name ***Arista_MSS***.

```
cvx#configure
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#no shutdown
cvx(config-cvx-mss)#vni range 30000-40000
cvx(config-cvx-mss)#dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)#tag Arista_MSS
```

- This command specifies multiple tags with names ***mss1***, ***mss2***, and ***mss3***.

```
cvx#configure
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#no shutdown
cvx(config-cvx-mss)#vni range 30000-40000
cvx(config-cvx-mss)#dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)#tag mss1 mss2 mss3
```

9.3.4.6.12 type palo-alto

The **`type palo-alto`** command configures the firewall type to be used in the MSS configuration.

The **`no type palo-alto`** command disables the firewall type from the MSS configuration.

Command Mode

MSS Configuration

Command Syntax

`type palo-alto` [firewall | panorama]

`no type palo-alto`

Parameters

- **firewall**: the Palo Alto Networks firewall.
- **panorama**: the Palo Alto Networks Panorama firewall manager.

Example

This command configures the Palo Alto Networks firewall type.

```
cvx#configure
cvx(config)#cvx
cvx(config-cvx)#service mss
cvx(config-cvx-mss)#dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)#type palo-alto firewall
```

Chapter 10

Quality of Service and Traffic Management

This chapter describes Arista's Quality of Service (QoS) implementation and Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

10.1 Quality of Service

This chapter describes Arista's Quality of Service (QoS) implementation, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Quality of Service Conceptual Overview
- QoS Configuration: Platform-Independent Features
- QoS Configuration: Arad Platform Switches
- QoS Configuration: Jericho Platform Switches
- QoS Configuration: FM6000 Platform Switches
- QoS Configuration: Petra Platform Switches
- QoS Configuration: Trident and Tomahawk Platform Switches
- QoS Configuration: Trident II and Helix Platform Switches
- Support for Configuring Color Extended Communities
- ACL based QoS Configuration
- Configuring IPv6 Flow Label Matches for QoS
- Differentiated MMU Discard Counters
- Quality of Service Configuration Commands
- Chipset Mapping for QoS

10.1.1 Quality of Service Conceptual Overview

QoS processes apply to traffic that flows through Ethernet ports and control planes. These processes can modify data fields (CoS or DSCP) or assign data streams to traffic classes for prioritized handling. Transmission queues are configurable for individual Ethernet ports to shape traffic based on its traffic class. Many switches also support traffic policies that apply to data that is filtered by access control lists.

The following sections describe QoS features:

- Identifying the Switch Platform
- QoS Data Fields and Traffic Classes
- Transmit Queues and Port Shaping
- Explicit Congestion Notification (ECN)
- ACL Policing
- Quality of Service (QoS) Profiles

10.1.1.1 Identifying the Switch Platform

QoS configuration varies significantly by switch platform. A list of Arista switch model numbers and their corresponding switch platforms (chipsets) can be found in the Chipset Mapping for QoS.

On some switches, the platform can also be determined by entering **`platform ?`** in the CLI.

Example

This command shows that the example switch is running on the Trident platform.

```
switch(config)#platform ?
  trident  Trident chip
switch(config)#
```

10.1.1.2 QoS Data Fields and Traffic Classes

Quality of Service (QoS) defines a method of differentiating data streams to provide varying levels of service to the different streams.

Criteria determining a packet's priority level include packet field contents and the port where data packets are received. QoS settings are translated into traffic classes, which are then used by switches to manage all traffic flows. Traffic flow management varies with each switch platform.

10.1.1.2.1 QoS Data Fields

Quality of service decisions are based on the contents of the following packet fields:

- CoS (three bits): Class of service (CoS) is a 3-bit field in Ethernet frame headers using VLAN tagging. The field specifies a priority value between zero and seven. Class of service operates at Layer 2.
- DSCP (six bits): Differentiated Service Code Point (DSCP) is a 6-bit field in the Type Of Service (TOS) field of IP packet headers.

10.1.1.2.2 Port Settings – Trust Mode and Traffic Class

Ethernet and port channel interfaces support three QoS trust modes:

- **CoS Trust:** Ports use inbound packet CoS field contents to derive the traffic class.
- **DSCP Trust:** Ports use inbound packets DSCP field contents to derive the traffic class.
- **Untrusted:** Ports use their default values to derive the traffic class, ignoring packet contents.

The default mode setting is **CoS trust** for switched ports and **DSCP trust** for routed ports.

Ports are associated with default CoS, DSCP, and traffic class settings; defaults vary by platform.

These sections describe procedures for configuring port settings:

- CoS and DSCP Port Settings – Arad Platform Switches
- CoS and DSCP Port Settings – FM6000 Platform Switches
- CoS and DSCP Port Settings – Petra Platform Switches
- CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches
- CoS and DSCP Port Settings – Trident II and Helix Platform Switches

10.1.1.2.3 Rewriting CoS and DSCP

CoS Rewrite

Switches can rewrite the CoS field for outbound tagged packets. The new CoS value is configurable, and is derived from a data stream's traffic class as specified by the traffic class-to-CoS rewrite map. CoS rewrite is disabled on all the traffic received on CoS trusted ports.

On Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, CoS rewrite can be enabled or disabled on DSCP trusted ports and untrusted ports.

- CoS rewrite is globally enabled by default for packets received on untrusted ports and DSCP trusted ports if at least one port is explicitly configured in **DSCP trust** or **untrusted** mode.
- CoS rewrite is globally disabled by default for packets received on untrusted ports and DSCP trusted ports if there are no ports explicitly configured in **DSCP trust** or **untrusted** mode.

On Petra platform switches, CoS rewrite is always enabled on DSCP trusted ports and untrusted ports.

DSCP Rewrite

Switches can rewrite the DSCP field for outbound IP packets. On FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, DSCP rewrite is disabled by default on all ports and always

disabled for traffic received on DSCP trusted ports. On Petra, Arad, and Jericho platform switches, DSCP rewrite is always disabled.

FM6000, Trident and Tomahawk, Trident II, and Helix platform switches provide a command that enables or disables DSCP rewrite for packets received on CoS trusted ports and untrusted ports. The new DSCP value is configurable, based on the data stream's traffic class, as specified by the traffic class-to-DSCP rewrite map.

These sections describe procedures for rewriting CoS and DSCP fields:

- CoS Rewrite – Arad Platform Switches
- CoS and DSCP Rewrite – FM6000 Platform Switches
- CoS Rewrite – Petra Platform Switches
- CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches
- CoS and DSCP Rewrite – Trident II and Helix Platform Switches

10.1.1.2.4 Traffic Classes

Data stream distribution is based on their traffic classes. Data stream management varies by switch platform. Traffic classes are derived from these data stream, inbound port, and switch attributes:

- CoS field contents.
- DSCP field contents.
- Inbound port trust setting.
- CoS default setting (Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches).
- DSCP default setting (Arad, Jericho, FM6000, Trident and Tomahawk, and Trident II platform switches).
- Traffic class default setting (Petra platform switches).

When a port is configured to derive a data stream's traffic class from the CoS or DSCP value associated with the stream, the traffic class is determined from a conversion map.

- A CoS-to-traffic class map derives a traffic class from a CoS value.
- A DSCP-to-traffic class map derives a traffic class from a DSCP value.

Map entries are configurable through CLI commands. Default maps determine the traffic class value when CLI map entry commands are not configured. Default maps vary by switch platform.

These sections describe traffic class configuration procedures:

- Traffic Class Derivations – Arad Platform Switches
- Traffic Class Derivations – Jericho Platform Switches
- Traffic Class Derivations – FM6000 Platform Switches
- Traffic Class Derivations – Petra Platform Switches
- Traffic Class Derivations – Trident and Tomahawk Platform Switches
- Traffic Class Derivations – Trident II and Helix Platform Switches

10.1.1.3 Transmit Queues and Port Shaping

Transmit queues are logical partitions of an Ethernet port's egress bandwidth. Data streams are assigned to queues based on their traffic class, then sent as scheduled by port and transmit settings. Support varies by switch platform. A queue's label determines its priority: queues with the suffix ***0*** have the lowest priority.

Parameters that determine transmission schedules include:

- **Traffic class-to-transmit queue** mapping determines the transmit queue for transmitting data streams based on traffic class. The set of available transmit maps vary by switch platforms:

    - **Arad, Jericho, FM6000, Trident II, and Helix platforms:** one map for all unicast and multicast traffic.
    - **Trident and Tomahawk platform:** one map for unicast traffic and one map for multicast traffic.
    - **Petra platform:** one map for unicast traffic. Queue shaping is not available for multicast traffic.
- **Port shaping** specifies a port's maximum egress bandwidth.
- **Queue shaping** specifies a transmit queue's maximum egress bandwidth, and implementation varies by platform.
    - **Trident and Tomahawk platform:** queue shaping is configurable separately for unicast and multicast queues.
    - **Trident II platform:** queue shaping is configurable for transmit queues. Port shaping and queue shaping are supported only in store-and-forward switching mode.
    - **Petra platform:** queue shaping is not available for multicast traffic.
    - **Helix platform:** queue shaping is configurable for transmit queues.
    - **FM6000 platform:** switches do not support simultaneous port shaping and queue shaping. Enabling port shaping on an FM6000 switch disables queue shaping, regardless of the previous configuration.
- **Guaranteed bandwidth** guarantees the allocation of a specified bandwidth for a transmit queue. Guaranteed bandwidth is supported only on Trident II platforms.
- **Queue priority** specifies the priority at which a transmit queue is serviced. The switch defines two queue priority types:
    - ***Strict priority queues*** are serviced in the order of their priority rank - subject to each queue's configured maximum bandwidth. Data is not handled for a queue until all queues with higher priority are emptied or their transmission limit is reached. These queues typically carry low latency real time traffic and require highest available priority.
    - ***Round robin queues*** are serviced simultaneously subject to assigned bandwidth percentage and configured maximum bandwidth. All round robin queues have lower priority than strict priority queues. Round robin queues can be starved by strict priority queues.
- **Queue scheduling** determines how packets from different transmit queues are serviced to be sent out on the port.
- **Queue bandwidth allocation** specifies the time slice (percentage) assigned to a round robin queue, relative to all other round robin queues.

These sections describe transmit queue and port shaping configuration procedures:

- Transmit Queues and Port Shaping – Arad Platform Switches
- Transmit Queues and Port Shaping – Jericho Platform Switches
- Transmit Queues and Port Shaping – FM6000 Platform Switches
- Transmit Queues and Port Shaping – Petra Platform Switches
- Transmit Queues and Port Shaping – Trident and Tomahawk Platform
- Transmit Queues and Port Shaping – Trident II and Helix Platform Switches

10.1.1.4 Explicit Congestion Notification (ECN)

Explicit Congestion Notification (ECN) is an IP and TCP extension that facilitates end-to-end network congestion notification without dropping packets. ECN recognizes early congestion and sets flags that signal affected hosts. Trident and Tomahawk, Trident II, and Helix platform switches extend ECN support to non-TCP packets.

ECN usage requires that it is supported and enabled by both endpoints. Although only unicast flows are modified by ECN markers, the multicast, broadcast, and unmarked unicast flows can affect network congestion and influence the indication of unicast packet congestion.

10.1.1.4.1 ECN Conceptual Overview

The ECN field in the IP header (bits 6 and 7 in the IPv4 TOS or IPv6 traffic class octet) advertises ECN capabilities:

- ***00***: Router does not support ECN.
- ***10***: Router supports ECN.
- ***01***: Router supports ECN.
- ***11***: Congestion encountered.

Networks typically signal congestion by dropping packets. After an ECN-capable host negotiates ECN, it signals impending congestion by marking the IP header of packets encountering the congestion instead of dropping the packets. The recipient echoes the congestion indication back to the sender, which reduces its transmission rate as if it had detected a dropped packet.

Switches support ECN for unicast queues through Weighted Random Early Detection (WRED), an Active Queue Management (AQM) algorithm that extends Random Early Detection (RED) to define multiple thresholds for an individual queue. WRED determines congestion by comparing average queue size with queue thresholds. Average queue size depends on the previous average and current queue size:

- average queue size = (old_avg * (1-2^(-weight))) + (current_queue_size * 2^(-weight))
- where weight is the exponential weight factor used for averaging the queue size.
- Packets are marked based on WRED as follows:
- If average queue size is below the minimum threshold, packets are queued as in normal operation without ECN.
- If average queue size is greater than the maximum threshold, packets are marked for congestion.
- If average queue size is between minimum and maximum queue threshold, packets are either queued or marked. The proportion of packets that are marked increases linearly from 0% at the minimum threshold to 100% at the maximum threshold.

Treatment of packets marked as not ECN capable varies by platform.

These sections describe ECN configuration procedures:

- ECN Configuration – Arad Platform Switches
- ECN Configuration – Trident and Tomahawk Platform Switches

10.1.1.5 ACL Policing

ACL policing monitors the ingress data rates for a particular class of traffic and performs the action configured when the traffic exceeds the user configured value. Therefore, it allows the user to control ingress bandwidth based on packet classification. The incoming traffic is metered and marked by the policing, and based on the metering results the actions are performed.

ACL policing uses a token bucket shaping algorithm for packet transmission. Packets are eligible for transmission when token count is positive, and when token count is negative the next packet will have to wait until the token count turns positive again. The tokens are renewed at 96ns time interval (Tc). The tokens are collected in the policer bucket up to a max burst size of 16KB, and any traffic beyond this shape rate and burst size is buffered in the shared memory. The packets are dropped if there is a memory overflow.

Note: The policer bucket is refilled at a sweeper period of 0.333 millisecond. This is applicable for all the platforms.

For example, let us assume that shaping is not enabled, and the link is at 10 Gbps, that is 1.25 bytes/nsec. In such case a each refill cycle will add tokens worth 120 bytes. For a shape rate of 500 Mbps, each refill cycle will add 6 bytes. And for 64 byte worth of tokens we need around 11 refill cycles = 1us. A 64 byte packet coming immediately after a jumbo frame will have to wait longer compared to a jumbo frame coming after 64 byte packet.

Token size depends on the interface speed, following the last example:

- For 10 Gbps, each refill cycle will add tokens worth 120 bytes.
- For 1 Gbps, each refill cycle will add tokens worth 12 bytes.

At lower shaping rates (less than 10 Mbps), granularity and rounding errors may alter the actual shaping rate by 20% from the specified rate, and the rounding errors are much less at higher speeds. For example, At 100 Mbps you will see 98.9 Mbps configured in hardware. User can use the **`show qos interfaces`** command to verify the interface speed.

The policing uses three types of traffic metering and coloring mechanisms.

- **Single Rate Two Color Marker**
- **Single Rate Three Color Marker**
- **Two Rate Three Color Marker**

Single Rate Two Color Marker

It meters the packet stream and marks packets based on committed burst size (bc) and excess burst size (be).

Single Rate Three Color Marker

It meters the packet stream and marks packets based on single rate committed information rate (cir), and committed burst size (bc) and excess burst size (be). The packets are marked in green if it does not exceed the set burst size, and marked in yellow if it does exceed the burst size but not the excess burst size, and marked red otherwise. The packets are marked in two color modes.

- **Color-blind Mode**: In color-blind mode the incoming packet color is ignored.
- **Color-aware Mode**: In color-aware mode it is assumed that incoming packet is colored by preceding entity. And, in color-aware mode, a packet never get better than it was. If the input color of the packet is green, it can be marked as green, yellow, or red. But if the input color is yellow, then it can be marked only yellow or red.

Two Rate Three Color Marker

It meters the packet stream and marks its packets based on two rates, peak information rate (pir) and committed information rate (cir), and associated burst sizes (bc and be).The packet is marked red if rate exceeds ‘pir’, and yellow if it exceeds ‘cir’ but not 'pir' and marked green if rate is lower than 'cir'. The two rate mode is configured by setting four parameters pir, cir, bc, and be.

The ACL policing is supported on platforms specified in the table below.

ACL Policing Support Matrix

Platform Supported	ACL Policing	ACL Policing on LAG Interface
Trident	Yes	Yes
Trident II	Yes	Yes
Trident+	Yes	Yes
FM6000	Yes	Yes
Arad	Yes	Only Per-Port
Jericho	Yes	Yes

Helix	Yes	Yes
XP	Yes	Yes
Trident 3	Yes	Yes
Tomahawk	Yes	Yes
Tomahawk 2	Yes	Yes
Tofino	No	No

10.1.1.5.1 Configuring ACL Policing

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policers. The following is the default behavior on conditions and available policing actions:

- Police command creates a per-interface policer. If you attach per-interface policers to multiple ingress ports, each one polices the matched traffic on each ingress port separately. Per interface statistics gathered for conformed/allowed traffic and exceeded/dropped traffic.
- When there is no policer configured within a class, all traffic is transmitted without any policing. If there are any actions configured, the configured actions are applied.
  - conform-action (green): transmit (default).
  - exceed-action (yellow): drop (default).
  - violate-action (red): drop (default).
- The policer bucket is refilled at a sweeper period of 0.333 milliseconds, and the tokens in the policer bucket are renewed at 96ns time interval (Tc). This is applicable for all the platforms.

Steps to Configure ACL Policing

These commands set the CIR, burst size, and creates a class and applies the policing to the policy map:

1. Create a policy map.
2. Create a class-map.
3. Apply the policer to the policy map created.

Examples

- These commands configure the ACL policing for a policy map.

```
switch#configure terminal
switch(config)#policy-map [type qos] policy-name
switch(config-pmap)#class { class-name }
switch(config-pmap-c)#[no] police cir cir [{bps|kbps|mbps}] bc
committed-burst-size [{bytes|kbytes|mbytes}]
```

- These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit

switch(config)#policy-map type quality-of-service policy1
switch(config-pmap)#class class1
switch(config-pmap-c)#police cir 512000 bc 96000
switch(config-pmap-c)#exit
```

```
switch(config-pmap)#
```

Displaying ACL Policing Information

Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)#show policy-map
Service-policy p

 Class-map: c (match-any)
    Match: ip access-group name a
       police rate 1000 mbps burst-size 100 bytes
 Class-map: class-default (match-any)
Service-policy p
 Class-map: c (match-any)
    Match: ip access-group name a
       police rate 1000 mbps burst-size 100 bytes
 Class-map: class-default (match-any)
```

- This command shows the interface-specific police counters for ***interface Ethernet 1***.

```
switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386
 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0
```

- This command shows the counters associated with the policy map called ***p1***.

```
switch(config)#show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229
```

- This command shows the QoS policy map for ***interface Ethernet 1***.

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)
```

10.1.1.6 Quality of Service (QoS) Profiles

QoS profiles are sets of QoS configuration instructions defined and applied at the interface level. A QoS profile serves the traffic better by reducing disorder in the running configuration. QoS profiles can modify all interface-level QoS configurations, and are supported on fabric, Ethernet, and port-channel interfaces. Control-plane policies cannot be applied using QoS profiles. Because configuration can be applied through QoS profiles or directly at the interface level, multiple configurations can be applied to the same interface. In such cases, QoS configurations with non-default values, whether configured through the CLI at the interface level or through a QoS profile, are given priority. In the case of multiple non-default values being configured, the interface-level CLI configuration is given priority.

Policy maps incorporating traffic resolution commands can also be applied by a QoS profile. If two policy maps are applied to the same interface (one through a QoS profile and another directly to the CLI).

Policy maps cannot be used on fabric interfaces. If a QoS profile which includes a policy map is applied to a fabric interface, a warning message will be displayed and the policy map will not be applied to the interface, but any additional supported configurations in the QoS profile will be applied. On SVIs and subinterfaces, QoS profiles are not supported, so policy maps must be applied directly through the CLI for these interfaces.

Note: For tx-queue configuration, conflicts between QoS profiles and configuration entered via the CLI are resolved at the tx-queue level and not at the tx-queue attribute level. If any non-default configuration has been entered for the tx-queue through the CLI, all tx-queue configuration included in the QoS profile is ignored.

10.1.1.6.1 IPv6 Flow Label Matches for QoS

Certain packets may include a flow label in their IPv6 headers when the source requests special handling by routers, such as for a media stream or other “real-time” service, among others. A flow consists of packets which share a single flow label, which is preserved throughout their passage from source to destination.

QoS policy map rules can match IPv6 traffic based on their flow labels. This requires a special TCAM profile (qos-match-ipv6-flow-label). These rules require either an exact match, using the “eq” operator, or both a label and a mask.

10.1.2 QoS Configuration: Platform-Independent Features

10.1.2.1 Creating QoS Profiles

QoS profiles are created by using the **qos profile** command. This also places the switch in QoS profile configuration mode, where the QoS parameters applied to interfaces are configured. To delete a QoS profile from the running configuration, use the no form of the command.

Example

This command creates a QoS profile named ***Test-Profile*** and places the switch in QoS profile configuration mode for the profile.

```
switch(config)# qos profile Test-Profile
switch(config-qos-profile-Test-Profile)#
```

10.1.2.2 Configuring QoS Profiles

The parameters that a QoS profile applies to interfaces are configured in QoS profile configuration mode by issuing the same QoS configuration commands that are available in interface configuration mode. **QoS profile** configuration mode is a group change mode, and changes made in the mode are

not saved until the mode is exited. To abandon all changes made while in the mode, use the **abort** command.

Example

These commands enter QoS profile configuration mode for a QoS profile named ***Test Profile***, configure the CoS value and transmit queue, and save the changes to the profile.

```
switch(config)# qos profile Test-Profile
switch(config-qos-profile-Test-Profile)# qos cos 3
switch(config-qos-profile-Test-Profile)# priority-flow-control on
switch(config-qos-profile-Test-Profile)# exit
switch(config)#
```

These commands enter QoS profile configuration mode for a QoS profile named ***Latency***, configure the maximum latency value for VOQ tail-drop threshold, and save the changes to the profile. The latency value can be specified to a maximum of ***50*** ms. Both milliseconds and microseconds may be used.

```
switch(config)# qos profile Latency
switch(config-qos-profile-Latency)# tx-queue 3
switch(config-qos-profile-Latency)# latency maximum <1-50000>
 microseconds
switch(config-qos-profile-Latency)# latency maximum <1-50> milliseconds
switch(config-qos-profile-Latency)# exit
switch(config)#
```

10.1.2.3 Attaching Policy-Map to a QoS Profile

The qos profile command places the switch in QoS profile configuration mode. The profile applies the QoS configurations to Ethernet and Port-Channel, and even to the Fabric interfaces, if it exists. A profile specifies the policy-map and other QoS supported configurations. The policy-map is then attached to the QoS profile using **service-policy** command.

Profiles are created in QoS-profile configuration mode, then applied to an interface in interface configuration mode.

Examples

- This command places the switch in QoS profile configuration mode, the policy-map is then attached to the profile using **service-policy** command in this mode.

  ```
  switch(config)# qos profile TP
  switch(config-qos-profile-TP)#
  ```

- This command applies the policy-map to the QoS profile.

  ```
  switch(config-qos-profile-TP)# service-policy type qos input PM-1
  ```

10.1.2.4 Applying a QoS profile on an Interface

The **service-profile** command applies a QoS profile to the configuration mode interface.

Example

This command applies the QoS profile TP to ***interface ethernet 13***.

```
switch(config)# interface ethernet 13
switch(config-if-Et13)# service-profile TP
```

10.1.2.5 Displaying the QoS Profile Information

The **show qos profile** command displays information about the QoS profiles configured and their parameters. To display the attribute of a specific profile, add the name of the profile. To display a list of configured QoS profiles and the interfaces on which they are configured, add the **summary** keyword.

Examples

- This command displays the configured profiles and their configuration.

```
switch# show qos profile
qos profile p
 qos cos 1
no priority-flow-control pause watchdog
priority-flow-control priority 1 no-drop
priority-flow-control priority 2 no-drop
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

- This command displays the contents of a specific profile.

```
switch# show qos profile p2
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

- This command displays the interfaces on which each profile is applied.

```
switch# show qos profile summary
Qos Profile: p
Configured on: Et13,7
Fabric
Po12
Qos Profile: p2
Configured on: Et56
```

10.1.3 QoS Configuration: Arad Platform Switches

Implementing QoS on an Arad platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- CoS and DSCP Port Settings – Arad Platform Switche
- Traffic Class Derivations – Arad Platform Switches
- CoS Rewrite – Arad Platform Switches
- Transmit Queues and Port Shaping – Arad Platform Switches
- ECN Configuration – Arad Platform Switches
- ACL Policing – Arad Platform Switches

Note: QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad, and Jericho.

10.1.3.1 CoS and DSCP Port Settings – Arad Platform Switches

Port Settings – Trust Mode and Traffic Class describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The **qos trust** command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- **`qos trust cos`** specifies **CoS** as the port's port-trust mode.
- **`qos trust dscp`** specifies **DSCP** as the port's port-trust mode.
- **`no qos trust`** specifies **untrusted** as the port's port-trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

These commands configure and display the following trust modes:

- ***Ethernet 3/5/1:*** **dscp**
- ***Ethernet 3/5/2:*** **untrusted**
- ***Ethernet 3/5/3:*** **cos**
- ***Ethernet 3/5/4:*** **default** as a switched port
- ***Ethernet 3/6/1:*** **default** as a routed port

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# qos trust dscp
switch(config-if-Et3/5/1)# interface ethernet 3/5/2
switch(config-if-Et3/5/2)# no qos trust
switch(config-if-Et3/5/2)# interface ethernet 3/5/3
switch(config-if-Et3/5/3)# qos trust cos
switch(config-if-Et3/5/3)# interface ethernet 3/5/4
switch(config-if-Et3/5/4)# switchport
switch(config-if-Et3/5/4)# default qos trust
switch(config-if-Et3/5/4)# interface ethernet 3/6/1
switch(config-if-Et3/6/1)# no switchport
switch(config-if-Et3/6/1)# default qos trust
switch(config-if-Et3/6/1) #show qos interface ethernet 3/5/1 - 3/6/1
 trust
Port                                    Trust Mode
                               Operational          Configured
-------------------------------------------------------------
Ethernet3/5/1                  DSCP                 DSCP
Ethernet3/5/2                  UNTRUSTED            UNTRUSTED
Ethernet3/5/3                  COS                  COS
Ethernet3/5/4                  COS                  DEFAULT
Ethernet3/6/1                  DSCP                 DEFAULT

switch(config-if-Et3/6/1)#
```

Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port's default CoS and DSCP values.

- **qos cos** configures a port's default CoS value.
- **qos dscp** configures a port's default DSCP value.

Example

These commands configure default CoS (***4***) and DSCP (***44***) values on ***Ethernet interface 3/6/2***.

```
switch(config)# interface ethernet 3/6/2
switch(config-if-Et3/6/2)# qos cos 4
```

```
switch(config-if-Et3/6/2)# qos dscp 44
switch(config-if-Et3/6/2)# show active
interface Ethernet3/6/2
   qos cos 4
   qos dscp 44
switch(config-if-Et3/6/2)# show qos interfaces ethernet 3/6/2
Ethernet3/6/2:
   Trust Mode: COS
   Default COS: 4
   Default DSCP: 44

switch(config-if-Et3/6/2)#
```

10.1.3.2 Traffic Class Derivations – Arad Platform Switches

Traffic Classes describes traffic classes.

Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

Table 6: Traffic Class Derivation Source: Arad Platform Switches

	Untrusted	CoS Trusted	DSCP Trusted
Untagged Non-IP	Default CoS (port)	Default CoS (port)	Default DSCP (port)
Untagged IP	Default CoS (port)	Default CoS (port)	DSCP (packet)
Tagged Non-IP	Default CoS (port)	CoS (packet)	Default DSCP (port)
Tagged IP	Default CoS (port)	CoS (packet)	DSCP (packet)

CoS and DSCP Port Settings – Arad Platform Switches describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The **qos map cos** command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the chip upon which it is received.

Example

This command assigns the traffic class of ***5*** to the classes of service ***1***, ***3***, ***5***, and ***7***.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ---------------------------
     tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS to Traffic Class map on Arad platform switches.

Table 7: Default CoS to Traffic Class Map: Arad Platform Switches

Inbound CoS	Untagged	0	1	2	3	4	5	6	7
Traffic Class	Derived: use default CoS as inbound	1	0	2	3	4	5	6	7

Mapping DSCP to Traffic Class

The **qos map dscp** command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

Example

This command assigns the traffic class of ***0*** to DSCP values of ***12***, ***24***, ***41***, and ***44-47***.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ----------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
      2 :     2  2  2  2  0  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  0  5  5  0  0  0  0  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

switch(config)#
```

The following table displays the default DSCP to traffic class map on Arad platform switches.

Table 8: Default DSCP to Traffic Class Map: Arad Platform Switches

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

10.1.3.3 CoS Rewrite – Arad Platform Switches

Rewriting CoS and DSCP describes the CoS rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The **qos map traffic-class to cos** command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

This command assigns the CoS of two to traffic classes ***1***, ***3***, and ***5***.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
   Number of Traffic Classes supported: 8

   Tc-cos map:
```

```
     tc:   0  1  2  3  4  5  6  7
     ---------------------------
     cos:  1  2  2  2  4  2  6  7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Arad platform switches.

Table 9: Default Traffic Class to CoS Rewrite Value Map: Arad Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Arad platform switches.

10.1.3.4 Transmit Queues and Port Shaping – Arad Platform Switches

Transmit Queues and Port Shaping describes transmit queues and port shaping.

Arad platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The **show qos maps** command displays the traffic class–transmit queue map.

The following table displays the default traffic class to transmit queue map on Arad platform switches.

Table 10: Default Traffic Class to Transmit Queue Map: Arad Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue	0	1	2	3	4	5	6	7

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from ***interface-ethernet*** configuration mode.

Mapping Traffic Classes to a Transmit Queue

The **qos map traffic-class to tx-queue** command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class ***7*** and transmit queue ***7*** are always mapped to each other. This association is not editable.

Example

These commands assign traffic classes of ***1***, ***3***, and ***5*** to ***transmit queue 1***, traffic classes ***2***, ***4***, and ***6*** to transmit queue ***2***, and traffic class ***0*** to transmit queue ***0***, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
```

```
switch(config)# show qos maps
   Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     ---------------------------------
     tx-queue:   0  1  2  1  2  1  2  7

switch(config)#
```

Entering Tx-Queue Configuration Mode

The **tx-queue (Arad/Jericho)** command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The **show qos interfaces** displays the transmit queue configuration for a specified port.

Example

This command enters Tx-queue configuration mode for ***transmit queue 4*** of ***interface Ethernet 3/3/3***.

```
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter **shape rate (Interface – Arad/Jericho)** from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter **shape rate (Tx-queue – Arad/Jericho)** from the queue's tx-queue configuration mode.

Examples

- This command configures a port shape rate of ***5*** Gbps on ***interface Ethernet 3/5/1***.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# shape rate 5000000
switch(config-if-Et3/5/1)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

   Port shaping rate: 5000012 / 5000000 kbps

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   ------------------------------------------------------
   7      - / -         - / -    (  -  )    SP / SP    D

switch(config-if-Et3/5/1)#
```

- These commands configure a shape rate of ***1*** Gbps on transmit queues ***3*** and ***4*** of ***interface Ethernet 3/4/1***.

```
switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# tx-queue 4
switch(config-if-Et3/4/1-txq-4)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)# tx-queue 3
switch(config-if-Et3/4/1-txq-3)# shape rate 1000000 kbps
```

```
switch(config-if-Et3/4/1-txq-3)# show qos interface ethernet 3/4/1
Ethernet3/4/1:

   Port shaping rate: disabled

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   ------------------------------------------------------
   7      - / -         - / -     (  -  )    SP / SP    D
   6      - / -         - / -     (  -  )    SP / SP    D
   5      - / -         - / -     (  -  )    SP / SP    D
   4      - / -      999 / 1000 ( Mbps )    SP / SP    D
   3      - / -      999 / 1000 ( Mbps )    SP / SP    D
   2      - / -         - / -     (  -  )    SP / SP    D
   1      - / -         - / -     (  -  )    SP / SP    D
   0      - / -         - / -     (  -  )    SP / SP    D

switch(config-if-Et3/4/1-txq-3)#
```

Configuring Queue Priority

The **priority (Arad/Jericho)** command configures a transmit queue's priority type:

- The **`priority strict`** command configures the queue as a strict priority queue.
- The **`no priority`** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The **bandwidth percent (Arad/Jericho)** command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Examples

- These commands configure queues ***0*** through ***3*** (***interface Ethernet 3/5/1***) as round robin, then allocate bandwidth for three queues at ***30%*** and one queue at ***10%***.

  The **`no priority`** statement for queue *3* also configures queues ***0***, ***1***, and ***2*** as round robin queues. Removing this statement reverts the other queues to **`strict priority`** type unless ***running-config*** contains a **`no priority`** statement for one of these queues.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# no priority
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   ------------------------------------------------------
   7      - / -         - / -     (  -  )    SP / SP    D
   6      - / -         - / -     (  -  )    SP / SP    D
   5      - / -         - / -     (  -  )    SP / SP    D
   4      - / -         - / -     (  -  )    SP / SP    D
```

```
   3      10 / 10        - / -     (  -  )     RR / RR     D
   2      30 / 30        - / -     (  -  )     RR / SP     D
   1      30 / 30        - / -     (  -  )     RR / SP     D
   0      30 / 30        - / -     (  -  )     RR / SP     D

switch(config-if-Et3/5/1-txq-0)#
```

- Changing the bandwidth percentage for queue ***3*** to ***30*** changes the operational bandwidth of each queue to its configured bandwidth divided by ***120%*** (10%+20%+30%+60%).

```
switch(config-if-Et3/5/1-txq-0)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-3)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

   Port shaping rate: disabled

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)         (units)
   ------------------------------------------------------
   7       - / -        - / -     (  -  )     SP / SP     D
   6       - / -        - / -     (  -  )     SP / SP     D
   5       - / -        - / -     (  -  )     SP / SP     D
   4       - / -        - / -     (  -  )     SP / SP     D

   1      24 / 30       - / -     (  -  )     RR / SP     D
   0      24 / 30       - / -     (  -  )     RR / SP     D

Note: Values are displayed as Operational/Configured

switch(config-if-Et3/5/1-txq-3)#
```

10.1.3.5 ECN Configuration – Arad Platform Switches

Explicit Congestion Notification (ECN) describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. Average queue length is tracked for transmit queues. When it reaches maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues that can simultaneously implement ECN.

The **random-detect ecn (Arad/Jericho)** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

Example

These commands enable ECN marking of unicast packets from ***unicast transmit queue 4*** of ***interface Ethernet 3/5/1***, setting thresholds at ***128*** kbytes and ***1280*** kbytes.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 4
switch(config-if-Et3/5/1-txq-4)# random-detect ecn minimum-threshold 128
 kbytes maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)# show active
interface Ethernet3/5/1
   tx-queue 4
      random-detect ecn minimum-threshold 128 kbytes maximum-threshold
 1280 kbytes
```

```
switch(config-if-Et3/5/1-txq-4)#
```

10.1.3.6 ACL Policing – Arad Platform Switches

ACL Policing describes ACL policing.

Implementing ACL policing consists of configuring the following:

- policy-map settings.
- class-name.
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users.
- burst size the maximum burst size in bytes the network commits to moving under normal conditions.

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default).
  - Violate-action (red): drop (default).

Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-class1)# match ip access-group acl1
switch(config-cmap-class1)# exit
switch(config)# policy-map type quality-of-service policy1
switch(config-policy1)# class class1
switch(config-policy1-class1)# police cir 512000 bc 96000
switch(config-policy1-class1)# exit
switch(config-policy1)# exit
switch(config)#
```

Displaying ACL Policing Information

Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)# show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
switch(config)#
```

- This command shows the interface-specific police counters for ***interface Ethernet 1***.

```
switch(config)# show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386
 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

switch(config)#
```

- This command shows the counters associated with the policy map called ***p1***.

```
switch(config)# show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229

switch(config)#
```

- This command shows the QoS policy map for ***interface Ethernet 1***.

```
switch(config)# show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

switch(config)#
```

10.1.4 QoS Configuration: Jericho Platform Switches

Implementing QoS on an Jericho platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- CoS and DSCP Port Settings – Jericho Platform Switches
- Traffic Class Derivations – Jericho Platform Switches
- CoS Rewrite – Jericho Platform Switches
- Transmit Queues and Port Shaping – Jericho Platform Switches
- ACL Policing – Jericho Platform Switches

Note: QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad. and Jericho.

10.1.4.1 CoS and DSCP Port Settings – Jericho Platform Switches

Port Settings – Trust Mode and Traffic Class describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The qos trust command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- **`qos trust cos`** specifies **CoS** as the port's port-trust mode.
- **`qos trust dscp`** specifies **DSCP** as the port's port-trust mode.
- **`no qos trust`** specifies **untrusted** as the port's port-trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

These commands configure and display the following trust modes:

- ***Ethernet 3/5/2:*** **untrusted**.
- ***Ethernet 3/5/3:*** **cos**.
- ***Ethernet 3/5/4:*** **default** as a switched port.
- ***Ethernet 3/6/1:*** **default** as a routed port.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# qos trust dscp
switch(config-if-Et3/5/1)# interface ethernet 3/5/2
switch(config-if-Et3/5/2)# no qos trust
switch(config-if-Et3/5/2)# interface ethernet 3/5/3
switch(config-if-Et3/5/3)# qos trust cos
switch(config-if-Et3/5/3)# interface ethernet 3/5/4
switch(config-if-Et3/5/4)# switchport
switch(config-if-Et3/5/4)# default qos trust
switch(config-if-Et3/5/4)# interface ethernet 3/6/1
switch(config-if-Et3/6/1)# no switchport
switch(config-if-Et3/6/1)# default qos trust
switch(config-if-Et3/6/1)# show qos interface ethernet 3/5/1 - 3/6/1
 trust
Port                                    Trust Mode
                               Operational          Configured
-------------------------------------------------------------
Ethernet3/5/1                  DSCP                 DSCP
Ethernet3/5/2                  UNTRUSTED            UNTRUSTED
Ethernet3/5/3                  COS                  COS
Ethernet3/5/4                  COS                  DEFAULT
Ethernet3/6/1                  DSCP                 DEFAULT

switch(config-if-Et3/6/1)#
```

Configuring Default Port Settings

Default **CoS** and **DSCP** values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port's default **CoS** and **DSCP** values.

- qos cos configures a port's default CoS value.
- qos dscp configures a port's default DSCP value.

Example

These commands configure default **CoS** (***4***) and **DSCP** (***44***) values on ***interface Ethernet 3/6/2***.

```
switch(config)# interface ethernet 3/6/2
switch(config-if-Et3/6/2)# qos cos 4
switch(config-if-Et3/6/2)# qos dscp 44
switch(config-if-Et3/6/2)# show active
interface Ethernet3/6/2
   qos cos 4
   qos dscp 44
switch(config-if-Et3/6/2)# show qos interfaces ethernet 3/6/2
Ethernet3/6/2:
   Trust Mode: COS
   Default COS: 4
   Default DSCP: 44

switch(config-if-Et3/6/2)#
```

10.1.4.2 Traffic Class Derivations – Jericho Platform Switches

Traffic Classes describes traffic classes.

Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class on Jericho platform switches.

Table 11: Traffic Class Derivation Source: Jericho Platform Switches

	Untrusted	CoS Trusted	DSCP Trusted
Untagged Non-IP	Default CoS (port)	Default CoS (port)	Default DSCP (port)
Untagged IP	Default CoS (port)	Default CoS (port)	DSCP (packet)
Tagged Non-IP	Default CoS (port)	CoS (packet)	Default DSCP (port)
Tagged IP	Default CoS (port)	CoS (packet)	DSCP (packet)

CoS and DSCP Port Settings – Arad Platform Switches describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the chip upon which it is received.

ExampleThis command assigns the traffic class of ***5*** to the classes of service ***1***, ***3***, ***5***, and ***7***.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ----------------------------
     tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS to Traffic Class map on Jericho platform switches.

Table 12: Default CoS to Traffic Class Map: Jericho Platform Switches

Inbound CoS	Untagged	0	1	2	3	4	5	6	7
Traffic Class	Derived: use default CoS as inbound	1	0	2	3	4	5	6	7

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

ExampleThis command assigns the traffic class of 0 to DSCP values of ***12***, ***24***, ***41***, and ***44-47***.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ----------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
      2 :     2  2  2  2  0  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  0  5  5  0  0  0  0  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

switch(config)#
```

The following table displays the default DSCP to traffic class map on Jericho platform switches.

Table 13: Default DSCP to Traffic Class Map: Jericho Platform Switches

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

10.1.4.3 CoS Rewrite – Jericho Platform Switches

Rewriting CoS and DSCP describes the CoS rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The qos map traffic-class to cos command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

ExampleThis command assigns the CoS of two to traffic classes ***1***, ***3***, and ***5***.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
   Number of Traffic Classes supported: 8

   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ----------------------------
```

```
     cos:  1  2  2  2  4  2  6  7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Jericho platform switches.

Table 14: Default Traffic Class to CoS Rewrite Value Map: Jericho Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Jericho platform switches.

10.1.4.4 Transmit Queues and Port Shaping – Jericho Platform Switches

Transmit Queues and Port Shaping describes transmit queues and port shaping.

Jericho platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The show qos maps command displays the traffic class–transmit queue map.

The following table displays the default traffic class to transmit queue map on Jericho platform switches.

Table 15: Default Traffic Class to Transmit Queue Map: Jericho Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue	0	1	2	3	4	5	6	7

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from interface-ethernet configuration mode.

Mapping Traffic Classes to a Transmit Queue

The qos map traffic-class to tx-queue command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.

ExampleThese commands assign traffic classes of ***1***, ***3***, and ***5*** to ***transmit queue 1***, traffic classes ***2***, ***4***, and ***6*** to ***transmit queue 2***, and ***traffic class 0*** to ***transmit queue 0***, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8
```

```
   Number of Transmit Queues supported: 8

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     ---------------------------------
     tx-queue:   0  1  2  1  2  1  2  7

switch(config)#
```

Entering Tx-Queue Configuration Mode

The tx-queue (Arad/Jericho) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. ***Tx-queue 7*** is not configurable. The show qos interfaces displays the transmit queue configuration for a specified port.

ExampleThis command enters Tx-queue configuration mode for ***transmit queue 4*** of ***interface ethernet 3/3/3***.

```
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter shape rate (Interface – Arad/Jericho) from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter shape rate (Tx-queue – Arad/Jericho) from the queue's tx-queue configuration mode.

Examples

- This command configures a port shape rate of ***5*** Gbps on ***interface ethernet 3/5/1***.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# shape rate 5000000
switch(config-if-Et3/5/1)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

   Port shaping rate: 5000012 / 5000000 kbps

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   ------------------------------------------------------
   7      - / -        - / -    (  -  )    SP / SP    D

switch(config-if-Et3/5/1)#
```

- These commands configure a shape rate of ***1*** Gbps on transmit queues ***3*** and ***4*** on ***interface ethernet 3/4/1***.

```
switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# tx-queue 4
switch(config-if-Et3/4/1-txq-4)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)# tx-queue 3
switch(config-if-Et3/4/1-txq-3)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)# show qos interface ethernet 3/4/1
```

```
Ethernet3/4/1:

   Port shaping rate: disabled

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   -----------------------------------------------------
   7      - / -        - / -    (  -  )    SP / SP    D
   6      - / -        - / -    (  -  )    SP / SP    D
   5      - / -        - / -    (  -  )    SP / SP    D
   4      - / -      999 / 1000 ( Mbps )    SP / SP    D
   3      - / -      999 / 1000 ( Mbps )    SP / SP    D
   2      - / -        - / -    (  -  )    SP / SP    D
   1      - / -        - / -    (  -  )    SP / SP    D
   0      - / -        - / -    (  -  )    SP / SP    D

switch(config-if-Et3/4/1-txq-3)#
```

Configuring Queue Priority

The priority (Arad/Jericho) command configures a transmit queue's priority type:

- The **`priority strict`** command configures the queue as a strict priority queue.
- The **`no priority`** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The bandwidth percent (Arad/Jericho) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Examples

- These commands configure queues ***0*** through ***3*** (***interface ethernet 3/5/1***) as round robin, then allocate bandwidth for three queues at ***30%*** and one queue at ***10%***.

  The **`no priority`** statement for queue ***3*** also configures queues ***0***, ***1***, and ***2*** as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless ***running-config*** contains a **`no priority`** statement for one of these queues.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# no priority
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   -----------------------------------------------------
   7      - / -        - / -    (  -  )    SP / SP    D
   6      - / -        - / -    (  -  )    SP / SP    D
   5      - / -        - / -    (  -  )    SP / SP    D
   4      - / -        - / -    (  -  )    SP / SP    D
   3     10 / 10       - / -    (  -  )    RR / RR    D
```

```
   2     30 / 30       - / -    (  -  )    RR / SP    D
   1     30 / 30       - / -    (  -  )    RR / SP    D
   0     30 / 30       - / -    (  -  )    RR / SP    D

switch(config-if-Et3/5/1-txq-0)#
```

- Changing the bandwidth percentage for queue ***3*** to ***30*** changes the operational bandwidth of each queue to its configured bandwidth divided by ***120%*** (10%+20%+30%+60%).

```
switch(config-if-Et3/5/1-txq-0)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-3)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

   Port shaping rate: disabled

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)         (units)
   ------------------------------------------------------
   7      - / -        - / -    (  -  )    SP / SP    D
   6      - / -        - / -    (  -  )    SP / SP    D
   5      - / -        - / -    (  -  )    SP / SP    D
   4      - / -        - / -    (  -  )    SP / SP    D
   3     24 / 30       - / -    (  -  )    RR / RR    D
   2     24 / 30       - / -    (  -  )    RR / SP    D
   1     24 / 30       - / -    (  -  )    RR / SP    D
   0     24 / 30       - / -    (  -  )    RR / SP    D

Note: Values are displayed as Operational/Configured

switch(config-if-Et3/5/1-txq-3)#
```

10.1.4.5 ACL Policing – Jericho Platform Switches

ACL Policing describes ACL policing.

Implementing ACL policing consists of configuring the following:

- **policy-map settings**.
- **class-name**.
- **committed information rate (CIR)** the data speed committed to any given circuit regardless of the number of users.
- **burst size** the maximum burst size in bytes the network commits to moving under normal conditions.

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad and Jericho only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default).
  - Violate-action (red): drop (default).

Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-class1)# match ip access-group acl1
switch(config-cmap-class1)# exit
switch(config)# policy-map type quality-of-service policy1
switch(config-policy1)# class class1
switch(config-policy1-class1)# police cir 512000 bc 96000
switch(config-policy1-class1)# exit
switch(config-policy1)# exit
switch(config)#
```

Displaying ACL Policing Information

Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)# show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
switch(config)#
```

- This command shows the interface-specific police counters for ***interface ethernet 1***.

```
switch(config)# show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386
 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

switch(config)#
```

- This command shows the counters associated with the policy map called ***p1***.

```
switch(config)# show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229

switch(config)#
```

- This command shows the QoS policy map for ***interface ethernet 1***.

```
switch(config)# show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

switch(config)#
```

10.1.5 QoS Configuration: FM6000 Platform Switches

Implementing QoS on an FM6000 platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- CoS and DSCP Port Settings – FM6000 Platform Switches
- Traffic Class Derivations – FM6000 Platform Switches
- CoS and DSCP Rewrite – FM6000 Platform Switches
- Transmit Queues and Port Shaping – FM6000 Platform Switches

10.1.5.1 CoS and DSCP Port Settings – FM6000 Platform Switches

Port Settings – Trust Mode and Traffic Class describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The qos trust command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **cos**. The port-trust default for routed ports is **dscp**.

- **`qos trust cos`** specifies **cos** as the port's port-trust mode.
- **`qos trust dscp`** specifies dscp as the port's port-trust mode.
- **`no qos trust`** specifies untrusted as the port's port-trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

These commands configure and display the following trust modes:

- ***Ethernet 15:*** **dscp**.
- ***Ethernet 16:*** **untrusted**.
- ***Ethernet 17:*** **cos**.
- ***Ethernet 18:*** **default** as a switched port.
- ***Ethernet 19:*** **default** as a routed port.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# qos trust dscp
switch(config-if-Et15)# interface ethernet 16
switch(config-if-Et16)# no qos trust
switch(config-if-Et16)# interface ethernet 17
switch(config-if-Et17)# qos trust cos
switch(config-if-Et17)# interface ethernet 18
switch(config-if-Et18)# switchport
```

```
switch(config-if-Et18)# default qos trust
switch(config-if-Et19)# interface ethernet 19
switch(config-if-Et19)# no switchport
switch(config-if-Et19)# default qos trust
switch(config-if-Et19)# show qos interface ethernet 15 - 19 trust
Port                                Trust Mode
                                Operational           Configured
-------------------------------------------------------------------
Ethernet15                      DSCP                  DSCP
Ethernet16                      UNTRUSTED             UNTRUSTED
Ethernet17                      COS                   COS
Ethernet18                      COS                   DEFAULT
Ethernet19                      DSCP                  DEFAULT

switch(config-if-Et19)#
```

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- qos cos configures a port's default CoS value.
- qos dscp configures a port's default DSCP value.

Example

These commands configure default CoS (***4***) and DSCP (***44***) settings on ***interface ethernet 19***.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# qos cos 4
switch(config-if-Et19)# qos dscp 44
switch(config-if-Et19)# show active
interface Ethernet19
   qos cos 4
   qos dscp 44
switch(config-if-Et19)# show qos interfaces ethernet 19
Ethernet19:
   Trust Mode: COS
   Default COS: 4
   Default DSCP: 44

switch(config-if-Et19)#
```

10.1.5.2 Traffic Class Derivations – FM6000 Platform Switches

Traffic Classes describes traffic classes.

Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

Table 16: Traffic Class Derivation Source: FM6000 Platform Switches

	Untrusted	CoS Trusted	DSCP Trusted
Untagged Non-IP	Default CoS (port)	Default CoS (port)	Default DSCP (port)
Untagged IP	Default CoS (port)	Default CoS (port)	DSCP (packet)
Tagged Non-IP	Default CoS (port)	CoS (packet)	Default DSCP (port)

Tagged IP	Default CoS (port)	CoS (packet)	DSCP (packet)

CoS and DSCP Port Settings – FM6000 Platform Switches describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

Example

This command assigns the traffic class of ***5*** to the classes of service ***1***, ***3***, ***5***, and ***7***.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
   Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     --------------------------
     tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS to Traffic Class map on FM6000 platform switches.

Table 17: Default CoS to Traffic Class Map: FM6000 Platform Switches

Inbound CoS	Untagged	0	1	2	3	4	5	6	7
Traffic Class	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

Example

This command assigns the traffic class of three to the DSCP values of ***12***, ***13***, ***25***, and ***37***.

```
switch(config)# qos map dscp 12 13 25 37 to traffic-class 3
switch(config)# show qos map
   Number of Traffic Classes supported: 8

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ---------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  3  3  0  0  2  2  2  2
      2 :     2  2  2  2  3  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  3  4  4
      4 :     5  5  5  5  5  5  5  5  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
```

```
       6 :      7   7   7   7

switch(config)#
```

The following displays the default DSCP to Traffic Class map on FM6000 platform switches.

Table 18: Default DSCP to Traffic Class Map: FM6000 Platform Switches

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

10.1.5.3 CoS and DSCP Rewrite – FM6000 Platform Switches

Rewriting CoS and DSCP describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The qos map traffic-class to cos command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

This command assigns the CoS rewrite value of two to traffic classes ***1***, ***3***, and ***5***.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
   Number of Traffic Classes supported: 8

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     --------------------------------
     tx-queue:   0  1  2  3  4  5  6  7

switch(config)#
```

The following table displays the default traffic class–CoS rewrite map on FM6000 platform switches.

Table 19: Default Traffic Class to CoS Rewrite Map: FM6000 Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The qos map traffic-class to dscp command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

Example

This command assigns the DSCP rewrite value of ***37*** to traffic classes ***2***, ***4***, and ***6***.

```
switch(config)# qos map traffic-class 2 4 6 to dscp 37
switch(config)# show qos map
   Number of Traffic Classes supported: 8
```

```
   Tc-dscp map:
     tc:    0  1  2  3  4  5  6  7
     ----------------------------
     dscp:  8  0 37 24 37 40 37 56

switch(config)#
```

The following table displays the default traffic class–DSCP rewrite map on on FM6000 platform switches.

Table 20: Default Traffic Class to DSCP Rewrite Map: FM6000 Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
DSCP Rewrite Value	8	0	16	24	32	40	48	56

10.1.5.4 Transmit Queues and Port Shaping – FM6000 Platform Switches

Transmit Queues and Port Shaping describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet and port channel interfaces and is used for unicast and multicast traffic. The show qos maps command displays the traffic class to transmit queue map.

The following table displays the default traffic class to transmit queue map on FM6000 platform switches.

Table 21: Default Traffic Class to Transmit Queue Map: FM6000 Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue	0	1	2	3	4	5	6	7

Mapping Traffic Classes to a Transmit Queue

The qos map traffic-class to tx-queue command assigns traffic classes to a transmit queue. Multiple commands create the complete map.

Example

These commands assign traffic classes of ***1***, ***3***, and ***5*** to ***transmit queue 1***, traffic classes ***2***, ***4***, and ***6*** to ***transmit queue 2***, and ***traffic class 0*** to ***transmit queue 0***, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     --------------------------------
     tx-queue:   0  1  2  1  2  1  2  7

switch(config)#
```

Entering TX-Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from interface ethernet configuration mode. The tx-queue (FM6000) command places the switch in tx-queue configuration mode. The show qos interfaces displays the transmit queue configuration for a specified port.

Example

This command enters tx-queue configuration mode for ***transmit queue 3*** of ***interface Ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
switch(config-if-Et5-txq-3)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

Note: Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in ***running-config***.

- To configure a port's shape rate, enter shape rate (Interface – FM6000) from the port's ***interface*** configuration mode.
- To configure a transmit queue's shape rate, enter shape rate (Tx-queue – FM6000) from the queue's ***tx-queue*** configuration mode.

Example

These commands configure a shape rate of ***5*** Gbs on ***interface Ethernet 3***, then configure the shape rate for the following transmit queues:

- • transmit queues ***0***, ***1***, and ***2***: ***500*** Mbps.
  • transmit queues ***3***, ***4***, and ***5***: ***400*** Mbps.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# shape rate 5000000
switch(config-if-Et3)# tx-queue 0
switch(config-if-Et3-txq-0)# shape rate 500000
switch(config-if-Et3-txq-0)# tx-queue 1
switch(config-if-Et3-txq-1)# shape rate 500000
switch(config-if-Et3-txq-1)# tx-queue 3
switch(config-if-Et3-txq-3)# shape rate 400000
switch(config-if-Et3-txq-3)# tx-queue 4
switch(config-if-Et3-txq-4)# shape rate 400000
switch(config-if-Et3-txq-4)# tx-queue 5
switch(config-if-Et3-txq-5)# shape rate 400000
switch(config-if-Et3-txq-5)# exit
switch(config-if-Et3)# show qos interface ethernet 3
Ethernet3:

   Port shaping rate: 5000000Kbps

   Tx-Queue    Bandwidth     Shape Rate      Priority
               (percent)        (Kbps)
   ---------------------------------------------
          7          N/A     disabled         strict
          6          N/A     disabled         strict
          5          N/A       400000         strict
          4          N/A       400000         strict
```

```
           3          N/A       400000        strict
           2          N/A     disabled        strict
           1          N/A       500000        strict
           0          N/A       500000        strict

switch(config-if-Et3)#
```

Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. The priority (FM6000) command configures a transmit queue's priority type:

- **`priority strict`** configures the queue as a strict priority queue.
- **`no priority`** configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The bandwidth percent (FM6000) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Examples

- These commands configure ***transmit queue 3*** (on ***interface Ethernet 19***) as a round robin queue, then allocates ***10%***, ***20%***, ***30%***, and ***40%*** bandwidth to queues ***0*** through ***3***.

  The **`no priority`** statement for ***queue 3*** also configures queues ***0***, ***1***, and ***2*** as round robin queues. Removing this statement reverts the other queues to **`strict priority`** type unless ***running-config*** contains a **`no priority`** statement for one of these queues.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# tx-queue 3
switch(config-if-Et19-txq-3)# no priority
switch(config-if-Et19-txq-3)# bandwidth percent 40
switch(config-if-Et19-txq-3)# tx-queue 2
switch(config-if-Et19-txq-2)# bandwidth percent 30
switch(config-if-Et19-txq-2)# tx-queue 1
switch(config-if-Et19-txq-1)# bandwidth percent 20
switch(config-if-Et19-txq-1)# tx-queue 0
switch(config-if-Et19-txq-0)# bandwidth percent 10
switch(config-if-Et19-txq-0)# show qos interface ethernet 19
Ethernet19:
   Port shaping rate: disabled

   Tx-Queue    Bandwidth     Shape Rate      Priority
               (percent)        (Kbps)
   ------------------------------------------------
          7          N/A     disabled         strict
          6          N/A     disabled         strict
          5          N/A     disabled         strict
          4          N/A     disabled         strict
          3           40     disabled    round-robin
          2           30     disabled    round-robin
          1           20     disabled    round-robin
          0           10     disabled    round-robin

switch(config-if-Et19-txq-0)#
```

- Changing the bandwidth percentage for queue ***3*** to ***60*** changes the operational bandwidth of each queue to its configured bandwidth divided by ***120%*** (10%+20%+30%+60%).

```
switch(config-if-Et19-txq-0) #tx-queue 3
switch(config-if-Et19-txq-3)# bandwidth percent 60
switch(config-if-Et19-txq-3)# show qos interface ethernet 19
Ethernet19:
   Port shaping rate: disabled

   Tx-Queue   Bandwidth    Shape Rate     Priority
              (percent)       (Kbps)
   ------------------------------------------------
          7         N/A     disabled        strict
          6         N/A     disabled        strict
          5         N/A     disabled        strict
          4         N/A     disabled        strict
          3          49     disabled   round-robin
          2          24     disabled   round-robin
          1          16     disabled   round-robin
          0           8     disabled   round-robin

switch(config-if-Et19-txq-3)#
```

10.1.6 QoS Configuration: Petra Platform Switches

Implementing QoS on a Petra platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- CoS and DSCP Port Settings – Petra Platform Switches
- Traffic Class Derivations – Petra Platform Switches
- CoS Rewrite – Petra Platform Switches
- Transmit Queues and Port Shaping – Petra Platform Switches

10.1.6.1 CoS and DSCP Port Settings – Petra Platform Switches

Port Settings – Trust Mode and Traffic Class describes port trust and default port CoS and DSCP values.

Configuring Port Trust Settings

The qos trust command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **cos**. The port-trust default for routed ports is **dscp**.

- **`qos trust cos`** specifies **cos** as the port's port-trust mode.
- **`qos trust dscp`** specifies dscp as the port's port-trust mode.
- **`no qos trust`** specifies untrusted as the port's port-trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

These commands configure and display the following trust modes:

- ***Ethernet 3/25:*** **dscp**.
- ***Ethernet 3/26:*** **untrusted**.
- ***Ethernet 3/27:*** **cos**.
- ***Ethernet 3/28:*** **default** as a switched port.

- ***Ethernet 3/29:*** **default** as a routed port.

```
switch(config)# interface ethernet 3/25
switch(config-if-Et3/25)# qos trust dscp
switch(config-if-Et3/25)# interface ethernet 3/26
switch(config-if-Et3/26)# no qos trust
switch(config-if-Et3/26)# interface ethernet 3/27
switch(config-if-Et3/27)# qos trust cos
switch(config-if-Et3/27)# interface ethernet 3/28
switch(config-if-Et3/28)# switchport
switch(config-if-Et3/28)# default qos trust
switch(config-if-Et3/28)# interface ethernet 3/29
switch(config-if-Et3/29)# no switchport
switch(config-if-Et3/29)# default qos trust
switch(config-if-Et3/29)# show qos interface ethernet 3/25 - 3/29 trust
Port                                    Trust Mode
                                Operational           Configured
-------------------------------------------------------------------
Ethernet3/25                    DSCP                  DSCP

Ethernet3/27                    COS                   COS
Ethernet3/28                    COS                   DEFAULT
Ethernet3/29                    DSCP                  DEFAULT

switch(config-if-Et3/29)#
```

Configuring Default Port Settings

Port channel and Ethernet interfaces are not assigned default CoS or DSCP settings.

10.1.6.2 Traffic Class Derivations – Petra Platform Switches

Traffic Classes describes traffic classes.

Traffic Class Derivation Source

The following table displays the source for deriving a data stream's default traffic class.

Table 22: Traffic Class Derivation Source: Petra Platform Switches

	Untrusted	CoS Trusted	DSCP Trusted
Untagged Non-IP	Default TC (chip)	Default TC (chip)	Default TC (chip)
Untagged IP	Default TC (chip)	Default TC (chip)	DSCP (packet)
Tagged Non-I	Default TC (chip)	CoS (packet)	Default TC (chip)
Tagged IP	Default TC (chip)	CoS (packet)	DSCP (packet)

Configuring Default Traffic Class

Petra platform switches assign a default traffic class to the set of Ethernet interfaces controlled by individual PetraA chips. Default traffic class values are configurable for each PetraA chip, not individual interfaces.

The platform petraA traffic-class command specifies the default traffic class used by all ports controlled by a specified chip. The show platform petraA traffic-class command displays traffic class assignments.

Examples

- This command configures the default traffic class to five for the ports ***32-39*** on ***linecard 3*** (7500 Series).

```
switch(config)# platform petraA petra3/4 traffic-class 5
switch(config)# show platform petraA module 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1
switch(config)#
```

- This command configures the default traffic class to three for all ports on ***linecard 6*** (7500 Series).

```
switch(config)# platform petraA module 6 traffic-class 6
switch(config)# show platform petraA module 6 traffic-class
Petra6/0 traffic-class: 6
Petra6/1 traffic-class: 6
Petra6/2 traffic-class: 6
Petra6/3 traffic-class: 6
Petra6/4 traffic-class: 6
Petra6/5 traffic-class: 6
switch(config)#
```

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS–traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

Example

This command assigns ***traffic class 4*** to the classes of service ***1***, ***3***, ***5***, and ***7***.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 4
switch(config)#show qos maps
   Number of Traffic Classes supported: 8

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ---------------------------
     tc:   1  4  2  4  4  4  6  4

switch(config)#
```

The following table displays the default CoS to traffic class map on Petra platform switches.

Table 23: Default CoS to Traffic Class Map: Petra Platform Switches

Inbound CoS	untagged	0	1	2	3	4	5	6	7
Traffic Class	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

Example

This command assigns ***traffic class 3*** to the DSCP values of ***12***, ***13***, ***25***, and ***37***.

```
switch(config)# qos map dscp 12 13 14 25 48 to traffic-class 3
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ----------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  3  3  3  0  2  2  2  2
      2 :     2  2  2  2  3  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  5  5  5  5  5  5  5  3  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

switch(config)#
```

The following table displays the default DSCP to Traffic Class map on Petra platform switches.

Table 24: Default DSCP to Traffic Class Map: Petra Platform Switches

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

10.1.6.3 CoS Rewrite – Petra Platform Switches

Rewriting CoS and DSCP describes the CoS rewrite function.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The qos map traffic-class to cos command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.

Example

This command assigns the CoS of two to traffic classes ***1***, ***3***, and ***5***.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
   Number of Traffic Classes supported: 8

   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ---------------------------
     cos:  1  2  2  2  4  2  6  7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Petra platform switches.

Table 25: Default Traffic Class to CoS Rewrite Value Map: Petra Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Petra platform switches.

10.1.6.4 Transmit Queues and Port Shaping – Petra Platform Switches

Transmit Queues and Port Shaping describes transmit queues and port shaping.

Petra platform switches provide four physical queues for each egress port: Unicast High, Unicast Low, Multicast High, and Multicast Low. Data is scheduled for the high or low queue based on its priority as defined by its transmit queue assignment (unicast traffic) or traffic class (multicast traffic), as shown in the table below. A Petra transmit queue is a data structure that defines scheduling of unicast traffic among phyical egress queues.

Table 26: Traffic Distribution to Egress Port Queues

	High Priority Queue	**Low Priority Queue**
Unicast Traffic	Transmit Queues 5 – 7	Transmit Queues 0 – 4
Multicast Traffic	Traffic Classes 5 – 7	Traffic Classes 0 – 4

Multicast queue capacity that is available after multicast traffic is serviced is used for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that is available after unicast traffic is serviced is used for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

Unicast Transmit Queues and Port Shaping describes unicast transmit queues and shaping. Multicast Egress Scheduling describes multicast priority and traffic classes.

10.1.6.4.1 Unicast Transmit Queues and Port Shaping

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast traffic on all Ethernet interfaces. The show qos maps command displays the traffic class–transmit queue map. The following table displays the default traffic class to transmit queue map on Petra platform switches.

Table 27: Default Traffic Class to Transmit Queue Map: Petra Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue	0	1	2	3	4	5	6	7

Transmit queue parameters are configured in tx-queue configuration command mode.

Mapping Traffic Classes to a Transmit Queue

The qos map traffic-class to tx-queue command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class ***7*** and transmit queue ***7*** are always mapped to each other. This association is not editable.

Example

These commands assign traffic classes of ***1***, ***3***, and ***5*** to ***transmit queue 1***, traffic classes ***2***, ***4***, and ***6*** to ***transmit queue 2***, and ***traffic class 0*** to ***transmit queue 0***, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     --------------------------------
     tx-queue:   0  1  2  1  2  1  2  7

switch(config)#
```

Entering Tx-Queue Configuration Mode

The tx-queue (Petra) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. ***Tx-queue 7*** not configurable. The show qos interfaces displays the transmit queue configuration for a specified port.

Example

This command enters tx-queue configuration mode for ***transmit queue 3*** of ***interface ethernet 3/28***.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# tx-queue 3
switch(config-if-Et3/28-txq-3)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter shape rate (Interface – Petra) from the port's ***interface*** configuration mode.
- To configure a transmit queue's shape rate, enter shape rate (Tx-queue – Petra) from the queue's ***tx-queue*** configuration mode.

Example

These commands configure a shape rate of ***5*** Gbs on ***interface Ethernet 3***, then configure the shape rate for the following transmit queues:

- transmit queues ***0***, ***1***, and ***2***: ***500*** Mbps
- transmit queues ***3***, ***4***, and ***5***: ***400*** Mbps

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# shape rate 5000000
switch(config-if-Et3/28)# tx-queue 0
switch(config-if-Et3/28-txq-0)# shape rate 500000
switch(config-if-Et3/28-txq-0)# tx-queue 1
switch(config-if-Et3/28-txq-1)# shape rate 500000
switch(config-if-Et3/28-txq-1)# tx-queue 2
switch(config-if-Et3/28-txq-2)# shape rate 500000
switch(config-if-Et3/28-txq-5)# tx-queue 3
switch(config-if-Et3/28-txq-3)# shape rate 400000
switch(config-if-Et3/28-txq-3)# tx-queue 4
```

```
switch(config-if-Et3/28-txq-4)# shape rate 400000
switch(config-if-Et3/28-txq-4)# tx-queue 5
switch(config-if-Et3/28-txq-5)# shape rate 400000
switch(config-if-Et3/28-txq-5)# show qos interface ethernet 3/28
Ethernet3/28:

   Port shaping rate: 5000000Kbps

   Tx-Queue   Bandwidth    Shape Rate     Priority
              (percent)       (Kbps)
   ---------------------------------------------
          7         N/A     disabled       strict
          6         N/A     disabled       strict
          5         N/A       400000       strict
          4         N/A       400000       strict
          3         N/A       400000       strict
          2         N/A       500000       strict
          1         N/A       500000       strict
          0         N/A       500000       strict

switch(config-if-Et3/28-txq-5)#
```

Configuring Queue Priority

The priority (Petra) command configures a transmit queue's priority type:

- The **`priority strict`** command configures the queue as a strict priority queue.
- The **`no priority`** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The bandwidth percent (Petra) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Examples

- These commands configure ***transmit queue 3*** (on ***interface Ethernet 3/28***) as a round robin queue, then allocates ***10%***, ***20%***, ***30%***, and ***40%*** bandwidth to queues ***0*** through ***3***.

  The **`no priority`** statement for ***queue 3*** also configures queues ***0***, ***1***, and ***2*** as round robin queues. Removing this statement reverts the other queues to **`strict priority`** type unless ***running-config*** contains a **`no priority`** statement for one of these queues.

```
switch(config-if-Et3/28)# tx-queue 3
switch(config-if-Et3/28-txq-3)# no priority
switch(config-if-Et3/28-txq-3)# bandwidth percent 40
switch(config-if-Et3/28-txq-3)# tx-queue 2
switch(config-if-Et3/28-txq-2)# bandwidth percent 30
switch(config-if-Et3/28-txq-2)# tx-queue 1
switch(config-if-Et3/28-txq-1)# bandwidth percent 20
switch(config-if-Et3/28-txq-1)# tx-queue 0
switch(config-if-Et3/28-txq-0)# bandwidth percent 10
switch(config-if-Et3/28-txq-0)# show qos interface ethernet 3/28
Ethernet3/28:

   Port shaping rate: 5000000Kbps

   Tx-Queue   Bandwidth    Shape Rate     Priority
              (percent)       (Kbps)
   ---------------------------------------------
```

```
           7          N/A     disabled         strict
           6          N/A     disabled         strict
           5          N/A       400000         strict
           4          N/A       400000         strict
           3           40       400000    round-robin
           2           30       500000    round-robin
           1           20       500000    round-robin
           0           10       500000    round-robin

switch(config-if-Et3/28-txq-0)#
```

- Changing the bandwidth percentage for queue ***3*** to ***60*** changes the operational bandwidth of each queue to its configured bandwidth divided by ***120%*** (10%+20%+30%+60%).

```
switch(config-if-Et3/28-txq-0)# tx-queue 3
switch(config-if-Et3/28-txq-3)# bandwidth percent 60
switch(config-if-Et3/28-txq-3)# show qos interface ethernet 3/28
Ethernet3/28:

   Port shaping rate: 5000000Kbps

   Tx-Queue    Bandwidth     Shape Rate      Priority
               (percent)        (Kbps)
   ---------------------------------------------------
           7          N/A     disabled         strict
           6          N/A     disabled         strict
           5          N/A       400000         strict
           4          N/A       400000         strict
           3           49       400000    round-robin
           2           24       500000    round-robin
           1           16       500000    round-robin
           0            8       500000    round-robin
switch(config-if-Et3/28-txq-3)#
```

10.1.6.4.2 Multicast Egress Scheduling

Multiclass traffic is not affected by traffic class assignment or port shaping statements. Multicast traffic is assigned to port egress queues based on traffic class and uses strict priority to schedule egress between the high and low queues.

10.1.7 QoS Configuration: Trident and Tomahawk Platform Switches

Implementing QoS on a Trident and Tomahawk platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches
- Traffic Class Derivations – Trident and Tomahawk Platform Switches
- CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches
- Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches
- ECN Configuration – Trident and Tomahawk Platform Switches

10.1.7.1 CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches

Configuring Port Trust Settings

The qos trust command configures the QoS port trust mode for the configuration mode interface. Trust-enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- **`qos trust cos`** specifies **CoS** as the port's trust mode.

- **`qos trust dscp`** specifies **DSCP** as the port's trust mode.
- **`no qos trust`** specifies **untrusted** as the port's trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

- These commands configure and display the following trust modes:
  - ***Ethernet 15***: **dscp**
  - ***Ethernet 16***: **untrusted**
  - ***Ethernet 17***: **cos**
  - ***Ethernet 18***: **default** as a switched port
  - ***interface ethernet 19***: **default** as a routed port

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# qos trust dscp
switch(config-if-Et15)# interface ethernet 16
switch(config-if-Et16)# no qos trust
switch(config-if-Et16)# interface ethernet 17
switch(config-if-Et17)# qos trust cos
switch(config-if-Et17)# interface ethernet 18
switch(config-if-Et18)# switchport
switch(config-if-Et18)# default qos trust
switch(config-if-Et18)# interface ethernet 19
switch(config-if-Et19)# no switchport
switch(config-if-Et19)# default qos trust
switch(config-if-Et19)# show qos interface ethernet 15 - 19 trust
Port                                Trust Mode
                                    Operational           Configured
-------------------------------------------------------------------
Ethernet15                          DSCP                  DSCP
Ethernet16                          UNTRUSTED             UNTRUSTED
Ethernet17                          COS                   COS
Ethernet18                          COS                   DEFAULT
Ethernet19                          DSCP                  DEFAULT

switch(config-if-Et19)#
```

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- qos cos configures a port's default CoS value.
- qos dscp configures a port's default DSCP value.

Example

These commands configure default CoS (***4***) and DSCP (***44***) values on ***interface ethernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# qos cos 4
switch(config-if-Et7)# qos dscp 44
switch(config-if-Et7)# show active
interface Ethernet7
   qos cos 4
   qos dscp 44
switch(config-if-Et7)# show qos interfaces ethernet 7
Ethernet7:
   Trust Mode: COS
   Default COS: 4
```

```
   Default DSCP: 44

switch(config-if-Et7)#
```

10.1.7.2 Traffic Class Derivations – Trident and Tomahawk Platform Switches

Traffic Classes describes traffic classes.

Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

Table 28: Traffic Class Derivation Source: Trident and Tomahawk Platform Switches

	Untrusted	CoS Trusted	DSCP Trusted
Untagged Non-IP	Default CoS (port)	Default CoS (port)	Default DSCP (port)
Untagged IP	Default CoS (port)	Default CoS (port)	DSCP (packet)
Tagged Non-IP	Default CoS (port)	CoS (packet)	Default DSCP (port)
Tagged IP	Default CoS (port)	CoS (packet)	DSCP (packet)

CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

Example

This command assigns the ***traffic class 5*** to the classes of service ***1***, ***3***, ***5***, and ***7***.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ----------------------------
     tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS–traffic class map on Trident and Tomahawk platform switches.

Table 29: Default CoS to Traffic Class Map: Trident II Platform Switches

Inboun CoS	0	1	2	3	4	5	6	7
Traffic Class	1	0	2	3	4	5	6	7

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

Example

This command assigns the ***traffic class 0*** to DSCP values of ***12***, ***24***, ***41***, and ***44-47***.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ----------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
      2 :     2  2  2  2  0  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  0  5  5  0  0  0  0  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

switch(config)#
```

The following table displays the default DSCP–traffic class map on Trident and Tomahawk platform switches.

Table 30: Default DSCP to Traffic Class Map: Trident and Tomahawk Platform Switches

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

10.1.7.3 CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches

Rewriting CoS and DSCP describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The qos map traffic-class to cos command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

This command assigns the ***CoS 2*** to traffic classes ***1***, ***3***, and ***5***.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
   Number of Traffic Classes supported: 8

   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ---------------------------
     cos:  1  2  2  2  4  2  6  7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Trident and Tomahawk platform switches.

Table 31: Default Traffic Class to CoS Rewrite Value Map: Trident and Tomahawk Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The qos map traffic-class to dscp command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

Example

This command assigns the DSCP value of ***29*** to traffic classes ***2***, ***4***, and ***6***.

```
switch(config)#qos map traffic-class 2 4 6 to dscp 29
switch(config)#show qos map
   Number of Traffic Classes supported: 8

   Tc-dscp map:
     tc:    0  1  2  3  4  5  6  7
     ---------------------------
     dscp:  8  0 29 24 29 40 29 56

switch(config)#
```

The following displays the default traffic class to DSCP rewrite map on Trident and Tomahawk platform switches.

Table 32: Traffic Class to DSCP Rewrite Value Map: Trident and Tomahawk Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
DSCP	8	0	16	24	32	40	48	56

10.1.7.4 Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches

Transmit Queues and Port Shaping describes transmit queues and port shaping.

Trident and Tomahawk platform switches define ***12*** transmit queues: eight unicast (UC0 – UC7) and four multicast (MC0 – MC03). The traffic class–transmit queue maps are configured globally and apply to all Ethernet interfaces. The show qos maps command displays the traffic class–transmit queue maps.

The following table displays the default traffic class–transmit queue maps.

Table 33: Default Traffic Class to Transmit Queue Map: Trident and Tomahawk Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
Unicast Transmit Queue	0	1	2	3	4	5	6	7

Multicast Transmit Queue	0	0	1	1	2	2	3	3

Mapping Traffic Classes to a Transmit Queue

These commands assign traffic classes to a transmit queue:

- qos map traffic-class to uc-tx-queue associates a unicast queue to a traffic class set.
- qos map traffic-class to mc-tx-queue associates a multicast queue to a traffic class set.

Multiple commands create the complete maps.

Example

These commands assign the following on ***interface ethernet 7***:

- traffic classes ***1***, ***3***, and ***5*** to ***unicast queue 1***
- traffic classes ***2***, ***4***, and ***6*** to ***unicast queue 5***
- traffic classes ***1***, ***2***, and ***3*** to ***multicast queue 1***
- traffic classes ***4***, ***5***, and ***6*** to ***multicast queue 3***
- ***traffic class 0*** to ***unicast queue 0*** and ***multicast queue 0***

```
switch(config)# default interface ethernet 7
switch(config)# qos map traffic-class 1 3 5 to uc-tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to uc-tx-queue 5
switch(config)# qos map traffic-class 1 2 3 to mc-tx-queue 1
switch(config)# qos map traffic-class 4 5 6 to mc-tx-queue 3
switch(config)# qos map traffic-class 0 to uc-tx-queue 0
switch(config)# qos map traffic-class 0 to mc-tx-queue 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 12

   Tc - uc-tx-queue map:
     tc:           0  1  2  3  4  5  6  7
     ---------------------------------
     uc-tx-queue:  0  1  5  1  5  1  5  7

   Tc - mc-tx-queue map:
     tc:           0  1  2  3  4  5  6  7
     ---------------------------------
     mc-tx-queue:  0  1  1  1  3  3  3  3

switch(config)#
```

Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on individual Ethernet ports. Parameters for individual transmit queues are configured in one of two transmit queue configuration modes. Transmit queue modes are accessed from an interface-ethernet configuration mode.

- uc-tx-queue places the switch in ***uc-tx-queue*** mode to configure a unicast transmit queue.
- mc-tx-queue places the switch in ***mc-tx-queue*** mode to configure a multicast transmit queue.

The show qos interfaces displays the transmit queue configuration for a specified port.

Examples

- This command enters the mode that configures ***unicast transmit queue 3*** of ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# uc-tx-queue 3
```

```
switch(config-if-Et5-uc-txq-3)#
```

- This command enters the mode to configure ***multicast transmit queue 3*** of ***interface ethernet 5***.

```
switch(config-if-Et5)# mc-tx-queue 2
switch(config-if-Et5-mc-txq-2)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies the port's maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port's shape rate, enter shape rate (Interface – Trident and Tomahawk) from the port's ***interface*** configuration mode.
- To configure a transmit queue's shape rate, enter shape rate (Tx-queue – Trident and Tomahawk) from the queue's ***tx-queue*** configuration mode.

Example

These commands configure a shape rate of ***5*** Gbs on ***interface Ethernet 7***, then configure the shape rate for the following transmit queues:

- unicast transmit queues ***0*** and ***1***: ***500*** Mbps.
- unicast transmit queues ***3*** and ***4***: ***400*** Mbps.
- multicast transmit queues ***0*** and *2*: ***300*** Mbps.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# shape rate 5000000
switch(config-if-Et7)# uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)# shape rate 500000
switch(config-if-Et7-uc-txq-0)# uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)# shape rate 500000
switch(config-if-Et7-uc-txq-1)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# shape rate 400000
switch(config-if-Et7-uc-txq-3)# uc-tx-queue 5
switch(config-if-Et7-uc-txq-5)# shape rate 400000
switch(config-if-Et7-uc-txq-5)# mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)# shape rate 300000
switch(config-if-Et7-mc-txq-0)# mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)# shape rate 300000
switch(config-if-Et7-mc-txq-2)# exit
switch(config-if-Et7)# show qos interface ethernet 7
Ethernet7:

   Port shaping rate: 5000000Kbps

        UC2          N/A     disabled        strict                0
        MC1          N/A     disabled        strict                0
        UC1          N/A       500000        strict                0
        UC0          N/A       500000        strict                0
        MC0          N/A       300000        strict                0
```

```
switch(config-if-Et7)#
```

Configuring Queue Priority

Trident and Tomahawk platform switch queues are categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The priority (Trident and Tomahawk) command configures a transmit queue's priority type:

- The **`priority strict`** command configures the queue as a strict priority queue.
- The **`no priority`** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The bandwidth percent (Trident and Tomahawk) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Priority Group 1 queues (UC7, UC6, MC3) are not configurable as round robin queues. The **`bandwidth percent`** command is not available for these queues.

Examples

- These commands configure ***unicast transmit queue 3*** as a round robin queue, then allocates ***5%***, ***15%***, ***25%***, ***35%***, ***8%***, and ***12%*** bandwidth to unicast transmit queues ***0*** through ***3*** and multicast transmit queues ***0*** and ***1***, respectively.

  The **`no priority`** statement for ***queue 3*** also configures priority for all lower priority queues. Removing the statement reverts the other queues to **`strict priority`** type unless ***running-config*** contains a **`no priority`** statement for one of these queues.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# no priority
switch(config-if-Et7-uc-txq-3)# bandwidth percent 5
switch(config-if-Et7-uc-txq-3)# uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)# bandwidth percent 15
switch(config-if-Et7-uc-txq-2)# uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)# bandwidth percent 25
switch(config-if-Et7-uc-txq-1)# uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)# bandwidth percent 35
switch(config-if-Et7-uc-txq-0)# mc-tx-queue 1
switch(config-if-Et7-mc-txq-1)# bandwidth percent 12
switch(config-if-Et7-mc-txq-1)# mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)# bandwidth percent 8
switch(config-if-Et7-mc-txq-0)# show qos interface ethernet 7
Ethernet7:

   Port shaping rate: disabled

        MC0            6     disabled    round-robin                 0

switch(config-if-Et7-uc-txq-3)#
```

10.1.7.5 ECN Configuration – Trident and Tomahawk Platform Switches

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. ECN is also globally configurable to mark packets from the shared pool used for dynamically allocating memory to the queues. Multicast packets contribute to the globally shared pool and can contribute to global level congestion that result in ECN marking of unicast packets queued after the multicast packets.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues (including the global shared pool) that can simultaneously implement ECN.

The qos random-detect ecn global-buffer (Trident and Tomahawk) command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes.

Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at ***20*** and ***500*** segments.

```
switch(config)# qos random-detect ecn global-buffer minimum-threshold
 20 segments
maximum-threshold 500 segments
switch(config)#
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)# no qos random-detect ecn global-buffer
switch(config)#
```

The random-detect ecn (Trident and Tomahawk) command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

- These commands enable ECN marking of unicast packets from ***transmit queue 4*** of ***interface Ethernet 15***, setting thresholds at ***10*** and ***100*** segments.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)# random-detect ecn minimum-threshold 10
 segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)# show active
interface Ethernet15
   uc-tx-queue 4
      random-detect ecn minimum-threshold 10 segments maximum-threshold
 100
segments
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15)#
```

- This command disables ECN marking of unicast packets from ***transmit queue 4*** of ***interface Ethernet 15***.

```
switch(config-if-Et15-uc-txq-4)# no random-detect ecn
switch(config-if-Et15-uc-txq-4)# show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15)#
```

10.1.8 QoS Configuration: Trident II and Helix Platform Switches

Implementing QoS on a Trident platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- CoS and DSCP Port Settings – Trident II and Helix Platform Switches
- Traffic Class Derivations – Trident II and Helix Platform Switches
- CoS and DSCP Rewrite – Trident II and Helix Platform Switches
- Transmit Queues and Port Shaping – Trident II and Helix Platform Switches
- Ingress Policing on LAG
- Fabric QoS -- – Trident II Platform Switches

10.1.8.1 CoS and DSCP Port Settings – Trident II and Helix Platform Switches

Configuring Port Trust Settings

The qos trust command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is ***cos***. The port-trust default for routed ports is ***dscp***.

- **`qos trust cos`** specifies ***cos*** as the port's port-trust mode.
- **`qos trust dscp`** specifies ***dscp*** as the port's port-trust mode.
- **`no qos trust`** specifies ***untrusted*** as the port's port-trust mode.

The show qos interfaces trust command displays the trust mode of specified interfaces.

Example

These commands configure and display the following trust modes:

- ***Ethernet 7/1***: **dscp**.
- ***Ethernet 7/2***: **untrusted**.
- ***Ethernet 7/3***: **cos**.
- ***Ethernet 7/4***: **default** as a switched port.
- ***Ethernet 8/1***: **default** as a routed port.
-

```
switch(config)# interface ethernet 7/1
switch(config-if-Et7/1)# qos trust dscp
switch(config-if-Et7/1)# interface ethernet 7/2
switch(config-if-Et7/2)# no qos trust
switch(config-if-Et7/2)# interface ethernet 7/3
switch(config-if-Et7/3)# qos trust cos
switch(config-if-Et7/3)# interface ethernet 7/4
switch(config-if-Et7/4)# switchport
switch(config-if-Et7/4)# default qos trust
switch(config-if-Et7/4)# interface ethernet 8/1
switch(config-if-Et8/1)# no switchport
switch(config-if-Et8/1)# default qos trust
switch(config-if-Et8/1)# show qos interface ethernet 7/1 - 8/1 trust

Port                                    Trust Mode
                                Operational           Configured
-------------------------------------------------------------------
Ethernet7/1                     DSCP                  DSCP
Ethernet7/2                     UNTRUSTED             UNTRUSTED
Ethernet7/3                     COS                   COS
Ethernet7/4                     COS                   DEFAULT
Ethernet8/1                     DSCP                  DEFAULT

switch(config-if-Et8/1)#
```

Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- qos cos configures a port's default CoS value.
- qos dscp configures a port's default DSCP value.

Example

These commands configure default ***CoS 4*** and ***DSCP 44*** values on ***interface ethernet 7/3***.

```
switch(config)# interface ethernet 7/3
```

```
switch(config-if-Et7/3)# qos cos 4
switch(config-if-Et7/3)# qos dscp 44
switch(config-if-Et7/3)# show active

interface Ethernet7/3
   qos cos 4
   qos dscp 44

switch(config-if-Et7/3)# show qos interfaces ethernet 7/3

Ethernet7/3:
   Trust Mode: COS
   Default COS: 4
   Default DSCP: 44

switch(config-if-Et7/3)#
```

10.1.8.2 Traffic Class Derivations – Trident II and Helix Platform Switches

Traffic Classes describes traffic classes.

Note: Qos traffic policy is supported on Trident II platform switches.

Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

Table 34: Traffic Class Derivation Source: Trident II Platform Switches

	Untrusted	CoS Trusted	DSCP Trusted
Untagged Non-IP	Default CoS (port)	Default CoS (port)	Default DSCP (port)
Untagged IP	Default CoS (port)	Default CoS (port)	DSCP (packet)
Tagged Non-IP	Default CoS (port)	CoS (packet)	Default DSCP (port)
Tagged IP	Default CoS (port)	CoS (packet)	DSCP (packet)

CoS and DSCP Port Settings – Trident II and Helix Platform Switches describes the default CoS and DSCP settings for each port.

Mapping CoS to Traffic Class

The qos map cos command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

Example

This command assigns the ***traffic class 5*** to the classes of service ***1***, ***3***, ***5***, and ***7***.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ----------------------------
     tc:   1  5  2  5  4  5  6  5
```

```
switch(config)#
```

The following table displays the default CoS–traffic class map on Trident II platform switches.

Table 35: Default CoS to Traffic Class Map: Trident II Platform Switches

Inbound CoS	0	1	2	3	4	5	6	7
Traffic Class	1	0	2	3	4	5	6	7

Mapping DSCP to Traffic Class

The qos map dscp command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

Example

This command assigns the *traffic class 0* to DSCP values of ***12***, ***24***, ***41***, and ***44-47***.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ----------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
      2 :     2  2  2  2  0  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  0  5  5  0  0  0  0  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

switch(config)#
```

The following table displays the default DSCP–traffic class map on Trident II platform switches.

Table 36: Default DSCP to Traffic Class Map: Trident II Platform Switches

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

10.1.8.3 CoS and DSCP Rewrite – Trident II and Helix Platform Switches

Rewriting CoS and DSCP describes the CoS and DSCP rewrite functions.

Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The qos map traffic-class to cos command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

Example

This command assigns the CoS of two to traffic classes ***1***, ***3***, and ***5***.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map

   Number of Traffic Classes supported: 8

   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     --------------------------
     cos:  1  2  2  2  4  2  6  7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Trident II platform switches.

Table 37: Default Traffic Class to CoS Rewrite Value Map: Trident II Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The qos map traffic-class to dscp command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

Example

This command assigns the DSCP value of ***29*** to traffic classes ***2***, ***4***, and ***6***.

```
switch(config)# qos map traffic-class 2 4 6 to dscp 29
switch(config)# show qos map

   Number of Traffic Classes supported: 8

   Tc-dscp map:
     tc:    0  1  2  3  4  5  6  7
     ----------------------------
     dscp:  8  0 29 24 29 40 29 56

switch(config)#
```

The following table displays the default traffic class to DSCP rewrite map on Trident II platform switches.

Table 38: Traffic Class to DSCP Rewrite Value Map: Trident II Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
DSCP	8	0	16	24	32	40	48	56

10.1.8.4 Transmit Queues and Port Shaping – Trident II and Helix Platform Switches

Transmit Queues and Port Shaping describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet interfaces and is used for unicast and multicast traffic. The traffic class to transmit queue maps are configured globally and apply to all Ethernet and port channel interfaces. The show qos maps command displays the traffic class to transmit queue map.

Trident II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The following table displays the default traffic class to transmit queue maps.

Table 39: Default Traffic Class to Transmit Queue Map: Trident II Platform Switches

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue Group	0	1	2	3	4	5	6	7

Mapping Traffic Classes to a Transmit Queue

The qos map traffic-class to tx-queue command assigns traffic classes to a transmit queue. Multiple commands create the complete map.

Example

These commands assign traffic classes of ***1***, ***3***, and ***5*** to ***transmit queue 1***, traffic classes ***2***, ***4***, and ***6*** to ***transmit queue 2***, and ***traffic class 0*** to ***transmit queue 0***, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
   Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     --------------------------------
     tx-queue:   0  1  2  1  2  1  2  7

switch(config)#
```

Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from the appropriate interface configuration mode. The tx-queue (Trident II) command places the switch in tx-queue configuration mode. The show qos interfaces displays the transmit queue configuration for a specified port.

Example

This command enters tx-queue configuration mode for ***transmit queue 3*** of ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
switch(config-if-Et5-txq-3)#
```

Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies the port's maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port's shape rate, enter shape rate (Interface – Trident II) from the port's ***interface*** configuration mode.
- To configure a transmit queue's shape rate, enter shape rate (Tx-queue – Trident II) from the queue's ***tx-queue*** configuration mode.

Example

These commands configure a shape rate of ***5*** Gbs on ***interface Ethernet 3***, then configure the shape rate for the following transmit queues:

- - transmit queues ***0***, ***1***, and ***2***: ***500*** Mbps
  - transmit queues ***3***, ***4***, and ***5***: ***400*** Mbps

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# shape rate 5000000
switch(config-if-Et17/3)# tx-queue 0
switch(config-if-Et17/3-txq-0)# shape rate 500000
switch(config-if-Et17/3-txq-0)# tx-queue 1
switch(config-if-Et17/3-txq-1)# shape rate 500000
switch(config-if-Et17/3-txq-1)# tx-queue 3
switch(config-if-Et17/3-txq-3)# shape rate 400000
switch(config-if-Et17/3-txq-3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# shape rate 400000
switch(config-if-Et17/3-txq-4)# tx-queue 5
switch(config-if-Et17/3-txq-5)# shape rate 400000
switch(config-if-Et17/3-txq-5)# exit
switch(config-if-Et17/3)# show qos interface ethernet 17/3
Ethernet17/3:

  Tx       Bandwidth                  Shape Rate         Priority
 Queue     Guaranteed (units)          (units)
   ---------------------------------------------------------------
   7        - / -    (  -  )       - / -    (  -  )     SP / SP
   6        - / -    (  -  )       - / -    (  -  )     SP / SP
   5        - / -    (  -  )     400 / 400  ( Mbps )    SP / SP
   4        - / -    (  -  )     400 / 400  ( Mbps )    SP / SP
   3        - / -    (  -  )     400 / 400  ( Mbps )    SP / SP
   2        - / -    (  -  )       - / -    (  -  )     SP / SP
   1        - / -    (  -  )     500 / 500  ( Mbps )    SP / SP
   0        - / -    (  -  )     500 / 500  ( Mbps )    SP / SP

switch(config-if-Et17/3)#
```

Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. Trident II supports strict priority queues; round robin queues are not supported.

The bandwidth guaranteed (Trident II) command configures specifies the minimum bandwidth for outbound traffic on the transmit queue.

Example

These commands configure a minimum egress bandwidth of ***1*** Mbps for ***transmit queue 4*** on ***interface ethernet 17/3***.

```
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# show qos interface ethernet 17/3

  Tx       Bandwidth                  Shape Rate         Priority
 Queue     Guaranteed (units)          (units)
   ---------------------------------------------------------------
```

```
    7         - / -     (  -  )        - / -     (  -  )     SP / SP
    6         - / -     (  -  )        - / -     (  -  )     SP / SP
    5         - / -     (  -  )      400 / 400   ( Mbps )    SP / SP
    4         1 / 1     ( Mbps )     400 / 400   ( Mbps )    SP / SP
    3         - / -     (  -  )      400 / 400   ( Mbps )    SP / SP
    2         - / -     (  -  )        - / -     (  -  )     SP / SP
    1         - / -     (  -  )      500 / 500   ( Mbps )    SP / SP
    0         - / -     (  -  )      500 / 500   ( Mbps )    SP / SP

switch(config-if-Et17/3-txq-4)#
```

10.1.8.5 Ingress Policing on LAG

Ingress policing on a port-channel polices the matched traffic from all member interfaces combined, i.e. it provides aggregate policing and statistics (DCS-7050X, DCS-7010T, DCS-7250X, and DCS-7300X series). When a per-interface policer is attached to a port-channel, one set of TCAM entries is created for all member interfaces. The associated interface bitmap is updated, and aggregate policing is performed on all member interfaces.

Examples

- These commands configure a service-policy (with policer action) on LAG by creating the service-policy and applying the service-policy on a port-channel.

```
switch(config)# policy-map policy-1
switch(config-pmap-qos-policy-1)# class class-1
switch(config-pmap-c-qos-policy-1-class-1)# police cir 512000 bps bc
 96000
switch(config-pmap-c-qos-policy-1-class-1)# exit
switch(config-pmap-qos-policy-1)# exit
switch(config)# interface Et 4 / 5 / 4
switch(config-if-Et4/5/4)# channel-group 2 mode active
switch(config-if-Et4/5/4)# exit
switch(config)# interface po2
switch(config-if-Po2)# service-policy type qos input policy-1
switch(config-if-Po2)# exit
switch(config)#
```

- These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-qos-class1)# match ip access-group acl1
switch(config-cmap-qos-class1)# exit
switch(config)# policy-map type quality-of-service policy1
switch(config-pmap-qos-policy1)# class class1
switch(config-pmap-c-qos-policy1-class1)# police cir 512000 bc 96000
switch(config-pmap-c-qos-policy1-class1)# exit
switch(config-pmap-qos-policy1)# exit
switch(config)# show policy-map
Service-policy policy1

  Class-map: class1 (match-any)
    Match: ip access-group name acl1
       police rate 512000 bps burst-size 96000 bytes

  Class-map: class-default (match-any)

switch(config)#
```

10.1.8.6 Fabric QoS -- – Trident II Platform Switches

EOS is optimized to support QoS configuration on the Fabric interfaces on 7250x and 7300 series switches. Configuring QoS on the Fabric interfaces in addition to front panel ports allows user to have end-to-end control and helps to manage traffic better over these switches. By default, tx queues are configured as strict priority on 7250X and 7300X series.

The following QoS configuration options are supported on Fabric interfaces on 7250x and 7300 series switches.

- **Guaranteed Bandwidth:** In order to prevent queue starvation on fabric ports EOS supports minimum bandwidth configuration on per queue basis across all fabric ports.
- **Explicit Congestion Notification (ECN):** EOS supports enabling ECN on a per queue basis across all fabric ports.
- **Priority Flow Control (PFC):** Queue back-pressure propagates across the backplane such that flow control messages can be generated to the upstream devices. This is done by enabling PFC for the desired backplane traffic-classes.
- **Weight Round Robin (WRR):** EOS supports configuring Weighted Round Robin (WRR) on a per queue basis across all fabric ports.

10.1.8.6.1 Configuring Fabric QoS on 7250X and 7300X Series

Fabric QoS is configured using a QoS profiles which is then applied on fabric interfaces on 7250x and 7300x series. Following are the steps to configure Fabric QoS.

1. Use **`qos profile`** command to create a QoS profile.
2. Use **`tx-queue (Trident II)`** command to configure a transmit queue on the configuration mode interface.
3. Use **`bandwidth guaranteed (Trident II)`** command to specifie the minimum bandwidth for outbound traffic on the transmit queue.
4. Use **`random-detect ecn (Trident)`** command to enable the ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.
5. Use **`priority-flow-control priority`** command to configure the packet resolution setting on the configuration mode interface.
6. Use **`interface fabric`** command to configure Fabric interface.
7. Use **`service-profile`** command to apply the QoS profile to the Fabric interface.

Examples

- These commands create a QoS profile named fabricProfile with tx queue, bandwidth, ECN, PFC and DLB values defined in it and then the profile is attached to Fabric interface of the switch.

Note: To support PFC on a particular priority, DLB is disabled for that priority.

```
switch(config)# qos profile fabricProfile
switch(config-qos-profile-fabricProfile)# tx-queue 0
switch(config-qos-profile-fabricProfile-txq-0)# bandwidth
 guaranteed 10000 kbps
switch(config-qos-profile-fabricProfile-txq-0)# random-detect
 ecn
minimum-threshold 10 mbytes maximum-threshold 10 mbytes
switch(config-qos-profile-fabricProfile)# priority-flow-control
 priority 1
no-drop
switch(config-qos-profile-fabricProfile)# priority-flow-control
 priority 6
no-drop dlb
```

- Applying the QoS profile on **`interface fabric`** of the switch.

```
switch# configure terminal
switch(config)# interface fabric
switch(config-if-fabric)# service-profile fabricProfile
```

10.1.8.6.2 Displaying Fabric QoS Information

These show commands display the configured Fabric QoS information on the switch.

- **`show qos profile`** **[*profile Name*]:** Displays the list of QoS profiles configured on the switch.
- **`show qos interfaces fabric:`** Displays the profile applied on the fabric interface on the switch.

Examples

- This command displays the ***fabricProfile*** profile information.

```
switch# show qos profile fabricProfile
  qos profile fabricProfile
     priority-flow-control priority 1 no-drop
     priority-flow-control priority 6 no-drop dlb
     tx-queue 0
         bandwidth guaranteed 10000 kbps
         random-detect ecn minimum-threshold 10 mbytes maximum-thres
hold 10 mbytes
```

- This command displays the profile applied on the fabric interface.

```
switch# show qos interfaces fabric
   qos profile fabricProfile
```

10.1.9 Support for Configuring Color Extended Communities

EOS Release 4.23.1F introduces the ability to configure the color extended community in route-map set clauses and in an extcommunity-list for inbound and outbound policy application.

Use the color extended community for per-destination steering into Segment-Routing Traffic-Engineered (SR-TE) policies. If the next-hop and color of a BGP route match a particular policy (composed of an endpoint and color), any traffic bound to the destination can be steered according to the policy instead of forwarded via an IGP path or tunnel.

This section describes support for configuring color extended communities, including configuration instructions and command descriptions. Topics covered by this section include:

- Platform Compatibility
- Configuration
- Limitations

10.1.9.1 Platform Compatibility

Configuring color extended communities is supported on all platforms.

10.1.9.2 Configuration

Use the following command for color extended community expressions:

`color` **COLOR-VALUE** [color-only (exact-match | (endpoint-match (any | null)))]

Use this command in route-maps and extcommunity-lists to apply inbound and outbound policy.

Configuring Color Extended Community in route-map mode	
Command(config-route-map mode)	**[no | default] set extcommunity COLOR-EXPRESSION** [additive | delete]
Action	Adds a color extended community to be applied to routes affected by the route-map. Multiple set clauses can be applied to a single route-map to configure multiple colors for routes. **Additive** adds the extended communities to those received, while **delete** deletes any matching extended color communities. Negating the command removes the entry from the route-map.
Default	None

Example	`switch(config)# route-map foo`
	`switch(config-route-map foo)# set extcommunity color 1`
	`switch(config-route-map foo)# set extcommunity color 2 color-only exact-match`
	`switch(config-route-map foo)# set extcommunity color 3 color-only endpoint-match null`
	`switch(config-route-map foo)# set extcommunity color 4 color-only endpoint-match any`

Configuring Color Extended Community in extcommunity-list	
Command(config mode)	`[(no|default)] ip extcommunity-list WORD (permit|deny){COLOR-EXPRESSION}`
Action	Adds a color extended community to an extcommunity-list. Multiple color extended communities can be added to the list. Negating the command removes the corresponding color extended community from the list.
Default	None
Example	`switch(config)# ip extcommunity-list foo permit color 1 color 2` `switch(config)# ip extcommunity-list bar permit color 3 color-only endpoint-match null color 4 color-only endpoint-match any`

10.1.9.3 Limitations

The color extended community is only supported in multi-agent mode. Enable Multi-agent mode via the following command:

```
service routing protocols mode multi-agent
```

10.1.10 ACL based QoS Configuration

10.1.10.1 ACL Based QoS (DCS-7160)

The IPv4 ACL based QoS is enabled on switches through policy-map configuration. The ACL based QoS can be configured on front panel ports, port-channel interfaces on **DCS-7160** series switches.

10.1.10.1.1 ACL based QoS on SVIs

The ACL based QoS policy applied on SVIs modify the QoS parameters for SVI traffic (L3 VLAN) based on ACL classification. The ACL based QoS on Switched Virtual Interface (SVI) ports is supported on DCS-7500E, DCS-7280E, DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X, DCS-7020TR.

10.1.10.1.2 ACL Sharing on QoS

The ACLs applied on QoS shares the hardware resources (TCAM) when potentially large QoS policy-maps are applied to multiple SVIs. For ACL based QoS on SVIs in sharing mode we share TCAM for class-maps without policer action and replicate entries for policer class-maps. The ACL Sharing on QoS is supported only on selected platforms.

The QoS actions is applicable only to the routed traffic flowing through the members of the corresponding VLAN.

The steps to configure ACL based QoS is as follows:

1. Create a access list using **`ip access-list`** command.
2. Create a class map and attach it to the access list using **`class-map`** command.
3. Create a policy and attach the class map to the policy created, using the **`policy-map`** command.
4. Apply the policy to the interface using the **`service-policy input`** command.

Examples

- These command configure the access list ***acl1***.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit ip 10.1.1.1/24 any
switch(config-acl-acl1)# exit
```

- These commands configure the class map ***class1***.

```
switch(config)# class-map match-any class1
switch(config-cmap-qos-class1)# match ip access-group acl1
switch(config-cmap-qos-class1)# exit
```

- These commands configure the policy map ***policy1***.

```
switch(config)# policy-map policy1
switch(config-pmap-qos-policy1)# class class1
switch(config-pmap-c-qos-policy1-class1)# set dscp 20
switch(config-pmap-c-qos-policy1-class1)# set traffic-class 2
switch(config-pmap-c-qos-policy1-class1)# exit
switch(config-pmap-c-qos-policy1)# exit
```

- These commands apply the ***policy1*** to the ***interface ethernet 1/1***.

```
switch(config)# interface Et1/1
switch(config-if-Et1/1)# service-policy input policy1
switch(config-if-Et1/1)# exit
```

- These commands configure a ACL based QoS on the SVI interface ***VLAN10***.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# service-policy [type qos] input policy1
```

- This command enables the resource (hardware) sharing when a ACL based QoS is attached to VLAN interface. The no form of the command disables it.

```
switch(config)# hardware access-list qos resource sharing vlan in
```

- This command allows inbound broadcast IP packets with source IP address as one of the permitted hosts and denies the rest of the directed broadcast traffic.

```
switch(config)# ip directed-broadcast
 switch(config-ip-directed-broadcast)# field-set ipv4 prefix ALLOWED1
 switch(config-ipdb-field-set-ipv4-prefix-ALLOWED)# 10.1.1.1/32
 20.1.1.1/32 30.1.1.1/32
 switch(config-ipdb-field-set-ipv4-prefix-ALLOWED)# commit

 switch(config-ip-directed-broadcast)# field-set ipv4 prefix ALLOWED2
 switch(config-ipdb-field-set-ipv4-prefix-ALLOWED)# 10.2.1.1/32
 20.2.1.1/32 30.2.1.1/32
 switch(config-ipdb-field-set-ipv4-prefix-ALLOWED)# commit
```

Show Commands

The following show commands display the status of policy-maps programmed on the interface, for more information on these commands refer Quality of Service Commands.

- **`show policy-map [policy-name]`**: Displays the policy-map programming status.
- **`show policy-map interface interface id`**: Displays the policy-map that is currently programmed on the interface.
- **`show policy-map [policy-name] counters`**: Displays the policy-map traffic hits.
- **`show platform xp qos tcam [hits]`**: Displays the TCAM entries programmed for each policy-map as well as the traffic hits. The hits option is used to see the TCAM entries with nonzero traffic hits.
- **`show run | grep sharing`**: Displays if whether the ACL based QoS is enabled or disabled.
- **`show platform trident tcam shared vlan interface-class-id`**: Displays what SVIs are currently sharing the QoS policy-map.
- **`show platform trident tcam directed-broadcast`**: Displays the permitted hosts via field-set.
- **`show platform trident tcam qos detail`**: Displays the list of all the SVIs that are sharing the TCAM entries.

10.1.10.1.3 Limitations

- Maximum number of TCAM entries that can be programmed in hardware for all QoS policy-maps on the box is ***1024***.
- Layer 4 port ranges are not supported for ACL based QoS. The ranges will be expanded into multiple TCAM rules and programmed in the hardware.
- Configured policer rate should be above 1mbps and recommended burst value is ***2000*** bytes.
- Policer action cannot be associated with policy-maps applied to Port-Channels.

The following are the limitations specific to DCS-7500E, DCS-7280E and DCS-7020TR:

UThe user cannot apply more than 31 QoS service policies per chip on L3 interfaces.

- When different QoS service policies are applied to the SVI and its member interfaces, the behavior is indeterministic.
- When QoS service policies are applied on SVIs with partial failures due to limited hardware resources, any event that triggers a forwarding agent restart will lead to indeterministic behavior.

- When QoS service policies are applied on 2 SVIs, any event that triggers the VLAN membership change of a member interface may result in a policy-map programming failure. To change the VLAN membership, remove the interface from the first VLAN and then add it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

The following are the limitations specific to DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X:

- TCAM resources will not be shared for the same policy-map applied to multiple SVIs.
- Policy-map applied to a SVI will result in TCAM allocation on all chips irrespective of whether the SVI members are present or not.

When QoS service policies are applied to both SVI and its member interfaces and packets hit both policies, the behavior is indeterministic.

10.1.11 Configuring IPv6 Flow Label Matches for QoS

In addition to criteria like COS and DSCP, QoS decisions can be based on the IPv6 flow labels of packets. To use IPv6 flow labels as a criterion for QoS decisions, use the **permit** command to create ACL rules to select packets based on their IPv6 flow labels using an exact match and an optional mask, and then apply the access list to a class map in a QoS policy map, which can then be applied to individual interfaces. This requires a TCAM profile which must be installed explicitly.

Install the QoS Flow Label TCAM Profile

Open the QoS flow label TCAM profile Web page at https://www.arista.com/en/support/toi/tcam-profile?pn=qos-match-ipv6-flow-label. Copy the entire contents of the file which starts with the following commands:

```
hardware tcam
system profile qos-match-ipv6-flow-label
```

There are approximately 130 lines.

Paste this into the CLI of the switch. Each command in the file will be executed in turn when you paste the file contents. When the paste completes, if the cursor is at the end of the last command, type **enter** to execute it.

Confirm the QoS Flow Label TCAM Profile Installation

Configure the TCAM with the **hardware tcam** command, and use the **system profile** command to confirm that the “qos-match-ipv6-flow-label” profile has been installed. If the profile is installed, the **?** operator will show “qos-match-ipv6-flow-label” as an available profile.

Example

The following commands confirm whether the “qos-match-ipv6-flow-label” profile is installed and available to be applied.

```
switch(config)#hardware tcam
switch(config-tcam)#system profile qos-match?
WORD  qos-match-ipv6-flow-label
switch(config-tcam)#exit
switch(config)#
```

Apply the QoS Flow Label TCAM Profile

If the profile "qos-match-ipv6-flow-label" is listed, use the **system profile** command to apply it. Confirm that the profile has been successfully applied with the **show hardware tcam profile** command.

Example

The following commands apply the profile “qos-match-ipv6-flow-label” to the TCAM configuration, then confirm that the profile has been applied. The warning is normal, as the restart of forwarding agents is part of the procedure.

```
switch(config)#hardware tcam
switch(config-tcam)#system profile qos-match-ipv6-flow-label
!
WARNING!
Changing TCAM profile will cause forwarding agent(s) to exit and restart.
All traffic through the forwarding chip managed by the restarting
forwarding agent will be dropped.

Proceed [y/n]y
switch(config-tcam)#exit
switch(config)#show hardware tcam profile
                  Configuration           Status
FixedSystem       qos-match-ipv6-flow-label qos-match-ipv6-flow-label
switch(config)#
```

Create IPv6 ACL Rules

Configure an access list with the **ipv6 access-list** command. Then create rules with the **permit ipv6** command.

Example

The following commands create an IPv6 ACL rule which matches the flow label ***23*** in the access list ***L1***.

```
switch(config)#ipv6 access-list L1
switch(config-ipv6-acl-L1)#permit ipv6 any any flow-label eq 23
switch(config-ipv6-acl-L1)#exit
switch(config)#
```

Add Access List to QoS Class Map

Configure a QoS class map with the **class-map** command. Then add an access list to the class map with the **match** command.

Example

The following commands create a QoS class map called ***C1***, and then add the access list ***L1***.

```
switch(config)#class-map type qos match-any C1
switch(config-cmap-qos-C1)#match ipv6 access-group L1
switch(config-cmap-qos-C1)#exit
switch(config)#
```

Add Class Map to Policy Map

Configure a QoS policy map, creating it if necessary, with the **policy-map** command. Then add a class map to the policy map and define the traffic class.

Example

The following commands configure the QoS policy map ***P1*** and add the class map ***C1***, and then assign the class to traffic class ***4***.

```
switch(config)#policy-map type quality-of-service P1
switch(config-pmap-quality-of-service-P1)#class C1
switch(config-pmap-c-quality-of-service-P1-C1)#set traffic-class 4
switch(config-pmap-c-quality-of-service-P1-C1)#exit
switch(config-pmap-quality-of-service-P1)#exit
switch(config)#
```

Configure An Interface with QoS Policy

Configure an interface with the **`interface`** command. Apply the QoS policy to the interface with the **`service-policy`** command.

Example

The following commands configure the Ethernet interface ***1/1***, and apply the QoS policy ***P1*** to the interface.

```
switch(config)#interface Ethernet 1/1
switch(config-if-Et1/1)#service-policy type qos input P1
switch(config-if-Et1/1)#exit
switch(config)#
```

Example

The following commands confirm that the policy map ***P1*** has been programmed successfully.

```
switch(config)#show policy-map P1
Service-policy input: P1
  Hardware programming status: Successful

  Class-map: C1 (match-any)
    Match: ipv6 access-group name L1
       set traffic-class 4

  Class-map: class-default (match-any)

switch(config)#show ipv6 access-lists L1
IPV6 Access List L1
        10 permit ipv6 any any flow-label eq 23
switch(config)#
```

10.1.12 Differentiated MMU Discard Counters

To count discarded packets through tagging, assign drop-precendes for a certain class of packets on platforms that support such tagging.

Configuring Differentiated MMU Discard Counters

The following steps configure the Differentiated MMU Discard Counters.

1. Configure an IP access-lists to match traffic

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit 41 any any !!41 = 0x29 = IPv6
```

2. Add the access-list to a class-map

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-qos-class1)# match ip access-group acl1
```

3. Add the class-map to a policy-map

```
switch(config)# policy-map type quality-of-service policy1
switch(config-pmap-quality-of-service-policy1)# class class1
```

4. Add drop-precedence action to the policy-map

```
switch(config-pmap-c-quality-of-service-policy1-class1)# set drop-
precedence 2
```

5. Create qos profile with the policy map assigned

```
switch(config)# qos profile qos1
switch(config-qos-profile-qos1)# service-policy input policy1
```

6. Apply the policy-map to the interface

```
switch(config)# int et3/1
switch(config-if-Et3/1)# service-profile qos1
```

Repeat step 6 on all interfaces that receive traffic to be counted. Packets are tagged on ingress. If the same packet gets dropped on egress as an MMU discard, the corresponding counter gets incremented.

Displaying Differentiated MMU Discard Counters

The **show interface counters queue drop-precedence** command displays the drop-precedence counters. Based on the above configuration, drop-precedence 2 counts IPv6 packets.

```
switch# show interface counters queue drop-precedence
intf         0          1          2
Et1/1      100          0        200
Et1/2      200          0        300
…
```

10.1.13 Quality of Service Commands

QoS Data Field and Traffic Class Configuration Commands

- color
- hardware access-list qos resource sharing vlan in
- ip extcommunity-list
- platform petraA traffic-class
- qos cos
- qos dscp
- qos map cos
- qos map dscp
- qos map dscp to traffic-class
- qos map dscp to traffic-class (MPLS tunnel termination VRF)
- qos map traffic-class to cos
- qos map traffic-class to dscp
- qos map traffic-class to mc-tx-queue
- qos map traffic-class to tx-queue
- qos map traffic-class to uc-tx-queue
- qos profile
- qos rewrite cos
- qos rewrite dscp
- qos trust
- service-policy type qos input
- service-profile
- set extcommunity

QoS and ECN Display Commands

- show interface counters queue drop-precedence
- show platform petraA traffic-class
- show platform trident tcam shared vlan interface-class-id
- show platform trident tcam qos detail
- show platform xp qos tcam hit
- show policy-map
- show policy-map interface
- show qos interfaces
- show qos interfaces latency maximum
- show qos interfaces trust
- show qos interfaces random-detect ecn
- show qos maps
- show qos map dscp to traffic-class
- show qos profile
- show run|grep sharing
- show qos profile summary
- show qos random-detect ecn

ECN Configuration Commands

- qos random-detect ecn allow non-ect chip-based (Tomahawk and Trident)
- qos random-detect ecn global-buffer (Helix)

- qos random-detect ecn global-buffer (Trident and Tomahawk)
- random-detect ecn (Arad/Jericho)
- random-detect ecn (Helix)
- random-detect ecn (Trident and Tomahawk)

Transmit Queue and Port Shaping Commands – Arad and Jericho Platforms

- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Interface – Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)
- tx-queue (Arad/Jericho)

Transmit Queue and Port Shaping Commands – FM6000 Platform

- bandwidth percent (FM6000)
- priority (FM6000)
- shape rate (Interface – FM6000)
- shape rate (Tx-queue – FM6000)
- tx-queue (FM6000)

Transmit Queue and Port Shaping Commands – Helix Platform

- bandwidth guaranteed (Helix)
- shape rate (Interface – Helix)
- shape rate (Tx-queue – Helix)
- tx-queue (Helix)

Transmit Queue and Port Shaping Commands – Petra Platform

- bandwidth percent (Petra)
- priority (Petra)
- shape rate (Interface – Petra)
- shape rate (Tx-queue – Petra)
- tx-queue (Petra)

Transmit Queue and Port Shaping Commands – Trident and Tomahawk Platform

- bandwidth percent (Trident and Tomahawk)
- mc-tx-queue
- priority (Trident and Tomahawk)
- shape rate (Interface – Trident and Tomahawk)
- shape rate (Tx-queue – Trident and Tomahawk)
- uc-tx-queue

Transmit Queue and Port Shaping Commands – Trident II Platform

-
- bandwidth guaranteed (Trident II)
- shape rate (Tx-queue – Trident II)
- shape rate (Interface – Trident II)
- tx-queue (Trident II)
- interface fabric (Trident II)

10.1.13.1 bandwidth guaranteed (Helix)

The **bandwidth guaranteed** command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The **no bandwidth guaranteed** and **default bandwidth guaranteed** commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding **bandwidth guaranteed** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

bandwidth guaranteed rate DATA_MIN

no bandwidth guaranteed

default bandwidth guaranteed

Parameters

DATA_MIN Minimum bandwidth. Value range varies with data unit:

- ***8*** to ***40000000*** ***8*** to ***40000000*** kbytes per second.
- ***8*** to ***40000000*** **kbps** ***8*** to ***40000000*** kbytes per second.
- ***1*** to ***60000000*** **pps** ***1*** to ***60000000*** packets per second.

Related Command

tx-queue (Helix) places the switch in tx-queue configuration mode.

Example

These commands configure a minimum egress bandwidth of ***1*** Mbps for ***transmit queue 4*** of ***interface ethernet 17/3***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# tx-queue 4
switch(config-if-Et17-txq-4)# bandwidth guaranteed 1000 kbps
switch(config-if-Et17-txq-4)# show qos interfaces ethernet 17

Ethernet17/3:
   Trust Mode: COS
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: disabled

  Tx       Bandwidth                 Shape Rate        Priority
 Queue     Guaranteed (units)          (units)
   ---------------------------------------------------------------

   1        - / -    (  -  )       - / -    (  -  )    SP / SP
   0        - / -    (  -  )       - / -    (  -  )    SP / SP

Note: Values are displayed as Operational/Configured
```

```
switch(config-if-Et17-txq-4)#
```

10.1.13.2 bandwidth guaranteed (Trident II)

The **bandwidth guaranteed** command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The **no bandwidth guaranteed** and **default bandwidth guaranteed** commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding **bandwidth guaranteed** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

bandwidth guaranteed rate **DATA_MIN**

no bandwidth guaranteed

default bandwidth guaranteed

Parameters

DATA_MIN minimum bandwidth. Value range varies with data unit:

- ***8*** to ***40000000*** kbytes per second.
- ***8*** to ***40000000*** **kbps** kbytes per second.
- ***1*** to ***60000000*****pps** packets per second.

Related Command

tx-queue (Trident II) places the switch in tx-queue configuration mode.

Example

These commands configure a minimum egress bandwidth of ***1*** Mbps for ***transmit queue 4*** of ***interface ethernet 17/3***.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# bandwidth guaranteed 1000 kbps
switch(config-if-Et17/3-txq-4)# show qos interfaces ethernet 17/3

Ethernet17/3:
   Trust Mode: COS
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: disabled

  Tx       Bandwidth                 Shape Rate        Priority
 Queue     Guaranteed (units)         (units)
   ---------------------------------------------------------------
   7        - / -    (  -  )       - / -    (  -  )    SP / SP

   0        - / -    (  -  )       - / -    (  -  )    SP / SP

Note: Values are displayed as Operational/Configured
```

```
switch(config-if-Et17/3-txq-4)#
```

10.1.13.3 bandwidth percent (Arad/Jericho)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

bandwidth percent ***proportion***

no bandwidth percent

default bandwidth percent

Parameters

proportion Bandwidth percentage assigned to queues. Values range from ***1*** to ***100***.

Related Command

tx-queue (Arad/Jericho) places the switch in tx-queue configuration mode.

Examples

- These commands configure queues ***0*** through ***3*** (***interface ethernet 3/5/1***) as round robin, then allocate bandwidth for three queues at ***30%*** and one queue at ***10%***.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# no priority
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)# show qos interfaces ethernet
 3/5/1

Ethernet3/5/1:

  Tx     Bandwidth        Shape Rate         Priority  ECN
 Queue   (percent)         (units)
   ------------------------------------------------------

10.1.13.4 bandwidth percent (FM6000)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

bandwidth percent ***proportion***

no bandwidth percent

default bandwidth percent

Parameters

proportion Configured bandwidth percentage. Value ranges from ***1*** to ***100***. Default value is ***0***.

Related Command

tx-queue (FM6000) places the switch in tx-queue configuration mode.

Examples

- These commands configure queues ***0*** through ***3*** (***interface Ethernet 19***) as round robin, then allocate bandwidth for three queues at ***30%*** and one queue at ***10%***.

```
switch(config)# interface Ethernet 19
switch(config-if-Et19)# tx-queue 3
switch(config-if-Et19-txq-3)# no priority
switch(config-if-Et19-txq-3)# bandwidth percent 10
switch(config-if-Et19-txq-3)# tx-queue 2

10.1.13.5 bandwidth percent (Petra)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

bandwidth percent ***proportion***

no bandwidth percent

default bandwidth percent

Parameters

proportionBandwidth percentage assigned to queues. Values range from ***1*** to ***100***.

Related Command

tx-queue (Petra) places the switch in tx-queue configuration mode.

Examples

- These commands configure queues ***0*** through ***3*** (***interface ethernet 3/28***) as round robin, then allocate bandwidth for three queues at ***30%*** and one queue at ***10%***.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# tx-queue 3
switch(config-if-Et3/28-txq-3)# no priority
switch(config-if-Et3/28-txq-3)# bandwidth percent 10
switch(config-if-Et3/28-txq-3)# tx-queue 2
switch(config-if-Et3/28-txq-2)# bandwidth percent 30
switch(config-if-Et3/28-txq-2)# tx-queue 1
switch(config-if-Et3/28-txq-1)# bandwidth percent 30
switch(config-if-Et3/28-txq-1)# tx-queue 0
switch(config-if-Et3/28-txq-0)# bandwidth percent 30
switch(config-if-Et3/28-txq-0)# show qos interface ethernet

10.1.13.6 bandwidth percent (Trident and Tomahawk)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command ***running-config***.

Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

Command Syntax

bandwidth percent ***proportion***

no bandwidth percent

default bandwidth percent

Parameters

proportion Bandwidth percentage assigned to queues. Values range from ***1*** to ***100***.

Related Commands

- mc-tx-queue places the switch in mc-tx-queue configuration mode.
- uc-tx-queue places the switch in uc-tx-queue configuration mode.

Examples

- These commands configure ***unicast transmit queue 3*** (and all other queues of lower priority) as round robin, then allocate bandwidth for unicast transmit queues ***1***, ***2***, and ***3*** at ***30%*** and ***multicast transmit queue 1*** at ***10%***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# no priority
switch(config-if-Et7-uc-txq-3)# bandwidth percent 30
switch(config-if-Et7-uc-txq-3)# uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)# bandwidth percent 30
switch(config-if-Et7-uc-txq-2)# uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)# bandwidth percent 30

10.1.13.7 color

Use the **color** command for the ability to configure the color extended community in route-map set clauses and in an extcommunity-list for inbound and outbound policy application.

Command Mode

Route-maps and extcommunity-lists

Command Syntax

color COLOR-VALUE [color-only [exact-match | [endpoint-match [any | null]]]]

Parameters

- **COLOR-VALUE** A single policy color value, range ***0*** to ***4294967295***.
- **color-only** Allows configuration of color-only bits.
- **exact-match** Explicitly sets the color-only bits of the extended community to ***00*** (optional).
- **endpoint-match any** Sets the color-only bits of the extended community to ***10***.
- **endpoint-match null** Sets the color-only bits of the extended community to ***01***.

Example

```
switch(config)# route-map foo
switch(config0route-map-foo)# set community color 2 color-only endpoint-
match any
```

10.1.13.8 dscp to traffic-class (DSCP map)

The **dscp to traffic-class** command configures the specified QoS map to map one or more DSCP classes to a traffic class. Only one traffic class may be specified per command. The command can be repeated to configure additional traffic classes. The configuration is modified immediately. Each **dscp to traffic-class** command overwrites the existing entries in the map.

The **default dscp to traffic-class** and **no dscp to traffic-class** commands restore the global map values for the given DSCP classes.

Command Mode

DSCP Map Configuration

Command Syntax

dscp ***dscp_classes*** **to traffic-class** ***traffic_class***

default dscp ***dscp_classes*** **to traffic-class**

no dscp ***dscp_classes*** **to traffic-class**

Parameters

- ***dscp_classes*** The DSCP class or classes to map to a new traffic-class value. These can be provided as a single value, a range given with a hyphen (such as 20-25), a comma separated list (such as 1,4,9), or a combination (such as 20-25, 35). The range for each value is 0-63.
- ***traffic_class*** The traffic class to map the specified DSCP class or classes to.

Example

These commands configure the DSCP-to-traffic-class map ***map1*** to map DSCP class ***35*** to traffic class ***7***, and DSCP classes ***20-25*** to traffic class ***6***.

```
switch(config)#qos map dscp to traffic-class name map1
switch(config-dscp-map-map1)#dscp 35 to traffic-class 7
switch(config-dscp-map-map1)#dscp 20-25 to traffic-class 6
```

10.1.13.9 hardware access-list qos resource sharing vlan in

The **hardware access-list qos resource sharing vlan in** command enables the ACL based QoS resources sharing on a VLAN interface.

The **no hardware access-list qos resource sharing vlan in** disables the ACL based QoS resources sharing on a VLAN interface. By default this function is disabled.

Command Mode

Global Configuration

Command Syntax

hardware access-list qos resource sharing vlan in

no hardware access-list qos resource sharing vlan in

Example

This commands enables the ACL based QoS resources sharing on a VLAN interface.

```
switch(config)# hardware access-list qos resource sharing vlan in
```

10.1.13.10 interface fabric (Trident II)

The **interface fabric** command places the switch in Fabric-interface configuration mode and allows the user to attach the QoS profile to the fabric interface of the switch.

Command Mode

Global Configuration

Command Syntax

interface fabric

Example

This command places the switch in Fabric-interface configuration mode.

```
switch(config)# interface fabric
switch(config-if-fabric)#
```

10.1.13.11 ip extcommunity-list

The **ip extcommunity-list** command adds a color extended community to an extcommunity-list. Multiple color extended communities can be added to the list. Negating the command removes the corresponding color extended community from the list.

Command Mode

Configuration mode

Command Syntax

ip extcommunity-list **WORD** [permit | deny][**COLOR-EXPRESSION**]

no ip extcommunity-list **WORD** [permit | deny] **COLOR-EXPRESSION**]

default ip extcommunity-list **WORD** [permit | deny][**COLOR-EXPRESSION**]

Parameters

- **WORD** Community list name.
- **permit** Specifies community to accept.
- **deny** Specifies comminity to reject.
- **COLOR-EXPRESSION** Color extended community.

Example

```
arista(config)# ip extcommunity-list foo permit color 1 color 2
arista(config)# ip extcommunity-list bar permit color 3 color-only
 endpoint-match null color 4 color-only endpoint-match any
```

10.1.13.12 mc-tx-queue

The **mc-tx-queue** command places the switch in mc-tx-queue configuration mode to configure a multicast transmit queue on the configuration mode interface. Mc-tx-queue configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident and Tomahawk switches have four multicast queues (***MC0 – MC03***) and eight unicast queues (***UC0 – UC7***), categorized into two priority groups. All queues are exposed through the CLI and are user configurable.

- **Priority Group 1:** ***UC7***, ***UC6***, ***MC3***
- **Priority Group 0:** ***UC5***, ***UC4***, ***MC2***, ***UC3***, ***UC2***, ***MC1***, ***UC1***, ***UC0***, ***MC0***

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no mc-tx-queue** and **default mc-tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **mc-tx-queue** mode commands from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

mc-tx-queue ***queue_level***

Parameters

queue_level The multicast transmit queue number. Values range from ***0*** to ***3***.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Trident and Tomahawk)
- priority (Trident and Tomahawk)
- shape rate (Tx-queue – Trident and Tomahawk)

Related Command

uc-tx-queue Configures unicast transmit queues on Trident and Tomahawk platform switches.

Example

This command enters mc-tx-queue configuration mode for ***multicast transmit queue 3*** of ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# mc-tx-queue 3
switch(config-if-Et5-mc-txq-3)#
```

10.1.13.13 platform petraA traffic-class

The **`platform petraA traffic-class`** command configures the default traffic class used by all ports on a specified chip. The default traffic class is implemented by Petra platform switches to replace qos cos and qos dscp commands. Traffic class values range from ***0*** to ***7***. The default traffic class is ***1***.

When **platform ?** returns **Petra**:

- **CoS trusted ports:** inbound untagged packets are assigned to the default traffic class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- **DSCP trusted ports:** inbound non-IP packets are assigned to the default traffic class. IP packets are assigned to the traffic class that corresponds to the contents of its DSCP field.
- **Untrusted ports:** all inbound packets are assigned to the default traffic class.

The **`no platform petraA traffic-class`** and **`default platform petraA traffic-class`** commands restore the default traffic class of one for all ports on the specified chips by deleting the corresponding **`platform petraA traffic-class`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform petraA` [**CHIP_NAME**] traffic-class ***tc_value***

`no platform petraA` [**CHIP_NAME**] traffic-class

`default platform petraA` [**CHIP_NAME**] traffic-class

Parameters

CHIP_NAME Trust mode assigned to the specified ports. Port designation options include:

- ***no parameter*** All ports on the switch.
- **module *cardX*** All ports on specified linecard (7500 Series).
- **petra *cardX* / *chipY*** All ports on PetraA chip ***chipY*** on linecard ***cardX*** (7500 Series).
- **petra *-chipZ*** All ports on PetraA chip chipZ (7048 Series)

7500 Series

Switches can contain up to eight linecards. ***CardX*** varies from ***3*** to ***10***.

Each linecard contains six PetraA chips. Each chip controls eight ports. ***ChipY*** varies from ***0*** to ***5***:

- ***0*** controls ports ***1*** through ***8***:
  - ***1*** controls ports ***9*** through ***16***.
  - ***2*** controls ports ***17*** through ***24***.
  - ***3*** controls ports ***25*** through ***32***.
  - ***4*** controls ports ***33*** through ***40***.
  - ***5*** controls ports ***41*** through ***48***.

7048 Series

Each switch contains two PetraA chips. ***ChipZ*** varies from ***0*** to ***1***:

- ***0*** controls ports ***1*** through ***32***.
  - ***1*** controls ports ***33*** through ***52***.
- ***tc_value*** Traffic class value. Values range from ***0*** to ***7***. Default value is ***1***.

Related Command

show platform petraA traffic-class displays the traffic class assignment on all specified Petra chips.

Example

This command configures the default ***traffic class 6*** for ports ***25-32*** on linecard ***5***.

```
switch(config)# platform petraA petra5/3 traffic-class 6
switch(config)#
```

10.1.13.14 priority (Arad/Jericho)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority:** contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority:** contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Tx-queue 7 is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. ***Tx-queue 6*** has higher priority than ***Tx-queue 5***, and ***Tx-queue 0*** has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

Command Mode

Tx-Queue Configuration

Command Syntax

priority strict

no priority

default priority

Related Command

tx-queue (Arad/Jericho) places the switch in tx-queue configuration mode.

Example

These commands perform the following on ***interface ethernet 3/4/1***:

- Displays the default state of all transmit queues.
- Configures ***transmit queue 3*** as a round robin queue.
- Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# show qos interfaces ethernet 3/4/1

Ethernet3/4/1:

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   ------------------------------------------------------
   7      - / -        - / -    (  -  )    SP / SP    D

              (percent)       (Kbps)
   ------------------------------------------------
          7         N/A     disabled        strict
          6         N/A     disabled        strict
          5         N/A     disabled        strict
          4         N/A     disabled        strict
          3          25     disabled   round-robin
          2          25     disabled   round-robin
          1          25     disabled   round-robin
          0          25     disabled   round-robin

switch(config-if-Et3/28-txq-3)#
```

10.1.13.17 priority (Trident and Tomahawk)

The **`priority`** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority:** contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all other queues is strict priority.
- **round robin priority:** contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Trident and Tomahawk switches have eight unicast queues (***UC0 – UC7***) and four multicast queues (M***C0 – MC03***), categorized into two priority groups. ***Priority group 1*** queues have priority over ***priority 0*** queues. The following lists display the priority group queues in order from higher priority to lower priority.

- **Priority Group 1:** ***UC7***, ***UC6***, ***MC3***
- **Priority Group 0:** ***UC5***, ***UC4***, ***MC2***, ***UC3***, ***UC2***, ***MC1***, ***UC1***, ***UC0***, ***MC0***

Priority group 1 queues are strict priority queues and are not configurable as round robin. ***Priority 0*** queues are strict priority by default and are configurable as round robin. When a queue is configured as a round robin queue, all lower priority queues automatically function as round robin queues.

The **`priority strict`** and **`default priority`** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **`no priority`** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

Command Syntax

```
priority strict
```

```
no priority
```

```
default priority
```

Related Commands

- mc-tx-queue places the switch in mc-tx-queue configuration mode.
- uc-tx-queue places the switch in uc-tx-queue configuration mode.

Example

These commands perform the following on ***interface ethernet 7***:

- Displays the default state of all transmit queues.
- Configures ***transmit queue 3*** as a round robin queue.
- Displays the effect of the **`no priority`** command on all transmit queues on the interface.

```
switch(config) #interface ethernet 7
switch(config-if-Et7)# show qos interface ethernet 7

Ethernet7:
   Trust Mode: COS

switch(config-if-Et7-uc-txq-3)#
```

10.1.13.18 qos cos

The **`qos cos`** command specifies the default class of service (CoS) value of the configuration mode interface. CoS values range from ***0*** to ***7***. Default value is ***0***.

Arad, Jericho, fm6000, Trident, Tomahawk, and **Trident II** platform switches:

- CoS trusted ports: the default CoS value determines the traffic class for inbound untagged packets. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: the default CoS value determines the traffic class for all inbound packets.

Petra platform switches:

- CoS trusted ports: inbound untagged packets are assigned to the default traffic class, as configured by platform petraA traffic-class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The **`no qos cos`** and **`default qos cos`** commands restore the port's default CoS value to zero by deleting the corresponding **`qos cos`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`qos cos` ***cos_value***

`no qos cos`

`default qos cos`

Parameters

cos_valueCoS value assigned to port. Value ranges from ***0*** to ***7***. Default value is ***0***.

Example

This command configures the default ***CoS 4*** on ***interface ethernet 8***.

```
switch(config-if-Et8)# qos cos 4
switch(config-if-Et8)#
```

10.1.13.19 qos dscp

The **qos dscp** command specifies the default Differentiated Services Code Point (DSCP) value of the configuration mode interface. The default DSCP determines the traffic class for non-IP packets that are inbound on DSCP trusted ports. DSCP trusted ports determine the traffic class for inbound packets as follows:

- **Arad, Jericho, fm6000, Trident, Tomahawk,** and **Trident II** platform switches:
  - non-IP packets: default DSCP value specified by **qos dscp** determines the traffic class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.
- **Petra** platform switches:
  - non-IP packets: assigned to default traffic class configured by platform petraA traffic-class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.

The **no qos dscp** and **default qos dscp** commands restore the port's default DSCP value to zero by deleting the corresponding **qos dscp** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

qos dscp ***dscp_value***

no qos dscp

default qos dscp

Parameters

dscp_value DSCP value assigned to the port. Value ranges from ***0*** to ***63***. Default value is ***0***.

Example

This command sets the default DSCP of ***44*** on ***interfacee thernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# qos dscp 44
switch(config-if-Et7)
```

10.1.13.20 qos map cos

The **`qos map cos`** command associates a traffic class to a list of class of service (CoS) settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

The **`no qos map cos`** and **`default qos map cos`** commands restore the specified CoS values to their default traffic class setting by deleting the corresponding **`qos map cos`** statements from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`qos map cos` ***cos_value_1*** [***cos_value_2 ... cos_value_n***] **to traffic-class** ***tc_value***

`no qos map cos` ***cos_value_1*** [***cos_value_2 ... cos_value_n***]

`default qos map cos` ***cos_value_1*** [***cos_value_2 ... cos_value_n***]

Parameters

- ***cos_value_x*** Class of Service (CoS) value. Value ranges from ***0*** to ***7***.
- ***tc_value*** Traffic class value. Value range varies by platform.

Default CoS to traffic class map varies by platform (Table 40: Default CoS to Traffic Class Map).

Default Inbound CoS to Traffic Class Map

Table 40: Default CoS to Traffic Class Map displays the default CoS to traffic class map for each platform.

Table 40: Default CoS to Traffic Class Map

Inbound CoS	untagged	0	1	2	3	4	5	6	7
Traffic Class (Arad / Jericho)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (FM6000)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (Helix)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (Petra)	Assigned default traffic class	1	0	2	3	4	5	6	7
Traffic Class (Trident and Tomahawk)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (Trident II)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7

Related Commands

- qos cos specifies the default CoS.
- platform petraA traffic-class specifies the default traffic class.

Example

This command assigns the ***traffic class 5*** to the classes of service ***1***, ***3***, ***5***, and ***7***.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
```

```
switch(config)#
```

10.1.13.21 qos map dscp

The **qos map dscp** command associates a traffic class to a set of Differentiated Services Code Point (DSCP) values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

This command configures the global DSCP to traffic-class map. To create additional named maps that can be attached to specific VRFs, use the **qos map dscp to traffic-class** command with the **name** option.

The **no qos map dscp** and **default qos map dscp** commands restore the specified DSCP values to their default traffic class settings by deleting corresponding **qos map dscp** statements from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos map dscp ***dscpv_1*** [***dscpv_2...dscpv_n***] **to traffic-class** ***tc_value***

no qos map dscp ***dscpv_1*** [***dscpv_2...dscpv_n***]

default qos map dscp ***dscpv_1*** [***dscpv_2...dscpv_n***]

Parameters

- ***dscpv_x*** Differentiated Services Code Point (DSCP) value. Value ranges from ***0*** to ***63***.
- ***tc_value*** Traffic class value. Value range varies by platform.

Default map varies by platform (Table 41: Default DSCP to Traffic Class Map).

Default Inbound DSCP to Traffic Class Map

Table 41: Default DSCP to Traffic Class Map displays the default DSCP to traffic class map for each platform.

Table 41: Default DSCP to Traffic Class Map

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class (Arad / Jericho)	1	0	2	3	4	5	6	7
Traffic Class (FM6000)	1	0	2	3	4	5	6	7
Traffic Class (Helix)	1	0	2	3	4	5	6	7
Traffic Class (Petra)	1	0	2	3	4	5	6	7
Traffic Class (Trident and Tomahawk)	1	0	2	3	4	5	6	7
Traffic Class (Trident II)	1	0	2	3	4	5	6	7

Example

This command assigns the ***traffic class 3*** to the DSCP values of ***12***, ***13***, ***25***, and ***37***.

```
switch(config)# qos map dscp 12 13 25 37 to traffic-class 3
switch(config)#
```

10.1.13.22 qos map dscp to traffic-class

The **qos map dscp to traffic-class** command puts the switch in DSCP Map Configuration mode for the specified QoS map. If the map does not already exist, it is created as a copy of the global DSCP-to-traffic-class map. In DSCP Map Configuration mode, the **dscp to traffic-class** command is available to make changes to the map.

The **no** and **default** forms of the command remove the specified custom map.

Command Mode

Global Configuration

Command Syntax

qos map dscp to traffic-class name ***map_name***

no qos map dscp to traffic-class name ***map_name***

default qos map dscp to traffic-class name ***map_name***

Parameters

- ***map_name*** The name of the map to configure. If the map does not exist, it is created as a copy of the global DSCP-to-traffic-class map.

Example

This command creates the map ***map1*** and places the switch in DSCP Map Configuration mode.

```
switch(config)#qos map dscp to traffic-class name map1
switch(config-dscp-map-map1)#
```

10.1.13.23 qos map dscp to traffic-class (MPLS tunnel termination VRF)

The **qos map dscp to traffic-class** command assigns a DSCP-to-traffic-class map to a VRF, replacing the global map or previous custom map. The switch uses this map to assign a traffic class to data packets routed to this VRF on the basis of the DSCP fields of these packets.

The **no qos map dscp to traffic-class** and **default qos map dscp to traffic-map** commands remove the assignment of a custom map from the VRF, restoring the global map. default traffic class settings by deleting corresponding **qos map dscp** statements from ***running-config***.

Command Mode

MPLS Tunnel Termination VRF Configuration

Command Syntax

qos map dscp to traffic-class ***map_name***

no qos map dscp to traffic-class ***map_name***

default qos map dscp to traffic-class ***map_name***

Parameter

- ***map_name*** DSCP to traffic-class map name.

Example

These commands assign the ***map1*** QoS DSCP-to-traffic-class map to the ***newVRF1*** and ***newVRF2*** VRFs.

```
switch(config)#mpls tunnel termination
switch(config-mpls-tunnel-termination)#vrf newVRF1
switch(config-tunnel-termination-vrf-newVRF1)#qos map dscp to
 traffic-class map1
switch(config-tunnel-termination-vrf-newVRF1)#exit
switch(config-mpls-tunnel-termination)#vrf newVRF2
switch(config-tunnel-termination-vrf-newVRF2)#qos map dscp to
 traffic-class map1
switch(config-tunnel-termination-vrf-newVRF2)#exit
switch(config-tunnel-termination)#
```

10.1.13.24 qos map traffic-class to cos

The **qos map traffic-class to cos** command associates a class of service (CoS) to a list of traffic classes. Multiple commands create a complete traffic class to CoS map. The switch uses this map in CoS rewrite operations to fill the CoS field in outbound packets. This map is applicable to DSCP trusted ports and untrusted ports. CoS rewrite is disabled on CoS trusted ports. The show qos maps command displays the CoS to traffic class map.

The **no qos traffic-class to cos** and **default qos traffic-class to cos** commands restore the specified traffic class values to their default CoS settings by removing the corresponding **qos map traffic-class to cos** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to cos** ***cos_value***

no qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to cos**

default qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to cos**

Parameters

- ***tc_num_x*** Traffic class value. Value range varies by switch platform.
- ***cos_value*** Class of Service (CoS) value. Value ranges from ***0*** to ***7***.

Default Inbound Traffic Class to CoS Map

Table 42: Default Traffic Class to CoS Rewrite Value Map displays the default traffic class to CoS map for each platform.

Table 42: Default Traffic Class to CoS Rewrite Value Map

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value (Arad and / Jericho)	1	0	2	3	4	5	6	7
CoS Rewrite Value (FM6000)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Helix)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Petra)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Trident and Tomahawk)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Trident II)	1	0	2	3	4	5	6	7

Example

This command assigns the ***CoS 2*** to traffic classes ***1***, ***3***, and ***5***.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)#
```

10.1.13.25 qos map traffic-class to dscp

The **qos map traffic-class to dscp** command associates a Differentiated Services Code Point (DSCP) value to a list of traffic classes. Multiple commands create a complete traffic class to DSCP map. The switch uses this map in DSCP rewrite operations to fill the DSCP field in outbound packets. This map is applicable to CoS trusted ports and untrusted ports but disabled by default on these ports. DSCP rewrite is disabled on DSCP trusted ports. The show qos maps command displays the traffic class to DSCP map.

The **no qos traffic-class to dscp** and **default qos traffic-class to dscp** commands restore the specified traffic class values to their default DSCP settings by removing the corresponding **qos map traffic-class to dscp** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to dscp** ***dscp_value***

no qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to dscp**

default qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to dscp**

Parameters

- ***tc_num_x*** Traffic class value. Value range varies by switch platform.
- ***dscp_value*** Differentiated Services Code Point (DSCP) value. Value ranges from ***0*** to ***63***.

Default Inbound Traffic Class to DSCP Map

Table 43: Default Traffic Class to DSCP Rewrite Value Map displays the default traffic class to DSCP map for each platform.

Table 43: Default Traffic Class to DSCP Rewrite Value Map

Traffic Class	0	1	2	3	4	5	6	7
DSCP Rewrite Value (FM6000)	8	0	16	24	32	40	48	56
DSCP Rewrite Value (Helix)	8	0	16	24	32	40	48	56
DSCP Rewrite Value (Trident and Tomahawk)	8	0	16	24	32	40	48	56
DSCP Rewrite Value (Trident II)	8	0	16	24	32	40	48	56

Example

This command assigns the DSCP value of ***17*** to traffic classes ***1***, ***2***, and ***4***.

```
switch(config)# qos map traffic-class 1 2 4 to dscp 17
switch(config)#
```

10.1.13.26 qos map traffic-class to mc-tx-queue

The **qos map traffic-class to mc-tx-queue** command associates a multicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to mc-tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The show qos maps command displays the traffic class to multicast transmit queue map.

The **no qos traffic-class to mc-tx-queue** and **default qos traffic-class to mc-tx-queue** commands restore the default traffic class to multicast transmit queue map for the specified traffic class values by removing the corresponding **qos map traffic-class to mc-tx-queue** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to mc-tx-queue** ***mtq_value***

no qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to mc-tx-queue**

default qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to mc-tx-queue**

Parameters

- ***tc_num_x*** Traffic class value. Value ranges from ***0*** to ***7***.
- ***mtq_value*** Multicast transmit queue number. Value ranges from ***0*** to ***3***.

Default Inbound Traffic Class to Multicast Transmit Queue Map

Table 44: Default Traffic Class to Multicast Transmit Queue Map displays the default traffic class to multicast transmit queue map for Trident and Tomahawk platform switches.

Table 44: Default Traffic Class to Multicast Transmit Queue Map

Traffic Class	0	1	2	3	4	5	6	7
Multicast Transmit Queue (Trident and Tomahawk)	0	0	1	1	2	2	3	3

Related Commands

- qos map traffic-class to uc-tx-queue (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.
- qos map traffic-class to tx-queue (all other platforms) associates traffic classes to a transmit queue.

Example

This command maps traffic classes ***0***, ***4***, and ***5*** to ***mc-tx-queue 2***.

```
switch(config)# qos map traffic-class 0 4 5 to mc-tx-queue 2
switch(config)#
```

10.1.13.27 qos map traffic-class to tx-queue

The **qos map traffic-class to tx-queue** command associates a transmit queue (tx-queue) to a list of traffic classes. Multiple commands create a complete traffic to tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The show qos maps command displays the transmit queue to traffic class map.

The **no qos traffic-class to tx-queue** and **default qos traffic-class to tx-queue** commands restore the specified traffic class values to their default transmit queue settings by removing the corresponding **qos map traffic-class to tx-queue** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to tx-queue** ***txq_value***

no qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to tx-queue**

default qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to tx-queue**

Parameters

- ***tc_num_x*** Traffic class value. Value range varies by platform.
- ***txq_value*** Transmit queue value. Value range varies by platform.

Restrictions

FM6000: When Priority Flow Control (PFC) is enabled, traffic classes are mapped to their corresponding transmit queues, regardless of existing **qos map traffic-class to tx-queue** statements.

Arad, Jericho, and Petra: ***Traffic class 7*** always maps to ***transmit queue 7***. This association is not editable.

Default Inbound Traffic Class to Transmit Queue Map

Table 45: Default Traffic Class to Transmit Queue Map displays the transmit queue to traffic class map.

Table 45: Default Traffic Class to Transmit Queue Map

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue (Arad / Jericho)	0	1	2	3	4	5	6	7
Transmit Queue (FM6000)	0	1	2	3	4	5	6	7
Transmit Queue (Helix)	0	1	2	3	4	5	6	7
Transmit Queue (Petra)	0	1	2	3	4	5	6	7
Transmit Queue (Trident II)	0	1	2	3	4	5	6	7

Related Commands

- qos map traffic-class to mc-tx-queue (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- qos map traffic-class to uc-tx-queue (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.

Example

This command maps traffic classes ***0***, ***4***, and ***5*** to ***tx-queue 4***.

```
switch(config)# qos map traffic-class 0 4 5 to tx-queue 4
switch(config)#
```

10.1.13.28 qos map traffic-class to uc-tx-queue

The **qos map traffic-class to uc-tx-queue** command associates a unicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to unicast transmit queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The show qos maps command displays the traffic class to unicast transmit queue map.

The **no qos traffic-class to uc-tx-queue** and **default qos traffic-class to uc-tx-queue** commands restore the default traffic class to unicast transmit queue map for the specified traffic class values by removing the corresponding **qos map traffic-class to uc-tx-queue** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to uc-tx-queue** ***utq_value***

no qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to uc-tx-queue**

default qos map traffic-class ***tc_num_1*** **[*tc_num_2 ... tc_num_n*] to uc-tx-queue**

Parameters

- ***tc_num_x*** Traffic class value. Value ranges from ***0*** to ***7***.
- ***utq_value*** Unicast transmit queue number. Value ranges from ***0*** to ***7***.

Default Inbound Traffic Class to Unicast Transmit Queue Map

Table 46: Default Traffic Class to Unicast Transmit Queue Map displays the default traffic class to Unicast transmit queue map for Trident and Tomahawk platform switches.

Table 46: Default Traffic Class to Unicast Transmit Queue Map

Traffic Class	0	1	2	3	4	5	6	7
Unicast Transmit Queue (Trident and Tomahawk)	0	1	2	3	4	5	6	7

Related Commands

- qos map traffic-class to mc-tx-queue (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- qos map traffic-class to tx-queue (all other platforms) associates traffic classes to a transmit queue.

Example

This command maps traffic classes ***0***, ***4***, and ***5*** to ***unicast transmit queue 4***.

```
switch(config)# qos map traffic-class 0 4 5 to uc-tx-queue 4
switch(config)#
```

10.1.13.29 qos profile

The **qos profile** command places the switch in QoS profile configuration mode and for the specified profile and creates the profile if it does not already exist. QoS profiles are used to apply the same QoS configuration to multiple interfaces.

The **no qos profile** and **default qos profile** command deletes the QoS profile from the running configuration.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

qos profile ***profile_name***

no qos profile ***profile_name***

default qos profile ***profile_name***

Parameter

profile_name QoS profile name.

Note: Commands use a subset of the listed fields. Available subset depends on the specified parameter. Use CLI syntax assistance to view options for specific parameter when creating a QoS profile.

Example

This command places the switch in QoS profile configuration mode for policy map policy map ***TP*** and creates the policy map if it does not already exist.

```
switch(config)# qos profile TP
switch(config-qos-profile-TP)#
```

10.1.13.30 qos random-detect ecn allow non-ect chip-based (Tomahawk and Trident)

The **qos random-detect ecn allow non-ect chip-based** enables per color queue thresholds using color based queue thresholds and drop-precedence values along with drop of non-ect traffic by allowing non-ect and set drop-precedence 1 in a policy map simultaneously.

The **no qos random-detect ecn allow non-ect chip-based** and **default qos random-detect ecn allow non-ect chip-based** commands disbales the use of non-ect and set drop-precedence 1 simultaneously in a policy map in the **running-config**.

Command Mode

Global Configuration

Command Syntax

qos random-detect ecn allow non-ect chip-based

no qos random-detect ecn allow non-ect chip-based

default qos random-detect ecn allow non-ect chip-based

Example

The following command enables the use of non-ect and ***set drop-precedence 1*** simultaneously in a policy map.

```
switch(config)# qos random-detect ecn allow non-ect chip-based
```

10.1.13.31 qos random-detect ecn global-buffer (Helix)

The **qos random-detect ecn global-buffer** command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

  When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The **no qos random-detect ecn global-buffer** and **default qos random-detect ecn global-buffer** commands disables ECN marking for the shared buffer by removing the **qos random-detect ecn global-buffer** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos random-detect ecn global-buffer minimum-threshold **MIN** maximum-threshold **MAX**

no qos random-detect ecn global-buffer

default qos random-detect ecn global-buffer

Guidelines

Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

Parameters

MIN and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - ***1*** to ***19456*** **segments** 208-byte segments units.
  - ***1*** to ***4*** **mbytes** Megabyte units.
  - ***1*** to ***4046*** **kbytes** Kilobyte units.
  - ***1*** to ***4046848*** **bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - ***1*** to ***19456*** **segments** 208-byte segments units.
  - ***1*** to ***4*** **mbytes** Megabyte units.
  - ***1*** to ***4046*** **kbytes** Kilobyte units.

- ***1*** to ***4046848*** **bytes** Byte units.

Related Command

random-detect ecn (Helix) enables ECN marking for a unicast transmit queue.

Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at ***20*** and ***500*** segments.

```
switch(config)# qos random-detect ecn global-buffer minimum-
threshold 20 segments
maximum-threshold 500 segments
switch(config)#
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)# no qos random-detect ecn global-buffer
switch(config)#
```

10.1.13.32 qos random-detect ecn global-buffer (Trident and Tomahawk)

The **qos random-detect ecn global-buffer** command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

  When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The **no qos random-detect ecn global-buffer** and **default qos random-detect ecn global-buffer** commands disables ECN marking for the shared buffer by removing the **qos random-detect ecn global-buffer** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

qos random-detect ecn global-buffer minimum-threshold **MIN** maximum-threshold **MAX**

no qos random-detect ecn global-buffer

default qos random-detect ecn global-buffer

Guidelines

Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

Parameters

MIN and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - ***1*** to ***46080*** **segments** 208-byte segments units.
  - ***1*** to ***9*** **mbytes** Megabyte units.
  - ***1*** to ***9584*** **kbytes** Kilobyte units.
  - ***1*** to ***9584640*** **bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - ***1*** to ***46080*** **segments** 208-byte segments units.
  - ***1*** to ***9*** **mbytes** Megabyte units.
  - ***1*** to ***9584*** **kbytes** Kilobyte units.

- ***1*** to ***9584640*** **bytes** Byte units.

Related Command

random-detect ecn (Trident and Tomahawk) enables ECN marking for a unicast transmit queue.

Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at ***20*** and ***500*** segments.

```
switch(config)# qos random-detect ecn global-buffer minimum-
threshold 20 segments maximum-threshold 500 segments
switch(config)#
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)# no qos random-detect ecn global-buffer
switch(config)#
```

10.1.13.33 qos rewrite cos

The **`qos rewrite cos`** command enables the rewriting of the CoS field for outbound tagged packets that were received on DSCP trusted ports and untrusted ports. CoS rewrite is always disabled on CoS trusted ports. The CoS value that is written into the packet is based on the data stream's traffic class. CoS rewriting is active by default.

The **`no qos rewrite cos`** command disables CoS rewriting on the switch. The default **qos rewrite cos** command restores the default setting of enabling CoS rewriting by removing the **`no qos rewrite cos`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`qos rewrite cos`

`no qos rewrite cos`

`default qos rewrite cos`

Related Command

qos map traffic-class to cos configures the traffic class to CoS rewrite map.

Example

This command enables CoS rewrite.

```
switch(config)# qos rewrite cos
switch(config)#
```

10.1.13.34 qos rewrite dscp

The **`qos rewrite dscp`** command enables the rewriting of the DSCP field for outbound tagged packets that were received on CoS trusted ports and untrusted ports. DSCP rewrite is always disabled on DSCP trusted ports. The DSCP value that is written into the packet is based on the data stream's traffic class. DSCP rewriting is disabled by default.

The **`no qos rewrite dscp`** and **`default qos rewrite dscp`** commands disable DSCP rewriting on the switch by removing the **`no qos rewrite dscp`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`qos rewrite dscp`

`no qos rewrite dscp`

`default qos rewrite dscp`

Related Command

qos map traffic-class to dscp configures the traffic class to DSCP rewrite map.

Example

This command enables DSCP rewrite.

```
switch(config)# qos rewrite dscp
switch(config)#
```

10.1.13.35 qos trust

The **qos trust** command configures the quality of service port trust mode for the configuration mode interface. Trust-enabled ports classify traffic by examining the traffic's CoS or DSCP value. Port trust mode default setting is **cos** for switched interfaces and **dscp** for routed interfaces.

The **default qos trust** command restores the default trust mode on the configuration mode interface by removing the corresponding **qos trust** or **no qos trust** statement from ***running-config***.

The **no qos trust** command performs the following:

- **no qos trust** places the port in ***untrusted*** mode.
- **no qos trust cos** removes the corresponding **qos trust cos** statement.
- **no qos trust dscp** removes the corresponding **qos trust dscp** statement.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

qos trust [**MODE**]

no qos trust [**MODE**]

default qos trust

Parameters

- ***MODE*** Trust mode assigned to the port. Options include:
  - **cos** Enables cos trust mode.
  - **dscp** Enables dscp trust mode.
- **no qos trust** Enables untrusted mode on the port.

Examples

- This command configures trust mode of dscp for ***interface ethernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# qos trust dscp
switch(config-if-Et7)# show active
interface Ethernet7
   qos trust dscp
switch(config-if-Et7)#
```

- This command configures trust mode of untrusted for ***Port Channel interface 23***.

```
switch(config)# interface port-channel 23
switch(config-if-Po23)# no qos trust
switch(config-if-Po23)# show active
interface Port-Channel23
   no qos trust
switch(config-if-Po23)#
```

10.1.13.36 random-detect ecn (Arad/Jericho)

The **random-detect ecn** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

  When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The **no random-detect ecn** and **default qos random-detect ecn** commands disables ECN marking for the shared buffer by removing the **qos random-detect ecn** command from ***running-config***.

Command Mode

Tx-Queue configuration

Command Syntax

random-detect ecn minimum-threshold **MIN** maximum-threshold **MAX**

no random-detect ecn

default random-detect ecn

Parameters

MIN and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - ***1*** to ***256*** **mbytes** Megabyte units.
  - ***1*** to ***256000*** **kbytes** Kilobyte units.
  - ***1*** to ***256000000*** **bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - ***1*** to ***256*** **mbytes** Megabyte units.
  - ***1*** to ***256000*** **kbytes** Kilobyte units.
  - ***1*** to ***256000000*** **bytes** Byte units.

Related Command

tx-queue (Arad/Jericho) places the switch in tx-queue configuration mode.

Example

These commands enable ECN marking of unicast packets from ***unicast transmit queue 4*** of ***interface Ethernet 3/5/1***, setting thresholds at ***128*** kbytes and ***1280*** kbytes.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 4
switch(config-if-Et3/5/1-txq-4)# random-detect ecn minimum-thres
hold 128 kbytes
maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)# show active
interface Ethernet3/5/1
   tx-queue 4
      random-detect ecn minimum-threshold 128 kbytes maximum-
threshold 1280 kbytes
switch(config-if-Et3/5/1-txq-4)#
```

10.1.13.37 random-detect ecn (Helix)

The **`random-detect ecn`** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **`congestion encountered`**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **`congestion encountered`**. The proportion of marked packets varies linearly with average queue size:
  - ***0%*** are marked when average queue size is less than or equal to minimum threshold.
  - ***100%*** are marked when average queue size is greater than or equal to maximum threshold.

  When transmitted packets are marked Non ECN Capable, congestion packets are dropped, not marked.

  Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The **`no random-detect ecn`** and **`default random-detect ecn`** commands disable ECN marking on the configuration mode queue, deleting the corresponding **`random-detect ecn`** command from ***running-config***.

Command Mode

Tx-Queue configuration

Command Syntax

`random-detect ecn minimum-threshold` **MIN** maximum-threshold **MAX**

`no random-detect ecn`

`default random-detect ecn`

Parameters

MIN and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - ***1*** to ***46080*** **segments** 208-byte segments units.
  - ***1*** to ***9*** **mbytes** Megabyte units.
  - ***1*** to ***9584*** **kbytes** Kilobyte units.
  - ***1*** to ***9584640*** **bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - ***1*** to ***46080*** **segments** 208-byte segments units.
  - ***1*** to ***9*** **mbytes** Megabyte units.
  - ***1*** to ***9584*** **kbytes** Kilobyte units.
  - ***1*** to ***9584640*** **bytes** Byte units.

Related Commands

- tx-queue (Helix) places the switch in tx-queue configuration mode.
- qos random-detect ecn global-buffer (Helix) enables ECN marking for globally shared packet memory.

Examples

- These commands enable ECN marking of unicast packets from ***transmit queue 4*** of ***interface ethernet 15***, setting thresholds at ***10*** and ***100*** segments.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# uc-tx-queue 4
switch(config-if-Et15-txq-4)# random-detect ecn minimum-thres
hold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-txq-4)# show active
interface Ethernet15
   tx-queue 4
      random-detect ecn minimum-threshold 10 segments maximum-
threshold 100
segments
switch(config-if-Et15-txq-4)# exit
switch(config-if-Et15)
```

- This command disables ECN marking of unicast packets from ***transmit queue 4*** of ***interface ethernet 15***.

```
switch(config-if-Et15-txq-4)# no random-detect ecn
switch(config-if-Et15-txq-4)# show active
interface Ethernet15
switch(config-if-Et15-txq-4)# exit
switch(config-if-Et15)#
```

10.1.13.38 random-detect ecn (Trident and Tomahawk)

The **random-detect ecn** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - ***0%*** are marked when average queue size is less than or equal to minimum threshold.
  - ***100%*** are marked when average queue size is greater than or equal to maximum threshold.

  When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

  Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The **no random-detect ecn** and **default random-detect ecn** commands disable ECN marking on the configuration mode queue, deleting the corresponding **random-detect ecn** command from ***running-config***.

Command Mode

Uc-Tx-Queue configuration

Command Syntax

random-detect ecn minimum-threshold **MIN** maximum-threshold **MAX**

no random-detect ecn

default random-detect ecn

Parameters

MIN and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - ***1*** to ***46080*** **segments** 208-byte segments units.
  - ***1*** to ***9*** **mbytes** Megabyte units.
  - ***1*** to ***9584*** **kbytes** Kilobyte units.
  - ***1*** to ***9584640*** **bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - ***1*** to ***46080*** **segments** 208-byte segments units.
  - ***1*** to ***9*** **mbytes** Megabyte units.
  - ***1*** to ***9584*** **kbytes** Kilobyte units.
  - ***1*** to ***9584640*** **bytes** Byte units.

Related Commands

- uc-tx-queue places the switch in the ***uc-tx-queue*** configuration mode.
- qos random-detect ecn global-buffer (Trident and Tomahawk) enables ECN marking for globally shared packet memory.

Examples

- These commands enable ECN marking of unicast packets from ***unicast transmit queue 4*** of ***interface ethernet 15***, setting thresholds at ***10*** and ***100*** segments.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)# random-detect ecn minimum-
threshold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
   uc-tx-queue 4
      random-detect ecn minimum-threshold 10 segments maximum-
threshold 100
segments
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15)#
```

- This command disables ECN marking of unicast packets from ***unicast transmit queue 4*** of ***interface ethernet 15***.

```
switch(config-if-Et15-uc-txq-4)# no random-detect ecn
switch(config-if-Et15-uc-txq-4)# show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15)#
```

10.1.13.39 service-policy type qos input

The **service-policy type qos input** command applies the specified policy map to a QoS profile. The profile is then applied to an interface in interface configuration mode using the service-profile command.

The **no service-policy** type qos and **default service-policy type qos** command deletes the policy map from the profile.

The **exit** command returns the switch to global configuration mode.

Command Mode

QoS Profile Configuration

Command Syntax

service-policy type qos input ***policy_map_name***

no service-policy type qos input ***policy_map_name***

default service-policy type qos input ***policy_map_name***

Parameter

policy_map_name QoS policy map name.

Example

This command applies the policy map ***PM-1*** to the QoS profile ***TP***.

```
switch(config-qos-profile-TP)# service-policy type qos input PM-1
switch(config-qos-profile-TP)#
```

10.1.13.40 service-profile

The command applies the QoS profile to the configuration mode interface.

The **no service-profile** and the **default service-profile** command removes the QoS profile from the interface.

The **exit** command returns the switch to global configuration mode.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

service-profile ***profile_name***

no service-profile ***profile_name***

default service-profile ***profile_name***

Parameter

profile_name QoS profile name.

Example

This commands applies the QoS profile ***TP*** to ***interfaceethernet 13***.

```
switch(config)# interface ethernet 13
switch(config-if-Et13)# service-profile TP
```

10.1.13.41 set extcommunity

The **set extcommunity** command adds a color extended community to be applied to routes affected by the route-map. Multiple set clauses can be applied to a single route-map to configure multiple colors for routes. Negating the command removes the entry from the route-map.

Command Mode

Config-route-map mode

Command Syntax

set extcommunity COLOR-EXPRESSION [additive | delete]

no set extcommunity COLOR-EXPRESSION [additive | delete]

default set extcommunity COLOR-EXPRESSION [additive | delete]

Parameters

- **COLOR-EXPRESSION** The color extended community to be applied to routes affected by the route-map.
- **additive** Adds the extended communities to those received.
- **delete** Deletes any matching extended color communities.

Example

```
arista(config)# route-map foo
arista(config-route-map foo)# set extcommunity color 1
arista(config-route-map foo)# set extcommunity color 2 color-only exact-
match
arista(config-route-map foo)# set extcommunity color 3 color-only
 endpoint-match null
arista(config-route-map foo)# set extcommunity color 4 color-only
 endpoint-match any
```

10.1.13.42 shape rate (Interface – Arad/Jericho)

The **`shape rate`** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Arad/Jericho) command. By default, outbound transmission rate is not bounded by a shape rate.

The **`no shape rate`** and **`default shape rate`** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **`shape rate`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`shape rate` ***byte_limit*** [kbps]

`no shape rate`

`default shape rate`

Parameters

byte_limit Shape rate applied to interface (Kbps). Value ranges from ***162*** to ***100000000***.

Example

This command configures a port shape rate of ***5*** Gbps on ***interface ethernet 3/5/1***.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# shape rate 5000000
switch(config-if-Et3/5/1)# show qos interfaces ethernet 3/5/1

Ethernet3/5/1:

   Port shaping rate: 5000012 / 5000000 kbps

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   ------------------------------------------------------
   7      - / -        - / -    (  -  )    SP / SP    D
   6      - / -        - / -    (  -  )    SP / SP    D
   5      - / -        - / -    (  -  )    SP / SP    D
   4      - / -        - / -    (  -  )    SP / SP    D
   3      - / -        - / -    (  -  )    SP / SP    D
   2      - / -        - / -    (  -  )    SP / SP    D
   1      - / -        - / -    (  -  )    SP / SP    D
   0      - / -        - / -    (  -  )    SP / SP    D

switch(config-if-Et3/5/1)#
```

10.1.13.43 shape rate (Interface – FM6000)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – FM6000) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

shape rate ***byte_limit*** [kbps]

no shape rate

default shape rate

Parameters

byte_limit Shape rate applied to interface (Kbps). Value ranges from ***7000*** to ***10000000***.

Guidelines

Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in ***running-config***.

Example

This command configures a port shape rate of ***5*** Gbps on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# shape rate 5000000
switch(config-if-Et5)#
```

10.1.13.44 shape rate (Interface – Helix)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Interface – Helix) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

shape rate DATA_LIMIT

no shape rate

default shape rate

Parameters

- **DATA_LIMIT** Shape rate applied to interface. Value range varies with data unit:
  - ***8*** to ***40000000*** ***8*** to ***40000000*** kbytes per second.
  - ***8*** to ***40000000*****kbps** ***8*** to ***40000000*** kbytes per second.
  - ***8*** to ***60000000*****pps** ***8*** to ***60000000*** packets per second.

Guidelines

Shaping rates of at least ***8*** kbps are supported. At shaping rates smaller than ***1*** Mbps, granularity and rounding errors may skew the actual shaping rate by ***20%*** from the specified rate.

Example

This command configures a port shape rate of ***5*** Gbps on ***interface ethernet 17***.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# shape rate 5000000 kbps
switch(config-if-Et17)# show qos interface ethernet 17/3

Ethernet17:
   Trust Mode: COS
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: 5000000 / 5000000 kbps

  Tx       Bandwidth                 Shape Rate        Priority
 Queue     Guaranteed (units)          (units)
   ---------------------------------------------------------------
   7        - / -    (  -  )       - / -    (  -  )    SP / SP
   6        - / -    (  -  )       - / -    (  -  )    SP / SP

switch(config-if-Et17)#
```

10.1.13.45 shape rate (Interface – Petra)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Petra) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

shape rate ***data_limit*** [kbps]

no shape rate

default shape rate

Parameters

data_limit Shape rate applied to interface (Kbps). Value ranges from ***100*** to ***10000000***.

Guidelines

The following port shaping rates are supported:

- 1G ports: above 100 kbps.
- 10G ports: above 7900 kbps.

Commands that specify a smaller shape rate disable port shaping on the interface.

Example

This command configures a port shape rate of ***5*** Gbps on ***interface ethernet 3/3***.

```
switch(config)# interface ethernet 3/3
switch(config-if-Et3/3)# shape rate 5000000
switch(config-if-Et3/3)# show active
interface Ethernet3/3
   shape rate 5000000
switch(config-if-Et3/3)#
```

10.1.13.46 shape rate (Interface – Trident and Tomahawk)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Trident and Tomahawk) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

shape rate **DATA_LIMIT**

no shape rate

default shape rate

Parameters

- **DATA_LIMIT** Shape rate applied to interface. Value range varies with data unit:
  - ***8*** to ***40000000*** ***8*** to ***40000000*** kbytes per second.
  - ***8*** to 40000000**kbps** ***8*** to ***40000000*** kbytes per second.
  - ***8*** to ***60000000*****pps** ***8*** to ***60000000*** packets per second.

Guidelines

Shaping rates of at least ***8*** kbps are supported. At shaping rates smaller than ***1*** Mbps, granularity and rounding errors may skew the actual shaping rate by ***20%*** from the specified rate.

Example

This command configures a port shape rate of ***5*** Gbps on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# shape rate 5000000
switch(config-if-Et5)#
```

10.1.13.47 shape rate (Interface – Trident II)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the shape rate (Tx-queue – Trident II) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

shape rate **DATA_LIMIT**

no shape rate

default shape rate

Parameters

DATA_LIMIT Shape rate applied to interface. Value range varies with data unit:

- • ***8*** to ***40000000*** **kbps** ***8*** to ***40000000*** kbytes per second.
- ***8*** to ***40000000*** **kbps** ***8*** to ***40000000*** kbytes per second.
- ***8*** to ***60000000*** **pps** ***8*** to ***60000000*** packets per second.

Guidelines

Shaping rates of at least ***8*** kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by ***20%*** from the specified rate.

Example

This command configures a port shape rate of ***5*** Gbps on ***interface ethernet 17/3***.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# shape rate 5000000 kbps
switch(config-if-Et17/3)# show qos interface ethernet 17/3

Ethernet17/3:
   Trust Mode: COS
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: 5000000 / 5000000 kbps

  Tx       Bandwidth                 Shape Rate         Priority
 Queue     Guaranteed (units)          (units)
   ---------------------------------------------------------------
   7         - / -    (  -  )       - / -    (  -  )    SP / SP
   6         - / -    (  -  )       - / -    (  -  )    SP / SP

switch(config-if-Et17/3)#
```

10.1.13.48 shape rate (Tx-queue – Arad/Jericho)

The **`shape rate`** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Arad/Jericho) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Shaping rates greater than ***50000*** kbps are supported. At lower shaping rates (less than ***10*** Mbps), granularity and rounding errors may skew the actual shaping rate by ***20%*** from the specified rate.

The **`no shape rate`** and **`default shape rate`** commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding **`shape rate`** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

`shape rate` ***byte_limit*** [kbps]

`no shape rate`

`default shape rate`

Parameters

byte_limit Shape rate applied to interface (Kbps). Value ranges from ***50000*** to ***100000000***.

Related Command

tx-queue (Arad/Jericho) places the switch in tx-queue configuration mode.

Related Information

shape rate (Interface – Arad/Jericho)

Example

These commands configure a shape rate of ***1*** Gbps on transmit queues ***3*** and ***4*** of ***interface ethernet 3/4/1***.

```
switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# tx-queue 4
switch(config-if-Et3/4/1-txq-4)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)# tx-queue 3
switch(config-if-Et3/4/1-txq-3)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)# show qos interface ethernet
 3/4/1

Ethernet3/4/1:

   Port shaping rate: disabled

  Tx    Bandwidth       Shape Rate        Priority  ECN
 Queue  (percent)        (units)
   ------------------------------------------------------
   7      - / -         - / -     (  -  )    SP / SP    D

   1      - / -         - / -     (  -  )    SP / SP    D
   0      - / -         - / -     (  -  )    SP / SP    D
```

```
switch(config-if-Et3/4/1-txq-3)#
```

10.1.13.49 shape rate (Tx-queue – FM6000)

The **shape rate**command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – FM6000) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping on an FM6000 port is supported only when port shaping is not enabled on the interface. Enabling port shaping on a port disables queue shaping internally. Disabling port shaping restores queue shaping as specified by ***running-config***.

Shaping rates greater than ***460*** kbps are supported. At lower shaping rates (less than ***10*** Mbps), granularity and rounding errors may skew the actual shaping rate by ***20%*** from the specified rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the transmit queue by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

shape rate ***byte_limit*** [kbps]

no shape rate

default shape rate

Parameters

byte_limit Shape rate applied to interface (Kbps). Value ranges from ***464*** to ***10000000***.

Related Commands

- tx-queue (FM6000) places the switch in tx-queue configuration mode.
- shape rate (Interface – FM6000) configures the shape rate for a configuration mode interface.

Example

These commands configure a shape rate of ***1*** Gbps (***1,000,000*** Kbps) on transmit queues ***3*** and ***4*** of ***interface ethernet 19***.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# tx-queue 4
switch(config-if-Et19-txq-4)# shape rate 1000000
switch(config-if-Et19-txq-4)# tx-queue 3
switch(config-if-Et19-txq-3)# shape rate 1000000
switch(config-if-Et19-txq-3)# show qos interface ethernet 19

Ethernet19:
   Trust Mode: COS

   Tx-Queue    Bandwidth     Shape Rate      Priority
               (percent)        (Kbps)
   ------------------------------------------------
          6          N/A     disabled         strict
          5          N/A     disabled         strict
          4          N/A      1000000         strict
          3           25      1000000    round-robin
          2           25     disabled    round-robin
          1           25     disabled    round-robin
          0           25     disabled    round-robin
```

```
switch(config-if-Et19-txq-3)#
```

10.1.13.50 shape rate (Tx-queue – Helix)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Helix) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

shape rate ***byte_limit*** [kbps]

no shape rate

default shape rate

Parameters

DATA_LIMIT Shape rate applied to the queue. Value range varies with data unit:

- • ***8*** to ***40000000*** ***8*** to 40,000,000 kbytes per second.
  - ***8*** to ***40000000*** **kbps** ***8*** to ***40000000*** kbytes per second.
  - ***8*** to ***60000000*** **pps** ***8*** to ***60000000*** packets per second.

Restrictions

Queue shaping is not supported in cut-through mode.

Related Commands

- tx-queue (Helix) places the switch in ***tx-queue*** configuration mode.
- shape rate (Interface – Helix) configures the shape rate for a configuration mode interface.

Example

These commands configure a shape rate of ***1*** Gbps (***1,000,000*** Kbps) on transmit queues ***3*** and ***4*** of ***interface Eethernet 17/3***.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)# tx-queue 3
switch(config-if-Et17/3-txq-3)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)# show qos interface ethernet 17/3

Ethernet17/3:

  Tx       Bandwidth                 Shape Rate        Priority

```
switch(config-if-Et17/3-txq-3)#
```

10.1.13.51 shape rate (Tx-queue – Petra)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Petra) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping applies only to unicast traffic. Shaping rates of at least 162 Kbps are supported.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

shape rate DATA_LIMIT

no shape rate

default shape rate

Parameters

DATA_LIMIT Shape rate applied to the queue. Value range varies with data unit:

- • ***8*** to ***40000000*** **kbps** Range is from ***8*** to ***40000000*** kbytes per second.
  • ***8***to ***60000000*****pps** Range is from ***8*** to ***60000000*** packets per second.

  Shaping rates greater than ***460*** kbps are supported. At lower shaping rates (less than ***10*** Mbps), granularity and rounding errors may skew the actual shaping rate by ***20%*** from the specified rate.

Related Commands

- tx-queue (Petra) places the switch in ***tx-queue*** configuration mode.
- shape rate (Interface – Petra) configures the shape rate for a configuration mode interface.

Example

These commands configure a shape rate of ***1*** Gbps (***1,000,000*** Kbps) on transmit queues ***3*** and ***4*** of ***interface ethernet 3/28***.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# tx-queue 4
switch(config-if-Et3/28-txq-4)# shape rate 1000000
switch(config-if-Et3/28-txq-4)# tx-queue 3
switch(config-if-Et3/28-txq-3)# shape rate 1000000
switch(config-if-Et3/28-txq-3)# show qos interface ethernet 3/28

Ethernet3/28:

   Tx-Queue    Bandwidth     Shape Rate      Priority
               (percent)        (Kbps)
   ---------------------------------------------
          7          N/A     disabled         strict
          6          N/A     disabled         strict
          5          N/A     disabled         strict
          4          N/A      1000000         strict
          3           25      1000000    round-robin
          2           25     disabled    round-robin
          1           25     disabled    round-robin
          0           25     disabled    round-robin
```

```
switch(config-if-Et3/28-txq-3)#
```

10.1.13.52 shape rate (Tx-queue – Trident and Tomahawk)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Trident and Tomahawk) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate limit from the configuration mode transmit queue by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

Command Syntax

shape rate DATA_LIMIT

no shape rate

default shape rate

Parameters

- **DATA_LIMIT** Shape rate applied to the queue. Value range varies with data unit:
  - ***8*** to ***40000000*** **kbps** Range is from ***8*** to ***40000000*** kbytes per second.
  - ***8*** to ***60000000*** **pps** Range is from ***8*** to ***60000000*** packets per second.

Related Commands

- mc-tx-queue places the switch in ***mc-tx-queue*** configuration mode.
- uc-tx-queue places the switch in ***uc-tx-queue*** configuration mode.
- shape rate (Interface – Trident and Tomahawk) configures the shape rate for a configuration mode interface.

Guidelines

Shaping rates of at least ***8*** kbps are supported. At shaping rates smaller than ***1*** Mbps, granularity and rounding errors may skew the actual shaping rate by ***20%*** from the specified rate.

When two queues source traffic from the same traffic class and the higher priority queue is shaped, that queue consumes all internal buffers, starving the lower priority queue even if bandwidth is available.

Example

These commands configure a shape rate of ***1*** Gbps (***1,000,000*** Kbps) on ***unicast transmit queues 3*** and ***multicast transmit 4*** of ***interface ethernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# shape rate 1000000
switch(config-if-Et7-uc-txq-3)# mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)# shape rate 1000000
switch(config-if-Et7-mc-txq-2)# show qos interface ethernet 7

Ethernet7:
   Tx-Queue    Bandwidth     Shape Rate      Priority    Priority
 Group
               (percent)        (Kbps)
```

10.1.13.53 shape rate (Tx-queue – Trident II)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the shape rate (Interface – Trident II) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding **shape rate** command from ***running-config***.

Command Mode

Tx-Queue Configuration

Command Syntax

shape rate ***byte_limit*** [*kbps*]

no shape rate

default shape rate

Parameters

DATA_LIMIT Shape rate applied to the queue. Value range varies with data unit:

- • ***8*** to ***40000000*** **kbps** Range is from ***8*** to ***40000000*** kbytes per second.
  - ***8*** to ***60000000*** **pps** Range is from ***8*** to ***60000000*** packets per second.

Restrictions

Queue shaping is not supported in cut-through mode

Related Commands

- tx-queue (Trident II) places the switch in ***tx-queue*** configuration mode.
- shape rate (Interface – Trident II) configures the shape rate for a configuration mode interface.

Example

These commands configure a shape rate of ***1*** Gbps (***1,000,000*** Kbps) on transmit queues ***3*** and ***4*** of ***interface ethernet 17/3***.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)# tx-queue 3
switch(config-if-Et17/3-txq-3)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)# show qos interface ethernet 17/3

```

10.1.13.54 show interface counters queue drop-precedence

The **show interface counters queue drop-precedence** command displays the drop-precedence counters.

Command Mode

EXEC

Command Syntax

show interface counters queue drop-precedence

Example

This command displays the drop precedence counts on two interfaces.

```
switch# show interface counters queue drop-precedence
intf        0          1          2
Et1/1     100          0        200
Et1/2     200          0        300
switch#
```

10.1.13.55 show platform petraA traffic-class

The **`show platform petraA traffic-class`** command displays the traffic class assignment on all specified Petra chips. Each chip controls eight Ethernet interfaces. The default traffic class of an interface is specified by the traffic class assigned to the chip that controls the interface.

Traffic class assignments are configured with the platform petraA traffic-class command.

Valid command options include:

- **show platform petraA traffic-class** Traffic class of all chips on all linecard.
- **show platform petraA CHIP_NAME traffic-class** Traffic class of specified chip.
- **show platform petraA MODULE_NAME traffic-class** Traffic class of all chips on specified linecard.

Command Mode

EXEC

Command Syntax

`show platform petraA traffic-class`

`show platform petraA` **CHIP_NAME** **`traffic-class`**

`show platform petraA` **MODULE_NAME** **`traffic-class`**

Parameters

- **CHIP_NAME** Name of Petra chip on linecard that control Ethernet ports. Options include:
  - **petra *cardX* / *chipY*** All ports on PetraA chip ***chipY*** on linecard ***cardX*** (7500 Series).
  - **petra *chipZ*** All ports on PetraA chip ***chipZ*** (7048 Series).

  7500 Series

  Switches can contain up to eight linecards. ***cardX*** varies from ***3*** to ***10***.

  Each linecard contains six PetraA chips. Each chip controls eight ports. ***chipY*** varies from ***0*** to ***5***:

  - 0 controls ports 1 through 8
  - 1 controls ports 9 through 16
  - 2 controls ports 17 through 24
  - 3 controls ports 25 through 32
  - 4 controls ports 33 through 40
  - 5 controls ports 41 through 48

  7048 Series

  Each switch contains two PetraA chips. ***chipZ*** varies from ***0*** to ***1***:

  - 0 controls ports 1 through 32
  - 1 controls ports 33 through 52
- **MODULE_NAME** Name and number of linecard (7500 Series). Options include:
  - **module linecard *mod_num*** Linecard number (***3*** to ***10***).
  - **module *mod_num*** Linecard number (***3*** to ***10***).

Related Command

platform petraA traffic-class configures the default traffic class used by all ports on a specified chip.

Example

This command displays the traffic class of all chips on ***linecard 3***.

```
switch# show platform petraA module linecard 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1
switch#
```

10.1.13.56 show platform trident tcam qos detail

The **show platform trident tcam qos detail** command displays the list of all the SVIs that are sharing the TCAM entries.

Command Mode

EXEC

Command Syntax

show platform trident tcam qos detail

Example

This command displays the list of all the SVIs that are sharing the TCAM entries.

```
switch(config)# show platform trident tcam qos detail

=== Policy-map p01 type qos on switch Linecard0/0 ===
Interfaces : Vlan2 Vlan1
=-= Interface BitMap =-=
0x00000000000000001FFFFFE
```

10.1.13.57 show platform trident tcam shared vlan interface-class-id

The **show platform trident tcam shared vlan interface-class-id** command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

Command Mode

EXEC

Command Syntax

show platform trident tcam shared vlan interface-class-id

Example

This command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

```
switch(config)# show platform trident tcam shared vlan interface-
class-id

=== Shared RACL Data on switch Linecard0/0 ===
=== Shared QoS Policy-map Data on switch Linecard0/0 ===
Interface Class Id             VLANs
1                               1 2
```

10.1.13.58 show platform xp qos tcam hit

The **`show platform xp qos tcam hit`** command displays the TCAM entries programmed for each policy-map as well as the traffic hits. The hits option is used to see the TCAM entries with nonzero traffic hits.

Command Mode

EXEC

Command Syntax

`show platform xp qos tcam hit`

Example

This command displays the QoS TCAM hits on ***interface ethernet 10/1***.

```
switch# show platform xp qos tcam hit

=== Policy-map test type qos on switch 0 ===
Assigned to ports: Ethernet10/1
=-= Class-map test type qos =-=

```

10.1.13.59 show policy-map interface

The **show policy-map interface** command displays contents of the policy map applied to specified the interface.

Command Mode

EXEC

Command Syntax

show policy-map interface ***interface_name***

Parameters

interface_name Interface for which command returns data. Options include:

- ***no parameter*** Returns data for all interfaces.
- ethernet ***e_range*** Ethernet interfaces specified by ***e_range***.
- **port-channel *p_range*** Port channel interfaces specified by ***p_range***.

Example

This command displays the name and contents of the policy map applied to ***interface Ethernet 1***.

```
switch# show policy-map interface ethernet 1
Service-policy input: p1
 Hardware programming status: Successful

 Class-map: c2001 (match-any)
    Match: vlan 2001 0xfff
       set dscp 4

 Class-map: c2002 (match-any)
    Match: vlan 2002 0xfff
       set dscp 8

 Class-map: c2003 (match-any)
    Match: vlan 2003 0xfff
       set dscp 12
```

10.1.13.60 show policy-map

The **show policy-map** command displays the policy map information for the configured policy map.

Command Mode

EXEC

Command Syntax

show policy-map ***policy_map_name*** [counters][interface | summary]

Parameters

- ***policy_map_name*** QoS policy map name.
- **counters** Specifies the policy map traffic match count (This parameter is applicable only on DCS-7010, DCS-7050X, DCS7250X, DCS-7300X and DCS-7280(E/R), DCS-7500(E/R) series switches.)
- **interface** Specifies the service policy on an interface.
- **summary** Policy map summary.

Examples

- The **show policy-map command** displays the information for the policy map ***policy1***.

```
switch# show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

- The **show policy-map counters** command displays the policy map traffic match count for the policy map configured.

```
switch# show policy-map policy1 counters

Service-policy input: policy1
 Hardware programming status: Successful
 Class-map: class1 (match-any)
    Match: vlan 20-40,1000-1250
       police rate 100 mbps burst-size 100 kbytes
        Interface: Ethernet16/1
          Conformed 28621 packets, 7098008 bytes -------------- packet match
 count

Class-map: class-default (match-any)
      Matched Packets: 19 -------------- packet match count
```

10.1.13.61 show qos interfaces random-detect ecn

The **show qos interfaces random-detect ecn** command displays the Explicit Congestion Notification (ECN) configuration for each transmit queue on the specified interfaces.

Command Mode

EXEC

Command Syntax

show qos interfaces [**INTERFACE_NAME**] random-detect ecn

Parameters

INTERFACE_NAME Interface for which command returns data. Options include:

- ***no parameter*** Returns data for all interfaces.
- **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
- **port-channel *p_range*** Port-Channel Interfaces specified by ***p_range***.

Example

This command configures ECN parameters for transmit queues ***0*** through ***3*** on ***interface ethernet 3/5/1***, then displays that configuration.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# random-detect ecn minimum-threshold 2560 kbytes
maximum-threshold 256000 kbytes
switch(config-if-Et3/5/1-txq-0)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# random-detect ecn minimum-threshold 25600
 kbytes
maximum-threshold 128000 kbytes
switch(config-if-Et3/5/1-txq-1)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# random-detect ecn minimum-threshold 25600 bytes
maximum-threshold 128000 bytes
switch(config-if-Et3/5/1-txq-2)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# random-detect ecn minimum-threshold 25 mbytes
maximum-threshold 128 mbytes
switch(config-if-Et3/5/1-txq-3)# show qos interfaces ethernet 3/5/1 random-
detect
ecn

Ethernet3/5/1:

   Tx-Queue   Mininimum Threshold    Maximum Threshold    Threshold Unit
   --------------------------------------------------------------------
          7                     -                    -                -
          6                     -                    -                -
          5                     -                    -                -
          4                     -                    -                -
          3                    25                  128           mbytes
          2                 25600               128000            bytes
          1                 25600               128000           kbytes
          0                  2560               256000           kbytes

switch(config-if-Et3/5/1-txq-3)#
```

10.1.13.62 show qos interfaces trust

The **show qos interfaces trust** command displays the configured and operational QoS trust mode of all specified interfaces.

Command Mode

EXEC

Command Syntax

show qos interfaces [**INTERFACE_NAME**] **trust**

Parameters

INTERFACE_NAME Interface for which command returns data. Options include:

- ***no parameter*** Returns data for all interfaces.
- **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
- **port-channel *p_range*** Port-Channel Interfaces specified by ***p_range***.

Example

These commands configure a variety of QoS trust settings on a set of interfaces, then displays the QoS trust mode on these interfaces.

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# qos trust cos
switch(config-if-Et1/1)# interface ethernet 1/2
switch(config-if-Et1/2)# qos trust dscp
switch(config-if-Et1/2)# interface ethernet 1/3
switch(config-if-Et1/3)# no qos trust
switch(config-if-Et1/3)# interface ethernet 1/4
switch(config-if-Et1/4)# default qos trust
switch(config-if-Et1/4)# interface ethernet 2/1
switch(config-if-Et2/1)# no switchport
switch(config-if-Et2/1)# default qos trust
switch(config-if-Et2/1)# show qos interface ethernet 1/1 - 2/4 trust

Port                                    Trust Mode
                                Operational           Configured
-------------------------------------------------------------------
Ethernet1/1                     COS                   COS
Ethernet1/2                     DSCP                  DSCP
Ethernet1/3                     UNTRUSTED             UNTRUSTED
Ethernet1/4                     COS                   DEFAULT
Ethernet2/1                     DSCP                  DEFAULT
Ethernet2/2                     COS                   DEFAULT
Ethernet2/3                     COS                   DEFAULT
Ethernet2/4                     COS                   DEFAULT

switch(config-if-Et2/1)#
```

10.1.13.63 show qos interfaces

The **`show qos interfaces`** command displays the QoS, DSCP, and transmit queue configuration on a specified interface. Information provided by this command includes the ports trust setting, the default CoS value, and the DSCP value.

Command Mode

EXEC

Command Syntax

`show qos interfaces` **INTERFACE_NAME**

Parameters

INTERFACE_NAME Interface For which command returns data. Options include:

- ***no parameter*** Returns data for all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.

Example

This command lists the QoS configuration for ***interface ethernet 4***.

```
switch> show qos interfaces ethernet 4

Ethernet4:
   Trust Mode: COS
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: 5000000Kbps

   Tx-Queue   Bandwidth    ShapeRate      Priority
              (percent)       (Kbps)
   ------------------------------------------------
          0          50     disabled   round-robin
          1          50     disabled   round-robin
          2         N/A     disabled        strict
          3         N/A      1000000        strict
          4         N/A      1000000        strict
          5         N/A      1500000        strict
          6         N/A      2000000        strict

switch>
```

10.1.13.64 show qos interfaces latency maximum

The **show qos interfaces latency maximum** command displays the maximum latency tail-drop threshold active on each Tx queue for a specified interface.

Command Mode

EXEC

Command Syntax

show qos interfaces ***INTERFACE_NAME*** **latency maximum**

Parameters

INTERFACE_NAME: Name of the interface.

This command lists the maximum latency for VOQ tail drop on ***interface ethernet 23/1***.

```
switch# show qos interfaces ethernet 23/1 latency maximum

Ethernet23/1:
Tx Queue            Maximum Latency
--------            ---------------
       7                          -
       6                          -
       5                          -
       4                          -
       3                      10 ms
       2                          -
       1                          -
       0                          -

switch# show qos profile
qos profile latency
    tx-queue 3
        latency maximum 4000 microseconds
    Tx-queue 4
        latency maximum 30 milliseconds
switch#
```

10.1.13.65 show qos maps

The **show qos maps** command lists the number of traffic classes that the switch supports and displays the CoS-Traffic Class, DSCP-Traffic Class, Traffic Class-CoS, and Traffic Class-Transmit Queue maps.

Command Mode

EXEC

Command Syntax

show qos maps

Example

This command displays the QoS maps that are configured on the switch.

```
switch> show qos maps
Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8
   Cos Rewrite:  Disabled
   Dscp Rewrite:  Disabled

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ----------------------------
     tc:   1  0  2  3  4  5  6  7

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ---------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
      2 :     2  2  2  2  3  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  5  5  5  5  5  5  5  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ----------------------------
     cos:  1  0  2  3  4  5  6  7

   Tc-dscp map:
     tc:    0  1  2  3  4  5  6  7
     ------------------------------
     dscp:  8  0 16 24 32 40 48 56

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     ----------------------------------
     tx-queue:  0  1  2  3  4  5  6  7

switch>
```

10.1.13.66 show qos map dscp to traffic-class

The **show qos map dscp to traffic-class** command shows all DSCP to traffic-class maps, or one specified DSCP to TC map.

Command Mode

Privileged EXEC mode

Command Syntax

`show qos map dscp to traffic-class` [***`map_name`***]

Parameters

- ***map_name*** The name of the DSCP to traffic-class map. If this is not specified, all DSCP to TC maps are shown.

Example

This command shows the DSCP to TC map named ***map1.***

```
switch#show qos map dscp to traffic-class map1
   DSCP to TC map: map1
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ---------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
      2 :     6  6  6  6  6  6  3  3  3  3
      3 :     3  3  4  4  4  7  4  4  4  4
      4 :     5  5  5  5  5  5  5  5  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7
switch#
```

10.1.13.67 show qos profile summary

The **show qos profile summary** command displays the QoS profile summary of those which are part of the running configuration.

Command Mode

EXEC

Command Syntax

show qos profile summary

Example

This command shows a summary of all QoS profiles configured on the switch.

```
switch(config)# show qos profile summary
Qos Profile: p
Configured on: Et13,7
Fabric
Po12
Qos Profile: p2
Configured on: Et56
```

10.1.13.68 show qos profile

The **show qos profile** command displays the contents of the specified QoS profile or of all QoS profiles in the running configuration.

Command Mode

EXEC

Command Syntax

show qos profile ***profile_name***

Parameter

profile_name QoS profile name.

Examples

- This command displays the contents of all QoS profiles configured on the switch.

```
switch(config)# show qos profile
qos profile p
qos cos 1
no priority-flow-control pause watchdog
priority-flow-control priority 1 no-drop
priority-flow-control priority 2 no-drop
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

- This command displays the configuration attached and information specific to ***QoS profile p2***.

```
switch# show qos profile p2
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

10.1.13.69 show qos random-detect ecn

The command displays the global Explicit Congestion Notification (ECN) configuration.

Command Mode

EXEC

Command Syntax

show qos random-detect ecn

Example

These commands configure global ECN parameters, then displays that configuration.

```
switch(config)# qos random-detect ecn global-buffer minimum-thres
hold 2 mbytes
maximum-threshold 5 mbytes
switch(config)# show qos random-detect ecn

   Minimum Threshold:  2
   Maximum Threshold:  5
   Threshold Unit:  mbytes

switch(config)#
```

10.1.13.70 show run|grep sharing

The **show run|grep sharing** command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

Command Mode

EXEC

Command Syntax

show run|grep sharing

Example

This command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

```
switch# show run|grep sharing
hardware access-list qos resource sharing vlan in ----
```

If this message is displayed then QoS policy-map sharing on SVIs is enabled.

10.1.13.71 tx-queue (Arad/Jericho)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Arad and Jericho platform switches have eight queues, ***0*** through ***7***, and all queues are exposed through the CLI. However, ***queue 7*** is not user-configurable. ***Queue 7*** is always mapped to ***traffic class 7***, which is reserved for control traffic.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting all corresponding **tx-queue** mode statements from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

tx-queue ***queue_level***

Parameters

queue_level The transmit queue. Values range from ***0*** to ***7***.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)
- shape rate (Tx-queue – Arad/Jericho)

Guidelines

Arad and Jericho platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

Example

This command enters Tx-queue configuration mode for ***transmit queue 4*** of ***interface ethernet 3/3/3***.

```
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```

10.1.13.72 tx-queue (FM6000)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

FM6000 platform switches have eight queues, ***0*** through ***7***. All queues are exposed through the CLI and are user configurable.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

tx-queue ***queue_level***

Parameters

queue_level The transmit queue. Values range from ***0*** to ***7***.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (FM6000)
- priority (FM6000)
- shape rate (Tx-queue – FM6000)

Guidelines

FM6000 platform switch queues handle unicast and multicast traffic.

Example

This command enters Tx-queue configuration mode for ***transmit queue 3*** of ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
switch(config-if-Et5-txq-3)#
```

10.1.13.73 tx-queue (Helix)

The **tx-queue** command places the switch in ***tx-queue*** configuration mode to configure a transmit queue on the configuration mode interface. The ***tx-queue*** configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Helix platform switches have eight unicast (***UC0 – UC7***) and eight multicast (***MC0 – MC7***) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

tx-queue ***queue_level***

Parameters

queue_level Transmit queue group number. Values range from ***0*** to ***7***.

Commands Available in tx-queue Configuration Mode

- bandwidth guaranteed (Helix)
- shape rate (Tx-queue – Helix)

Guidelines

Helix platform switch queues handle unicast and multicast traffic.

Example

This command enters Tx-queue configuration mode for ***transmit queue 4*** of ***interface ethernet 17/3***.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)#
```

10.1.13.74 tx-queue (Petra)

The **`tx-queue`** command places the switch in ***tx-queue*** configuration mode to configure a transmit queue on the configuration mode interface. The ***tx-queue*** configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **`exit`** command does not affect the configuration.

Petra platform switches have eight queues, ***0*** through ***7***, and all queues are exposed through the CLI. However, ***queue 7*** is not user-configurable. ***Queue 7*** is always mapped to ***traffic class 7***, which is reserved for control traffic.

The **`exit`** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **`no tx-queue`** and **`default tx-queue`** commands remove the configuration for the specified transmit queue by deleting the all corresponding **`tx-queue`** mode commands from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`tx-queue` ***queue_level***

Parameters

queue_level The transmit queue. Values range from ***0*** to ***7***.

Commands Available in tx-queue Configuration Mode

- bandwidth percent (Petra)
- priority (Petra)
- shape rate (Tx-queue – Petra)

Guidelines

Petra platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

Example

This command enters the ***tx-queue*** configuration mode for ***transmit queue 3*** of ***interface ethernet 3/3***.

```
switch(config)# interface ethernet 3/3
switch(config-if-Et3/3)# tx-queue 3
switch(config-if-Et3/3-txq-3)#
```

10.1.13.75 tx-queue (Trident II)

The **tx-queue** command places the switch in ***tx-queue*** configuration mode to configure a transmit queue on the configuration mode interface. The ***tx-queue*** configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident II platform switches have eight unicast (***UC0 – UC7***) and eight multicast (***MC0 – MC7***) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

tx-queue ***queue_level***

Parameters

queue_level Transmit queue group number. Values range from ***0*** to ***7***.

Commands Available in tx-queue Configuration Mode

- bandwidth guaranteed (Trident II)
- shape rate (Tx-queue – Trident II)

Trident II platform switch queues handle unicast and multicast traffic.

Example

This command enters the ***tx-queue*** configuration mode for ***transmit queue 4*** of ***interface ethernet 17/3***.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)#
```

10.1.13.76 uc-tx-queue

The **`uc-tx-queue`** command places the switch in the ***uc-tx-queue*** configuration mode to configure a unicast transmit queue on the configuration mode interface. The ***uc-tx-queue*** configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **`exit`** command does not affect the configuration.

Trident and Tomahawk switches have eight unicast queues (***UC0 – UC7***) and four multicast queues (***MC0 – MC03***), categorized into two priority groups. All queues are exposed through the CLI and are user-configurable.

- **Priority Group 1:** ***UC7***, ***UC6***, ***MC3***
- **Priority Group 0:** ***UC5***, ***UC4***, ***MC2***, ***UC3***, ***UC2***, ***MC1***, ***UC1***, ***UC0***, ***MC0***

The **`exit`** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **`no uc-tx-queue`** and **`default uc-tx-queue`** commands remove the configuration for the specified transmit queue by deleting the all corresponding **`uc-tx-queue`** mode commands from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`uc-tx-queue` ***queue_level***

Parameters

queue_level The multicast transmit queue number. Values range from ***0*** to ***7***.

Commands Available in `uc-tx-queue` Configuration Mode

- bandwidth percent (Trident and Tomahawk)
- priority (Trident and Tomahawk)
- shape rate (Tx-queue – Trident and Tomahawk)

Related Command

mc-tx-queue: Configures multicast transmit queues on Trident and Tomahawk platform switches.

Example

This command enters the ***mc-tx-queue*** configuration mode for ***multicast transmit queue 4*** of ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# uc-tx-queue 4
switch(config-if-Et5-mc-txq-4)#
```

10.2 Traffic Management

This chapter describes Arista's Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Traffic Management Conceptual Overview
- Traffic Management Configuration Arad Platform Switches
- Traffic Management Configuration FM6000 Platform Switches
- Traffic Management Configuration Petra Platform Switches
- Traffic Management Configuration Trident Platform Switches
- Traffic Management Configuration Trident II Platform Switches
- Traffic Management Configuration Commands

10.2.1 Traffic Management Conceptual Overview

Traffic is managed through policy maps that apply data shaping methods to specific data streams. A policy map is a data structure that identifies specific data streams and then defines shaping parameters that modify packets within the streams. The switch defines four types of policies:

- Control Plane Policies: Control plane policy maps are applied to the control plane.
- QoS Policies: QoS policy maps are applied to Ethernet and port channel interfaces.
- Segment Routing Traffic Engineering Policy (SR-TE).
- PBR Policies: PBR policy maps are applied to Ethernet interfaces, port channel interfaces and switch virtual interfaces (SVIs).

A policy map consists of classes. Each class contains an eponymous class map and traffic resolution commands.

- A class map is a data structure that defines a data stream by specifying characteristics of data packets that comprise that stream. Each class map is typed as either QoS, control plane, or PBR and is available only to identically typed policy maps.
- Traffic resolution commands specify data handling methods for traffic that matches a class map. Traffic resolution options vary by policy map type.

Data packets that enter an entity to which a policy map is assigned are managed with traffic resolution commands of the first class that matches the packets.

10.2.1.1 Control Plane Policies

The switch defines one control plane policy map named ***copp-system-policy***. The ***copp-system-policy*** policy map is always applied to the control plane and cannot be removed from the switch. Other control plane policy maps cannot be added. **Copp-system-policy** consists of preconfigured classes, each containing a static class map and traffic resolution commands. Preconfigured classes cannot be removed from ***copp-system-policy***.

Static class maps are provided by the switch and cannot be modified or deleted. The naming convention of static class maps is ***copp-system-*** *name*, where *name* differentiates the class maps. Static class maps have pre-defined internal conditions, are not based on ACLs, and are only listed in ***running-config*** as components of ***copp-system-policy***. The sequence of static class maps in the policy map is not significant. Traffic resolution commands define minimum (bandwidth) and maximum (shape) transmission rates for data streams matching the corresponding class map.

Copp-system-policy can be modified through the following steps:

1. Add classes consisting of an eponymous dynamic class map and traffic resolution commands.

   Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in ***running-config***.

2. Change traffic resolution commands for a preconfigured class.

These sections describe control plane traffic policy configuration procedures:

- Configuring Control Plane Traffic Policies Arad Platform Switches
- Configuring Control Plane Traffic Policies FM6000 Platform Switches
- Configuring Control Plane Traffic Policies Petra Platform Switches
- Configuring Control Plane Traffic Policies Trident Platform Switches

10.2.1.2 QoS Policies

QoS policy maps are user defined. The switch does not provide preconfigured QoS policy maps and in the default configuration, policy maps are not applied to any Ethernet or port channel interface. Policy maps and class maps are created and applied to interfaces through configuration commands.

A QoS policy map is composed of one or more classes. Each class contains an eponymous dynamic class map and traffic resolution commands. Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in ***running-config***.

QoS traffic resolution commands perform one of the following:

- Set the Layer 2 CoS field
- Set the DSCP value in the ToS byte
- Specify a traffic class queue

The last class in all QoS policy maps is ***class-default***, which is composed as follows:

- The ***class-default*** class map matches all traffic except IPv4 or IPv6 traffic and is not editable.
- By default, ***class-default*** class contains no traffic resolution commands. Traffic resolution commands can be added through configuration commands.

Data packets that enter an interface to which a policy map is assigned are managed with traffic resolution commands that correspond to the first class that matches the packet.

These sections describe QoS traffic policy configuration procedures:

- Configuring QoS Traffic Policies Arad Platform Switches
- Configuring QoS Traffic Policies FM6000 Platform Switches
- Configuring QoS Traffic Policies Petra Platform Switches
- Configuring QoS Traffic Policies Trident Platform Switches

10.2.1.3 Segment Routing Traffic Engineering Policy (SR-TE)

Segment Routing Traffic Engineering Policy (SR-TE) policy uses Segment Routing (SR) to enable a headend to steer traffic along any path without maintaining per flow state in every node based on the policy. Configuring SR policy for the MPLS dataplane (SR-MPLS) for Type-1 SR policy segments with BGP and locally configured policies as sources of SR policy is available on DCS-7500 and DCS-7280 family of switches.

SR Policy Overview
SR Policy Identification

The following identifies an SR policy.

- **Endpoint**: an IPv4 or IPv6 address which refers to the destination of the policy. (0/0, 0:: are allowed and called “null endpoints”)
- **Color**: an unsigned 32-bit opaque numerical quantity. The semantic of a color is up to the operator. It can refer to, for instance, an application or a type of traffic (low latency) or a geographical location, etc.

SR Policy Constituents

The SR policy consists of *candidate paths*. Each candidate path has the following.

- **SID-lists (SLs)**: an ordered list of Segment Identifiers. (Each SID is a MPLS label in the MPLS instantiation of SR). An SL encodes one path from the headend to the destination. Each SL has an optional weight attached to it for the purpose of Unequal Cost Multipath (UCMP) traffic distribution. The default value for SL weight is ***1***.
- **Preference**: an optional, unsigned 32-bit integer used in the candidate path selection algorithm to select the “active” candidate path. The default value for preference is ***100***.
- **Binding SID (BSID)**: an optional, SID.

Note: In EOS, a BSID is mandatory for each candidate path.

SR Policy Sources

A headend learns SR policies using the following.

- **BGP**
  - Single agent routing model (Ribd)
  - Multi-agent routing model
- **Local configuration using CLI**
  - Single agent routing model (Ribd)
  - Multi-agent routing model
  - Openconfig YANG models
- **PCEP**

Note: PCEP is not supported in EOS.

Identity of a Candidate Path

A candidate path within an SR policy is identified by a 3-tuple of {Protocol-Origin, Originator, Discriminator}. In EOS, for locally configured policies:

- the ASN in the Originator is set to 0.
- the node address in the Originator is set to ***0.0.0.0***.
- discriminator is set to the Preference configured.

Note: EOS CLI allows configuring only one candidate path at a given preference and does not allow configuring the discriminator for a candidate path.

State of an SID List (SL)

The following describes the state of an SL.

- **Valid**: the top label of the SL is resolvable within the LFIB to outgoing next hop(s), interface(s) and a label action.
- **Invalid**: top label of the SL is not resolvable to outgoing next hop(s), interface(s) and a label action. An SL is also marked as invalid when the SL is resolvable, but the resolved labeled stack exceeds the platform’s maximum SID depth (SID), that is, exceeds the maximum number of labels the platform can push in to the outgoing packet.

Note: The state is either valid or invalid.

State of a Candidate Path

The following describes the states of a candidate path.

- **Invalid**: not eligible to participate in the best/active candidate path selection algorithm because of one of the reasons below.
  - all constituent SLs are invalid

    - Binding SID is not present
    - Binding SID is present but outside SRLB range
- **Valid**: At least one SL is valid and has lost out to some other candidate path in the best / active candidate path selection algorithm.
- **Active**: The candidate path is valid and is the winner in the best / active candidate path selection algorithm. The active candidate path is installed in the switch hardware and used for forwarding traffic.

State of an SR Policy

An SR policy is “valid” when at least one of its candidate paths is valid as described above. Otherwise, the SR policy is said to be “invalid”.

Resolution of an SL

An SL is resolved if the top label (first SID) can be resolved in the system Labeled FIB (LFIB) to yield a nexthop and outgoing interface(s). The other labels in the SID-List do not play a part in resolution.

Best Candidate Path (Active Candidate Path) Selection Algorithm

EOS overrides selection based on discriminator by retaining the current active candidate path even when current active path has a lower discriminator value. This reduces the active path flap when a new path is learnt of the same significance. The following is a summary of valid candidate paths ordering for a given policy.

1. Candidate path with higher preference is chosen.
2. Locally configured candidate path is chosen over BGP learnt path
3. Lower originator is chosen.
    a. Lower AS number of Originator field is chosen
    b. Lower Node address of Originator field is chosen
4. Current active candidate path is chosen

The following displays the reason for a path not getting selected as an active path for a specified policy.

```
switch# show traffic-engineering segment-routing policy endpoint
 <endpoint> color <color>
```

Binding SID

The use cases for Binding SID are the following.

- Stitch together multiple domains
- Stitch together different traffic tunnels
- Overcome label stack imposition limitation in hardware.

BSID Conflict Handling

Examples

1. **(Between Policies)**: If the policy (E1, C1) becomes eligible to be active first then it would be installed in the LFIB and the policy (E2,C2) whose best path(CP1) is in conflict with the Policy (E1, C1) and will not become active.
    - Policy(E1, C1): CP1: Binding-SID 965536 (wins best path)
    - Policy(E2, C2): CP1: Binding-SID 965536 (wins best path)
    - CP2: Binding-SID 965537
2. **(with other Application)**: The SR-TE policies have the lowest preference when there is a conflict with any other application in EOS using the SRLB range. The candidate paths which have the binding-SID as that of an LFIB entry by another application (for example, static adjacency segment) will be kept as “invalid”.

In both the cases, when the conflict no longer exists, the candidate paths are re-evaluated and may become active.

BGP as a Source of Policies

SR Policies from a BGP peer (a controller, route reflector) is received for installation at the headend by EOS. It does not propagate the received policies to BGP peers nor does it originate SR Policies for transmission to BGP peers.

The following are supported over IPv4 or IPv6 peers which can be single hop or multi-hop iBGP or eBGP peers.

1. **SAFI 73 for AFI 1 and AFI 2**: IPv4 and IPv6 policy endpoints, with the encoding defined in section 2.1 of ***Advertising Segment Routing Policies in BGP***.

   Note: The nexthop address-family must match the AFI of the NLRI.

2. **Sub-TLVs of Tunnel Encapsulation TLV of type 15 (SR-TE Policy Type) of the Tunnel Encapsulation Path Attribute**:

   a. Preference (Sub-TLV Type 12)
   b. Binding SID (Sub-TLV Type 13) of length ***2*** or ***6*** bytes
   c. Segment List (Sub-TLV Type 128). The following Segment List sub-TLVs are supported:

      1. Type 1 Segment (Sub-TLV type 1)
      2. Weight (Sub-TLV type 9)

   d. Explicit NULL Label Policy (Sub-TLV Type 14)

Note: All other sub-TLVs of the Tunnel Encapsulation TLV and Segment List sub-TLVs are ignored.

Route-Target and NO_ADVERTISE Community in SR-TE SAFI Updates

EOS implements the Acceptance and Usability checks as defined in sections 4.2.1 and 4.2.2 of the IETF draft Advertising Segment Routing Policies in BGP. However EOS skips matching the Route-Target with the router-ID of the headend if the SR-TE NLRI is tagged with **NO_ADVERTISE** community.

ECMP is not supported for SR-TE SAFI Paths

EOS does not support ECMP for BGP SR-TE SAFI. Only one best candidate path is chosen by BGP path selection and published to SR-TE Policy Agent for candidate path selection.

Note: ECMP of BGP next hops where each next hop resolves to an SR-TE policy is supported.

Path Selection within BGP

The IETF draft **Advertising Segment Routing Policies in BGP** supports passing multiple candidate paths from a single protocol source for an SR-TE policy path selection. Hence it includes a field distinguisher in the NLRI which can be unique for each controller to make BGP pass through the policies. However when multiple sources use the same distinguisher, BGP performs a path selection for the tuple: Endpoint, Color and Distinguisher. The best path for that tuple is published to the SR-TE Policy Agent for selecting an Active path. The best **bgp-best-path** selection applies to SR-TE SAFI as well.

Error Handling / Edge Cases

- **Weight 0**: The IETF draft does not limit the range of SL weight to exclude weight 0. A SID-List with weight 0 is not used for forwarding so BGP module in EOS does not pass on SID-Lists with weight 0 to the SR-TE policy agent. Such SID-Lists will be visible in **`show bgp sr-te`** commands but not in **`show traffic-engineering segment-routing policy`** commands.
- **Empty SLs**: Given the TLV encoding used to propagate SR Policies in BGP, it is possible to receive SID-Lists that have no SIDs (SID-Lists are empty). The BGP module in EOS does not pass

such empty SID-Lists to SR-TE policy agent. Such SID-Lists will be visible in **`show bgp sr-te`** commands but not in **`show traffic-engineering segment-routing policy`** commands.

- **Non Type 1 segments**: EOS supports only Type-1 segments. If a BGP update is received with a SID-List that has non Type-1 segments, the entire SID-List is ignored and **`BGP-4-SRTE_IGNORED_SEGMENT_LIST_UNSUPPORTED_SEGMENTS`** syslog is emitted. Such SID-Lists are not stored locally, and **`show bgp sr-te`** command does not display them.

Note: The SID-Lists that are made up of all Type-1 segments are passed on to the SR-TE policy agent.

Steering Traffic into a Policy

Incoming label is BSID - “Labelled Steering”

At the headend when a packet is received with a label stack that has a BSID of an active CP of a valid SR Policy as the top label, the headend pops the label, and imposes the resolved label stack on the outgoing packet.

Example

Consider an SR Policy with an active candidate path with BSID ***965536*** and SL with label stack [***965540***, ***900001***, ***900002***]. Assume that ***965540*** is an IS-IS SR Adjacency SID. An incoming packet has label stack [***965536***, ***100000***] then the outgoing label stack is [***900001***, ***900002***, ***100000***].

Steering BGP learnt IP(v6) prefixes - “IP Steering”

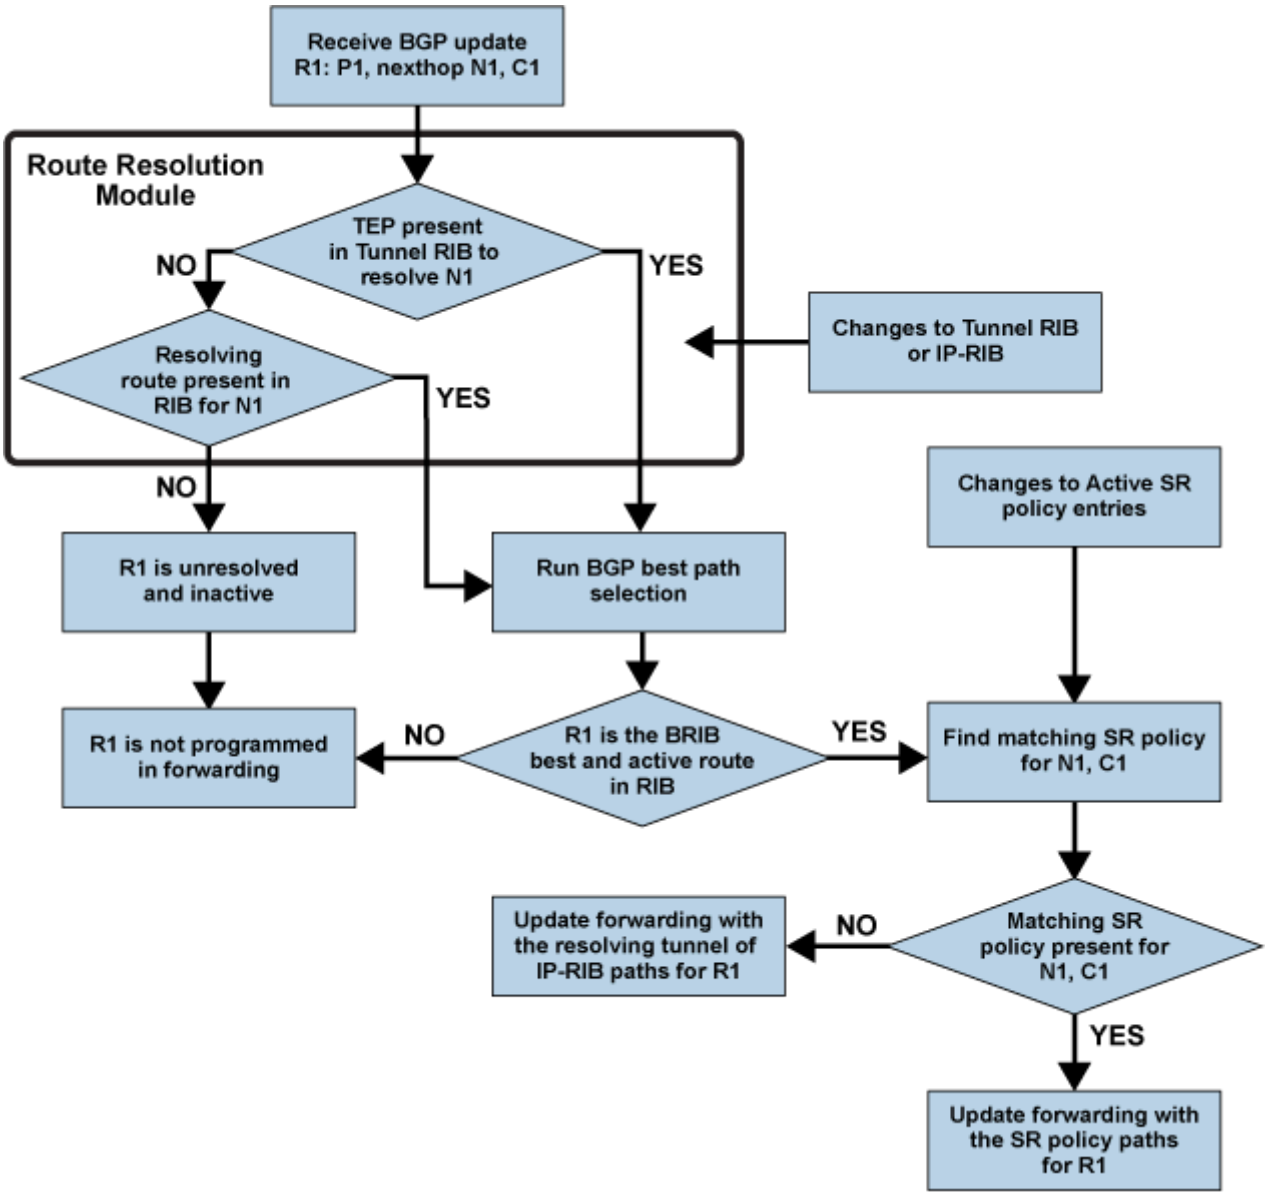
Incoming label is BSID - “Labelled Steering”

At the headend, BGP IPv4 and IPv6 routes received with one or more extended color communities are recursively resolved through any active SR Policy that matches the BGP routes’ nexthop and color. When an IPv4 or IPv6 packet is received that is forwarded using this policy, the SL’s resolved label stack is imposed in the outgoing packet.

For BGP routes received with color community to be steered via an SR policy, the route’s nexthop must already be resolvable through IGP. If there is no resolving route in IGP, the route is considered unresolvable and will not be programmed in hardware even if there is a matching SR policy for the corresponding nexthop and color.

If there is no matching SR policy for the received BGP nexthop and color, the route will be resolved through the IGP route in IP RIB. If an active SR policy that matches the BGP nexthop and color gets instantiated at a later time, the BGP route will change from resolving through IGP to the new active SR policy.

Note: The recursion through SR policy is only applicable for BGP routes that are active in RIB.



Color only IP steering using CO bits

It is possible to relax the requirement of an exact match of the BGP route's nexthop with the endpoint of the SR Policy using the "CO" (Color Only) bits in the color extended community. The "CO" bits are 2 reserved bits repurposed for color only steering as defined in section 3 of Advertising Segment Routing Policies in BGP. The exact match of the nexthop is done with the CO bits set to 00 or 11.

CO = 01 Steering: relaxes the nexthop to match the null endpoint of a policy. For a BGP route with nexthop N and color C, the following order is used for resolution. If there is no IGP route resolving the BGP nexthop, the route is not programmed in hardware.

1. Active SR policy with endpoint N and color C
2. Active SR policy with null endpoint (from the same AFI as the BGP route) and color C
3. Active SR policy with null endpoint from any AFI and color C
4. IGP route

CO = 10 Steering: in addition to the steps in CO = ***01*** steering, CO = ***10*** additionally relaxes the nexthop to match *any* endpoint. The following order is used for resolving a BGP route with nexthop N and color C. The behavior described is in accordance with section 8.8.1 of the IETF draft Segment Routing Policy for Traffic Engineering.

1. Active SR policy with endpoint N and color C
2. Active SR policy with null endpoint (from the same AFI as the BGP route) and color C
3. Active SR policy with null endpoint from any AFI and color C
4. Active SR policy for any endpoint from the same AFI as the BGP route and color C
5. Active SR policy for any endpoint from any AFI and color C
6. IGP route

ECMP of IPv4/IPv6 Prefixes that Resolve over SR-TE Policies

When multiple BGP paths of BGP unicast prefixes resolve through active SR policies form ECMP, the resulting FIB entry for the BGP route has an ECMP of segment list paths which is a union of all the segments-list entries present in each of the resolving SR policies for the BGP paths.

Example

The following table displays four paths for prefix ***192.1.0.0/31***, and each of the four paths resolves via SR-TE policies.

Table 48: List of Paths Resolved via SR-TE Policies

Path	Nexthop	Color	Policy EP	Policy Color	Segment Lists	Per SL Traffic Distribution
1	1.0.0.2	CO(00):1000	1.0.0.2	1000	[2500 500], Weight: 1 [2501 500], Weight: 2	8.33% 16.66%
2	1.0.2.2	CO(00):2000	1.0.2.2	2000	[2502 500], Weight: 1 [2503 500], Weight: 1	12.5% 12.5%
3	1.0.4.2	CO(00):3000	1.0.4.2	3000	[2504 500], Weight: 1 [2505 500], Weight: 1	12.5% 12.5%
4	1.0.6.2	CO(00):4000	1.0.6.2	4000	[2506 500], Weight: 1 [2507 500], Weight: 1	12.5% 12.5%

```
B I    192.1.0.0/31 [200/0] via SR-TE Policy 1.0.4.2, color 3000
                              via SR-TE tunnel index 6, weight 1
                                 via 1.0.4.2, Ethernet1, label 2505 500
                              via SR-TE tunnel index 5, weight 1
                                 via 1.0.4.2, Ethernet1, label 2504 500
                           via SR-TE Policy 1.0.0.2, color 1000
                              via SR-TE tunnel index 2, weight 1
                                 via 1.0.0.2, Ethernet2, label 2501 500
                              via SR-TE tunnel index 1, weight 1
                                 via 1.0.0.2, Ethernet2, label 2500 500
                           via SR-TE Policy 1.0.2.2, color 2000
                              via SR-TE tunnel index 4, weight 1
                                 via 1.0.2.2, Ethernet3, label 2503 500
```

```
                                  via SR-TE tunnel index 3, weight 1
                                     via 1.0.2.2, Ethernet3, label 2502 500
                               via SR-TE Policy 1.0.6.2, color 4000
                                  via SR-TE tunnel index 8, weight 1
                                     via 1.0.6.2, Ethernet6, label 2507 500
                                  via SR-TE tunnel index 7, weight 1
                                     via 1.0.6.2, Ethernet6, label 2506 500
```

The traffic distribution honors the weights of the SID-Lists. In the example, each of the four SR Policies will get ***25%*** of the total traffic meant for prefix ***192.1.0.0/31***. Within each policy, the distribution is based on the weights of the SID-Lists.

ECMP Group when some BGP unicast paths resolve over SR Policies and some via non SR Policy IGP paths

If some BGP paths resolve via SR Policy paths and some BGP paths resolve via non SR Policy IGP, then the ECMP group formed programmed as the active route in FIB, only considers the SR Policy paths. ECMP in the FIB is not formed between paths that resolve over SR Policy and paths that resolve via non SR Policy IGP routes. In the example above, if SR Policy with endpoint ***1.0.6.2*** and color ***4000*** becomes inactive or is removed, the FIB path for ***192.1.0.0/31*** resolves via 3 SR Policies as shown below.

```
B I    192.1.0.0/31 [200/0] via SR-TE Policy 1.0.4.2, color 3000
                               via SR-TE tunnel index 6, weight 1
                                  via 1.0.4.2, Ethernet1, label 2505 500
                               via SR-TE tunnel index 5, weight 1
                                  via 1.0.4.2, Ethernet1, label 2504 500
                            via SR-TE Policy 1.0.0.2, color 1000
                               via SR-TE tunnel index 2, weight 1
                                  via 1.0.0.2, Ethernet2, label 2501 500
                               via SR-TE tunnel index 1, weight 1
                                  via 1.0.0.2, Ethernet2, label 2500 500
                            via SR-TE Policy 1.0.2.2, color 2000
                               via SR-TE tunnel index 4, weight 1
                                  via 1.0.2.2, Ethernet3, label 2503 500
                               via SR-TE tunnel index 3, weight 1
                                  via 1.0.2.2, Ethernet3, label 2502 500
```

Note: **`show ip bgp`** still shows a 4-way ECMP. The FIB paths switch to resolving via the (non SR Policy) IGP paths when there are no BGP paths in the ECMP group that resolve via an SR Policy.

UCMP of IPv4/IPv6 prefixes using LinkBandwidth (LBW) Extended Community that resolve over SR-TE policies not supported

When multiple BGP paths of BGP unicast prefixes resolve through active SR policies form ECMP, and the unicast paths also contain the LBW extended community, EOS does not form UCMP amongst the unicast paths. Only ECMP is formed at the unicast prefix level. The LBW is ignored the behavior is identical to the behavior explained in the previous section.

Resolution of BGP unicast prefixes that resolve over other BGP unicast prefixes resolved via SR Policies

A BGP unicast prefix P1, that is recursively resolved via another BGP prefix P2, such that P2 resolves via an SR Policy, then in the FIB, P1 is programmed with the resolved nexthop pointing to the non SR Policy resolution of P2. P1 does not use P2s SR Policy for forwarding.

Explicit Null Label Imposition

When the address family of the BGP unicast prefix is not the same as the address family of the endpoint of the SR Policy that the unicast prefixes resolves via, an explicit null label is automatically imposed in the outgoing label stack.

Example

If an IPv4 unicast prefix ***P1*** resolves over a policy whose endpoint ***EP1*** is an IPv6 address (this can happen due to color only CO=01/10 steering with ***P1*** having an IPv4 nexthop) and the SR Policy had a SID-List whose resolved label stack is [***1001***, ***1002***, ***1003***], the outgoing packet is imposed with [***1001***, ***1002***, ***1003***, ***2***] where ***0*** is the IPv4 explicit null label.

If an IPv6 prefix ***P2***, resolves over a policy whose endpoint ***EP2*** is an IPv4 address (this can happen with color only CO=01/10 steering with ***P2*** having a IPv6 nexthop) and the SR Policy had a SID-List whose resolved label stack is [***1001***, ***1002***, ***1003***], the outgoing packet is imposed with [***1001***, ***1002***, ***1003***, ***2***] where ***2*** is the IPv6 explicit null label.

The following table lists the configurations which result in having explicit-null label in the resolved label stack.

Table 49: Configurations resulting in Explicit-Null Label in Resolved Label Stack

ENLP configuration for the resolving SR Policy	IPv4 Prefixes	IPv6 Prefixes
None	-	-
IPv4	IPv4 explicit null appended to the end of label stack	-
IPv6	-	IPv6 explicit null appended to the end of label stack
Both	IPv4 explicit null appended to the end of label stack	IPv6 explicit null appended to the end of label stack
No/Default config (incase of BGP learnt policies ENLP Sub-TLV is not received)	Resolving SR Policy has IPv4 Endpoint address: No explicit-null	Resolving SR Policy has IPv4 Endpoint address: IPv6 explicit null appended to the end of label stack
	Resolving SR Policy has IPv6 Endpoint address: IPv4 explicit null appended to the end of label stack	Resolving SR Policy has IPv6 Endpoint address: No explicit-null

Traffic Accounting

All egress tunnel counters (MPLS/GRE/MPLSoGRE using SR-TE/Nexthop-group/BGP-LU tunnel types) share the same hardware resource.

- **7280E/7500E systems**: Up to ***16k*** tunnels
- **7280R/7500R systems**: Up to ***8k*** tunnels

Tunnel counters are allocated on a first-come, first-served basis. Configurations using GRE/MPLSoGRE, GRE, and MPLS further limit a maximum of 4k countable egress MPLS tunnels on 7280R/7500R.

FEC Optimizations

The hardware FEC usage could be reduced as the underlying FEC is shared among different routes.

- Programming of the active candidate path of an SR-TE policy in hardware is shared between the BSID route and IP steering route.

- If all of the following conditions are met, ISIS-SR MPLS routes and tunnel entries directly point to the next hop FEC generated by the routing agent (IGP FEC).
  - All the next hops of the MPLS route either point to pop or forward (i.e. swapping to the same label) label action.
  - The switch is either a 7280 or a 7500 platform.
- The corresponding SR-TE policy BSID routes (and corresponding Segment List tunnels) that resolve over ISIS-SR MPLS routes, will directly point to the IGP FEC.

Configuring SR-TE

The following commands start the **SrTePolicy** agent and enter the switch into the Traffic Engineering configuration sub-mode.

```
switch(config)# router traffic-engineering
switch(config-te)# segment-routing
```

Note: The agent must be running even if the only source of policies is BGP.

Static Policy Configuration

The following commands set the policy using endpoint and color value, and define the BSID for the policy.

```
switch(config-te-sr)# policy endpoint v4Address|v6Address color color-
value
switch(config-te-sr-policy)# binding-sid mpls-label
switch(config-te-sr-policy)# path-group preference value
```

The following commands enter the policy path configuration sub mode, and adds a segment list to the candidate path.

```
switch(config-te-sr-policy)# path-group preference value
switch(config-te-sr-policy-path)# segment-list label-stack label1 label2
 … weight value
```

Note: The default weight value is ***1***. Adding weight is optional. Repear the configuration statement for multiple segment lists per candidate path.

The following commands configures a null label policy.

```
switch(config-te-sr-policy-path)# explicit-null [none|ipv4|ipv6|both]
```

Note: The null label policy configuration is optional.

BGP configuration for SR-TE SAFI

The following commands configures a BGP router to activate a neighbor to negotiate and accept SR-TE address-family with this peer.

```
switch(config)# router bgp <as>
switch(config-router-bgp)# address-family ipv4|ipv6 sr-te
switch(config-router-bgp-af-srte)# neighbor neighbor activate
```

The following command configures an inbound route-map to filter or modify attributes on incoming SR-TE prefixes from the peer.

```
switch(config-router-bgp-af-srte)# neighbor neighbor route-
map routeMapName in
```

Configuring Egress SR-TE Traffic Accounting

The following command enables egress traffic accounting for SR policies (also known as MPLS tunnels).

```
switch(config)# hardware counter feature mpls tunnel
```

The following command displays current status of the MPLS counters.

```
switch#show hardware counter feature
Feature             Direction        Counter Resource (Engine)
------------------ ---------------- --------------------------
ACL-IPv4           out              Jericho: 2, 3
ACL                in               Jericho: 4, 5, 6, 7
MPLS tunnel        out              Jericho: 8, 9
```

The following command disables egress traffic accounting for SR policies.

```
switch(config)# no hardware counter feature mpls tunnel
```

The following command displays a summary information of SR-TE SAFI.

```
switch# show bgp sr-te summary
BGP summary information for VRF default
Router identifier 100.1.1.2, local AS number 100
Neighbor Status Codes: m - Under maintenance
  Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State  PfxRcd PfxAcc
  100.1.1.1        4  100             407       413    0    0 00:18:57 Estab  1      1
  1000::1          4  100             407       413    0    0 00:18:57 Estab  1      1
```

The following command displays a summary information of candidate paths received from neighbors which have negotiated AFI=1 for SR-TE SAFI.

```
switch# show bgp sr-te ipv4 summary
BGP summary information for VRF default
Router identifier 100.1.1.2, local AS number 100
Neighbor Status Codes: m - Under maintenance
  Neighbor    V  AS   MsgRcvd  MsgSent InQ OutQ  Up/Down  State  PfxRcd PfxAcc
  100.1.1.1   4  100  407      413     0   0     00:18:57 Estab  0      0
```

The following command displays a summary information of candidate paths received from neighbors which have negotiated AFI=2 for SR-TE SAFI.

```
switch# show bgp sr-te ipv6 summary
BGP summary information for VRF default
Router identifier 100.1.1.2, local AS number 100
Neighbor Status Codes: m - Under maintenance
  Neighbor     V  AS   MsgRcvd  MsgSent InQ OutQ  Up/Down  State  PfxRcd PfxAcc
  1000::1      4  100  407      413     0   0     00:18:57 Estab  0      0
```

The following command displays all the SR-TE candidate paths.

```
switch# show bgp sr-te
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
Policy status codes: * - valid, > - active, E - ECMP head, e - ECMP
                     c - Contributing to ECMP
Origin codes: i - IGP, e - EGP, ? - incomplete
```

```
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
 Nexthop

     Endpoint    Color   Distinguisher   Next Hop    Metric  LocPref Weight  Path

         Segment-List: Label Stack: [ 2000 3000 ]
```

10.2.1.4 PBR Policies

Policy-Based Routing (PBR) allows the operator to specify the next hop for selected incoming packets on an L3 interface, overriding the routing table. Incoming packets are filtered through a policy map referencing one or more ACLs, and matching packets are routed to the next hop specified.

A PBR policy map is composed of one or more classes and can include next-hop information for each class. It can also include single-line raw match statements, which have the appearance and function of a single line from an ACL. Each class contains an eponymous class map. Class maps are user-created, can be edited or deleted, filter traffic using IPv4 ACLs, and are listed in ***running-config***.

These sections describe PBR policy configuration procedures:

- Configuring PBR Policies Arad Platform Switches
- Configuring PBR Policies FM6000 Platform Switches
- Configuring PBR Policies Petra Platform Switches

- Configuring PBR Policies Trident Platform Switches

10.2.2 Traffic Management Configuration Arad Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane, or to L3 interfaces for Policy-Based Routing (PBR). Policy maps contain classes, which are composed of class maps and traffic resolution commands.

Traffic Management Conceptual Overview describes traffic policies.

10.2.2.1 Configuring Control Plane Traffic Policies Arad Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in class (policy-map (control-plane) Arad). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

Example

This command enters policy-map configuration mode for editing copp-system-policy.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

The `class (policy-map (control-plane) Arad)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example

This command enters policy-map-class configuration mode for the copp-system-lacp static class.

```
switch(config-pmap-copp-system-policy)# class copp-system-lacp
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- bandwidth (policy-map-class (control-plane) Arad) specifies the minimum bandwidth.

- shape (policy-map-class (control-plane) Arad) specifies the maximum bandwidth.

Example

These commands configure a bandwidth range of ***2000*** to ***4000*** kilobits per seconds (kbps) for traffic filtered by the copp-system-lacp class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-
lacp)# bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# shape
 kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp
    shape kbps 4000
    bandwidth kbps 2000

  class copp-system-l3ttl1

  class copp-system-l3slowpath

switch(config-pmap-copp-system-policy)# exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

Displaying Policy Maps

The show policy-map interface type qos command displays the configured values of the policy maps classes and the number of packets filtered and dropped as a result of the class maps.

Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Hardware programming status: InProgress

  Class-map: copp-system-mlag (match-any)
       shape : 10000001 kbps
       bandwidth : 10000001 kbps
      Out Packets : 0
      Drop Packets : 0

  Class-map: copp-system-bpdu (match-any)
       shape : 2604 kbps
       bandwidth : 1302 kbps
      Out Packets : 0
      Drop Packets : 0

  Class-map: copp-system-lacp (match-any)
       shape : 4230 kbps
       bandwidth : 2115 kbps
      Out Packets : 0
      Drop Packets : 0

switch(config)#

switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
```

10.2.2.2 Configuring QoS Traffic Policies Arad Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

Example

This command enters class-map configuration mode to create QoS class map named ***Q-CMap_1***.

```
switch(config)# class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 access control list (ACL). The **`match ip access-group`** command assigns an ACL to the class map. Subsequent **`match`** commands replace the existing **`match`** command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

This command adds the IPv4 ACL named ***ACL_1*** to the class map.

```
switch(config-cmap-Q-CMap_1)# match ip access-group ACL_1
switch(config-cmap-Q-CMap_1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **`show active`** command displays the saved version of class map. The **`show pending`** command displays the unsaved class map.

Example

The **`show active`** command indicates that the configuration mode class map is not stored in ***running-config***. The **`show pending`** command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-Q-CMap_1)# show active
switch(config-cmap-Q-CMap_1)# show pending
class-map type qos match-any Q-CMap_1
   match ip access-group ACL_1

switch(config-cmap-Q-CMap_1)#
```

The **`exit`** command returns the switch to global configuration mode and saves pending class map changes. The **`abort`** command returns the switch to global configuration mode and discards pending changes.

Example

This command exits class-map configuration mode and stores pending changes to ***running-config***.

```
switch(config-cmap-CP-CMAP_1)# exit
switch(config)# show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
    Match: ip access-group name ACLv4_1
switch(config)#
```

Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type quality-of-service` command enters policy-map configuration mode.

Example

This command places the switch in policy-map configuration mode and creates a QoS policy map named ***Q-PMAP_1***.

```
switch(config)# policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in ***policy-map-class*** configuration mode. The **`below`** command adds a class to the configuration mode policy map and places the switch in ***policy-map-class*** configuration mode, where traffic resolution commands are added to the class.

Example

This command adds the ***Q-CMap_1*** class to the ***Q-PMAP_1*** policy map and places the switch in ***policy-map-class*** configuration mode.

```
switch(config-pmap-Q-PMAP_1)# class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The **`set cos`** commands configure traffic resolution methods for data that passes the class map:

- **set cos** sets the Layer 2 CoS field.
- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

Example

These commands configure the policy map to set the ***CoS field 7*** on packets filtered by the class map, then assigns those packets to ***traffic class 4***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

Policy-map and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **`exit`** command or discarded with the **`abort`** command. The **`show active`** and ***show pending*** commands display the saved and modified policy map versions, respectively.

Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# exit
switch(config-pmap-Q-PMAP_1)# show pending
policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4

  class class-default

switch(config-pmap-Q-PMAP_1)# exit
switch(config)#
```

The last class in all QoS policy maps is ***class-default***. The ***class-default*** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The ***class-default*** class map is not editable; traffic resolution commands can be added to the ***class-default*** class.

To modify traffic resolution commands for the ***class-default*** class, enter ***policy-map-class*** configuration mode for the class, then enter the desired **`set`** commands.

Example

These commands enter ***policy-map-class*** configuration mode for ***class-default***, configures the stream to enter ***traffic class 2***, and saves the altered policy map to ***running-config***.

```
switch(config)# policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)# class class-default
switch(config-pmap-c-Q-PMap_1-class-default)# set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)# exit
switch(config-pmap-Q-PMap_1)# exit
switch(config)# show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

  Class-map: Q-CMap_1 (match-any)
    Match: ipv6 access-group name ACLv6_1
       set cos 7
       set traffic-class 4

  Class-map: class-default (match-any)
       set traffic-class 2

switch(config)#
```

Applying Policy Maps to an Interface

The `service-policy type qos (Interface mode)` command applies a specified policy map to the configuration mode interface.

These commands apply ***PMAP-1*** policy map to ***interfaceEthernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
   service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

10.2.2.3 Configuring PBR Policies Arad Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in the ***class-map*** configuration mode. The class-map type pbr command enters the ***class-map*** configuration mode.

Example

This command enters the ***class-map*** configuration mode to create a PBR class map named CMAP1.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more access control lists (ACLs). The match (policy-map (pbr)) command assigns an ACL to the class map. Subsequent **match** commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

Example

This command adds the ACL named ***ACL1*** to the class map.

```
switch(config-cmap-PBR-CMAP1)# match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

The ***class-map*** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map.

The **show active** command indicates that the configuration mode class map is not stored in ***running-config***.

```
switch(config-cmap-PBR-CMAP1)# show active
switch(config-cmap-PBR-CMAP1)#
```

The **exit** command returns the switch to the ***global*** configuration mode and saves pending class map changes. The **abort** command returns the switch to the ***global*** configuration mode and discards pending changes.

Example

This command exits class-map configuration mode and stores pending changes to ***running-config***.

```
switch(config-cmap-PBR-CMAP1)# exit
switch(config)# show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
   10 match ip access-group ACL1
switch(config)#
```

Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The policy-map type pbr command enters the ***policy-map*** configuration mode.

Example

This command enters the ***policy-map*** configuration mode for creating a PBR policy map named ***PMAP1***.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in the ***policy-map-class*** configuration mode. The class (policy-map (pbr)) command adds a class to the configuration mode policy map and places the switch in the ***policy-map-class*** configuration mode, where next-hop commands are added to the class.

Example

- This command adds the *CMAP1* class to the policy map and places the switch into the ***policy-map-class*** configuration mode.

  ```
  switch(config-pmap-PMAP1)# class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

  The set nexthop (policy-map-class pbr) command configures the next hop for data that passes the class map.
- This command configures the policy map to set the next hop to ***10.12.0.5*** on packets filtered by the class map.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)# set nexthop 10.12.0.5
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

  The set nexthop-group (policy-map-class(pbr) Arad) command configures a nexthop group as the next hop for data that passes the class map.
- These commands configure the policy map ***PMAP1*** to set the next hop to a nexthop group named ***GROUP1*** for traffic defined by class map ***CMAP1***.

  ```
  switch(config)# policy-map type pbr PMAP1
  switch(config-pmap-PMAP1)# class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)# set nexthop-group GROUP1
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

  The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the currently saved map version.
- These commands exits the ***policy-map-class*** configuration mode, then exits the ***policy-map*** configuration mode to save the altered policy map to ***running-config***.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)# exit
  switch(config-pmap-PMAP1)# exit
  switch(config)#
  ```

Applying a PBR Policy Map to an Interface

The service-policy type pbr (Interface mode) command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

These commands apply the PMAP1 PBR policy map to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Arad platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).

10.2.3 Traffic Management Configuration FM6000 Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Traffic Management Conceptual Overview describes traffic policies.

FM6000 platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps on FM6000 platform switches:

- Configuring Control Plane Traffic Policies FM6000 Platform Switches
- Configuring QoS Traffic Policies FM6000 Platform Switches
- Configuring PBR Policies FM6000 Platform Switches

10.2.3.1 Configuring Control Plane Traffic Policies FM6000 Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in copp-system-policy default classes: FM6000 Platform Switches. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 50: Copp-system-policy Default Classes: FM6000 Platform Switches

Class Name	shape (pps)	bandwidth (pps)
copp-system-arp	10000	1000
copp-system-default	8000	1000

copp-system-ipmcrsvd	10000	1000
copp-system-ipmcmiss	10000	1000
copp-system-igmp	10000	1000
copp-system-l2rsvd	10000	10000
copp-system-l3slowpath	10000	1000
copp-system-pim-ptp	10000	1000
copp-system-ospf-isis	10000	1000
copp-system-selfip	5000	5000
copp-system-selfip-tc6to7	5000	5000
copp-system-sflow	25000	1000

Policy maps are modified in the ***policy-map*** configuration mode. The `policy-map type copp` command enters the ***policy-map*** configuration mode.

Example

This command enters the ***policy-map*** configuration mode for editing ***copp-system-policy***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

The `class (policy-map (control-plane) FM6000)` command enters the ***policy-map-class*** configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example

This command enters the ***policy-map-class*** configuration mode for the copp-system-arp static class.

```
switch(config-pmap-copp-system-policy)# class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- bandwidth (policy-map-class (control-plane) FM6000)
- shape (policy-map-class (control-plane) FM6000)

Example

These commands configure a bandwidth range of ***2000*** to ***4000*** packets per seconds (pps) for traffic filtered by the copp-system-arp class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-
arp)# bandwidth pps 2000
switch(config-pmap-c-copp-system-policy-copp-system-arp)# shape
 pps 4000
```

```
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

The policy-map and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

Example

These commands exit the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000

  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp

  class copp-system-arp

  class copp-system-arpresolver

  class copp-system-default

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

10.2.3.2 Configuring QoS Traffic Policies FM6000 Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in the ***class-map*** configuration mode. The `class-map type qos` command enters the ***class-map*** configuration mode.

Example

This command enters the ***class-map*** configuration mode to create QoS class map named Q-CMap_1.

```
switch(config)# class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 access control list (ACL). The `match (class-map (qos) FM6000)` command assigns an ACL to the class map. Subsequent **`match`** commands replace the existing **`match`** command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

This command adds the IPv4 ACL named ***ACL_1*** to the class map.

```
switch(config-cmap-Q-CMap_1)# match ip access-group ACL_1
switch(config-cmap-Q-CMap_1)#
```

The ***class-map*** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **`show active`** command displays the saved version of class map. The **`show pending`** command displays the unsaved class map.

Example

The **`show active`** command indicates that the configuration mode class map is not stored in ***running-config***. The **`show pending`** command displays the class map to be stored upon exiting the ***class-map*** configuration mode.

```
switch(config-cmap-Q-CMap_1)# show active
switch(config-cmap-Q-CMap_1)# show pending
class-map type qos match-any Q-CMap_1
   match ip access-group ACL_1

switch(config-cmap-Q-CMap_1)#
```

The **`exit`** command returns the switch to the ***global*** configuration mode and saves pending class map changes. The **`abort`** command returns the switch to the ***global*** configuration mode and discards pending changes.

Example

This command exits the ***class-map*** configuration mode and stores pending changes to ***running-config***.

```
switch(config-cmap-CP-CMAP_1)# exit
switch(config)# show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
    Match: ip access-group name ACLv4_1
switch(config)#
```

Creating Policy Maps

Policy maps are created and modified in the ***policy-map*** configuration mode. The `policy-map type quality-of-service` command enters the ***policy-map*** configuration mode.

Example

This command places the switch in the ***policy-map*** configuration mode and creates a QoS policy map named ***Q-PMAP_1***.

```
switch(config)# policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in the ***policy-map-class*** configuration mode. The `class (policy-map (qos) FM6000)` command adds a class to the configuration mode policy map and places the switch in the *policy-map-class* configuration mode, where traffic resolution commands are added to the class.

Example

This command adds the ***Q-CMap_1*** class to the ***Q-PMAP_1*** policy map and places the switch in the ***policy-map-class*** configuration mode.

```
switch(config-pmap-Q-PMAP_1)# class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

`set (policy-map-class (qos) FM6000)` commands configure traffic resolution methods for data that passes the class map:

- **`set cos`** sets the Layer 2 CoS field.
- **`set dscp`** sets the DSCP value in the ToS byte.
- **`set traffic class`** specifies a traffic class queue.

Example

These commands configure the policy map to set the ***CoS field 7*** on packets filtered by the class map, then assigns those packets to ***traffic class 4***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **`exit`** command or discarded with the **`abort`** command. The **`show active`** and **`show pending`** commands display the saved and modified policy map versions, respectively.

Example

These commands exit the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# exit
switch(config-pmap-Q-PMAP_1)# show pending
policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4

  class class-default

switch(config-pmap-Q-PMAP_1)# exit
switch(config)#
```

The last class in all QoS policy maps is ***class-default***. The ***class-default*** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The ***class-default*** class map is not editable; traffic resolution commands can be added to the ***class-default*** class.

To modify traffic resolution commands for the ***class-default*** class, enter the ***policy-map-class*** configuration mode for the class, then enter the desired **`set`** commands.

Example

These commands enter the ***policy-map-class*** configuration mode for ***class-default***, configures the stream to enter ***traffic class 2***, and saves the altered policy map to ***running-config***.

```
switch(config)# policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1) #class class-default
switch(config-pmap-c-Q-PMap_1-class-default)# set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)# exit
switch(config-pmap-Q-PMap_1)# exit
switch(config)# show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

  Class-map: Q-CMap_1 (match-any)
    Match: ipv6 access-group name ACLv6_1
       set cos 7
       set traffic-class 4

  Class-map: class-default (match-any)
       set traffic-class 2

switch(config)#
```

Applying Policy Maps to an Interface

The service-policy type qos (Interface mode) command applies a specified policy map to the configuration mode interface.

These commands apply ***PMAP-1*** policy map to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
```

```
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
   service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

10.2.3.3 Configuring PBR Policies FM6000 Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or Switch Virtual Interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in the ***class-map*** configuration mode. The `class-map type pbr` command enters the ***class-map*** configuration mode.

Example

This command enters the ***class-map*** configuration mode to create a PBR class map named ***CMAP1***.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more IPv4 access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent **`match`** commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

On FM6000 platform switches, counters are not supported, so a `counters per-entry (ACL configuration modes)` command in an ACL is ignored.

Example

This command adds the IPv4 ACL named ***ACL1*** to the class map.

```
switch(config-cmap-PBR-CMAP1)# match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

The ***class-map*** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **`show active`** command displays the saved version of class map.

The **`show active`** command indicates that the configuration mode class map is not stored in ***running-config***.

```
switch(config-cmap-PBR-CMAP1)# show active
switch(config-cmap-PBR-CMAP1)#
```

The **`exit`** command returns the switch to ***global*** configuration mode and saves pending class map changes. The **`abort`** command returns the switch to ***global*** configuration mode and discards pending changes.

Example

This command exits the ***class-map*** configuration mode and stores pending changes to ***running-config***.

```
switch(config-cmap-PBR-CMAP1)# exit
switch(config)# show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
   10 match ip access-group ACL1
switch(config)#
```

Creating PBR Policy Maps

Policy maps are created and modified in the ***policy-map*** configuration mode. The `policy-map type pbr` command enters the ***policy-map*** configuration mode.

Example

This command enters the ***policy-map*** configuration mode for creating a PBR policy map named ***PMAP1***.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in the ***policy-map-class*** configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in the ***policy-map-class*** configuration mode, where next-hop commands are added to the class.

Examples

- This command adds the ***CMAP1*** class to the policy map and places the switch in the ***policy-map-class*** configuration mode.

  ```
  switch(config-pmap-PMAP1)# class CMAP1
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

  The **`set nexthop (policy-map-class pbr)`** command configures the next hop for data that passes the class map.
- This command configures the policy map to set the next hop to ***10.12.0.5*** on packets filtered by the class map.

  ```
  switch(config-pmap-c-PMAP1-CMAP1)# set nexthop 10.12.0.5
  switch(config-pmap-c-PMAP1-CMAP1)#
  ```

  The ***policy-map*** and ***policy-map-clas***s configuration modes are group-change modes. Changes are saved with the **`exit`** command or discarded with the **`abort`** command. The **`show active`** command displays the currently saved map version.

Example

These commands exits the ***policy-map-class*** configuration mode, then exits the ***policy-map configuration*** mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-PMAP1-CMAP1)# exit
switch(config-pmap-PMAP1)# exit
switch(config)#
```

Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

These commands apply the ***PMAP1*** PBR policy map to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on FM6000 platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).

10.2.4 Traffic Management Configuration Petra Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane. Policy maps contain classes, which are composed of class maps and traffic resolution commands. QoS traffic policies are not supported on 7500 Series switches.

Traffic Management Conceptual Overview describes traffic policies.

10.2.4.1 Configuring Control Plane Traffic Policies Petra Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in copp-system-policy default classes: Petra Platform Switches. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 51: copp-system-policy default classes: Petra Platform Switches

Class Name	shape (kbps)	bandwidth (kbps)
copp-system-bpdu	2500	1250
copp-system-default	2500	250

copp-system-igmp	2500	250
copp-system-ipbroadcast	2500	250
copp-system-ipmc	2500	250
copp-system-ipmcmiss	2500	250
copp-system-ipmcrsvd	2500	250
copp-system-ipunicast	NO LIMIT	250
copp-system-l3destmiss	2500	250
copp-system-l3slowpath	2500	250
copp-system-l3ttl0	2500	250
copp-system-l3ttl1	2500	250
copp-system-lacp	2500	1250
copp-system-lldp	2500	250
copp-system-unicast-arp	2500	250

Policy maps are modified in the ***policy-map*** configuration mode. The **policy-map type copp** command enters the ***policy-map*** configuration mode.

Example

This command enters the ***policy-map*** configuration mode for editing **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

The class (policy-map (control-plane) Petra) command enters the ***policy-map-class*** configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example

- This command enters the ***policy-map-class*** configuration mode for the **copp-system-lldp** static class.

  ```
  switch(config-pmap-copp-system-policy)# class copp-system-lldp
  switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
  ```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- bandwidth (policy-map-class (control-plane) Petra) specifies the minimum bandwidth.
- shape (policy-map-class (control-plane) Petra) specifies the maximum bandwidth.

Example

These commands configure a bandwidth range of ***2000*** to ***4000*** kilobits per seconds (kbps) for traffic filtered by the **copp-system-arp** class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-
lldp)# bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape
 kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the configured policy map.

Petra platform switches do not support all discrete rate values. When a **bandwidth** or **shape** command specifies a value that is not supported, the switch converts the rate to the next highest discrete value that it supports. The show policy-map interface type qos command displays the converted rate and not the user configured rate.

Example

These commands exits the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu

  class copp-system-lldp
    shape kbps 4000
    bandwidth kbps 2000

  class copp-system-lacp

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

Displaying Policy Maps

The show policy-map interface type qos command displays the traffic resolution rates of the policy maps classes and the number of packets filtered and dropped as a result of the class maps. The shape and bandwidth rates may differ from configured values, because the switch does not support all discrete rate values.

Example

These commands exits the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the *policy-map* configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Hardware programming status: InProgress

  Class-map: copp-system-mlag (match-any)
       shape : 10000001 kbps
       bandwidth : 10000001 kbps
      Out Packets : 0
      Drop Packets : 0

  Class-map: copp-system-lacp (match-any)
       shape : 2604 kbps
       bandwidth : 1302 kbps
      Out Packets : 0
      Drop Packets : 0

switch(config)#
```

Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

10.2.4.2 Configuring QoS Traffic Policies Petra Platform Switches

QoS traffic policies are not supported on Petra platform switches.

10.2.4.3 Configuring PBR Policies Petra Platform Switches

PBR policies are not supported on Petra platform switches.

10.2.5 Traffic Management Configuration Trident Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Traffic Management Conceptual Overview describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps:

- Configuring Control Plane Traffic Policies Trident Platform Switches
- Configuring QoS Traffic Policies Trident Platform Switches
- Configuring PBR Policies Trident Platform Switches

10.2.5.1 Configuring Control Plane Traffic Policies Trident Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by creating class maps and editing the policy map to include the new class maps.

Creating Class Maps

Control plane traffic policies utilize static and dynamic class maps. Static class maps are provided by the switch, are not editable, and cannot be deleted. Dynamic class maps are created and modified in the ***class-map*** configuration mode. The `class-map type copp` command enters the ***class-map*** configuration mode.

Example

This command enters the ***class-map*** configuration mode for creating or editing a control plane dynamic class map named ***CP-CMAP_1***.

```
switch(config)# class-map type copp match-any CP-CMAP_1
switch(config-cmap-CP-CMAP_1)#
```

Class maps contain one IPv4 or IPv6 access control list (ACL). The match (class-map (control-plane) Trident) command assigns an ACL to the class map. Subsequent **`match`** commands replace the existing **`match`** command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

This command assigns the IPv4 ACL named ***ACLv4_1*** to the class map.

```
switch(config-cmap-CP-CMAP_1)# match ip access-group ACLv4_1
switch(config-cmap-CP-CMAP_1)#
```

The ***class-map*** configuration mode is a group-change mode. Changes are saved by exiting the mode. The **`show active`** command displays the saved version of class map. The **`show pending`** command displays the unsaved class map.

Example

The **`show active`** command indicates that the configuration mode class map is not stored in ***running-config***. The **`show pending`** command displays the class map to be stored upon exiting the ***class-map*** configuration mode.

```
switch(config-cmap-CP-CMAP_1)# show active
switch(config-cmap-CP-CMAP_1)# show pending
class-map type copp match-any CP-CMAP_1
   match ip access-group ACLv4_1

switch(config-cmap-CP-CMAP_1)#
```

The **`exit`** command returns the switch to the ***global*** configuration mode and saves pending class map changes. The **`abort`** command returns the switch to the ***global*** configuration mode and discards pending class map changes.

Example

This command exits the ***class-map*** configuration mode and stores pending changes to ***running-config***.

```
switch(config-cmap-CP-CMAP_1)# exit
switch(config)# show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
    Match: ip access-group name ACLv4_1
switch(config)#
```

Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in copp-system-policy default classes: Trident Platform Switches. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 52: copp-system-policy default classes: Trident Platform Switches

Class Name	shape (pps)	bandwidth (pps)
copp-system-bpdu	5000	5000
copp-system-lacp	5000	5000
copp-system-selfip-tc6to7	5000	5000
copp-system-selfip	5000	5000
copp-system-tc6to7	10000	1000
copp-system-lldp	10000	1000
copp-system-ipmcrsvd	10000	1000
copp-system-igmp	10000	1000
copp-system-ipmcmiss	10000	1000
copp-system-glean	10000	1000
copp-system-tc3to5	10000	1000
copp-system-arp	10000	1000
copp-system-arpresolver	10000	1000
copp-system-l3destmiss	10000	1000
copp-system-l3slowpath	10000	1000
copp-system-l3ttl1	10000	1000
copp-system-default	8000	1000
copp-system-acllog	10000	1000
copp-system-sflow	25000	0

Policy maps are modified in the ***policy-map*** configuration mode. The `policy-map type copp` command enters the ***policy-map*** configuration mode.

Example

This command enters the ***policy-map*** configuration mode for editing **copp-system-policy**.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

Dynamic classes are inserted in front of the static classes. Classes automatically contain their eponymous class map; traffic resolution commands are created or edited in the ***policy-map-class*** configuration mode. The class (policy-map (control-plane) Trident) command adds a class to the policy map and places the switch in the ***policy-map-class*** configuration mode, where traffic resolution commands are added to the class.

Example

This command adds the ***CP-CMAP_1*** class to the copp-system-policy policy map and places the switch in the ***policy-map-class*** configuration mode.

```
switch(config-pmap-copp-system-policy)#class CP-CMAP_1
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- bandwidth (policy-map-class (control-plane) Trident) specifies the minimum bandwidth.
- shape (policy-map-class (control-plane) Trident) specifies the maximum bandwidth.

Example

These commands configure a bandwidth range of ***2000*** to ***4000*** packets per seconds (pps) for traffic filtered by the ***CP-CMAP_1*** class map:

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)# bandwidth pps
 2000
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)# shape pps
 4000
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
```

Example

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

Example

These commands exits the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000

  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp

  class copp-system-arp

  class copp-system-arpresolver

  class copp-system-default

switch(config-pmap-copp-system-policy)# exit
switch(config)#
```

Example

To modify traffic resolution commands for a static class, enter the ***policy-map-class*** configuration mode for the class, then enter the desired **bandwidth** and **shape** commands.

Example

These commands enters the ***policy-map-class*** configuration mode for **copp-system-bpdu** class, change the bandwidth range for the class, then save the altered policy map to ***running-config***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-bpdu
switch(config-pmap-c-copp-system-policy-copp-system-bpdu)# shape
 pps 200
switch(config-pmap-c-copp-system-policy-copp-system-
bpdu)# bandwidth pps 100
switch(config-pmap-c-copp-system-policy-copp-system-bpdu)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000

  class copp-system-bpdu
    shape pps 200
    bandwidth pps 100

  class copp-system-lldp
```

```
switch(config-pmap-copp-system-policy)# exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

10.2.5.2 Configuring QoS Traffic Policies Trident Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in the ***class-map*** configuration mode. The `class-map type qos` command enters the ***class-map*** configuration mode.

Example

This command enters the ***class-map*** configuration mode to create QoS class map named ***Q-CMap_1***.

```
switch(config)# class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 or IPv6 Access Control List (ACL). The `match (class-map (qos) Trident)` command assigns an ACL to the class map. Subsequent **`match`** commands replace the existing **`match`** command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

Example

This command adds the IPv6 ACL named **`ACLv6_1`** to the class map.

```
switch(config-cmap-Q-CMap_1)# match ipv6 access-group ACLv6_1
switch(config-cmap-Q-CMap_1)#
```

The ***class-map*** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **`show active`** command displays the saved version of class map. The **`show pending`** command displays the unsaved class map.

Example

The **`show active`** command indicates that the configuration mode class map is not stored in ***running-config***. The **`show pending`** command displays the class map to be stored upon exiting the ***class-map*** configuration mode.

```
switch(config-cmap-Q-CMap_1)# show active
```

```
switch(config-cmap-Q-CMap_1)# show pending
class-map type qos match-any Q-CMap_1
   match ipv6 access-group ACLv6_1

switch(config-cmap-Q-CMap_1)#
```

The **exit** command returns the switch to ***global*** configuration mode and saves pending class map changes. The **abort** command returns the switch to ***global*** configuration mode and discards pending class map changes.

Example

This command exits the ***class-map*** configuration mode and stores pending changes to ***running-config***.

```
switch(config-cmap-CP-CMAP_1)# exit
switch(config)# show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
    Match: ip access-group name ACLv4_1
switch(config)#
```

Creating Policy Maps

Policy maps are created and modified in the ***policy-map*** configuration mode. The `policy-map type quality-of-service` command enters the ***policy-map*** configuration mode.

Example

This command enters the ***policy-map*** configuration mode for creating a QoS policy map named ***Q-PMAP_1***.

```
switch(config)# policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in the ***policy-map-class*** configuration mode. The `class (policy-map (qos) Trident)` command adds a class to the configuration mode policy map and places the switch in the ***policy-map-class*** configuration mode, where traffic resolution commands are added to the class.

Example

This command adds the ***Q-CMap_1*** class to the ***Q-PMAP_1*** policy map and places the switch in the ***policy-map-class*** configuration mode.

```
switch(config-pmap-Q-PMAP_1)# class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The **set (policy-map-class (qos) Trident)** command configures traffic resolution methods for data that passes the class map:

- **set cos** sets the layer 2 CoS field.

- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

Example

These commands configure the policy map to set ***CoS field 7*** on packets filtered by the class map, then assigns those packets to ***traffic class 4***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **`abort`** command. The **`show active`** and **`show pending`** commands display the saved and modified policy map versions, respectively.

Example

These commands exit the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# exit
switch(config-pmap-Q-PMAP_1)# show pending
policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4

  class class-default

switch(config-pmap-Q-PMAP_1)# exit
switch(config)#
```

The last class in all QoS policy maps is ***class-default***. The ***class-default*** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The ***class-default*** class map is not editable; traffic resolution commands can be added to the ***class-default*** class.

To modify traffic resolution commands for the ***class-default*** class, enter the ***policy-map-class*** configuration mode for the class, then enter the desired **`set`** commands.

Example

These commands enters the ***policy-map-class*** configuration mode for ***class-default***, configures the stream to enter ***traffic class 2***, and saves the altered policy map to ***running-config***.

```
switch(config)# policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)# class class-default
switch(config-pmap-c-Q-PMap_1-class-default)# set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)# exit
```

```
switch(config-pmap-Q-PMap_1)# exit
switch(config)# show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

  Class-map: Q-CMap_1 (match-any)
    Match: ipv6 access-group name ACLv6_1
       set cos 7
       set traffic-class 4

  Class-map: class-default (match-any)
       set traffic-class 2

switch(config)#
```

Applying Policy Maps to an Interface

The `service-policy type qos (Interface mode)` command applies a specified policy map to the configuration mode interface.

Example

These commands apply ***PMAP-1*** policy map to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
   service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

10.2.5.3 Configuring PBR Policies Trident Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or Switch Virtual Interfaces (SVIs).

Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in the ***class-map*** configuration mode. The `class-map type pbr` command enters the ***class-map*** configuration mode.

Example

This command enters the ***class-map*** configuration mode to create a PBR class map named ***CMAP1***.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more Access Control Lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent **`match`** commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules.

Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

Examples

- This command adds the ACL named ***ACL1*** to the class map.

```
switch(config-cmap-PBR-CMAP1)# match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

The ***class-map*** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **`show active`** command displays the saved version of class map.

- The **`show active`** command indicates that the configuration mode class map is not stored in ***running-config***.

```
switch(config-cmap-PBR-CMAP1)# show active
switch(config-cmap-PBR-CMAP1)#
```

The **`exit`** command returns the switch to ***global*** configuration mode and saves pending class map changes. The **`abort`** command returns the switch to ***global*** configuration mode and discards pending changes.

Example

This command exits the ***class-map*** configuration mode and stores pending changes to ***running-config***.

```
switch(config-cmap-PBR-CMAP1)# exit
switch(config)# show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
   10 match ip access-group ACL1
switch(config)#
```

Creating PBR Policy Maps

Policy maps are created and modified in the ***policy-map*** configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

Example

This command enters the ***policy-map*** configuration mode for creating a PBR policy map named ***PMAP1***.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in the ***policy-map-class*** configuration mode. The `class (policy-map (pbr))` command adds a class

to the configuration mode policy map and places the switch in the ***policy-map-class*** configuration mode, where next-hop commands are added to the class.

Example

- This command adds the ***CMAP1*** class to the policy map and places the switch in the ***policy-map-class*** configuration mode.

```
switch(config-pmap-PMAP1)# class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

- The set nexthop (policy-map-class pbr) command configures the next hop for data that passes the class map.This command configures the policy map to set the next hop to ***10.12.0.5*** on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```

- The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the currently saved map version.These commands exits the ***policy-map-class*** configuration mode, then exits the ***policy-map*** configuration mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-PMAP1-CMAP1)# exit
switch(config-pmap-PMAP1)# exit
switch(config)#
```

Applying a PBR Policy Map to an Interface

The service-policy type pbr (Interface mode) command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the ***PMAP1*** PBR policy map to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Trident platform switches match on inner packet headers (i.e., they match based on the attributes of the decapsulated packet).

10.2.6 Traffic Management Configuration Trident II Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. Traffic Management Conceptual Overview describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

10.2.6.1 Configuring Control Plane Traffic Policies Trident II Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in copp-system-policy default classes: Trident II Platform Switches. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Table 53: copp-system-policy default classes: Trident II Platform Switches

Class Name	**shape (pps)**	bandwidth (pps)
copp-system-acllog	1000	10000
copp-system-arp	1000	10000
copp-system-arpresolver	1000	10000
copp-system-bfd	5000	10000
copp-system-bgp	5000	5000
copp-system-bpdu	5000	5000
copp-system-default	1000	8000
copp-system-glean	1000	10000
copp-system-igmp	1000	10000
copp-system-ipmcmiss	1000	10000
copp-system-ipmcrsvd	1000	10000
copp-system-l3destmiss	1000	10000
copp-system-l3slowpath	1000	10000
copp-system-l3ttl1	1000	10000
copp-system-lacp	5000	5000
copp-system-lldp	1000	10000
copp-system-mlag	5000	5000
copp-system-selfip	5000	5000
copp-system-selfip-tc6to7	5000	5000
copp-system-sflow	0	25024
copp-system-tc3to5	1000	10000
copp-system-tc6to7	1000	10000

copp-system-urm	1000	10000

Policy maps are modified in the ***policy-map*** configuration mode. The policy-map type copp command enters the ***policy-map*** configuration mode.

Example

This command enters the ***policy-map*** configuration mode for editing **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

Example

The class (policy-map (control-plane) Trident II) command enters the ***policy-map-class*** configuration mode, where traffic resolution commands are modified for the configuration mode class.

Example

This command enters the ***policy-map-class*** configuration mode for the **copp-system-lacp static** class.

```
switch(config-pmap-copp-system-policy)# class copp-system-lacp
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- bandwidth (policy-map-class (control-plane) Trident II) specifies the minimum bandwidth.
- shape (policy-map-class (control-plane) Trident II) specifies the maximum bandwidth.

Example

These commands configure a bandwidth range of ***2000*** to ***4000*** packets per seconds (pps) for traffic filtered by the **copp-system-lacp** class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-
lacp)# bandwidth pps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# shape
 pps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
```

Example

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The

show active command displays the saved version of policy map. The **show pending** command displays the modified policy map.

Example

These commands exits the ***policy-map-class*** configuration mode, display the pending ***policy-map***, then exit ***policy-map*** configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp
    shape pps 4000
    bandwidth pps 2000

  class copp-system-arp

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

10.2.7 Traffic Management Configuration Commands

Traffic Policy (Control Plane) Configuration Commands

- bandwidth (policy-map-class (control-plane) Arad)
- bandwidth (policy-map-class (control-plane) FM6000)
- bandwidth (policy-map-class (control-plane) Helix)
- bandwidth (policy-map-class (control-plane) Petra)
- bandwidth (policy-map-class (control-plane) Trident)
- bandwidth (policy-map-class (control-plane) Trident II)
- class-map type copp
- class (policy-map (control-plane) Arad)
- class (policy-map (control-plane) FM6000)
- class (policy-map (control-plane) Helix)
- class (policy-map (control-plane) Petra)
- class (policy-map (control-plane) Trident)
- class (policy-map (control-plane) Trident II)
- match (class-map (control-plane) Helix)
- match (class-map (control-plane) Trident)
- match (class-map (control-plane) Trident II)
- policy-map type copp
- shape (policy-map-class (control-plane) Arad)
- shape (policy-map-class (control-plane) FM6000)
- shape (policy-map-class (control-plane) Helix)
- shape (policy-map-class (control-plane) Petra)
- shape (policy-map-class (control-plane) Trident)
- shape (policy-map-class (control-plane) Trident II)

Traffic Policy (PBR) Configuration Commands

- action set-ttl
- class (policy-map (pbr))
- class-map type pbr
- feature pbr
- match (class-map (pbr))
- match (policy-map (pbr))
- platform arad tcam counters feature
- policy-map type pbr
- resequence (class-map (pbr))
- resequence (policy-map (pbr))
- service-policy type pbr (Interface mode)
- set nexthop (policy-map-class pbr)
- set nexthop-group (policy-map-class(pbr) Arad)

CPU Traffic Policy Command

- feature traffic-policy cpu
- feature traffic-policy port

Traffic Policy (QoS) Configuration Commands

- class-map type qos
- class (policy-map (qos) FM6000)
- class (policy-map (qos) Helix)
- class (policy-map (qos) Trident)
- class (policy-map (qos) Trident II)
- match (class-map (qos) FM6000)
- match (class-map (qos) Helix)
- match (class-map (qos) Trident)
- match (class-map (qos) Trident II)
- policy-map type quality-of-service
- policy-map type quality-of-service policer
- service-policy type qos (Interface mode)
- set (policy-map-class (qos) FM6000)
- set (policy-map-class (qos) Helix)
- set (policy-map-class (qos) Trident)
- set (policy-map-class (qos) Trident II)

Traffic Policy Display and Utility Commands

- clear policy-map counters
- show class-map type control-plane
- show class-map type pbr
- show class-map type qos
- show policy-map type copp
- show policy-map type pbr
- show policy-map type qos
- show policy-map type qos counters
- show policy-map copp
- show policy-map interface type qos
- show policy-map interface type qos counters
- show traffic-policy

10.2.7.1 action set-ttl

The TTL action is effective only when it is configured along with a set nexthop or nexthop-group action. The TCAM profile has the set-ttl-3b or set-ttl action in the pbr ip and pbr ipv6 features, such as in the tc-counters system profile.

Command Mode

For IP

TCAM feature PBR IP configuration mode.

For IPv6

TCAM feature PBR IPv6 configuration mode.

Command Syntax

`action set-time` [set-ttl | set-ttl-3b]

`no action set-time` [set-ttl | set-ttl-3b]

`default action set-time` [set-ttl | set-ttl-3b]

Parameters

- **set-ttl** Set time to live.
- **set-ttl-3b** Set 3-bit time to live.

Example

In the following example, for IP, the action sets the time to live for the next hop.

```
(config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
(config-tcam-feature-pbr-ip)# action set-ttl
```

In the following example, for IPv6, the action sets the time to live for the next hop group.

```
config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
(config-tcam-feature-pbr-ip)# feature pbr ipv6
(config-tcam-feature-pbr-ipv6)# action set-ttl
```

10.2.7.2 bandwidth (policy-map-class (control-plane) Arad)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration

accessed through `class (policy-map (control-plane) Arad)`

Command Syntax

bandwidth kbps ***kilobits***

no bandwidth

default bandwidth

Parameters

kilobits Minimum data rate in kilobits per second. Value ranges from ***1*** to ***10000000***.

Related Commands

- class (policy-map (control-plane) Arad) places the switch in the ***policy-map-class*** (control plane) configuration mode.
- shape (policy-map-class (control-plane) Arad) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth

Arad platform switches define these default bandwidths for control plane static classes:

- copp-system-bgp 250 copp-system-l3lpmoverflow 250
- copp-system-bpdu 1250 copp-system-l3slowpath 250
- copp-system-default 250 copp-system-l3ttl1 250
- copp-system-ipbroadcast 250 copp-system-lacp 1250
- copp-system-ipmc 250 copp-system-linklocal 250
- copp-system-ipmcmiss 250 copp-system-lldp 250
- copp-system-ipunicast 250 copp-system-mlag 250
- copp-system-l2broadcast 250 copp-system-multicastsnoop 250
- copp-system-l2unicast 250 copp-system-OspfIsis 250
- copp-system-l3destmiss 250 copp-system-sflow 250

Example

These commands configure the minimum bandwidth of ***500*** kbps for data traffic specified by the class map **copp-system-lldp** of the default ***control-plane*** policy map.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth kbps
 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Hardware programming status: InProgress

  Class-map: copp-system-lldp (match-any)
```

```
        shape : 2500 kbps
        bandwidth : 500 kbps
       Out Packets : 0
       Drop Packets : 0

switch(config)#
```

10.2.7.3 bandwidth (policy-map-class (control-plane) FM6000)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration

accessed through class (policy-map (control-plane) FM6000)

Command Syntax

bandwidth pps ***packets***

no bandwidth

default bandwidth

Parameters

packets Minimum data rate in packets per second. Value ranges from ***1*** to ***100000***.

Related Commands

- class (policy-map (control-plane) FM6000) places the switch in ***policy-map-class*** (control plane) configuration mode.
- shape (policy-map-class (control-plane) FM6000) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth

FM6000 platform switches define these default bandwidths for control plane static classes:

- copp-system-arp 1000 copp-system-l3slowpath 1000
- copp-system-default 1000 copp-system-pim-ptp 1000
- copp-system-ipmcrsvd 1000 copp-system-ospf-isis 1000
- copp-system-ipmcmiss 1000 copp-system-selfip 5000
- copp-system-igmp 1000 copp-system-selfip-tc6to7 5000
- copp-system-l2rsvd 10000 copp-system-sflow 1000

Example

These commands configure the minimum bandwidth of ***1000*** packets per second for data traffic specified by the class map ***PMAP-1*** in the policy map named **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```

10.2.7.4 bandwidth (policy-map-class (control-plane) Helix)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration

accessed through `class (policy-map (control-plane) Helix)`

Command Syntax

bandwidth pps ***packets***

no bandwidth

default bandwidth

Parameters

packets Minimum data rate in packets per second. Value ranges from ***1*** to ***100000***.

Related Commands

- class (policy-map (control-plane) Helix) places the switch in ***policy-map-class*** (control plane) configuration mode.
- shape (policy-map-class (control-plane) Helix) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth

Helix platform switches define these default bandwidths for control plane static classes:

- copp-system-acllog 1000 copp-system-l3ttl1 1000
- copp-system-arp 1000 copp-system-lacp 5000
- copp-system-arpresolver 1000 copp-system-lldp 1000
- copp-system-bfd 5000 copp-system-mlag 5000
- copp-system-bgp 5000 copp-system-OspfIsis 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 1000 copp-system-selfip-tc6to7 5000
- copp-system-glean 1000 copp-system-sflow 0
- copp-system-igmp 1000 copp-system-tc3to5 1000
- copp-system-ipmcmiss 1000 copp-system-tc6to7 1000
- copp-system-ipmcrsvd 1000 copp-system-urm 1000
- copp-system-l3destmiss 1000 copp-system-vrrp 1000
- copp-system-l3slowpath 1000

Example

These commands configure the minimum bandwidth of ***500*** packets per second for data traffic specified by the class map **copp-system-lldp**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth pps
 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map interface control-plan copp-system-policy
```

```
Service-policy input: copp-system-policy
  Number of units programmed: 4
  Hardware programming status: Successful

  Class-map: copp-system-lldp (match-any)
       shape : 10000 pps
       bandwidth : 500 pps
      Out Packets : 304996
      Drop Packets : 0

switch(config)#
```

10.2.7.5 bandwidth (policy-map-class (control-plane) Petra)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration

accessed through class (policy-map (control-plane) Petra)

Command Syntax

bandwidth kbps ***kilobits***

no bandwidth

default bandwidth

Parameters

kbits Minimum data rate in kilobits per second. Value ranges from ***1*** to ***10000000***.

Related Commands

- class (policy-map (control-plane) Petra) places the switch in ***policy-map-class*** (control plane) configuration mode.
- shape (policy-map-class (control-plane) Petra) specifies the maximum bandwidth for traffic defined by the associated class map in its ***policy map class*** configuration mode .

Static Classes Default Bandwidth

Petra platform switches define these default bandwidths for control plane static classes:

- copp-system-bpdu 1250 copp-system-l3destmiss 250
- copp-system-default 250 copp-system-l3slowpath 250
- copp-system-igmp 250 copp-system-l3ttl0 250
- copp-system-ipbroadcast 250 copp-system-l3ttl1 250
- copp-system-ipmc 250 copp-system-lacp 1250
- copp-system-ipmcmiss 250 copp-system-lldp 250
- copp-system-ipmcrsvd 250 copp-system-unicast-arp 250
- copp-system-ipunicast 250

Guidelines

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show** command displays the converted rate and not the user-configured rate.

Example

These commands configure a minimum bandwidth of ***500*** kbps for data traffic specified by the class map ***copp-system-lldp*** of the default ***control-plane*** policy map. Because the switch does not support the discrete value of ***500*** kbps, it converts the bandwidth up to ***651*** kbps.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth kbps
 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
```

```
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Hardware programming status: InProgress

  Class-map: copp-system-lldp (match-any)
       shape : 2766 kbps
       bandwidth : 651 kbps
      Out Packets : 0
      Drop Packets : 0

switch(config)#
```

10.2.7.6 bandwidth (policy-map-class (control-plane) Trident II)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration

accessed through `class (policy-map (control-plane) Trident II)`.

Command Syntax

bandwidth pps ***packets***

no bandwidth

default bandwidth

Parameters

packets Minimum data rate in packets per second. Value ranges from *1* to ***100000***.

Related Commands

- class (policy-map (control-plane) Trident II) places the switch in ***policy-map-class*** (control plane) configuration mode.
- shape (policy-map-class (control-plane) Trident II) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth

Trident II platform switches define these default bandwidths for control plane static classes:

- copp-system-acllog 1000 copp-system-l3slowpath 1000
- copp-system-arp 1000 copp-system-l3ttl1 1000
- copp-system-arpresolver 1000 copp-system-lacp 5000
- copp-system-bfd 5000 copp-system-lldp 1000
- copp-system-bgp 5000 copp-system-mlag 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 1000 copp-system-selfip-tc6to7 5000
- copp-system-glean 1000 copp-system-sflow 0
- copp-system-igmp 1000 copp-system-tc3to5 1000
- copp-system-ipmcmiss 1000 copp-system-tc6to7 1000
- copp-system-ipmcrsvd 1000 copp-system-urm 1000
- copp-system-l3destmiss 1000

Example

These commands configure the minimum bandwidth of ***500*** packets per second for data traffic specified by the class map **copp-system-lldp**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth pps
 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map interface control-plan copp-system-policy
Service-policy input: copp-system-policy
```

```
  Number of units programmed: 4
  Hardware programming status: Successful

  Class-map: copp-system-lldp (match-any)
       shape : 10000 pps
       bandwidth : 500 pps
      Out Packets : 304996
      Drop Packets : 0

switch(config)#
```

10.2.7.7 bandwidth (policy-map-class (control-plane) Trident)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration

accessed through `class (policy-map (control-plane) Trident)`.

Command Syntax

bandwidth pps ***packets***

no bandwidth

default bandwidth

Parameters

packets Minimum data rate in packets per second. Value ranges from ***1*** to ***100000***.

Related Commands

- class (policy-map (control-plane) Trident) places the switch in ***policy-map-class*** (control plane) configuration mode.
- shape (policy-map-class (control-plane) Trident) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

Static Classes Default Bandwidth

Trident platform switches define these default bandwidths for control plane static classes:

- copp-system-arp 1000 copp-system-lldp 1000
- copp-system-arpresolver 1000 copp-system-l3destmiss 1000
- copp-system-bpdu 5000 copp-system-l3slowpath 1000
- copp-system-default 1000 copp-system-l3ttl1 1000
- copp-system-glean 1000 copp-system-selfip 5000
- copp-system-igmp 1000 copp-system-selfip-tc6to7 5000
- copp-system-ipmcmiss 1000 copp-system-sflow 0
- copp-system-ipmcrsvd 1000 copp-system-tc6to7 1000
- copp-system-lacp 5000 copp-system-tc3to5 1000

Example

These commands configure the minimum bandwidth of ***1000*** packets per second for data traffic specified by the class map ***PMAP-1*** in the policy map named ***copp-system-policy***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```

10.2.7.8 class (policy-map (control-plane) Arad)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains ***20*** static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Arad platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until ***bandwidth*** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the ***shape*** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove `policy-map-class` commands for the specified class assignment from the policy map.

Command Mode

Policy-Map (control plane) configuration accessed through `policy-map type copp` command.

Command Syntax

class ***class_name***

no class ***class_name***

default class ***class_name***

Parameters

class_name name of the class.

Static Classes

Arad platform switches provide the following static control plane classes:

- copp-system-bgp copp-system-l2broadcast copp-system-linklocal
- copp-system-bpdu copp-system-l2unicast copp-system-lldp
- copp-system-default copp-system-l3destmiss copp-system-mlag
- copp-system-ipbroadcast copp-system-l3lpmoverflow copp-system-multicastsnoop
- copp-system-ipmc copp-system-l3slowpath copp-system-OspfIsis
- copp-system-ipmcmiss copp-system-l3ttl1 copp-system-sflow
- copp-system-ipunicast copp-system-lacp

Commands Available in Policy-map-class (control plane) Configuration Mode

- bandwidth (policy-map-class (control-plane) Arad)
- shape (policy-map-class (control-plane) Arad)
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

Related Commands

policy-map type copp places switch in ***policy-map*** (control plane) configuration mode.

Example

These commands enters ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-lldp***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

10.2.7.9 class (policy-map (control-plane) FM6000)

The **class** command places the switch in ***policy-map-class*** (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains ***12*** static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on FM6000 platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until ***bandwidth*** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the ***shape*** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove **policy-map-class** commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

Command Mode

Policy-Map (control plane) configuration accessed through `policy-map type copp` command.

Command Syntax

class ***class_name***

no class ***class_name***

default class ***class_name***

Parameters

class_name name of the class.

Static Classes

FM6000 platform switches provide the following static control plane classes:

- copp-system-arp copp-system-igmp copp-system-PimPtp
- copp-system-default copp-system-l2rsvd copp-system-selfip
- copp-system-ipmcmiss copp-system-l3slowpath copp-system-selfip-tc6to7
- copp-system-ipmcrsvd copp-system-OspfIsis copp-system-sflow

Commands Available in Policy-map-class (control plane) Configuration Mode

- bandwidth (policy-map-class (control-plane) FM6000)
- shape (policy-map-class (control-plane) FM6000)
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.

Related Commands

policy-map type copp places switch in ***policy-map*** (control plane) configuration mode.

Example

These commands enters ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-arp***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

10.2.7.10 class (policy-map (control-plane) Helix)

The **class** command places the switch in ***policy-map-class*** (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The **control plane** policy map contains *23* static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Helix platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the ***shape*** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to ***policy-map*** configuration mode. Saving policy-map-class changes also require an exit from ***policy-map*** mode, which saves the pending ***policy-map-class*** and ***policy-map*** changes to ***running-config*** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the ***policy-map-class*** commands for the specified class assignment from the policy map.

Command Mode

Policy-Map (control plane) configuration accessed through `policy-map type copp` command.

Command Syntax

class ***class_name***

no class ***class_name***

default class ***class_name***

Parameters

class_name name of the class.

Static Classes

Helix platform switches provide the following static control plane classes:

- copp-system-acllog copp-system-ipmcmiss copp-system-OspfIsis
- copp-system-arp copp-system-ipmcrsvd copp-system-selfip
- copp-system-arpresolver copp-system-l3destmiss copp-system-selfip-tc6to7
- copp-system-bfd copp-system-l3slowpath copp-system-sflow
- copp-system-bgp copp-system-l3ttl1 copp-system-tc3to5
- copp-system-bpdu copp-system-lacp copp-system-tc6to7
- copp-system-default copp-system-lldp copp-system-urm
- copp-system-glean copp-system-lldp copp-system-vrrp
- copp-system-igmp copp-system-lldp

Commands Available in Policy-map-class (control plane) Configuration Mode

- bandwidth (policy-map-class (control-plane) Helix)
- shape (policy-map-class (control-plane) Helix)

- **`exit`** saves pending class map changes, then returns the switch to the *global* configuration mode.
- **`abort`** discards pending class map changes, then returns the switch to the ***global*** configuration mode.

Related Commands

policy-map type copp places switch in ***policy-map*** (control plane) configuration mode.

Example

These commands enters ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-arp***.

```
switch(config)# policy-map
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

10.2.7.11 class (policy-map (control-plane) Petra)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 15 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Petra platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until ***bandwidth*** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the ***shape*** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to ***policy-map*** configuration mode. Saving the ***policy-map-class*** changes also require an exit from ***policy-map*** mode, which saves the pending ***policy-map-class*** and ***policy-map*** changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the **policy-map-class** commands for the specified class assignment from the policy map.

Command Mode

Policy-Map (control plane) configuration accessed through policy-map type copp command.

Command Syntax

class ***class_name***

no class ***class_name***

default class ***class_name***

Parameters

class_name name of the class.

Static Classes

Petra platform switches provide the following static control plane classes:

- copp-system-bpdu copp-system-ipmcmiss copp-system-l3ttl0
- copp-system-default copp-system-ipmcrsvd copp-system-l3ttl1
- copp-system-igmp copp-system-ipunicast copp-system-lacp
- copp-system-ipbroadcast copp-system-l3destmiss copp-system-lldp
- copp-system-ipmc copp-system-l3slowpath copp-system-unicast-arp

Commands Available in Policy-map-class (control plane) Configuration Mode

- bandwidth (policy-map-class (control-plane) Petra)
- shape (policy-map-class (control-plane) Petra)
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.

Related Commands

policy-map type copp places switch in ***policy-map*** (control plane) configuration mode.

Example

These commands enters ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-lldp***.

```
switch(config)# policy-map
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

10.2.7.12 class (policy-map (control-plane) Trident II)

The **class** command places the switch in ***policy-map-clas***s (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains ***23*** static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Trident II platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the ***shape*** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to the ***policy-map*** configuration mode. Saving the ***policy-map-class*** changes also require an exit from the ***policy-map*** mode, which saves the pending ***policy-map-class*** and ***policy-map*** changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the ***policy-map-class*** commands for the specified class assignment from the policy map.

Command Mode

Policy-Map (control plane) configuration accessed through `policy-map type copp` command.

Command Syntax

class ***class_name***

no class ***class_name***

default class***class_name***

Parameters

class_name name of the class.

Static Classes

Trident II platform switches provide the following static control plane classes:

- copp-system-acllog copp-system-igmp copp-system-mlag
- copp-system-arp copp-system-ipmcmiss copp-system-selfip
- copp-system-arpresolver copp-system-ipmcrsvd copp-system-selfip-tc6to7
- copp-system-bfd copp-system-l3destmiss copp-system-sflow
- copp-system-bgp copp-system-l3slowpath copp-system-tc3to5
- copp-system-bpdu copp-system-l3ttl1 copp-system-tc6to7
- copp-system-default copp-system-lacp copp-system-urm
- copp-system-glean copp-system-lldp

Commands Available in Policy-map-class (control plane) Configuration Mode

- bandwidth (policy-map-class (control-plane) Trident II)
- shape (policy-map-class (control-plane) Trident II)
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.

- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.

Related Commands

policy-map type copp places switch in ***policy-map (control plane)*** configuration mode.

Example

These commands enters the ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-arp***.

```
switch(config)# policy-map
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

10.2.7.13 class (policy-map (control-plane) Trident)

The **class** command places the switch in ***policy-map-class*** (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. The command adds the specified class to the policy map if it was not previously included. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 18 static classes and up to *30* dynamic classes. Dynamic classes contain an eponymous class map. All classes may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Dynamic class maps identify a data stream with an ACL assigned by `match (class-map (control-plane) Trident)`. Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content.

Static classes are provided with the switch and cannot be removed from the policy map or modified by the **class** command. Dynamic classes are user defined and added to the policy map by this command. Dynamic classes are always placed in front of the static classes. Bandwidth and shape parameters are editable for all classes.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until ***bandwidth*** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the ***shape*** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving the ***policy-map-class*** changes also require an exit from ***policy-map*** mode, which saves the pending ***policy-map-class*** and ***policy-map*** changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the ***policy-map-class*** commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

Command Mode

Policy-Map (control plane) configuration accessed through `policy-map type copp` command.

Command Syntax

class ***class_name*** [**PLACEMENT**]

no class ***class_name*** [**PLACEMENT**]

default class ***class_name*** [**PLACEMENT**]

Parameters

- ***class_name*** name of the class.
- **PLACEMENT** Specifies the classs map placement. Configurable only for dynamic classes.
  - ***no parameter*** New classes are placed between the dynamic and static classes. Previously defined classes retain their current policy map placement.
  - **insert-before** ***dynamic_class*** Class is inserted in front of the specified dynamic class.

Static Classes

Trident switches provide the following static control plane classes:

- copp-system-acllog copp-system-ipmcmiss copp-system-lldp
- copp-system-arp copp-system-ipmcrsvd copp-system-selfip

- copp-system-arpresolver copp-system-l3destmiss copp-system-selfip-tc6to7
- copp-system-bpdu copp-system-l3slowpath copp-system-sflow
- copp-system-glean copp-system-l3ttl1 copp-system-tc3to5
- copp-system-igmp copp-system-lacp copp-system-tc6to7

Commands Available in Policy-map-class (control plane) Configuration Mode

- bandwidth (policy-map-class (control-plane) Trident)
- shape (policy-map-class (control-plane) Trident)
- **`exit`** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **`abort`** discards pending class map changes, then returns the switch to the ***global*** configuration mode.

Related Commands

- class-map type copp places switch in the ***class-map*** (control-plane) configuration mode.
- policy-map type copp places switch in the ***policy-map*** (control plane) configuration mode.

Example

These commands add ***CM-1*** class to the ***copp-system-policy*** policy map.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class CM-1
switch(config-pmap-c-copp-system-policy-CM-1)#
```

10.2.7.14 class (policy-map (pbr)

The **class (policy-map (pbr)** command places the switch in ***policy-map-class (pbr)*** configuration mode, which is a group change mode that modifies the specified class of the configuration mode Policy-Based Routing (PBR) policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the mode is exited, and can be canceled by using the **abort** command.

A PBR policy map is an ordered list of classes. Each class contains an eponymous class map and can contain set commands to specify next hop. Classes without set commands translate to no action being performed on that class of packets.

- The class map identifies a data stream through ACLs. Class maps are configured in the ***class-map*** (pbr) configuration mode.
- **Set** commands can be used to specify the next hop for a given class. **Set** commands are configured in ***policy-map-class*** (pbr) configuration mode.

PBR policy maps can also contain one or more raw match statements which filter incoming traffic without using ACLs. Data packets are managed by commands of the first class or raw match statement matching the packets contents.

The **exit** command returns the switch to the ***policy-map*** (pbr) configuration mode. However, saving the policy-map-class changes also requires an exit from ***policy-map*** (pbr) configuration mode. This saves all the pending policy map and policy-map-class changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from ***running-config***.

Command Mode

Policy-Map (pbr) Configuration accessed through `policy-map type pbr`.

Command Syntax

[***sequence_number***] **class** ***class_name***

no [***sequence_number***] **class** ***class_name***

default [***sequence_number***] **class** ***class_name***

no [***sequence_number***]

default [***sequence_number***]

Parameters

- ***sequence_number*** Sequence number (***1*** to ***4294967295***) assigned to the rule. If no number is entered, the number is derived by adding ***10*** to the number of the policy maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- ***class_name*** name of the class.

Commands Available in Policy-map-class (pbr) Configuration Mode

- set nexthop (policy-map-class pbr) sets next hop for the class.
- **exit** saves pending class changes and returns switch to ***policy-map (pbr)*** configuration mode.
- **abort** discards pending class changes and returns switch to ***policy-map (pbr)*** configuration mode.

Related Commands

- class-map type pbr places switch in the ***class-map*** (pbr) configuration mode.
- policy-map type pbr places switch in the ***policy-map (pbr)*** configuration mode.

Example

These commands add the ***CMAP1*** class map to the ***PMAP1*** policy map, then place the switch in ***policy-map-class*** configuration mode where the next hops can be assigned to the class. Changes will not take effect until both modes are exited.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

10.2.7.15 class (policy-map (qos) FM6000)

The **class** command places the switch in ***policy-map-class*** (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in the ***class-map*** (qos) configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in the ***policy-map-class*** (qos) configuration mode.

  Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to the ***policy-map*** configuration mode. However, saving policy-map-class changes also require an exit from the ***policy-map*** mode. This saves all pending policy map and policy-map-class changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from ***running-config***.

Command Mode

Policy-Map (qos) Configuration accessed through `policy-map type quality-of-service`.

Command Syntax

class ***class_name*** [**PLACEMENT**]

no class ***class_name*** [**PLACEMENT**]

default class ***class_name*** [**PLACEMENT**]

Parameters

- ***class_name*** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - ***no parameter*** Class is placed at the top of the list.
  - **insert-before** ***existing_class*** Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode

- set (policy-map-class (qos) FM6000)
- **exit** saves pending class changes and returns switch to ***policy-map (qos)*** configuration mode.
- **abort** discards pending class changes and returns switch to ***policy-map (qos)*** configuration mode.

Related Commands

- class-map type qos places switch in the ***class-map*** (QoS) configuration mode.
- policy-map type quality-of-service places switch in the ***policy-map*** (QoS) configuration mode

Example

These commands add the ***CMAP_1*** class map to the ***PMAP_1*** policy map, then places the switch in the ***policy-map-class*** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
```

```
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.16 class (policy-map (qos) Helix)

The **class** command places the switch in the ***policy-map-class*** (QoS) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in the ***class-map*** (qos) configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in the ***policy-map-class*** (qos) configuration mode.

  Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to the ***policy-map*** configuration mode. However, saving policy-map-class changes also require an exit from the ***policy-map*** mode. This saves all the pending policy map and policy-map-class changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from ***running-config***.

Command Mode

Policy-Map (qos) Configuration accessed through `policy-map type quality-of-service` command.

Command Syntax

class ***class_name*** [**PLACEMENT**]

no class ***class_name*** [**PLACEMENT**]

default class ***class_name*** [**PLACEMENT**]

Parameters

- ***class_name*** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - ***no parameter*** Class is placed at the top of the list.
  - **insert-before** ***existing_class*** Class is inserted in front of the specified class.

Commands Available in Policy-map-class (QoS) Configuration Mode

- set (policy-map-class (qos) Helix)
- **exit** saves pending class changes and returns switch to ***policy-map (qos)*** configuration mode.
- **abort** discards pending class changes and returns switch to ***policy-map (qos)*** configuration mode.

Related Commands

- class-map type qos places switch in the ***class-map*** (qos) configuration mode.
- policy-map type quality-of-service places switch in the ***policy-map*** (QoS) configuration mode.

Example

These commands add the ***CMAP_1*** class map to the ***PMAP_1*** policy map, then places the switch in ***policy-map-class*** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
```

```
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.17 class (policy-map (qos) Trident II)

The **class** command places the switch in the ***policy-map-class*** (QoS) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in ***class-map (qos)*** configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in ***policy-map-class (qos)*** configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to the ***policy-map*** configuration mode. However, saving the policy-map-class changes also require an exit from the ***policy-map*** mode. This saves all the pending policy map and policy-map-class changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from ***running-config***.

Command Mode

Policy-Map (qos) Configuration accessed through `policy-map type quality-of-service` command.

Command Syntax

class ***class_name*** [**PLACEMENT**]

no class ***class_name*** [**PLACEMENT**]

default class ***class_name*** [**PLACEMENT**]

Parameters

- ***class_name*** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - ***no parameter*** Class is placed at the top of the list.
  - **insert-before** ***existing_class*** Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode

- `set (policy-map-class (qos) Trident II)`
- **exit** saves pending class changes and returns switch to ***policy-map (qos)*** configuration mode.
- **abort** discards pending class changes and returns switch to ***policy-map (qos)*** configuration mode.

Related Commands

- class-map type qos places switch in ***class-map (qos)*** configuration mode.
- policy-map type quality-of-service places switch in ***policy-map (qos)*** configuration mode.

Example

These commands add the ***CMAP_1*** class map to the ***PMAP_1*** policy map, then places the switch in ***policy-map-class*** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
```

```
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.18 class (policy-map (qos) Trident)

The **class** command places the switch in ***policy-map-class (qos)*** configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in ***class-map (qos)*** configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in ***policy-map-class (qos)*** configuration mode.

  Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to ***policy-map*** configuration mode. However, saving policy-map-class changes also require an exit from ***policy-map*** mode. This saves all the pending policy map and policy-map-class changes to ***running-config*** and returns the switch to the ***global*** configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from ***running-config***.

Command Mode

Policy-Map (qos) Configuration accessed through `policy-map type quality-of-service` command.

Command Syntax

class ***class_name*** [**PLACEMENT**]

no class ***class_name*** [**PLACEMENT**]

default class ***class_name*** [**PLACEMENT**]

Parameters

- ***class_name*** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - ***no parameter*** Class is placed at the top of the list.
  - **insert-before** ***existing_class*** Class is inserted in front of the specified class.

Commands Available in Policy-map-class (qos) Configuration Mode

- set (policy-map-class (qos) Trident)
- **exit** saves pending class changes and returns switch to ***policy-map (qos)*** configuration mode.
- **abort** discards pending class changes and returns switch to ***policy-map (qos)*** configuration mode.

Related Commands

- class-map type qos places switch in ***class-map (qos)*** configuration mode.
- policy-map type quality-of-service places switch in ***policy-map (qos)*** configuration mode.

Example

These commands add the ***CMAP_1*** class map to the ***PMAP_1*** policy map, then places the switch in ***policy-map-class*** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
```

```
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.19 class-map type copp

The **class-map type copp** command places the switch in ***Class-Map*** (control plane) configuration mode, which is a group change mode that modifies a control-plane dynamic class map. A dynamic class map is a data structure that uses Access Control Lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. Control-plane policy maps use class maps to specify which control plane traffic is controlled by policy map criteria.

The **exit** command saves pending class map changes to ***running-config*** and returns the switch to the ***global*** configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to the ***global*** configuration mode.

The **no class-map type copp** and **default class-map type copp** commands delete the specified class map by removing the corresponding **class-map type copp** command and its associated configuration.

Command Mode

Global Configuration

Command Syntax

class-map type copp match-any ***class_name***

no class-map type copp [match-any] ***class_name***

default class-map type copp [match-any] ***class_name***

Parameters

class_name Name of class map.

Commands Available in Class-Map (Control Plane) Configuration Mode

match (class-map (control-plane) Trident)

Related Commands

- policy-map type copp
- class (policy-map (control-plane) Trident)
- class-map type qos

Example

This command creates the control plane class map named ***CP-MAP-1*** and places the switch in ***class-map*** configuration mode.

```
switch(config)# class-map type copp match-any CP-CMAP-1
switch(config-cmap-CP-CMAP-1)#
```

10.2.7.20 class-map type pbr

The **`class-map type pbr`** command places the switch in the ***class-map*** (pbr) configuration mode for the specified class map, and creates the class map if one does not already exist. The ***class-map*** (PBR) configuration mode is a group change mode that modifies a class map for Policy-Based Routing (PBR). PBR class maps contain one or more **match** statements which filter incoming traffic using ACLs. PBRs can then use these class maps to set next-hop IP addresses for the traffic that matches them. (Classes without set commands translate to no action being performed on that class of packets.)

The **`exit`** command saves pending class map changes to ***running-config***, then returns the switch to the ***global*** configuration mode. Class map changes are also saved by directly entering a different configuration mode. The **`abort`** command discards pending changes and returns the switch to the ***global*** configuration mode.

The **`no class-map type pbr`** and **`default class-map type pbr`** commands delete the specified class map by removing the corresponding **`class-map type pbr`** command and its associated configuration.

Command Mode

Global Configuration

Command Syntax

`class-map type pbr match-any` ***map_name***

`no class-map type pbr match-any` ***map_name***

`default class-map type pbr match-any` ***map_name***

Parameters

map_name Name of class map.

Commands Available in Class-Map (PBR) configuration mode

- match (class-map (pbr))
- resequence (class-map (pbr))

Related Commands

- policy-map type pbr
- class (policy-map (pbr))

Example

This command creates the PBR class map named ***MAP1*** and places the switch in ***class-map (pbr)*** configuration mode where match criteria can be configured for the class.

```
switch(config)# class-map type pbrmatch-any MAP1
switch(config-cmap-MAP1)#
```

10.2.7.21 class-map type qos

The **`class-map type qos`** command places the switch in the ***class-map*** (QoS) configuration mode, which is a group change mode that modifies a QoS dynamic class map. A dynamic class map is a data structure that uses Access Control Lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. QoS policy maps use class maps to specify the traffic (to which the policy map is assigned) that is transformed by policy map criteria.

The **`exit`** command saves pending class map changes to ***running-config***, then returns the switch to the ***global*** configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to the ***global*** configuration mode.

The **`no class-map type qos`** and **`default class-map type qos`** commands delete the specified class map by removing the corresponding **`class-map type qos`** command and its associated configuration. The **`class-map`** and **`class-map type qos`** commands are equivalent.

Command Mode

Global Configuration

Command Syntax

`class-map [type qos] match-any` ***`class_name`***

`no class-map [type qos] match-any` ***`class_name`***

`default class-map [type qos] match-any` ***`class_name`***

Parameters

class_name Name of class map.

Commands Available in Class-Map (QoS) Configuration Mode

- match (class-map (qos) FM6000)
- match (class-map (qos) Trident)

Conditions

class-map *map_name* and **class-map type qos *map_name*** are identical commands.

Related Commands

- policy-map type quality-of-service
- class (policy-map (qos) FM6000)
- class (policy-map (qos) Trident)

Example

This command creates the QoS class map named ***MAP-1*** and places the switch in ***class-map*** configuration mode.

```
switch(config)# class-map type qos match-any MAP-1
switch(config-cmap-MAP-1)#
```

10.2.7.22 clear policy-map counters

The **`clear policy-map`** command resets the specified policy map counters to zero. Policy map counters record the quantity of packets that are filtered by the ACLs that comprise a specified policy map.

Command Mode

Privileged EXEC

Command Syntax

`clear policy-map` **INTERFACE_NAME** **`counters`** **MAP_NAME**

Parameters

- **INTERFACE_NAME** Interface for which command clears table counters. Options include:
  - **interface control-plane** Control plane.
- **MAP_NAME** Policy map for which command clears counters. Options include:
  - ***copp-system-policy*** Name of only policy map supported for the control plane.

10.2.7.23 feature pbr

Policy-Based Routing (PBR) is a feature that is applied on IPv4 or IPv6 routable ports, to preferentially route packets. Forwarding is based on a policy that is enforced at the ingress of the applied interface and overrides normal routing decisions. In addition to matches on regular ACLs, PBR policy-maps can also include “raw match” statements that look like a single entry of an ACL as a convenience for users.

Configuration Mode

For IP:

TCAM PBR profile set TTL configuration mode.

For IPv6:

TCAM feature PBR IP configuration mode.

Command Syntax

For IP:

feature pbr ip [copy]

no feature pbr ip [copy]

default featue pbr ip [copy]

For IPv6:

feature pbr ipv6[copy | bank]

no feature pbr ipv6 [copy | bank]

default featue pbr ipv6 [copy | bank]

Parameters

For IP:

copy Copy a feature from a TCAM profile.

For IPv6:

- **copy** Copy a feature from a TCAM profile.
- **bank** TCAM banks to reserve.

Example

In the following example, the PBR is configured on an IP routable port.

```
(config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
```

In the following example, the PBR is configured on an IPv6 routable port.

```
(config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
(config-tcam-feature-pbr-ip)# feature pbr ipv6
```

10.2.7.24 feature traffic-policy cpu

The **feature traffic-policy cpu** command configures the CPU traffic policy features for the IPv4 and IPv6 traffic in user-defined TCAM profile.

The **no feature traffic-policy cpu** and **default feature traffic-policy cpu** commands remove the CPU policy configurations from ***running-config***.

Command Mode

Hardware TCAM

Command Syntax

feature traffic-policy cpu [ipv4 | ipv6]

no feature traffic-policy cpu [ipv4 | ipv6]

default feature traffic-policy cpu [ipv4 | ipv6]

Parameters

- **ipv4** CPU traffic policy for IPv4 traffic.
- **ipv6** CPU traffic policy for IPv6 traffic.

Example

These commands places the switch in the hardware TCAM profile mode and configures the CPU traffic policy features for IPv4 traffic in the TCAM profile test.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile test
switch(config-hw-tcam-profile-test)# feature traffic-policy cpu ipv4
```

10.2.7.25 feature traffic-policy port

The **feature traffic-policy port** command configures the port-related traffic policy features for the IPv4 and IPv6 traffic in user-defined TCAM profile.

The **no feature traffic-policy port** and **default feature traffic-policy port** commands remove the CPU policy configurations from ***running-config***.

Command Mode

Hardware TCAM

Command Syntax

feature traffic-policy port [ipv4 | ipv6]

no feature traffic-policy port [ipv4 | ipv6]

default feature traffic-policy port [ipv4 | ipv6]

Parameters

- **ipv4** port traffic policy for IPv4 traffic.
- **ipv6** port traffic policy for IPv6 traffic.

Example

These commands places the switch in the hardware TCAM profile mode and configures the port traffic policy features for IPv4 traffic in the TCAM profile test.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile test
switch(config-hw-tcam-profile-test)# feature traffic-policy port ipv4
```

10.2.7.26 match (class-map (control-plane) Helix)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) Helix)` command.

The ***class map*** (control plane) configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Command Mode

Class-Map (control plane) configuration accessed through `class-map type copp` command.

Command Syntax

match ip access-group ***list_name***

no match ip access-group ***list_name***

default match ip access-group ***list_name***

Parameters

list_name name of ACL assigned to class map.

Related Commands

- class-map type copp places the switch in the ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (control-plane) Helix) assigns a ***class map*** to a ***policy map***.

Guidelines

Static class maps cannot be modified by this command.

Match statements are saved to ***running-config*** only upon exiting ***class-map (control plane)*** configuration mode.

Example

These commands add the IP ACL ***list_1*** to the ***map_1*** class map, then saves the command by exiting ***class-map*** mode.

```
switch(config)# class-map type copp map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#
```

10.2.7.27 match (class-map (control-plane) Trident II)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) Trident II)` command.

The ***class map*** (control plane) configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Command Mode

Class-Map (control plane) configuration accessed through `class-map type copp` command.

Command Syntax

list_name

list_name

list_name

Parameters

list_name name of ACL assigned to class map.

Related Commands

- class-map type copp places the switch in the ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (control-plane) Trident II) assigns a class map to a ***policy map***.

Guidelines

Static class maps cannot be modified by this command.

Match statements are saved to ***running-config*** only upon exiting ***class-map (control plane)*** configuration mode.

Example

These commands add the IP ACL ***list_1*** to the ***map_1*** class map, then saves the command by exiting ***class-map*** mode.

```
switch(config)# class-map type copp map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#
```

10.2.7.28 match (class-map (control-plane) Trident)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv6, IPv4 standard, and IPv6 standard ACLs.

A class map is assigned to a policy map by the `class (policy-map (control-plane) Trident)` command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Command Mode

Class-Map (control plane) configuration accessed through `class-map type copp` command

Command Syntax

match IP_VERSION **access-group** ***list_name***

no match IP_VERSION **access-group** ***list_name***

default match IP_VERSION **access-group** ***list_name***

Parameters

- **IP_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- ***list_name*** name of ACL assigned to class map.

Related Commands

- class-map type copp places the switch in ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (control-plane) Trident) assigns a class map to a policy map.

Guidelines

Static class maps cannot be modified by this command.

Match statements are saved to ***running-config*** only upon exiting ***class-map (control plane)*** configuration mode.

Example

These commands add the IPv4 ACL names ***list_1*** to the ***map_1*** class map, then saves the command by exiting ***class-map*** mode.

```
switch(config)# class-map type copp map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#
```

10.2.7.29 match (class-map (pbr))

The **match** command assigns ACLs to the configuration mode Policy-Based Routing (PBR) class map. The command accepts IPv4, IPv4 standard, IPv6 and IPv6 standard ACLs.

Class map (pbr) configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Note: PBR ACLs use only permit rules to filter data; if there are deny rules in an ACL used by PBR, the configuration will be reverted.

Command Mode

Class-map (pbr) configuration accessed through `class-map type pbr` command.

Command Syntax

[*sequence_number*] match [ip | ipv6] access-group *list_name*

no [*sequence_number*] match [ip | ipv6] access-group *list_name*

default [*sequence_number*] [ip | ipv6] access-group *list_name*

no [*sequence_number*]

default [*sequence_number*]

Parameters

- ***sequence_number*** Sequence number (***1*** to ***4294967295***) assigned to the rule. If no number is entered, the number is derived by adding ***10*** to the number of the class maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- ***list_name*** name of ACL assigned to class map.

Related Commands

- class-map type pbr places the switch in the ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (pbr)) assigns a class map to a policy map.

Example

These commands add the IPv4 ACL named ***list1*** to the ***map1*** class map, then save the change by exiting ***class-map*** mode.

```
switch(config)# class-map type pbr map1
switch(config-cmap-map1)# match ip access-group list1
switch(config-cmap-map1)# exit
switch(config)#
```

10.2.7.30 match (class-map (qos) FM6000)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

The ***class map (qos)*** configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Command Mode

Class-map (qos) configuration accessed through `class-map type qos` command.

Command Syntax

match **IP_VERSION** **access-group** ***list_name***

no match **IP_VERSION** **access-group** ***list_name***

default match **IP_VERSION** **access-group** ***list_name***

Parameters

- **IP_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
- ***list_name*** name of ACL assigned to class map.

Related Commands

- class-map type qos places the switch in the ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (qos) FM6000) assigns a ***class map*** to a ***policy map***.

Example

These commands add the IPv4 ACL named ***list_1*** to the ***map_1*** class map, then saves the command by exiting ***class-map*** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#
```

10.2.7.31 match (class-map (qos) Helix)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

the ***class map (QoS)*** configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Command Mode

Class-Map (QoS) configuration accessed through `class-map type qos` command.

Command Syntax

match IP_VERSION access-group *list_name*

no match IP_VERSION access-group *list_name*

default match IP_VERSION access-group *list_name*

Parameters

- **IP_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- ***list_name*** name of ACL assigned to class map.

Related Commands

- class-map type qos places the switch in the ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (qos) Helix) assigns a class map to a policy map.

Example

These commands add the IPv4 ACL named ***list_1*** to the ***map_1*** class map, then saves the command by exiting ***class-map*** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#
```

10.2.7.32 match (class-map (qos) Trident II)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

The ***class map (QoS)*** configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Command Mode

The ***class-map (qos)*** configuration accessed through `class-map type qos` command.

Command Syntax

IP_VERSION *list_name*

IP_VERSION *list_name*

IP_VERSION *list_name*

Parameters

- **IP_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- ***list_name*** name of ACL assigned to class map.

Related Commands

- class-map type qos places the switch in the ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- `abort` discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (qos) Trident) assigns a class map to a policy map.

Example

These commands add the IPv4 ACL named ***list_1*** to the ***map_1*** class map, then saves the command by exiting ***class-map*** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#
```

10.2.7.33 match (class-map (qos) Trident)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (QoS) configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from ***running-config***.

Command Mode

Class-Map (qos) configuration accessed through `class-map type qos` command.

Command Syntax

match IP_VERSION access-group *list_name*

no match IP_VERSION access-group *list_name*

default match IP_VERSION access-group *list_name*

Parameters

- **IP_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- ***list_name*** name of ACL assigned to class map.

Related Commands

- class-map type qos places the switch in the ***class-map*** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the ***global*** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the ***global*** configuration mode.
- class (policy-map (qos) Trident) assigns a ***class map*** to a ***policy map***.

Example

These commands add the IPv4 ACL named ***list_1*** to the ***map_1*** class map, then saves the command by exiting ***class-map*** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#
```

10.2.7.34 match (policy-map (pbr))

The **match** command creates a policy map clause entry that specifies one filtering condition. When a packet matches the filtering criteria, its next hop is set as specified. When a packets properties do not equal the statement parameters, the packet is evaluated against the next clause or class map in the policy map, as determined by sequence number. If all clauses fail to set a next hop for the packet, the packet is routed according to the FIB.

The **no match** and **default match** commands remove the **match** statement from the configuration mode policy map by deleting the corresponding command from ***running-config***.

Command Mode

Policy-Map (pbr) Configuration accessed through `policy-map type pbr` command.

Command Syntax

[***sequence_number***] **match ip SOURCE_ADDR DEST_ADDR** [**set nexthop [recursive]** ***NH-addr_1*** [***NH-addr_2***] ***...*** [***NH-addr_n***]]

no match ip SOURCE_ADDR DEST_ADDR [**set nexthop [recursive]** ***NH-addr_1*** [***NH-addr_2***] ***...*** [***NH-addr_n***]]

default match match ip SOURCE_ADDR DEST_ADDR [**set nexthop [recursive]** ***NH-addr_1*** [***NH-addr_2***] ***...*** [***NH-addr_n***]]

no SEQ_NUM

default SEQ_NUM

Parameters

- ***sequence_number*** Sequence number assigned to the rule. If no number is entered, the number is derived by adding ***10*** to the number of the policy maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- **SOURCE_ADDR** and **DEST_ADDR** source and destination address filters. Options include:
  - ***network_addr*** subnet address (CIDR or address-mask).
  - **any** packets from or to all addresses are matched.
  - **host *ip_addr*** IP address (dotted decimal notation).

  Source and destination subnet addresses support discontiguous masks.
- **recursive** enables recursive next hop resolution.
- ***NH_addr*** IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

Related Commands

- policy-map type pbr enters the policy-map (PBR) configuration mode.
- show policy-map type pbr displays the PBR policy maps.

Example

These commands create a match rule in policy map ***PMAP1*** which sets the next hop to ***192.168.3.5*** for packets received from ***172.16.0.0/12*** regardless of their destination, then exit the mode to save the changes.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# match ip 172.16.0.0/12 any set nexthop
 192.163.3.5
switch(config-pmap-PMAP1)# exit
switch(config)#
```

10.2.7.35 platform arad tcam counters feature

The **platform arad tcam counters feature** command enables incrementing PBR hardware counters corresponding to ACL. If counters for PBR are enabled, then counters for ACL will be automatically disabled in all cases. If counters for ACL are enabled, then counters for PBR will be automatically disabled in all cases.

The **no platform arad tcam counters feature** command disables PBR/ACL counters selection. The **default platform arad tcam counters feature** commands resets the default behavior.

Command Mode

Global Configuration

Command Syntax

platform arad tcam counters feature [***OPTIONS***]

no platform arad tcam counters feature [***OPTIONS***]

default platform arad tcam counters feature [***OPTIONS***]

Parameters

OPTIONS Assign the TCAM counters feature. Options include:

- **pbr** assign the TCAM counters feature PBR hardware counters.
- **acl** assign the TCAM counters feature ACL hardware counters.

Example

- This command enables incrementing ACL hardware counters selection.

```
switch(config)# platform arad tcam counters feature acl
switch(config)#
```

- This command disables incrementing ACL hardware counters selection.

```
switch(config)# no platform arad tcam counters feature acl
switch(config)#
```

10.2.7.36 policy-map type copp

The **`policy-map type copp`** command places the switch in the ***policy-map*** (control plane) configuration mode, which is a group change mode that modifies a ***control-plane*** policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and specify bandwidth and shaping parameters that controls its transmission. Control plane policy maps are applied to the control plane to manage traffic.

The ***copp-system-policy*** policy map is supplied with the switch and is always applied to the control plane. The ***copp-system-policy*** is the only valid control plane policy map.

The **`exit`** command saves pending policy map changes to ***running-config*** and returns the switch to the ***global*** configuration mode. Policy map changes are also saved by entering a different configuration mode. The **`abort`** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **`no policy-map type copp`** and **`default policy-map type copp`** commands delete the specified policy map by removing the corresponding **`policy-map type copp`** command and its associated configuration.

Command Mode

Global Configuration

Command Syntax

`policy-map type copp copp-system-policy`

`no policy-map type copp copp-system-policy`

`default policy-map type copp copp-system-policy`

The ***copp-system-policy*** is supplied with the switch and is the only valid control plane policy map.

Commands Available in Policy-Map Configuration Mode

- class (policy-map (control-plane) FM6000)
- class (policy-map (control-plane) Trident)

Related Commands

class-map type copp enters the ***control-plane class-map*** configuration mode for modifying a control-plane dynamic class map.

Only Helix and Trident platform switches support dynamic classes for control plane policing.

Example

This command places the switch in the ***policy-map*** configuration mode to edit the ***copp-system-policy*** policy map.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

10.2.7.37 policy-map type pbr

The **policy-map type pbr** command places the switch in ***policy-map (pbr)*** configuration mode, which is a group change mode that modifies a Policy-Based Routing (PBR) policy map. The command also creates the specified policy map if it does not already exist. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The **exit** command saves pending policy map changes to ***running-config*** and returns the switch to the ***global*** configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no policy-map type pbr** and **default policy-map type pbr** commands delete the specified policy map by removing the corresponding **policy-map type pbr** command and its associated configuration.

Command Mode

Global Configuration

Command Syntax

policy-map type pbr ***map_name***

no policy-map type pbr ***map_name***

default policy-map type pbr ***map_name***

Parameters

map_name Name of policy map.

Commands Available in Policy-Map Configuration Mode

- class (policy-map (pbr))
- match (policy-map (pbr))

Related Commands

- class-map type pbr
- service-policy type pbr (Interface mode)

Example

This command creates the PBR policy map named ***PMAP1*** and places the switch in ***policy-map*** configuration mode.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

10.2.7.38 policy-map type quality-of-service

The **policy-map type quality-of-service** command places the switch in the ***policy-map (QoS)*** configuration mode, which is a group change mode that modifies a QoS policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and shaping parameters that controls its transmission. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The **exit** command saves pending policy map changes to ***running-config*** and returns the switch to the ***global*** configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no policy-map type quality-of-service** and **default policy-map type quality-of-service** commands delete the specified policy map by removing the corresponding **policy-map type quality-of-service** command and its associated configuration. The **policy-map** and **policy-map type quality-of-service** commands are equivalent.

Command Mode

Global Configuration

Command Syntax

policy-map type quality-of-service ***map_name***

no policy-map type quality-of-service ***map_name***

default policy-map type quality-of-service ***map_name***

Parameters

map_name Name of policy map.

Commands Available in Policy-Map Configuration Mode

- class (policy-map (qos) FM6000)
- class (policy-map (qos) Trident)

Conditions

policy-map ***map_name*** and **policy-map type quality-of-service** ***map_name*** are identical commands.

Related Commands

- class-map type qos
- service-policy type qos (Interface mode)

Example

This command creates the QoS policy map named ***PMAP-1*** and places the switch in the ***policy-map*** configuration mode.

```
switch(config)# policy-map PMAP-1
switch(config-pmap-PMAP-1)#
```

10.2.7.39 resequence (class-map (pbr))

The **resequence** command assigns sequence numbers to rules in the configuration mode class map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the **resequence** command, but the interval used for numbering new rules reverts to ***10*** on the exiting ***class-map (pbr)*** configuration mode.

Maximum rule sequence number is ***4294967295***.

Command Mode

Class-Map (PBR) Configuration accessed through `class-map type pbr` command.

Command Syntax

resequence [***start_num*** [***inc_num***]]

Parameters

- ***start_num*** sequence number assigned to the first rule. Default is ***10***.
- ***inc_num*** numeric interval between consecutive rules. Default is ***10***.

Example

The **resequence** command renumbers the rules in ***CMAP1***, starting the first command at number ***100*** and incrementing subsequent lines by ***20***.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)# show active
class-map type pbr match-any CMAP1
10 match ip access-group group1
20 match ip access-group group2
30 match ip access-group group3
switch(config-cmap-CMAP1)# resequence 100 20
switch(config-cmap-CMAP1)# exit
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)# show active
class-map type pbr match-any CMAP1
100 match ip access-group group1
120 match ip access-group group2
140 match ip access-group group3
```

10.2.7.40 resequence (policy-map (pbr))

The **resequence** command assigns sequence numbers to rules in the configuration mode policy map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the **resequence** command, but the interval used for numbering new rules reverts to ***10*** on the exiting ***policy-map (pbr)*** configuration mode.

Maximum rule sequence number is ***4294967295***.

Command Mode

Policy-Map (PBR) Configuration accessed through `policy-map type pbr` command

Command Syntax

resequence [***start_num*** [***inc_num***]]

Parameters

- ***start_num*** sequence number assigned to the first rule. Default is ***10***.
- ***inc_num*** numeric interval between consecutive rules. Default is ***10***.

Example

The **resequence** command renumbers the rules in ***PMAP1***, starting the first command at number ***100*** and incrementing subsequent lines by ***20***.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# show active
policy-map type pbr PMAP1
10 class CMAP1
set nexthop 172.16.1.1
20 class CMAP2
set nexthop 172.16.2.2
30 class CMAP3
set nexthop 172.16.3.3
switch(config-pmap-PMAP1)# resequence 100 20
switch(config-pmap-PMAP1)# exit
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# show active
class-map type pbr PMAP1
100 class CMAP1
set nexthop 172.16.1.1
120 class CMAP2
set nexthop 172.16.2.2
140 class CMAP3
set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#
```

10.2.7.41 service-policy type pbr (Interface mode)

The **`service-policy pbr`** command applies the specified Policy-Based Routing (PBR) policy map to the configuration mode interface. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic. Only one service policy is supported per interface.

The **`no service-policy pbr`** and **`default service-policy pbr`** commands remove the service policy assignment from the configuration mode interface by deleting the corresponding **`service-policy pbr`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`service-policy type pbr` **TRAFFIC_DIRECTION** ***map_name***

`no service-policy type pbr` **TRAFFIC_DIRECTION** ***map_name***

`default service-policy type pbr` **TRAFFIC_DIRECTION** ***map_name***

Parameters

- **TRAFFIC_DIRECTION** IP address or peer group name. Values include:
  - **input** Policy map applies to inbound packet streams.
- ***map_name*** Name of policy map.

Guidelines

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual interface Ethernet configuration. Members that are removed from a port channel revert to the policy map implementation specified by its interface Ethernet configuration.

Related Commands

policy-map type pbr

Example

This command applies the PBR policy map ***PMAP1*** to ***interface Ethernet 8***.

```
switch# config
switch(config)# interface ethernet 8
switch(config-if-Et8)# service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

10.2.7.42 service-policy type qos (Interface mode)

The **service-policy** command applies a specified policy map to the configuration mode interface. A policy map is a data structure that identifies data traffic through class maps, then specifies actions to classify the traffic (by setting the traffic class), mark the traffic (by setting the cos and dscp values), and police the traffic (by setting the police rate) through data packet field modifications.

The **no service-policy** and **default service-policy** commands remove the service policy assignment from the configuration mode interface by deleting the corresponding **service-policy** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

service-policy [type qos] **TRAFFIC_DIRECTION** ***map_name***

no service-policy [type qos] **TRAFFIC_DIRECTION** ***map_name***

default service-policy [type qos] **TRAFFIC_DIRECTION** ***map_name***

Parameters

- **type qos** Parameter has no functional effect.
- **TRAFFIC_DIRECTION** Direction of data stream to which command applies. Options include:
  - **input** Policy map applies to inbound packet streams.
  - ***map_name*** Name of policy map.

Guidelines

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual interface Ethernet configuration. Members that are removed from a port channel revert to the policy map implementation specified by its interface Ethernet configuration.

DCS-7500E and DCS-7280E limitations:

- A maximum of ***31*** QoS service policies per chip may be applied on L3 interfaces.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
- When an SVI on which QoS service policies are applied experiences partial failure due to limited hardware resources, a forwarding agent restart causes unpredictable behavior.
- Policy-map programming may fail when QoS service policies are applied on two SVIs if an event causes a member interface to switch membership from one to the other. To change the VLAN membership of an interface in this case, remove the interface from one VLAN before adding it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X limitations:

- When the same policy map is applied to multiple SVIs, TCAM resources are not shared.
- A policy map applied to an SVI results in TCAM allocation on all chips whether SVI members are present or not.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.

Related Commands

policy-map type quality-of-service

Example

This command applies the ***PMAP-1*** policy map to ***interface ethernet 8***.

```
switch# config
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
   service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

10.2.7.43 set (policy-map-class (qos) FM6000)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from ***running-config***.

Command Mode

Policy-map-class (qos) configuration

accessed through `class (policy-map (qos) FM6000)` command.

Command Syntax

set QOS_TYPE *value*

no set QOS_TYPE

default set QOS_TYPE

Parameters

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- ***value*** Specifies the data field value or traffic class queue. Valid data range depends on **QOS_TYPE**.
  - **QOS_TYPE** is **cos** Value ranges from ***0*** to ***7***.
  - **QOS_TYPE** is **dscp** Value ranges from ***0*** to ***63***.
  - **QOS_TYPE** is **traffic-class** Value ranges from ***0*** to ***7***.

Related Commands

- policy-map type quality-of-service
- class (policy-map (qos) FM6000)

Example

These commands configure the policy map to set ***CoS field 7*** to data traffic specified by the class map ***CMAP-1***, then assigns that data to traffic class ***queue 4***.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.44 set (policy-map-class (qos) Helix)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (**cos**, **dscp**) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from ***running-config***.

Command Mode

Policy-map-class (qos) configuration accessed through `class (policy-map (qos) Helix)` command.

Command Syntax

set QOS_TYPE *value*

no set QOS_TYPE

default set QOS_TYPE

Parameters

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- ***value*** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE** is **cos** Value ranges from ***0*** to ***7***.
  - **QOS_TYPE** is **dscp** Value ranges from ***0*** to ***63***.
  - **QOS_TYPE** is **traffic-class** Value ranges from ***0*** to ***7***.

Related Commands

- policy-map type quality-of-service
- class (policy-map (qos) Helix)

Example

These commands configure the policy map to set ***CoS field 7*** to data traffic specified by the class map ***CMAP-1***, then assigns that data to ***traffic class queue 4***.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.45 set (policy-map-class (qos) Trident II)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from ***running-config***.

Command Mode

Policy-map-class (qos) configuration accessed through `class (policy-map (qos) Trident)` command.

Command Syntax

set QOS_TYPE *value*

no set QOS_TYPE

default set QOS_TYPE

Parameters

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- ***value*** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE** is **cos** Value ranges from ***0*** to ***7***.
  - **QOS_TYPE** is **dscp** Value ranges from ***0*** to ***63***.
  - **QOS_TYPE** is **traffic-class** Value ranges from ***0*** to ***7***.

Related Commands

- policy-map type quality-of-service
- class (policy-map (qos) Trident)

Example

These commands configure the policy map to set ***CoS field 7*** to data traffic specified by the class map ***CMAP-1***, then assigns that data to ***traffic class queue 4***.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.46 set (policy-map-class (qos) Trident)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from ***running-config***.

Command Mode

Policy-map-class (qos) configuration accessed through `class (policy-map (qos) Trident)` command.

Command Syntax

set QOS_TYPE *value*

no set QOS_TYPE

default set QOS_TYPE

Parameters

- **QOS_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- ***value*** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS_TYPE** is **cos** Value ranges from ***0*** to ***7***.
  - **QOS_TYPE** is **dscp** Value ranges from ***0*** to ***63***.
  - **QOS_TYPE** is **traffic-class** Value ranges from ***0*** to ***7***.

Related Commands

- policy-map type quality-of-service
- class (policy-map (qos) Trident)

Example

These commands configure the policy map to set ***CoS field 7*** to data traffic specified by the ***class map CMAP-1***, then assigns that data to ***traffic class queue 4***.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

10.2.7.47 set nexthop (policy-map-class pbr)

The **`set nexthop`** command specifies the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The **`no set nexthop`** and **`default set nexthop`** commands remove the specified action from the class map by deleting the associated **`set nexthop`** command from ***running-config***.

Command Mode

Policy-map-class (pbr) configuration accessed through `class (policy-map (pbr))` command.

Command Syntax

`set nexthop` [recursive] ***NH-addr_1*** [***NH-addr_2***] ***...*** [***NH-addr_n***]

`no set nexthop` [recursive]

`default set nexthop` [recursive]

Parameters

- **recursive** enables recursive next hop resolution.
- ***NH_addr*** IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

Related Commands

- policy-map type pbr
- class (policy-map (pbr))

Example

These ***192.168.5.3*** commands configure the policy map ***PMAP1*** to set the next hop to for traffic defined by class map ***CMAP1***.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop 192.168.5.3
switch(config-pmap-c-PMAP1-CMAP1)#
```

10.2.7.48 set nexthop-group (policy-map-class(pbr) Arad)

The **set nexthop-group** command specifies a nexthop group as the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The **no set nexthop-group** and **default set nexthop-group** commands remove the specified action from the class map by deleting the associated **set nexthop-group** command from ***running-config***.

Command Mode

Policy-map-class (pbr) configuration accessed through `class (policy-map (pbr))` command.

Command Syntax

set nexthop-group ***group_name***

no set nexthop-group ***group_name***

default set nexthop-group ***group_name***

Parameters

group_name name of ECMP group to use as next hop.

Related Commands

- policy-map type pbr
- class (policy-map (pbr))

Example

These commands configure the policy map ***PMAP1*** to set the next hop to a nexthop group named ***GROUP1*** for traffic defined by class map ***CMAP1***.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

10.2.7.49 shape (policy-map-class (control-plane) Arad)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) Arad)

Command Syntax

Parameters

kilobits Maximum data rate in kilobits per second. Value ranges from 1 to 10000000.

Related Commands

- class (policy-map (control-plane) Arad) places the switch in the ***policy-map-class (control plane)*** configuration mode.
- bandwidth (policy-map-class (control-plane) Arad) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Static Classes Default Shape

Arad platform switches define these default shapes for static classes:

- copp-system-bgp 2500 copp-system-l3lpmoverflow 2500
- copp-system-bpdu 2500 copp-system-l3slowpath 2500
- copp-system-default 2500 copp-system-l3ttl1 2500
- copp-system-ipbroadcast 2500 copp-system-lacp 2500
- copp-system-ipmc 2500 copp-system-linklocal 2500
- copp-system-ipmcmiss 2500 copp-system-lldp 2500
- copp-system-ipunicast NO LIMIT copp-system-mlag 2500
- copp-system-l2broadcast 2500 copp-system-multicastsnoop 2500
- copp-system-l2unicast NO LIMIT copp-system-OspfIsis 2500
- copp-system-l3destmiss 2500 copp-system-sflow 2500

Example

These commands configure the maximum bandwidth of ***2000*** kbps for data traffic specified by the class map ***copp-system-lldp*** of the default ***control-plane policy map***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape kbps
 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

  Class-map: copp-system-lldp (match-any)
       shape : 2000 kbps
       bandwidth : 250 kbps
      Out Packets : 0
      Drop Packets : 0
```

```
switch(config)#
```

10.2.7.50 shape (policy-map-class (control-plane) FM6000)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) FM6000).

Command Syntax

shape pps ***packets***

no shape

default shape

Parameters

packets Maximum data rate in packets per second. Value ranges from 1 to 100000.

Related Commands

- class (policy-map (control-plane) FM6000) places the switch in the ***policy-map-class (control plane)*** configuration mode.
- bandwidth (policy-map-class (control-plane) FM6000) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Static Classes Default Shape

FM6000 platform switches define these default shapes for static classes:

- copp-system-arp 10000 copp-system-l3slowpath 10000
- copp-system-default 8000 copp-system-pim-ptp 10000
- copp-system-ipmcrsvd 10000 copp-system-ospf-isis 10000
- copp-system-ipmcmiss 10000 copp-system-selfip 5000
- copp-system-igmp 10000 copp-system-selfip-tc6to7 5000
- copp-system-l2rsvd 10000 copp-system-sflow 25000

Example

These commands configure a maximum bandwidth of ***5000*** packets per second for data traffic specified by the class map ***PMAP-1*** in the policy map named ***copp-system-policy***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```

10.2.7.51 shape (policy-map-class (control-plane) Helix)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) Helix).

Command Syntax

shape pps ***packets***

no shape

default shape

Parameters

packets Maximum data rate in packets per second. Value ranges from ***1*** to ***100000***.

Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-acllog 10000 copp-system-l3ttl1 10000
- copp-system-arp 10000 copp-system-lacp 5000
- copp-system-arpresolver 10000 copp-system-lldp 10000
- copp-system-bfd 10000 copp-system-mlag 5000
- copp-system-bgp 5000 copp-system-OspfIsis 10000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 8000 copp-system-selfip-tc6to7 5000
- copp-system-glean 10000 copp-system-sflow 25024
- copp-system-igmp 10000 copp-system-tc3to5 10000
- copp-system-ipmcmiss 10000 copp-system-tc6to7 10000
- copp-system-ipmcrsvd 10000 copp-system-urm 10000
- copp-system-l3destmiss 10000 copp-system-vrrp 5000
- copp-system-l3slowpath 10000

Related Commands

- class (policy-map (control-plane) Helix) places the switch in the ***policy-map-class (control plane)*** configuration mode.
- bandwidth (policy-map-class (control-plane) Helix) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Example

These commands configure a maximum bandwidth of ***5000*** packets per second for data traffic specified by the ***copp-system-lldp*** of the default control-plane policy map.

```
switch(config)# policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

  Class-map: copp-system-lldp (match-any)
```

```
        shape : 5000 pps
        bandwidth : 500 pps
      Out Packets : 305961
      Drop Packets : 0

switch(config)#
```

10.2.7.52 shape (policy-map-class (control-plane) Petra)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) Petra)

Command Syntax

shape kbps ***kilobits***

no shape

default shape

Parameters

kilobits Maximum data rate in kilobits per second. Value ranges from ***1*** to ***10000000***.

Related Commands

- class (policy-map (control-plane) Petra) places the switch in policy-map-class (control plane) configuration mode.
- bandwidth (policy-map-class (control-plane) Petra) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Static Classes Default Shape

Petra platform switches define these default shapes for static classes:

- copp-system-bpdu 2500 copp-system-l3destmiss 2500
- copp-system-default 2500 copp-system-l3slowpath 2500
- copp-system-igmp 2500 copp-system-l3ttl0 2500
- copp-system-ipbroadcast 2500 copp-system-l3ttl1 2500
- copp-system-ipmc 2500 copp-system-lacp 2500
- copp-system-ipmcmiss 2500 copp-system-lldp 2500
- copp-system-ipmcrsvd 2500 copp-system-unicast-arp 2500
- copp-system-ipunicast No Limit

Guidelines

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show** command displays the converted rate and not the user-configured rate.

Example

These commands configure the maximum bandwidth of ***2000*** kbps for data traffic specified by the class map ***copp-system-lldp*** of the ***default control-plane*** policy map. Because the switch does not support the discrete value of ***2000*** kbps, it converts the bandwidth up to ***2115*** kbps.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape kbps
 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
```

```
  Class-map: copp-system-lldp (match-any)
       shape : 2115 kbps
       bandwidth : 325 kbps
      Out Packets : 0
      Drop Packets : 0

switch(config)#
```

10.2.7.53 shape (policy-map-class (control-plane) Trident II)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) Trident II).

Command Syntax

shape pps ***packets***

no shape

default shape

Parameters

packets Maximum data rate in packets per second. Value ranges from ***1*** to ***100000***.

Static Classes Default Shape

Trident II platform switches define these default shapes for static classes:

- copp-system-acllog 10000 copp-system-l3slowpath 10000
- copp-system-arp 10000 copp-system-l3ttl1 10000
- copp-system-arpresolver 10000 copp-system-lacp 5000
- copp-system-bfd 10000 copp-system-lldp 10000
- copp-system-bgp 5000 copp-system-mlag 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 8000 copp-system-selfip-tc6to7 5000
- copp-system-glean 10000 copp-system-sflow 25024
- copp-system-igmp 10000 copp-system-tc3to5 10000
- copp-system-ipmcmiss 10000 copp-system-tc6to7 10000
- copp-system-ipmcrsvd 10000 copp-system-urm 10000

Related Commands

- class (policy-map (control-plane) Trident II) places the switch in ***policy-map-class (control plane)*** configuration mode.
- bandwidth (policy-map-class (control-plane) Trident II) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Example

These commands configure a maximum bandwidth of ***5000*** packets per second for data traffic specified by the ***copp-system-lldp*** of the ***default control-plane policy*** map.

```
switch(config)# policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

  Class-map: copp-system-lldp (match-any)
       shape : 5000 pps
       bandwidth : 500 pps
```

```
      Out Packets : 305961
      Drop Packets : 0

switch(config)#
```

10.2.7.54 shape (policy-map-class (control-plane) Trident)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from ***running-config***.

Command Mode

Policy-map-class (control plane) configuration accessed through class (policy-map (control-plane) Trident).

Command Syntax

shape pps ***packets***

no shape

default shape

Parameters

packets Maximum data rate in packets per second. Value ranges from 1 to 100000.

Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-arp 10000 copp-system-lldp 10000
- copp-system-arpresolver 10000 copp-system-l3destmiss 10000
- copp-system-bpdu 5000 copp-system-l3slowpath 10000
- copp-system-default 8000 copp-system-l3ttl1 10000
- copp-system-glean 10000 copp-system-selfip 5000
- copp-system-igmp 10000 copp-system-selfip-tc6to7 5000
- copp-system-ipmcmiss 10000 copp-system-sflow 25000
- copp-system-ipmcrsvd 10000 copp-system-tc3to5 10000
- copp-system-lacp 5000 copp-system-tc6to7 10000

Related Commands

- class (policy-map (control-plane) Trident) places the switch in the ***policy-map-class (control plane)*** configuration mode.
- bandwidth (policy-map-class (control-plane) Trident) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

Example

These commands configure a maximum bandwidth of ***5000*** packets per second for data traffic specified by the class map ***PMAP-1*** in the policy map named ***copp-system-policy***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)
```

10.2.7.55 show class-map type control-plane

The **show class-map** command displays contents of available control-plane class maps. **Control-plane** class maps can be added to the ***copp-system-policy*** policy map. ***Control-plane*** class maps can be static class maps defined by the system or dynamic maps created in ***class-map*** configuration mode.

Dynamic class maps are composed of statements that match IPv4 access control lists. Static class maps are defined by the switch and cannot be altered.

Command Mode

EXEC

Command Syntax

show class-map type control-plane [**MAP_NAME**]

Parameters

MAP_NAME Name of class map displayed by the command. Options include:

- ***no parameter*** Command displays all control plane class maps.
- ***name_text*** Command displays specified control-plane class maps.

Related Command

- **show class-map** command displays QoS class maps.
- show class-map type qos displays control plane class maps.

Example

This command displays the available control plane class maps.

```
switch# show class-map type control-plane
  Class-map: CM-CP1 (match-any)
    Match: ip access-group name LIST-CP1
  Class-map: copp-system-acllog (match-any)
  Class-map: copp-system-arp (match-any)
  Class-map: copp-system-arpresolver (match-any)
  Class-map: copp-system-bpdu (match-any)
  Class-map: copp-system-glean (match-any)
  Class-map: copp-system-igmp (match-any)
  Class-map: copp-system-ipmcmiss (match-any)
  Class-map: copp-system-ipmcrsvd (match-any)
  Class-map: copp-system-l3destmiss (match-any)
  Class-map: copp-system-l3slowpath (match-any)
  Class-map: copp-system-l3ttl1 (match-any)
  Class-map: copp-system-lacp (match-any)
  Class-map: copp-system-lldp (match-any)
  Class-map: copp-system-selfip (match-any)
  Class-map: copp-system-selfip-tc6to7 (match-any)
  Class-map: copp-system-sflow (match-any)
  Class-map: copp-system-tc3to5 (match-any)
  Class-map: copp-system-tc6to7 (match-any)
switch>
```

10.2.7.56 show class-map type pbr

The **show class-map** command displays contents of all available Policy-Based Routing (PBR) class maps, or of a specified PBR class map. PBR class maps are used by PBR policy maps. PBR class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

Command Mode

EXEC

Command Syntax

show class-map type pbr [***map_name***]

Parameters

map_name Name of class map displayed by the command. If no parameter is entered, command show all available PBR class maps.

Related Command

show policy-map type pbr displays PBR policy maps.

Example

This command displays the contents of the PBR class map ***CMAP1***.

```
switch# show class-map type pbr CMAP1
  Class-map: CMAP1 (match-any)
    Match: 10 ip access-group PBRgroup1
    Match: 20 ip access-group PBRgroup2
    Match: 30 ip access-group PBRgroup3
switch>
```

10.2.7.57 show class-map type qos

The **show class-map**command displays contents of all available QoS class maps. QoS class maps are used by QoS policy maps. QoS class maps are dynamic maps that are created in ***class-map*** configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

Command Mode

EXEC

Command Syntax

show class-map [**type qos**][**MAP_NAME**]

Parameters

MAP_NAME Name of class map displayed by the command.

- ***no parameter*** Command displays all QoS class maps.
- ***name_text*** Command displays specified QoS class maps.

show class-map and **show class-map type qos** are identical commands.

Related Command

show class-map type control-plane displays control plane class maps.

Example

This command displays the available QoS class maps.

```
switch# show class-map type qos
  Class-map: CM-Q1 (match-any)
    Match: ipv6 access-group name LIST-1
  Class-map: CM-Q2 (match-any)
    Match: ip access-group name LIST-2
switch>
```

10.2.7.58 show policy-map copp

The **show policy-map copp** command displays contents of the control-plane policy map. Control-plane policy maps are applied to the control plane, and copp-system-policy is the only supported policy map.

Command Mode

EXEC

Command Syntax

show policy-map copp **copp-system-policy**

Example

This command displays the contents and throughput of the policy map applied to the control plane.

```
switch# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Number of units programmed: 1
  Hardware programming status: Successful

  Class-map: copp-system-bpdu (match-any)
       shape : 5000 pps
       bandwidth : 5000 pps
      Out Packets : 2
      Drop Packets : 0

  Class-map: copp-system-lacp (match-any)
       shape : 5000 pps
       bandwidth : 5000 pps
      Out Packets : 0
      Drop Packets : 0

switch>
```

10.2.7.59 show policy-map interface type qos counters

The **show policy-map interface** command displays the quantity of packets that are filtered by ACLs applied to a interface.

Command Mode

EXEC

Command Syntax

show policy-map [**INTERFACE_NAME**][**type qos**][**TRAFFIC**] **counters**

Parameters

- **INTERFACE_NAME** Filters policy map list by interfaces. Options include:
  - ***no parameter*** Displays data for all configured interfaces.
  - **interface ethernet *e_range*** Ethernet ports for which command displays policy maps.
  - **interface port-channel *p_range*** Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - ***no parameter*** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.

Example

This command displays the policy maps applied to interfaces Ethernet ***7*** and ***8***.

```
switch# show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: cmap-1 (match-any)
    Match: ip access-group name LIST-2
       set cos 6

  Class-map: class-default (match-any)

Service-policy input: PMAP-2
  Hardware programming status: Successful

  Class-map: cmap-2 (match-any)
    Match: ip access-group name LIST-2
       set dscp 10

  Class-map: class-default (match-any)

switch#
```

10.2.7.60 show policy-map interface type qos

The **show policy-map interface** command displays contents of the policy maps applied to specified interfaces or to the control plane.

Command Mode

EXEC

Command Syntax

show policy-map interface **INTERFACE_NAME** [**type qos**] [**TRAFFIC**]

Parameters

- **INTERFACE_NAME** Filters policy map list by interfaces. Options include:
  - **ethernet** ***e_range*** Ethernet ports for which command displays policy maps.
  - **port-channel** ***p_range*** Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - ***no parameter*** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.

Example

This command displays the policy maps applied to interfaces Ethernet ***7*** and ***8***.

```
switch# show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: cmap-1 (match-any)
    Match: ip access-group name LIST-2
       set cos 6

  Class-map: class-default (match-any)

Service-policy input: PMAP-2
  Hardware programming status: Successful

  Class-map: cmap-2 (match-any)
    Match: ip access-group name LIST-2
       set dscp 10

  Class-map: class-default (match-any)

switch#
```

10.2.7.61 show policy-map type copp

The **show policy-map type copp** command displays contents of control plane policy maps. Control-plane policy maps are applied to the control plane; copp-system-policy is the only supported policy map.

Command options filter the output to display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

Command Mode

EXEC

Command Syntax

show policy-map type copp copp-system-policy [**CMAP_NAME**]

Parameters

CMAP_NAME Name of class map displayed by the command.

- ***no parameter*** Command displays all class maps in specified policy map.
- ***class_name*** Command displays specified class map.

Example

This command displays the contents of the copp-system-bpdu class map in the copp-system-policy policy maps.

```
switch# show policy-map type copp copp-system-policy class copp-system-b
pdu
  Class-map: copp-system-bpdu (match-any)
       shape : 5000 pps
       bandwidth : 5000 pps

switch>
```

10.2.7.62 show policy-map type pbr

The **show policy-map pbr** command displays contents of Policy-Based Routing (PBR) policy maps. PBR policy maps are applied to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or summary contents of all or a specified policy map.

Command Mode

EXEC

Command Syntax

show policy-map type pbr [**PMAP_NAME**][**DATA_LEVEL**]

Parameters

- **PMAP_NAME** Name of policy map displayed by the command.
  - ***no parameter*** Command displays all policy maps.
  - ***policy_map*** Command displays specified policy map.
- **DATA_LEVEL** Type of information the command displays. Values include:
  - ***no parameter*** Command displays all class maps in specified policy map.
  - **summary** Command displays summary data for the specified policy map.

Example

This command displays the contents of all PBR policy maps in ***running-config***.

```
switch# show policy-map type pbr
Service policy PMAP1
Configured on:
Applied on:
10: Class-map: CMAP1 (match-any)
Match: 10 ip access-group PBRgroup1
Match: 20 ip access-group PBRgroup2
Match: 30 ip access-group PBRgroup3
Configured actions: set nexthop 172.16.10.12
20: Class-map: CMAP2 (match-any)
Match: 10 ip access-group PBRgroup1
Match: 10 ip access-group PBRgroup4
Match: 20 ip access-group PBRgroup5
Configured actions: set nexthop 192.168.15.15
switch#
```

10.2.7.63 show policy-map type qos counters

The **show policy-map counters** command displays the quantity of packets that are filtered by the ACLs that comprise a specified QoS policy map.

Command Mode

EXEC

Command Syntax

show policy-map [**type qos**] ***pmap_name*** [**TRAFFIC**] **counters** [**INFO_LEVEL**]

Parameters

- ***pmap_name*** Name of policy map displayed by the command.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - ***no parameter*** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** displays summarized information about the policy map.
  - **detail** displays detailed policy map information.

10.2.7.64 show policy-map type qos

The **show policy-map qos** command displays contents of QoS policy maps. QoS policy maps are applied to Ethernet or port channel interfaces.

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

Command Mode

EXEC

Command Syntax

show policy-map [**type qos**][**PMAP_NAME** [**CMAP_NAME**]]

Parameters

- **PMAP_NAME** Name of policy map displayed by the command.
  - ***no parameter*** Command displays all policy maps.
  - ***policy_map*** Command displays specified policy map.
- **CMAP_NAME** Name of class map displayed by the command. This option is available only when the command includes a policy map name.
  - ***no parameter*** Command displays all class maps in specified policy map.
  - ***class_name*** Command displays specified class map.

Example

This command displays the contents of all QoS policy maps in ***running-config***.

```
switch# show policy-map type qos
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: xeter (match-any)
    Match: ip access-group name LIST-1
       set cos 6

  Class-map: class-default (match-any)

Service-policy PMAP-2

  Class-map: class-default (match-any)

switch#
```

10.2.7.65 show traffic-policy

The **show traffic-policy** command displays traffic policy information on the interface.

Command Mode

EXEC

Command Syntax

show traffic-policy NAME interface

show traffic-policy interface [**DETAILS**]

Parameters

DETAILS Details requested. Options include:

- **summary** Display summary information about the policy.
  - **errors** Display all configured remote grantees, associated profile name and latest update.
  - **details** Display all interfaces on which the policy has been configured.

Examples

- This command displays the sumary information configured on the switch interfaces.

```
switch(config-traffic-policies)# show traffic-policy interface summary
Traffic policy samplePolicy
   Configured on interfaces: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
   Applied on interfaces for IPv4 traffic: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
   Applied on interfaces for IPv6 traffic:
   Total number of rules configured: 3
      match SIMPLE ipv4
      match ipv4-all-default ipv4
      match ipv6-all-default ipv6
```

- This command displays information about the traffic policy named ***samplePolicy***.

```
switch(config-traffic-policies)# show traffic-policy samplePolicy interface
Traffic policy samplePolicy
   Configured on interfaces: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
   Applied on interfaces for IPv4 traffic: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
   Applied on interfaces for IPv6 traffic:
   Total number of rules configured: 3
      match SIMPLE ipv4
         Source prefix: 192.0.2.0/24
                        198.51.100.0/24
         Destination prefix: 203.0.113.0/24
         Protocol: tcp
            Source port: 50-100
                         110-200
         Actions: Drop
      match ipv4-all-default ipv4
      match ipv6-all-default ipv6
```

- This command displays all interfaces on which samplePolicy has been configured.

```
switch(config-traffic-policies)# show traffic-policy interface detail
Traffic policy samplePolicy
   Configured on interfaces: Ethernet1/1, Ethernet2/1, Ethernet3/1, Ethernet4/1
   Applied on interfaces for IPv4 traffic: Ethernet1/1, Ethernet2/1, Ethernet3/1,
 Ethernet4/1
   Applied on interfaces for IPv6 traffic:
   Total number of rules configured: 3
      match SIMPLE ipv4
         Source prefix: 192.0.2.0/24
                        198.51.100.0/24
         Destination prefix: 203.0.113.0/24
         Protocol: tcp
            Source port: 50-100
                         110-200
         Actions: Drop
      match ipv4-all-default ipv4
```

```
      match ipv6-all-default ipv6
```

- This command displays installation errors for a match statement. The example has no errors.

```
switch(config-traffic-policies)# show traffic-policy interface errors
Traffic policy samplePolicy
   Failed on interface for IPv4 traffic:
   Failed on interface for IPv6 traffic:
```

Chapter 11

Interface Configuration

This chapter describes Ethernet ports supported by Arista switches as well as channel groups, port channels, port channel interfaces, Link Aggregation Control Protocol (LACP), and Multi-Chassis Link Aggregation. This chapter contains the following sections:

11.1 Ethernet Ports

This section describes Ethernet ports supported by Arista switches. Topics covered in this section include:

11.1.1 Ethernet Ports Introduction

Arista switches support a variety of Ethernet network interfaces. This chapter describes the configuration and monitoring options available in Arista switching platforms.

11.1.2 Ethernet Standards

Ethernet, standardized in ***IEEE 802.3***, is a group of technologies used for communication over local area networks. Ethernet communication divides data streams into frames containing addresses (source and destination), payload, and Cyclical Redundancy Check (CRC) information.

IEEE 802.3 also describes two types of optical fiber: Single-Mode Fiber (SMF) and Multi-Mode Fiber (MMF). MMF range limits from ***50*** to ***500*** meters range.

11.1.2.1 100 Gigabit Ethernet

The 100 Gigabit Ethernet (100GbE) standard defines an Ethernet implementation with a nominal data rate of 100 billion bits per second over 10x10G, 4x25G, or 1x100G. 100 Gigabit Ethernet implements full duplex point to point links connected by network switches. Arista switches support 100GBASE-10SR through MXP ports.

11.1.2.2 40 Gigabit Ethernet

The 40 Gigabit Ethernet (40GbE) standard defines an Ethernet implementation with a nominal data rate of 40 billion bits per second over multiple 10 gigabit lanes. 40 Gigabit Ethernet implements full

duplex point to point links connected by network switches. 40 gigabit Ethernet standards are named ***40GBASE-xyz***, as interpreted by 40GBASE-xyz Interpretation.

Table 54: 40GBASE-xyz Interpretation

x	y	z
Non-fiber media type, or fiber wavelength	PHY encoding	Number of WWDM wavelengths or XAUI Lanes
C = Copper F = Serial SMF K = Backplane L = Long (1310 nm) S = Short (850 nm)	R = LAN PHY (64B/66B)	No value = 1 (serial) 4 = 4 WWDM wavelengths or XAUI Lanes

11.1.2.3 10 Gigabit Ethernet

The 10 Gigabit Ethernet (10GbE) standard defines an Ethernet implementation with a nominal data rate of 10 billion bits per second. 10 Gigabit Ethernet implements full duplex point to point links connected by network switches. Half duplex operation, hubs and CSMA/CD do not exist in 10GbE. The standard encompasses several PHY standards; a networking device may support different PHY types through pluggable PHY modules. 10GbE standards are named ***10GBASE-xyz***, as interpreted by 10GBASE-xyz Interpretation.

Table 55: 10GBASE-xyz Interpretation

x	y	z
media type or wavelength, if media type is fiber	PHY encoding type	Number of WWDM wavelengths or XAUI Lanes
C = Copper (twin axial) T = Twisted Pair S = Short (850 nm) L = Long (1310 nm) E = Extended (1550 nm) Z = Ultra extended (1550 nm)	R = LAN PHY (64B/66B) X = LAN PHY (8B/10B) W = WAN PHY(*) (64B/66B)	If omitted, value = 1 (serial) 4 = 4 WWDM wavelengths or XAUI Lanes

11.1.2.4 Gigabit Ethernet

The Gigabit Ethernet (GbE), defined by ***IEEE 802.3-2008***, describes an Ethernet version with a nominal data rate of one billion bits per second. GbE cables and equipment are similar to those used in previous standards. While full-duplex links in switches is the typical implementation, the specification permits half-duplex links connected through hubs.

Gigabit Ethernet physical layer standards that Arista switches support include 1000BASE-X (optical fiber), 1000BASE-T (twisted pair cable), and 1000BASE-CX (balanced copper cable).

- 1000BASE-SX is a fiber optic standard that utilizes multi-mode fiber supporting 770 to 860 nm, near infrared (NIR) light wavelength to transmit data over distances ranging from ***220*** to ***550*** meters. 1000BASE-SX is typically used for intra-building links in large office buildings, co-location facilities and carrier neutral Internet exchanges.
- 1000BASE-LX is a fiber standard that utilizes a long wavelength laser (***1,2701,355*** nm), with a RMS spectral width of 4 nm to transmit data up to ***5*** km. 1000BASE-LX can run on all common types of multi-mode fiber with a maximum segment length of ***550*** m.
- 1000BASE-T is a standard for gigabit Ethernet over copper wiring. Each 1000BASE-T network segment can be a maximum length of ***100*** meters.

11.1.2.5 10/100/1000 BASE-T

Arista switches provide 10/100/1000 BASE-T Mbps Ethernet out of band management ports. Auto-negotiation is enabled on these interfaces. Speed (10/100/1000), duplex (half/full), and flow control settings are available using the appropriate **`speed`** and **`flowcontrol`** commands.

11.1.2.6 Power over Ethernet (PoE)

Selected Arista switches provide Power over Ethernet (PoE) to power connected devices. Arista's PoE implementation is compliant with IEEE standards ***802.3af*** and ***802.3at***, and includes partial support for ***802.3bt***.

When a standards-compliant Powered Device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its power class is determined by hardware negotiation; more granular power adjustments can then be managed by Link Layer Discovery Protocol (LLDP).

11.1.2.7 Link Fault Signaling

Link Fault Signaling (LFS) is a mechanism by which remote link faults are transmitted to the peer over the link that is experiencing problems by configuring specific actions. LFS operates between the remote Reconciliation Sublayer (remote RS) and the local Reconciliation Sub-layer (local RS). Faults that are detected between the remote RS and the local RS are treated by the local RS as Local Faults.

LFS enables monitoring FCS and Symbol errors on an interface and if they exceed a configured threshold, one of the following three actions are enabled.

- Disable the error on the interface
- Generate system log messages
- Generate a link fault

11.1.3 Ethernet Physical Layer

The Ethernet Physical Layer (PHY) includes hardware components connecting a switchs MAC layer to the transceiver, cable, and ultimately a peer link partner.

Data exist in digital form at the MAC layer. On the line side of the PHY, data exist as analog signals: light blips on optical fiber or voltage pulses on copper cable. Signals may be distorted while in transit and recovery may require signal processing. Ethernet physical layer components include a PHY and a transceiver.

11.1.3.1 PHYs

The PHY provides translation services between the MAC layer and transceiver. It also helps to establish links between the local MAC layer and peer devices by detecting and signaling fault conditions. The PHY line-side interface receives Ethernet frames from the link partner as analog waveforms. The PHY uses signal processing to recover the encoded bits, then sends them to the MAC layer.

PHY line-side interface components and their functions include:

- Physical Medium Attachment (PMA): Framing, octet synchronization, scrambling / descrambling.
- Physical Medium Dependent (PMD): Consists of the transceiver.
- Physical Coding Sublayer (PCS): Performs auto-negotiation and coding (8B/10B or 64B/66B).

The MAC sublayer of the PHY provides a logical connection between the MAC layer and the peer device by initializing, controlling, and managing the connection with the peer.

Ethernet frames transmitted by the switch are received by the PHY system-side interface as a sequence of digital bits. The PHY encodes them into a media-specific waveform for transmission through the line-side interface and transceiver to the link peer. This encoding may include signal processing, such as signal pre-distortion and forward error correction.

PHY system-side interface components and their functions include:

- **10 Gigabit Attachment Unit Interface (XAUI):** Connects an Ethernet MAC to a 10G PHY.
- **Serial Gigabit Media Independent Attachment (SGMII):** Connects an Ethernet MAC to a 1G PHY.

11.1.3.2 Transceivers

A transceiver connects the PHY to an external cable (optical fiber or twisted-pair copper) and through a physical connector (LC jack for fiber or RJ-45 jack for copper).

- Optical transceivers convert the PHY signal into light pulses that are sent through optical fiber.
- Copper transceivers connect the PHY to twisted-pair copper cabling.

Arista Small Form-Factor Pluggable (SFP+) and Quad Small Form Factor Pluggable (QSFP+) modules and cables provide high-density, low-power Ethernet connectivity over fiber and copper media. Arista offers transceivers that span data rates, media types, and transmission distances.

Arista 10 Gigabit Ethernet SFP+ Modules

- 10GBASE-SR (Short Reach)
  - Link length maximum 300 meters over multi-mode fiber.
- Optical interoperability with 10GBASE-SRL.
- 10GBASE-SRL (Short Reach Lite)
  - Link length maximum 100 meters over multi-mode fiber.
  - Optical interoperability with 10GBASE-SR.
- 10GBASE-LRL (Long Reach Lite)
  - Link length maximum 1 km over single-mode fiber.
  - Optical interoperability with 10GBASE-LR (1 km maximum).
- 10GBASE-LR (Long Reach)
  - Link length maximum 10 km over single-mode fiber.
  - Optical interoperability with 10GBASE-LRL (1 km maximum).
- 10GBASE-LRM (Long Reach Multimode)
  - Link length maximum 220 meters over multi-mode fiber (50 um and 62.5 um).
- 10GBASE-ER (Extended Reach)
  - Link length maximum 40 km over single-mode fiber.
- 10GBASE-ZR (Ultra-Extended Reach)
  - Link length maximum 80 km over single-mode fiber.
- 10GBASE-DWDM (Dense Wavelength Division Multiplexing)
  - Link length maximum 80 km over single-mode fiber (40 color options).
  - Tunable SFP+ Optics Module, Full C-Band 50 GHz ITU Grid, up to 80km over duplex SMF.

Arista 10 Gigabit Ethernet CR Cable Modules

- 10GBASE-CR SFP+ to SFP+ Cables
  - Link lengths of 0.5, 1, 1.5, 2, 2.5, 3, 5, and 7 meters over twinax copper cable.
  - Includes SFP+ connectors on both ends.
- 4 x 10GbE QSFP+ to 4 x SFP+ twinax copper cables.
  - Link lengths of 0.5, 1, 2, 3, and 5 meters over twinax copper cable

Arista 25 Gigabit Ethernet Modules

- 25GBASE-CR SFP28 Cable
  - Capable of 10G/25G with link length of 1 to 5 meters.
- AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable.
  - Link length of 3 to 30 meters.
- SFP-25G-SR SFP28 Optics Module
  - Link length up to 70m over OM3 MMF or 100m over OM4 MMF.
- SFP-25G-LR SFP28 Optics Module
  - Link length up to 10 kilometers over duplex SMF

Arista 40 Gigabit Ethernet QSFP+ Cables and Optics

- 40GBASE-SR4 QSFP+ Transceiver.
  - Link length maximum 100 meters over parallel OM3 or 150 meters over OM4 MMF.
  - Optical interoperability with 40GBASE-XSR4 (100/150 meter maximum).
- 40GBASE-XSR4 QSFP+ Transceiver.
  - Link length maximum 300 meters over parallel OM3 or 450 meters over OM4 MMF.
  - Optical interoperability with 40GBASE-SR4 (100/150 meter maximum).
- 40GBASE-LR4 QSFP+.
  - Link length maximum 10 km over duplex single-mode fiber.
- 40GBASE-CR4 QSFP+ to QSFP+ twinax copper cables.
  - Link lengths of 1, 2, 3, 5, and 7 meters over twinax copper cable.
- 40G-SRBD Bidirectional QSFP+ Optic.
  - Link length maximum up to 100 meters over parallel OM3 or 150 meters over OM4 MMF.
- 40G Univ QSFP+ Optic.
  - Link length maximum up to 150 meters over duplex OM3/OM4 and 500 meters over duplex SMF.
- 40GBASE-LRL QSFP+ Optic.
  - Link length maximum up to 1 kilometer over duplex SMF.
- 40GBASE-PLRL4 QSFP+ Optic.
  - Link length maximum up to 1 kilometer over parallel SMF (4x10G LR up to 1 km).
- 40GBASE-PLR4 QSFP+ Optic
  - Link length maximum up to 1 kilometer over parallel SMF (4x10G LR up to 1 km).
- 40GBASE-ER QSFP+ Optic.
  - Link length maximum up to 40 kilometers duplex SMF.

Arista Gigabit Ethernet SFP Options

- 1000BASE-SX (Short Haul).
  - Multi-mode fiber.
  - Link length maximum 550 meter.
- 1000BASE-LX (Long Haul).
  - Single-mode fiber.
  - Link length maximum 10 km (single mode).
- 1000BASE-T (RJ-45 Copper).

- Category 5 cabling.
- Full duplex 1000Mbps connectivity.

Arista 100 Gigabit Ethernet QSFP Modules

- 100GBASE-SR4 QSFP transceiver.
  - Link length up to 70 meters over parallel OM3 or 100 meters over OM4 multi-mode fiber.
- 100GBASE-SWDM4 QSFP transceiver.
  - Link length up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-SRBD BIDI QSFP transceiver.
  - Link length up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-PSM4 40G/100G dual speed QSFP Optics Module.
  - Link length up to 500 meters over parallel single-mode fiber.
- 100GBASE-CWDM4 40G/100G dual speed QSFP Optics Module.
  - Link length up to 2 km over duplex single-mode fiber.
- 100GBASE-LRL4 QSFP Optics Module.
  - Link length up to 2 km over duplex single-mode fiber.
- 100GBASE-LR4 QSFP Optics Module.
  - Link length up to 10 km over duplex single-mode fiber.
- 100GBASE-ERL4 QSFP Optics Module.
  - Link length up to 40 km over duplex single-mode fiber.
- 100G DWDM QSFP transceiver.
  - Link length up to 80 km over single-mode fiber.
- 100GBASE-CR4 QSFP to QSFP Twinax Copper Cable.
  - Link length of 1 to 5 meters.
- 100GBASE-CR4 QSFP to 4 x 25GbE SFP Twinax Copper Cable.
  - Link length of 1 to 5 meters.

Internal Ports

Several Arista switches include internal ports that connect directly to an external cable through an RJ-45 jack. Internal ports available on Arista switches include:

- 100/1000BASE-T (7048T-A)
- 100/1000/10GBASE-T (7050-T)

AOC Cables

- AOC-Q-Q-100G QSFP 100GbE Active Optical Cable.
  - Link length of 3 to 30 meters
- AOC-Q-Q-40G QSFP+ to QSFP+ 40GbE Active Optical Cable.
  - Link length of 3 to 100 meters.
- AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable.
  - Link length of 3 to 30 meters.

11.1.3.2.1 400GBASE-ZR Transceivers

400GBASE-ZR transceiver is the industry's first multi-vendor DWDM standard, a Digital Coherent Optical module with tunable laser, using DWDM multiplexing and 16QAM modulation and capable of delivering 400G per port over distances up to 120 km.

Key software features supported:

- Compliant with CMIS4.0/CMIS4.1 (CMIS5.0) and Coherent CMIS
- Frequency tuning (100GHz and 75GHz grids)
- DOM monitoring, including VDM (Versatile Diagnostics Monitoring) pages, defined in CMIS4.0
- Coherent alarms and faults, including pages, defined by Coherent CMIS
- Configurable Tx output power
- A separate command for shutting down Tx output path for unidirectional mode
- 1-sec update of pre-FEC BER, OSNR, ESNR
- Support of 4x100G mode for the 400GBASE-ZR transceivers (*EOS release 4.25.2F*)
- Support of 400GBASE-ZR with Open Forward Error Correction (O-FEC) (*EOS release 4.25.2F*)
- Override a transceiver slot's maximum power limit (*EOS release 4.25.2F*)

Platform Compatibility

The 400GBASE-ZR transceiver is a power class 8 module with power consumption up to 20W, the highest power consumption among 400G transceivers.

In theory, every 400GBASE OSFP or QSFP-DD switch is qualified to host 400GBASE-ZR transceivers. However, the actual number of 400GBASE-ZR modules that can be plugged in the switch simultaneously may vary, depending on platform (modular vs fixed) and ASIC type. It is always recommended to discuss installation of 400GBASE-ZR modules with Arista support.

Using 400GBASE-ZR in Combination with OSFP-LS

Arista EOS allows using OSFP-LS (pluggable line system in the OSFP form factor), instead of traditional DCI line systems.

11.1.3.2.1.1Configuring 400GBASE-ZR Transceivers

Laser Frequency Configuration

All coherent modules, including 400GBASE-ZR, require their laser frequency to be explicitly configured. To configure laser frequency in 400GBASE-ZR, use the **`transceiver frequency`** command under the defined interface, providing frequency in Gigahertz, in the range ***191.3-196.1*** THz. If laser frequency is not configured or is configured outside the valid range, all interfaces associated with the port are put into error disabled state.

```
switch# conf
switch(config)#
switch(config)# interface Ethernet12/1
switch(config-if-Et12/1)# transceiver frequency 193100
switch(config-if-Et12/1)#
```

Configured and Operational frequency settings can be verified using the **`show interface transceiver hardware`** command.

Note:

- It can take up to ***90*** seconds for the 400GBASE-ZR module to fully complete frequency tuning.
- The frequency plan for 400GBASE-ZR modules support channel spacings of ***100GHz*** or ***75GHz***. It is recommended to use operating frequency channel definitions in chapter 15 of [4].

Transmit Output Power Configuration

CMIS4.0 defines support of configurable transmit output power as an optional feature. Check the output of **`show interface transceiver eeprom`** command for page 04h, registers ***196-201*** to see if it is supported.

```
Programmable output power advertisement (04h:196-201):
    Lane programmable output power supported (04h:196): true
    Min programmable output power (04h:198-199): -14 dB
    Max programmable output power (04h:200-201): -10 dB
```

Transmit Output Power can be configured using **`transceiver transmitter signal power`** command.

```
switch# conf
switch(config)# interface Ethernet14/1
switch(config-if-Et14/1)# transceiver transmitter signal-power ?
switch(config-if-Et14/1)# transceiver transmitter signal-power -10
```

Configured Tx Power is verified using the **`show interface transceiver hardware`** command. Actual operational Tx Power can be verified using **`show interface transceiver`** command.

Note:

- 400GBASE-ZR does not have a recommended level of transmit laser power. In most cases, it is OK to stay with default power.
- Some vendors may not populate the range of supported output power correctly. The range ***-10 to -14 dBm*** should be supported. Contact Arista Support if you are planning to configure output power outside of this range.

Transmit Output Disable and Unidirectional Mode

In the coherent optics, **`shutdown`** command impacts both transmit and receive path and can't be used to set up unidirectional mode. To shut down Tx output path, use the **`transceiver transmitter disabled`** command:

```
switch# conf
switch(config)# interface Ethernet14/1
switch(config-if-Et14/1)# transceiver transmitter DISABLED
```

To re-enable transmit output, use the **no** or **default** version of the above configuration command.

Configuring 4x100G mode for 400GBASE-ZR transceivers

4x100G mode connects 4 host ethernet interfaces, over electrical interfaces 100GAUI-2 to the single optical lane, acting as 4x1 muxponder. To enable the mode on a 400GBASE-ZR transceiver, configure the speed on each of the 4 interfaces.

```
switch(config-if-Et4/1)# speed 100g-2
switch(config-if-Et4/3,4/5,4/7)# speed 100g-2

switch# show interfaces ethernet 4/1-5/8 status
Port    Name   Status      Vlan  Duplex Speed  Type      Flags Encapsulation
Et4/1          connected    1     full   100G   400GBASE-ZR
Et4/3          connected    1     full   100G   400GBASE-ZR
Et4/5          connected    1     full   100G   400GBASE-ZR
Et4/7          connected    1     full   100G   400GBASE-ZR
Et5/1          connected          1     full   100G   400GBASE-ZR
Et5/3          connected          1     full   100G   400GBASE-ZR
Et5/5          connected          1     full   100G   400GBASE-ZR
Et5/7          connected    1     full   100G   400GBASE-ZR
```

Each of the ethernet interfaces can be independently shut down without affecting the transmission over the other interfaces.

```
switch(config-if-Et4/1,4/3,4/5)# shutdown
switch# show interfaces ethernet 4/1-5/8 status
Port    Name   Status      Vlan  Duplex Speed  Type      Flags Encapsulation
Et4/1          disabled    1     full   100G   400GBASE-ZR
Et4/3          disabled    1     full   100G   400GBASE-ZR
Et4/5          disabled    1     full   100G   400GBASE-ZR
Et4/7          connected   1     full   100G   400GBASE-ZR
Et5/1          notconnect        1     full   100G   400GBASE-ZR
Et5/3          notconnect        1     full   100G   400GBASE-ZR
Et5/5          notconnect        1     full   100G   400GBASE-ZR
Et5/7          connected    1     full   100G   400GBASE-ZR

switch# show interfaces ethernet 4/1 transceiver
If device is externally calibrated, only calibrated values are printed.
N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
                            Bias   Optical   Optical
       Temp    Voltage    Current    Tx Power  Rx Power
Port   (Celsius)  (Volts)    (mA)    (dBm)     (dBm)    Last Update
-----  ---------  --------   --------  --------  --------    -------------------
Et4/1      59.00      3.25     279.70     -9.46     -8.29    0:00:01 ago
```

Shutting down all 4 interfaces will however disable the laser:

```
switch(config-if-Et4/7)# shutdown
switch# show interfaces ethernet 4/1-5/8 status
Port    Name   Status      Vlan  Duplex Speed  Type      Flags Encapsulation
Et4/1          disabled    1     full   100G   400GBASE-ZR
Et4/3          disabled    1     full   100G   400GBASE-ZR
Et4/5          disabled    1     full   100G   400GBASE-ZR
Et4/7          disabled    1     full   100G   400GBASE-ZR
Et5/1          notconnect        1     full   100G   400GBASE-ZR
Et5/3          notconnect        1     full   100G   400GBASE-ZR
Et5/5          notconnect        1     full   100G   400GBASE-ZR
Et5/7          notconnect   1     full   100G   400GBASE-ZR

switch# show interfaces ethernet 4/1 transceiver
If device is externally calibrated, only calibrated values are printed.
N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
                            Bias   Optical   Optical
       Temp    Voltage    Current    Tx Power  Rx Power
Port   (Celsius)  (Volts)    (mA)    (dBm)     (dBm)    Last Update
-----  ---------  --------   --------  --------  --------    -------------------
Et4/1      44.00      3.33       0.00    -30.00    -30.00    0:00:01 ago
```

Configuring Open Forward Error Correction on 400GBASE-ZR

Open FEC (O-FEC) is a Forward Error Correction encoder and decoder, specified in the Open ZR + MSA [2], with an overhead of 15.3% and a net coding gain of 11.6dB for 16QAM modulation. Compared to the Concatenated FEC (C-FEC), which is a default FEC specified for 400GBASE-ZR coherent transceivers by CMIS4.0, O-FEC provides higher coding gain (11.6dB for O-FEC vs 10.8 dB for C-FEC /16QAM), and it can correct pre-FEC BER of up to 2e-2.

The **`error-correction encoding <FEC>`** command configures the transceiver's optical transmission to use O-FEC:

```
switch(config-if-Et4/1)# error-correction encoding open
```

Transceiver slot's Maximum Power Limit

The **`transceiver power ignore`** command allows EOS to bypass the power check for the transceivers to be operational.

```
Switch(config-if-Et4/1)# transceiver power ignore
```

```
! You can risk damaging hardware by using transceiver modules with high
 power consumption. We recommend that you do this only under direction
 from Arista Networks.
```

11.1.3.2.1.2Show Commands

- **show interface transceiver eeprom**

  The **`show interface transceiver eeprom`** command displays the parsed capabilities.

  Example

  For 400GBASE-ZR, parsing of frequency tuning, power tuning (page 04h) and VDM configuration pages (20h-23h) is added.

```
switch# show interface Ethernet15/1 transceiver eeprom
Ethernet15 EEPROM:
...
  Frequency tuning support (04h:128-129):
    Grid spacing capabilities (04h:128):
      100 GHz grid supported (04h:128): true
      12.5 GHz grid supported (04h:128): false
      25 GHz grid supported (04h:128): false

```

- **show interface transceiver dom**

  The **show interface transceiver dom** command displays the most important current performance data on the media (line) side.

  Example

```
switch# show interface Ethernet11/1 transceiver dom
Ch: Channel, N/A: not applicable, TX: transmit, RX: receive
mA: milliamperes, dBm: decibels (milliwatts), C: Celsius, V: Volts

Port 11

  - ESNR: Electrical Signal to Noise Ratio
  - SOP: State of Polarization
  - SOPMD: State of Polarization Mode Dispersion

- **show interfaces hardware**

  The **show interfaces hardware** command displays the speed capabilities of a module. A 400GBASE-ZR supports 4x100G mode if the 100G-2/full speed is supported.

  Example

```
switch# show interfaces ethernet 4/1 hardware
*  = Requires speed group setting change
Ethernet4/1
  Model: DCS-7280PR3K-24
  Type: 400GBASE-ZR
  Speed/duplex: 100G-2/full,400G-8/full(default)
  Flowcontrol: rx-(off,on),tx-(off)
  Modulation: 16QAM
  Error correction: C-FEC(16QAM(default)), O-FEC(16QAM)
```

The **`show interface status`** command displays the ethernet interfaces:

```
switch#show interfaces ethernet 4/1,4/3,4/5,4/7 status
Port      Name  Status    Vlan  Duplex Speed  Type      Flags Encapsulation
Et4/1           connected 1     full   100G   400GBASE-ZR
Et4/3           connected 1     full   100G   400GBASE-ZR
Et4/5           connected 1     full   100G   400GBASE-ZR
Et4/7           connected 1     full   100G   400GBASE-ZR
```

- **show transceiver status interface**

  The **`show transceiver status interface`** command displays the most important alarms, faults and interface status and the existence of 4 host interfaces.

  Example

  For 400GBASE-ZR modules, media and host side coherent alarms, host-side pre-FEC BER, defined in the Coherent CMIS and post-FEC BER have been added to the command's output:

```
switch# show transceiver status interface Ethernet 4/1,4/3,4/5,4/7
                               Current State        Changes       Last Change
                               -------------        -------       -----------

- **Wavelength/Frequency and Output Power Status**

  The **show interface transceiver hardware** command displays the configured and programmed wavelength and output power. It takes a short time for the configured wavelength or output power to be programmed into the transceiver. The configured wavelength/output power and programmed wavelength/output power should not differ for extended periods of time.

```
switch# show interface Ethernet23/1 trans hardware
Name: Et23/1
Media type: 400GBASE-ZR
Maximum module power (W): 20.0
Maximum slot power (W): 20.0
Configured frequency (GHz): 193100.0
Computed wavelength (nm): 1552.52
```

```
Operational frequency (GHz): 193,100.0
Operational wavelength (nm): 1552.52
Configured TX power (dBm): -10.0
Operational TX power (dBm): -10.0
```

Note: Configured transmit output power and operational transmit output power are only displayed if configurable output power is supported by the module.

11.1.3.2.1.3Troubleshooting

1. Check transceiver type – make sure it is 400GBASE-ZR
2. Check peer transceiver – make sure it is also 400GBASE-ZR.
3. Check that channel/frequency is configured and interfaces are not in errdisabled state
4. Check that the selected frequency is matching on both sides of the optical link
5. Check that transmit output is not disabled
6. If Tx power is not configured, check that it is in the range of -6 dB to -12 dB.
7. If Tx power is configured, check that matches its configured values on both sides of the optical link.
8. Check Rx power. The best performance of an optical link is achieved when the received power is -10dB.
9. Collect the output of CLI commands listed in the “Show commands” section before making a request for support from the development team.
10. Check that pre-FEC BER (‘show transceiver dom’ command) is in the correctable range (less than 1e-2).
11. ‘show transceiver status interface’ - check that module state is ‘Ready’, datapath state is ‘Activated’. Check for possible alarms and faults

Link Issues

If a link has issues, the following commands and files are useful for debugging and Arista TAC.

- **`show interfaces <interfaceName> phy detail`**
- **`show interfaces <interfaceName> transceiver detail`**
- **`show idprom transceiver <interfaceName> ext`**
- files in **`/var/log/agents/*`**
- files in **`/var/log/qt/*`**
- **`/var/log/messages*`**

11.1.3.2.1.4Limitations

400GBASE-ZR transceivers are relatively new. The modules could be Arista branded or 3rd party, from multiple vendors. For 3rd party optics, some optional properties (Tx output power, support of 75GHz grid) or DOM properties in the VDM pages, may not be implemented.

11.1.3.3 MXP Ports

MXP ports provide embedded optics that operate in one of three modes: 10GbE (12 ports), 40GbE (3 ports), and 100GbE (1 port). Each mode requires a specified cable is implemented through configuration commands. MXP ports utilize multi-mode fiber to provide support over 150 meters.

- 100GbE mode requires an MTP-24 to MTP-24 cable, which uses 20 of 24 fibers to carry 100Gbe across 10 send and 10 receive channels. When connecting two 100GbE MXP ports, the TX lanes must be crossed with the RX lanes.
- 40GbE mode requires an MTP cable that provides a split into three MTP-12 ends. The cable splits the MXP port into three MTP-12 ends, each compatible with standards based 40GBASE-SR4 ports over OM3 or OM4 fiber up to 100m or 150m.

- 10GbE mode requires an MTP cable that provides a split into 12x10G with LC connectors to adapt the MXP port into 12x10GbE. The cable splits the MXP port into twelve LC ends for using SR or SRL optics over multimode OM3/OM4 cables.

11.1.4 Interfaces

Arista switches provide two physical interface types that receive, process, and transmit Ethernet frames: Ethernet interfaces and Management interfaces.

Each Ethernet interface is assigned a 48-bit MAC address and communicates with other interfaces by exchanging data packets. Each packet contains the MAC address of its source and destination interface. Ethernet interfaces establish link level connections by exchanging packets. Interfaces do not typically accept packets with a destination address of a different interface.

Ethernet data packets are frames. A frame begins with preamble and start fields, followed by an Ethernet header that includes source and destination MAC addresses. The middle section contains payload data, including headers for other protocols carried in the frame. The frame ends with a 32-bit Cyclic Redundancy Check (CRC) field that interfaces use to detect data corrupted during transmission.

11.1.4.1 Ethernet Interfaces

Ethernet speed and duplex configuration options depend on the media type of the interface:

- 40G, OSFP, QSFP+, QSFP-DD, and QSFP200: Default operation is as four 10G ports. **`Speed`** command options support configuration as a single 40G port.
- 1000BASE-T / 2.5GBASE-T / 5GBASE-T / 10GBASE-T (copper): Default configuration enables the **Clause 28 auto-negotiation** for the port to negotiate the speed based on peer capabilities. Depending on individual SKU capabilities, these ports support 10M/100M/1G/2.5G/5G and 10G rates and half / full-duplex mode of operation. The Speed auto SPEED command limits the port advertisements only to a specific speed. The **`SPEED`** commands disables the Clause 28 auto-negotiation and uses the specified speed as the forced speed setting.**`sa`** commands.
- 10GBASE-T (SFP+): Port operates as a single 10G port. **`speed`** commands do not affect configuration.
- 100G CFP2: Default operation is 100G. It cannot be split, and its speed cannot be changed.
- 100G MXP: Operates as three 40G ports on the 7050 platform. On the 7050 platforms, available speed/duplex settings are three 40G ports or twelve 10G ports. Adjustments are made with **`speed`** commands.
- 100G QSFP100: Available speeds are transceiver-dependent. The QSFP100 transceiver supports a single 100G port, four 25G ports, or two 50G ports; the QSFP+ transceiver supports one 40G port or four 10G ports; the CWDM transceiver supports all five configurations. Adjustments are made using **`speed`** commands.
- The **SFP1000BASE-T** transceivers advertise one speed at a time only. Hence, the desired speed and negotiation must be configured explicitly using the following commands:
  - speed auto: auto-negotiated 1Gbps (this is because no speed is specified and we are defaulting to advertise 1G).
  - speed auto 1Gfull / speed auto: auto-negotiated 1Gbps (note that per BASE-T standard, 1G must be negotiated).
  - speed auto 100full: auto-negotiated 100Mbps.
  - speed 100full: non-negotiated / forced 100Mbps.
- The **SFP10GBASE-Ts** transceivers advertise one speed at a time only, similar to SFP1000BASE-Ts, unlike native BASE-T ports. The **`no and default speed`** commands configure the PHY to advertise only 10G.

For information relating to transceivers, see Transceivers.

11.1.4.2 Subinterfaces

Subinterfaces divide a single ethernet or port channel interface into multiple logical L3 interfaces based on the 802.1q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in the L2/L3 boundary device, but they can also be used to isolate traffic with 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

While subinterfaces can be configured on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

- An L3 interface with subinterfaces configured on it should not be made a member of a port channel.
- An interface that is a member of a port channel should not have subinterfaces configured on it.
- A subinterface cannot be made a member of a port channel.

Subinterfaces on multiple ports can be assigned the same ***VLAN ID***, but there is no bridging between subinterfaces (or between subinterfaces and SVIs), and each subinterface is considered to be in a separate bridge domain.

The following features are supported on subinterfaces:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- ACL
- VRF
- VRRP
- SNMP
- Subinterface counters (on some platforms)
- VXLAN (on some platforms)
- MPLS (on some platforms)
- GRE (on some platforms)
- PBR (on some platforms)
- QoS (on some platforms)
- Inheriting QoS settings (trust mode and default DSCP) from the parent interface
- Inheriting MTU setting from parent interface

The following are not supported on subinterfaces:

- Per-subinterface MTU setting
- Per-subinterface SFLOW settings
- Per-subinterface mirroring settings

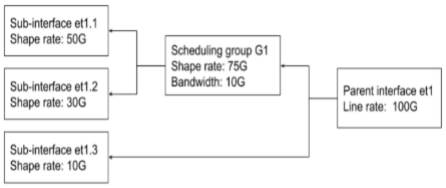
11.1.4.2.1 Shared Shaper across Multiple Subinterfaces

Sub-interfaces can be grouped into logical units called scheduling groups, which are shaped as a single unit. Each scheduling group may be assigned a scheduling policy which defines a shape rate in kbps and optionally a guaranteed bandwidth, also in kbps.

The guaranteed bandwidth is used if the sum of the shape rates of all scheduling groups and sub-interfaces that are not part of groups for a parent interface exceeds the available bandwidth. Each sub-interface within that scheduling group may have its own independent shape rate which are applied in a hierarchical manner.

Adding a sub-interface to a scheduling group results in allocation of dedicated Virtual Output Queues (VOQ) for the sub-interface.

11.1.4.2.1.1Configuring Shared Shaper



Scheduling groups and scheduling policies are configured in the **qos scheduling** CLI mode.

1. First, configure one or more sub-interfaces.
2. Then, create a scheduling policy with the desired shape rate and optional guaranteed bandwidth:

```
switch(config)# qos scheduling
switch(config-qos-scheduling)# scheduling policy P1
switch(config-qos-scheduling-policy-P1)# shape rate 75000000
switch(config-qos-scheduling-policy-P1)# bandwidth guaranteed 10000000
```

3. The shape rate and guaranteed bandwidth may also be defined as percents of the next highest level of the hierarchy (in this case line rate):

```
switch(config-qos-scheduling-policy-P1)# shape rate 75 percent
switch(config-qos-scheduling-policy-P1)# bandwidth guaranteed percent
 10
```

4. Create the scheduling group on the parent interface:

```
switch(config)# qos scheduling
switch(config-qos-scheduling)# interface et1
switch(config-qos-scheduling-intf-Ethernet1)# scheduling group G1
```

5. Assign a policy to the scheduling group:

```
switch(config-qos-scheduling-intf-Ethernet1-group-G1)# policy P1
```

6. Assign members to the scheduling group (members may be put all on one line or on separate lines):

```
switch(config-qos-scheduling-intf-Ethernet1-group-G1)# members et1.1
 et1.2
```

11.1.4.2.1.2Show Commands

- QoS configuration on one or more scheduling groups. Both group name and parent interface name are optional, in which case all groups are displayed as shown in the example below:

  Example

```
switch# show qos scheduling group G1 Ethernet1
Interface: Et1
Scheduling Group Name: G1
Bandwidth: 10.1 / 10.0 (Gbps)
Shape Rate: 75.2 / 75.0 (Gbps)

Member          Bandwidth         Shape Rate
                  (units)           (units)
------        -------------  ------------------
Et1.1            - /  - (-)  50.1 / 50.0 (Gbps)
```

```
Et1.2            - /  - (-)  30.1 / 30.0 (Gbps)
```

- QOS configuration on a parent interface will show scheduling groups configured on the parent interface.

  Example

```
switch# show qos interface Ethernet1
Ethernet1:

   Trust Mode: DSCP
   Default COS: 0
   Default DSCP: 0

   Port shaping rate: disabled

Scheduling Group        Bandwidth            Shape Rate
                          (units)              (units)
----------------    ------------------  ------------------
G1                  10.1 / 10.0 (Gbps)  75.1 / 75.0 (Gbps)
```

- The entire scheduling hierarchy for a subinterface can be displayed. This displays the shape rate for each transmit queue and then the shape rate and guaranteed bandwidth at every other level of the hierarchy.

  Example

```
switch# show qos scheduling hierarchy Ethernet1.1
Interface     Hierarchy Level            Bandwidth             Shape Rate
                                         (units)               (units)
---------    -------------------------  ------------------     ----------------
Et1/1.100     tx queue (0)                  - /    -            100 / 100 (Mbps)
              tx queue (2)                  - /    -            200 / 200 (Mbps)
              subinterface (Et1/1.1)      100 /  100 (Mbps)     500 / 500 (Mbps)
              group (G1)                  10 /   10 (Gbps)       75 /  75 (Gbps)
              parent (Et1/1) (100 Gbps)    - /    -              - /   -  ( - )
```

11.1.4.3 Agile Ports

Agile Ports are a feature of the 7150S Series that allows the user to configure adjacent blocks of 4 x SFP+ interfaces as a single 40G link. The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common PHY component can be combined. One interface within a combinable set is designated as the primary port.

When the primary interface is configured as a higher speed port, all configuration statements are performed on that interface. All other interfaces in the set are subsumed and not individually configurable when the primary interface is configured as the higher speed port. This feature allows the 7150S-24 to behave as a 4x40G switch (using 16 SFP+) and the remaining SFP+ provide 8 x 10Gports. On the 7150S-52 this allows up to 13x 40G (all 52 ports grouped as 40G) and on the 7150S-64 Agile Ports allows the switch to be deployed with up to 16 native 40G interfaces - 4 are QSFP+ and the remaining 12 as 4xSFP+ groups.

11.1.4.4 Management Interfaces

The management interface is a Layer 3 host port that is typically connected to a PC for performing out of band switch management tasks. Each switch has one or two management interfaces. Only one port needs to manage the switch; the second port, when available, provides redundancy.

Management interfaces are 10/100/1000 BASE-T interfaces. By default, auto-negotiation is enabled on management interfaces. All combinations of speed 10/100/1000 and full or half duplex is enforceable on these interfaces through **speed** commands.

Management ports are enabled by default. The switch cannot route packets between management ports and network (Ethernet interface) ports because they are in separate routing domains. When the PC is multiple hops from the management port, packet exchanges through Layer 3 devices between the management port and PC may require the enabling of routing protocols.

The Ethernet management ports are accessed remotely over a common network or locally through a directly connected PC. An IP address and static route to the default gateway must be configured to access the switch through a remote connection.

11.1.4.5 Tunable SFP

Tuning of DWDM 10G SFP+ transceivers (10GBASE-DWDM) includes:

- Tuning transceiver wavelength/frequency by channel number.
- Showing wavelengths/frequencies for specified channels supported by the transceiver.
- Showing current wavelength/frequency settings of the transceiver interface.

For information relating to tuning the transceiver wavelength/frequency by channel number, refer to the command `transceiver channel`. To show the current wavelength/frequency settings for specified channels, refer to the command `show interfaces transceiver channels`. To show the current wavelength/frequency settings of an interface, refer to the command `show interfaces transceiver hardware`.

11.1.5 MRU Enforcement

Maximum Receive Unit (MRU) enforcement provides the ability to drop frames that exceed a configured threshold on the ingress interface.

11.1.5.1 Configuring MRU Enforcement

MRU is configurable per-interface, and can be configured on Ethernet and Port-Channel interfaces. Frames with size greater than the configured MRU value drop on the ingress, and do not forward to the destined egress interface. MRU enforcement happens at the Ethernet interface and applies to both L2 and L3 traffic. Note that FCS (frame check sequence) is included in the frame size.

Ethernet Interface

```
switch(config)# interface ethernet 1
switch(config)# l2 mru 9000
```

Frames with size greater than ***9000*** bytes ingressing into ***Ethernet1*** are dropped.

Port-Channel Interface

Members of a Port-Channel interface inherit the Port-Channel interface's MRU value. Members' MRU configured in the ***Ethernet interface configuration mode*** has no effects.

```
switch(config)# interface ethernet 1 - 4
switch(config-if-Et1-4)# channel-group 10 mode active
switch(config)# interface port-Channel 10
switch(config-if-Po10)#
```

Frames with size greater than ***9000*** bytes ingressing into ***Ethernet1***, ***2***, ***3***, and ***4*** are dropped.

Sub-interfaces

MRU configured on an Ethernet interface or Port-Channel are applied to all of its sub-interfaces.

Default Behaviours

By default, MRU is set to the maximum value.

- For DCS-7280R3 and DCS-7500R3 series
  - The maximum MRU is ***10240*** bytes
- For other supported platforms
  - In TapAgg mode, the maximum MRU is ***10240*** bytes.
  - In non TapAgg mode, the maximum MRU is ***10200*** bytes.

11.1.5.2 MRU Enforcement Limitations

- The number of features for which the hardware counters can be enabled simultaneously is limited by the availability of counter hardware resources in the system. When the configured hardware features exceed the available counter resources, not all counters for all features are available.
  - At lower scales of the feature key (for example, the number of interfaces in the case of subinterface/SVI counters), you can typically concurrently support up to six (6) ingress features and three (3) egress features. As scales grow beyond table sizes, single features use multiple tables.
- Route counters do not support the counting of host routes or ALPM routes.
- Packets sent from the CPU are not included in egress counters.

11.1.5.3 MRU Enforcement Show commands

The MRU on an interface is found in the show interface output.

```
switch(config)# show interface ethernet 1
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 444c.a8b7.1ed8 (bia 444c.a8b7.1ed8)
  Member of Port-Channel10
  Ethernet MTU 10178 bytes, Ethernet MRU 1500 bytes, BW 10000000 kbit
  Full-duplex, 10Gb/s, auto negotiation: off, uni-link: disabled.
```

Counter

MRU dropped packets are counted per-chip.

The Ethernet interfaces corresponding chip are found in the **`show platform fap mapping`** output.

```
switch(config)# show platform fap mapping interface Ethernet 1
Jericho0 (FapId: 0  BaseSystemCoreId: 0)
Port            SysPhyPort   Voq   Core  FapPort  OtmPort BaseQPair QPairs Xlge NifPort
-------------------------------------------------------------------------------------
Ethernet1       100          2608  0     2        0       0         8     8     33
```

Reassembly Errors use per-chip counters from the show hardware counter drop output.

```
switch(config)# show hardware counter drop
Type  Chip       CounterName       : Count    : First Occurrence    : Last Occurrence
-------------------------------------------------------------------------------------
A     Jericho0   ReassemblyErrors  : 12132989 : 2020-09-22 17:05:45 : 2020-09-22 17:22:40
```

11.1.6 Ethernet Configuration Procedures

These sections describe Ethernet and Management interface configuration procedures:

- Physical Interface Configuration Modes
- Assigning a MAC Address to an Interface
- Port Groups (QSFP+ and SFP+ Interface Selection)

- Referencing Modular Ports
- Referencing Multi-lane Ports
- Hitless Speed Change with Dynamic Logical Ports
- QSFP+ Ethernet Port Configuration
- QSFP100 Ethernet Port Configuration
- CFP2 Ethernet Port Configuration
- Default QSFP Mode Support
- MXP Ethernet Port Configuration
- Port Speed Capabilities
- Agile Ports
- Subinterface Configuration
- Maximum Latency Tail-drop Thresholds
- Autonegotiated Settings
- Displaying Ethernet Port Properties
- Ingress Counters
- Configuring Ingress Traffic-Class Counters
- Hardware Counter Support
- Configuring Power over Ethernet (PoE)
- Configuring Link Fault Signaling
- Configuring Hardware TCAM
- CPU Traffic Policy
- TCAM Profile for Configurable Port Qualifier Sizing

11.1.6.1 Physical Interface Configuration Modes

The switch provides two configuration modes for modifying Ethernet parameters:

- ***Interface-Ethernet*** mode configures parameters for specified Ethernet interfaces.
- ***Interface-Management*** mode configures parameters for specified management Ethernet interfaces.

Physical interfaces cannot be created or removed.

Multiple interfaces can be simultaneously configured. Commands are available for configuring Ethernet specific, layer 2, Layer 3, and application layer parameters. Commands that modify protocol specific settings in Ethernet configuration mode are listed in the protocol chapters.

- The `interface ethernet` command places the switch in ***Ethernet-interface*** configuration mode.
- The `interface management` command places the switch in ***management*** configuration mode.

Examples

- This command places the switch in ***Ethernet-interface*** mode for ***interface ethernet 5-7*** and ***10***.

```
switch(config)# interface ethernet 5-7,10
switch(config-if-Et5-7,10)#
```

- This command places the switch in ***management-interface*** mode for ***management interface 1***.

```
switch(config)# interface management 1
switch(config-if-Ma1)#
```

11.1.6.2 Assigning a MAC Address to an Interface

Ethernet and Management interfaces are assigned a MAC address when manufactured. This address is the burn-in address. The `mac-address` command assigns a MAC address to the configuration mode interface in place of the burn-in address. The **`no mac-address`** command reverts the interfaces current MAC address to its burn-in address.

Examples

- This command assigns the MAC address of ***001c.2804.17e1*** to ***Ethernet interface 7***.

```
switch(config-if-Et7)# mac-address 001c.2804.17e1
```

- This command displays the MAC address of ***interface ethernet 7***. The active MAC address is ***001c.2804.17e1***. The burn-in address is ***001c.7312.02e2***.

```
switch(config-if-Et7)# show interface ethernet 7
Ethernet7 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
  Description: b.e45
switch(config-if-Et7)#
```

11.1.6.3 Port Groups (QSFP+ and SFP+ Interface Selection)

Several of Arista's fixed switches limit the number of 10G data lanes in operation through the use of port groups. A port group is a set of interfaces that can be configured as four SFP+ interfaces or a single QSFP+ interface. When configured in SFP+ mode, the port group enables four standalone 10GbE interfaces using SFP+ optics. When configured in QSFP+ mode, the port group enables a single QSFP+ interface (in addition to the dedicated QSFP+ ports), which can operate as a single 40GbE port, or as four 10GbE ports with the appropriate breakout cabling.

Hardware port groups are used on the following systems:

- DCS-7050Q-16
- DCS-7050QX-32S

Use the `hardware port-group` command to select the interface mode for the specified port group.

Note: The **`hardware port-group`** command restarts the forwarding agent, which disrupts traffic on all switch ports.

Example

These commands configure the DCS-7050-Q16 switch to enable four SFP+ interfaces and one extra QSFP+ interface by enabling the SFP+ interfaces in ***port-group 1*** and the QSFP+ interface in ***port-group 2***.

```
switch(config)# hardware port-group 1 select Et17-20
switch(config)# hardware port-group 2 select Et16/1-4
```

The show hardware port-group command displays the status of ports in the port groups.

Example

This command displays the status of the flexible ports within the two port groups on a DCS-7050Q-16 switch.

```
switch# show hardware port-group

Portgroup: 1    Active Ports: Et17-20
Port            State
----------------------------------------
Ethernet17      Active
```

```
Ethernet18      Active
Ethernet19      Active
Ethernet20      Active
Ethernet15/1    ErrDisabled
Ethernet15/2    ErrDisabled
Ethernet15/3    ErrDisabled
Ethernet15/4    ErrDisabled

Portgroup: 2    Active Ports: Et16/1-4
Port            State
-----------------------------------------
Ethernet16/1Active
Ethernet16/2Active
Ethernet16/3Active
Ethernet16/4Active
Ethernet21ErrDisabled
Ethernet22ErrDisabled
Ethernet23ErrDisabled
Ethernet24ErrDisabled
```

11.1.6.3.1 DCS-7050Q-16

The DCS-7050Q-16 has 14 dedicated QSFP+ ports, plus two port groups. The port groups support either two additional QSFP+ ports or eight SFP+ ports as shown in DCS-7050Q-16 Port Groups.

Table 56: DCS-7050Q-16 Port Groups

Port Group 1 **Active Interface(s)**		**Port Group 2** **Active Interface(s)**	
In SFP+ Mode	In QSFP+ Mode (Default)	In SFP+ Mode	In QSFP+ Mode (Default)
Et17-20 (four SFP+ ports)	Et15/1-4 (one QSFP+ port)	Et21-24 (four SFP+ ports)	Et16/1-4 (one QSFP+ port)

11.1.6.3.2 DCS-7050QX-32S

The DCS-7050QX-32S has 31 dedicated QSFP+ ports, plus one port group. The port group supports either one additional QSFP+ port or four SFP+ ports as shown in DCS-7050QX-32S Port Groups.

Table 57: DCS-7050QX-32S Port Groups

Port Group 1 **Active Interface(s)**	
In SFP+ Mode	In QSFP+ Mode (Default)
Et1-4 (four SFP+ ports)	Et5/1-4 (one QSFP+ port)

11.1.6.4 Referencing Modular Ports

Arista modular switches provide port access through installed line cards. The maximum number of line cards on a modular switch varies with the switch series and model.

Several CLI commands modify modular parameters for all ports on a specified line card or controlled by a specified chip. This manual uses these conventions to reference modular components:

- ***card_x*** refers to a line card.
- ***module_y*** refers to a QSFP+ module.
- ***port_z*** refers to a line card or module port.

Commands that display Ethernet port status use the following conventions:

- **SFP ports: *card_x/port_z*** to label the line card-port location of modular ports.
- **QSFP ports: *card_x/module_y/port_z*** to label the line card-port location of modular ports.

QSFP+ Ethernet Port Configuration describe QSFP+ module usage.

Example

This command displays the status of interfaces ***1*** to ***9*** on ***line card 4***:

```
switch# show interface ethernet 4/1-9 status
Port      Name               Status       Vlan        Duplex  Speed Type
Et4/1                        connected    1             full    10G Not Present
Et4/2                        connected    1             full    10G Not Present
Et4/3                        connected    1             full    10G Not Present
Et4/4                        connected    1             full    10G Not Present
Et4/5                        connected    1             full    10G Not Present
Et4/6                        connected    1             full    10G Not Present
Et4/7                        connected    1             full    10G Not Present
Et4/8                        connected    1             full    10G Not Present
Et4/9                        connected    1             full    10G Not Present
switch>
```

11.1.6.5 Referencing Multi-lane Ports

EOS supports two types of Ethernet ports:

- single-lane (also called fixed-lane)
- multi-lane (also called flexible-lane)

Single-lane (or fixed-lane) ports are always modeled as a single interface within EOS. While the speed of the interface may be configurable, the physical port can never be broken out into multiple lower-speed interfaces. Single-lane ports use the following naming scheme:

- Ethernet <port #> (for fixed switches)
- Ethernet <module #>/<port #> (for modular switches)

Multi-lane (or flexible lane) ports are made up of multiple parallel lanes, each served by its own laser. Multi-lane ports can be configured to combine the lanes and operate as a single native high-speed interface (a 40GbE or 100GbE interface), or to operate each lower-speed interface independently (four 10GbE or 25GbE interfaces). Multi-lane ports use the following naming scheme:

- Ethernet ***port #***/***lane #*** (for fixed switches)

Ethernet ***module #***/***port #***/***lane #*** (for modular switches)

The operational state displayed for each lane of a multi-lane port is determined by the configuration applied to the primary lane(s), as shown in Lane States. When broken out into multiple lower-speed interfaces, all lanes will be active in parallel, and each will display its operational state as **connected** or **not connected**. In high-speed mode, only the primary lane(s) will be displayed as active, with the remaining lanes showing as **errdisabled**. The exception is the CFP2 module: when it is configured as a single 100GbE port, the primary lane is displayed as active in the CLI while the other lanes are hidden.

Table 58: Lane States

Parent Port Configured Mode	Primary Lane(s)	Secondary Lanes
single high-speed interface	active (connected/not connected)	inactive (errdisabled)
multi-interface breakout	active (connected/not connected)	active (connected/not connected)

A multi-lane port is configured as a single high-speed interface or multiple breakout interfaces by using the **speed** command on the primary lane(s) of the port. For specific configuration instructions and details regarding the primary lane(s) of a specific interface, refer to the configuration section for the appropriate interface type:

- QSFP+ Ethernet Port Configuration
- QSFP100 Ethernet Port Configuration
- CFP2 Ethernet Port Configuration
- MXP Ethernet Port Configuration

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

11.1.6.6 Hitless Speed Change with Dynamic Logical Ports

Higher speed ports on several switches can be broken out into multiple interfaces that can be configured at lower speeds. Each of these interfaces is called a Logical Port (LP). Switches such as the DCS-7260CX3-64, allocate and deallocate the logical ports dynamically to optimize hardware resources. Care must be taken for hitless speed changes, therefore, as a change of speed on a Dynamic Logical Port (DLP) may impact the status of one or more related DLP(s).

Checking Status of DLPs

The following example is applicable to a switch that supports a breakout of a 100G physical port to 4x 25G DLPs.

The command displays the status of Et 45/1-4, when a 100G physical port is broken out to 4x 25G DLPs.

```
switch(config)# show interfaces ethernet 45/1-4 status
Port    Name   Status    Vlan  Duplex Speed  Type      Flags
Et45/1         notconnect   1     full   25G Not Present
Et45/2         notconnect   1     full   25G Not Present
Et45/3         notconnect   1     full   25G Not Present
Et45/4         notconnect   1     full   25G Not Present
```

The following example displays the inactive interfaces (DLPs) when the 100G physical port is configured for the 100G speed.

```
switch(config)# show interfaces ethernet 45/1-4 status
Port    Name   Status    Vlan  Duplex Speed  Type      Flags
Et45/1         notconnect 1     full   100G   Not Present
Et45/2         inactive   1     unconf unconf Not Present
Et45/3         inactive   1     unconf unconf Not Present
Et45/4         inactive   1     unconf unconf Not Present
```

By default, inactive interfaces will not be displayed by this command. To enable showing them, use the following command.

```
switch(config)# [no] service interface inactive expose
```

Only systems without DLP allocation have enough logical ports for every interface to be active simultaneously.

The following example displays the logical port pool information and current logical port allocation status for a fully loaded switch.

```
switch> show hardware logical-port pool status
Pool Max Free Configured Interfaces
---- --- ---- ---------- ------------------------------------------------------
   1  18    2         16 Et2/5/1-2/8/4,3/5/1-3/8/4,4/5/1-4/8/4,5/9/1-5/12/4
   2  18    2         16 Et2/1/1-2/4/4,3/9/1-3/12/4,4/1/1-4/4/4,5/5/1-5/8/4
   3  18    2         16 Et2/9/1-2/12/4,3/1/1-3/4/4,4/9/1-4/12/4,5/1/1-5/4/4
   4  18    2         16 Et2/13/1-2/16/4,3/13/1-3/16/4,4/13/1-4/16/4,5/13/1-5/16/4
   5  18    2         16 Et6/13/1-6/16/4,7/13/1-7/16/4,8/13/1-8/16/4,9/13/1-9/16/4
   6  18    2         16 Et6/1/1-6/4/4,7/9/1-7/12/4,8/1/1-8/4/4,9/9/1-9/12/4
   7  18    2         16 Et6/5/1-6/8/4,7/1/1-7/4/4,8/9/1-8/12/4,9/1/1-9/4/4
   8  18    2         16 Et6/9/1-6/12/4,7/5/1-7/8/4,8/5/1-8/8/4,9/5/1-9/8/4
```

The following example displays the logical port pool information and current logical port allocation status for a switch with only Linecard ***3***, ***4***, ***5***, and ***7*** inserted.

```
switch> show hardware logical-port pool status
Pool Max Free Configured Interfaces
---- --- ---- ---------- ------------------------------------------------------
   1  18    8         10 Et3/5/1-3/8/4,4/2/1-8,5/3/1-8
   2  18   12          6 Et3/9/1-3/12/4,4/1/1-8,5/2/1-8
   3  18    8         10 Et3/1/1-3/4/4,4/3/1-8,5/1/1-8
   4  18    7         11 Et3/13/1-3/16/4,4/4/1-8,5/4/1-8
   5  18   16          2 Et7/13/1-7/16/4
   6  18   14          4 Et7/9/1-7/12/4
   7  18   14          4 Et7/1/1-7/4/4
   8  18   12          6 Et7/5/1-7/8/4
```

11.1.6.7 QSFP+ Ethernet Port Configuration

Each QSFP+ module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This allows a QSFP+ Ethernet port to be configured as a single 40GbE interface or as four 10GbE interfaces.

When the four lanes are combined to form a 40GbE interface, display commands will show ***lane /1*** as **connected** or **not connected**, and will show lanes ***/2*** through ***/4*** as **errdisabled**.

The following sections describe the configuration of QSFP+ ports.

11.1.6.7.1 Configuring a QSFP+ Module as a Single 40GbE Interface

To configure the port as a single 40GbE interface, combine the modules four data lanes by using the speed command (**speed forced 40g full**) on the ports /1 lane (the primary lane).

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the QSFP+ Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/1/1)# speed 40gfull
```

3. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
    <-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1 connected 1 full 40G 40GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 40GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 40GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 40GBASE-SR4
     <-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.7.2 Configuring a QSFP+ Module as Four 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the speed command (**speed 10000full**) on the ***ports /1*** lane (the primary lane).

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the QSFP+ Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the `speed` **10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)# speed 10000full
```

3. Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
PortNameStatusVlanDuplexSpeedTypeFlags
Et1connected2full1G10GBASE-T
Et5/1/1connected1full10G40GBASE-SR4
Et5/1/2connected1full10G40GBASE-SR4
Et5/1/3connected1full10G40GBASE-SR4
Et5/1/4connected1full10G40GBASE-SR4
```

11.1.6.8 QSFP100 Ethernet Port Configuration

Each QSFP100 module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This allows a QSFP100 Ethernet port to be configured as a single 100GbE interface, a single 40GbE interface, or four 10GbE interfaces. The default mode is a single 100GbE interface.

The 7060X, 7260X and 7320X platforms also allow a QSFP100 port to be configured as two 50GbE interfaces or four 25GbE interfaces.

When the lanes are combined to form a higher-speed interface, display commands show the primary lane(s) as **connected** or **not connected**, and shows the other lanes as **errdisabled**.

The following sections describe the configuration of QSFP+ ports.

11.1.6.8.1 Configuring a QSFP100 Module as a Single 100GbE Interface

By default, the QSFP100 module operates as a single 100GbE interface; using the **default speed** or **no speed** command on the primary lane restores the default behavior.

To explicitly configure the port as a single 100GbE interface, combine the modules four data lanes by using the speed command (**speed 100gfull**) on the ports ***/1*** lane (the primary lane).

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the speed **100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/1/1)# speed 100gfull
```

3. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port    Name     Status    Vlan    Duplex     Speed    Type    Flags
Et1              connected    2     full       1G     10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1          connected    1     full       100G   100GBASE-SR4
Et5/1/2          errdisabled  1    unconf    unconf  100GBASE-SR4
Et5/1/3          errdisabled  1    unconf    unconf  100GBASE-SR4
Et5/1/4          errdisabled  1    unconf     unconf 100GBASE-SR4
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.8.2 Configuring a QSFP100 Module as Two 50GbE Interfaces

To configure the port as a two 50GbE interfaces, configure the modules four data lanes by using the **speed** command (**speed 50gfull**) on the ports ***/1*** and ***/3*** lanes. This configuration is available on 7060X, 7260X and 7320X platforms.

Note:

Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, s7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 50gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/1/1)# speed 50gfull
```

3. Repeat the above steps for lane ***/3***.

```
switch(config-if-Et5/1/1)#interface ethernet 5/1/3
```

```
switch(config-if-Et5/1/3)#speed 50gfull
```

4. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port       Name     Status       Vlan      Duplex    Speed    Type
 Flags
Et1                 connected     2          full      1G     10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1             connected     1          full      50G    100GBASE-
SR4
Et5/1/2             errdisabled   1          unconf  unconf   100GBASE-
SR4
Et5/1/3             connected     1          full      50G    100GBASE-
SR4
Et5/1/4             errdisabled   1          unconf  unconf   100GBASE-
SR4
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.8.3 Configuring a QSFP100 Module as a Single 40GbE Interface

To configure the port as a single 40GbE interface, combine the modules four data lanes by using the speed command (**speed 40gfull**) on the ports ***/1*** lane (the primary lane).

Note:

Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/1/1)# speed 40gfull
```

3. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port      Name      Status       Vlan      Duplex    Speed     Type
 Flags
Et1                 connected     2         full       1G     10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1             connected     1         full       40G    100GBASE-SR4
Et5/1/2             errdisabled   1         unconf    unconf  100GBASE-SR4
Et5/1/3             errdisabled   1         unconf    unconf  100GBASE-SR4
Et5/1/4             errdisabled   1         unconf    unconf  100GBASE-SR4
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.8.4 Configuring a QSFP100 Module as Four 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the speed command (**speed 10000full**) on the ports ***/1*** lane (the primary lane).

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other

platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/1/1)# speed 10000full
```

3. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port       Name       Status       Vlan     Duplex    Speed      Type          Flags
Et1                   connected    2         full        1G    10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1               connected    1         full        10G   100GBASE-SR4
Et5/1/2               connected    1         full        10G   100GBASE-SR4
Et5/1/3               connected    1         full        10G   100GBASE-SR4
Et5/1/4               connected    1         full        10G   100GBASE-SR4
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.9 CFP2 Ethernet Port Configuration

Each CFP2 module contains ten data lanes. The configuration options available on the port depend on the optic inserted:

- CFP2-100G-LR4 optics operate only in 100GbE mode.
- CF2-100G-ER4 optics operate only 100GbE mode.
- CFP2-100G-XSR10 optics can be configured as a single 100GbE interface or as ten 10GbE interfaces.

When the port is configured as ten 10GbE interface, each lane is active and visible in CLI display commands. When the lanes are combined to form a single 100GbE interface, display commands will show the primary lane as **connected** or **not connected**; all other lanes will be hidden.

The following sections describe the configuration of CFP2 ports.

11.1.6.9.1 Configuring a CFP2 Module a as a Single100GbE Interface

To configure the port as a single 100GbE interface (the default configuration), combine the modules ten data lanes by using the speed command (**speed 100gfull**) on the ports ***/1*** lane (the primary lane).

This configuration is available for all pluggable optics.

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for ***lane /1*** of the ***CFP2*** Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/1/1)# speed 100gfull
```

3. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port      Name      Status     Vlan     Duplex    Speed     Type      Flags
Et1               connected    2       full       1G     10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1           connected    1       full      100G    100GBASE-SR1
Et5/2/1           connected    1       full      100G    100GBASE-SR1
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.9.2 Configuring a CFP2 Module as Ten 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the speed command (**speed 10000full**) on the ports ***/1*** lane (the primary lane).

This configuration is available only for CFP2-100G-XSR10 optics.

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the CFP2 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/1/1)# speed 10000full
```

3. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port      Name      Status     Vlan Duplex    Speed    Type        Flags
Et1               connected    2    full       1G    10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1           connected    1    full      10G   100GBASE-SR1
Et5/1/2           connected    1    full      10G   100GBASE-SR1
Et5/1/3           connected    1    full      10G   100GBASE-SR1
Et5/1/4           connected    1    full      10G   100GBASE-SR1
Et5/1/5           connected    1    full      10G   100GBASE-SR1
Et5/1/6           connected    1    full      10G   100GBASE-SR1
Et5/1/7           connected    1    full      10G   100GBASE-SR1
Et5/1/8           connected    1    full      10G   100GBASE-SR1
Et5/1/9           connected    1    full      10G   100GBASE-SR1
Et5/1/10          connected    1    full      10G   100GBASE-SR1
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.10 Default QSFP Mode Support

QSFP+ transceiver supports 40G and 4x10G. This feature provides support for changing the default QSFP mode between 40G and 4x10G on all ports with QSFP+ transceivers.

11.1.6.10.1 Configuration

On all front panel ports which support this feature, the following global configuration command changes their default QSFP mode from 40G to 4x10G,

```
transceiver qsfp default-mode 4x10G
```

The **no** or **default** version of the command reverts the default QSFP mode back to 40G.

Note: This configuration command is not honored on ports that do not support this feature (such as QSFP100 ports with external PHY always choose 40G as the default QSFP mode).

11.1.6.10.2 Show Commands

There is no explicit show command to display the default QSFP mode. Use the **show running-config** command to determine whether the default QSFP mode is 4x10G or 40G. Use the **show interfaces hardware** command to check the default QSFP mode on the given ports.

- When default QSFP mode is configured as 4x10G, the output of **show running-config** contains **transceiver qsfp default-mode 4x10G**. In the output of the **show interfaces hardware** command, 10G is shown as the default speed.

```
switch(config)# transceiver qsfp default-mode 4x10G
switch(config)# show running-config | grep 4x10G
transceiver qsfp default-mode 4x10G
switch(config)# show interfaces ethernet 35/1 hardware
*  = Requires speed group setting change
Ethernet35/1
  Model:          DCS-7280CR3-32P4
  Type:           40GBASE-CR4
  Speed/Duplex:   10G/full(default),40G/full,auto
  Flowcontrol:    rx-(off,on,desired),tx-(off)
```

- When default QSFP mode configuration is reverted the default, the output of **show running-config** command does not contain **transceiver qsfp default-mode 4x10G**. In the output of **show interfaces hardware** command, 40G is shown as the default speed.

```
switch(config)# no transceiver qsfp default-mode
switch(config)# show running-config | grep 4x10G
switch(config)# show interfaces ethernet 35/1 hardware
*  = Requires speed group setting change
Ethernet35/1
  Model:          DCS-7280CR3-32P4
  Type:           40GBASE-CR4
  Speed/Duplex:   10G/full,40G/full(default),auto
  Flowcontrol:    rx-(off,on,desired),tx-(off)
```

11.1.6.10.3 Limitations

There is support for the **no transceiver qsfp default-mode 4x10G** command on the DCS-7300X Series, but the default QSFP mode still remains as 4x10G.

11.1.6.11 MXP Ethernet Port Configuration

Each MXP module contains twelve data lanes which can be used individually or combined to form one or more higher-speed interfaces. This allows an MXP Ethernet port to be configured as a single 100GbE interface, up to twelve 10GbE interfaces, or a mixture of 40GbE and 10GbE ports.

MXP ports do not use pluggable optics: instead, an MTP-24 ribbon is inserted directly into the port. The remote end of the MTP 24 ribbon must then be broken out using a splitter cable or cartridge based on the operational mode and speed of the MXP port.

When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands show the primary lane of that group as **connected or not connected** and the other three lanes as **errdisabled**.

The following sections describe the configuration of MXP interfaces.

11.1.6.11.1 Configuring an MXP Module as a Single 100GbE Interface

To configure the port as a single 100GbE interface (the default configuration), enter the speed command (**speed 100gfull**) on the ports ***/1*** lane (the primary lane). This combines lanes ***1-10*** and disables lanes ***11*** and ***12***.

Under this configuration, CLI display commands will show lane ***/1*** as **connected** or **not connected**, and show lanes ***/2-/12*** as **errdisabled**.

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the MXP Ethernet interface.

```
switch(config)# interface ethernet 5/49/1
```

2. Enter the **speed 100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/49/1)# speed 100gfull
```

3. Use the show interfaces status command to confirm the change in configuration.

```
switch(config-if-Et5/49/1)# show interfaces status
Port          Name        Status        Vlan        Duplex     Speed      Type
 Flags
Et1                       connected      2           full        1G      10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/49/1                  connected      1           full       100G     100GBASE-SR1
Et5/49/2                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/3                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/4                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/5                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/6                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/7                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/8                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/9                  errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/10                 errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/11                 errdisabled    1           unconf     unconf   100GBASE-SR1
Et5/49/12                 errdisabled    1           unconf     unconf   100GBASE-SR1
```

11.1.6.11.2 Configuring an MXP Module With 40GbE Interfaces

Each set of four lanes on the MXP module is independently configurable as a single 40GbE interface or four 10GbE interfaces. To configure four lanes as a single 40GbE interface, enter the speed command (**speed forced 40gfull**) on the groups primary lane ***(/1***, ***/5***, or ***/9***). To revert a group of four lanes to functioning as four independent 10GbE interfaces, enter the **speed 10000full** command on the primary lane of the group.

When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands will show the primary lane of that group as **connected** or **not connected** and the other three lanes as **errdisabled**. In groups of four lanes which are configured as four independent 10GbE interfaces, each lane will be displayed in the CLI as **connected** or **not connected**.

Note that a **speed forced 100gfull** command entered on the /1 lane takes precedence over **speed 40gfull** commands on the ***/5*** and ***/9*** lanes.

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

The example below shows the steps for configuring an MXP module as three 40GbE interfaces.

1. Enter interface Ethernet configuration mode for lane ***/1*** of the MXP Ethernet interface.

```
switch(config)# interface ethernet 5/49/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/49/1)# speed 40gfull
```

3. Repeat the above steps for ***lanes /5*** and ***/9***.

```
switch(config-if-Et5/49/1)# interface ethernet 5/49/5
switch(config-if-Et5/49/5)# speed 40gfull
switch(config-if-Et5/49/5)# interface ethernet 5/49/9
switch(config-if-Et5/49/9)# speed 40gfull
```

4. Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/49/9)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1          connected       2     full      1G      10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/49/1     connected       1     full      40G     100GBASE-SR1
Et5/49/2     errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/3     errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/4     errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/5     connected       1     full      40G     100GBASE-SR1
Et5/49/6     errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/7     errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/8     errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/9     connected       1     full      40G     100GBASE-SR1
Et5/49/10    errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/11    errdisabled     1     unconf    unconf  100GBASE-SR1
Et5/49/12    errdisabled     1     unconf    unconf  100GBASE-SR1
```

11.1.6.11.3 Configuring an MXP Module as Twelve 10GbE Interfaces

Each lane of an MXP port functions as a 10GbE interface when it is not included in a higher-speed interface configuration (either actively or as an **errdisabled** port).

To explicitly configure the port as twelve 10GbE interfaces, use the `speed` command (**speed 10000full**) on all twelve lanes of the port.

When each lane is configured as an independent 10GbE interface, CLI display commands show each lane as **connected** or **not connected**.

Note: Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for all twelve lanes of the MXP Ethernet interface.

```
switch(config)# interface ethernet 5/49/1-12
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for ***60*** seconds or more.

```
switch(config-if-Et5/49/1-12)# speed 10000full
```

3. Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/49/1-12)# show interfaces status
Port       Name      Status      Vlan      Duplex       Speed      Type       Flags
Et1                  connected      2        full          1G      10GBASE-T
<-------OUTPUT OMITTED FROM EXAMPLE-------->
Et5/1/1              connected      1        full          10G     100GBASE-SR1
Et5/1/2              connected      1        full          10G     100GBASE-SR1
Et5/1/3              connected      1        full          10G     100GBASE-SR1
Et5/1/4              connected      1        full          10G     100GBASE-SR1
Et5/1/5              connected      1        full          10G     100GBASE-SR1
Et5/1/6              connected      1        full          10G     100GBASE-SR1
Et5/1/7              connected      1        full          10G     100GBASE-SR1
Et5/1/8              connected      1        full          10G     100GBASE-SR1
Et5/1/9              connected      1        full          10G     100GBASE-SR1
Et5/1/10             connected      1        full          10G     100GBASE-SR1
<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

11.1.6.12 Port Speed Capabilities

The supported speeds supported on each Arista platform per interface type are described in Supported Speeds (GbE).

Table 59: Supported Speeds (GbE)

Platform	SFP+	SFP28	QSFP+	QSFP100	MXP	CFP2
7050	100M, 1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7050X	100M, 1, 10	N/A	1, 10, 40	N/A	10, 40	N/A
7050X2	100M, 1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7050X3	100M, 1, 10	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	N/A
7250X	N/A	N/A	1, 10, 40	N/A	N/A	N/A
7060X	100M, 1, 10	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7060X2	100M, 1, 10	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	N/A
7260X3	100M, 1, 10	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7300X	100M, 1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7300X3	N/A	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	N/A
7320X	N/A	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7150S	1, 10	N/A	1, 10, 40	N/A	N/A	N/A

7048T	1, 10	N/A	N/A	N/A	N/A	N/A
7500	1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7500E	1, 10	N/A	1, 10, 40	10, 40, 100	10, 40, 100	100
7500R	1, 10	1, 10, 25	1, 10, 40	10, 25, 40, 50, 100	N/A	N/A
7280SE	1, 10	N/A	1, 10, 40	10, 40, 100	10, 40, 100	N/A
7280QR	N/A	N/A	1, 10, 40	10, 25, 40, 50, 100	N/A	N/A
7280SR (R2)	1, 10	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	100, 200
7280CR	N/A	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7010T	100M, 1, 10	N/A	N/A	N/A	N/A	N/A

11.1.6.13 Agile Ports

An agile port is an interface that can function as a 10G port or can subsume a predefined set of 10G interfaces to form an interface with higher speed capabilities.

The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common PHY component can be combined. One interface within a combinable set is designated as the primary port.

- To view the set of available agile ports and the subsumable interfaces that comprise them, enter `show platform fm6000 agileport map`.
- To configure the primary port as a higher speed port, enter `speed` **40gfull** or `speed` **auto 40gfull**.
- To revert the primary port and its subsumed ports to 10G interfaces, enter **no** `speed`.

11.1.6.14 Subinterface Configuration

For a subinterface to be operational on an Ethernet or port channel interface, the parent interface must be configured as a routed port and be administratively up, and a VLAN must be configured on the subinterface. If the parent interface goes down, all subinterfaces automatically go down as well, but will come back up with the same configuration once the parent interface is up.

Note that a port channel should not contain Ethernet interfaces with subinterfaces configured on them, and that subinterfaces cannot be members of a port channel.

Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface. Note that the subinterface number has no relation to the ID of the VLAN corresponding to the subinterface.

Subinterfaces are available on the following platforms:

- DCS-7050X
- DCS-7060X
- DCS-7250X

- DCS-7260X
- DCS-7280E
- DCS-7300X
- DCS-7320X
- DCS-7500E

11.1.6.14.1 Creating a Subinterface

To create a subinterface on an Ethernet or port channel interface:

1. Bring up the parent interface and ensure that it is configured as a routed port.

```
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# no switchport
switch(config-if-Et1/1)# no shutdown
```

2. Configure a VLAN on the subinterface. The `encapsulation dot1q vlan` command is also used for VLAN translation, but in this context it associates a VLAN with the subinterface.

```
switch(config-if-Et1/1)# interface Ethernet1/1.1
switch(config-if-Et1/1.1)# encapsulation dot1q vlan 100
```

3. Configure an IP address on the subinterface (optional) and ensure that it is up.

```
switch(config-if-Et1/1)# ip address 10.0.0.1/24
switch(config-if-Et1/1)# no shutdown
switch(config-if-Et1/1)#
```

11.1.6.14.2 Creating a Range of Subinterfaces

A range of subinterfaces can also be configured simultaneously. The following example configures subinterfaces ***1*** to ***100*** on ***Ethernet interface 1/1***, and assigns ***VLANs 501*** through ***600*** to them. Note that the range of interfaces must be the same size as the range of VLAN IDs.

Example

```
switch(config)# interface eth1/1.1-100
switch(config-if-Et1/1.1-100)# no shutdown
switch(config-if-Et1/1.1-100)# encapsulation dot1q vlan {501,600}
switch(config-if-Et1/1.1-100)# exit
switch(config)#
```

11.1.6.14.3 Parent Interface Configuration

For subinterfaces to function, the parent interface must be administratively up and configured as a routed port.

Some settings are inherited by subinterfaces from the parent interface. These include QoS (trust mode and default DSCP) and MTU.

Additionally, on the DCS-7050X, DCS-7250X, and DCS-7300X platforms, the parent interface may be configured with an IP address. In this case, untagged packets are treated as incoming traffic on the parent interface

11.1.6.14.4 Configuring Routing Features on a Subinterface

Once a subinterface is created, the following features can be configured on it:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- VRF
- VRRP
- SNMP
- Inheritance of QoS (trust mode and default DSCP) and MTU settings from the parent interface

Additionally, these features can be configured on subinterfaces on Arad (DCS-7500E and DCS-7280E) platforms:

- Subinterface counters on ingress
- VXLAN
- MPLS
- GRE
- PBR
- QoS

11.1.6.14.5 Displaying Subinterface Information

Subinterface information is displayed using the same show commands as for other interfaces.

Examples

- This command displays summary information for all IP interfaces on the switch, including subinterfaces.

```
switch# show ip interfaces brief
 Interface            IP Address     Status    Protocol     MTU
 Ethernet1/1          10.1.1.1/24up      up         1500
 Ethernet1/1.1        10.0.0.1/24up      up         1500
 Ethernet1/2          unassigned         up           up     1500
```

- This command displays information for subinterface Ethernet ***1/1.1***.

```
switch# show interface ethernet 1/1.1
Ethernet1/1.1 is down, line protocol is lowerlayerdown (notconnect)
  Hardware is Subinterface, address is 001c.735d.65dc
  Internet address is 10.0.0.1/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes , BW 10000000 kbit
  Down 59 seconds
switch>
```

- This command displays status information for all subinterfaces configured on the switch.

```
switch# show interfaces status sub-interfaces
Port       Name    Status       Vlan     Duplex       Speed       Type                Flags
Et1.1              connect      101        full       10G         dot1q-encapsulation
Et1.2              connect      102        full       10G         dot1q-encapsulation
Et1.3              connect      103        full       10G         dot1q-encapsulation
Et1.4              connect      103        full       10G         dot1q-encapsulation
```

11.1.6.15 Maximum Latency Tail-drop Thresholds

The maximum latency for Tail-drop thresholds can be configured in interface configuration mode or in the QoS profile. **QoS profile** configuration mode is a group change mode.

Example

These commands configure the maximum latency value for VOQ tail-drop threshold on ***transmit queue 3*** on ***interface Ethernet1***. The latency value can be specified to a maximum of ***50*** ms. Both milliseconds and microseconds may be used.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# tx-queue 3
switch(config-if-Et1-txq-3)# latency maximum <1-50000> microseconds
switch(config-if-Et1-txq-3)# latency maximum <1-50> milliseconds
switch(config)#
```

11.1.6.16 Autonegotiated Settings

In autonegotiation, the transmission speed, duplex setting, and flow control parameters used for Ethernet-based communication can be automatically negotiated between connected devices to establish optimized common settings.

11.1.6.16.1 Speed and Duplex

The `speed` command affects the transmission speed and duplex setting for the configuration mode interface. When a **`speed`** command is in effect on an interface, autonegotiation of speed and duplex settings is disabled for the interface; to enable autonegotiation, use the **`speed auto`** command.

The scope and effect of the **`speed`** command depends on the interface type; see Ethernet Interfaces and Ethernet Configuration Procedures for detailed information on the speed settings for different interfaces.

11.1.6.16.2 Flow Control

Flow control is a data transmission option that temporarily stops a device from sending data because of a peer data overflow condition. If a device sends data faster than the receiver can accept it, the receiver's buffer can overflow. The receiving device then sends a PAUSE frame, instructing the sending device to halt transmission for a specified period.

Flow control commands configure administrative settings for flow control packets.

- The flowcontrol receive command configures the port's ability to receive flow control pause frames.
  - **off**: port does not process pause frames that it receives.
  - **on**: port processes pause frames that it receives.
  - **desired**: port autonegotiates; processes pause frames if peer is set to **send** or desired.
- The flowcontrol send command configures the port's ability to transmit flow control pause frames.
  - **off**: port does not send pause frames.
  - **on**: port sends pause frames.
  - **desired**: port autonegotiates; sends pause frames if peer is set to **receive** or **desired**.

Desired is not an available parameter option. Ethernet data ports cannot be set to **desired**. Management ports are set to **desired** by default and with the **`no flowcontrol receive`** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. Compatible Settings for Flow Control Negotiation lists the compatible flow control settings.

Table 60: Compatible Settings for Flow Control Negotiation

local port	peer port
receive on	send on or send desired
receive off	send off or send desired

receive desired	send on , send off, or send desired
send on	receive on or receive desired
send off	receive off or receive desired
send desired	receive on , receive off, or receive desired

Example

These commands set the flow control receive and send to **on** on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# flowcontrol receive on
switch(config-if-Et5)# flowcontrol send on
switch(config-if-Et5)#
```

11.1.6.17 Displaying Ethernet Port Properties

Show commands are available to display various Ethernet configuration and operational status on each interface. Ethernet settings that are viewable include:

- Port Type
- PHY Status
- Negotiated Settings
- Flow Control
- Capabilities

Port Type

The port type is viewable from the output of **show interfaces status**, **show interfaces hardware**, and **show interfaces transceiver properties** commands.

Examples

- This **show interfaces status** command displays the status of Ethernet interfaces ***1-5***.

```
switch# show interfaces status
Port      Name              Status       Vlan        Duplex  Speed Type
Et1                         connected    1             full    10G 10GBASE-SRL
Et2                         connected    1             full    10G 10GBASE-SRL
Et3                         connected    1             full    10G 10GBASE-SRL
Et4                         connected    1             full    10G 10GBASE-SRL
Et5                         notconnect   1             full    10G Not Present
switch>
```

- This **show interfaces hardware** command displays the speed, duplex, and flow control capabilities of Ethernet interfaces ***2*** and ***18***.

```
switch# show interfaces ethernet 2,18 hardware
Ethernet2
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-CR
  Speed/Duplex: 10G/full,40G/full,auto
  Flowcontrol:  rx-(off,on,desired),tx-(off,on,desired)
Ethernet18
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol:  rx-(off,on),tx-(off,on)
switch>
```

- This command displays the media type, speed, and duplex properties for Ethernet interfaces ***1***.

```
switch# show interfaces ethernet 1 transceiver properties
Name : Et1
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL
```

PHY

PHY information for each Ethernet interface is viewed by entering the **show interfaces phy** command.

Example

This command summarizes PHY information for Ethernet interfaces ***1-3***.

```
switch#show interfaces ethernet 1-3 phy
Key:
   U    = Link up
   D    = Link down
   R    = RX Fault
   T    = TX Fault
   B    = High BER
   L    = No Block Lock
   A    = No XAUI Lane Alignment
   0123 = No XAUI lane sync in lane N

                                  State    Reset
Port           PHY state        Changes    Count PMA/PMD PCS   XAUI
-------------- ---------------- -------- -------- ------- ----- --------
Ethernet1      linkUp             14518     1750 U..     U.... U.......
Ethernet2      linkUp             13944     1704 U..     U.... U.......
Ethernet3detectingXcvr          3        1               D..A0123
switch>
```

Negotiated Settings

Speed, duplex, and flow control settings are displayed through the show interfaces hardware, PHY information for each Ethernet interface is viewed by entering the **show interfaces hardware**, **show interfaces flow-control**, and **show interfaces status** commands.

Examples

- This command displays speed/duplex and flow control settings for Ethernet interface ***1***.

```
switch#show interfaces ethernet 1 hardware
Ethernet1
  Model:        DCS-7150S-64-CL
  Type:         10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol:  rx-(off,on),tx-(off,on)
switch>
```

- This command shows the flow control settings for Ethernet interfaces ***1-2***.

```
switch#show flow-control interface ethernet 1-2
Port       Send FlowControl  Receive FlowControl  RxPause       TxPause
           admin    oper     admin    oper
---------  -------- -------- -------- --------    ------------- -------------
Et1        off      off      off      off         0             0
Et2        off      off      off      off         0             0
switch>
```

- This command displays the speed type and duplex settings for management interfaces ***1-2***.

```
switch#show interfaces management 1-2 status
Port      Name             Status       Vlan        Duplex  Speed Type
Ma1                        connected    routed      a-full a-100M 10/100/1000
```

```
Ma2                          connected    routed      a-full   a-1G 10/100/1000
switch>
```

11.1.6.18 Ingress Counters

The Ingress counters enables the switch to count the ingress traffic on the Layer 3 ports of the switch.

Any ingress traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision. The VLAN counters are supported on DCS- 7050x, DCS-7250x, and DCS-7300x series switches and not supported on any routed ports.

11.1.6.18.1 Configuring Ingress Counters

The hardware counter feature in command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

Examples

- This command configures the ingress traffic count on the sub-interfaces. The **no** form of the command disables the counter configuration from the switch ports.

```
switch# hardware counter feature subinterface in
```

- This command configures the ingress traffic count on the VLAN interface. The **no** form of the command disables the counter configuration from the VLAN configured switch ports.

```
switch# hardware counter feature vlan-interface in
```

11.1.6.18.2 Displaying the Ingress Counter Information

The show interface counters command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface of the switch. The clear counters command resets the counters to ***0***.

Example

This command displays the ingress traffic count on a VLAN interface ***vl12***.

```
switch# show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
Vl12           3136          47           2
```

11.1.6.19 Configuring Ingress Traffic-Class Counters

Ingress traffic class counter support is enabled in order to display per traffic-class counters on ingress interfaces, and supported on routed-ports and subinterfaces. Both packet and octet counts are displayed.

Examples

- This command enables traffic-class counter support.

```
switch(config)# hardware counter feature traffic-class in
```

- This command enables TCAM profile tc-counters if this profile is configured.

```
switch(config)# hardware tcam profile tc-counters
```

11.1.6.20 Hardware Counter Support

Hardware counter support allows enabling counters for features using programmable hardware counter resources.

Hardware counter support can be used to count the following feature specific counters:

- Ingress VLAN-interface counters count the packets/octets ingressing through a VLAN interface.
- Egress VLAN-interface counters count the packets/octets egressing a VLAN interface.
- Ingress subinterface counters count the packets/octets ingressing through a subinterface.
- Egress subinterface counters count the packets/octets egressing a subinterface.
- VXLAN VNI counters count the packets/octets encapsulated/decapsulated per VNI.
- VXLAN VTEP counters count the packets/octets encapsulated/decapsulated per VTEP.
- Route counter for IPv4/IPv6 routes count the packets/octets routed using the route entry.
- Ingress GRE Tunnel Interface counters count the packets/octets ingressing through the GRE Tunnel Interface.
- Egress GRE Tunnel Interface counters count the packets/octets egressing through the GRE Tunnel Interface.

11.1.6.20.1 Hardware Counter Support Configuration

You can enable the Hardware Counter feature on a per-feature basis using the **`hardware counter feature`** command. The **`no hardware counter feature`** disables the feature. Multiple ingress and egress hardware counter features can work concurrently. Review MRU Enforcement Limitations for details.

Note: Enabling the hardware counter features may impact the transit traffic.

11.1.6.20.1.1 Ingress VLAN Interface Counters

The **`hardware counter feature vlan-interface in`** command enables the counting of ingress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the VLAN interface for every VLAN interface configured in the system.

Example

```
switch# [no]hardware counter feature vlan-interface in
```

11.1.6.20.1.2 Egress VLAN Interface Counters

The **`hardware counter feature vlan-interface out`** command enables the counting of egress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the VLAN interface for every VLAN interface configured in the system.

Example

```
switch# [no]hardware counter feature vlan-interface out
```

11.1.6.20.1.3 Ingress SubInterface Counters

The **`hardware counter feature subinterface in`** command enables the counting of ingress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the subinterface for every L3 subinterface configured in the system.

Example

```
switch# [no]hardware counter feature subinterface in
```

11.1.6.20.1.4 Egress SubInterface Counters

The **`hardware counter feature subinterface out`** command enables the counting of egress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the subinterface for every L3 subinterface configured in the system.

Example

```
switch# [no]hardware counter feature subinterface out
```

11.1.6.20.1.5 VXLAN VNI Encapsulation Counters

The **`hardware counter feature vni encap`** command enables the counting of per VNI encap counters. When enabled, the switch counts the number of packets and bytes egressing a VNI through VTI, encap BUM packets, and the number of encap packets dropped due to any reason.

Example

```
switch(config)# [no]hardware counter feature vni encap
```

11.1.6.20.1.6 VXLAN VNI Decapsulation Counters

The **`hardware counter feature vni decap`** command enables the per VNI decap counters. When enabled, the switch counts the number of packets/octets received from VTEP and decapsulated for each VNI.

Example

```
switch(config)# [no]hardware counter feature vni decap
```

11.1.6.20.1.7 Route Counters

The **`hardware counter feature route`** command configures the route counters for the specified IP version and ip-address/ip-prefix. When enabled, the switch counts the number of packets/bytes hitting a route. The VRF name is optional and default VRF is assumed if no VRF is specified.

Example

```
switch(config)# [no]hardware counter feature route[ipv4|ipv6]vrf
 <name>][ip-address|ip-address-prefix]
```

11.1.6.20.1.6 GRE Tunnel Interface Encapsulation Counters

The **hardware counter feature gre tunnel interface out** command enables GRE Tunnel Interface encap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting encapsulated on the Tunnel Interface.

Example

```
switch(config)# [no]hardware counter feature gre tunnel interface
 out
```

11.1.6.20.1.6 GRE Tunnel Interface Decapsulation Counters

The **hardware counter feature gre tunnel interface in** command enables GRE Tunnel Interface decap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting decapsulated on the Tunnel Interface.

Example

```
switch(config)# [no]hardware counter feature gre tunnel interface
 in
```

11.1.6.20.2 MRU Enforcement Show commands

The MRU on an interface is found in the show interface output.

```
switch(config)# show interface ethernet 1
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 444c.a8b7.1ed8 (bia 444c.a8b7.1ed8)
  Member of Port-Channel10
  Ethernet MTU 10178 bytes, Ethernet MRU 1500 bytes, BW 10000000 kbit
  Full-duplex, 10Gb/s, auto negotiation: off, uni-link: disabled.
```

Counter

MRU dropped packets are counted per-chip.

The Ethernet interfaces corresponding chip are found in the **show platform fap mapping** output.

```
switch(config)# show platform fap mapping interface Ethernet 1
Jericho0 (FapId: 0  BaseSystemCoreId: 0)
Port            SysPhyPort   Voq   Core  FapPort  OtmPort BaseQPair QPairs Xlge NifPort
-------------------------------------------------------------------------------------
Ethernet1       100          2608  0     2        0       0         8     8     33
```

Reassembly Errors use per-chip counters from the show hardware counter drop output.

```
switch(config)# show hardware counter drop
Type  Chip       CounterName       : Count    : First Occurrence    : Last Occurrence
-------------------------------------------------------------------------------------
A     Jericho0   ReassemblyErrors  : 12132989 : 2020-09-22 17:05:45 : 2020-09-22 17:22:40
```

11.1.6.20.3 MRU Enforcement Limitations

- The number of features for which the hardware counters can be enabled simultaneously is limited by the availability of counter hardware resources in the system. When the configured hardware features exceed the available counter resources, not all counters for all features are available.
  - At lower scales of the feature key (for example, the number of interfaces in the case of subinterface/SVI counters), you can typically concurrently support up to six (6) ingress features and three (3) egress features. As scales grow beyond table sizes, single features use multiple tables.
- Route counters do not support the counting of host routes or ALPM routes.
- Packets sent from the CPU are not included in egress counters.

11.1.6.21 Configuring Power over Ethernet (PoE)

Power over Ethernet (PoE) is enabled by default on all Ethernet ports of PoE-capable switches, and the switch will detect IEEE-compliant Powered Devices (PDs) when they are plugged into a port and supply power appropriately.

Limitations

- Ethernet ports will not detect non IEEE-compliant devices by default, and may not be able to detect or power them even if configured to do so.
- If attached PDs overload the switch, it will power off. This can occur when an attached PD increases its power demand via LLDP, when too many PDs are connected to the switch, or when a power supply fails on a heavily loaded dual-supply switch.
- Power-cycling the switch will cause temporary loss of power to attached PDs.
- PoE is not available on management interfaces.

Disabling PoE on an Interface

On switches which support PoE, it is enabled by default on all Ethernet ports but can be disabled per-port with the poe disabled command.

Example

These commands disable PoE on Ethernet interface 5.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe disabled
switch(config-if-Et5)#
```

PoE Power Settings

When an IEEE-compliant powered device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its initial power needs are determined by hardware negotiation, after which further negotiation is managed through the Link Layer Discovery Protocol (LLDP). For details, see Configuring LLDP for Power over Ethernet.

PoE power output can be limited on a port using the poe limit command. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

Note: LLDP uses Power Via MDI type-length-value elements (TLVs) to allow the switch to dynamically negotiate power needs with PDs. LLDP will not include Power Via MDI TLVs for the interface if a power limit has been configured on it.

Examples

- These commands limit nominal PoE power output on Ethernet interface ***5*** to ***10*** W.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe limit 10 watts
switch(config-if-Et5)#
```

- These commands limit nominal PoE power output on Ethernet interface ***7*** to ***4*** W.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe limit class 1
switch(config-if-Et7)#
```

Detecting Legacy PDs

IEEE-compliant Powered Devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. By default, legacy PD detection is disabled, and legacy devices are not powered.

To configure an interface to use hardware detection for these non-compliant PoE devices and attempt to power them, use the poe legacy detect command.

Note: Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

Example

These commands configure ***interface ethernet 5*** to attempt to detect and power non-compliant PDs.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe legacy detect
switch(config-if-Et5)#
```

Displaying PoE Information

To display PoE information for a specific interface range or for all Ethernet interfaces, use the show poe command.

Example

This command displays PoE information for ***Ethernet interface 46***.

```
switch(config)# show poe interface ethernet 46
show poe interface ethernet 46
PSELLDPPowerGrantedPort
Port Enabled Enabled Limit  Power   State   Class  Power Current Voltage Temperature
---- ------- ------- ------ ------- ------- ------ ----- ------- ------- -----------
46      True    True 15.40W 15.40W  powered class0  1.40W 27.00mA 55.04V  41.25C
switch(config-if-Et7)#
```

11.1.6.22 Configuring Link Fault Signaling

As part of the Link Fault Signaling (LFS) configuration, a new configuration mode called the Ethernet Operations Administration and Management (EOAM) mode is introduced. The EOAM profile has a link-error sub-mode wherein the threshold, action, and the period is configured for both FCS and Symbol errors. The period can be in seconds or in number of frames. The default values are threshold ***0***, action

syslog, and period ***0*** seconds. If the errors exceed the threshold within the given period, the configured action is executed. The recovery time configures the recovery timeout value for link fault signaling. Only one EOAM profile is associated with a port.

The following steps enable configuring the LFS parameters:

1. Enable the EOAM mode.

```
switch(config)# monitor ethernet oam
```

2. Create an EOAM profile named as ***profile1***.

```
switch(config-eoam)# profile profile1
```

3. Enter the EOAM ***link-error sub-mode***.

```
switch(config-eoam-profile-profile1)# link-error
```

4. Enter the commands in the profile ***link-error submode*** to configure a specific LFS parameter.

```
switch(config-eoam-profile-profile1-link-error)# symbol action
 errdisable
switch(config-eoam-profile-profile1-link-error)# symbol period 300
 frames
switch(config-eoam-profile-profile1-link-error)# symbol threshold 20
switch(config-eoam-profile-profile1-link-error)# recovery-time 40
```

5. Apply the EOAM profile ***profile1*** to the Ethernet interface ***1/1***.

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# monitor ethernet oam profile profile1
```

11.1.6.23 Configuring Hardware TCAM

Ternary Content-Addressable Memory (TCAM) is a specialized type of high-speed memory that increase the speed of route look-up, packet classification, packet forwarding and access control list-based commands. The **`hardware tcam`** command is used to configure and place the switch in the TCAM mode. In this mode the user can configure few TCAM related commands such as feature, profile and system.

In the TCAM mode, use the feature command to configure the reservation of TCAM banks for the features like ACL, IPsec, flow-spec, l2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy. The profile command configures a new TCAM profile, or just copy the TCAM profile which is already created using the hardware tcam profile command such as default, mirroring-acl, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, vxlan-routing. Similarly, the system command configures the system-wide TCAM profiles.

Example

This command places the switch in Hardware TCAM configuration mode.

```
switch(config)# hardware tcam
switch(config-hw-tcam)#
```

These are the commands allowed to configure in Hardware TCAM mode.

Examples

- This command allow the switch to configure the TCAM feature.

```
switch(config)# hardware tcam
```

```
switch(config-hw-tcam)# feature
```

- This command allow the switch to configure TCAM profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile
```

- This command allow the switch to configure TCAM system profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# system
```

11.1.6.24 CPU Traffic Policy

Create a TCAM profile to enable actions such as permit, deny, and police in hardware before the traffic gets to the kernel for processing. The action is taken based on IP packet header information such as DSCP, L4 port values, fragmentation bits, etc.

TCAM Profile Example

The following file extract displays an example of a TCAM profile, **cpu-traffic-policy**, with features configured to enable CPU traffic policy.

```
hardware tcam
   profile cpu-traffic-policy
      feature acl port ip
         sequence 45
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops l4-
src-port src-ip tcp-control ttl
         action count drop
         packet ipv4 forwarding bridged
         packet ipv4 forwarding routed
         packet ipv4 forwarding routed multicast
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet ipv4 non-vxlan forwarding routed decap
         packet ipv4 vxlan eth ipv4 forwarding routed decap
         packet ipv4 vxlan forwarding bridged decap
      feature acl port ipv6
         sequence 25
         key field dst-ipv6 ipv6-next-header ipv6-traffic-class l4-dst-
port l4-ops-3b l4-src-port src-ipv6-high src-ipv6-low tcp-control
         action count drop mirror
         packet ipv6 forwarding bridged
         packet ipv6 forwarding routed
         packet ipv6 forwarding routed multicast
         packet ipv6 ipv6 forwarding routed decap
      feature acl subintf ip
         sequence 40
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops-18b
 l4-src-port src-ip tcp-control ttl
         action count drop mirror
         packet ipv4 forwarding routed
      feature acl subintf ipv6
         sequence 15
         key field dst-ipv6 ipv6-next-header l4-dst-port l4-src-port src-
ipv6-high src-ipv6-low tcp-control
         action count drop mirror redirect
         packet ipv6 forwarding routed
      feature counter lfib
```

```
         sequence 85
      feature mpls
         sequence 5
         key size limit 160
         action drop redirect set-ecn
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet mpls ipv4 forwarding mpls
         packet mpls ipv6 forwarding mpls
         packet mpls non-ip forwarding mpls
      feature mpls pop ingress
         sequence 90
      feature pbr mpls

```

Configuring the Policy

The following configures **cpu-traffic-policy** under the traffic-policies global configuration mode.

```
traffic-policies
  cpu traffic-policy <name> vrf <vrf-list>
  traffic-policy <name>
    match <rule-name> <ipv4 | ipv6> [ <after | before> <rule-name> ]

      source prefix       A.B.C.D/E [ A.B.C.D/E ]
      destination prefix  A.B.C.D/E [ A.B.C.D/E ]
      protocol <protocol-list> | {tcp,udp}
                          [ source port <port-list> |
```

```
                                        field-set <port-set-name> ] |
                          [ destination port <port-list> |
                                        field-set <port-set-name> ]
      actions
         drop
         police rate <rate> <unit>
         count
```

The following applies the policies to the VRFs. The policy is applied to all interfaces belonging to the VRF.

```
traffic-policies
  cpu traffic-policy <name> vrf all
```

Default Rules

The **ipv4-all-default** and **ipv6-all-default** are programmed by default and cannot be reordered, or removed. Only the associated action can be changed. The **permit** rule is never installed and is the default action for packet processing.

Examples

L3 Protocol Match Criteria (protocol neighbors bgp)

The following displays the configuration of a profile to match on a set of configured protocol peers which allows only TCP traffic from those BGP peers.

```
traffic-policies
  cpu traffic-policy <name> vrf <vrf-list>
  traffic-policy <name>
    match <rule-name> <ipv4 | ipv6> [ <after | before> <rule-name> ]

      source prefix       A.B.C.D/E [ A.B.C.D/E ]
      destination prefix  A.B.C.D/E [ A.B.C.D/E ]
      protocol <protocol-list> | {tcp,udp}
                          [ source port <port-list> |
                                        field-set <port-set-name> ] |
                          [ destination port <port-list> |
                                        field-set <port-set-name> ]
      actions
         drop
         police rate <rate> <unit>
         count

traffic-policies
  cpu traffic-policy <traffic-policy-name> vrf all
    match <rule-name> <ipv4 | ipv6> [ <after | before> <rule-name> ]

      protocol neighbors bgp
      actions
         drop

traffic-policies
   cpu traffic-policy foo vrf all
      traffic-policy foo
         match BGP ipv4
            protocol neighbors bgp
```

The following policy permits dynamic peers from the listen-range ***2.0.0.0/24*** and all IPv6 BGP LL peers.

```
traffic-policies
```

```
   traffic-policy cpuPolicy
      match BGP ipv4
         protocol neighbors bgp
      match BGP-DYN ipv4
         source prefix 2.0.0.0/24
      match BGP-LL ipv6
         source prefix fe80::/64
```

Note: Configuring any match criteria will result in a CLI error when combined with the **`protocol neighbor bgp`** match criteria as these conflict with the expanded BGP rules.

The following displays error messages with conflicting configurations.

```
traffic-policies
   traffic-policy cpuPolicy
      match BGP ipv4
         protocol neighbors bgp
         source prefix 1.0.0.1/32
! The 'source prefix' subcommand is not supported when the 'protocol
 neighbors' subcommand is configured.

traffic-policies
   traffic-policy cpuPolicy
      match BGP ipv4
         source prefix 1.0.0.1/32
         protocol neighbors bgp
! The 'protocol neighbors' subcommand is not supported when any other
 match subcommands are configured.
```

Deny other BGP Traffic

The following displays a policy to whitelist some BGP sessions and other management IPs or IP protocol. The policy is inadequate as attempts to create BGP sessions from ***1.0.0.0/24*** (for example) will pass through this policy unfiltered.

```
traffic-policies
   cpu traffic-policy CPU vrf all
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
      match BFD ipv4
         source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

The following displays a policy to whitelist some BGP sessions and other management IPs or IP protocol. The policy is effective and easier to implement for administrators.

```
traffic-policies
   cpu traffic-policy CPU
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
      match BGP-REST ipv4
         protocol tcp udp destination port 179
         actions
            drop
      match BFD ipv4
```

```
         source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

The following displays a policy to whitelist some BGP sessions and other management IPs or IP protocol. The policy is effective and easier to implement for administrators. The clause matches on any inbound traffic destined for the configured BGP port(s).

```
traffic-policies
   cpu traffic-policy CPU
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
      match BGP-REST ipv4
         protocol bgp
         actions
            drop
      match BFD ipv4
         source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

Actions

Drop: packet is discarded on a match

Police: tracks the usage for each BGP neighbor, and holds it to a maximum rate.

The **`police rate <rate-value> [rate-unit]`** command sets the policing rate. The optional **rate-unit** are bps, kbps (default), mbps, and gbps. The following configures a policing rate of 15 kbps for each BGP neighbor.

```
traffic-policies
   cpu traffic-policy CPU vrf all
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
         actions
            police rate 15 kbps
```

Count

The following enables counters for the CPU traffic policy to count all packets matching the rule in which the **count** action is configured.

```
no hardware counter feature acl out <address-family>

hardware counter feature traffic-policy cpu

traffic-policies
   cpu traffic-policy CPU vrf all
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
         actions
```

```
            count
```

Use-case Scenarios
Securing BGP Neighbors

The following implements a policy to secure BGP neighbors.

```
traffic-policies
   cpu traffic-policy CPU-DEFAULT vrf all
   traffic-policy CPU-DEFAULT
      match ICMPV6 ipv6
         protocol icmpv6
      match BGP ipv4
         protocol neighbors bgp
      match BGP-OTHER ipv4
         protocol bgp
         actions
            drop
      match BGP6 ipv6
         protocol neighbors bgp
      match BGP-OTHER6 ipv6
         protocol bgp
         actions
            drop
      match OSPF ipv4
         protocol ospf
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

Whitelist BFD Neighbors (not neighbor-specific)

Add the following rule to Whitelist BFD Neighbors.

```
traffic-policies
   traffic-policy CPU-DEFAULT
      match BFD-DPORT ipv4
         protocol udp destination port 3784-3785
      match BFD-SPORT ipv4
         protocol udp source port 49152
      match BFD-DPORT6 ipv6
         protocol udp destination port 3784-3785
      match BFD-SPORT6 ipv6
         protocol udp source port 49152
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

Whitelist a few Common Control-plane Protocols and Deny others

Add the following rule to Whitelist protocols such as ICMPv6 while denying others.

```
traffic-policies
   cpu traffic-policy CPU-DEFAULT vrf all
   traffic-policy CPU-DEFAULT
      match ICMPV6 ipv6
         protocol icmpv6
```

```
      match BGP ipv4
         protocol neighbors bgp
      match BGP-OTHER ipv4
         protocol bgp
         actions
            drop
      match BGP6 ipv6
         protocol neighbors bgp
      match BGP-OTHER6 ipv6
         protocol bgp
         actions
            drop
      match OSPF ipv4
         protocol ospf
      match PIM4 ipv4
         protocol pim
      match PIM6 ipv6
         protocol pim
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

11.1.6.25 TCAM Profile for Configurable Port Qualifier Sizing

A TCAM profile can be created from scratch, or the feature can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

Modifying a Default TCAM Profile to allow Dynamic Sizing for ACL Labels

The following commands create a copy of the default TCAM profile, name it **port-qualifier-size**, and configure it to support a 6-bit dynamic sizing for ACL labels for IPKGV. Once the profile has been created, it can be applied to the system.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile port-qualifier-size copy default
switch(config-hw-tcam-profile-port-qualifier-size)# feature port-qualifie
r-size ip copy
system-feature-source-profile
switch(config-hw-tcam-profile-port-qualifier-size-feature-port-qualifier-
size)# port-qualifier-size 6
switch(config-hw-tcam-profile-port-qualifier-size-feature-port-qualifier-
size)# exit
switch(config-hw-tcam-profile-port-qualifier-size)# feature acl port ip
switch(config-hw-tcam-profile-port-qualifier-size)# exit
switch(config-hw-tcam)# exit
switch(config)#
```

Verifying the Configuration of Dynamic Qualifier Size

The following command verifies the configuration.

```
switch# show running-config
hardware tcam
   profile port-qualifier-size
      feature acl port ip
         port qualifier size 6 bits
```

Verifying the Configuration of System Profile

The following command verifies the system profile was configured and applied successfully. The profile name appears in both the Configuration and Status columns.

```
switch# show harware tcam profile
              Configuration               Status
Linecard1     port-qualifier-size         port-qualifier-size
Linecard2     port-qualifier-size         port-qualifier-size
Linecard3     port-qualifier-size         port-qualifier-size
```

When the profile does not get applied correctly, the Status column shows Error.

```
switch#show harware tcam profile
               Configuration              Status
Linecard1      port-qualifier-size        ERROR
Linecard2      port-qualifier-size        ERROR
Linecard3      port-qualifier-size        ERROR
```

Note: The packet type, the key field must be set. The dynamic qualifier size can be set for ACL. Not all hardware platforms support this feature. Modular systems require all linecards to support this feature for the profile to be applicable.

11.1.7 Ethernet Configuration Commands

Global Configuration Commands

- clear counters
- clear vxlan counters
- hardware port-group
- hardware counter feature
- hardware counter feature in (DCS-7050x, 7350x, 7300x)
- hardware tcam
- interface ethernet
- interface ethernet create
- interface management
- monitor ethernet oam
- transceiver channel
- transceiver qsfp default-mode

Hardware TCAM Commands

- feature
- system

Interface Configuration Commands Ethernet and Management Interfaces

- flowcontrol receive
- flowcontrol send
- link-debounce
- mac-address
- poe disabled
- poe legacy detect
- poe limit
- power budget
- power budget exceed action (warning | hold-down)
- speed

EOAM Configuration Commands

- link-error
- monitor ethernet oam profile
- profile

Link-error Configuration Commands

- action
- period
- phy link detection aggressive
- recovery-time
- threshold

Interface Display Commands

- show hardware counter
- show hardware port-group

- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates
- show interfaces flow-control
- show interfaces hardware
- show interfaces hardware default
- show interfaces interactions
- show interfaces negotiation
- show interfaces phy
- show interfaces status
- show interfaces status errdisabled
- show interfaces transceiver
- show interfaces transceiver channels
- show interfaces transceiver hardware
- show interfaces transceiver properties
- show monitor ethernet oam profile
- show platform fm6000 agileport map
- show platform trident flexcounters
- show platform trident flexcounters l3intf
- show poe
- show route counters
- show vxlan counters vni

400GBASE-ZR Transceivers Display Commands

- show interface transceiver dom
- show interface transceiver eeprom
- show transceiver status interface

Shared Support across Multiple Subinterfaces Commands

- qos scheduling
- show qos scheduling

11.1.7.1 action

The **action** command configures the link monitoring action that is specified for the link fault signaling event.

The **no action** command removes the action type specified for the chosen link fault signaling. The **default action** command configures the link monitoring action as system log type.

Command Mode

Link-error Configuration

Command Syntax

{fcs | symbol} **action** [linkfault | errdisable | log]

no {fcs | symbol} **action** [linkfault | errdisable | log]

default {fcs | symbol} **action** [linkfault | errdisable | log]

Parameters

- **fcs** Inbound packets with frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **linkfault** The link fault action type.
- **errdisable** The errdisable action type.
- **log** The system log action type.

Related Commands

- period
- threshold

Example

These commands set the errdisable action type for the profile ***profile1*** in the Link-error configuration mode for symbol error.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)# symbol action errdisable
```

11.1.7.2 clear counters

The **`clear counters`** command in ***privileged EXEC*** mode resets the counters to zero for the specified interfaces including VLAN interfaces, Sub-Interfaces, and GRE Tunnel Interfaces.

Command Mode

Privileged EXEC

Command Syntax

`clear counters` [vlan ***vlanId*** | Tunnel ***tunnelID***][[route][ipv4 | ipv6][vrf]]

Parameters

- **vlan *vlanId*** Clears the VLAN Interface and subinterface Ingress and Egress counters.
- **Tunnel *tunnelID*** Allows the command to be used for clearing counters only for the specified VLAN interface.
- **route** Clears the route counters.
  - **ipv4** Allows targeting the clearing of IPv4 route counters.
  - **ipv6** Allows targeting the clearing of IPv6 route counters.
- **vrf** Allows specifying the VRF to only clear the route counters for the VRF.

Examples

- Clears the VLAN Interface and subinterface ingress and egress counters.

```
switch# clear counters[vlan vlanId]
```

- Clears the GRE Tunnel Interface Ingress and Egress counters.

```
switch# clear counters[tunnel TunnelId]
```

11.1.7.3 clear vxlan counters

Use the **clear vxlan counters** command to clear the VXLAN encap and decap counters.

Command Mode

EXEC

Command Syntax

clear vxlan counters [[vni | [vtep [vtep-ip-address | unlearnt]]]

Parameters

- **vni** Clears the VXLAN counters.
- **vtep** Clears the VTEP counters.
  - **vtep-ip-address** Clears the counters for the specified VTEP.
  - **unlearnt** Clears the counters for unlearned VTEPs. Unlearned VTEPs track the counts of packets received by the switch before the VTEP is learned.

11.1.7.4 feature

The **feature** command allows the user to reserve the number of TCAM banks for the following features such as ACL, flow-spec, IPsec, l2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy.

The **exit** command returns the switch to global configuration mode.

Command Mode

Hardware TCAM

Command Syntax

feature

Example

This commands allows the switch to configure the TCAM flow-spec feature for IPv4 ports.

```
switch(config-hw-tcam)# feature flow-spec port ipv4 bank maximum count 12
```

11.1.7.5 flowcontrol receive

The **flowcontrol receive** command configures administrative settings for inbound flowcontrol packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The flowcontrol receive command configures the configuration mode port's ability to receive flowcontrol pause frames.

- ***off***: port does not process pause frames that it receives.
- ***on***: port processes pause frames that it receives.
- ***desired***: port autonegotiates flow control; processes pause frames if the peer is set to send **desired**.

Desired is not an available parameter option. Ethernet data ports cannot be set to desired. Management ports are set to desired by default and with the **no flowcontrol receive** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. The table below lists the compatible flow control settings.

Table 61: Compatible Settings for Flow Control Negotiation – Local Port Receiving

local port	peer port
receive on	send on or send desired
receive off	send off or send desired
receive desired	send on , send off, or send desired

The **no flowcontrol receive** and **default flowcontrol receive** commands restore the default flowcontrol setting for the configuration mode interface by removing the corresponding **flowcontrol receive** command from **running-config**. The default setting is **off** for Ethernet data ports and desired for Management ports.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

flowcontrol receive STATE

no flowcontrol receive

default flowcontrol receive

Parameters

STATE flow control pause frame processing setting. Options include:

- **On**
- **Off**

Example

These commands set the flow control received on Ethernet interface ***5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# flowcontrol receive on
switch(config-if-Et5)#
```

11.1.7.6 flowcontrol send

The **flowcontrol send** command configures administrative settings for outbound flow control packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The **flowcontrol send** command configures the configuration mode port's ability to transmit flow control pause frames.

- **off**: port does not send pause frames.
- **on**: port sends pause frames.
- **desired**: port autonegotiates flow control; sends pause frames if the peer is set to **receive desired**.

Desired is not an available parameter option. Ethernet data ports cannot be set to **desired**. Management ports are set to **desired** by default and with the **no flowcontrol send** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. Compatible Settings for Flow Control Negotiation Local Port Transmitting lists the compatible flow control settings.

Table 62: Compatible Settings for Flow Control Negotiation Local Port Transmitting

local port	peer port
send on	receive on or receive desired
send off	receive off or receive desired
send desired	receive on , receive off, or receive desired

The **no flowcontrol send** and **default flowcontrol send** commands restore the default flow control setting for the configuration mode interface by removing the corresponding **flowcontrol send** command from ***running-config***. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

flowcontrol send STATE

no flowcontrol send

default flowcontrol send

Parameters

STATE Flow control send setting. Options include:

- **on**
- **off**

Example

These commands set the flow control sent on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# flowcontrol send on
switch(config-if-Et5)#
```

11.1.7.7 hardware counter feature

You can enable on a per feature basis the **hardware counter feature** command from the global configuration mode. The **no hardware counter feature** disables the feature. Multiple ingress and egress hardware counter features can work concurrently.

Command Mode

Global configuration mode

Command Syntax

hardware counter feature [[vlan-interface | subinterface] [in | out]][vni [encap | decap]][[route [ipv4 | ipv6][vrf ***name***][ip-address | ip-address-prefix]][[gre tunnel interface][in | out]]

no hardware counter feature [[vlan-interface | subinterface] [in | out]][vni [encap | decap]] [[route [ipv4 | ipv6][vrf *name*][ip-address | ip-address-prefix]][[gre tunnel interface][in | out]]

Parameters

- **vlan-interface** Enables VLAN interface counters
  - **in** Enables the counting of ingress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets ingressing through the VLAN interface for every VLAN interface configured in the system.
  - **out** Enables the counting of egress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets egressing the vlan interface for every vlan interface configured in the system.
- **subinterface** Enables the counting subinterface counters.
  - **in** Enables the counting of ingress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets ingressing through the subinterface for every L3 subinterface configured in the system.
  - **out** Enables the counting of egress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets egressing the subinterface for every L3 subinterface configured in the system.
- **vni** Enables the counting of per VNI counters.
  - **encap** Enables the per encap counters. When enabled, the switch counts the number of packets/octets coming from the edge, encapsulated on the device and directed towards the core.
  - **decap** Enables the per VTEP decap counters. When enabled, the switch counts the number of packets/octets coming from the core, decapsulated on the device and heading towards the edge per each VTEP.
- **route** Configures the route counters for the specified ip version and ip-address/ip-prefix. When enabled, the switch counts the number of packets/bytes hitting a route.
  - **ipv4** Identifies the IPv4 route.
  - **ipv6** Identifies the IPv6 route.
- **vrf *name*** The VRF name is optional and default VRF is assumed if no VRF is specified.
- **ip-address** Specifies the target IP address.
- **ip-address-prefix** Specifies the target IP address prefix.
- **gre tunnel interface** Enables GRE tunnel interface counters.
  - **in** Enables GRE tunnel interface decap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting decapsulated on the tunnel interface.
  - **out** Enables GRE Tunnel Interface encap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting encapsulated on the Tunnel Interface.

Examples

```
switch# hardware counters feature vlan-interface in
```

```
switch# hardware counter feature vlan-interface out
```

```
switch# hardware counter feature subinterface in
```

```
switch# hardware counter feature subinterface out
```

```
switch(config)# hardware counter feature vni encap
```

```
switch(config)# hardware counter feature vni decap
```

```
switch(config)# hardware counter feature vtep encap
```

```
switch(config)# hardware counter feature vtep decap
```

```
switch(config)# hardware counter feature gre tunnel interface in
```

```
switch(config)# hardware counter feature gre tunnel interface out
```

11.1.7.8 hardware counter feature in (DCS-7050x, 7350x, 7300x)

The **hardware counter feature** command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

The **no hardware counter feature in** command disable the counter configuration from the switch ports. By default the ingress counter is disabled on the switch.

Command Mode

Global Configuration

Command Syntax

hardware counter feature [**INTERFACE**]in

no hardware counter feature [**INTERFACE**]in

Parameters

INTERFACE Layer 3 interface on the switch.

- **subinterface** Displays the subinterface traffic count.
- **vlan-interface** Displays the VLAN-interface traffic count.

Examples

- This command configures the ingress traffic count on the sub-interfaces.

```
switch# hardware counter feature subinterface in
```

- This command configures the ingress traffic count on the VLAN interface.

```
switch# hardware counter feature vlan-interface in
```

- These commands enable the QSFP+ interface in port *group 1* and SFP+ interfaces in port ***group 2*** on a DCS-7050Q-16 switch, display the port group status, and display interface status.

```
switch(config)# hardware port-group 1 select Et15/1-4
switch(config)# hardware port-group 2 select Et21-24
switch(config)# show hardware port-group

Portgroup: 1    Active Ports: Et17-20

switch(config)#
```

11.1.7.9 hardware port-group

The **`hardware port-group`** command configures a port group to activate a 40GBASE (QSFP+) interface or four 10GBASE (SFP+) interfaces, affecting QSFP+ and SFP+ availability.

The **`no hardware port-group`** and **`default hardware port-group`** commands restore a port groups default setting by removing the corresponding **`hardware port-group`** command from ***running-config***. The QSFP+ interface is active by default in each port group.

The **`hardware port-group`** command is available on DCS-7050Q-16 and DCS-7050QX-32S switches, and has different parameters on each platform.

Command Mode

Global Configuration

Command Syntax

`hardware port-group` ***group_number*** **`select`** **PORT_LIST**

`no hardware port-group` ***group_number*** **`select`** **PORT_LIST**

`default hardware port-group` ***group_number*** **`select`** **PORT_LIST**

Parameters

- ***group_number*** Label of the port group. Valid options are ***1*** and ***2*** on the 7050Q-16; only ***1*** is available on the 7050QX-32S.
- **PORT_LIST** Ports activated by command. Options vary by platform and depend on ***group_number*** value.
  - DCS-7050Q-16
    - ***Et15/1-4*** activates QSFP+ port on port ***group 1***. Available when ***group_number*** is ***1***.
    - ***Et16/1-4*** activates QSFP+ port on port ***group 2***. Available when ***group_number*** is ***2***.
    - ***Et17-20*** activates SFP+ ports on port ***group 1***. Available when ***group_number*** is ***1***.
    - ***Et21-23*** activates SFP+ ports on port ***group 2***. Available when ***group_number*** is ***2***.
  - DCS-7050QX-32S
    - ***Et1-4*** activates SFP+ ports on port ***group 1***. Available when *group_number* is ***1***.
    - ***Et5/1-4*** activates QSFP+ port on port ***group 1***. Available when ***group_number*** is ***1***.

11.1.7.10 hardware tcam

The **hardware tcam** command places the switch in Hardware TCAM configuration mode.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

hardware tcam

Related Commands

- profile
- interface ethernet

Example

This command places the switch in Hardware TCAM configuration mode.

```
switch(config)# hardware tcam
switch(config-hw-tcam)#
```

11.1.7.11 interface ethernet create

The **`interface ethernet create`** command is used to configure a range of Ethernet subinterfaces. The command places the switch in Ethernet-interface configuration mode for the specified range of subinterfaces.

Command Mode

Global Configuration

Command Syntax

`interface ethernet create` ***sub_range***

Parameters

sub_range Range of subinterfaces to be configured. Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface.

Example

This command enters interface configuration mode for Ethernet subinterfaces ***1/1.1-100***:

```
switch(config)# interface ethernet create 1/1.100
switch(config-if-Et1/1.1-100)#
```

11.1.7.12 interface ethernet

The **`interface ethernet`** command places the switch in Ethernet-interface configuration mode for the specified interfaces. The command can specify a single interface or multiple interfaces.

Ethernet interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- **description**
- **exit**
- **load-interval**
- **mtu**
- **shutdown** (Interfaces)

Ethernet management commands include:

- **flowcontrol**
- **mac-address**
- **speed**

Chapters describing supported protocols and other features list additional configuration commands available from Ethernet interface configuration mode.

Command Mode

Global Configuration

Command Syntax

`interface ethernet` ***e_range***

Parameters

e_range Ethernet interfaces (number, range, or comma-delimited list of numbers and ranges). Valid Ethernet numbers depend on the switchs available Ethernet interfaces.

Examples

- This command enters interface configuration mode for Ethernet interfaces ***1*** and ***2***:

```
switch(config)# interface ethernet 1-2
switch(config-if-Et1-2)#
```

- This command enters interface configuration mode for ***interface ethernet 1***:

```
switch(config)# interface ethernet 1
switch(config-if-Et1)#
```

11.1.7.13 interface management

The **`interface management`** command places the switch in management-interface configuration mode for the specified interfaces. The list can specify a single interface or multiple interfaces if the switch contains more than one management interface.

Management interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- **description**
- **exit**
- **load-interval**
- **mtu**
- **shutdown** (Interfaces)

Ethernet management commands include:

- **flowcontrol**
- **mac-address**
- **speed**

Chapters describing supported protocols and other features list additional configuration commands available from ***management-interface*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`interface management` ***m_range***

Parameter

m_range Management interfaces (number, range, or comma-delimited list of numbers and ranges).

Valid management numbers depend on the switchs available management interfaces. A value of ***0***, where available, configures the virtual management interface on a dual-supervisor modular switch. Management interface ***0*** accesses management port ***1*** on the active supervisor of a dual-supervisor modular switch.

Examples

- This command enters the ***interface configuration*** mode for management interfaces ***1*** and ***2***.

```
switch(config)# interface management 1-2
switch(config-if-Ma1-2)#
```

- This command enters the ***interface configuration*** mode for management interface ***1***:

```
switch(config)# interface management 1
switch(config-if-Ma1)#
```

11.1.7.14 link-debounce

The **link-debounce** command configures the link debounce time for the configuration mode interface. Link debounce time is the time that advertisements for new link states are delayed after the link state is established. By default, debounce time is set to zero, disabling link debounce.

Debounce times for link-up and link-down transitions can be independently configured.

- **Link-up debounce time:** the delay before an interface advertises link down to link up transitions.
- **Link-down debounce time:** the delay before an interface advertises link up to link down transitions.

The **no link-debounce** and **default link-debounce** commands restore the default debounce setting for the configuration mode interface by removing the corresponding **link-debounce** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

link-debounce time WAIT_TIME

no link-debounce time WAIT_TIME

default link-debounce time WAIT_TIME

Parameters

WAIT_TIME Link debounce period (milliseconds). All debounce values range from 0 (disabled) to 30000 (30 seconds). Options include:

- ***0*** - ***30000*** One debounce value assigned as both link up and link down.
- ***0*** - ***30000 0*** - ***30000*** Two debounce values: link up is first, link down is second.

Examples

- These commands set the link-up and link-down debounce period to ***10*** seconds on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# link-debounce time 10000
switch(config-if-Et5)#
```

- These commands set the link-up debounce to ***10*** seconds and the link-down debounce period to zero on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# link-debounce time 10000 0
switch(config-if-Et5)#
```

- These commands set the link-up debounce to ***0*** and the link-down debounce period to ***12.5*** seconds on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# link-debounce time 0 12500
switch(config-if-Et5)#
```

11.1.7.15 link-error

The **link-error** command places the Ethernet Operations, Administration, and Management (EOAM) profile in the EOAM link-error sub-mode.

The **no link-error** and **default link-error** commands exit from the EOAM link-error sub-mode.

Command Mode

EOAM Configuration

Command Syntax

link-error

no link-error

default link-error

Related Commands

- monitor ethernet oam profile
- show monitor ethernet oam profile

Example

These commands place the EOAM profile ***profile1*** in the ***link-error*** sub-mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)#
```

11.1.7.16 mac-address

The **mac-address** command assigns a MAC address to the configuration mode interface. An interfaces default MAC address is its burn-in address.

The **no mac-address** and **default mac-address** commands revert the interface to its default MAC address by removing the corresponding **mac-address** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

mac-address ***address***

no mac-address

default mac-address

Parameter

address MAC address assigned to the interface. Format is dotted hex notation (***H.H.H***). Disallowed addresses are ***0.0.0*** and ***FFFF.FFFF.FFFF***.

Example

This command assigns the MAC address of ***001c.2804.17e1*** to **interface ethernet 7**, then displays interface parameters, including the assigned address.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# mac-address 001c.2804.17e1
switch(config-if-Et7)# show interface ethernet 7
Ethernet3 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
  Description: b.e45
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 7.84 kbps (0.0% with framing), 10 packets/sec
  5 seconds output rate 270 kbps (0.0% with framing), 24 packets/sec
     1363799 packets input, 222736140 bytes
     Received 0 broadcasts, 290904 multicast
     0 runts, 0 giants
     0 input errors, 0 CRC, 0 alignment, 0 symbol
     0 PAUSE input
     2264927 packets output, 2348747214 bytes
     Sent 0 broadcasts, 28573 multicast
     0 output errors, 0 collisions
     0 late collision, 0 deferred
     0 PAUSE output
switch(config-if-Et7)#
```

11.1.7.17 monitor ethernet oam profile

The **monitor ethernet oam profile** command applies the EOAM profile to the specific interface in interface configuration mode.

The **no monitor ethernet oam profile** and **default monitor ethernet oam profile** commands remove the EOAM profile from the interface.

Command Mode

Interface Configuration

Command Syntax

monitor ethernet oam profile ***name***

no monitor ethernet oam profile

default monitor ethernet oam profile

Parameters

name The EOAM profile name. An EOAM profile cannot be named as summary.

Related Commands

- link-error
- show monitor ethernet oam profile

Example

These commands apply the EOAM profile ***profile1*** to the **interface ethernet 1/1**.

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# monitor ethernet oam profile profile1
```

11.1.7.18 monitor ethernet oam

The **monitor ethernet oam** command places the switch in the Ethernet Operations, Administration, and Management (EOAM) configuration mode.

The **no monitor ethernet oam** and **default monitor ethernet oam** commands exit from the EOAM configuration mode.

Command Mode

Global Configuration

Command Syntax

monitor ethernet oam

no monitor ethernet oam

default monitor ethernet oam

Example

This command places the switch in the ***EOAM*** configuration mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)#
```

11.1.7.19 period

The **period** command configures the link monitoring period that is specified for a link error in terms of number of frames or seconds.

The **no period** command removes the period type specified on the chosen link error. The **default period** command configures the link monitoring period as zero seconds.

Command Mode

Link-error Configuration

Command Syntax

{fcs | symbol} **period** num {***seconds*** | ***frames***}

no {fcs | symbol} **period** num {***seconds*** | ***frames***}

default {fcs | symbol} **period** num {***seconds*** | ***frames***}

Parameters

- **fcs** Inbound packets with Frame Check Sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **num** The link monitoring period in frames or seconds. The frames value ranges from ***1*** to ***4000000000***. The seconds value ranges from ***2*** to ***200*** seconds. The default value is ***2*** seconds.
  - ***seconds*** The monitor errors per num seconds.
  - ***frames*** The monitor errors per num frames.

Related Commands

- action
- threshold

Example

These commands set the frames period type for the profile ***profile1*** in the Link-error configuration mode for ***300*** frames.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)# symbol period 300 frames
```

11.1.7.20 phy link detection aggressive

The **phy link detection aggressive** command allows configuration of interfaces for aggressive link-up declaration (~***50*** ms) on those interfaces. **no/default phy link detection aggressive** configuration reverts to a more reliable link-up with at least a two-second delay. When the aggressive mode is not supported, the system generates an advisory message.

Command Mode

Global Configuration

Command Syntax

phy link detection aggressive

no phy link detection aggressive

default phy link detection aggressive

Examples

- This command configures aggressive link detection.

```
switch(config-if-Et1)# phy link detection aggressive
switch(config-if-Et1)#
```

- This command configures aggressive link detection but fails on a platform that does not support the feature.

```
switch(config-if-Et1)# phy link detection aggressive
detection     detection not supported on this hardware platform
switch(config-if-Et1)#
```

11.1.7.21 poe disabled

Power over Ethernet (PoE) is enabled on all Ethernet ports by default on switches that support PoE. The **poe disabled** command disables PoE on the configuration-mode interface.

The **no poe disabled** and **default poe disabled** commands restore PoE on the interface by removing the corresponding **poe disabled** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

poe disabled

no poe disabled

default poe disabled

Example

These commands disable PoE on ***interface ethernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe disabled
switch(config-if-Et7)#
```

11.1.7.22 poe legacy detect

IEEE-compliant Powered Devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. The **poe legacy detect** command causes the configuration-mode interface to attempt to use hardware detection for these non-compliant PoE devices and power them. By default, legacy PD detection is disabled, and legacy devices are not powered.

Note: Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

The **no poe legacy detect** and **default poe legacy detect** commands restore the default behavior by removing the corresponding **poe legacy detect** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

poe legacy detect

no poe legacy detect

default poe legacy detect

Example

These commands configure ***interface ethernet 7*** to attempt to detect and power capacitive PDs.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe legacy detect
switch(config-if-Et7)#
```

11.1.7.23 poe limit

Power over Ethernet (PoE) power output is limited by the hardware-negotiated power level and by the total power capacity of the switch. The **`poe limit`** command sets an additional maximum power output for the configuration-mode interface. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

Note: If a power limit is set by this command, Power Via MDI TLVs will not be sent from the interface. See Configuring LLDP for Power over Ethernet for details.

The **`no poe limit`** and **`default poe limit`** commands restore the default power limitation by removing the corresponding **`poe limit`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`poe limit` **{*class class_num* | *watt_num watts*}**

`no poe limit`

`default poe limit`

Parameters

- ***class_num*** Specifies the power output limit by power class. Values range from 0-6 as follows:
  - Class 0 = 15.4 W
  - Class 1 = 4 W
  - Class 2 = 7 W
  - Class 3 = 15.4 W
  - Class 4 = 30 W
  - Class 5 = 45 W
  - Class 6 = 60 W
- ***watt_num*** Specifies the power output limit in watts. Values range from ***0-60***. A value of ***0*** watts prevents the port from providing PoE power.

Examples

- These commands limit nominal PoE power output on ***interface ethernet 7*** to ***10 W***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe limit 10 watts
switch(config-if-Et7)#
```

- These commands limit nominal PoE power output on ***interface ethernet 7*** to ***4 W***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe limit class 1
switch(config-if-Et7)#
```

11.1.7.24 power budget

Power over Ethernet (PoE) budget is not set on all Ethernet ports by default on switches that support PoE. The **power budget [n] watts** command sets a limit of 'n' watts available for use by the ports on the switch. Otherwise, available power for PoE is limited to the sum of all power provided by the PSUs minus the power reserved for the chassis.

The **no power budget** restores the default state.

Command Mode

Interface-Ethernet Configuration

Command Syntax

power budget [n] watts

no power budget

Example

The following command sets the PoE power budget to ***600W***.

```
switch(config)# power budget 600 watts
```

11.1.7.25 power budget exceed action (warning | hold-down)

When the Power over Ethernet (PoE) ports exceeds the budgeted amount, the switch issues a warning and continues to provide additional power above the budgeted limit. The **power budget exceed action hold-down** command causes the switch to issue a warning and limit the power to the configured limit.

The **no power budget** restores the default state.

Command Mode

Interface-Ethernet Configuration

Command Syntax

power budget exceed action hold-down

no power budget

Example

The following commands set the PoE power budget to ***600W*** and configure the switch to not exceed the limit.

```
switch(config)# power budget 600 watts
switch(config)# power budget exceed action hold-down
```

11.1.7.26 profile

The **profile** command creates an Ethernet Operations, Administration, and Management (EOAM) profile in the EOAM configuration mode.

The **no profile** and **default profile** commands exit from the EOAM configuration mode.

Command Mode

EOAM Configuration

Command Syntax

profile ***profile_name***

no profile ***profile_name***

default profile ***profile_name***

Parameter

profile_name The profile name that is specified.

Related Commands

- monitor ethernet oam profile
- show monitor ethernet oam profile

Guidelines

Run the **shutdown** or **no shutdown** command to bring the port back to the normal state.

Example

These commands create an EOAM profile ***profile1*** in the ***EOAM*** configuration mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)#
```

11.1.7.27 qos scheduling

The **qos scheduling** command places the switch in the QoS scheduling mode under which the scheduling groups and scheduling policies are configured for shared shaper across multiple subinterfaces.

The **no qos scheduling** command removes the QoS scheduling configuration from the **running-config**.

Command Mode

QoS Scheduling Mode

Command Syntax

qos scheduling

no qos scheduling

Example

These commands create a scheduling policy with the desired shape rate and optional guaranteed bandwidth:

```
switch(config)# qos scheduling
switch(config-qos-scheduling)# scheduling policy P1
switch(config-qos-scheduling-policy-P1)# shape rate 75000000
switch(config-qos-scheduling-policy-P1)# bandwidth guaranteed 10000000
```

11.1.7.28 recovery-time

The **recovery-time** command configures the recovery timeout value for link fault signaling.

The **no recovery-time** command and the **default recovery-time** command removes the recovery timeout value specified for the chosen link error.

Command Mode

Link-error Configuration

Command Syntax

recovery-time ***value***

no recovery-time ***value***

default recovery-time ***value***

Parameters

value Specifies the recovery timeout value for LFS. The value ranges from ***20*** to ***200***.

Related Commands

- action
- period
- threshold

Example

These commands set the recovery time value of ***40*** for the ***profile profile1*** in the Link-error configuration mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)# recovery-time 40
```

11.1.7.29 show hardware counter

The **show hardware counter** command displays counter events across time intervals.

Command Mode

EXEC

Command Syntax

show hardware counter

Example

This command displays counter events across all time intervals, which are currently more than one standard deviation apart from a given time interval.

```
switch(config-handler-eventHandler1-counters)# show hardware counter events
-------------------------------------------------------------------------------------------
Interval | Event Name  | Chip | First  | Last  | Count | Z-Score
 |  | Name | Occurrence  | Occurrence  |  |
-------------------------------------------------------------------------------------------
5 Min  | MacCounters |  All | 2017-01-31 09:31:35 | 2017-01-31 09:44:32 |  5 | -6.9430
10 Min | MacCounters |  All | 2017-01-31 09:39:43 | 2017-01-31 09:44:32 |  3 | -4.8123
-------------------------------------------------------------------------------------------
switch(config-handler-eventHandler1-counters)#
```

11.1.7.30 show hardware port-group

The **show hardware port-group** command displays the status of DCS-7050Q-16 port-groups. Port groups contain one QSFP+ interface and a set of four SFP+ interfaces. In each port group, either the QSFP+ interface or the SFP+ interface set is enabled. The port groups are configured independent of each other.

- ***Port group 1*** contains ***interface 15*** (QSFP+) and ***interfaces 17-20*** (SFP+).
- ***Port group 2*** contains ***interface 16*** (QSFP+) and ***interfaces 21-24*** (SFP+).

Command Mode

EXEC

Command Syntax

show hardware port-group

Guidelines

The **hardware port-group** command is available on on DCS-7050Q-16 switches.

Example

This command displays the status of ports in the two port groups on a DCS-7050Q-16 switch.

```
switch# show hardware port-group

Portgroup: 1    Active Ports: Et15/1-4
Port            State
----------------------------------------
Ethernet17      ErrDisabled
Ethernet18      ErrDisabled
Ethernet19      ErrDisabled
Ethernet20      ErrDisabled
Ethernet15/1    Active
Ethernet15/2    Active
Ethernet15/3    Active
Ethernet15/4    Active

Portgroup: 2    Active Ports: Et16/1-4
Port            State
----------------------------------------
Ethernet16/1    Active
Ethernet16/2    Active
Ethernet16/3    Active
Ethernet16/4    Active
Ethernet21      ErrDisabled
Ethernet22      ErrDisabled
Ethernet23      ErrDisabled
Ethernet24      ErrDisabled
switch>
```

11.1.7.31 show interfaces counters bins

The **`show interfaces counters bins`** command displays packet counters, categorized by packet length, for the specified interfaces. Packet length counters that the command displays include:

- 64 bytes
- 65-127 bytes
- 128-255 bytes
- 256-511 bytes
- 512-1023 bytes
- 1024-1522 bytes
- larger than 1522 bytes

Command Mode

EXEC

Command Syntax

`show interfaces` **[INTERFACE]** **`counters bins`**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Related Commands

- show interfaces counters
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates

Example

This command displays packet counter results for ***interface ethernet 1*** and ***interface ethernet 2***.

```
switch#show interfaces ethernet 1-2 counters bins
Input
Port                64 Byte      65-127 Byte     128-255 Byte     256-511 Byte
--------------------------------------------------------------------------------
Et1                    2503         56681135          1045154          1029152
Et2                       8         50216275          1518179          1086297

Port          512-1023 Byte   1024-1522 Byte    1523-MAX Byte
------------------------------------------------------------
Et1                  625825         17157823          8246822
Et2                  631173         27059077          5755101
switch>
```

11.1.7.32 show interfaces counters errors

The **`show interfaces counters errors`** command displays the error counters for the specified interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` **[INTERFACE]** **`counters errors`**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Display Values

The table displays the following counters for each listed interface:

- **`FCS`**: Inbound packets with CRC error and proper size.
- **`Align`**: Inbound packets with improper size (undersized or oversized).
- **`Symbol`**: Inbound packets with symbol error and proper size.
- **`Rx`**: Total inbound error packets.
- **`Runts`**: Outbound packets that terminated early or dropped because of underflow.
- **`Giants`**: Outbound packets that overflowed the receiver and were dropped.
- **`Tx`**: Total outbound error packets.

Related Commands

- show interfaces counters
- show interfaces counters bins
- show interfaces counters queue
- show interfaces counters rates

Examples

This command displays the error packet counters on ***interface ethernet 1*** and ***interface ethernet 2***.

```
switch# show interfaces ethernet 1-2 counters errors
Port               FCS    Align    Symbol       Rx    Runts   Giants
 Tx
Et1                  0        0        0        0        0        0
  0
Et2                  0        0        0        0        0        0
  0
switch>
```

11.1.7.33 show interfaces counters queue

The **`show interfaces counters queue`** command displays the queue drop counters for the specified interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` **[INTERFACE]** **`counters queue`**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Related Commands

- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters rates

Example

This command displays the queue drop counters for ***interface ethernet 1*** and ***interface ethernet 2***.

```
switch# show interfaces ethernet 1-2 counters queue
Port                  InDrops
Et1                       180
Et2                       169
switch>
```

11.1.7.34 show interfaces counters rates

The **show interfaces counters rates** command displays the received and transmitted packet rate counters for the specified interfaces. Counter rates provided include megabits per second (Mbps), kilopackets per second (Kpps) and utilization percentage.

All port rates are approximately calculated. Note that, when displaying the rate information of a port channel, the rate value of the port channel differs from the sum of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports except for port channels with single ports. The rate values of individual member ports are less inaccurate than the rate values of the port channel as a whole.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] counters rates

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Related Commands

- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue

Example

This command displays rate counters for ***interface ethernet 1*** and ***interface ethernet 2***.

```
switch# show interfaces ethernet 1-2 counters rates
Port         Intvl   In Mbps      %  In Kpps  Out Mbps      % Out Kpps
Et1           0:05      53.3   0.5%        5      31.2   0.3%         2
Et2           0:05      43.3   0.4%        4       0.1   0.0%         0
switch#
```

11.1.7.35 show interfaces counters

The **`show interface counters`** command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface. The clear counters command resets the counters to zero. Counters displayed by the command include:

- inbound bytes
- inbound unicast packets
- inbound multicast packets
- inbound broadcast packets
- outbound bytes
- outbound unicast packets
- outbound multicast packets
- outbound broadcast packets

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`counters`** [*incoming*]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** All interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **subinterface** Displays the subinterface traffic counts.
  - **vlan-interface** Displays the VLAN-interface traffic counts.
- ***incoming*** Displays the traffic count for the ingress port.

Note: When no interface is specified, the output starts with ingress and egress counters section for regular interfaces, followed by section for the ingress L3 Interface counters.

Related Commands

- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates

Examples

- This command displays byte and packet counters for ***interface ethernet 1*** and ***interface ethernet 2***

```
switch# show interfaces ethernet 1-2 counters
Port                InOctets     InUcastPkts     InMcastPkts     InBcastPkts
Et1               99002845169        79116358           75557            2275
Et2               81289180585        76278345           86422              11

Port               OutOctets    OutUcastPkts    OutMcastPkts    OutBcastPkts

Et2                4512762190         5791718          110498              15
switch>
```

- This command displays the ingress traffic count on a ***VLAN interface vl12***.

```
switch# show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
```

Vl12	3136	47	2

11.1.7.36 show interfaces flow-control

The **`show interfaces flow-control`** command displays administrative and operational flow control data for the specified interfaces. Administrative data is the parameter settings stored in ***running-config*** for the specified interface; the switch uses these settings to negotiate flow control with the peer switch. Operational data is the resolved flow control setting that controls the ports behavior.

Command Mode

EXEC

Command Syntax

`show` **[INTERFACE]** **`flow-control`**

Parameters

INTERFACE Interface type and number for which flow control data is displayed.

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interfaces in the specified range.
- **management *m_range*** Management interfaces in the specified range.

Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command shows the settings for Ethernet interfaces ***1-10***.

```
switch# show flow-control interface ethernet 1-10
Port       Send FlowControl  Receive FlowControl  RxPause       TxPause
           admin    oper     admin    oper
---------  -------- -------- -------- --------    -------------
 -------------
Et1        off      off      off      off         0             0
Et2        off      off      off      off         0             0
Et3        off      off      off      off         0             0
Et4        off      off      off      off         0             0
Et5        off      off      off      off         0             0
Et6        off      off      off      off         0             0
Et7        off      off      off      off         0             0
Et8        off      off      off      off         0             0
Et9        off      off      off      off         0             0
Et10       off      off      off      off         0             0
switch#
```

11.1.7.37 show interfaces hardware default

The **show interfaces hardware default** command displays the static interface capability information of the specified interfaces. This command displays information related to the speed, auto-negotiation, error correction, and modulation capabilities (when applicable) of a system's ports. The command also provides information displayed by the show interfaces hardware command, such as model number, interface type, duplex mode, and flow control settings of the specific interface. Compared to the show interfaces hardware command, this command accounts for the capabilities of the system architecture only, and does not consider the capabilities of a transceiver.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **hardware default**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command displays the static interface capability information at the default level.

```
switch> show interfaces hardware default
Ethernet1
  Model:     DCS-7020TR-48
  Type:      1000BASE-T
  Speed/Duplex: 100M/full,1G/full
  Flowcontrol:  rx-(off,on,desired),tx-(off)
  Autoneg CL28: 100M/full,1G/full
  Autoneg CL37: 1G/full
switch>
```

- This command displays the static interface capability information for ***interface ethernet 4/1/1***

```
switch> show interfaces ethernet 4/1/1 hardware default
Ethernet4/1/1
  Model:     7500R2AK-36CQ-LC
  Type:      40GBASE-CR4
  Speed/Duplex: 1G/full,10G/full,25G/full,40G/full,50G/full,100G/full
  Flowcontrol:  rx-(off,on,desired),tx-(off)
  Autoneg CL28: 1G/full,10G/full
  Autoneg CL73:
IEEE:           25G/full,40G/full,100G/full
Consortium: 25G/full,50G/full
  Error Correction:
Reed-Solomon: 25G,50G,100G
Fire-code:   25G,50G
```

11.1.7.38 show interfaces hardware

The **show interfaces hardware** command displays the model number, interface type, duplex mode, and flow control settings of the specified interfaces. The capabilities command is available on Ethernet and management interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] hardware

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the model number, interface type, duplex mode, and flow control settings for ***interface ethernet 2*** and ***interface ethernet 18***.

```
switch# show interfaces ethernet 2,18 hardware
Ethernet2
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-CR
  Speed/Duplex: 10G/full,40G/full,auto
  Flowcontrol:  rx-(off,on,desired),tx-(off,on,desired)
Ethernet18
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol:  rx-(off,on),tx-(off,on)
switch#
```

11.1.7.39 show interfaces interactions

The **show interfaces interactions** command aims to provide users a resource that explains various relationships between ethernet interfaces. It describes interactions in which a configuration on an interface causes another set of interfaces to become inactive or have reduced capabilities. Examples include a primary interface consuming subordinate interfaces to service a four-lane speed or platform restrictions that require four interfaces of a port to operate at the same speed.

Command Mode

EXEC

Command Syntax

show interfaces [***intf***] **interactions**

Parameters

intf Hardware Ethernet interface. You can restrict the output by interface name.

Examples

The information is displayed as a text dump. Each section of information appears on a separate indentation level. The first indent level is the interface, the second is the desired configuration, and the third is the list of interactions. For example, the output below describes the following:

1. If the user wants to configure ***Ethernet2/1*** for 40G, ***Ethernet2/2-4*** becomes inactive.
2. If the user wants to configure ***Ethernet2/1*** for 10G, it does not affect other interfaces.

```
switch# show interface et2/1 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet2/1:
  For speed 40G
    Ethernet2/2-4 become inactive
  For speed 10G*
    No interactions with other interfaces
```

The asterisk next to the 10G entry indicates that these same interactions apply for speeds lower than 10G that the interface supports. In other words, if this interface also supported 1G or 100M, the configuration does not affect other interfaces.

Types of Interactions

No Interactions

If there are no interactions for the given interfaces, the display shows **No interfaces interactions.** Depending on what configurations actually have interactions, the line could appear at a number of different indentation levels. The rules are:

1. If all specified interfaces have no interactions, print at the first indentation level.
2. If only some specified interfaces have no interactions and those interfaces have no interactions at any speeds, print at the second indentation level for those interfaces.
3. If only some specified interfaces have no interactions and those interfaces only have interactions at some speeds, print at the third indentation level for those speeds.

```
switch# show int et1,2 interactions
No interfaces interactions
switch# show int et1,2,5/1 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet1
  No interactions with other interfaces
```

```
Ethernet2
  No interactions with other interfaces
Ethernet5/1
  For speed 40G
    Ethernet5/2-4 become inactive
  For speed 10G*
    No interactions with other interfaces
```

Inactive Interfaces

If a configuration on an interface causes other interfaces to become inactive, a message similar to the ones bolded below appear. A common example of this is configuring a QSFP28 port for 100G, which results in the ***/2***,***/3***, and ***/4*** interfaces becoming inactive. Note that display information for inactive interfaces are included in the specified range, ignoring whether or not inactive interfaces are exposed.

```
switch#show interfaces et11/1,11/3 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet11/1:
  For speed 100G-4
    Ethernet11/2-4 become inactive
  For speed 50G-2
    Ethernet11/2,11/4 become inactive
    Ethernet11/3 is limited to 50G-2
  For speed 40G
    Ethernet11/2-4 become inactive
  For speed 25G
    Ethernet11/2-4 are limited to 25G
  For speed 10G*
    Ethernet11/2-4 are limited to 10G*
Ethernet11/3:
  For speed 50G-2
    Ethernet11/4 becomes inactive
    Primary interface Ethernet11/1 must be operating at 50G-2
  For speed 25G
    Primary interface Ethernet11/1 must be operating at 25G
  For speed 10G*
    Primary interface Ethernet11/1 must be operating at 10G*
```

Required Primary Interface Configuration

Some interface configurations require a particular primary interface configuration to function. These interactions are captured with messages similar to the ones bolded below.

```
switch#show interfaces et11/1,11/3 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet11/1:
  For speed 100G-4
    Ethernet11/2-4 become inactive
  For speed 50G-2
    Ethernet11/2,11/4 become inactive
    Ethernet11/3 is limited to 50G-2
  For speed 40G
    Ethernet11/2-4 become inactive
  For speed 25G
    Ethernet11/2-4 are limited to 25G
  For speed 10G*
    Ethernet11/2-4 are limited to 10G*
Ethernet11/3:
  For speed 50G-2
```

```
    Ethernet11/4 becomes inactive
    Primary interface Ethernet11/1 must be operating at 50G-2
  For speed 25G
    Primary interface Ethernet11/1 must be operating at 25G
  For speed 10G*
    Primary interface Ethernet11/1 must be operating at 10G*
```

Hardware Speed-Group Requirements

Some interface configurations require an additional speed-group configuration in order to operate correctly. If speed-group configurations are required, there will be a message displayed similar to the ones bolded below.

Note: A single speed-group may include more than one compatibility setting. Using the example below as reference, ***Ethernet1/1*** at 100G-4 and ***Ethernet2/1*** at 40G are compatible configurations as long as hardware speed-group 1 can include 50g and 10g rates simultaneously.

```
switch# show interfaces et1/1,2/1 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet1/1:
  For speed 100G-4
    Ethernet1/2-4 become inactive
    Hardware speed-group 1 must include 50g
  For speed 40G
    Ethernet1/2-4 become inactive
    Hardware speed-group 1 must include 10g
  For speed 25G
    Ethernet2/1,2/3 become inactive
    Ethernet1/3 is limited to 25G/10G
    Hardware speed-group 1 must include 25g
  For speed 10G
    Ethernet2/1,2/3 become inactive
    Ethernet1/3 is limited to 25G/10G
    Hardware speed-group 1 must include 10g
Ethernet2/1:
  For speed 100G-4
    Ethernet2/3 becomes inactive
    Ethernet1/1 must be operating at 100G-4/50G-2/40G
    Hardware speed-group 1 must include 50g
  For speed 40G
    Ethernet2/3 becomes inactive
    Ethernet1/1 must be operating at 100G-4/50G-2/40G
    Hardware speed-group 1 must include 10g
```

Compatible Parent Interface Configuration

The parent interface may be configured for any one of the list of compatible rates. Additionally, more than one interface may be required to be configured at a compatible rate. These interactions are captured with messages similar to the ones bolded below

Note: Using the example below as a reference, suppose that ***Ethernet1/1*** is configured for 100G-4 and that the goal is to configure ***Ethernet1/8*** to 50G-1. According to the display, ***Ethernet1/1*** is configured for a compatible rate. That said, in order for ***Ethernet1/1*** to operate at 100G-4, ***hardware speed-group 1*** must be configured to include the 25g compatibility setting. Additionally, hardware speed-group 1 must also include the 50g compatibility setting to

enable ***Ethernet1/8*** to operate at 50G-1. Interactions on ***Ethernet1/5*** and ***Ethernet1/7*** must be considered as well (omitted from the example for brevity).

```
switch# show interfaces et1/1,1/8 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet1/1:
  Ethernet1/1-4/8 share 18 interface hardware resources
  For speed 400G-8
    Ethernet1/2-8 become inactive
    Hardware speed-group 1 must include 50g
  For speed 200G-4
    Ethernet1/2-4 become inactive
    Hardware speed-group 1 must include 50g
  For speed 100G-2
    Ethernet1/2 becomes inactive
    Hardware speed-group 1 must include 50g
  For speed 100G-4
    Ethernet1/2-4 become inactive
    Hardware speed-group 1 must include 25g
  For speed 50G-1
    Hardware speed-group 1 must include 50g
  For speed 50G-2
    Ethernet1/2 becomes inactive
    Hardware speed-group 1 must include 25g
  For speed 40G
    Ethernet1/2-4 become inactive
    Hardware speed-group 1 must include 10g
  For speed 25G
    Hardware speed-group 1 must include 25g
  For speed 10G
    Hardware speed-group 1 must include 10g
Ethernet1/8:
  For speed 50G-1
    Ethernet1/1 must be operating at 200G-4/100G-2/100G-4/50G-1
/50G-2/40G/25G/10G
    Ethernet1/5 must be operating at 100G-2/50G-1/50G-2/25G/10G
    Ethernet1/7 must be operating at 50G-1/25G/10G
    Hardware speed-group 1 must include 50g
```

Speed-limited Interfaces

Some interface configurations limit at what other interfaces can operate. If such limitations occur, a message displays similar to the ones bolded below.

```
switch# show interfaces et11/1,11/3 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet11/1:
  For speed 100G-4
    Ethernet11/2-4 become inactive
  For speed 50G-2
    Ethernet11/2,11/4 become inactive
    Ethernet11/3 is limited to 50G-2
  For speed 40G
    Ethernet11/2-4 become inactive
  For speed 25G
    Ethernet11/2-4 are limited to 25G
  For speed 10G*
    Ethernet11/2-4 are limited to 10G*
Ethernet11/3:
  For speed 50G-2
```

```
    Ethernet11/4 becomes inactive
    Primary interface Ethernet11/1 must be operating at 50G-2
  For speed 25G
    Primary interface Ethernet11/1 must be operating at 25G
  For speed 10G*
    Primary interface Ethernet11/1 must be operating at 10G*
```

Interfaces Sharing Logical Ports

Some interface ranges share logical port resources. If an interface shares logical ports with other interfaces, a message displays similar to the ones bolded below.

Note: There must be logical ports available for an interface to become operational. Not all interfaces sharing logical ports can be operational simultaneously. Inactive interfaces do not consume a resource.

```
switch# show interfaces et1/1,4/1 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet1/1:
  Ethernet1/1-4/8 share 18 interface hardware resources
  For speed 400G-8
    ...
Ethernet4/1:
  Ethernet1/1-4/8 share 18 interface hardware resources
  For speed 400G-8
    ...
```

11.1.7.40 show interfaces negotiation

The **show interfaces negotiation** command displays the speed, duplex, and flow control auto-negotiation status for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **negotiation** [**INFO_LEVEL**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays status and negotiated setting of local ports.
  - **detail** Displays status and negotiated settings of local ports and their peers.

Examples

- This command displays the negotiated status of ***management 1*** and ***management 2*** interfaces.

```
switch# show interface management 1-2 negotiation
Port       Autoneg            Negotiated Settings
           Status   Speed     Duplex    Rx Pause  Tx Pause
---------  -------  --------  --------  --------  --------
Ma1        success  100M      full      off       off
Ma2        success  auto      auto      off       off
switch>
```

- This command displays the negotiated status of ***management 1*** interface and its peer interface.

```
switch# show interface management 1 negotiation detail
Management1 :

Auto-Negotiation Mode     10/100/1000 BASE-T (IEEE Clause 28)
Auto-Negotiation Status   Success

  Advertisements       Speed           Duplex     Pause
                       --------------- ---------- --------------------
      Local            10M/100M/1G     half/full  Disabled
      Link Partner     None            None       None

  Resolution           100Mb/s         full       Rx=off,Tx=off
switch>
```

11.1.7.41 show interfaces phy

The **`show interfaces phy`** command displays physical layer characteristics for the specified interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`phy`** [**INFO_LEVEL**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- ***ethernet e_range*** Ethernet interfaces in specified range.

  Valid ***e_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Command displays table that summarizes PHY data.
  - **detail** Command displays data block for each specified interface.

Examples

- This command summarizes PHY information for Ethernet interfaces ***1-5***.

```
switch# show interfaces ethernet 1-5 phy
Key:
   U    = Link up
   D    = Link down
   R    = RX Fault
   T    = TX Fault
   B    = High BER
   L    = No Block Lock
   A    = No XAUI Lane Alignment
   0123 = No XAUI lane sync in lane N

                                 State    Reset
Port           PHY state        Changes    Count PMA/PMD PCS   XAUI
-------------- --------------- -------- -------- ------- ----- --------
Ethernet1      linkUp             14518     1750 U..     U.... U.......

11.1.7.42 show interfaces status errdisabled

The **show interfaces status errdisabled** command displays interfaces that are in errdisabled state, including their link status and errdisable cause.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] status errdisabled

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the error-disabled ports.

```
switch# show interfaces status errdisabled

Port    Name           Status        Reason
------- -------------- ------------- ------------------
Et49/2                 errdisabled   multi-lane-intf
Et49/3                 errdisabled   multi-lane-intf
Et49/4                 errdisabled   multi-lane-intf
switch>
```

11.1.7.43 show interfaces status

The **show interfaces status** command displays the interface name, link status, vlan, duplex, speed, and type of the specified interfaces. When the command includes a link status, the results are filtered to display only interfaces whose link status match the specified type.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**]**status** [**STATUS_TYPE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All existing interfaces.
- **ethernet *e_range*** Ethernet interfaces in the specified range.
- **management *m_range*** Management interfaces in the specified range.
- **port-channel *p_range*** All existing port-channel interfaces in the specified range.

  Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **STATUS_TYP** Einterface status upon which the command filters output. Options include:
  - ***no parameter*** Command does not filter on interface status.
  - **connected** Interfaces connected to another port.
  - **notconnect** Unconnected interfaces that are capable of connecting to another port.
  - **disabled** Interfaces that have been powered down or disabled.
  - **sub-interfaces** L3 subinterfaces configured on the switch.

    Command may include multiple status types (**connected, notconnect, disabled**), which can be placed in any order.

Examples

- This command displays the status of Ethernet interfaces ***1-5***.

```
switch# show interfaces ethernet 1-5 status
Port      Name               Status       Vlan         Duplex  Speed Type
Et1                          connected    1              full    10G
 10GBASE-SRL
Et2                          connected    1              full    10G
 10GBASE-SRL
Et3                          connected    1              full    10G
 10GBASE-SRL
Et4                          connected    1              full    10G
 10GBASE-SRL
Et5                          notconnect   1              full    10G Not
 Present
switch>
```

- This command displays status information for all subinterfaces configured on the switch.

```
switch# show interfaces status sub-interfaces
Port       Name    Status       Vlan     Duplex Speed  Type
    Flags
Et1.1              connect       101      full   10G   dot1q-encapsu
lation
Et1.2              connect       102      full   10G   dot1q-encapsu
lation
```

```
Et1.3                connect       103      full   10G   dot1q-encapsu
lation
Et1.4                connect       103      full   10G   dot1q-encapsu
lation
switch>
```

11.1.7.44 show interface transceiver dom

The **show interface [<intf>] transceiver dom** command displays the most important current performance data on the media (line) side.

Example

```
switch# show interface Ethernet11/1 transceiver dom
Ch: Channel, N/A: not applicable, TX: transmit, RX: receive
mA: milliamperes, dBm: decibels (milliwatts), C: Celsius, V: Volts

Port 11
Last update: 0:00:05 ago
                                          Value
                                        ----------------
   Case temperature                        66.59 C
   Voltage                                  3.26 V
   TX power                               -10.23 dBm
   RX total power                         -11.61 dBm
   RX channel power                       -11.94 dBm
   Pre-FEC BER                           1.82e-03
   Post-FEC errored frames ratio         0.00e+00
   Chromatic dispersion (short link)        0.00 ps/nm
   Chromatic dispersion (long link)         0.00 ps/nm
   Differential group delay                 9.31 ps

   Laser frequency                     193100.00 GHz
```

- BER: Bit Error Rate
- FEC: Forward Error Correction
- OSNR: Optical Signal to Noise Ratio
- ESNR: Electrical Signal to Noise Ratio
- SOP: State of Polarization
- SOPMD: State of Polarization Mode Dispersion

11.1.7.45 show interface transceiver eeprom

The **show interface [<intf>] transceiver eeprom** command displays the parsed capabilities.

Example

For 400GBASE-ZR, parsing of frequency tuning, power tuning (page 04h) and VDM configuration pages (20h-23h) is added.

```
switch# show interface Ethernet15/1 transceiver eeprom
Ethernet15 EEPROM:
...

```

11.1.7.46 show interfaces transceiver channels

The **`show interfaces transceiver channels`** command displays current wavelength/frequency settings for the specified channels.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE e_range**] **`transceiver channels`**

Parameters

INTERFACE Interface type and port numbers.

- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.

Related Commands

- transceiver channel
- show interfaces transceiver hardware

Example

This command displays the supported wave lengths/frequencies and their corresponding channel numbers on ***Ethernet interface 4*** to ***slot 3*** through ***4***.

```
switch(config-as-if-Et4/1/3)#show interfaces ethernet 4/3/4 transceiver
channels
Name: Et4/3/4
100GHz- 50GHz-
Wavelength Frequency spacing spacing
(nm) (GHz) Channel Channel
---------- --------- ------- -------
1567.95 191,200 1 1
1567.54 191,250 2
1567.13 191,300 2 3
1566.72 191,350 4
....
1529.16 196,050 98
1528.77 196,100 50 99
1528.38 196,150 100
switch(config-as-if-Et4/1/3)#
```

11.1.7.47 show interfaces transceiver hardware

The **show interfaces transceiver hardware** command displays current wavelength/frequency settings for the specified transceiver interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] ethernet ***e_range*** **transceiver hardware**

Parameters

INTERFACE Interface type and port numbers.

- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.

Related Commands

- transceiver channel
- show interfaces transceiver channels

Example

This command displays the current wavelength/frequency settings on ***interface ethernet 4*** to ***slot 3*** through ***4***.

```
switch(config-as-if-Et4/1/3)# show interfaces ethernet 4 / 3 / 4
 transceiver hardware
Name: Et4/3/4
Media Type: 10GBASE-DWDM
Configured Channel : 39
Configured Grid (GHz) : 50
Computed Frequency (GHz) : 193,100
Computed Wavelength (nm) : 1552.52
Operational Channel : 39 (Default)
Operational Grid (GHz) : 50 (Default)
Operational Frequency (GHz): 193,100
Operational Wavelength (nm): 1552.52
switch(config-as-if-Et4/1/3)#
```

11.1.7.48 show interfaces transceiver properties

The **show interfaces transceiver properties** command displays configuration information for the specified interfaces. Information provided by the command includes the media type, interface speed-duplex settings, speed-duplex operating state.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **transceiver properties**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Related Commands

show interfaces transceiver

Example

This command displays the media type, speed, and duplex properties for Ethernet interfaces ***1-3***.

```
switch# show interfaces ethernet 1-3 transceiver properties
Name : Et1
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et2
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et3
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

switch>
```

11.1.7.49 show interfaces transceiver

The **`show interfaces transceiver`** command displays operational transceiver data for the specified interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`transceiver`** [**DATA_FORMAT**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range***, and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **DATA_FORMAT** format used to display the data. Options include:
  - ***no parameter*** table entries separated by tabs.
  - **csv** table entries separated by commas.

Related Commands

show interfaces transceiver properties

Example

This command displays transceiver data on ***interface ethernet 1*** through ***interface ethernet 4***.

```
switch# show interfaces ethernet 1-4 transceiver
If device is externally calibrated, only calibrated values are printed.

switch#
```

11.1.7.50 show monitor ethernet oam profile

The **show monitor ethernet oam profile** command displays configuration information for the specified ethernet OAM profile name or the summary information of all configured profile names.

Command Mode

EXEC

Command Syntax

show monitor ethernet oam profile [***name*** | summary]

Parameters

- ***name*** The EOAM profile name.
- **summary** The EOAM summary of all profiles that are configured.

Related Commands

- link-error
- monitor ethernet oam profile

Examples

- This command displays the OAM profile configuration information for the specific profile name.

```
switch# show monitor ethernet oam profile[name]

         Ethernet OAM Profile : p

         Error Type : symbol

                           Threshold  :    20  frames
                           Action     :           log
                           Period     :    20 seconds

         Error Type : fcs
                           Threshold  :    10  frames
                           Action     :     linkfault
                           Period     :   100  frame

         Recovery Timeout : 20
```

- This command displays the OAM profile configuration summary for all profiles configured.

```
switch# show monitor ethernet oam profile [name] summary

         Eoam Profile : p
            Configured on:  Et3/1-4,5
```

11.1.7.51 show platform fm6000 agileport map

The **`show platform fm6000 agileport map`** command displays the list of Ethernet interfaces that are combinable to form a higher speed port.

Command Mode

Privileged EXEC

Command Syntax

`show platform fm6000 agileport map`

Example

These commands displays the agile port map for the switch, then configures Ethernet interface ***13*** as a 40G port, subsuming Ethernet interfaces ***15***, ***17*** and ***19***.

```
switch# show platform fm6000 agileport map

-----------------------------------------------------------------
Agile Ports       |        Interfaces subsumed in 40G link
-----------------------------------------------------------------
Ethernet1         |  Ethernet3      Ethernet5      Ethernet7
Ethernet2         |  Ethernet4      Ethernet6      Ethernet8
Ethernet13        |  Ethernet15     Ethernet17     Ethernet19
Ethernet14        |  Ethernet16     Ethernet18     Ethernet20

switch# config
switch(config)# interface ethernet 13
switch(config-if-Et13)# speed 40gfull

  WARNING!  Executing this command will cause the forwarding agent
            to be restarted. All interfaces will briefly drop links
            and forwarding on all interfaces will momentarily stop.

            Do you wish to proceed with this command? [y/N]

Ethernet13 configured for 40G.
Ethernet15, Ethernet17 and Ethernet19 are now subsumed.
switch(config-if-Et13)#
```

11.1.7.52 show platform trident flexcounters

Use the **show platform trident flexcounters** command to display the L3 interfaces when the corresponding hardware counter feature is enabled.

Command Mode

Privileged EXEC

Command Syntax

show platform trident flexcounters [vni [egress summary | ingress summary]]|[[vtep [decap summary | encap summary]]

Parameters

- **vni** Displays the VNI feature state.
  - **egress summary** Displays the egress direction flexcounters summary.
  - **ingress summary** Displays the ingress direction flexcounters summary.
- **vtep** Displays the VTEP feature state
  - **decap summary** Displays the decap direction flexcounter summary.
  - **encap summary** Displays the encap direction flexcounter summary.

Examples

- The following example displays the headings for the **show platform tridant flexcounters vni egress summary** show command.

```
switch# show platform tridant flexcounters vni egress summary
VNI      EgrVfiIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------------
```

- The following example displays the headings for the **show platform trident flexcounters vni ingress summary** show command.

```
switch# show platform trident flexcounters vni ingress summary
VNI      VfiIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------
```

- The following example displays the headings for the **show platform trident flexcounters vtep decap summary** show command.

```
switch# show platform trident flexcounters vtep decap summary
VTEP      SvpIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------
```

- The following example displays the headings for the **show platform trident flexcounters vtep encap summary** show command.

```
switch# show platform trident flexcounters vtep encap summary
VTEP      DvpIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------
```

11.1.7.53 show platform trident flexcounters l3intf

Use the **show platform trident flexcounters l3intf** command to display the subinterface, SVI, and GRE tunnel interface features.

Command Mode

EXEC

Command Syntax

show platform trident flexcounters l3intf [[in | out] [summary | values]]

Parameters

- **in summary** Displays the details of the hardware resources allocated to the ingress subinterface, SVI, and GRE Tunnel Interface features.
- **out summary** Displays the details of the hardware resources allocated to the egress subinterface, SVI, and GRE Tunnel Interface features.
- **in values** Displays the counters in the counter and snapshot table for the ingress subinterface, SVI, and GRE Tunnel Inteface features.
- **out values** Displays the counters in the counter and snapshot table for the egress subinterface, SVI, and GRE Tunnel Interface features.

Note: The counter values in this show command output are not reset by the **clear counters** command.

Examples

- Use the **show platform trident flexcounters l3intf in summary** command to display the details of the hardware resources allocated to the ingress subinterface, SVI, and GRE Tunnel Interface features.

```
switch# show platform trident flexcounters l3intf in summary
L3intf     CounterIndex    PoolId    OffsetMode   BaseCounterIndex
-------------------------------------------------------------------
```

- Use the **show platform trident flexcounters l3intf out summary** command to display the details of the hardware resources allocated to the egress subinterface, SVI, and GRE Tunnel Interface features.

```
switch# show platform trident flexcounters l3intf out summary
L3intf     CounterIndex    PoolId    OffsetMode   BaseCounterIndex
-------------------------------------------------------------------
```

- Use the **show platform trident flexcounters l3intf in values** command to display the counters in the counter and snapshot table for the ingress subinterface, SVI, and GRE Tunnel Interface features.

```
switch# show platform trident flexcounters l3intf in values
L3intf   Offser Bytes(cntTbl)    Bytes(snapTbl)    Pkts(cntTbl)
 Pkts(snapTbl)
-------------------------------------------------------------------
-----------------
```

- Use the **show platform trident flexcounters l3intf out values** command to display the counters in the counter and snapshot table for the egress subinterface, SVI, and GRE Tunnel Interface features.

```
switch# show platform trident flexcounters l3intf out values

L3intf   Offser Bytes(cntTbl)    Bytes(snapTbl)    Pkts(cntTbl)
 Pkts(snapTbl)
```

```
------------------------------------------------------------------------
----------------
```

11.1.7.54 show poe

The **show poe** command displays PoE information for a specified port range or for all ports.

Command Mode

Privileged EXEC

Command Syntax

show poe [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.

Example

This command displays PoE information for ***interface ethernet 46***.

```
switch(config)# show poe interface ethernet 46

Port Enabled Enabled Limit  Power   State   Class  Power Current Voltage Temperature
---- ------- ------- ------ ------- ------- ------ ----- ------- ------- -----------
46      True    True 15.40W  15.40W powered class0 1.40W 27.00mA  55.04V      41.25C
switch(config-if-Et7)#
```

11.1.7.55 show qos scheduling

The **`show qos scheduling`** command displays the QoS configuration on one or more scheduling groups. Both group name and parent interface name are optional, in which case all groups will be displayed.

Command Mode

Privileged EXEC

Command Syntax

`show qos scheduling` **Options**

Parameter

Options include the Group, Interface or the Hierarchy.

Example

This command displays the QoS configuration for scheduling group G1 of interface ***Ethernet1***.

```
switch# show qos scheduling group G1 Ethernet1
Interface: Et1
Scheduling Group Name: G1
Bandwidth: 10.1 / 10.0 (Gbps)
Shape Rate: 75.2 / 75.0 (Gbps)

Member          Bandwidth        Shape Rate
                  (units)          (units)
------        -------------  ------------------
Et1.1            - /  - (-)  50.1 / 50.0 (Gbps)
Et1.2            - /  - (-)  30.1 / 30.0 (Gbps)
```

11.1.7.56 show route counters

Use the **show route [ipv4 | ipv6] counters** to display the IPv4 or IPv6 pack and byte counts.

Command Mode

EXEC

Command Syntax

show route [ipv4 | ipv6]

Parameters

- **ipv4** Displays IPv4 route counters.
- **ipv6** Displays IPv6 route counters.

Example

The following example displays the IPv4 packet and byte count.

```
switch# show route ipv4 counters
Vrf Name         Prefix       Packet Count    Byte Count
-------- ---------------- ------------------ ----------
 default    22.0.0.0/8                    0          0
 default    32.0.0.0/8                    0          0
```

11.1.7.57 show transceiver status interface

The **`show transceiver status interface [<intf>]`** command displays the most important alarms, faults and interface status.

Example

For 400GBASE-ZR modules, media and host side coherent alarms, host-side pre-FEC BER, defined in the Coherent CMIS and post-FEC BER have been added to the command's output:

```
switch# show transceiver status interface Ethernet14/1
                              Current State        Changes       Last
 Change
                              -------------        -------
 -----------

```

Note: In the operational state, module state is ‘Ready’ and datapath state for all 8 lanes is activated.

11.1.7.58 show vxlan counters vni

Use the **show vxlan counters vni** command to display the encapsulation and decapsulation counters at the VNI.

Command Mode

Privledged EXEC

Command Syntax

show vxlan counters vni [encap | decap]

Parameters

- **encap** Displays the encapsulation related counters at the VNI.
- **decap** Displays the decapsulation related counters at the VNI.

Examples

- The following **show vxlan counters vni encap** command displays the encapsulation related commands at the VNI.

```
switch# show vxlan counters vni encap
                                        Encap BUM   Encap Drop
VNI       Encap Bytes  Encap Packets  Packets     Packets
--------- ------------ -------------- ----------- -----------
2824963             0              0           0           0
7023745             0              0           0           0
```

  Encap Packets displays the total count of L2 packets that have been successfully encapsulated by the VNI towards the VTEP.

  Encap Drop Or Exception Packets display the total count of L2 packets that have been encapsulated and dropped for any reason.

- The following **show vxlan counters vni decap** command displays the decapsulation related counters at the VNI.

```
switch# show vxlan counters vni decap
                                                          Decap Drop Or

                            Decap Known   Decap BUM       Exception
VNI       Decap Bytes   Unicast Packets      Packets        Packets
-------   -----------   ---------------   ----------   -------------
2824963             0                 0           0               0
7023745             0                 0           0               0
```

  Decap Known UnicastPkts displays the total count of L2 known unicast packets coming into the VTI hitting the VTEP and getting decapsulated.

  Decap BUM Packets displays the total count of L2 BUM packets coming into the VTI hitting the VTEP and getting decapsulated.

  Decap Drop or Exception Packets displays the count of L2 packets coming into the VTI and getting dropped for any reason.

11.1.7.59 speed

The **speed** command configures the transmission speed and duplex setting for the configuration mode interface. The scope and effect of this command depends on the interface type. Interface types include:

- **40GBASE (QSFP+)**: Default is 4x10G-full. **Speed forced 40gfull** and **Speed auto 40gfull** configure interface as a 40G port.
- **10GBASE-T**: Default is 10G-full. **Speed** command affects interface.
- **10GBASE (SFP+)**: Default is 10G-full. **Speed** command does not affect interface.
- **1000BASE (copper)**: Default is 1G-full. **speed auto 100full** affects interface.
- **1000BASE (fiber)**: Default is 1G-full. **Speed** command does not affect interface.
- **10/100/1000**: Default is auto-negotiation. **Speed** command (10/100/1000 options) affects interface.

The **speed 40gfull** and **auto 40gfull** commands configure a QSFP+ Ethernet interface as a 40G port. The **no speed** and **no auto 40gfull** commands configure a QSFP+ Ethernet interface as four 10G ports. These commands must be applied to the /1 port. These commands are hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, these commands restart the forwarding agent, which will result in traffic disruption.

The **no speed** and **default speed** commands restore the default setting for the configuration mode interface by removing the corresponding **speed** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

speed MODE

no speed

default speed

Parameters

MODE Transmission speed and duplex setting. Options include:

- **speed auto** auto negotiation mode. (For SFP-1G-T, auto-negotiates 1Gbps, this is because no speed is specified, and we are defaulting to advertise 1G).
- **speed auto 40gfull** auto negotiation mode with clause 73 auto negotiation.
- **speed auto 1G full/ speed 1G** auto-negotiated 1Gbps (note that per BASE-T standard, 1G must be negotiated).
- **speed auto 100full** auto-negotiated 100Mbps.
- **speed 100full** non-negotiated and true-forced 100Mbps.

  Note: Interfaces using clause 73 auto negotiation must connect to a device that runs clause 73 auto negotiation.
- **sfp-1000baset auto** auto-negotiation mode (fu).
- **10000full** 10G full duplex.
- **1000full** 1G full duplex.
- **1000half** 1G half duplex.
- **100full** 100M full duplex.
- **100gfull** 100G full duplex.
- **100half** 100M half duplex.
- **10full** 10M full duplex.
- **10half** 10M half duplex.
- **40gfull** 40G full duplex.

On 40GBASE and 100GBASE interfaces, options that change the SFP+ and MXP interfaces (the **auto 40gfull**, the ***40gfull***, and the **no speed** options) may restart the forwarding agent on some switch platforms, disrupting traffic on all ports for more than a minute.

Guidelines

Note: The **SFP-1G-T** transceivers advertise one speed at a time only. Hence, the desired speed and negotiation must be configured explicitly using the **speed auto, speed auto 1G full/ speed 1G, speed auto 100full,** and **speed 100full** commands.

Examples

- This command configures a 40GBASE interface as a 40G port.

```
switch(config)# interface ethernet 49/1
switch(config-if-Et49/1)# speed 40gfull
switch(config-if-Et49/1)# show interface ethernet 49/1 - 49/4 status
Port      Name          Status       Vlan        Duplex  Speed Type
Et49/1                  connected    in Po999      full    40G 40GBASE-
CR4
Et49/2                  errdisabled  inactive    unconf unconf 40GBASE-
CR4
Et49/3                  errdisabled  inactive    unconf unconf 40GBASE-
CR4
Et49/4                  errdisabled  inactive    unconf unconf 40GBASE-
CR4
switch(config-if-Et49/1)#
```

- This command configures a 40GBASE interface as four 10G ports (default configuration).

```
switch(config-if-Et49/1)# no speed
switch(config-if-Et49/1)# show interface ethernet 49/1 - 49/4 status
Port      Name          Status       Vlan        Duplex  Speed Type
Et49/1                  connected    routed        full    10G 40GBASE-
SR4
Et49/2                  connected    routed        full    10G 40GBASE-
SR4
Et49/3                  connected    routed        full    10G 40GBASE-
SR4
Et49/4                  notconnect   inactive      full    10G 40GBASE-
SR4
switch(config-if-Et49/1)#
```

11.1.7.60 system

The **system** command allows the user to configure the system-wide TCAM profiles such as default, mirroring-acl, mpls-evpn, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, and vxlan-routing.

The **exit** command returns the switch to global configuration mode.

Command Mode

Hardware TCAM

Command Syntax

system profile *name*

Parameter

name TCAM profile name.

Reference

hardware tcam

Example

This commands allow the switch to configure the TCAM profile qos.

```
switch(config-hw-tcam)# system profile qos
```

11.1.7.61 threshold

The **threshold** command configures the link monitoring threshold value that is specified for a link error.

The **no threshold** and the **default threshold** commands remove the threshold value specified for the chosen link error.

Command Mode

Link-error Configuration

Command Syntax

[**fcs** | **symbol**] **threshold** ***threshold_value***

no [**fcs** | **symbol**] **threshold** ***threshold_value***

default [**fcs** | **symbol**] **threshold** ***threshold_value***

Parameters

- **fcs** Inbound packets with Frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- ***threshold_value*** Specifies the threshold value in number of errors. The value ranges from ***1*** to ***100***.

Related Commands

- action
- period

Example

These commands set the threshold value of ***20*** for the ***profile profile1*** in the ***link-error*** configuration mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)# symbol threshold 20
```

11.1.7.62 transceiver channel

The **`transceiver channel`** command displays transceiver wavelength/frequency by channel number. The channel numbering depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing.

- If the startup configuration does not specify the channel number for the interface, the transceiver will automatically tune to the default channel (i.e. ***channel-39*** of 50GHz-spacing grid) when it is inserted.
- If the configured wavelength/frequency is not supported by the transceiver, the transceiver is tuned to the default channel (i.e. ***channel-39*** of 50GHz-spacing grid).

The interface is shutdown before the channel number is configured.

Command Mode

Global Configuration

Command Syntax

`transceiver channel` **CHANNEL_NUMBER** **`grid-spacing`** ***SPACING_GRID***

`no transceiver channel` **CHANNEL_NUMBER** **`grid-spacing`** ***SPACING_GRID***

`default transceiver channel` **CHANNEL_NUMBER** **`grid-spacing`** ***SPACING_GRID***

Parameters

- **CHANNEL-NUMBER** The default channel is ***39*** (50GHz-spacing grid) which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
- **GRID_SPACING** Grid-spacing mode (optional) depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing. For example, channel ***39*** of 50GHz-spacing grid is equivalent to channel ***20*** of 100GHz-spacing grid, which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
  - ***SPACING_GRID*** default grid-spacing mode in GHz.

Related Commands

- show interfaces transceiver channels
- show interfaces transceiver hardware

Example

This command tunes the transceiver on slot number ***4*** to slot ***1*** through ***3*** of 50GHz-spacing grid.

```
switch(config-as)# interface ethernet 4/1/3
switch(config-if-Et4/1/3)# transceiver channel 1 grid-spacing 50
switch(config-if-Et4/1/3)#
```

11.1.7.63 transceiver qsfp default-mode

The **transceiver qsfp default-mode** command specifies the transmission mode of all QSFP transceiver modules that are not explicitly configured.

Each QSFP+ module Ethernet interface is configurable as a single 40G port or as four 10G ports. The switch displays four ports for each interface. Each ports status depends on the interface configuration:

- The ***/1*** port is active (**connected** or not connected), regardless of the interface configuration.
- The ***/2***, ***/3***, and ***/4*** ports are **error-disabled** when the interface is configured as a single 40G port.
- All ports are active (**connected** or not connected), when the interface is configured as four 10G ports.

QSFP modules that are not configured through a **speed** command are operated as four 10G ports.

The **no transceiver qsfp default-mode** and **default transceiver qsfp default-mode** commands restore the default-mode transceiver setting from 40G to 4x10G.

Command Mode

Global Configuration

Command Syntax

transceiver qsfp default-mode 4x10G

no transceiver qsfp default-mode

default transceiver qsfp default-mode

Note: QSFP100 ports with external PHY always have 40G as the default QSFP mode.

Guidelines

The **transceiver qsfp default-mode 4x10g** statement is always in ***running-config*** and cannot be modified or removed in the current release.

Example

- When default QSFP mode is configured as 4x10G, the **show running-config** contains **transceiver qsfp default-mode 4x10G**. **show interfaces hardware** shows 10G as the default speed.

```
switch(config)# transceiver qsfp default-mode 4x10G
switch(config)# show running-config | grep 4x10G
transceiver qsfp default-mode 4x10G
switch(config)# show interfaces ethernet 35/1 hardware
*  = Requires speed group setting change
Ethernet35/1
  Model:          DCS-7280CR3-32P4
  Type:           40GBASE-CR4
  Speed/Duplex:   10G/full(default),40G/full,auto
  Flowcontrol:    rx-(off,on,desired),tx-(off)
```

- When QSFP mode configuration is reverted to the default, **show running-config**does not contain **transceiver qsfp default-mode 4x10G**. **show interfaces hardware** shows 40G as the default speed.

```
switch(config)# no transceiver qsfp default-mode
switch(config)# show running-config | grep 4x10G
switch(config)# show interfaces ethernet 35/1 hardware
*  = Requires speed group setting change
Ethernet35/1
  Model:          DCS-7280CR3-32P4
  Type:           40GBASE-CR4
```

```
  Speed/Duplex:    10G/full,40G/full(default),auto
  Flowcontrol:     rx-(off,on,desired),tx-(off)
```

11.2 Port Channels and LACP

This chapter describes channel groups, port channels, port channel interfaces, and the Link Aggregation Control Protocol (LACP). This chapter contains the following sections:

- Port Channel Introduction
- Port Channel Conceptual Overview
- Port Channel Configuration Procedures
- Load Balancing Hash Algorithms
- Port Channel and LACP Configuration Commands

11.2.1 Port Channel Introduction

Arista's switching platforms support industry-standard link aggregation protocols. Arista switches optimize traffic throughput by using MAC addressing, IP addressing, and services fields to effectively load share traffic across aggregated links. Managers can configure multiple ports into a logical port channel, either statically or dynamically through the IEEE Link Aggregation Control Protocol (LACP). Various negotiation modes are supported to accommodate different configurations and peripheral requirements, including LACP fallback to support devices that need simple network connectivity to retrieve images or configurations prior to engaging port channel aggregation modes.

Arista's Multi-chassis Link Aggregation protocol (MLAG) supports LAGs across paired Arista switches to provide both link aggregation and active/active redundancy.

11.2.2 Port Channel Conceptual Overview

11.2.2.1 Channel Groups and Port Channels

A port channel is a communication link between two switches supported by matching channel group interfaces on each switch. A port channel is also referred to as a Link Aggregation Group (LAG). Port channels combine the bandwidth of multiple Ethernet ports into a single logical link.

A channel group is a collection of Ethernet interfaces on a single switch. A port channel interface is a virtual interface that serves a corresponding channel group and connects to a compatible interface on another switch to form a port channel. Port channel interfaces can be configured and used in a manner similar to Ethernet interfaces. Port channel interfaces are configurable as Layer 2 interfaces, Layer 3 (routable) interfaces, and VLAN members. Most Ethernet interface configuration options are also available to port channel interfaces.

11.2.2.2 Port Channel Subinterfaces

Port channel subinterfaces divide a single port channel interface into multiple logical L3 interfaces based on the 802.1q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in the L2/L3 boundary device, but they can also be used to isolate traffic with 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

For further details about subinterfaces, see Subinterfaces.

11.2.2.3 Link Aggregation Control Protocol (LACP)

The Link Aggregation Control Protocol (LACP), described by IEEE 802.3ad, defines a method for two switches to automatically establish and maintain link aggregation groups (LAGs, also called channel groups or port channels). Using LACP, a switch can configure LACP-compatible ports into a dynamic LAG. The ports try to complete LACP negotiation automatically with the linked ports (also configured as a dynamic LAG) on the partner switch. The maximum number of ports per LAG varies by platform;

numbers for each platform in the latest EOS release are available here: https://www.arista.com/en/support/product-documentation/supported-features.

Static LAGs

In static mode (with the channel-group mode configured as **on** on the member interfaces), the switch aggregates links without an awareness of LAGs on the partner switch and without LACP negotiation. The member ports do not send LACP packets or process inbound LACP packets on static LAGs. Packets may drop when static LAG configurations differ between switches.

Dynamic LAGs

Dynamic LAGs are aware of their partners' port-channel states. Interfaces configured as dynamic LAGs are designated as **active** or **passive**.

- **Active interfaces** send LACP Protocol Data Units (LACP PDUs) at a rate of one per second when forming a channel with an interface on the peer switch. An aggregate forms if the peer runs LACP in active or passive mode.
- **Passive interfaces** only send LACP PDUs in response to PDUs received from the partner. The partner switch must be in active mode and initiates negotiation by sending a LACP packet. The passive mode switch receives and responds to the packet to form a LAG.

An active interface can form port channels with passive or active partner interfaces, but port channels are not formed when the interface on each switch is passive.

Table 63: LACP Mode Combinations summarizes the effect of different LACP mode combinations:

Table 63: LACP Mode Combinations

Switch 1	Switch 2	Comments
active	active	Links aggregate when LACP negotiation is successful.
active	passive	Links aggregate when LACP negotiation is successful.
passive	passive	Links do not aggregate because LACP negotiation is not initiated.
on (static)	on (static)	Links aggregate without LACP.
on (static)	active or passive	Links aggregate on the static switch without LACP; links do not aggregate on the other switch, and no port-channel connection is established with the partner.

During synchronization, interfaces in dynamic LAGs transmit one LACP PDU per second. After synchronization is complete, interfaces exchange one PDU every thirty seconds, facilitated by a default timeout of 30 seconds and a failure tolerance of three. Under these parameters, when the switch does not receive a LACP PDU for an interface during a ninety-second period, it records the partner interface as **failed** and removes the interface from the port channel.

Fallback Mode

An active interface that is not in fallback mode does not form a LAG until it receives PDUs from, and negotiates with its peer. Fallback mode allows an active LACP interface to maintain a LAG without receiving PDUs from its peer. The fallback timer specifies the period the LAG waits to receive a peer PDU. Upon timer expiry, the port channel reverts to its configured fallback mode if one is configured.

Static fallback: the port channel maintains one active port while in fallback mode; all its other member ports are in standby mode until a LACP PDU is received by the port channel. All member ports send (and can receive) LACP PDUs, but only the active port sends or receives data.

Individual fallback: all member ports act as individual switch ports while in fallback mode. Individual port configuration (rather than port channel configuration) is active while the port channel is in fallback mode, with the exception of ACLs. This includes VLAN membership. All member ports send and receive data, and continue to send LACP PDUs. As soon as a LACP PDU is received by a member of the port channel, all ports revert to normal port-channel operation.

The switch uses a link aggregation hash algorithm to determine the forwarding path within a link aggregation group. The IP and MAC header fields can be selected as components of the hash algorithm.

11.2.3 Port Channel Configuration Procedures

These sections describe channel group and port channel configuration procedures:

- Configuring a Channel Group
- Configuring a Port Channel Interface
- Maximum Port Channel ID Increase
- Configuring Port Channel Subinterfaces
- Configuring LACP
- Displaying Port Channel Information

11.2.3.1 Configuring a Channel Group

Creating a Channel Group

The channel-group command assigns the configuration-mode Ethernet interfaces to a channel group, creates the channel group if it does not already exist, and specifies LACP attributes for the channel.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in port-channel configuration mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group.

LACP is enabled on the member interfaces by setting the channel-group mode to **active** or **passive**. Setting the mode to **on** disabled LACP on the member interfaces and creates a static channel group.

Example:

These commands assign Ethernet interfaces ***1*** and ***2*** to channel group ***10*** (creating the channel group if it does not already exist), enable LACP on those interfaces, and place the channel group in a negotiating state.

```
switch(config)# interface ethernet 1-2
switch(config-if-Et1-2)# channel-group 10 mode active
switch(config-if-Et1-2)#
```

Adding an Interface to a Channel Group

The channel-group command is also used to add the configuration mode interface to an existing channel group. When adding channels to a previously created channel group, the channel-group mode for the new channel must match the mode for the existing group.

Example

These commands add Ethernet interfaces ***7*** through ***10*** to previously created channel group ***10***, using the channel-group mode (**active**) under which it was created.

```
switch(config)# interface ethernet 7-10
switch(config-if-Et7-10)# channel-group 10 mode active
switch(config-if-Et7-10)#
```

Removing an Interface from a Channel Group

The **`no channel-group`** command removes the configuration mode interface from the specified channel group. Deleting all members of a channel group does not remove the associated port channel interface from ***running-config***.

Example

These commands removes ***interface ethernet 8*** from previously created channel group ***10***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# no channel-group
switch(config-if-Et8)#
```

Configuring a Port-Channel as Mixed-Speed

By default, only configured members of the same speed become active. The port-channel speed mixed command configures a port channel with the ability to have active members of multiple speeds.

Note: Available on the 7020, 7280, 7500, and 7800 platforms. Minimum links is not available on mixed-speed port channels.

Example

```
switch(config)# interface port-channel 1
switch(config-if-Po1)# port-channel speed mixed
```

Configuring Minimum Links

Note: Minimum links is not available on Mixed-Speed Port-Channels. If a minimum requirement is desired for a Mixed-Speed Port-Channel, consider Minimum Speed instead. On Port-Channels that are not mixed-speed, if both Minimum Links and Minimum Speed are configured, then Minimum Speed will take precedence.

Configuring Minimum Speed

The port-channel speed minimum command specifies the cumulative minimum speed of all active members in order for a port channel to become active. If there is less than the specified by this command, the port channel interface does not become active.

Note: If both minimum speed and minimum links are configured, minimum speed will take precedence.

Example

These command sets 100 Gbps as the minimum speed needed for ***port channel 1*** to become active.

```
switch(config)# interface port-channel 1
switch(config-if-Po1)# port-channel speed minimum 100 gbps
```

Deleting a Channel Group

A channel group is deleted by removing all Ethernet interfaces from the channel group. A channel group's LACP mode can be changed only by deleting the channel group and then creating an equivalent group with a different LACP mode. Deleting a channel group by removing all Ethernet interfaces from the group preserves the port channel interface and its configuration settings.

View ***running-config*** to verify the deletion of all Ethernet interfaces from a channel group.

11.2.3.2 Configuring a Port Channel Interface

Creating a Port Channel Interface

The switch provides two methods for creating port channel interfaces:

- creating a channel group simultaneously creates an associated port channel.
- the **`interface port-channel`** command creates a port channel without assigning Ethernet channels to the new interface.

The interface port-channel command places the switch in ***interface-port channel*** configuration mode.

Example

This command creates ***interface port-channel 8*** and places the switch in ***port channel interface*** configuration mode.

```
switch(config)# interface port-channel 8
switch(config-if-Po8)#
```

Deleting a Port Channel Interface

The **`no interface port-channel`** command deletes the configuration mode port channel interface and removes the channel group assignment for each Ethernet interface assigned to the group associated with the port channel interface. Removing all Ethernet interfaces from a channel group does not remove the associated port channel interface from ***running-config***.

11.2.3.3 Maximum Port Channel ID Increase

Previously, the maximum valid port channel ID was equal to the maximum number of port channels configurable on the system, ***2000***, and this feature increases the maximum ID to ***999,999*** while maintaining the same limit of ***2000*** port channels on the system.

11.2.3.3.1 Configuration

This feature does not involve any specific configuration procedure, but it does include visible changes to port channel configuration commands. In the following examples, suppose port channels ***1-2000*** have already been configured, so creating Port-Channel ***2001*** would exceed the configuration limit.

```
switch(config)# interface create port-channel 2001
Port channel config limit 2000 reached. No interfaces were created.
```

```
switch(config-ifEtX)# channel-group 2001 mode
Port channel config limit 2000 reached. No interfaces were created.
```

11.2.3.3.2 Show Commands

Changes to existing show commands simply involve displaying when a port channel is inactive. In the following examples, suppose port channels ***2001-4001*** are configured, Port-Channel ***4001*** is inactive, and Ethernet1 is a member of Port-Channel ***4001***.

```
switch(config)# show lacp 1-$ aggregates
Port channel 4001 is inactive. The number of configured port channels exceeds the config
 limit 2000.

```

11.2.3.3.3 Limitations

- The number of configured port channels can exceed the configurable limit if two configuration sessions simultaneously create two different port channels. In this scenario, port channels that exceed the limit are inactive. This is uncommon and does not impact traffic in any way. If an inactive port channel exists and an active port channel is deleted, then the inactive port channel is activated.
- Only port channels with ID from ***1 to 2000*** are configured as MLAG port channels.

11.2.3.4 Configuring Port Channel Subinterfaces

When configuring subinterfaces on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

An L3 interface with subinterfaces configured on it should not be made a member of a port channel.

- An interface that is a member of a port channel should not have subinterfaces configured on it.
- A subinterface cannot be made a member of a port channel.

Port channel subinterfaces are otherwise configured similarly to Ethernet subinterfaces. For additional information, see Subinterfaces.

11.2.3.5 Configuring LACP

Configuring the Channel-group Mode

The channel-group mode is configured when a channel group is created using the channel-group command. A channel group's mode cannot be modified without deleting the entire channel group, but it can be modified without deleting the port channel interface associated with the channel group. The mode setting defines whether the port channel is static or dynamic, and whether a dynamic port channel is active or passive.

Examples

- These commands create a dynamic channel group and place it in LACP **active** mode.

```
switch(config)# interface ethernet 1-2
switch(config-if-Et1-2)# channel-group 10 mode active
switch(config-if-Et1-2)#
```

- These commands create a static channel group.

```
switch(config)# interface ethernet 4-5
switch(config-if-Et4-5)# channel-group 11 mode on
switch(config-if-Et4-5)#
```

Configuring the System Priority

Each switch is assigned a globally unique system identifier by concatenating the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). The system identifier is used by peer devices when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities in response to LACP information; the system with the numerically lower system identifier is permitted to dynamically change advertised aggregation capabilities.

The lacp system-priority command configures the switch's LACP system priority.

Example

This command assigns the system priority of ***8192*** to the switch.

```
switch(config)# lacp system-priority 8192
switch(config)#
```

Configuring Port Priority

LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority. Port priority is supported on port channels that are enabled with LACP physical interfaces.

The lacp port-priority command sets the aggregating port priority for the configuration mode interface.

Example

This command assigns the port priority of ***4096*** to ***Ethernet interface 1***.

```
switch(config-if-Et1)# lacp port-priority 4096
```

```
switch(config-if-Et1)#
```

Configuring the LACP Packet Reception Rate

The lacp timer command sets the reception rate of LACP packets on the local device for the interface being configured. This command supports the following reception rates:

- **normal:** LACP packets are received at the following rates:
  - 30 seconds for synchronized interfaces.
  - One second for interfaces that are being synchronized.
- **fast:** LACP packets are received every second.
-

Example

This command sets the LACP reception rate to one second on the ***Ethernet interface 4***.

```
switch(config-if-Et4)# lacp timer fast
switch(config-if-Et4)#
```

Configuring LACP Fallback

Fallback mode (static or individual) is configured on a port channel interface with the port-channel lacp fallback command. The fallback timeout interval is configured with the port-channel lacp fallback timeout command. Fallback timeout settings persist in ***running-config*** without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is ***90*** seconds.

Examples

- These commands enable LACP static fallback mode, then configure an LACP fallback timeout of ***100*** seconds on ***port channel interface 13***. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

```
switch(config)# interface port-channel 13
switch(config-if-Po13)# port-channel lacp fallback static
switch(config-if-Po13)# port-channel lacp fallback timeout 100
switch(config-if-Po13)# show active
interface Port-Channel13
   port-channel lacp fallback static
   port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

- These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of ***50*** seconds on ***port channel interface 17***. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config)# interface port-channel 17
switch(config-if-Po17)# port-channel lacp fallback individual
switch(config-if-Po17)# port-channel lacp fallback timeout 50
switch(config-if-Po17)# show active
interface Port-Channel17
   port-channel lacp fallback individual
```

```
   port-channel lacp fallback timeout 50
switch(config-if-Po17)#
```

Configuring Minimum Links

The port-channel min-links command specifies the minimum number of interfaces that the configuration mode LAG requires to be active. If there are fewer ports than specified by this command, the port channel interface does not become active.

Note: In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up. In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner's side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links. EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs **LAG-4-MINLINK_INTF_INSUFFICIENT** message. If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. **LAG-4-MINLINK_INTF_NORMAL** is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise **LAG-4-MINLINK_INTF_INSUFFICIENT** is syslogged and the port-channel goes Link Down. If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is 360 seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

Example

This command sets four as the minimum number of ports required for ***port channel 5*** to become active.

```
switch(config-if-Po5)# port-channel min-links 4
switch(config-if-Po5)#
```

Configuring Minimum Links Review Interval

The port-channel min-links review interval command enables or disables timer based min-links review feature for all port-channels. The timer based min-links feature is enabled when all of the following conditions are true. It is disabled otherwise:

- The min-links configured is greater than ***1***.
- LACP fallback is disabled.
- The number of interfaces configured in the port-channel is more than min-links.
- The number of active member interfaces in the port-channel is less than min-links.
- The default timer values are:

- min-links-review-timeout = min-links-timeout-base + f (configured min-links)
- min-links-timeout-base = ***180*** seconds
- min-links-retry-timeout = ***360*** seconds

11.2.3.6 Displaying Port Channel Information

Port channel information is accessed using some of the **show** commands listed under Interface Display Commands. Ensure that while using the show interfaces counters rates command to view the rate information of a port channel, rate values for the individual member ports are less inaccurate than rate values of the port channel.

Both the port channel rate and the individual port rates are calculated approximations; the rate value of a port channel might vary from the total of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports, and will be most obvious in single-port port channels.

11.2.4 Load Balancing Hash Algorithms

The switch balances packet load across multiple links in a port channel by calculating a hash value based on packet header fields. The hash value determines the active member link through which the packet is transmitted. This method, in addition to balancing the load in the LAG, ensures that all packets in a data stream follow the same network path.

In network topologies that include MLAGs or Multiple Paths with Equal Cost (ECMP), programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links. This uneven distribution is avoided by performing different hash calculations on each switch routing the paths.

The port-channel load-balance command specifies the seed for hashing algorithms that balance the load across ports comprising a port channel. Available seed values vary by switch platform.

Example

This command configures the hash seed of ***10*** on 7150 Series (FM6000 platform) switches.

```
switch(config)# port-channel load-balance fm6000 10
switch(config)#
```

Hashing algorithm inputs varies by switch platform. These sections describe hashing algorithm inputs for each platform.

- Load Balance Hash Algorithms on 7048 and 7500 Series Switches
- Load Balance Hash Algorithms on 7500E Series Switches
- Load Balance Hash Algorithms on 7050 Series Switches
- Load Balance Hash Algorithms on 7150 Series Switches

11.2.4.1 Load Balance Hash Algorithms on 7048 and 7500 Series Switches

One command configures the load balance hash algorithm on 7048 and 7500 Series switches:

- port-channel load-balance petraA fields ip: controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Example

These commands configure the load balance algorithm for IP packets by using the entire MAC header.

```
switch(config)# port-channel load-balance petraA fields ip mac-
header
switch(config)#
```

11.2.4.2 Load Balance Hash Algorithms on 7500E Series Switches

One command configures the load balance hash algorithm on 7500E Series switches:

port-channel load-balance arad fields ip: controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Example

These commands configure the load balance algorithm for IP packets by using the entire MAC header.

```
switch(config)# port-channel load-balance arad fields ip mac-
header
switch(config)#
```

11.2.4.2.1 Dynamic and Symmetric LAG Hashing

Dynamic LAG hashing enables high link utilization and highly even distribution among LAG members by employing a randomized hashing algorithm. Symmetric LAG hashing allows the two flows of a bidirectional communication link, even when the two flows enter the switch on different ingress ports, to be hashed to the same member of a LAG on egress.

Dynamic and symmetric LAG hashing policies are enabled via named port-channel load-balancing profiles. LAG load-balancing policies can be provisioned on per line-card basis using these profiles. Load-balancing profiles can be used to provision all LAG load-balance attributes, including hash polynomials, hash seeds, and hash fields.

When no specific LAG hashing profile is assigned to a line card, then a global LAG hashing profile can be defined and applied to all the line cards with no LAG hashing defined on them.

Note, if no profile is selected as global profile then the default profile takes the precedence and set as a global profile. The default profile is reserved and if it is set as a global profile it cannot be deleted, if the profile is deleted then the following warning message is displayed.

Note: When a global profile is already set and if some other profile is tried to configured as a default profile the following warning message is displayed "! A global load balancing profile myProfile is currently active. This setting will not take effect."

Examples

- These commands configure a load balance profile for symmetric hashing.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance arad
 profile
switch(config-sand-load-balance-profile-symmetric-p
rofile-1)# hash symmetric
switch(config-sand-load-balance-profile-symmetric-p
rofile-1)# show active
load-balance policies
   load-balance arad profile symmetric-profile-1
      hash symmetric
```

- These commands configure a load balance profile for dynamic hashing.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance arad
 profile
switch(config-sand-load-balance-profile-dynamic-hash-
profile-1)# distribution
clock
switch(config-sand-load-balance-profile-dynamic-hash-
profile-1)# show active
load-balance policies
   load-balance arad profile dynamic-hash-profile-1
      distribution clock
```

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)# port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)# no port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command configures a global profile on all line cards on which LAG hashing is not defined.

```
switch(config)# port-channel load-balance sand profile
 myGlobalProfile
```

- These commands designates a default profile as a global profile, if no other profile is set as a global profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance sand
 profile default
```

- These commands configure a hash seed in a profile and assigns it as a global profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance sand
 profile myGlobalProfile
switch(config-sand-load-balance-profile-myGlobalProfile)# hash
 seed 20
switch(config)# port-channel load-balance sand profile
 myGlobalProfile
```

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)# port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)# no port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

11.2.4.3 Load Balance Hash Algorithms on 7050 Series Switches

Three commands configure the load balance hash algorithm on 7050 Series switches:

- port-channel load-balance trident fields ip controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the **`port-channel load-balance trident fields mac`** command.
- port-channel load-balance trident fields ipv6 controls the hash algorithm for IPv6 packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the **`port-channel load-balance trident fields mac`** command.
- port-channel load-balance trident fields mac controls the hash algorithm for non-IP packets b specifying the algorithm's use of MAC header fields. Fields that the command can specify include the MAC source address, MAC destination address, and Ethernet type fields.

Example

These commands configure the switch's port channel load balance for non IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)# port-channel load-balance trident fields mac dst-
mac eth-type
switch(config)#
```

11.2.4.4 Load Balance Hash Algorithms on 7150 Series Switches

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports ***16*** load balance profiles, including the default profile. The default load balance profile is configured through port-channel load-balance fm6000 fields ip and port-channel load-balance fm6000 fields mac commands.

11.2.4.4.1 Load Balance Profiles

Load balance profiles are managed in ***load-balance-policies*** configuration mode. The ***load-balance-policies*** configuration mode provides commands that display the contents of all configured profiles and place the switch in **`load-balance-profile`** command. Load balance profiles are created by entering the ***load-balance-profile*** mode and edited while in that mode.

The load-balance policies command places the switch in ***load-balance-policies*** configuration mode. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

Examples

- This command places the switch in ***load-balance-policies*** configuration mode.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)#
```

- This command displays the contents of the four load balance profiles configured on the switch.

```
switch(config-load-balance-policies)# show active

load-balance policies
   load-balance fm6000 profile F-01
      port-channel hash-seed 22
      fields ip dscp
      distribution random port-channel
   !
   load-balance fm6000 profile F-02
      fields ip protocol dst-ip
      distribution random port-channel
   !
   load-balance fm6000 profile F-03
      fields ip protocol dst-ip
      fields mac dst-mac eth-type
      distribution random ecmp port-channel
   !
   load-balance fm6000 profile F-04

switch(config-load-balance-policies)#
```

Creating a Load Balance Profile

The load-balance fm6000 profile command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.

Example

These commands enter ***load-balance-profile*** configuration mode, creates the ***LB-5*** profile, and lists the default settings for the profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000 profile
 LB-5
switch(config-load-balance-profile-LB-5)# show active all

load-balance policies
   load-balance fm6000 profile LB-5
      port-channel hash-seed 0
      fields mac dst-mac src-mac eth-type vlan-priority vlan-id
      fields ip protocol dst-ip dst-port src-ip src-port dscp
      no distribution symmetric-hash
      no distribution random

switch(config-load-balance-profile-LB-5)#
```

Configuring a Load Balance Profile

These commands are available in load-balance-profile configuration mode to specify the parameters that comprise a profile.

- The fields ip command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The fields mac command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The distribution symmetric-hash command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.
- The distribution random command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile.

Example

These commands configure the following components of the hash algorithm defined by the LB-7 load balance profile:

- L2 header fields: MAC destination address, VLAN priority.
- L3/L4 header fields: Source IP address, protocol field.
- Symmetric hash distribution of IP and non-IP packets.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000
 profile LB-7
switch(config-load-balance-profile-LB-7)# fields ip src-ip
 protocol
switch(config-load-balance-profile-LB-7)# fields mac dst-mac
 vlan-priority
switch(config-load-balance-profile-LB-7)# distribution
 symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)# show active
load-balance policies
   load-balance fm6000 profile LB-7
      fields mac dst-mac vlan-priority
      fields ip protocol src-ip
      distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)# exit
switch(config-load-balance-policies)# exit
switch(config)# exit
```

Assigning a Load Balance Profile to an Interface

The ingress load-balance profile command applies a specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

Example

This command applies the ***LB-1*** load balance profile to ***interface port-channel 100***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# ingress load-balance profile LB-1
switch(config-if-Po100)# show active
```

```
interface Port-Channel100
   ingress load-balance profile LB-1
switch(config-if-Po100)#
```

11.2.4.4.2 Default Load Balance Profile

Two commands configure the load balance default profile on 7150 Series switches:

- port-channel load-balance fm6000 fields ip controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets).
- port-channel load-balance fm6000 fields mac controls the hash algorithm for non-IP packets by specifying the algorithm's use of MAC header fields. Fields that the command can specify include include the MAC source address, MAC destination address, and Ethernet type, VLAN-ID, and VLAN-priority fields.

Examples

- These commands configure the load balance default profile for IP packets by using source and destination IP address fields, along with source and destination port fields for TCP, and UDP packets.

```
switch(config)# port-channel load-balance fm6000 fields ip ip-tcp-udp-header
switch(config)#
```

- This command applies the default load balance profile to ***interface port-channel 100***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# no ingress load-balance profile
switch(config-if-Po100)# show active
interface Port-Channel100
switch(config-if-Po100)#
```

11.2.5 Port Channel and LACP Configuration Commands

Global Port Channel and LACP Configuration Commands

- interface port-channel
- lacp system-priority

Interface Configuration Commands – Ethernet Interface

- channel-group
- lacp port-priority
- lacp timer
- port-channel lacp fallback
- port-channel lacp fallback timeout
- port-channel min-links
- port-channel min-links review interval
- port-channel speed minimum
- port-channel speed mixed

Load Balance (Default) Commands

- port-channel load-balance
- port-channel load-balance arad fields ip
- port-channel load-balance fm6000 fields ip
- port-channel load-balance fm6000 fields mac
- port-channel load-balance module
- port-channel load-balance petraA fields ip
- port-channel load-balance sand profile (7500E/7500R)
- port-channel load-balance trident fields ip
- port-channel load-balance trident fields ipv6
- port-channel load-balance trident fields mac

Load Balance Policies Commands

- distribution random
- distribution symmetric-hash
- fields ip
- fields mac
- hash-seed
- ingress load-balance profile
- load-balance fm6000 profile
- load-balance policies
- load-balance sand profile (7500E/7500R)
- port-channel hash-seed

EXEC Commands

- show lacp aggregates
- show lacp counters
- show lacp interface
- show lacp internal
- show lacp peer

- show lacp sys-id
- show load-balance profile
- show port-channel
- show port-channel dense
- show port-channel limits
- show port-channel load-balance
- show port-channel load-balance fields

11.2.5.1 channel-group

The **`channel-group`** command assigns the configuration mode Ethernet interfaces to a channel group, creates the group if it does not already exist, and sets the port-channel mode for the group. When adding interfaces to a previously created channel group, the port-channel mode for the newly added interfaces must match the mode for the existing group.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in Port-channel Configuration Mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group. The interface port-channel command places the switch in the ***interface-port-channel*** configuration mode.

The **`no channel-group`** and **`default channel group`** commands remove the configuration-mode interface from the specified channel group.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`channel-group` ***number*** mode ***group_mode***

`no channel-group`

`default channel-group`

Parameters

- ***number*** Specifies a channel group ID. Values range from 1 through 2000.
- ***group_mode*** Specifies the channel-group mode for the channel group. Values include:
  - **on** Port channel is static and LACP is disabled on member interfaces. Port neither verifies nor negotiates port channel membership.
    - **active** Port channel is dynamic and member interfaces are active LACP ports that transmit and receive LACP negotiation packets.
    - **passive** Port channel is dynamic and member interfaces are passive LACP ports that respond to LACP negotiation packets but do not generate them.

Guidelines: Port Channels

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform-specific. For example, compatibility may require identical operating parameters such as speed and Maximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

Guidelines: MLAG Configurations

Static LAG is not recommended in MLAG configurations. However, these considerations apply when the channel group mode is **on** while configuring static MLAG:

- When configuring multiple interfaces on the same static port channel:
  - all interfaces must physically connect to the same neighboring switch.
  - the neighboring switch must configure all interfaces into the same port channel.

The switches are misconfigured when these conditions are not met.

Disable the static port channel membership before moving any cables connected to these interfaces or changing a static port channel membership on the remote switch.

Examples

- These commands assign Ethernet interfaces ***8*** and ***9*** to channel group ***10***, and enable LACP in negotiating mode.

```
switch(config)# interface ethernet 8-9
switch(config-if-Et8-9)# channel-group 10 mode active
switch(config-if-Et8-9)# show active
interface Ethernet8
   channel-group 10 mode active
interface Ethernet9
   channel-group 10 mode active
switch(config-if-Et8-9)#
```

- These commands assign Ethernet interfaces ***12*** and ***13*** to static channel group ***11***. LACP is disabled on these interfaces.

```
switch(config)# interface ethernet 12-13
switch(config-if-Et12-13)# channel-group 11 mode on
switch(config-if-Et12-13)# show active
interface Ethernet12
   channel-group 11 mode on
interface Ethernet13
   channel-group 11 mode on
switch(config-if-Et12-13)#
```

11.2.5.2 distribution random

The **distribution random** command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile. All data fields and hash seeds that are configured for the profile are used as seeds for the random number generator that defines the distribution of individual packets.

Command options allow for the random distribution of traffic across port channel links and ECMP routes. Random distribution can be enabled for either, both, or neither.

The **no distribution random** and **default distribution random** commands remove random distribution on the configuration mode load balance profile by deleting the corresponding **distribution random** command from the configuration.

Command Mode

Load-balance-profile Configuration

Command Syntax

distribution random **BALANCE_TYPE**

no distribution random

default distribution random

Parameters

SCOPE Specifies use of random distribution for port channels and ECMP routes. Options include:

- ***no parameter*** Random distribution is enabled for ECMP routes and port channel links.
- **ecmp** Random distribution is enabled for ECMP routes.
- **port-channel** Random distribution is enabled for port channel links.
- **port-channel ecmp** Random distribution is enabled for ECMP routes and port channel links.
- **ecmp port-channel** Random distribution is enabled for ECMP routes and port channel links.

Guidelines

The **distribution random** command takes precedence over the distribution symmetric-hash command when both methods are simultaneously enabled.

Related Commands

load-balance fm6000 profile places the switch in the ***load-balance-profile*** configuration mode.

Example

These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)# distribution random
 ecmp port-channel
switch(config-load-balance-profile-LB-1)# show active
load-balance policies
   load-balance fm6000 profile LB-1
      distribution random ecmp port-channel
switch(config-load-balance-profile-LB-1)#
```

11.2.5.3 distribution symmetric-hash

The **distribution symmetric-hash** command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.

Two symmetric-hash options specify the traffic upon which symmetry is enforced:

- **distribution symmetric-hash mac** specifies that only non-IP traffic is hashed symmetrically. IP traffic is hashed normally without regard to symmetry.
- **distribution symmetric-hash mac-ip** specifies that all traffic is hashed symmetrically.

The **no distribution symmetric-hash** and **default distribution symmetric-hash** commands remove the specified hashing symmetry restriction on the configuration mode load balance profile by deleting the corresponding **distribution symmetric-hash** command from ***running-config***.

Command Mode

Load-balance-profile

Command Syntax

distribution symmetric-hash **FIELD_TYPE**

no distribution symmetric-hash

default distribution symmetric-hash

Parameters

FIELD_TYPE Fields the hashing algorithm uses for Layer 3 routing. Options include:

- **mac** Non-IP traffic is hashed symmetrically.
- **mac-ip** All traffic is hashed symmetrically.

Guidelines

The distribution random command takes precedence over the **distribution symmetric-hash** command when both methods are simultaneously enabled.

Related Commands

load-balance fm6000 profile places the switch in the ***load-balance-profile*** configuration mode.

Example

These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)# distribution symmetric-
hash mac-ip
switch(config-load-balance-profile-LB-1)# show active
load-balance policies
   load-balance fm6000 profile LB-1
      distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-1)#
```

11.2.5.4 fields ip

The **fields ip** command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value by using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no fields ip** configures the algorithm not to use L3/L4 data fields. The **default fields ip** command restores the default data L3/L4 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **fields ip** or **no fields ip** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

fields ip IP_FIELD

no fields ip

default fields ip

Parameters

IP_FIELD Specifies the L3/L4 fields the hashing algorithm uses. Options include:

- **dscp** Algorithm uses dscp field.
- **dst-ip** Algorithm uses destination IP address field.
- **dst-port** Algorithm uses destination TCP/UDP port field.
- **protocol** Algorithm uses protocol field.
- **src-ip** Algorithm uses source IP address field.
- **src-port** Algorithm uses source TCP/UDP port field.

Command may include from one to six fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

load-balance fm6000 profile places the switch in the ***load-balance-profile*** configuration mode.

Example

These commands specify the IP source and protocol fields as components of the hash algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)# fields ip src-ip
 protocol
switch(config-load-balance-profile-LB-1)# show active
load-balance policies
```

```
   load-balance fm6000 profile LB-1
      fields ip protocol src-ip
switch(config-load-balance-profile-LB-1)#
```

11.2.5.5 fields mac

The **fields mac** command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no fields mac** configures the algorithm not to use L2 data fields. The **default fields mac** command restores the default data L2 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **fields mac** or **no fields mac** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

fields mac **MAC_FIELD**

no fields mac

default fields mac

Parameters

MAC_FIELD Specifies the L2 fields the hashing algorithm uses. Options include:

- **dst-mac** Algorithm uses the MAC destination field.
- **eth-type** Algorithm uses the Ethernet port type field.
- **src-mac** Algorithm uses MAC source field.
- **vlan-id** Algorithm uses VLAN ID field.
- **vlan-priority** Algorithm uses VLAN priority field.

Related Commands

The load-balance fm6000 profile command places the switch in to the ***load-balance-profile*** configuration mode.

Example

These commands specify the MAC destination and VLAN priority fields as components of the hash algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)# fields mac dst-mac
 vlan-priority
switch(config-load-balance-profile-LB-1)# show active
load-balance policies
   load-balance fm6000 profile LB-1
      fields mac dst-mac vlan-priority
```

```
switch(config-load-balance-profile-LB-1)#
```

11.2.5.6 hash-seed

The **hash-seed** command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile. Profile algorithms can load balance packets across port channel links or ECMP routes.

The **no hash-seed** and **default hash-seed** commands restore the default hash seed value of 0 to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **hash-seed** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

hash-seed ***number***

no hash-seed ***number***

default hash-seed ***number***

Parameters

number Specifies the value of the hash seed. Value ranges from ***0*** to ***39***.

Example

These commands configure the ***hash seed 20*** in a profile and assign it as the global profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance sand profile
 myGlobalProfile
switch(config-sand-load-balance-profile-myGlobalProfile)# hash-
seed 20
switch(config)# port-channel load-balance sand profile
 myGlobalProfile
```

11.2.5.7 ingress load-balance profile

The **`ingress load-balance profile`** command applies the specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

Load balance profiles can be assigned to Ethernet and port channel interfaces. Profiles define the distribution method of traffic that ingresses the interface among the ports comprising a port channel or routes comprising an ECMP.

The default load balance profile is configured through port-channel load-balance fm6000 fields ip and port-channel load-balance fm6000 fields mac commands.

The **`no ingress load-balance profile`** and **`default ingress load-balance profile`** commands restore the default load balance profile for the configuration mode interface by removing the corresponding **`ingress load-balance profile`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`ingress load-balance profile` ***profile_name***

`no ingress load-balance profile`

`default ingress load-balance profile`

Parameters

profile_name Name of profile assigned to interface.

Example

This command applies the ***LB-1*** load balance profile to port channel interface ***100***.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# show active
interface Port-Channel100

switch(config-if-Po100)# ingress load-balance profile LB-1
switch(config-if-Po100)#
interface Port-Channel100
   ingress load-balance profile LB-1

switch(config-if-Po100)#
```

11.2.5.8 interface port-channel

The **`interface port-channel`** command places the switch in port-channel interface configuration mode for modifying parameters of specified link aggregation (LAG) interfaces. When entering configuration mode to modify existing port channel interfaces, the command can specify multiple interfaces.

The command creates a port channel interface if the specified interface does not exist prior to issuing the command. When creating an interface, the command can only specify a single interface.

The **`no interface port-channel`** and **`default interface port-channel`** commands delete the specified LAG interfaces from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`interface port-channel` ***p_range***

`no interface port-channel` ***p_range***

`default interface port-channel` ***p_range***

Parameter

p_range Port channel interfaces (number, range, or comma-delimited list of numbers and ranges).

Port channel numbers range from ***1*** to ***2000***.

Guidelines

When configuring a port channel, you do not need to issue the **`interface port-channel`** command before assigning a port to the port channel (see the channel-group command). The port channel number is implicitly created when a port is added to the specified port channel with the **`channel-group number`** command.

To display ports that are members of a port channel, enter show port-channel. To view information about hardware limitations for a port channel, enter show port-channel limits.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or Maximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

You can configure a port channel with a set of ports such that more than one subset of the member ports are mutually compatible. Port channels in EOS are designed to activate the compatible subset of ports with the largest aggregate capacity. A subset with two 40 Gbps ports (aggregate capacity 80 Gbps) has preference to a subset with five active 10 Gbps ports (aggregate capacity 50 Gbps).

Example

This example creates ***interface port-channel 3***:

```
switch(config)# interface port-channel 3
switch(config-if-Po3)#
```

11.2.5.9 lacp port-priority

The **lacp port-priority** command sets the aggregating port priority for the configuration mode interface. Priority is supported on port channels with LACP-enabled physical interfaces. LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority.

Each port in an aggregation is assigned a 32-bit port identifier by prepending the port priority (16 bits) to the port number (16 bits). Port priority determines the ports that are placed in standby mode when hardware limitations prevent a single aggregation of all compatible ports.

Priority numbers range from ***0*** to ***65535***. The default is ***32768***. Interfaces with higher priority numbers are placed in standby mode before interfaces with lower priority numbers.

The **no lacp port-priority** and **default lacp port-priority** commands restore the default port-priority to the configuration mode interface by removing the corresponding **lacp port-priority** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

lacp port-priority ***priority_value***

no lacp port-priority

default lacp port-priority

Parameters

priority_level Port priority. Values range from ***0*** to ***65535***. Default is ***32768***

Example

These commands assign the port priority of ***4096*** to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# lacp port-priority 4096
switch(config-if-Et8)# show active
interface Ethernet8
   lacp port-priority 4096
switch(config-if-Et8)#
```

11.2.5.10 lacp system-priority

The **lacp system-priority** command configures the switch's LACP system priority. Values range between ***0*** and ***65535***. Default value is ***32768***.

Each switch is assigned a globally unique 64-bit system identifier by prepending the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). Peer devices use the system identifier when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities resulting from LACP data; the system with the numerically lower system identifier can dynamically change advertised aggregation parameters.

The **no lacp system-priority** and **default lacp system-priority** commands restore the default system priority by removing the **lacp system-priority** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

lacp system-priority ***priority_value***

no lacp system-priority

default lacp system-priority

Parameters

priority_value System priority number. Values range from ***0*** to ***65535***. Default is ***32768***.

Example

This command assigns the system priority of ***8192*** to the switch.

```
switch(config)# lacp system-priority 8192
switch(config)#
```

11.2.5.11 lacp timer

The **`lacp timer`** command configures the LACP reception interval on the configuration mode interface. The LACP timeout specifies the reception rate of LACP packets at interfaces supporting LACP. Supported rates include:

- **normal**: 30 seconds with synchronized interfaces; one second while interfaces are synchronizing.
- **fast**: one second.

This command is supported on LACP-enabled interfaces. The default value is **normal**.

The **`no lacp timer`** and **`default lacp timer`** commands restore the default value of **normal** on the configuration mode interface by deleting the corresponding **`lacp timer`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`lacp timer` **RATE_LEVEL**

`no lacp timer`

`default lacp timer`

Parameters

RATE_LEVEL LACP reception interval. Options include:

- **fast** One second.
- **normal** ***30*** seconds for synchronized interfaces; ***1*** second while interfaces synchronize.

Example

This command sets the LACP timer to ***1*** second on ***ethernet interface 4***.

```
switch(config-if-Et4)# lacp timer fast
switch(config-if-Et4)#
```

11.2.5.12 load-balance fm6000 profile

The **`load-balance fm6000 profile`** command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports 16 load balance profiles, including the default profile. The default load balance profile is configured through port-channel load-balance fm6000 fields ip and port-channel load-balance fm6000 fields mac commands.

The load balance profile name is referenced when it is applied to an interface. The default profile is not associated with a name and is applied to an interface in the absence of a named profile assignment.

The **`no load-balance fm6000 profile`** and **`default load-balance fm6000 profile`** commands delete the specified load balance profile from ***running-config***. Profiles that are assigned to an interface cannot be deleted. Attempts to delete an assigned profile generate a **`profile in use`** error messages.

The **`load-balance fm6000 profile`** command is accessible from ***load-balance-policies*** configuration mode. The ***load-balance-profile*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***load-balance-policies*** configuration mode does not affect the configuration. The **`exit`** command returns the switch to the ***load-balance-policies*** configuration mode.

Command Mode

Load-balance-policies Configuration

Command Syntax

`load-balance fm6000 profile` ***profile_name***

`no load-balance fm6000 profile` ***profile_name***

`default load-balance fm6000 profile` ***profile_name***

Parameters

profile_name Name of the load-balance profile.

Commands Available in Load-balance-profile Configuration Mode

- fields ip
- fields mac
- distribution random
- distribution symmetric-hash
- port-channel hash-seed
- **`show active`** displays the contents of the configuration mode profile.

Related Commands

- The load-balance policies command places the switch in to the ***load-balance-policies*** configuration mode.
- The ingress load-balance profile command applies a load-balance profile to an Ethernet or port channel interface.
- The show load-balance profile command displays the contents of load balance profiles.

Example

These commands enters the ***load-balance-profile*** configuration mode, creates the **LB-1** profile, and lists the default settings for the profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)# show active all
load-balance policies
   load-balance fm6000 profile LB-1
      port-channel hash-seed 0
      fields mac dst-mac src-mac eth-type vlan-priority vlan-id
      fields ip protocol dst-ip dst-port src-ip src-port dscp
      no distribution symmetric-hash
      no distribution random
switch(config-load-balance-profile-LB-1)#
```

11.2.5.13 load-balance policies

The **load-balance policies** command places the switch in load-balance-policies configuration mode. Load-balance-policies configuration mode provides commands for managing load-balance profiles. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

The **no load-balance policies** and **default load-balance policies** commands delete all load balance profiles from ***running-config***. The command generates an error message when at least one profile is assigned to an interface.

Load-balance-policies configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***load-balance-policies*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

load-balance policies

no load-balance policies

default load-balance policies

Commands Available in Load-balance-policies Configuration Mode

- load-balance fm6000 profile places the switch in ***load-balance-profile*** configuration mode.
- **show active** displays contents of all load balance profiles.

Related Commands

- The ingress load-balance profile command applies a load-balance profile to an Ethernet or port channel interface.
- The show load-balance profile command displays the contents of load balance profiles.

Examples

- This command places the switch in the ***load-balance-policies*** configuration mode.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)#
```

- This command displays the contents of the three configured load balance profiles.

```
switch(config-load-balance-policies)# show active

load-balance policies
   load-balance fm6000 profile F-01
      port-channel hash-seed 22
      fields ip dscp
      distribution random port-channel
   !
   load-balance fm6000 profile F-02
      fields ip protocol dst-ip
      fields mac dst-mac eth-type
      distribution random ecmp port-channel
   !
   load-balance fm6000 profile F-03
```

```
switch(config-load-balance-policies)#
```

11.2.5.14 load-balance sand profile (7500E/7500R)

The **load-balance sand profile** command configures a load-balance profile on a sand module switch. A default profile is designated as a global profile when no other profile is set as global profile. Note, a warning message is displayed when a profile is entered or deleted.

If **no load-balance sand profile** command is executed when the profile set is default then the following warning message is displayed:

```
! profile default is a reserved profile and cannot be deleted
```

Command Mode

Global Configuration

Command Syntax

load-balance sand profile ***profile_name***

no load-balance sand profile ***profile_name***

Parameter

profile_name Name of the profile assigned to the selected module.

Examples

- These commands designate a default profile as a global profile on sand module platform switch. Note, a warning message is displayed when a profile is entered or deleted.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance sand
 profile default
 ! profile default is a reserved profile
! profile default is the current global profile
```

- When no form of the command is executed it displays the following warning message.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# no load-balance sand
 profile default
! profile default is a reserved profile and cannot be deleted
```

11.2.5.15 port-channel hash-seed

The **`port-channel hash-seed`** command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile when distributing the load across ports comprising a port channel. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The hash seed that the algorithm uses to select port channel links or ECMP routes is configured by the ip load-sharing command.

The **`no port-channel hash-seed`** and **`default port-channel hash-seed`** commands restore the default hash seed value of ***0*** to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **`port-channel hash-seed`** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

`port-channel hash-seed` ***number***

`no port-channel hash-seed`

`default port-channel hash-seed`

Parameters

number The hash seed. Value ranges from ***0*** to ***39***.

Related Commands

The load-balance fm6000 profile command places the switch in to the ***load-balance-profile*** configuration mode.

Example

Thes commands configure the port-channel hash seed of ***22*** for the hash algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)# load-balance policies
switch(config-load-balance-policies)# load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)# port-channel hash-seed
 22
switch(config-load-balance-profile-LB-1)# show active
load-balance policies
   load-balance fm6000 profile LB-1
      port-channel hash-seed 22
switch(config-load-balance-profile-LB-1)#
```

11.2.5.16 port-channel lacp fallback

The **port-channel lacp fallback** command enables the LACP fallback mode on the interface.

LACP fallback is unconfigured and disabled by default. An LACP interface without fallback enabled does not form a LAG until it receives PDUs from its peer.

LACP fallback can be configured on an interface in static or individual mode:

- **static mode** The port channel member with the lowest LACP port priority is active and maintains contact with the peer (sending and receiving data) while other port channel members remain in standby mode until a LACP PDU is received. All members continue to send (and can receive) LACP PDUs.
- **individual mode** All port channel members act as individual ports, reverting to their port-specific configuration while the channel is in fallback mode, and continue to send and receive data. All members continue to send LACP PDUs until a LACP PDU is received by one of the member ports.

The **no port-channel lacp fallback** and **default port-channel lacp fallback** commands disable LACP fallback mode on the configuration mode interface by removing the corresponding **port-channel lacp fallback** command from ***running-config***.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

port-channel lacp fallback [**MODE**]

no port-channel lacp fallback

default port-channel lacp fallback

Parameters

MODE LACP fallback mode. Options include:

- ***no parameter*** Enables static LACP fallback mode.
  - **static** Enables static LACP fallback mode.
  - **individual** Eenables individual LACP fallback mode.

Related Commands

- The port-channel lacp fallback timeout command configures the fallback timeout period for a port channel interface. The default LACP fallback timeout period is ***90*** seconds.
- The lacp port-priority command configures the port priority for an individual interface.

Examples

- These commands enable LACP static fallback mode, then configure an LACP fallback timeout of 100 seconds on ***interface port-channel 13***. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

```
switch(config)# interface port-channel 13
switch(config-if-Po13)# port-channel lacp fallback static
switch(config-if-Po13)# port-channel lacp fallback timeout 100
switch(config-if-Po13)# show active
interface Port-Channel13
   port-channel lacp fallback static
   port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

- These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of ***50*** seconds on ***interface port-channel 17***. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config)# interface port-channel 17
switch(config-if-Po17)# port-channel lacp fallback individual
switch(config-if-Po17)# port-channel lacp fallback timeout 50
switch(config-if-Po17)# show active
interface Port-Channel17
   port-channel lacp fallback individual
   port-channel lacp fallback timeout 50
switch(config-if-Po17)#
```

11.2.5.17 port-channel lacp fallback timeout

The **`port-channel lacp fallback timeout`** command specifies the fallback timeout period for the configuration mode interface.

Fallback timeout settings persist in ***running-config*** without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is ***90*** seconds.

The **`no port-channel lacp fallback timeout`** and **`default port-channel lacp fallback timeout`** commands restore the default fallback timeout of ***90*** seconds for the configuration mode interface by removing the corresponding **`port-channel lacp fallback timeout`** command from ***running-config***.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

`port-channel lacp fallback timeout` ***period***

`no port-channel lacp fallback timeout`

`default port-channel lacp fallback timeout`

Parameters

period Maximum interval between receipt of LACP PDU packets (seconds). Value ranges from ***1*** to ***300*** seconds. Default value is ***90***.

Related Commands

The port-channel lacp fallback command configures fallback mode for a port channel interface.

Guidelines

The fallback timeout period should not be shorter than the LACP reception interval (lacp timer). The default LACP reception interval is ***30*** seconds.

Example

This command enables LACP fallback mode, then configures an LACP fallback timeout of ***100*** seconds on ***interface port-channel 13***.

```
switch(config)# interface port-channel 13
switch(config-if-Po13)# port-channel lacp fallback
switch(config-if-Po13)# port-channel lacp fallback timeout 100
switch(config-if-Po13)# show active
interface Port-Channel13
   port-channel lacp fallback
   port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

11.2.5.18 port-channel load-balance

The **`port-channel load-balance`** command specifies the seed in the hashing algorithm that balances the load across ports comprising a port channel. Available seed values vary by switch platform.

The **`no port-channel load-balance`** and **`default port-channel load-balance`** commands remove the **`port-channel load-balance`** command from ***running-config***, restoring the default hash seed value of ***0***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` ***platform*** { ***hash_seed*** | fields ip ***fields*** | hash ***hash_function*** }

`no port-channel load-balance` ***platform*** [***hash_seed***]

`default port-channel load-balance` ***platform*** [***hash_seed***]

Parameters

Note: Parameter options vary by switch model. Verify available options with the **`?`** command.

- ***platform*** ASIC switching device. Value depends on the switch model.
- ***hash_seed*** The numerical seed for the hash function. Value range varies by switch platform:
  - **arad** ***0*** to ***65535***.
  - **fm6000** ***0*** to ***39***.
  - **petraA** Uses field inputs only.
  - **trident** ***0*** to ***47***.

  For trident platform switches, algorithms using hash seeds between ***0*** and *15* typically result in more effective distribution of data streams across the port channels.
- ***fields*** Which fields will be used as inputs to the port channel hash.
  - **gre** Configure which GRE fields are inputs to the hash.
  - **ip** Configure which fields are inputs to the hash for IPv4 packets.
  - **ipv6** Configure which fields are inputs to the hash for IPv6 packets.
  - **mac** Configure which MAC fields are inputs to the hash.
  - **mac-in-mac** Configure which MAC-in-MAC fields are inputs to the hash.
  - **mpls** Configure which MPLS fields are inputs to the hash.
  - **destination-ip** Use the Layer 3 IP destination address in the hash.
  - **destination-port** Use the Layer 4 TCP/UDP destination port in the hash.
  - **dst-ip** Use the destination IP address in the hash.
  - **dst-mac** Use the destination Payload MAC in the hash (or the destination MAC address in the MAC hash).
  - **eth-type** Use the Ethernet type in the MAC hash.
  - **ip-in-ip** Use the outer IP header in the hash for IPv4 over IPv4 GRE tunnel.
  - **ip-in-ipv6** Use the outer IP header in the hash for IPv4 over IPv6 GRE tunnel.
  - **ipv6-in-ip** Use the outer IP header in the hash for IPv6 over IPv4 GRE tunnel.
  - **ipv6-in-ipv6** Use the outer IP header in the hash for IPv6 over IPv6 GRE tunnel.
  - **ip-tcp-udp-header** Use the Layer 3 and Layer 4 hashes.
  - **isid** Use the MAC-in-MAC ISID in the hash.
  - **label** Use the MPLS label in the hash.
  - **mac-header** Use the MAC hash.
  - **outer-mac** Use the outer MAC of source and destination in the hash.

- **source-ip** Use the Layer 3 IP source address in the hash.
- **src-ip** Use the source IP address in the hash.
- **source-port** Use l\Layer 4 TCP/UDP source port in the hash.
- **src-mac** Use the source payload MAC in the hash (or the source MAC address in the MAC hash).

- ***hash_function*** Specifies the hash polynomial function. Values range from ***0***-***2***.

Example

This command configures a hash seed of ***10*** on an FM6000 platform switch.

```
switch(config)# port-channel load-balance fm6000 10
switch(config)#
```

11.2.5.19 port-channel load-balance arad fields ip

The **`port-channel load-balance arad fields ip`** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Arad platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **`no port-channel load-balance arad fields ip`** and **`default port-channel load-balance arad fields ip`** commands restore the default data fields for the IP packet load balancing algorithm by removing the **`port-channel load-balance arad A fields ip`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance arad` fields ip **IP_FIELD_NAME**

`no port-channel load-balance arad` fields ip

`default port-channel load-balance arad` fields ip

Parameters

IP_FIELD_NAME Fields the hashing algorithm uses for Layer 3 routing. Options include:

- **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
    - **mac-header** Algorithm uses entire MAC header.

      A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Related Command

The port-channel load-balance command configures the hash seed for the algorithm.

Example

These commands configure the switch's port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)# port-channel load-balance fm6000 fields ip ip-
tcp-udp-header
switch(config)#
```

11.2.5.20 port-channel load-balance fm6000 fields ip

The **port-channel load-balance fm6000 fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on FM6000 platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance fm6000 fields ip** and **default port-channel load-balance fm6000 fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance fm6000 fields ip** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance fm6000 fields ip **IP_FIELD_NAME**

no port-channel load-balance fm6000 fields ip

default port-channel load-balance fm6000 fields ip

Parameters

IP_FIELD_NAME Specifies fields the hashing algorithm uses for layer 3 routing. Options include:

- **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Related Commands

- The port-channel load-balance command configures the hash seed for the algorithm.
- The port-channel load-balance fm6000 fields mac command controls the hash algorithm for non-IP packets.

Example

These commands configure the switch's port channel load balance for IP packets by source and destination IP address and port fields.

```
switch(config)# port-channel load-balance fm6000 fields ip ip-
tcp-udp-header
switch(config)#
```

11.2.5.21 port-channel load-balance fm6000 fields mac

The **port-channel load-balance fm6000 fields mac** command specifies data fields that configure the port channel load balance hash algorithm for non-IP packets on FM6000 platform switches. The hashing algorithm fields used for balancing non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance fm6000 fields mac** and **default port-channel load-balance fm6000 fields mac** commands restore the default data fields for the non-IP packet load balancing algorithm by removing the **port-channel load-balance fm6000 fields mac** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance fm6000 fields mac **MAC_FIELD_NAME**

no port-channel load-balance fm6000 fields mac

default port-channel load-balance fm6000 fields mac

Parameters

MAC_FIELD_NAME Fields the hashing algorithm uses for Layer 2 routing. Options include:

- **dst-mac** MAC destination field.
- **eth-type** EtherType field.
- **src-mac** MAC source field.
- **vlan-id** VLAN ID field.
- **vlan-priority** VLAN priority field.

Command may include from one to five fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

- The port-channel load-balance command configures the hash seed for the algorithm.
- The port-channel load-balance fm6000 fields ip command controls the hash algorithm for IP packets.

Example

These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)# port-channel load-balance fm6000 fields mac dst-
mac eth-type
switch(config)#
```

11.2.5.22 port-channel load-balance module

The **port-channel load-balance module** command assigns a named load-balancing profile to a linecard.

Note: Available on the 7500E platform.

The **no port-channel load-balance module** and **default port-channel load-balance module** commands unassigns the load balancing module, or restores the default data fields for the load balancing module.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

no port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

default port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

Parameters

- **LINECARD_RANGE** Linecard number range includes:
  - ***3-10*** Linecard number range.
- **PROFILE_NAME** Load-balance profile name.

Examples

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)# port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)# no port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

11.2.5.23 port-channel load-balance petraA fields ip

The **port-channel load-balance petraA fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Petra platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance petraA fields ip** and **default port-channel load-balance petraA fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance petraA fields ip** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance petraA fields ip **IP_FIELD_NAME**

no port-channel load-balance petraA fields ip

default port-channel load-balance petraA fields ip

Parameters

IP_FIELD_NAME Fields the hashing algorithm uses for Layer 3 routing. Options include:

- **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
- **mac-header** Algorithm uses entire MAC header.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Related Command

The port-channel load-balance command configures the hash seed for the algorithm.

Example

These commands configure the switch's port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)# port-channel load-balance fm6000 fields ip ip-
tcp-udp-header
switch(config)#
```

11.2.5.24 port-channel load-balance sand profile (7500E/7500R)

The **`port-channel load-balance sand profile`** command configures a global LAG hashing profile on the port channel interface. A default profile is set as a global profile when no other profile is set as global.

The **`no port-channel load-balance sand profile`** command removes the active profile from the **`port-channel load-balance`** command from ***running-config***, restoring the default profile.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` sand profile ***profile_name***

`no port-channel load-balance` sand profile ***profile_name***

Parameter

profile_name Name of the profile assigned to the selected module.

Example

This command configures a global LAG hashing profile on 7500 series platform switch.

```
switch(config)# port-channel load-balance sand profile
 myGlobalProfile
switch(config)#
```

11.2.5.25 port-channel load-balance trident fields ip

The **`port-channel load-balance trident fields ip`** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Trident platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **`no port-channel load-balance trident fields ip`** and **`default port-channel load-balance trident fields ip`** commands restore the default data fields for the IP packet load balancing algorithm by removing the **`port-channel load-balance trident fields ip`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` trident fields ip **IP_FIELD_NAME**

`no port-channel load-balance` trident fields ip

`default port-channel load-balance` trident fields ip

`default port-channel load-balance` trident fields ip ingress-interface ***disabled***

Parameters

- **IP_FIELD_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Command may include from one to four of the following four options, in any combination and listed in any order.
  - **destination-ip** Algorithm uses destination IP address field.
  - **source-ip** Algorithm uses source IP address field.
  - **destination-port** Agorithm uses destination TCP/UDP port field.
  - **source-port** Algorithm uses source TCP/UDP port field.
    - **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.

      Note: This option cannot be used in combination with any other option.
  - **mac-header** Algorithm uses fields specified by port-channel load-balance trident fields mac.

    Note: This option cannot be used in combination with any other option.
  - **ingress-interface** Disable from LAG hashing.

Default setting is **ip-tcp-udp-header**

Related Commands

- The port-channel load-balance command configures the hash seed for the algorithm.
- The port-channel load-balance trident fields ipv6 command controls the hash algorithm for IPv6 packets.

- The port-channel load-balance trident fields mac command controls the hash algorithm for non-IP/IPv6 packets.

Examples

- These commands configure the switch's port channel load balance for IP packets by using the IPv6 destination field in the hashing algorithm.

```
switch(config)# port-channel load-balance trident fields ip
 destination-ip
switch(config)#
```

- This command disables the ingress interface for IPv4 traffic.

```
switch(config)# port-channel load-balance trident fields ip
 ingress-interface disabled
switch(config)#
```

11.2.5.26 port-channel load-balance trident fields ipv6

The **`port-channel load-balance trident fields ipv6`** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IPv6 packets on Trident platform switches. The hashing algorithm fields used for IPv6 packets differ from the fields used for non-IPv6 packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **`no port-channel load-balance trident fields ipv6`** and **`default port-channel load-balance trident fields ipv6`** commands restore the default data fields for the IPv6 packet load balancing algorithm by removing the **`port-channel load-balance trident fields ipv6`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` trident fields ipv6 **IP_FIELD_NAME**

`no port-channel load-balance` trident fields ipv6

`default port-channel load-balance` trident fields ipv6

Parameters

- **IP_FIELD_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Command may include from one to four of the following four options, in any combination and listed in any order.
  - **destination-ip** Algorithm uses destination IPv6 address field.
  - **source-ip** Algorithm uses source IPv6 address field.
  - **destination-port** Algorithm uses destination TCP/UDP port field.
  - **source-port** Algorithm uses source TCP/UDP port field.
    - **ip-tcp-udp-header** Algorithm uses source and destination IPv6 address fields. Source and destination port fields are included for TCP and UDP packets.

      Note: This option can't be used in combination with any other option.
    - **mac-header** Algorithm uses fields specified by port-channel load-balance trident fields mac.

      Note: This option can't be used in combination with any other option.
    - **ingress-interface** Disable from LAG hashing.

  Default setting is **ip-tcp-udp-header**

Related Commands

- The port-channel load-balance command configures the hash seed for the algorithm.
- The port-channel load-balance trident fields ipv6 commands controls the hash algorithm for non-IP packets.
- The port-channel load-balance trident fields mac command controls the hash algorithm for non-IP packets.

Examples

- These commands configure the switch’s port channel load balance for IP packets by using the IPv6 source field in the hashing algorithm.

```
switch(config)# port-channel load-balance trident fields ipv6
 source-ip
switch(config)#
```

- This command disables the ingress interface for IPv6 traffic.

```
switch(config)# port-channel load-balance trident fields ipv6
 ingress-interface disabled
switch(config)#
```

11.2.5.27 port-channel load-balance trident fields mac

The **`port-channel load-balance trident fields mac`** command specifies data fields that the port channel load balance hash algorithm uses for distributing non-IP packets on Trident platform switches. The hashing algorithm fields used for non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **`no port-channel load-balance trident fields mac`** and **`default port-channel load-balance trident fields mac`** commands restore the default data fields for the non-IP packet load balancing algorithm by removing the **`port-channel load-balance trident fields mac`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` trident fields mac **MAC_FIELD_NAME**

`no port-channel load-balance` trident fields mac

`default port-channel load-balance` trident fields mac

`default port-channel load-balance` trident fields mac ingress-interface ***disabled***

Parameters

- **MAC_FIELD_NAME** Fields the hashing algorithm uses for Layer 2 routing. Options include:
  - **dst-mac** MAC destination field.
  - **eth-type** EtherType field.
  - **src-mac** MAC source field.
  - **ingress-interface** Disable from LAG hashing.

  Command may include from one to three fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

- port-channel load-balance configures the hash seed for the algorithm.
- port-channel load-balance trident fields ip controls the hash algorithm for IP packets.
- port-channel load-balance trident fields ipv6 controls the hash algorithm for IP packets.

Examples

- These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)# port-channel load-balance trident fields mac
 dst-mac eth-type
switch(config)#
```

- This command disables the ingress interface for IPv4 traffic.

```
switch(config)# port-channel load-balance trident fields mac
 ingress-interface disabled
switch(config)#
```

11.2.5.28 port-channel min-links

The **port-channel min-links** command specifies the minimum number of interfaces that the configuration mode LAG requires to become active. If there are fewer ports than specified by this command, the port channel interface does not become active. The default min-links value is ***0***.

The **no port-channel min-links** and **default port-channel min-links** commands restore the default min-links setting for the configuration mode LAG by removing the corresponding **port-channel min-links** command from the configuration.

Note: In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up. In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner's side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links. EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs **LAG-4-MINLINK_INTF_INSUFFICIENT** message. If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. **LAG-4-MINLINK_INTF_NORMAL** is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise **LAG-4-MINLINK_INTF_INSUFFICIENT** is syslogged and the port-channel goes Link Down. If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is ***360s*** seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

port-channel min-links ***quantity***

no port-channel min-links

default port-channel min-links

Parameters

quantity Minimum number of interfaces. Value range varies by platform. Default value is ***0***.

Example

These commands set ***4*** as the minimum number of ports required for ***port channel 13*** to become active.

```
switch(config)# interface port-channel 13
switch(config-if-Po13)# port-channel min-links 4
switch(config-if-Po13)# show active
interface Port-Channel13
   port-channel min-links 4
```

```
switch(config-if-Po13)#
```

11.2.5.29 port-channel min-links review interval

The **`port-channel min-links review interval`** command enables or disables timer based min-links review feature for all port-channels.

The **`no port-channel min-links review interval`** and **`default port-channel min-links review interval`**commands restore the default min-links-timeout-base to 180 seconds by removing the corresponding **`port-channel min-links review interval`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel min-links review interval` ***timeout (seconds)***

`no port-channel min-links review interval`

`default port-channel min-links review interval`

Guidelines

The min-links-timeout-base interval for port-channels can be set within the range of ***0*** to ***600*** seconds. When setting the review interval to zero, the command has the following effect:

- Disables the timer-based min-links review feature for all port-channels.
  - For LACP port-channels, it prevents the port-channel from bringing link up (even after one or more member ports were negotiated to collect or distribute (rx or tx)) until there are sufficient member interfaces ready to join the port-channel. Meanwhile, the partner can enable the port-channel link with fewer than required member interfaces. This configuration does not impact port-channels without min-links configuration.

Related Command

port-channel min-links

Example

This command sets the port-channel min-links interval to ***200*** seconds.

```
switch(config)# port-channel min-links review interval 200
```

11.2.5.30 port-channel speed mixed

The **`port-channel speed mixed`** command configures a port channel with the ability to have active members of multiple speeds.

Note: Available on the 7020, 7280, 7500, and 7800 platforms. Minimum links is not available on mixed-speed port channels.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

`port-channel speed mixed`

Related Commands

The interface port-channel command places the switch in the ***interface-port-channel*** configuration mode.

Example

These commands place the switch in the ***interface port-channel*** mode and configure the mixed speed port-channel.

```
switch(config)# interface port-channel 1
switch(config-if-Po1)# port-channel speed mixed
```

11.2.5.31 port-channel speed minimum

The **`port-channel speed minimum`** command specifies the cumulative minimum speed of all active members in order for a port channel to become active. If there is less than the specified by this command, the port channel interface does not become active.

Note: If both minimum speed and minimum links are configured, minimum speed will take precedence.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

`port-channel speed minimum` ***speed-value***

Parameter

speed-value Minimum speed value. The value ranges from ***1*** to ***65535***.

Related Command

The interface port-channel command places the switch in interface-port-channel configuration mode.

Example

These command sets ***100*** Gbps as the minimum speed needed for port channel ***1*** to become active.

```
switch(config)# interface port-channel 1
switch(config-if-Po1)# port-channel speed minimum 100 gbps
```

11.2.5.32 show lacp aggregates

The **show lacp aggregates** command displays aggregate IDs and the list of bundled ports for all specified port channels.

Command Mode

EXEC

Command Syntax

show lacp [**PORT_LIST**] aggregates [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: **PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** Port channels for which aggregate information is displayed. Options include:
  - ***<no parameter>*** All configured port channels.
  - ***c_range*** Channel list (number, range, or comma-delimited list of numbers and ranges).
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Ports bundled by LACP into the port channel.
  - **all-ports** All channel group ports, including channel group members not bundled into the port channel interface.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Aggregate ID and bundled ports for each channel.
  - **brief** Aggregate ID and bundled ports for each channel.
  - **detailed** Aggregate ID and bundled ports for each channel.

Example

This command lists aggregate information for all configured port channels.

```
switch> show lacp aggregates

Port Channel Port-Channel1:
 Aggregate ID:
[(8000,00-1c-73-04-36-d7,0001,0000,0000),(8000,00-1c-73-09-a0-f3,0001,0000,0000)]
  Bundled Ports: Ethernet43 Ethernet44 Ethernet45 Ethernet46
Port Channel Port-Channel2:
 Aggregate ID:
[(8000,00-1c-73-01-02-1e,0002,0000,0000),(8000,00-1c-73-04-36-d7,0002,0000,0000)]
  Bundled Ports: Ethernet47 Ethernet48
Port Channel Port-Channel3:
 Aggregate ID:
[(8000,00-1c-73-04-36-d7,0003,0000,0000),(8000,00-1c-73-0c-02-7d,0001,0000,0000)]

11.2.5.33 show lacp counters

The **`show lacp counters`** command displays LACP traffic statistics.

Command Mode

EXEC

Command Syntax

`show lacp` [**PORT_LIST**] counters [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: PORT_LEVEL and **INFO_LEVEL** parameters can be interchanged while running the command.

Parameters

- **PORT_LIST** Ports for which port information is displayed. Options include:
  - ***no parameter*** All configured port channels.
  - ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet *e_num*** Port on Ethernet interface specified by ***e_num***.
  - **interface port-channel *p_num*** Port on port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Only ports bundled by LACP into an aggregate.
  - **all-ports** All ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays packet transmission (TX and RX) statistics.
  - **brief** Displays packet transmission (TX and RX) statistics.
  - **detailed** Displays packet transmission (TX and RX) statistics and actor-partner statistics.

Example

This command displays transmission statistics for all configured port channels.

```
switch> show lacp counters brief

                      LACPDUs          Markers   Marker Response

switch>
```

11.2.5.34 show lacp interface

The **show lacp interface** command displays port status for all port channels that include the specified interfaces. Within the displays for each listed port channel, the output displays sys-id, partner port, state, actor port, and port priority for each interface in the channel.

Command Mode

EXEC

Command Syntax

show lacp interface [**INTERFACE_PORT**] [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: INTERFACE_PORT is listed first when present. Other parameters can be listed in any order.

Parameters

- **INTERFACE_PORT** Interfaces for which information is displayed. Options include:
  - ***no parameter*** All interfaces in channel groups.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** Port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Command lists data for ports bundled by LACP into the aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

Example

This command displays LACP configuration information for all ethernet interfaces.

```
switch> show lacp interface
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,
       D = Distributing, d = default neighbor state

             |                        Partner                          Actor

11.2.5.35 show lacp internal

The **`show lacp internal`** command displays the local LACP state for all specified channels. Local state data includes the state machines and LACP protocol information.

Command Mode

EXEC

Command Syntax

`show lacp` [**PORT_LIST**] internal [**PORT_LEVEL**] [**INFO_LEVEL**]

Parameters

- **PORT_LIST** Interface for which port information is displayed. Options include:
  - ***no parameter*** All configured port channels.
  - ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **interface port-channel *p_num*** Port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Command lists data for ports bundled by LACP into an aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

Note: PORT_LEVEL and **INFO_LEVEL** parameters can be placed in any order.

Example

This command displays internal data for all configured port channels.

```
switch> show lacp internal

LACP System-identifier: 8000,00-1c-73-04-36-d7
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,
       D = Distributing, d = default neighbor state
            |Partner                                Actor

```

11.2.5.36 show lacp peer

The **show lacp peer** command displays the LACP protocol state of the remote neighbor for all specified port channels.

Command Mode

EXEC

Command Syntax

show lacp [**PORT_LIST**] peer [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: **PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** Interface for which port information is displayed. Options include:
  - ***no parameter*** Displays information for all configured port channels.
  - ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **interface port-channel *p_num*** Port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Command lists data for ports bundled by LACP into an aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

Example

This command displays the LACP protocol state of the remote neighbor for all port channels.

```
switch> show lacp peer

State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,
       D = Distributing, d = default neighbor state
                |                          Partner
Port    Status  | Sys-id                  Port#   State     OperKey  PortPri
-------------------------------------------------------------------------------
Port Channel Port-Channel1:

* - Only local interfaces for MLAGs are displayed. Connect to the peer to
```

```
    see the state for peer interfaces.
switch>
```

11.2.5.37 show lacp sys-id

The **show lacp sys-id** command displays the System Identifier the switch uses when negotiating remote LACP implementations.

Command Mode

EXEC

Command Syntax

show lacp sys-id [**INFO_LEVEL**]

Parameters

INFO_LEVEL Amount of information that is displayed. Options include:

- ***no parameter*** Displays system identifier.
- **brief** Displays system identifier.
- **detailed** Displays system identifier and system priority, including the MAC address.

Examples

- This command displays the system identifier.

```
switch> show lacp sys-id brief
8000,00-1c-73-04-36-d7
```

- This command displays the system identifier and system priority.

```
switch> show lacp sys-id detailed
System Identifier used by LACP:
System priority: 32768  Switch MAC Address: 00:1c:73:04:36:d7
  802.11.43 representation: 8000,00-1c-73-04-36-d7
```

11.2.5.38 show load-balance profile

The **`show load-balance profile`** command displays the contents of the specified load balance profiles. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes.

Command Mode

EXEC

Command Syntax

`show load-balance profile` [**PROFILES**]

Parameters

PROFILES Load balance profiles for which command displays contents. Options include:

- ***no parameter*** Displays all load balance profiles.
- ***profile_name*** Displays specified profile.

Related Commands

- load-balance policies places the switch in ***load-balance-policies*** configuration mode.
- ingress load-balance profile applies a load-balance profile to an Ethernet or port channel interface.

Example

This command displays the contents of the ***LB-1*** load balance profile.

```
switch> show load-balance profile LB-1

---------- LB-1 ----------

Source MAC address hashing                ON
Destination MAC address hashing           ON
Ethernet type hashing                     ON
VLAN ID hashing                           ON
IP protocol field hashing                 ON
DSCP field hashing is                     ON
Symmetric hashing for non-IP packets      OFF
Symmetric hashing for IP packets          OFF
Random distribution for port-channel      ON
Random distribution for ecmp              ON

Profile LB-1 is applied on the following
    Port-Channel100

---------- myGlobalProfile (global) ----------
L3 hashing is ON
Symmetric hashing is OFF
Hashing mode is flow-based
Hash polynomial is 3
Hash seed is 0
Profile myGlobalProfile (global) is applied on the following
Linecard3
Linecard4
Linecard5
Linecard6

switch>
```

11.2.5.39 show port-channel

The **show port-channel** command displays information about members the specified port channels.

Command Mode

EXEC

Command Syntax

show port-channel [**MEMBERS**] [**PORT_LIST**] [**INFO_LEVEL**]

Parameters

- **MEMBERS** List of port channels for which information is displayed. Options include:
  - ***no parameter*** All configured port channels.
  - ***p_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Displays information on ports that are active members of the LAG.
  - **active-ports** Displays information on ports that are active members of the LAG.
  - **all-ports** Displays information on all ports (active or inactive) configured for LAG.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays information at the brief level.
  - **brief** Displays information at the brief level.
  - **detailed** Displays information at the detail level.

Display Values

- **Port Channel** Type and name of the port channel.
- **Time became active** Time when the port channel came up.
- **Protocol** Protocol operating on the port channel.
- **Mode** Status of the Ethernet interface on the port. The status value is Active or Inactive.
- **No active ports** Number of active ports on the port channel.
- **Configured but inactive ports** Ports configured but that are not actively up.
- **Reason unconfigured** Reason why the port is not part of the LAG.

Guidelines

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform specific. For example, compatibility may require identical operating parameters such as speed and Maximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

Examples

- This command displays output from the **show port-channel** command.

```
switch> show port-channel 3
Port Channel Port-Channel3:
  Active Ports:
       Port                Time became active       Protocol    Mode
     --------------------------------------------------------------------------
       Ethernet3           15:33:41                 LACP        Active
       PeerEthernet3       15:33:41                 LACP        Active
```

- This command displays output from the **show port-channel active-ports** command.

```
switch> show port-channel active-ports
```

```
Port Channel Port-Channel3:
  No Active Ports
Port Channel Port-Channel11:
  No Active Ports
switch>
```

- This command displays output from the **show port-channel all-ports** command.

```
switch> show port-channel all-ports
Port Channel Port-Channel3:
  No Active Ports
  Configured, but inactive ports:
      Port            Time became inactive    Reason unconfigured
    ------------------------------------------------------------------------
      Ethernet3       Always                  not compatible with aggregate

Port Channel Port-Channel11:
  No Active Ports
  Configured, but inactive ports:
      Port            Time became inactive    Reason unconfigured
    ------------------------------------------------------------------------
      Ethernet25      Always                  not compatible with aggregate
      Ethernet26      Always                  not compatible with aggregate
```

11.2.5.40 show port-channel dense

The **show port-channel dense** command displays the port-channels on the switch and lists their component interfaces, LACP status, and set flags.

Command Mode

EXEC

Command Syntax

show port-channel dense

Example

This command displays **show port-channel dense** output:

```
switch> show port-channel dense

    Flags
--------------------------------------------------------------------
a - LACP Active        p - LACP Passive
U - In Use             D - Down
+ - In-Sync            - - Out-of-Sync      i - incompatible with agg
P - bundled in Po      s - suspended        G - Aggregable
I - Individual         S - ShortTimeout     w - wait for agg

Number of channels in use: 2
Number of aggregators:2

   Port-Channel       Protocol    Ports
------------------------------------------------------
   Po1(U)             LACP(a)      Et47(PG+) Et48(PG+)
   Po2(U)             LACP(a)      Et39(PG+) Et40(PG+)
```

11.2.5.41 show port-channel limits

The **show port-channel limits** command displays groups of ports that are compatible and may be joined into port channels. Each group of compatible ports is called a LAG group. For each LAG group, the command also displays **Max interfaces** and **Max ports per interface**.

- **Max interfaces** defines the maximum number of active port channels that may be formed out of these ports.
- **Max ports per interface** defines the maximum number of active ports allowed in a port channel from the compatibility group.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or ZMaximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

Command Mode

EXEC

Command Syntax

show port-channel limits

Example

This command displays **show port-channel list** output:

```
switch> show port-channel limits

LAG Group: focalpoint
--------------------------------------------------------------------------------
  Max port-channels per group: 24, Max ports per port-channel: 16
  24 compatible ports: Ethernet1  Ethernet2  Ethernet3  Ethernet4
                       Ethernet5  Ethernet6  Ethernet7  Ethernet8
                       Ethernet9  Ethernet10 Ethernet11 Ethernet12
                       Ethernet13 Ethernet14 Ethernet15 Ethernet16
                       Ethernet17 Ethernet18 Ethernet19 Ethernet20
                       Ethernet21 Ethernet22 Ethernet23 Ethernet24
--------------------------------------------------------------------------------
```

11.2.5.42 show port-channel load-balance fields

The **show port-channel load-balance fields** command displays the fields that the hashing algorithm uses to distribute traffic across the interfaces that comprise the port channels.

Command Mode

EXEC

Command Syntax

show port-channel load-balance **HARDWARE** fields

Parameters

HARDWARE ASIC switching device. Selection options depend on the switch model and include:

- **arad**
- **fm6000**
- **petraA**
- **trident**

Example

This command displays the hashing fields used for balancing port channel traffic.

```
switch> show port-channel load-balance fm6000 fields

Source MAC address hashing for non-IP packets is ON
Destination MAC address hashing for non-IP packets is ON
Ethernet type hashing for non-IP packets is ON
VLAN ID hashing for non-IP packets is ON
VLAN priority hashing for non-IP packets is ON
Source MAC address hashing for IP packets is ON
Destination MAC address hashing for IP packets is ON
Ethernet type hashing for IP packets is ON
VLAN ID hashing for IP packets is ON
VLAN priority hashing for IP packets is ON
IP source address hashing is ON
IP destination address hashing is ON
IP protocol field hashing is ON
TCP/UDP source port hashing is ON
TCP/UDP destination port hashing is ON

switch>
```

11.2.5.43 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

The distribution values displayed are based on the total interface counters which start from ***0*** at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the clear counters command.

Command Mode

EXEC

Command Syntax

show port-channel load-balance [**MEMBERS**]

Parameters

MEMBERS list of port channels for which information is displayed. Options include:

- ***no parameter*** all configured port channels.
- ***c_range*** ports in specified channel list (number, number range, or list of numbers and ranges).

Example

This command displays traffic distribution for all configured port channels.

```
switch> show port-channel load-balance
ChanId      Port Rx-Ucst Tx-Ucst Rx-Mcst Tx-Mcst Rx-Bcst Tx-Bcst
------ --------- ------- ------- ------- ------- ------- -------

11.3 Multi-Chassis Link Aggregation

Arista switches support Multi-Chassis Link Aggregation (MLAG) to logically aggregate ports across two switches. For example, two 10-gigabit Ethernet ports, one each from two MLAG configured switches, can connect to two 10-gigabit ports on a host, switch, or network device to create a link that appears as a single 20-gigabit port. MLAG-configured ports provide Layer 2 multipathing, increased bandwidth, higher availability, and other improvements on traditional active-passive or Spanning Tree governed infrastructures.

The Multi-Chassis Link Aggregation section contains these topics:

11.3.1 MLAG Introduction

High availability data center topologies typically provide redundancy protection at the expense of over-subscription by connecting Top-Of-Rack (TOR) switches and servers to dual aggregation switches. In these topologies, Spanning Tree Protocol prevents network loops by blocking half of the links to the aggregation switches. This reduces the available bandwidth by 50%.

Deploying MLAG removes over-subscription by configuring an MLAG link between two aggregation switches to create a single logical switching instance that utilizes all connections to the switches. Interfaces on both devices participate in a distributed port channel, enabling all active paths to carry data traffic while maintaining the integrity of the Spanning Tree topology.

MLAG provides these benefits:

- Aggregates multiple Ethernet ports across two switches.
- Provides higher bandwidth links as network traffic increases.
- Utilizes bandwidth more efficiently with fewer links blocked by STP.
- Connects to other switches and servers by static LAG or LACP without other proprietary protocols.
- Supports normal STP operation to prevent loops.
- Supports active-active Layer-2 redundancy.

Note: For information on enabling Precision Timing Protocol (PTP) on an MLAG interface, see the Timing Protocols chapter.

Note: The global STP configuration is derived from the primary peer device while the secondary device parameters are ignored. When STP is disabled on the primary device, the secondary device will not contain any STP configuration information from the primary device. As a result, the secondary device will not be able to decide on the port roles or states, and will remain in the default state which is the discarding state. This is an expected behavior.

Note: It is highly recommended that both MLAG peer switches are identical platforms and run identical EOS images. Running different images/platform may result in a failure to form an association with the MLAG peer or see discrepancy in behavior.

11.3.2 MLAG Conceptual Overview

11.3.2.1 MLAG Operation Process

A Multi-chassis Link Aggregation Group (MLAG) is a pair of links that terminate on two cooperating switches and appear as an ordinary Link Aggregation Group (LAG). The cooperating switches are MLAG peer switches and communicate through an interface called a peer link. While the peer link's primary purpose is exchanging MLAG control information between peer switches, it also carries data traffic from devices that are attached to only one MLAG peer and have no alternative path. An MLAG domain consists of the peer switches and the control links that connect the switches.

In the figure below, Switch A and Switch B are peer switches in the MLAG domain and connect to each other through the peer link. Each peer switch uses the peer address to form and maintain the peer link.

The MLAG domain ID is a text string configured in each peer switch. MLAG switches use this string to identify their peers. The MLAG System ID (MSI) is the MLAG domain's MAC address. The MSI is automatically derived when the MLAG forms and does not match the bridge MAC address of either peer. Each peer uses the MSI in STP and LACP PDUs.

The topology shown below contains four MLAGs: one MLAG connects each device to the MLAG domain. Each peer switch connects to the four servers through MLAG link interfaces.

In a conventional topology, with dually-attaching devices to multiple switches for redundancy, Spanning Tree Protocol (STP) blocks half of the switch-device links. In the MLAG topology, STP does not block any portion because it views the MLAG Domain as a single switch and each MLAG as a single port. The MLAG protocol facilitates the balancing of device traffic between the peer switches.

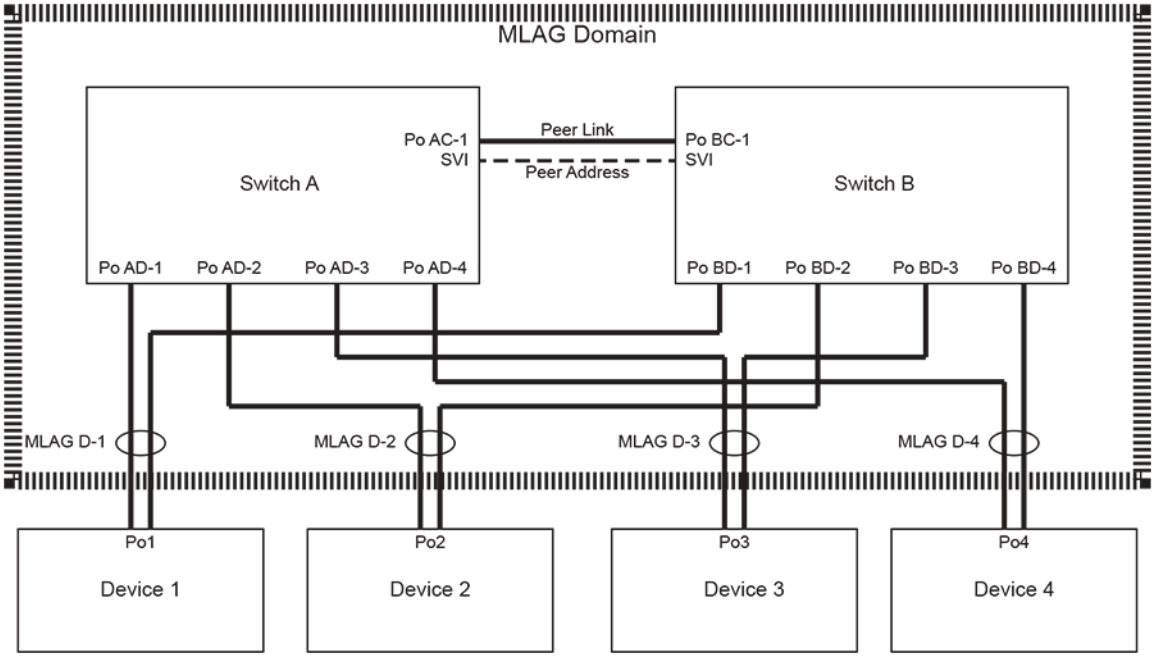

Figure 23: MLAG Domain Topology

When MLAG is disabled, peer switches revert to their independent state. MLAG is disabled by any of the following:

- MLAG configuration changes.
- The TCP connection breaks.
- The peer-link or local-interface goes down.
- A switch does not receive a response to a keep alive message from its peer within a specified period.

11.3.2.2 MLAG Interoperability with Other Features

The following sections describe MLAG interaction with other switch features.

11.3.2.2.1 VLANs

VLAN parameters must be configured identically on each peer for the LAGs comprising the peer link and MLAGs. These parameters include the switchport access VLAN, switchport mode, trunk-allowed VLANs, the trunk native VLAN, and switchport trunk groups.

Configuration discrepancies may result in traffic loss in certain failure scenarios. Port-specific bridging configuration originates on the switch where the port is physically located.

11.3.2.2.2 LACP

Link Aggregation Control Protocol (LACP) should be used on all MLAG interfaces, including the peer-link. LACP control packets reference the MLAG system ID.

11.3.2.2.3 Static MAC Addresses

A static MAC address configured on an MLAG interface is automatically configured on the peer's corresponding interface. Configuring static MAC addresses on both peers prevents undesired flooding if an MLAG peer relationship fails.

If the MLAG peering relationship is disabled, the static MAC previously learned from peer is removed.

11.3.2.2.4 Spanning Tree Protocol (STP)

When implementing MLAG in a spanning tree network, spanning tree must be configured globally and on port-channels configured with an MLAG ID. Port specific spanning tree configuration comes from the switch where the port physically resides. This includes spanning-tree PortFast BPDU Guard and BPDU filter.

11.3.2.2.5 Port Mirroring

A port channel which is a member of an MLAG *must not* be used as the destination port for a port mirroring (port monitoring) session.

11.3.2.3 IPv6 Flow Label Hashing

Arista switches use the hashing algorithm to load-balance traffic among LAG members and Layer 3 ECMP (equal cost multipath) paths. For IP and IPv6 traffic, the hashing algorithm includes (if so configured for LAG) the IP packet fields such as source and destination IP addresses as well as source and destination ports for UDP and TCP traffic.

To improve traffic distribution for IPv6 traffic, IPv6 Flow Label field has been added to the hashing algorithm for both LAG and ECMP.

Note: IPv6 Flow Label is included in the LAG hashing algorithm only when the MAC header hashing is not enabled for IPv6 traffic.

11.3.3 MLAG Maintenance

These sections describe tasks required for MLAG to operate on the switch:

- Ensuring Control Plane ACL Compatibility
- MLAG Availability through a Single Functional Peer
- Upgrading MLAG Peers

11.3.3.1 Ensuring Control Plane ACL Compatibility

The control plane Access Control List (ACL) on any interface participating in the MLAG must be configured to allow only the peer link neighbor to generate MLAG control traffic. The required rules are included in the default control plane ACL for Ethernet ports.

Any custom control plane ACL applied to a participating port must include these three rules:

```
permit tcp any any eq mlag ttl eq 255
permit udp any any eq mlag ttl eq 255
permit tcp any eq mlag any ttl eq 255
```

MLAG peers that function as routers must each have routing enabled.

11.3.3.2 MLAG Availability through a Single Functional Peer

MLAG high availability advantages are fully realized when all devices that connect to one MLAG switch also connect to the peer switch. A switch can continue supporting MLAG when its peer is offline if the STP agent is restartable. When one peer is offline, data traffic flows from the devices through the MLAG component link that connects to the functioning switch. When a switch is offline, its interfaces and ports do not appear in show mlag and **`show spanning tree protocol`** commands of the functioning peer.

To view the restartability status of the STP agent, use the **detail** option of the **`show spanning-tree instance`** command:

```
switch-1# show spanning-tree instance detail | grep agent
Stp agent restartable                       :            True
```

STP agent restartability requires consistent configuration between the peers of STP, LACP, MLAG, and switchport parameters. Events triggering an STP state machine change may also briefly prevent the STP agent from being restartable.

11.3.3.2.1 Reload Delay

If an MLAG peer reboots, all ports except those in the peer-link port-channel remain in ***errdisabled*** state for a specified time, called the reload-delay period. This period allows all topology states to stabilize before the switch begins forwarding traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches**: 300 seconds
- **Trident II modular switches**: 1200 seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches**: 600 seconds
  - 7280 series (except 7280CR2 and 7280SR2)
  - 7020 series
- **Sand platform modular switches**: 1800 seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S
